2. Using the appropriate feature RC/V view, change the feature AP ID to an AP ID that is not defined as a secondary AP ID; or, using RC/V View 24.7 (DSL AP COMMUNICATIONS DATA), update the appropriate AP ID so that the AP ID used by the feature is not used as the secondary AP ID.
3. Data on the AP for the links assigned to each AP ID may need to be updated.

14. CMAPSENDP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMapsend() primitive failed to send a message to an application processor (AP) because of an OSSENDMSG() macro failure.

15. CMAUARQF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asynchronous report queue was full. The error report could not be sent from the foundation peripheral controller (FPC) to the AM.

16. CMAUASYR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Corrupt parameters to the asynchronous report routine in the CM were encountered.

17. CMAUBADIDLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM message packetization audit detected a problem with the idle list. The top pointer to the idle list is not within the valid range. A packet data initialization is performed to correct the problem. Messages could be lost. The CMpktidle[] data structure is dumped.

18. CMAUBADIPADDR (5E12 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency of IP address occurred between our stored data in the MH and the dynamic data from the socket.

Probable Cause:
Software error.

Action:
Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on reporting occurrence.

19. CMAUBDINV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
CM software detected an invalid buffer descriptor (BD) index value.

Probable Cause:
Software problem.

Action:
Report occurrence to the next level of technical support.

20. CMAUDBLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A packet buffer residing under the CM subsystem in the direct link node (DLN) processor was recovered by the CMPKT audit. The linkage checks for this buffer failed two times consecutively. The au_recover and au_detect bits were set 1 resulting in recovering this buffer to the packet buffer free list.

The first dump is the usetype, the second dump is the packet buffer recovered, and the third dump is the value of the local variable cursor indicating on which packet the audit is working.

21. CMAUDPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A message was sent to an invalid processor.

22. CMAUENPTYPE (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
CM software received an unsupported ethernet protocol packet type in the AWS/VCDX configuration. The frame containing the invalid protocol type is dumped for debugging purposes.

Probable Cause:
Ethernet hardware may be faulty.

Action:
If problem persists, diagnose the ethernet using the MCTSI diagnostics.

23. CMAUERRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or corrupted error type variable was encountered.

24. CMAUESATPINIT (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external system/acknowledged transport protocol (ES/ATP) is being initialized due to an error being detected. Data/messages that ES/ATP is in the process of transporting may be lost as part of the protocol initialization. Note that this assert may occur from other SMs if the Global Billing SM goes through a power-up initialization.

Probable Cause:

Software error or power-up initialization of GBSM.

Action:

If the GBSM went through a power-up initialization or other initialization where memory was cleared, this assert should be ignored. Otherwise report occurrence to next level of technical support.

25. CMAUESATPINIT (5E12 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external system/acknowledged transport protocol (ES/ATP) is being initialized due to an error being detected. Data/messages that ES/ATP is in the process of transporting may be lost as part of the protocol initialization.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report occurrence.

26. CMAUEXTSYSTYPE (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ES/ATP external system type is invalid.

Probable Cause:

Software error.

Action:

If the problem persists report the occurrence and the associated assert dumps to the next level of technical support.

27. CMAUFDINV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Frame descriptor (FD) value is out of range. The CLNK/QLNK/DQLNK that was being processed when the error occurred will be re-initialized.

28. CMAUFDLINK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The Frame descriptor (FD) linkage that was being checked is invalid. The CLNK/QLNK/DQLNK that was being processed at the time of the error was re-initialized.

29. CMAUFDLOW (5E11 and later)

Recovery Action: spp	SPP: n	Audit: FD	Audit Mode: nonseg

Problem:

Message routing software in the SM-2000 message handler (MH) or quad-link gateway processor (QGP) has exceeded its frame descriptor (FD) exhaustion threshold. This assert will schedule the FD audit in a attempt to recovery any "lost" FDs because the number of FDs should be over engineered.

Probable Cause:

Software error.

Action:

FD audit was schedule. If problem persists, contact next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

30. CMAUFREE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Data related to free buffer handling was corrupted, or a call to free a buffer was invalid.

31. CMAUGDITIMEOUT (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

After the connection comes up to the RTCD billing server software waits for a message from the billing server indicating the last GDI sequence number the server received. In this case the message never arrived.

Probable Cause:

Software error or MELNK problem.

Action:

After the assert software begins sending to the billing server anyway. This could result in a MELNK error indicating a protocol timeout, if the first GDI sequence number sent to the billing server does not match the next one it expects.

If the assert persists report the occurrence to the next level of technical support.

32. CMAUILL2X4 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CM software has detected an inconsistency in the data used to derive the pseudo-2x4 switch in the SM-2000. When attempting to convert a synchronous/asynchronous protocol data formatter (SPYDER) -T channel number to a communication link (CLNK) synchronous data link controller (SDLC) number (0 or 1) based on the data stored in SMmhc12x4[] in the SM-2000 message handler (MH) processor, software was unable to perform the translation.

Either the SMmh2x4[] data was corrupted or the SPYDER-T device in the message handler (MH) was programmed incorrectly. A CLNK initialization will occur to correct the problem.

33. CMAUINFR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid "i" frame was found in the message that was received.

34. CMAUINPCBINV (5E13 and later)

Recovery Action: spp	SPP: n	Audit: INPCB	Audit Mode: nonseq

Problem:

Internet Protocol software has detected an invalid resource index. The INPCB audit is requested to recover lost resources.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support.

35. CMAUINVATPMMSG (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by the ES/ATP protocol code that contained invalid data.

Probable Cause:

Software error.

Action:

If the problem persists report the occurrence and the associated assert dumps to the next level of technical support.

36. CMAUINVATPST (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ES/ATP protocol state was invalid in the context it was being checked in.

Probable Cause:

Software error or lost message.

Action:

If the problem persists report the occurrence and the associated assert dumps to the next level of technical support.

37. CMAUINVBIND (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Socket is bound more than once as indicated by the internet protocol control block data.

Probable Cause:
Software error.

Action:
Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report occurrence.

38. CMAUINVEFD (5E13 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
Ethernet frame descriptor (EFD) value is out of range. The MELNK that was being processed when the error occurred will be re-initialized.

Probable Cause:
Software error.

Action:
This assert causes an operational software restart of the MH, which should clean up the data. If the problem persists contact the next level of technical support.

39. CMAUINVEFDMELNK (5E13 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
The MCTSI-based ethernet link (MELNK) value stored in an ethernet frame descriptor (EFD) did not agree with the MELNK number that the EFD was queued for.

Probable Cause:
Software error.

Action:
An operational software reset (OSR) is scheduled to clean up the data. If the problem persists report the occurrence and assert dumps to the next level of technical support.

40. CMAUINVEDATA (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A data inconsistency has been detected in the external system/acknowledged transport protocol (ES/ATP) control data and the ODD. It is not possible to determine which data is correct because the data in the asserting SM is based upon ODD and data received from another SM from its ODD.

Probable Cause:
Software or data (ODD) problem.

Action:
Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report occurrence.

41. CMAUINVHWADDR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency of hardware address occurred between our stored data base and the address resolution protocol (ARP) packet data.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report occurrence.

42. CMAUINVINIT (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM-2000 message handler (MH) was requested to initialize but the initialization type was invalid. This assert will cause the initialization to fail, which will cause a new MH initialization to occur.

Probable Cause:

Software bug.

Action:

None, the switch automatically recovered itself.

43. CMAUINV3QAUST (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While running the layer 3 queue audit an invalid audit state was encountered.

Probable Cause:

Software error.

Action:

Software will attempt to clean up and will try again. If the problem persists report the occurrence to the next level of technical support.

44. CMAUINVMELNK (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid MEPIPE or MELNK number was passed to a CM primitive.

Probable Cause:

Software error.

Action:

If the problem persists report the problem along with the assert output to the next level of technical support.

45. CMAUINVMESERV (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet service field is unrecognized.

Probable Cause:

The relation RLENETLINK is provisioned incorrectly.

Action:

Correct the data in the relation, or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

46. CMAUINVPARAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A CM function was passed an invalid or unexpected parameter value. This is a general purpose assert.

47. CMAUINVSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM subsystem uses CMPKTBUF structures to deliver large messages between processors. The CMPKT audit found a packet buffer with an invalid usetype residing under the CM subsystem in the direct link node (DLN) processor. The first dump is the value of usetype, the second dump is the packet buffer, and the third dump is the value of the local variable cursor indicating the packet that the audit is working on.

48. CMAUINVTCPST (5E12 and later)

Recovery Action: spp	SPP: n	Audit: TCPCB	Audit Mode: nonseg

Problem:

An invalid transmission control protocol (TCP) state was found. The TCP control block is dumped for debugging purposes. The TCPCB audit is requested to recover.

Probable Cause:

Software error. **Action:**

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report occurrence.

49. CMAUINVUNIT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM-2000 message handler (MH) based peripheral pump detected an invalid unit type.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

50. CMAUINVUTPACK (5E13 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The external system unacknowledged transport protocol (ES/UTP) software received an invalid acknowledgement.

Probable Cause:

Software error.

Action:

The stack trace should show who sent the invalid acknowledgement. Report the assert with the ROP output to the next level of technical support.

51. CMAUL1BUSY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CM level 1 software was requested to queue a frame descriptor (FD); however, the FD was already owned by level 1. The frame was not queued and level 2 software should recover. Data dumped includes the synchronous/asynchronous protocol data formatter (SPYDER) -T channel data block, FD and the frame buffer.

Probable Cause:

Software error.

Action:

Provide data to the next level of technical support.

52. CMAUL1DERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A communications level 1 protocol device reported an error to software or the software driver for the level 1 protocol device has detected an error in the hardware.

Probable Cause:

Hardware fault.

Action:

Report occurrence to the next level of technical support.

53. CMAUL1DTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Software has timed out programming a communications level 1 protocol device.

Probable Cause:

Hardware problem.

Action:

Report occurrence to next level of technical support.

54. CMAUL3QACKERR (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

After validating the GDI acknowledgement from the far end, the EFD index passed in does not match the EFD at the head of the layer 3 queue.

Probable Cause:

Corrupted data or software error.

Action:

If the problem persists report the occurrence and associated data dumps to the next level of technical support.

55. CMAUL3QRCVRFail (5E13 and later)

Recovery Action: spp	SPP: n	Audit: EXENET	Audit Mode: nonseg

Problem:

The layer 3 queue audit has attempted all available recovery, and the problem has still not cleared. This assert will fire every 30 seconds until the MH escalates to a higher level of recovery which should clear the problem.

Probable Cause:

Corrupted data or software error.

Action:

If after several asserts fire and the MH escalates to a higher level of recovery the problem does not clear, report the occurrence and associated data dumps to the next level of technical support.

56. CMAULGINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A client attempted to use the unaltered large operating system for distributed switching (OSDS) message (ULM) sending primitive in a CM1 equipped switch.

Probable Cause:

Software bug in client (see stack trace for caller). The message being sent is dumped for debugging purposes.

Action:

Report to the next level of technical support.

57. CMAULGMLNG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A client attempted to use the unaltered large operating system for distributed switching (OSDS) message (ULM) sending primitive to send a message larger than the maximum unaltered large message size supported by a non-CM1 equipped switch.

Probable Cause:

Software bug in client software (see stack trace for caller). The message being sent is dumped for debugging purposes.

Action:

Report to the next level of technical support.

58. CMAULINK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to a CM function, or a corrupted link member was detected.

59. CMAULOSTPKT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A lost packet residing under the CM subsystem in the direct link node (DLN) processor was found by the CMPKT audit. The packet's au_visitcnt field in the usage data had a value greater than the allowable value of 2. This means that the audit ran two times and this packet did not move from its current place during these passes.

This packet is recovered to the free list in the current third pass. The first dump is the value of the usage type of the packet, the second dump is the packet buffer that was lost, and the third dump is the value of the local variable cursor indicating the packet that the audit is working on.

60. CMAUMENOCNFIG (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message handler ethernet link (MELNK) was requested to be restored, but the data for that MELNK has not been copied to the MH yet.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the error.

61. CMAUMHCOMFAIL (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During ES/ATP protocol processing sending a message to the message handler failed.

Probable Cause:

Software or hardware error.

Action:

The protocol should resend the message. If the problem persists diagnose the MCTSI side for the SM the assert was reported on. If no errors are found report the occurrence to next level of technical support.

62. CMAUMHERR (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The synchronous/asynchronous protocol data formatter (SPYDER) -T device in the SM-2000 message handler (MH) processor reported that a channel has exhausted its allocated received descriptors (RDs)/buffers (also known as frame descriptors [FDs]). This event should not be possible based on the method used to engineer the number of RDs allocated for each channel. Since the error has occurred, the most likely cause is corruption of the SPYDER-T receive list. Recovery for this error is to initialize the message handler (MH). The SPYDER-T control block and the CM channel control block are dumped for debugging.

63. CMAUMHIDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the module controller/time slot interchanger (MCTSI) switch of the SM-2000, the message handler (MH) detected its hardware identification value was that of an unsupported MH. The link terminating device in the message handler (MH) was not reprogrammed due to this inconsistency. The SM-2000 may lose communication until software recovers the links.

64. CMAUMHINV (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message handler (MH) has been specified in a CM subsystem primitive.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

65. CMAUMHPPIP (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM-2000 message handler (MH) based peripheral pump has detected an inconsistency. The SMP attempted to perform a peripheral pump on a unit that is still in progress.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

66. CMAUMHSWERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM-2000 message handler (MH) detected a synchronous/asynchronous protocol data formatter (SPYDER) -T error while performing the module controller/time slot interchanger (MCTSI) switch request. Messages being transported on the links where the error occurred and all links after the one that detected the error will be lost. This assert implies that the MH circuit pack in the SM-2000 may be faulty.

67. CMAUMLNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process attempted to send a message that is longer than the maximum allowable message length: CMMAXMLEN for most messages and OSMAXMSGTXT for large messages.

68. CMAUMSGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was sent or received.

69. CMAUNOBUFS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Communications software attempted to allocate a message buffer but none were available.

Probable Cause:

Either the idle list has been corrupted or the number of buffers needed was under engineered.

Action:

Report occurrence to the next level of technical support.

70. CMAUNOFDS (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Messaging software attempted to allocate a frame descriptor (FD) from the reserved pool but none were available. Either the idle list has been corrupted or the number needed was under engineered. The FD idle list is dumped for debugging purposes.

71. CMAUNOGDIMATCH (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A GDI acknowledgement was received from the billing server, but the message it is acknowledging could not be found on the layer 3 queue.

Probable Cause:

Other recovery action occurred, or software error.

Action:

If the problem persists report the occurrence and the associated assert dumps to the next level of technical support.

72. CMAUNOINPCB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to allocate an internet protocol control block.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence.

73. CMAUNOTPCB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to allocate a transmission control protocol (TCP) control block.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence.

74. CMAUNOTDS (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The synchronous/asynchronous protocol data formatter (SPYDER) -T device driver software attempted to allocate a transmit descriptor (TD) from the idle list but none were available. Either the TD idle list has been corrupted or the number of TDs was under engineered. The TD idle list is dumped for debugging.

75. CMAUNXST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM transmitter state variable contains an illegal value.

76. CMAUOQFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

If this assert is reported from the SM, the CM output message buffer queue has overflowed. The operating system for distributed switching (OSDS) "topid", OSMSGHEAD of the messages in the output message queue, and the messages in the transmit window queue are dumped. There are 3 data dumps. As a final recovery action, the output message buffer queue is flushed to allow these assert event messages to be printed.

If this assert is reported from the communication module processor (CMP), the CM output message queue to the message switch control unit (MSCU) is full. If this occurs after an MSCU/message switch (MSGs) fault or an AM init that forced the MSCU, the assert should be ignored. Under these conditions the subtending CMP cannot be reset, which causes all messages leaving the CMP to be queued until the overflow occurs and the assert fires. The queue pointers, measurements counts, and contents of the queue are dumped.

77. CMAUORCV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message for the operating system for distributed switching-SM (OSDS-M) could not be received; that is, the CMsendosd() function failed. The background queue may be full.

78. CMAUOSMG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was returned by the OSWGETMSG() macro in a situation where an error should not be generated.

79. CMAUPHSE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM variable indicating the X.25 phase was corrupted.

80. CMAUPINVUNIT (5E12 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Message handler (MH) write-protected data for determining channel to peripheral unit mapping has been corrupted.

Probable Cause:

Software error.

Action:

The MH will be initialized to reconstruct the mapping table. Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

81. CMAUPKTBLAST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMPKT audit could not localize the recovery for the packet buffer that was in error. This required an initialization of all packet buffers in the processor. Messages could be lost.

82. CMAUPKTLNG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CM message packetization detected an inconsistency with a received packetized message. The message size in the assembled message does not match the size of the data shipped in the packets. All packets are dumped.

83. CMAUPTINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MH received a frame that contains an unsupported ethernet packet type.

Probable Cause:

Ethernet connection to SM may be faulty.

Action:

If problem persists, replace ethernet cables and/or ethernet paddle board and/or UN584 circuit pack.

84. CMAUPTST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of Grrerror.pstate is invalid or corrupted.

85. CMAUPT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupted pointer update type was encountered.

86. CMAUQERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Shared processor first-in, first-out (FIFO) queue error has occurred. The FIFO queue pointers at the time of the error are dumped for debugging purposes.

87. CMAUQLINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CM was requested by quad-link fault recovery (QLFR) to initialize a quad-link packet switch (QLPS) network that does not exist. This assert will purge the caller.

88. CMAUQTSBAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CM message handler (MH) software on the SM-2000 detected invalid data in the quad-link packet switch (QLPS) PIPE time slot buffer. More than the maximum number of time slots (32) have been found the QLPS time slot data area (SMqpipe_per[network][0] which is dumped in the assert).

Probable Cause:

Either the data in the MH is being corrupted or the SM-2000 has an office-dependent data (ODD) problem in RLMHPIPE.

Action:

Verify that RLMHPIPE tuple for both networks are correct. If both are correct, then provide data to the next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual. If not correct, then fix the ODD problem.

89. CMAURCST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value in Grcvcb.state was encountered.

90. CMAURCVERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMspchstrt() function has determined that the receive data structures required to properly initialize a

synchronous/asynchronous protocol data formatter (SPYDER) -T device channel have not been properly initialized or the data has been overwritten since the initialization. A new channel initialization will be performed as part of the recovery actions.

91. CMAURCVF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMrcv() function was called in the wrong processor.

92. CMAURETC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from a function call. Example: A call to the OSgetbuf() function from CM returns an unrecognizable return code.

93. CMAURETINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code has been detected from a task function.

Probable Cause:

Interface problem.

Action:

Correct the interface.

94. CMAURJOB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No receive job is in the job queue; there should be a job in the queue.

95. CMAURMMG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred on a call to the CMrem_msg() function in the foundation peripheral controller (FPC). The message could not be transmitted over the link.

96. CMAURMTS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect state was received during a receive interrupt. CM received an unexpected result from the synchronous data link controller (SDLC). This could indicate a marginal SDLC device on the TN872, TN1617, or UN518 circuit pack.

Action:

If this assert occurs frequently, replace the specified circuit pack.

97. CMAUSCERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The MH SONIC ethernet protocol device reported an unexpected interrupt to software.

Probable Cause:

The SONIC device was programmed incorrectly or the SONIC device is faulty.

Action:

Replace UN584 circuit pack if problem persists.

98. CMAUSCRCV (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The MH SONIC device reported a receive source exhaustion. This should not occur since the SONIC resources are over-engineered by a factor of 2.

Probable Cause:

Software problem.

Action:

Report occurrence to the next level of technical support.

99. CMAUSCRDTO (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Timed out reading events out of SONIC device.

Probable Cause:

Hardware or software failure.

Action:

If problem persists report the occurrence to the next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

100. CMAUSCTO (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Timed out programming SONIC device.

Probable Cause:

Hardware failure.

Action:

If problem persists, replace UN584 circuit pack.

101. CMAUSMGD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM global data that is accessed by CM is corrupted or inconsistent.

102. CMAUSNDF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMsend() function was called in the wrong processor [not the operational kernel process (OKP) or switch maintenance kernel process (SMKP)].

103. CMAUSOBNDFAIL (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMsobind() failed for a socket.

Probable Cause:

Corrupted socket or protocol data.

Action:

The software should clean up the data. If the problem persists refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence.

104. CMAUSOCKETINV (5E13 and later)

Recovery Action: spp	SPP: n	Audit: SOCKET	Audit Mode: nonseg

Problem:

Socket software has detected an invalid resource index. The SOCKET audit is requested to recover lost resources.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support.

105. CMAUSOCKINV (5E12 and later)

Recovery Action: spp	SPP: n	Audit: TCPCB	Audit Mode: nonseg

Problem:

Internet protocol socket software has detected corrupt data in the socket control block. The socket control block is dumped for debugging purposes. The TCPCB audit is requested to recover.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence.

106. CMAUSOCLSFAIL (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMsoclose() failed to close the requested socket.

Probable Cause:

Software or data error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the error.

107. CMAUSOCONFAIL (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMsoconnect() failed to start up protocol on a socket.

Probable Cause:

Corrupted socket or protocol data.

Action:

The software should clean up the data. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence.

108. CMAUSOCRTFAIL (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CMscreate() failed to create a socket. This should not happen because this resource should be engineered for the maximum number needed.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on how to contact the next level of technical support.

109. CMAUSOSHUTFAIL (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CMsoshutdown() failed, but the only reason it can fail is that the socket index passed in was bad.

Probable Cause:

Internal data is corrupted, or there is a software error.

Action:

This assert causes a operational software restart of the MH, which should clean up the data. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on how to contact the next level of technical support.

110. CMAUSPDERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CM software detected an invalid data value when determining what action needed to be performed on data received from the synchronous/asynchronous protocol data formatter (SPYDER) -T device in the message handler (MH) on the SM-2000. Depending upon where the assert occurs, various pieces of debugging information are dumped to assist in determining the cause of the error.

Probable Cause:

Hardware/software interface problem.

Action:

Provide data to the next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual. If problem persists on one module controller/time slot interchanger (MCTSI) side, replace the message handler (MH) circuit pack (UN538) on the SM-2000.

111. CMAUSPERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The synchronous/asynchronous protocol data formatter (SPYDER) -T device reported data to CM that was invalid or unexpected. The channel being processed at the time of the error will be re-initialized.

112. CMAUSPTO (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The synchronous/asynchronous protocol data formatter (SPYDER) -T device channel configuration software timed out waiting for the SPYDER-T device to complete the specified request. Continued occurrences of this assert indicate a possible hardware problem. The most likely cause of this problem is a faulty SPYDER-T device located on the UN538 (message handler) circuit pack.

113. CMAUSRCF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operational kernel process (OKP) or the switch maintenance kernel process (SMKP) received a message from an invalid source (that is, the message contained a wrong message type).

114. CMAUSTAT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM variable indicating the X.25 state was corrupted.

115. CMAUSUPT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A supervisory command type parameter was corrupted.

116. CMAUSWMFERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CM communication module processor (CMP) soft forwarding detected a problem with the soft switch copied message queue. This causes the soft switch to fail by purging it in the critical phase of the CMP switch. The soft switch copied message queue pointers and the IP->AP queue pointers are dumped.

117. CMAUSWQERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CM message interject processing detected a problem in the communication module processor (CMP) soft switch copied message buffer. The queue pointers were out-of-range, or the data the unload pointer was pointing to was not the CM flag byte. All messages in the queue are considered lost since CM can no longer process them. The queue pointers and the message the unload pointer is pointing to is dumped.

118. CMAUTCMELNKDATA (5E12 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Data for a message handler ethernet link (MELNK) that was once known to be valid is now invalid.

Probable Cause:

The data was corrupted or a software error occurred.

Action:

This assert will trigger a critical error interrupt which should result in the data being corrected. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence to next level of technical support.

119. CMAUTCPCBINV (5E13 and later)

Recovery Action: spp	SPP: n	Audit: TCPCB	Audit Mode: nonseg

Problem:

Transmission control protocol software has detected an invalid resource index. The TCPCB audit is requested to recover lost resources.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support.

120. CMAUTCPCINV (5E12 and later)

Recovery Action: spp	SPP: n	Audit: TCPCB	Audit Mode: nonseg

Problem:

Transmission control protocol (TCP) software has detected corrupt data in the TCP control block. The TCP control block is dumped for debugging purposes. The TCPCB audit is requested to recover.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence.

121. CMAUTCSOBINDFAIL (5E12 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

CMsobind() failed for a socket that the function worked for before an MCTSI switch.

Probable Cause:

Corrupted socket or protocol data.

Action:

This assert will trigger a critical error interrupt which should clean up the data. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence to next level of technical support.

122. CMAUTCSOCONFAIL (5E12 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

CMsoconnect() failed for a socket that had been successfully connected before an MCTSI switch.

Probable Cause:

Corrupted socket or protocol data.

Action:

This assert will trigger a critical error interrupt which should clean up the data. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence to next level of technical support.

123. CMAUTDAF (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The MH frame is attempting to queue a frame for transmission over the ethernet, but there are no available transmit descriptor areas (TDAs).

Probable Cause:

Software problem.

Action:

Report occurrence to the next level of technical support.

124. CMAUTDEOL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The synchronous/asynchronous protocol data formatter (SPYDER) -T device driver software has detected an error in the channel data block (CDB). The transmit descriptor (TD) that was allocated for the end-of-list (EOL) was not

correctly marked as the EOL TD. The channel being processed at the time the error was detected is reinitialized. The CDB and the TD are dumped for debugging.

125. CMAUTDERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to release a transmit descriptor (TD) resource, an error has been detected in the TD and/or frame descriptor (FD) data structures. Debugging data dumped depends upon where the error occurred. The first data dump is always the TD control data stored in CMsptduse[] for the TD being released. The synchronous/asynchronous protocol data formatter (SPYDER) -T channel that was being processed at the time of the error will be reinitialized.

126. CMAUTDFREE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to release a transmit descriptor (TD), an error has been detected in the TD idle list. The recovery for this error is to reconstruct the TD idle list.

127. CMAUTDINV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

transmit descriptor (TD) value is out of range. The CLNK/QLNK/DQLNK that was being processed when the error occurred will be re-initialized.

128. CMAUTDLINK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The transmit descriptor (TD) linkage that was being checked is invalid. The CLNK/QLNK/DQLNK that was being processed at the time of the error was re-initialized.

129. CMAUTIMT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer type parameter was corrupted.

130. CMAUUNEXPDI (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A GDI acknowledgment was received for a frame, but there were no frames on the layer 3 queue being transmitted at the time.

Probable Cause:

Software error.

Action:

If the problem persists report the occurrence to next level of technical support.

131. CMAUWINFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The messaging protocol out-of-window overflow queue has been exceeded. The message being queued is discarded and local recovery is attempted to restart message transmission.

Probable Cause:

Resource overload.

Action:

If problem persists, contact next level of technical support.

132. CMAUXCBINV (5E12 only)

Recovery Action: spp	SPP: n	Audit: TCPCB	Audit Mode: nonseg

Problem:

Internet protocol software has detected an invalid resource index. The TCPCB audit is requested to recover lost resources.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence to next level of technical support.

133. CMAUXMTERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMspchstrt() function has determined that the transmit data structures required to properly initialize a synchronous/asynchronous protocol data formatter (SPYDER) -T device channel have not been properly initialized or the data has been overwritten since the initialization. A new channel initialization will be performed as part of the recovery actions.

134. CMAUXMTS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected transmit interrupt was received from a synchronous data link controller (SDLC). The state variable may be corrupted. This problem is recoverable.

135. CMAUXTST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of Gxmtcb.state is invalid.

136. CMBADPINDEX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMPKT	Audit Mode: elev

Problem:

The index field in the call to the CMrlspkt() function does not match what was in the buffer to be released. Audits are scheduled to clean up the data.

137. CMBADPKTPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMPKT	Audit Mode: elev

Problem:

The pointer given in the call to the CMrlspkt() function does not point into the packet buffer area. Audits are scheduled to clean up the data.

138. CMBADPLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMPKT	Audit Mode: elev

Problem:

The link field in the two packet buffers that were linked together do not match. The link field was incorrectly set or the buffers were incorrectly linked. Audits are scheduled to clean up the data.

139. CMBADP_PREV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMPKT	Audit Mode: elev

Problem:

The pointer to the previous item in the linked list of a packet buffer does not point to the correct packet. Either a pointer was corrupted or the buffers were incorrectly linked. Audits are scheduled to clean up the data.

140. CMBADPRIOR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMsendbfm() function was called to send a message that contained an invalid value in the priority field of the message header. The priority field value will be changed to 0. The message structure is dumped for debugging purposes to determine the invalid value.

141. CMBADPSIZE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The size parameter passed to the CMbfmrem_msg() function was invalid; consequently, the number of packets calculated came out as an invalid value. A failure is returned to the caller.

142. CMBADPTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMPKT	Audit Mode: elev

Problem:

The type of buffer given in the call to the CMrlspkt() function is an invalid type or does not match what was in the buffer to be released. Audits are scheduled to clean up the data.

143. CMBADSEQORDER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A local variable that holds the order in which packets were received was found to be corrupted in the CMpktrcvmsg() function. Since the variable was set earlier in the function, this indicates a serious problem.

144. CMBADTOPPTR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The pointer into the free packet buffer list was corrupted. The running CM environment is purged so that all packet information can be initialized for this processor. This action causes the loss of any partially received messages from all processors, or any messages that have not yet been delivered to this processor in the case of the SM.

145. CMBADUSETYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid usetype field was found during message processing in a message buffer. A message may have been discarded since CM cannot determine how to process the message. The message buffer is dumped.

146. CMBPOFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM base priority output queue is full.

147. CMBUFERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Data related to free buffer handling was corrupted, or the call to free a buffer was invalid. The buffer that was trying to be released is dumped.

148. CMCCBDDATA (5E12 and later)

Recovery Action: spp	SPP: n	Audit: CCENDPT	Audit Mode: nonseg

Problem:

The state of a common channel signaling (CCS) end point indicates that it is currently accessible, however the state of the end point is actually inaccessible on both quad-link packet switch (QLPS) networks according to the level 2 data. Thus, a CCS message signaling unit (MSU) will be discarded.

Probable Cause:

The CCS data table CMccqsls2endpt[] on the message handler (MH) is out of sync with the state of the Level 2 data arrays QLlmdb[] and QLlcb[]. The CCS data table should always be updated immediately following a state change in end point accessibility.

Action:

The discarded MSU will be dumped to the receive-only printer (ROP) for further evaluation. Contact local field support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

149. CMCCQPHL3IFDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

QPHLNK layer 3 frame descriptor (FD) check error.

Probable Cause:

On doing expected FD values check, invalid value found.

Action:

Report on ROP and return from calling function.

150. CMCCQPHL3INV (5E14 and later)

Recovery Action: spp	SPP: n	Audit: QPHLNK	Audit Mode: nonseg

Problem:

A QPHLNK layer 3 range check error.

Probable Cause:

QPHLNK layer 3 state or network states combination is invalid.

Action:

Assert has scheduled the QPHLNK audit to run.

151. CMCMKPTABLE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No entry was found in the communications kernel process (CMKP) table. The *UNIX*® process that a message was sent to had terminated, or a communication port to the *UNIX*® process was not properly opened.

152. CMCMTHOPCNT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A CCS message that is being transported between the NGSM and host GSM has made too many hops through the CMT network.

Probable Cause:

The CMT routing data is incorrect.

Action:

Contact local field support if the problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

153. CMCORLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QLLCB	Audit Mode: nonseg

Problem:

resource software detected that a list of the Logical Link Control Blocks (QLLCBs) was corrupted.

Probable Cause:

Software error.

Action:

The QLLCB audit was scheduled. If the problem persists, contact the next level of technical support.

154. CMDFREEMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not free a DMERT message buffer.

155. CMDLNCOMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A user of the OSSENBFBM() macro in the direct link node (DLN) requested that a message be compressed. This is not a valid option in the DLN. The message is sent, and the compression parameter is ignored.

156. CMEDLCP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The load index of the external data link communication package (EDLCP) shared segment is out of range.

157. CMEDLCP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recording error was encountered in the external data link communication package (EDLCP) shared segment.

158. CMERRRCVBUF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Data related to free buffer handling was corrupted, or the call to free a buffer that is believed to be a receive message buffer was invalid. The data structures CMhilink[0], CMhilink[1], and the message buffer are dumped.

159. CMHIQEMPTY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data related to buffer handling from combined receive interrupt to the synchronous data link controller (SDLC) A or SDLC B receive interrupt was corrupted. Both combined receive queues are dumped. SDLC A's queue is printed first and SDLC B's is second.

160. CMINPTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid base priority input queue pointers were encountered.

161. CMINVLIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) Level 2 or message transport (MT) resource software detected that a list of the logical link control blocks (QLLCBs) was corrupted.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support.

162. CMINVMSGTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

If the assert is reported from the direct link node (DLN) processor, then CMsendbfm() has been called to send a large message that is not supported. A failure is returned to the caller. The message data is dumped for debugging purposes. If the assert is reported from the SM-2000 message handler (MH) processor, then CMmhmtscan() located a maintenance message being sent to an MH that is not supported. The message data is dumped for debugging purposes.

163. CMMSGGLONG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The business and residential custom services (BRCS) client is sending a message that is too long to send to the administrative processor (AP).

164. CMNOPKTBUF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMPKT	Audit Mode: elev

Problem:

No packet buffers are available when a call to the CMallocpkt() function is made. The number of buffers needed may have been underestimated. The CMPKT audit is scheduled in elevated mode to find any buffers that should be marked as free and are not. If no audit error reports are printed, then the number of packet buffers allocated in the code is too small.

Note: Because of the way the CMPKT audit works, it could take up to three of these asserts to locate lost resources.

165. CMOPCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid base priority input queue opcode was encountered.

166. CMOSDELIVER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSdeliver() function returned a failure.

167. CMOUTLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QLLCB	Audit Mode: nonseg

Problem:

The quad-link packet switch (QLPS) level 2 or message transport (MT) resource software detected that there were no QLLCBs left on the free list.

Probable Cause:

Since the office is engineered with sufficient QLLCBs, this problem indicates that the QLLCB free list has been corrupted or that some QLLCBs have been lost.

Action:

The QLLCB audit was scheduled. The audit will check the QLLCB free list and recover any lost QLLCBs. If the problem persists, contact the next level of technical support.

168. CMOUTPTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid base priority output queue pointers were encountered.

169. CMPCRID0 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The user requested CM to send a message to processor ID (PCRID) 0. This is not a valid PCRID. The message buffer passed to CM is dumped.

170. CMPGMUPF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred on the messink() function call from the program update message.

171. CMPKTINTERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal defensive check failed while CM was processing a packetized message.

172. CMPORTID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid port ID was encountered in the kportid() function.

173. CMQLOORENDPT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: nonseg

Problem:

An non-existing end point has been encountered.

Probable Cause:
Corrupted data.

174. CMQUEUEMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The message was not sent because of a queuenm() function failure.

175. CMSAMEMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A packet was received with the same message and packet sequence numbers as a message already received. This means that somewhere the message was duplicated. Both the incoming packet and the previously received packet are dumped.

176. CMSEGBYTE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An invalid segment or byte count was encountered.

177. CMSIPBUFERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
Shared buffer between SM and ethernet interface board (EIB) corrupted or buffer pointer out of range.

Probable Cause:
Memory update corruption.

Action:
Audits or reset SIP.

178. CMSIPCALLER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Unknown caller to CMecscan; cannot deliver message.

Probable Cause:
Don't know

Action:
None

179. CMSIPRESET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SIP is being restarted due to inconsistency between the AM and the SM.

Probable Cause:

SIP failed to recover from lost messages.

Action:

None.

180. CMSIPSTAT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

SIP state corrupted.

Probable Cause:

Don't know.

Action:

Restart the link.

181. CMSIPTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Wrong SIP type received.

Probable Cause:

Message corrupted during transmission.

Action:

Verify ethernet link.

182. CMTOPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid "to" process identifier (PID) was encountered.

183. CM_UCIERR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Host digital facility interface (DFI-H) simulator detected an unexpected return code from a primitive.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

184. MTB_ACTION (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal protocol action was encountered during level 2 link access procedure B (LAPB) processing.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

185. MTB_CHAN (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal channel number was detected during level 2 link access procedure B (LAPB) processing.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

186. MTB_ERROR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal error occurred during level 2 link access procedure B (LAPB) processing that has been recovered from.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

187. MTB_GENFRM (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal frame was passed to the state transition function. The frame should have been handled in the calling function.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

188. MTB_IFD (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The frame descriptor (FD) linkage that was being checked is invalid. The link access procedure B (LAPB) link that was being processed at the time of the error was re-initialized.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

189. MTB_REJEVENT (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal frame rejection action was encountered during level 2 link access procedure B (LAPB) processing.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the occurrence to next level of technical support.

190. MTB_STATE (5E12 and later)

Recovery Action: spp	SPP: n	Audit: QLLCB	Audit Mode: nonseg

Problem:

An illegal protocol state was encountered during level 2 link access procedure B (LAPB) processing.

Probable Cause:

Software error.

Action:

The QLLCB audit was scheduled to correct the problem. If the problem persists, contact the next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

191. MTB_TIMER (5E12 and later)

Recovery Action: spp	SPP: n	Audit: QLLCB	Audit Mode: nonseg

Problem:

An illegal protocol timer timeout value was encountered during level 2 link access procedure B (LAPB) processing.

Probable Cause:

Software error.

Action:

The QLLCB audit was scheduled to correct the problem. If the problem persists, contact the next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

192. MTB_UNITTYP (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal peripheral messaging unit type was encountered during level 2 link access procedure B (LAPB) processing.

Probable Cause:

Software error.

Action:

Report occurrence to next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

193. MTINCLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QLLCB	Audit Mode: nonseg

Problem:

The message transport (MT) level 2 protocol software detected an inconsistency between two fields in the logical link control block (LLCB) or between a field in the LLCB and the current action being performed by MT.

Probable Cause:

Software error.

Action:

The LLCB audit was scheduled to correct the problem. If the problem persists, contact the next level of technical support.

194. MTINVCOMB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message-transport (MT) level 2 protocol software has received a frame that is invalid for the state the MT level 2 link is in.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support.

195. MTINVFRMTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message transport (MT) level 2 protocol software detected an invalid (out of range) level 2 frame type.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support.

196. MTINVLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QLLCB	Audit Mode: nonseg

Problem:

The message transport (MT) level 2 protocol software detected an invalid (out-of-range) field in the logical link control block (LLCB).

Probable Cause:

Software error.

Action:

The LLCB audit was scheduled to correct the problem. If the problem persists, contact the next level of technical support.

197. MTINVPCCB (5E12 and later)

Recovery Action: spp	SPP: n	Audit: PCCB	Audit Mode: nonseg

Problem:

Message transport (MT) software detected an invalid field in the peripheral channel control block (PCCB).

Probable Cause:

Software error.

Action:

The PCCB audit was scheduled to correct the problem. If the problem persists, contact the next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

198. MTINVSEQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message transport (MT) Level 2 protocol software detected an invalid event in its internal event/state table.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support.

199. MTINVXMITQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message transport (MT) Level 2 protocol software detected an invalid (out-of-range) field in the Logical Link Control Block (LLCB).

Probable Cause:

Software error.

Action:

The field has been corrected. If the problem persists, contact the next level of technical support.

200. MTLLCBIXINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message transport (MT) Level 2 protocol or resource software detected a null or invalid (out of range) Logical Link Control Block (LLCB) index.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support.

201. MTNORESRCE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TELEM	Audit Mode: nonseg

Problem:

Ran out of resources, could not continue processing.

Probable Cause:

Unknown.

Action:

Contact technical support.

202. MTPARMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad parameter was passed to a message transport primitive. Refer to the stack dump to find that primitive.

Probable Cause:

Unknown.

Action:

Contact technical support

203. MTTBADDELAY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An application to message transport (MT) timing requested to start a timer with a delay that exceeds the maximum supported value.

Probable Cause:

Started a timer that exceeded the maximum supported delay.

Action:

No action required.

204. MTTBADHDC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: THC	Audit Mode: nonseg

Problem:

A message transport timing headcell was found to be corrupted.

Probable Cause:
Unknown.

Action:
Contact technical support.

205. MTTBADNXT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TELEM	Audit Mode: nonseg

Problem:
Message transport timing list linkage to the next element was found to be corrupted.

Probable Cause:
Unknown.

Action:
Contact technical support

206. MTTBADOWNER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TELEM	Audit Mode: nonseg

Problem:
A message transport timing primitive in the message handler (MH) has detected a corrupt or inconsistent headcell owner in a timer element.

Probable Cause:
Unknown.

Action:
Notify Technical support.

207. MTTBADPREV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TELEM	Audit Mode: nonseg

Problem:
A message transport timer list linkage to the previous element was found to be corrupted.

Probable Cause:
Unknown.

Action:
Contact technical support.

208. MTTBADSTRUCT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
A bad structure type was passed or found to be corrupted by message transport timing primitives.

Probable Cause:
Unknown.

Action:

Contact technical support

209. MTTBADTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message transport timing primitive in the message handler (MH) has detected a corrupted current time increment.

Action:

Notify technical support.

210. MTTBADTTYE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TELEM	Audit Mode: nonseg

Problem:

A bad timer type was passed or found to be corrupted by a message transport timing primitive.

Probable Cause:

Unknown.

Action:

Contact technical support.

211. QLINCLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QLLCB	Audit Mode: nonseg

Problem:

The quad-link packet switch (QLPS) level 2 protocol software detected an inconsistency between two fields in the logical link control block (QLLCB) or between a field in the QLLCB and the current action being performed on the QLPS network and endpoint associated with the QLLCB.

Probable Cause:

Software error.

Action:

The QLLCB audit was scheduled to correct the problem. If the problem persists, contact the next level of technical support.

212. QLINCLMDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LMDB	Audit Mode: nonseg

Problem:

The quad-link packet switch (QLPS) link management software detected an inconsistency between two fields in the link management data block (LMDB) or between a field in the LMDB and the current action being performed on the QLPS network associated with the LMDB.

Probable Cause:

Software error.

Action:

The LMDB audit was scheduled to clean up the problem. If the problem persists, contact the next level of technical support.

213. QLINVENDPOINT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) level 2 protocol, link management, or resource software detected an invalid QLPS endpoint.

Probable Cause:

Software error.

Action:

If problem persists, contact next level of technical support.

214. QLINVFRMTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) level 2 protocol software detected an invalid (out of range) level 2 frame type.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support.

215. QLINVLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QLLCB	Audit Mode: nonseg

Problem:

The quad-link packet switch (QLPS) level 2 protocol software detected an invalid (out of range) field in the logical link control block (QLLCB).

Probable Cause:

Software error.

Action:

The QLLCB audit was scheduled to correct the problem. If the problem persists, contact the next level of technical support.

216. QLINVLMDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LMDB	Audit Mode: nonseg

Problem:

The quad-link packet switch (QLPS) link management software detected an invalid (out of range) field in the link management data block (LMDB).

Probable Cause:

Software error.

Action:

The LMDB audit was scheduled to correct the problem. If the problem persists, contact the next level of technical support.

217. QLINVNETWORK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) level 2 protocol, link management, resource software detected an invalid QLPS network number.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support.

218. QLINVPKTTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) level 2 protocol software detected an invalid (out of range) level 2 packet type.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support.

219. QLINVTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) level 2 protocol, link management, or resource software detected an invalid (out of range) timer type.

Probable Cause:

Software error.

Action:

If problem persists, contact next level of technical support.

220. QLLLCBIXINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) level 2 protocol, link management, or resource software detected a null or invalid (out of range) logical link control block (QLLCB) index.

Probable Cause:

Software error.

Action:

If the problem persists, contact the next level of technical support

221. QLTSKNUMINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) resource task manager software detected an invalid (out of range) task number.

Probable Cause:

Software error.

Action:

If problem persists, contact next level of technical support.

222. QLTSKPRIINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link packet switch (QLPS) resource task manager software detected an invalid (out of range) task priority.

Probable Cause:

Software error.

Action:

If problem persists, contact next level of technical support.

223. UC_EADRS (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt has been made to access a remote integrated services line unit (RISLU) virtual unified control interface (UCI), but the peripheral interface control bus (PICB)/UCI address is invalid. The UCI access has been denied.

224. UC_ECOUNT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt has been made to access a remote integrated services line unit (RISLU) virtual unified control interface (UCI), but the count of UCI addresses to be accessed is invalid. For access to UCI registers, a count of 1 must be used. For access to UCI RAM, the count must be within the range of 1 through 0x7f inclusive, and the starting address plus the count must not attempt access beyond the end of the UCI RAM. The UCI access has been denied.

225. UC_EL1 (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt has been made to access a remote integrated services line unit (RISLU) virtual unified control interface (UCI), but the associated communication link does not have layer 1 activated. The UCI access has been denied.

226. UC_EPICB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt has been made to access a remote integrated services line unit (RISLU) virtual unified control interface

(UCI), but the peripheral interface control bus (PICB)/UCI identifier is invalid. The UCI access has been denied.

227. UC_EUSER (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt has been made to access a remote integrated services line unit (RISLU) virtual unified control interface (UCI), but the user performing the access is invalid. The UCI access has been denied.

Range: cmram**1. CMCKT2PICBNUL (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No entry was found in relation RLCKTDATA corresponding to the rclname given to macro SMCKT2PICB(). This error should rarely occur since the rclname was read earlier from RLCKTDATA.

2. CMDDLDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Values read by the intra-cluster communication process (ICC) from global data (for example, the Slddlmap[] array or the RLSGDB relation) were invalid. The ICC calls the appropriate refresh functions to refresh the data.

3. CMDDLIDLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMIM	Audit Mode: elev

Problem:

An idle buffer list for the intra-cluster communication process (ICC) contained an invalid value. If the toppt field is invalid, it is dumped and set to the idle state. If one of the pointers to the idle buffers is invalid, it is dumped and the toppt field is set so that the invalid pointer will not be used again. In either case, the audit is requested.

4. CMDDLDC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMIM	Audit Mode: elev

Problem:

A derived data links (DDL) logical channel structure was corrupted. The structure is dumped and the invalid data is corrected. The audit is requested, but the logical channel is not reset.

5. CMDDLDCR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A derived data links (DDL) logical channel structure was corrupted. The structure is dumped and reset.

6. CMDDLDCG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMIM	Audit Mode: elev

Problem:

A derived data links (DDL) group structure was corrupted. The structure is dumped and the invalid data is corrected. The audit is requested, but the link group is not restarted.

7. CMDDLDCPARAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid input parameter was passed to a derived data links (DDL) function.

8. CMDDLPKT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CMIM	Audit Mode: elev

Problem:

A derived data links (DDL) packet buffer with invalid data was detected. The buffer is dumped and returned to the idle list.

9. CMDDLRCCLDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The derived data links (DDL) structure, CMrcldata, was corrupted. The structure is dumped and initialized.

10. CMDDLRETC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function called by a derived data links (DDL) function returned an unexpected value.

11. CMDDLSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A derived data link (DDL) level 3 logical channel was found in an invalid state following an event, such as the expiration of a timer. The logical channel structure is dumped and returned to a valid state.

12. CMDDLTIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The derived data link (DDL) global variable CMtimer_lc was corrupted. The parameter is dumped and reset to 1.

13. CMFAC2RCLNUL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple in RLMATATT contained entry for an rcl facility but corresponding data in either RLCKTDATA or in RLUNIT_CKT could not be found.

14. CMNOICC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The intra-cluster communication process (ICC) system process was called in a module that is not a remote switching module (RSM). No action is taken because there is nothing to be done.

15. CMOSSIGNAL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The intra-cluster communication process (ICC) system process was called by something other than the `OSsignal()` function or the `OStimeout()` function (the timer expired). No action is taken because there is nothing to be done.

Range: cra**1. CRA_1_ASRT (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid SM in the call ID was received as a parameter.

2. CRA_2_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range call record index in the call ID was received as a parameter.

3. CRA_3_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An event was received that was not expected.

4. CRA_4_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

Failed to attach the call record back to the idle list.

5. CRA_5_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Call record resources have been exhausted. Automatic message accounting (AMA) data may be lost. The call record audit is scheduled following the assert, but not as part of the assert. This assert is report only to avoid escalation.

6. CRA_6_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

A call record idle queue overflow occurred.

7. CRA_7_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message of the wrong type was received. The call record assembler (CRA) does not recognize this message type.

8. CRA_8_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

The CRqread() function retrieved an invalid item from the call record queue.

9. CRA_10_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

Spare CRA AUASRTB (when used add explanation).

10. CRA_11_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare CRA AUASRTB (when used add explanation).

11. CRA_12_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare CRA AUASRTB (when used add explanation).

12. CRA_13_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid peg count was referenced.

13. CRA_14_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The table maximum size was exceeded for the electronic directory service (EDS) table, message desk service (MDS) table, or message desk center (MDC) table.

14. CRA_15_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The electronic directory service (EDS) or message desk service (MDS) peg count table was accessed with an invalid bcid, or the message desk center (MDC) peg count table was accessed with an invalid mlhg number.

15. CRA_16_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invocation of ACRqrecover() failed to find an idle operator services position system (OSPS) auxiliary call record (ACR). ACRqrecover() is only called if an error is detected in the ACR idle queue.

16. CRA_20_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maximum table size was exceeded for the intercom calling restriction (ICR) peg count table.

17. CRA_21_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The intercom calling restriction (ICR) hourly report table was accessed with an invalid simulated facilities group (SFG) ID.

18. CRA_22_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to ASICRMAC().

19. CRA_23_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

In the CRinput() function, an invalid parameter was in a message to a remote processor.

20. CRA_24_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

The CRoutput() function timed out while waiting for a response from a remote processor.

21. CRA_25_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

In the CRoutput() function, a message to a remote processor was truncated.

22. CRA_26_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

In the CRoutput() function, an invalid return was received from a message to a remote processor.

23. CRA_27_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

The CRoutput() function encountered an invalid call ID.

24. CRA_28_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to allocate a release link trunk (RLT) call record structure failed because the RLT call record array is at capacity. The RLT load should be redistributed across more SMs.

25. CRA_29_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The release link trunk (RLT) call record structure array index variable (CRrlt_cri), which is set to the index of the next available RLT call record structure, was out of range during an RLT call record allocation or deallocation attempt. The true value of this variable is automatically recovered.

26. CRA_30_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

A call ID with an out-of-range call record index was received as a parameter.

27. CRACRIDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

ACRqwrite() attempted to add an auxiliary call record (ACR) index to the ACR idle queue, but the ACR index already existed on the queue. ACRqwrite() is called when an ACR is deallocated.

28. CRA_FF_BCI (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The cyclic timer used in the blocked call indicator (BCI) can not be destroyed. An attempt was made to destroy the timer via OSdeterimer(). Escalation is requested. A single process purge of the ASTI process will begin.

29. CRAUXDAGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACRECORD	Audit Mode: elev

Problem:

The auxiliary call record (ACR) DAGETACREC macro returned an invalid pointer to the auxiliary call record.

Probable Cause:

A bad ACR call ID was passed as a parameter.

Action:

The auxiliary call record audit is scheduled.

30. CRAUXEXRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Auxiliary call record (ACR) resources have been exhausted from the idle list.

Probable Cause:

Call load has exceeded the expected amount for this resource.

Action:

If this is an SM-2000, overload control should report the condition and the office personnel will have to request more of this resource per administrative/engineering guidelines.

31. CRAUXFARI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to retrieve an auxiliary call record from the idle list during the allocation procedure.

Probable Cause:

The DA primitive received a bad parameter and could not find the idle list.

Action:

None.

32. CRAUXFATI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACRECORD	Audit Mode: elev

Problem:

Failed to attach an auxiliary call record to the idle list either during initialization of the auxiliary call record idle list, a request for more resources to be allocated by the CRAFT, the addition of more hardware, or the deallocation procedure after a call is completed.

Probable Cause:

The DA primitive received a bad parameter and was not able to link the auxiliary call record to the idle list.

Action:

The auxiliary call record audit is scheduled.

33. CRAUXLOSP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACRECORD	Audit Mode: elev

Problem:

Failed to link the auxiliary call record to its owning operator services position system (OSPS) call record.

Probable Cause:

A bad parameter was passed to the DA primitive and it was not able to find either the OSPS call record or the auxiliary call record.

Action:

The auxiliary call record audit is scheduled.

34. CRAUXOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range auxiliary call record index was found.

Probable Cause:

The auxiliary call record keys may be corrupted.

Action:
None.

35. CRAUXUOSP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACRECORD	Audit Mode: elev

Problem:

Failed to unlink the auxiliary call record from its owning operator services position system (OSPS) call record.

Probable Cause:

A bad parameter was passed to the DA primitive and it was not able to locate either the OSPS call record or the auxiliary call record.

Action:

The auxiliary call record audit is scheduled.

36. CRBADARG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call record function was called with an invalid parameter.

Probable Cause:

Unknown.

Action:

None.

37. CRBCR_NS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

An error occurred that indicates an invalid NS_IDX key in a call record. The AUas_cr audit is called when the NS_IDX key is out of range. The AUas_cr audit cleans up the problem.

38. CRBNSBILL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSBILL	Audit Mode: elev

Problem:

An error indicating incorrect linkages in the RLNS_BILL relation occurred when the call record primitives tried to retrieve an rINS_BILL tuple. The AUnsbill audit will be scheduled to clean up the linkage problem.

39. CRBNSIDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSIDX	Audit Mode: elev

Problem:

An error indicating incorrect linkages in the RLNS_IDX relation occurred when the call record primitives tried to retrieve an rINS_IDX tuple. The AUnsidx audit will be scheduled to clean up the linkage problem.

40. CRBQRYCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSIDX	Audit Mode: elev

Problem:

An error occurred that indicates an invalid network services query count in the retrieved rINS_IDX tuple. The AUnsidx audit will clean up the problem.

41. CRDELDYN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfdltup has returned failure to delete a tuple in a dynamic relation.

Probable Cause:

Unknown.

Action:

None.

42. CRFRNAMA (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: FRNAMA	Audit Mode: elev

Problem:

An error occurred while invoking a DA primitive for adding a Furnish_AMA tuple to head of the list. The AUfrn_ama audit will be scheduled to clean up the problem.

43. CRGETPCBLA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No rIPCBLA tuple exists for a given process control block link area (PCBLA) key. For example, the DAGETPCBLA()/DAgetpcbla() function may have failed.

Probable Cause:

Bad linkage.

Action:

Report the problem.

44. CRINNSBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSBILL	Audit Mode: elev

Problem:

An error occurred that indicates incorrect linkages between the NS_IDX and NS_BILL data structures. The AUUnsbill audit is called when an attempt to add an NS_BILL structure to a list is unsuccessful.

45. CRINSDYN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfintup has returned failure to insert a tuple in a dynamic relation.

Probable Cause:

Unknown.

Action:
None.

46. CRNSBLFRN (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: FRNAMA	Audit Mode: elev

Problem:

An error occurred that indicates incorrect linkages between the NS_BILL and Furnish_AMA data structures or was unable to obtain an idle Furnish_AMA tuple from the idle list. The AUfrn_ama audit is called when an attempt to add a Furnish_AMA structure to a list is unsuccessful. The AUfrn_ama audit cleans up the problem.

47. CROCRGET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get an operator services position system (OSPS) call record in CRoblk. Dumping related data.

Probable Cause:
Unknown.

Action:
None.

48. CROSPDAGT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: OCRECORD	Audit Mode: elev

Problem:

The operator services position system (OSPS) call record DAGETOCREC macro returned an invalid pointer to the OSPS call record.

Probable Cause:
A bad call ID was passed as a parameter.

Action:
The OSPS call record audit is scheduled.

49. CROSPEXRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) call record resources have been exhausted from the idle list.

Probable Cause:
Call load has exceeded the expected amount for this resource.

Action:
If this problem resides on an SM-2000, then overload control should report the condition and the office personnel will have to request more of this resource per administrative/engineering guidelines.

50. CROSPFARI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to retrieve an operator services position system (OSPS) call record from the idle list during the allocation procedure.

Probable Cause:

The DA primitive received a bad parameter and could not find the idle list.

Action:

None.

51. CROSPFATI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OCRECORD	Audit Mode: elev

Problem:

Failed to attach an operator services position system (OSPS) call record to the idle list either during initialization of the OSPS call record idle list, a request for more resources to be allocated by the CRAFT, the addition of more hardware, or the deallocation procedure after a call is completed.

Probable Cause:

The DA primitive received a bad parameter and was not able to link the OSPS call record to the idle list.

Action:

The OSPS call record audit is scheduled.

52. CRRGLPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error has been returned from an attempted read of a global parameter from within a transaction.

Probable Cause:

Unknown.

Action:

None.

53. CRUGLPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There has been an error in updating a global parameter.

Probable Cause:

Unknown.

Action:

None.

Range: ct**1. CTADDTUPBRELID (5E14 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected relation ID was passed to the CCgetnode() function to add a tuple in it. No action is taken.

2. CTADSIIENT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected reason for initialization was passed to the CCadsiin() function. No work will be performed.

3. CTADSIIENT (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason was sent to the CCadsiin() function, the direct link node (DLN) system integrity (SI) system process in the AM.

4. CTADSIUMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected assert message type was passed to the CCdsiprmsg() function. The assert can not be processed for printing. No action is taken.

5. CTADSIUMSG (5E11 to 5E13)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code or unexpected message was received by the CCadsiin() function, the direct link node (DLN) system integrity (SI) system process in the AM.

6. CTADSIURET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCadsiwtmsg() function received an unexpected return code from OSWGETMSG(). We will suspend the process and re-enter when it has work.

7. CTAMDSAPPMMSGSENDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsenddcis() function in AM failed to transmit a direct signaling message to the CNI. A self recovery process is attempted automatically but the message is discarded. The data dump contains the CNI channel descriptor.

8. CTAMRCV3BWRERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamrcv() function failed to write of the DLN-AM in-queue 0 pointers. An unexpected return code from the _ims3bwt() function was received. No action is taken.

9. CTAMRDCMPLMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdbrdcmp() function could not send an OSDS message to the DB system process in DLN about a completion of the database read in the AM. The message is discarded.

10. CTAMTCAPMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM CCsndtcap() function failed to transmit a TCAP message to the CNI. A self recovery process is attempted automatically but the message is discarded. The data dump contains the CNI channel descriptor.

11. CTAMTOUP_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamtoup() function could not format a message.

12. CTAMTOUP_BAD1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamtoup() function could not format a user part message or returned an unexpected return code to the CCrecvisup() function after the latter failed to read a RLLAB7_PCI relation. The message will be dropped.

13. CTAMTOUP_BAD2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamtoup() function could not format a user part message or returned an unexpected return code to the CCrecvisup() function after the latter failed to read a RLPCI_PRT relation. The message will be dropped.

14. CTAMTOUP_BAD3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamtoup() function could not format a user part message or returned an unexpected return code to the CCrecvisup() function after the latter found out that SM is in real-time overload or the call should be blocked. The message will be dropped.

15. CTAMTSMGSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsendtccs() function in AM failed to transmit a trunk signaling message to the CNI. A self recovery process is attempted automatically but the message is discarded. The data dump contains the CNI channel descriptor.

16. CTAPP_BREL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected relation ID was passed to the CCds_app() function for update. No action is taken.

17. CTAPPOORINDX (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range index to the RLDS_APP relation in the DLN was received by the CCapprc() function. No action is taken.

18. CTAPPRCCMPMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCappcmp() function could not send an OSDS message about the completion of the RC operation on the RLDS_APP relation. The message is discarded.

19. CTAPPRCMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCds_app() function could not send an OSDS message with RC information to the active DLN. The message is discarded. No action is taken.

20. CTAPPTPLBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CCapprc() function to be performed on the existing tuple of the RLDS_APP relation in the DLN. No action is taken.

21. CTAPPTPLNOTFNDBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CCapprc() function to be performed on the not found tuple of the RLDS_APP relation in the DLN. No action is taken.

22. CTBADDATA (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the internal variable of the CCsendtccs() function is out of range. The associated signaling message is discarded. If it occurs often, seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

23. CTBADDATA (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Data does not match an expected range or type.

24. CTBADDTRG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An unexpected DDKEY was passed to the CCddupdate() function. No action is taken.

25. CTBADDTRG (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An unknown parameter was passed to the CCddupdate() function.

26. CTBADRETCODE1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The cHsxhdr() function called by the CCrecvisup() function could not format a signaling message header due to the unexpected/inconsistent message data passed to it or the CNI channel was not open. The message is discarded.

27. CTBADRETCODE2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The cHsxhdr() function called by the CCrecvisup() function could not format a signaling message header due to the unexpected/inconsistent message data passed to it or the CNI channel was not open. The message is discarded.

28. CTBLKAPPMMSGSGINVRET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The CCrecvcni() function received an unexpected return value from the cHrecv() function while trying to get a block of application messages. The CNI channels will be reinitialized as a part of the automatic self recovery in the code. The data dump contains the CNI direct signaling channel number. If the assert is seen frequently, contact technical support for further analysis. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

29. CTBLKOSDSMSGSGINVRET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCreteCvni() function received an unexpected return value from the cHrecv() function while trying to get a block of OSDS messages. The CNI channels will be reinitialized as a part of the automatic selfrecovery in the code. The data dump contains the CNI OSDS channel number. If the assert is seen frequently, contact technical support for further analysis. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

30. CTCHGWBUFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when requesting a common network interface (CNI) message buffer.

31. CTCHIOCTL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The input/output control (IOCTL) setup for a common network interface (CNI) channel failed.

32. CTCHKOPEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A common network interface (CNI) channel open failed.

33. CTCHRECV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following errors occurred while receiving a common network interface (CNI) message:

1. A message with zero length was detected.
2. A message with an invalid length was detected.
3. An unexpected return code from the CNI cHrecv() function was encountered.

Corrective action will take place within the operational kernel process (OKP). In cases 1 and 2, the queue pointers will be adjusted to avoid the corrupt message. In case 3, the CNI channels will be reinitialized. These specific errors do not represent a loss of common channel signaling (CCS) call processing. However, due to the automatic recovery within the code, the assert should not occur frequently. If the assert is seen frequently, contact technical support for further analysis.

34. CTCHXMIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to transmit a common network interface (CNI) message using the cHxmit() function. A return code other than cH_PASS was received.

If the assert was issued from the operational kernel process (OKP), then the data dumps contain the following:

1. the CNI channel descriptor.

2. the message being sent, beginning with the CNI header.

If the assert was issued from the direct link node (DLN), then the data dumps contain the following:

1. the return code from cHxmit().
2. the message being sent, beginning with the CNI header.

35. CTCLASS_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received that has an invalid message class associated with it.

36. CTCLASS_BAD1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrecvisup() function found an unexpected trunk signaling message class that it has assigned to this message. The message will be dropped.

37. CTCLASS_BAD2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected trunk signaling message class was found by the CCrecvisup() function while it was trying to send a message to a proper for this class destination process. The message will be dropped.

38. CTCMPLAB7_BREL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected relation ID was passed to the CClab7trig() function in CMP for update. No action is taken.

39. CTDBHRNF3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdbhrnf() function failed to read the pump data buffer from the DLN-AM. An unexpected return code was received from the _ims3brd() function. No action is taken.

40. CTDBHWNF3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdbhwnf() function failed to read the pump header from the DLN-AM. An unexpected return code was received from the _ims3brd() function. No action is taken.

41. CTDBLAB6_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the relation RLLAB6PRT, which resulted in a failure to translate the common channel signaling no. 6 domestic (CCIS6) routing label into the 5ESS[®] switch internal representation of that SM port (known as gport).

The data dump consists of the following:

sl_group	6 bits
sl_mem	4 bits
sl_vlink	3 bits
fill	3 bits
band	9 bits (translates from band_num)
bmem_num	4 bits (translates from trnk_num)
fill	3 bits
total	32 bits

The band and member number are extracted from the CCIS6 routing label. The band and member from the signal transfer point (STP) can be found by performing a binary to decimal conversion. The CCIS6 routing label is defined as follows:

filler	12 bits
heading	3 bits
sig_info	4 bits
band_num	9 bits (translates to band)
trnk_num	4 bits (translates to bmem_num)
total	32 bits

42. CTDBLAB7_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLLAB7_PCI relation. The data dump contains the following:

dpc	24 bits
fill	8 bits
opc	24 bits
fill	8 bits

43. CTDBPCI_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the relation RLPCI_PRT. The data dump contains the following:

pci	8 bits
fill	8 bits
circuit	14 bits
fill	2 bits

44. CTDBTC_AP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLDS_APP relation.

45. CTDBTC_SS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLDS_SSN relation.

46. CTDDDBENTRY (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected reason was passed to the CCdInsp() function for creation of the CCdInsp system process. The process is not created.

47. CTDDDBENTRY (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason was sent to the direct link node (DLN) database (DB) system process.

48. CTDDDBINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A memory protection problem was encountered during direct link node (DLN) database (DB) initialization.

49. CTDDDBMPRO (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdbrepro() function was unable to reprotect the DLN database memory. No action is taken.

50. CTDDDBMPRO (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to reprotect the direct link node (DLN) database (DB) memory.

51. CTDDDBMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message type was received by the CCdInsp() function for DLN DB update. No action is taken. Wait for the next OSDS message.

52. CTDDDBMSG (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the direct link node (DLN) database (DB) system process.

53. CTDDBOPER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid recent change operation was encountered by the direct link node (DLN) database (DB) system process.

54. CTDDBRCMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the operating system for distributed switching (OSDS) memory protection manager in the direct link node (DLN).

55. CTDDBREID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation ID was encountered by the direct link node (DLN) database (DB) access functions.

56. CTDDBUNPRO (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdbunpro() function was unable to unprotect the DLN database memory. No action is taken.

57. CTDDBUNPRO (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to unprotect direct link node (DLN) database (DB) memory.

58. CTDDRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTrrchk() function received a negative return from the DDREAD() macro reading the current RRR level. The call will not be blocked. If it occurs often, seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

59. CTDDRDERR (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCS transport has encountered a DD read error.

Probable Cause:

Corrupt data or transient read error.

Action:

If it occurs often seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

60. CTDIRSIGCHOPENFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHkopen() function failed to open the CNI direct signaling channel on request of the CCinit() function. No action is taken. Seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual. The data dump contains the CNI channel descriptor.

61. CTDIRSIGCHSETFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHioclt() function failed to set the CNI direct signaling channel options on the CCinit() function request. No action is taken. Seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

62. CTDLNDBSSNINSFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCssnrc() function failed to put the SSN in service after it was inserted by RC. No action is taken. The data dump contains the affected RLDS_SSN relation tuple.

63. CTDLNDBSSNOOSFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCssnrc() function failed to take the SSN out of service after it was deleted by RC. No action is taken. The data dump contains the affected RLDS_SSN relation tuple.

64. CTDLNDSAPPMMSGSENDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsenddcis() function in DLN failed to transmit a direct signaling message to the CNI. An unexpected return code was received from the cHxmit() function. The message is discarded.

65. CTDLNINV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmrcv() function failed to translate the RNA into the DLN index due to the unexpected value of RNA. No action is taken.

66. CTDLNINV (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to translate between the ring node address and the direct link node (DLN) index.

67. CTDLNMEMINITREPRFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdln_indb() function received a failure from the CCdbrepro() function that was requested to re-protect a memory area for all the arrays, hash tables, and free list pointers after initialization. No action is taken. The memory is initialized but un-protected.

68. CTDLNMEMINITUNPRFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdln_indb() function received a failure from the CCdbunpro() function that was requested to un-protect a memory area for all the arrays, hash tables, and free list pointers. No action is taken.

69. CTDLNPMPBRELID (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdln_pmp() function received a message with a bad relation ID to download to a DLN. No action is taken.

70. CTDLNPMPCMPMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCpumpcmp() function could not send an OSDS message about the DLN pump completion. The message is discarded.

71. CTDLNTCAPMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DLN CCsndtcap() function failed to transmit a TCAP message to the CNI. A self recovery process is attempted automatically but the message is discarded.

72. CTDLNTSMMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsndtccs() function in DLN failed to transmit a trunk signaling message to the CNI. An unexpected return code received from the cHxmit() function. The message is discarded.

73. CTDMAWRK3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdmawork() function failed to read the DLN-AM queue 0 pointers. An unexpected return code was received from the _ims3brd() function. No action is taken.

74. CTDSAPPREADFAIL1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCinit() function failed to read the RLDS_APP relation in the database. The data dump contains the direct signaling application type for which it tried to find a SSN. No action is taken.

75. CTDSAPPREADFAIL2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsenddcis() function failed to read the RLDS_APP relation in the database. The data dump contains the direct signaling application type for which it tried to find a SSN. No action is taken.

76. CTDSAPPREADFAIL3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdactinit() function failed to read the RLDS_APP relation while trying to find out a SSN for the direct application type. No action is taken. The data dump contains the application type.

77. CTDSAPPREADFAIL4 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsenddcis() function failed to read the RLDS_APP relation while trying to find out a SSN for the direct application type of destination routed CCIS6. No action is taken. The data dump contains the application type.

78. CTDSAPPSSNISFAIL1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCinit() function failed to put a direct signaling application subsystem number in service. The data dump contains the application type and SSN. No action is taken.

79. CTDSAPPSSNISFAIL2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCactinit() function failed to put a direct signaling application subsystem number in service. No action is taken. The data dump contains the affected RLDS_SSN relation tuple.

80. CTDSICRPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Output message queue corruption was found in the direct link node (DLN) system integrity (SI) system process.

81. CTDSIFRBUFCRPT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corruption in one of the assert output message queues was found by the CCdsifrbuf() function while trying to free

a buffer in this queue. This queue (and/or all the others) will be initialized.

82. CTDSIIENT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected entry reason was passed to the CCdsinit() function. No action is taken.

83. CTDSIIENT (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason was sent to the CCdsinit() function, the direct link node (DLN) system integrity (SI) system process.

84. CTDSIINSPRC (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdico() function detected a runaway process. The runaway process (that did not give up a control for more than 350ms) will be purged in an attempt to recover.

85. CTDSIINSPRC (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN) integrity monitor, the DLN integrity control (DICO), detected an unstable process in the DLN.

86. CTDSISND (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdsisend() function was unable to send assert output messages to the AM because the DLN transport's OSDS buffer was full for more than 10 consecutive attempts. The DLN transport will be purged in an attempt to correct the problem.

87. CTDSISND (5E11 to 5E13)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

Direct link node (DLN) system integrity (SI) in the DLN was unable to send messages to the AM after ten or more consecutive attempts because DLN transport returned CCBUFFULL (ring buffer full) through the OSsendmsg() function. DLN transport will be purged in an attempt to correct the problem.

88. CTDSIULBUFCRPT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corruption in one of the assert output message queues was found by the CCdsigulbuf() function while trying to

unload a buffer in this queue. This queue (and/or all the others) will be initialized.

89. CTDSIURET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdsiwait() function received an unexpected return code from the OSwait() function. No action is taken.

90. CTDSIUSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdsisghdl() function received an unexpected signal from the OSwait() function. No action is taken.

91. CTDSIUSG (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdsinit() function received an unexpected return from the OSwait() function or an unexpected signal. CCdsinit() is the direct link node (DLN) system integrity (SI) process in the DLN.

92. CTDSSNREADFAIL1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrecvcni() function failed to read the RLDS_SSN relation in the database. The data dump contains the SSN for which it tried to find an application type. No action is taken.

93. CTDSSNREADFAIL2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrecvcni() function failed to read a SSN for a TCAP application. in the database. The data dump contains the TCAP application type. No action is taken.

94. CTDSSNREADFAIL3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrrcv() function failed to read the RLDS_SSN relation for the SSN to which an SCCP message was addressed. The message is discarded. The data dump contains the SSN.

95. CTDACKCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdataack() function could not allocate an IMS buffer for writing a data acknowledgement message to the ringmon. An unexpected return code was received from the CCgwbuf() function. The message is discarded.

96. CTECPCCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTecpcsend() function could not allocate an IMS buffer for writing a SCCP message for ECPC. An unexpected return code was received from the CCgwbuf() function. The message is discarded.

97. CTEPCMSDSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTecpcsend() function failed to send a SCCP message to ECPC. An unexpected return code was received from the cHxmit() function. The message is discarded.

98. CEMPTYLAB7BADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CC7_pcirc() function to be performed on the empty RLLAB7_PCI relation in the DLN. No action is taken.

99. CEMPTYPCIBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CCpcirc() function to be performed on the empty RLPCI_PRT relation in the DLN. No action is taken.

100. CTERRRPTCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrpterr() function could not allocate an IMS buffer for writing an error report message to the ringmon. An unexpected return code was received from the CCgwbuf() function. The message is discarded.

101. CTFREETUPBREID (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected relation ID was passed to the CCfreenode() function to free a tuple in it. No action is taken.

102. CTHBACKCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CChb_ack() function could not allocate an IMS buffer for writing a heartbeat acknowledgement message to the ringmon. An unexpected return code was received from the CCgwbuf() function. The message is discarded.

103. CTIMS3BRD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when calling the `_ims3brd()` function.

104. CTIMS3BWT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when calling the `_ims3bwt()` function.

105. CTIMSBFR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The `CCrrcv()` function failed to free an IMS ring receive buffer. No action is taken.

106. CTIMSBFR (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to free an interprocess message switch (IMS) receive buffer failed.

107. CTIMSOPEN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The `CCdltrinit()` function could not open a DLN Maintenance channel to RINGMON in the AM. No action is taken.

108. CTIMSOPEN (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not open an interprocess message switch (IMS) channel.

109. CTIMSWRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when calling the `_imswrite()` function.

110. CTINVLNMSGRECV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected length CCS message was received from the CNI by the `CCrecvcni()` function. This corrupted message is discarded. Due to the automatic recovery from this error within the code, the assert should not occur frequently. The data dump contains the length of the message. If the assert is seen frequently, contact technical support for further analysis. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

111. CTINVMLTLATAAPPL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected multilata application was passed to the CTrc_mlata() function for update. No action is taken.

112. CTINVOSDSDLTRMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdltrmsg() function received an unexpected OSDS message. The message is discarded. The data dump contains the first 160 bytes of the message.

113. CTINVOSPSTADLTRMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdltrmsg() function received an OSDS MGOPCCAUD or MGOPCCUPD message while the GLOSPSTA was set to DBNO. The message is discarded. The data dump contains the first 160 bytes of the message.

114. CTINVRETCODE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrecvisup() function received an unexpected return code from the cHsxhdr() function. The message will be dropped.

115. CTINVSSNAPPTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrrcv() function found an unexpected application type for the SSN to which a SCCP message was addressed. The message is discarded. The data dump contains the SSN and application type.

116. CTINVTMRTAG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdltrmsg() function received an OSDS MGTIMER message with an unexpected timer tag. The message is discarded. The data dump contains the first 160 bytes of the message.

117. CTIPMHD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHsxiph() function, on request of the CCossend() function, could not format the CNI interprocess message header. The message is lost.

118. CTIPMHD (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not format a common network interface (CNI) interprocess message header.

119. CTLAB6PCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the relation RLLAB6_PCI. The contents of the first word in the data dump are the following:

sl_group	6 bits
sl_mem	4 bits
sl_vlink	3 bits
fill	3 bits
band	9 bits
bmem_num	4 bits
fill	3 bits

120. CTLAB6RCCMPMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CC6rccmp() function could not send an OSDS message about the completion of the RC operation on the RLLAB6_PCI relation. The message is discarded.

121. CTLAB7RCCMPMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CC7rccmp() function could not send an OSDS message about the completion of the RC operation on the RLLAB7_PCI relation. The message is discarded.

122. CTLAB7RCMSGSENDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CClab7trig() function could not send an OSDS message with RC information to the active DLN. The message is discarded. No action is taken.

123. CTLAB7READERR1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrecvisup() function received an unexpected return code from a function trying to read the RLLAB7_PCI relation from database. The associated signaling message is discarded. The data dump contains the following:

dpc 24 bits
fill 8 bits
opc 24 bits
fill 8 bits

124. CTLAB7READERR2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CThdrbld() function received an unexpected return code from a function trying to read the RLLAB7_PCI relation from database. The associated signaling message is discarded. The data dump contains the following:

dpc 24 bits

fill 8 bits

opc 24 bits

fill 8 bits

125. CTLAB7TPLBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CC7_pcirc() function to be performed on the existing tuple of the RLLAB7_PCI relation in the DLN. No action is taken.

126. CTLAB7TPLNOTFNDBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CC7_pcirc() function to be performed on the not found tuple of the RLLAB7_PCI relation in the DLN. No action is taken.

127. CTLLMRNF3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCllmrnf() function failed to read the data block from the DLN-AM in-queue 0. An unexpected return code was received from the _ims3brd() function. No action is taken.

128. CTMG_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message type was received.

129. CTMLTL_BREL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected relation ID was passed to the CTmlt_lata() function for update. No action is taken.

130. CTMLTLINVRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CTrc_mlata() function to be performed on the RLMLT_LATA relation in the DLN. No action is taken.

131. CTMLTLRCCMPMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTcmplt_mlata() function could not send an OSDS message about the completion of the RC operation on the RLMLT_LATA relation. The message is discarded.

132. CTMLTLRCMSGSENDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTmlt_lata() function could not send an OSDS message with RC information to the active DLN. The message is discarded. No action is taken.

133. CT_MSGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected or invalid operating system for distributed switching (OSDS) message was received. The data dump contains the first 160 bytes of the message.

134. CTMSGQFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsndpgcni() function could not send a DMERT message to the CCpgeupdt process. The message will be lost. No action is taken.

135. CTMSGQFAIL (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddupdate() function could not send a message.

136. CTNOAPP_DLNMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCds_app() function timed out waiting for the active DLN to confirm an APP RC info update. No action is taken.

137. CTNOBFR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsndrmon() function was unable to allocate a buffer to send an OSDS message to CCringmon. The message is discarded. No action is taken.

138. CTNOBFR (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No buffer was available to send a message from the direct link node (DLN) trigger function to the ring monitor kernel process (RINGMON).

139. CTNOBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsndpgcni() function could not allocate a message buffer to send a DMERT message to the CCpgeupdt process. The message will be lost. No action is taken.

140. CTNOBUF (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddupdate() function could not allocate a message buffer.

141. CTNODLNMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No return message was received from the direct link node (DLN).

142. CTNODSBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHgwbuf() function returned an unexpected value after being requested by the CCsenddcis() function to allocate a buffer for a direct signaling message addressed to CNI. The message is discarded. CNI will attempt recovery. The data dump contains the CNI channel number.

143. CTNOLAB7_DLNMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CClab7trig() function timed out waiting for the active DLN to confirm a LAB7 RC information update. No action is taken.

144. CTNOMLTL_DLNMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTmlt_lata() function timed out waiting for the active DLN to confirm a MLT_LATA RC information update. No action is taken.

145. CTNOOSDSBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHgwbuf() function returned an unexpected value after being requested by the CCosend() function to allocate a buffer for an OSDS message addressed to a DLN. The message is discarded. CNI will attempt recovery. The data dump contains the CNI channel number.

146. CTNOPCI_DLNMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCpciprt() function timed out waiting for the active DLN to confirm a PCI RC info update. No action is taken.

147. CTNOQUE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsdrmon() function was unable to queue a message to CCringmon. The message is discarded. No action is taken.

148. CTNOQUE (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A direct link node (DLN) database (DB) trigger function was unable to queue a message to the ring monitor kernel process (RINGMON).

149. CTNOSSN_DLNMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCds_ssn() function timed out waiting for the active DLN to confirm a SSN RC information update. No action is taken.

150. CTNOTCAPBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHgwbuf() function returned an unexpected value after being requested by the CCsndtcap() function to allocate a buffer for a TCAP message addressed to CNI. The message is discarded. CNI will attempt recovery. The data dump contains the CNI channel number.

151. CTNOTSBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHgwbuf() function returned an unexpected value after being requested by the CCsendtccs() function to allocate a buffer for a trunk signaling message addressed to CNI. The message is discarded. CNI will attempt recovery. The data dump contains the CNI channel number.

152. CTNOTSMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsendtccs() was called by the CCrecevmsgs() function but no trunk signaling message for CNI was passed to it. No action is taken.

153. CTOKPLAB7_BREL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected relation ID was passed to the CClab7trig() function in OKP for update. No action is taken.

154. CTOS_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to send a message to another process using the OSsendmsg() function failed. The message will be lost.

155. CTOSDSCHOPENFAIL1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The chkopen() function failed to open the CNI OSDS channel on request of the CCosinit() function. No action is taken. Seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual. The data dump contains the CNI OSDS channel number.

156. CTOSDSCHOPENFAIL2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The chkopen() function failed to open the CNI OSDS channel on the CCinit() function request. No action is taken. Seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual. The data dump contains the CNI OSDS channel number.

157. CTOSDSCHSETFAIL1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The chioctl() function failed to set the CNI OSDS channel options on the CCosinit() function request. No action is taken. Seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

158. CTOSDSCHSETFAIL2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The chioctl() function failed to set the CNI OSDS channel options on the CCinit() function request. No action is taken. Seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section

of the Asserts manual.

159. CTOSDSMSGSENDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCosend() function failed to transmit an OSDS message to the CNI. A self recovery process is attempted automatically but the message is discarded. The data dump contains the CNI channel descriptor.

160. CTOVLCNGCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCswupd() function could not allocate an IMS buffer for writing an overload/congestion status message to the standby DLN. An unexpected return code was received from the CCgwbuf() function. The message is discarded.

161. CTPCI_BREL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected relation ID was passed to the CCpciprt() function for update. No action is taken.

162. CTPCIRCCMPMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCpcicmp() function could not send an OSDS message about the completion of the RC operation on the RLPCI_PRT relation. The message is discarded.

163. CTPCIRCMMSGSENDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCpciprt() function could not send an OSDS message with RC information to the active DLN. The message is discarded. No action is taken.

164. CTPCIREADERR1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrecvisup() function received an unexpected return code from a function trying to read the RLPCI_PRT relation from database. The associated signaling message is discarded. The data dump contains the following:

pci 8 bits

fill 8 bits

circuit 14 bits

fill 2 bits

165. CTPCIREADERR2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CThdrbld() function received an unexpected return code from a function trying to read the RLPCI_PRT relation from database. The associated signaling message is discarded. The data dump contains the following:

pci 8 bits

fill 8 bits

circuit 14 bits

fill 2 bits

166. CTPCITPLBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CCpcirc() function to be performed on the existing tuple of the RLPCI_PRT relation in the DLN. No action is taken.

167. CTPCITPLNOTFNDBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CCpcirc() function to be performed on the not found tuple of the RLPCI_PRT relation in the DLN. No action is taken.

168. CTPMPDNCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCpumpdone() function could not allocate an IMS buffer for writing a pump done notification message to the ringmon. An unexpected return code was received from the CCgwbuf() function. The message is discarded.

169. CTPMPHDRWRRTERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdbdn() function failed to write data to the pump message header. An unexpected return code from the _ims3bwt() function was received. The message is discarded.

170. CTQ0HRNF3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCq0hrnf() function failed to read the DLN-AM queue 1 pointers. An unexpected return code was received from the _ims3brd() function. No action is taken.

171. CTQ0HWNF3BWRERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCq0hwnf() function failed to write of the DLN-AM in-queue 1 pointers. An unexpected return code from the _ims3bwt() function was received. No action is taken.

172. CTQ0RDNF3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCq0rdnf() function failed to read the data block from the DLN-AM in-queue 1. An unexpected return code was received from the _ims3brd() function. No action is taken.

173. CTQ0WRNF3BWRERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCq0wrnf() function failed to write a message to the DLN-AM out-queue 1. An unexpected return code from the _ims3bwt() function was received. The message is discarded.

174. CTQ1HRNF3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCq1hrnf() function failed to read the SM bit map from the AM. An unexpected return code was received from the _ims3brd() function. No action is taken.

175. CTQ1WRNF3BWRERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCq1wrnf() function failed to write of the DLN-AM in-queue 0 pointers. An unexpected return code from the _ims3bwt() function was received. No action is taken.

176. CTRCSSNINSFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCds_ssn() function failed to put the SSN in service after it was inserted by RC. No action is taken. The data dump contains the affected RLDS_SSN relation tuple.

177. CTRCSSNOOSFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCds_ssn() function failed to take the SSN out of service after it was deleted by RC. No action is taken. The data dump contains the affected RLDS_SSN relation tuple.

178. CTREPRINVRET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdbrepro() function received an unexpected return code from the OSmprepro() function. No action is taken.

179. CTRETCODE_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the cHsxhdr() function. The message will be dropped.

180. CTRNBFOV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cannot allocate a buffer for writing a message to the ring.

181. CTROPFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCropcall() function failed to send or queue a message for ROP printout. The data dump contains the message. The message is discarded.

182. CTROPQUEOVFL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Due to the ROP output queue overflow, the CCropcall() function could not queue its own message for ROP printout. The data dump contains the message. The message is discarded.

183. CTROPTRY2FAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCropcall() function failed to send or queue a message for ROP printout on second try; even though, it was given OK on check after the first try with queue overflow response. The data dump contains the message. The message is discarded.

184. CTRRCVIMSWRTERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrrcv() function failed to write a message to the IMS buffer. An unexpected return code from the _imswrite() function was received. The message is discarded.

185. CTRWTNFIMSWRTERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrwnf() function received an unexpected or "bad message format" IMS write buffer status code. The message is discarded.

186. CTSMBMPNF3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTsmbmpnf() function failed to read the SM OOS bit map from the AM. An unexpected return code was received from the _ims3brd() function. No action is taken.

187. CTSMOUTNF3BRDERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTsmoutnf() function failed to read the logical link map from the AM. An unexpected return code was received from the _ims3brd() function. No action is taken.

188. CTSPPCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsppchk() function could not allocate an IMS buffer for writing a single process purge manual request message to the ringmon. An unexpected return code was received from the CCgwbuf() function. The message is discarded.

189. CTSSN_BREL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected relation ID was passed to the CCds_ssn() function for update. No action is taken.

190. CTSSNIS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to put the signaling connection control part (SCCP) subsystem number in service.

191. CTSSNOORINDX (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range index to the RLDS_SSN relation in the DLN was received by the CCssnrc() function. No action is taken.

192. CTSSNOOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to take the signaling connection control part (SCCP) subsystem number out of service.

193. CTSSNRCCMPMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCssncmp() function could not send an OSDS message about the completion of the RC operation on the RLDS_SSN relation. The message is discarded.

194. CTSSNRCMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCds_ssn() function could not send an OSDS message with RC information to the active DLN. The message is discarded. No action is taken.

195. CTSSNTPLBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CCssnrc() function to be performed on the existing tuple of the RLDS_SSN relation in the DLN. No action is taken.

196. CTSSNTPLNOTFNDBADRCOPER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected recent change operation was received by the CCssnrc() function to be performed on the not found tuple of the RLDS_SSN relation in the DLN. No action is taken.

197. CTSTBYDLN_LAB7MSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCossend() function returned an unexpected value to the CClab7trig() function while it was trying to send an OSDS message to the standby DLN about a LAB7 RC update. No action is taken.

198. CTSTBYDLN_PCIMSGFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCossend() function returned an unexpected value to the CCpciprt() function while it was trying to send an OSDS message to the standby DLN about a PCI RC update. No action is taken.

199. CTSTRTACKCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCstrtack() function could not allocate an IMS buffer for writing a STRTACK message to the ringmon. An unexpected return code was received from the CCgwbuff() function. The message is discarded.

200. CTSWUPDACKCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCswupdock() function could not allocate an IMS buffer for writing a switch update acknowledgement message to the active DLN. An unexpected return code was received from the CCgwbuff() function. The message is discarded.

201. CTSWUPDCNIBUFERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCswupd() function could not allocate an IMS buffer for writing a switch update message to the standby DLN. An unexpected return code was received from the CCgwbuff() function. The message is discarded.

202. CTTCBLEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The outgoing transaction capability application part (TCAP) message had an unexpected length.

203. CTTRIG_BREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation ID was passed to the direct link node (DLN) database (DB) trigger function.

204. CTTRIG_ROP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A direct link node (DLN) database (DB) trigger function could not send a craft error message to the read only printer (ROP).

205. CTTRSPENT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected entry reason was passed to the CCdltrinit() function. No action is taken.

206. CTTRSPENT (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason was sent to the common channel signaling (CCS) transport system process.

207. CTUNEXPMMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCtranspen() function received a message while it should not receive any one. The message is discarded.

208. CTUNKCMOSDSMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrecvmgs() function received an unknown OSDS message. The message is discarded. The data dump contains the first 160 bytes of the message.

209. CTUNKNDESTMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrem_msg() function received an OSDS message for an unknown destination. The message is dropped. The data dump contains the first 160 bytes of the message.

210. CTUNKPDESTMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamrcv() function received a message from DLN-AM queues that is destined to an unknown process. The message is discarded.

211. CTUNPRINVRET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdbunpro() function received an unexpected return code from the OSmpunpro() function. No action is taken.

212. CTUNXPIPMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmrcv() function received a CNI interprocess message with an unexpected message type. The message discarded.

213. CTUNXPNPCKTMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamrcv() function received a non-packet message for CCS transport with an unexpected message type. The message is discarded. The data dump contains the first 160 bytes of the message.

214. CTUNXPPCKTMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamrcv() function received a packet message for CCS transport with an unexpected message type. The message is discarded. The data dump contains the first 160 bytes of the message.

215. CTUNXRRCVMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrrcv() function received an unexpected message. The message is discarded. The data dump contains the first 160 bytes of the message.

216. CTWRTAM3BWRTErr (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCwrtam() function failed to write a message to the DLN-AM out-queue 0. An unexpected return code from the _ims3bwt() function was received. The message is discarded.

217. CTZEROLNGMSGRECV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A zero length CCS message was received from the CNI by the CCrcvcni() function. This corrupted message is discarded. Due to the automatic recovery from this error within the code, the assert should not occur frequently. The data dump contains the previous message. If the assert is seen frequently, contact technical support for further analysis. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

Range: da**1. ABSMASRT (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: APBUF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIAPBUF tuple. The appropriate idle list should be verified.

2. ACLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACCSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIACCSDB tuple. The appropriate idle list should be verified.

3. AHSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APHEADC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIAP_HEADC tuple. The appropriate idle lists should be verified.

4. AJLMASRT (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the RLASP_TP relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

5. AJSMASRT (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the RLASP_TP relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

6. AKSMASRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CGACKT	Audit Mode: nonseg

Problem:

Linkage field of the CGACKT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

7. ALSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EISCALL	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIEISCALL tuple. The appropriate idle list should be verified.

8. ANSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rIANQ tuple. The appropriate idle lists should be verified.

9. APDBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIAPB tuple. The appropriate idle lists should be verified.

10. APLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIAPB tuple. The appropriate idle list should be verified.

11. APSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIAPB tuple.

12. AQLMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the AUTOQ relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

13. AQSMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the AUTOQ relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

14. ARLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACRECORD	Audit Mode: elev

Problem:

Linkage field of the ACRECORD relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

Action:
None.

15. ARSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACRECORD	Audit Mode: elev

Problem:
Linkage field of the ACRECORD relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

Action:
None.

16. ASLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APSPB	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIAPSPB tuple. The appropriate idle list should be verified.

17. ASSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APSPB	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIAPSPB tuple. The appropriate idle list should be verified.

18. AUSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APDU	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIAPDU tuple. The appropriate idle lists should be verified.

19. AXSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid syntactic linkage was found in an rIGPAXDB tuple. The appropriate idle lists should be verified.

20. BCLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OSBCB	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIOSBCB tuple. No idle list is affected.

21. BCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OSBCB	Audit Mode: elev

Problem:

Dynamic access (DA) detected a corrupt linkage between the RLDB_HEADC relation and the RLOSBCB relation. Audits will be called from the operating system (OS) if necessary.

22. BDLMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the BRGDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

23. BDSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the BRGDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

24. BFSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BFDATA	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDB_BFDAT tuple. The appropriate idle lists should be verified.

25. BILMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OSBIT	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIOSBIT tuple. No idle lists are affected.

26. BISMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OSBIT	Audit Mode: elev

Problem:

A linkage field between the RLDB_HEADC relation and the RLOSBIT relation was corrupted. Audits will be called by the operating system (OS) to cleanup the linkage.

27. BLSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIATTH_BLF tuple. The appropriate idle list should be verified.

28. BRLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIBRCSDb tuple. The appropriate idle list should be verified.

29. BRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCSDb	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIBRCSDb tuple. The appropriate idle lists should be verified.

30. BUSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BUfMSG	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIBUfMSG tuple. The appropriate idle lists should be verified.

31. C1SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the CLS_STAT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

32. C7SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the CINDX7 relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

33. CASMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCATPS	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIR_CATPS tuple. The appropriate idle lists should be verified.

34. CBLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICBDB tuple. The appropriate idle lists should be verified.

35. CBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICBDB tuple. The appropriate idle list should be verified.

36. CCLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICBCOM tuple. No idle list is affected.

37. CCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICBCOM tuple. The appropriate idle lists should be verified.

38. CDLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICDBCOM tuple. No idle list is affected.

39. CDSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICDBCOM tuple. The appropriate idle lists should be verified.

40. CFLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CFSCOP	Audit Mode: null

Problem:

Linkage field of the CFSCOP relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

41. CFSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CFSCOP	Audit Mode: null

Problem:

Linkage field of the CFSCOP relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

42. CHLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICHDB tuple. No idle list is affected.

43. CHSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICHDB tuple. The appropriate idle lists should be verified.

44. CLLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICLDB tuple. The appropriate idle list should be verified.

45. CLSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICLDB tuple. The appropriate idle list should be verified.

46. CNLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rICHAN tuple. The appropriate idle list should be verified.

47. CNSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBCND	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICHAN tuple. The appropriate idle list should be verified.

48. COSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CGAPORT	Audit Mode: elev

Problem:

Linkage field of the CGAPORT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

49. CPSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CPLR	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICPLR tuple. The appropriate idle lists should be verified.

50. CQDBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICQDB tuple. The appropriate idle lists should be verified.

51. CQLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICQDB tuple. The appropriate idle lists should be verified.

52. CQSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICQB tuple. The appropriate idle lists should be verified.

53. CRLMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the CRECORD relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

54. CRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: null

Problem:

Linkage field of the CRECORD relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

55. CTLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCSSTPDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICCSSTPDB tuple. The appropriate idle lists should be verified.

56. CTSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCSSTPDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICCSSTPDB tuple. The appropriate idle lists should be verified.

57. CUSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the CLU_RDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

58. CVLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STATE	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICV_STATE tuple. The appropriate idle list should be verified.

59. CVSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STATE	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICV_STATE tuple. The appropriate idle list should be verified.

60. CZLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICBDB tuple. The appropriate idle lists should be verified.

61. CZSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICBDB tuple. The appropriate idle lists should be verified.

62. D6SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the LS6_DATA relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

63. DALMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDALB tuple. The appropriate idle lists should be verified.

64. DASMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDALB tuple. The appropriate idle lists should be verified.

65. DBLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ADB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIADB tuple. The appropriate idle list should be verified.

66. DBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIAPB tuple. The appropriate idle lists should be verified.

67. DCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the DPC_STAT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

68. DHLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIMODH_BLF tuple.

69. DHSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIMODH_BLF tuple.

70. DILMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DISPDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDISPDB tuple. The appropriate idle lists should be verified.

71. DISMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DISPDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDISPDB tuple. The appropriate idle lists should be verified.

72. DLLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDALB tuple. The appropriate idle lists should be verified.

73. DMSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIMODM_BLF tuple. The appropriate idle list should be verified.

74. DNLMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the rIDN_GSDB relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

75. DNSMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the rIDN_GSDB relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

76. DOLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DOC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDOC tuple. The appropriate idle lists should be verified.

77. DOSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DOC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDOC tuple. The appropriate idle lists should be verified.

78. DPSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDPB tuple. The appropriate idle lists should be verified.

79. DTLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLTBDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDLTBDB tuple. The appropriate idle list should be verified.

80. DTSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rDLTSBDB tuple. The appropriate idle list should be verified.

81. E7SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the ENTRY7 relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

82. E9LMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: E911DB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIE911DB tuple. The appropriate idle lists should be verified.

83. E9SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: E911DB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIE911DB tuple. The appropriate idle lists should be verified.

84. EBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rISMPERBLK tuple. The appropriate idle lists should be verified.

85. EISMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIEIS_LNK tuple. The appropriate idle lists should be verified.

86. ENSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the NET_STAT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

87. ERSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLOCK	Audit Mode: elev

Problem:

An error was found and corrected in the RLSMEST relation that is relative to RLSMPERBLK relation linkage. There may be errors in non-idle rLSMPERBLK tuples.

88. EXLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EXRR	Audit Mode: elev

Problem:

An error was found in the one-to-one linkage of the RLEXRR relation.

89. EXSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EXRR	Audit Mode: elev

Problem:

An error was found in the set linkage of the RLEXRR relation.

90. FCSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the CAL_INFO relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

91. FLLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CFLNTRM	Audit Mode: null

Problem:

Linkage field of the CFLNTRM relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

92. FLSTMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CFLNTRM	Audit Mode: null

Problem:

Linkage field of the CFLNTRM relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

93. FTSMASRT (5E13 and later)

Recovery Action: spp	SPP: n	Audit: GPFTIMER	Audit Mode: nonseg

Problem:

Linkage field of the RLGPFTIMER relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

94. FTSMASRT (5E12 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the GPFTIMER relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

95. FUSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the FRN_AMA relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

96. GEN_NOREL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation ID was detected as an input within the general dynamic primitives.

97. GEN_NOTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The specified tuple was not found for the specified relation.

98. GKLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the GSLK relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

99. GKSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the GSLK relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

100. GRLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GRPTGC	Audit Mode: elev

Problem:
An error was found in the one-to-one linkage of the RLGRP_TGC relation.

101. GRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GRPTGC	Audit Mode: elev

Problem:
An error was found in the set linkage of the RLGRP_TGC relation.

102. GSLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the GSDB relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

103. GSSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GSDB	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIGSDB tuple. The appropriate idle lists should be verified.

104. GTSMASRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CGALIST	Audit Mode: nonseg

Problem:
Linkage field of the CGALIST relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

105. HCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBHEADC	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIDB_HEADC tuple. The appropriate idle lists should be verified.

106. HDLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the HDD relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

107. HILMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the PHISTORY relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

108. HISMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the PHISTORY relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

109. HLSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIHCCALLTQ tuple. The appropriate idle lists should be verified.

110. HQSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the HC_SRVQ relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

111. IASMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDINFO	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIACDINFO tuple. The appropriate idle lists should be verified.

112. ICSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ICI	Audit Mode: elev

Problem:
Linkage field of the QO_ICI relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

113. IGLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the AI_GSDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

114. IGSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the AI_GSDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

115. ISSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rIISPABUF tuple. The appropriate idle lists should be verified.

116. JFSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the JBUF relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

117. KLSMASRT (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the RLTCPBLK relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

118. KTSMASRT (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the RLTCPPKT relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

119. LBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the LSB_CLSB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

120. LCLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LSCMDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found between an rLSCMDB tuple and its one-to-one link.

121. LCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LSCMDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in the one-to-many member linkage of an rLSCMDB tuple.

122. LHSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RLHPTPN	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rLR_LHPTPN tuple. The appropriate idle lists should be verified.

123. LKLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBLOCK	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDB_LOCK tuple. The appropriate idle list should be verified.

124. LKSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBLOCK	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDB_LOCK tuple. The appropriate idle list should be verified.

125. LOSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LOOPDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rLOOPDB tuple. The appropriate idle lists should be verified.

126. LQSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the HC_CLLQ relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

127. LRSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the LORSTMR relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

128. LTLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGTKSTAT	Audit Mode: elev

Problem:
An error was found in the one-to-one linkage of the RLLGTKSTAT relation.

129. LXSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the LS_STAT relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

130. LYLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: REPLYBLF	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIREPLYBLF tuple. The appropriate idle list should be verified.

131. LYSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: REPLYBLF	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIREPLYBLF tuple. The appropriate idle list should be verified.

132. MASMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid syntactic linkage was found in an rIMANQ tuple. The appropriate idle lists should be verified.

133. MCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RMCATPS	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIR_MCATPS tuple. The appropriate idle lists should be verified.

134. MDSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIMDB tuple. The appropriate idle list should be verified.

135. MLSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MALLOC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIMALLOC tuple. The appropriate idle lists should be verified.

136. MPLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rIMPC tuple. The appropriate idle lists should be verified.

137. MQSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MDRQ	Audit Mode: null

Problem:

Linkage field of the MDRQ relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

138. MRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the RSTMR relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

139. MWSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MSMWIDA	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rMSMWIDA tuple. The appropriate idle lists should be verified.

140. N1SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the NALS_ST relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

141. N7SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the NA7MDB relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

142. NASMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the NA7RDB relation tuple is corrupt.

Probable Cause:
Broken or dangling linkage.

143. NBLMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkage field of the NS_BILL relation tuple is corrupt.

Probable cause:
Broken or dangling linkage.

144. NBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSBILL	Audit Mode: elev

Problem:
A linkage field in an rINS_BILL tuple was corrupted. The appropriate idle lists should be verified.

145. NDLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBCND	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIDBCND tuple. The appropriate idle list should be verified.

146. NDSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBCND	Audit Mode: elev

Problem:
Invalid syntactic linkage was found in an rIDBCND tuple. The appropriate idle list should be verified.

147. NILMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSIDX	Audit Mode: elev

Problem:

A linkage field in an rINS_IDX tuple was corrupted. The appropriate idle lists should be verified.

148. NISMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSIDX	Audit Mode: elev

Problem:

A linkage field in an rINS_IDX tuple was corrupted. The appropriate idle lists should be verified.

149. NSLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TN	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rINS_TN tuple. The appropriate idle list should be verified.

150. NSSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TN	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rINS_TN tuple. The appropriate idle list should be verified.

151. OASMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OPNDC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDB_OPNDC tuple in the AM. The appropriate idle lists should be verified.

152. OCLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OCRECORD	Audit Mode: null

Problem:

Linkage field of the OCRECORD relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

153. OCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OCRECORD	Audit Mode: null

Problem:

Linkage field of the OCRECORD relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

154. OHSMASRT (5E13 and later)

Recovery Action: spp	SPP: n	Audit: OHTIMER	Audit Mode: nonseg

Problem:

Linkage field of the RLOHTIMER relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

155. OHSMASRT (5E12 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the OHTIMER relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

156. OPLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OPNDC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDB_OPNDC tuple. The appropriate idle list should be verified.

157. OPSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OPNDC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDB_OPNDC tuple. The appropriate idle lists should be verified.

158. OSSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OPNDC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDB_OPNDC tuple in the SM. The appropriate idle lists should be verified.

159. OTLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICOINOT tuple. The appropriate idle list should be verified.

160. OTSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rICOINOT tuple. The appropriate idle list should be verified.

161. OUSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the SCCPSTAT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

162. P7SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the PCILST7 relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

163. PALMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rACDPOSDB tuple. The appropriate idle lists should be verified.

164. PASMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rACDPOSDB tuple. The appropriate idle lists should be verified.

165. PBLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPTSB tuple. The appropriate idle lists should be verified.

166. PBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPTSB tuple. The appropriate idle lists should be verified.

167. PCLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPCBLA tuple. No idle list is affected.

168. PCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPCBLA tuple. The appropriate idle lists should be verified.

169. PESMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PUENTRY	Audit Mode: elev

Problem:

Linkage field of the PU_ENTRY relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

170. PHLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPHDB tuple. No idle list is affected.

171. PHSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPHDB tuple. The appropriate idle lists should be verified.

172. PISMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPRISTAT tuple. The appropriate idle lists should be verified.

Probable Cause:

The rIPRISTAT tuple is not the owner of the rIDALB tuple.

173. PKSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PKB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPKB tuple. The appropriate idle lists should be verified.

174. PLSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRTLST	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPRTLST tuple. The appropriate idle lists should be verified.

175. POLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPORTLA tuple. No idle list is affected.

176. POSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPORTLA tuple. The appropriate idle lists should be verified.

177. PQSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PUQUEUE	Audit Mode: elev

Problem:

Linkage field of the PU_QUEUE relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

178. PRLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPTRDB tuple. The appropriate idle list should be verified.

179. PRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

Linkage field of the PTRDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

180. PSSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: POSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIPOSDB tuple. The appropriate idle lists should be verified.

181. PUSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the APC_STAT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

182. PVLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rINSDB tuple. The appropriate idle list should be verified.

183. PVSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rINSDB tuple. The appropriate idle list should be verified.

184. PXSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APXCTBL	Audit Mode: elev

Problem:

Bad syntactic linkage found in a tuple of relation RLAPXCTBL.

Probable Cause:

Broken linkage in APXCTBL.

Action:

Audit scheduled to rebuild list.

185. PYSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHISTORY	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rPHISTORY tuple. The appropriate idle lists should be verified.

186. QBLMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: REQBLOCK	Audit Mode: elev

Problem:

Linkage field of the REQBLOCK relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

187. QBSMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: REQBLOCK	Audit Mode: elev

Problem:

Linkage field of the REQBLOCK relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

188. QCLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rCQDB tuple. The appropriate idle lists should be verified.

189. QCSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rCQDB tuple. The appropriate idle lists should be verified.

190. QDSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the CLLQDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

191. QGSMSART (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OGT	Audit Mode: elev

Problem:

Linkage field of the QO_OGT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

192. QLMSASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rISMQLIST tuple. The appropriate idle lists should be verified.

193. QMSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MLHG	Audit Mode: elev

Problem:

Invalid syntactic set linkage was found by the DAqoqm() function, where the owner was the RLQO_MLHG relation and the member was the RLQM_MLHG relation. Verify that the key being passed was not zero, unless a keyshift was declared.

194. QOSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MLHG	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIQO_MLHG tuple. The appropriate idle lists should be verified.

195. QPLMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: RQTP	Audit Mode: elev

Problem:

Linkage field of the RQTP relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

196. QPSMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: RQTP	Audit Mode: elev

Problem:

Linkage field of the RQTP relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

197. QRLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QRYDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIQRYDB tuple. The appropriate idle list should be verified.

198. QRSMASRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QRYDB	Audit Mode: nonseg

Problem:

Linkage field of the QRYDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

199. QTSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OGT	Audit Mode: elev

Problem:

Linkage field of the QM_OGT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

200. QVLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the QV_STATE relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

201. QVSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the QV_STATE relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

202. RBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMSGBUF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIRMSGBUF tuple. The appropriate idle lists should be verified.

203. RDSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the S7RDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

204. RESMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the RESTRTMR relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

205. RGSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RGBUS	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIRGBUS tuple. The appropriate idle lists should be verified.

206. RLLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTLb	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIRTLb tuple. The appropriate idle lists should be verified.

207. RLSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTLb	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIRTLb tuple. The appropriate idle lists should be verified.

208. RNSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the ASPTRANS relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

209. RPSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the PCI_RTE relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

210. RQSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RELQ	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDBRELQ tuple. The appropriate idle lists should be verified.

211. RRLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rIRRMPC tuple. The appropriate idle lists should be verified.

212. RRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the RCGTMR relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

213. RTSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTEILA	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIRTEILA tuple. The appropriate idle lists should be verified.

214. RVLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NMTR	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITR tuple. The appropriate idle list should be verified.

215. RVSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NMTR	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITR tuple. The appropriate idle list should be verified.

216. S0LMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DS0B	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDS0B tuple. The appropriate idle lists should be verified.

217. S0SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DS0B	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDS0B tuple. The appropriate idle lists should be verified.

218. S7SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the S7MDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

219. SBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVTM	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIHCSERVTM tuple. The appropriate idle lists should be verified.

220. SCLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SCMDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rSCMDB tuple. The appropriate idle should be verified.

221. SCSMASRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: SCMDB	Audit Mode: nonseq

Problem:

Invalid syntactic linkage was found in an rSCMDB tuple. The appropriate idle list should be verified. The audit is run on demand.

222. SDLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the HDS relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

223. SDSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the HDS relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

224. SESMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

Linkage field of the SMEST relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

225. SISMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the ASPDISP relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

226. SLSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the SDAP_SDL relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

227. SNSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RSPTPN	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIR_SPTPN tuple. The appropriate idle lists should be verified.

228. SPLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SPB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rISPB tuple. The appropriate idle lists should be verified.

229. SPSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SPB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rISPB tuple. The appropriate idle lists should be verified.

230. SQSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the SRVQDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

231. SRLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SRVOT	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rISRVOT tuple. The appropriate idle list should be verified.

232. SRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SRVOT	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rISRVOT tuple. The appropriate idle list should be verified.

233. STLMASTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rISTQDB tuple. The appropriate idle lists should be verified.

234. STSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rISTQDB tuple. The appropriate idle lists should be verified.

235. SULMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STPDB	Audit Mode: elev

Problem:

A linkage field in an rISTPDB tuple was corrupted. The appropriate idle lists should be verified.

236. SUSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STPDB	Audit Mode: elev

Problem:

A linkage field in an rISTPDB tuple was corrupted. The appropriate idle lists should be verified.

237. SXLMASRT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the SMXRF relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

238. SXSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SMXRF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rISMXRF tuple. The appropriate idle lists should be verified.

239. T7SMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the TIMER7 relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Action:

None.

240. TALMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TAPOSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITAPOSDB tuple. The appropriate idle lists should be verified.

241. TASMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TAPOSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITAPOSDB tuple. The appropriate idle lists should be verified.

242. TBLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TATDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITATDB tuple. The appropriate idle lists should be verified.

243. TBSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TATDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITATDB tuple. The appropriate idle lists should be verified.

244. TDLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the OAOTDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

245. TDSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the OAOTDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

246. TELMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

An invalid linkage field was found in an rITEDB tuple.

Probable Cause:

Linkages were not unlinked properly.

Action:

The appropriate idle lists should be verified.

247. TESMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITEDB tuple. The appropriate idle lists should be verified.

248. TGLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TGC	Audit Mode: elev

Problem:

An error was found in the one-to-one linkage of the RLTGC relation.

249. TGSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TGC	Audit Mode: elev

Problem:

An error was found in the set linkage of the RLTGC relation.

250. TISMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEILA	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rTEILA tuple. The appropriate idle list should be verified.

251. TKLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKSTAT	Audit Mode: elev

Problem:

An error was found in the one-to-one linkage of the RLTKSTAT relation.

252. TLSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rTALOOPDB tuple. The appropriate idle lists should be verified.

253. TMSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIATTM_BLF tuple. The appropriate idle list should be verified.

254. TNSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TNINFO	Audit Mode: elev

Problem:

A linkage field in an rITN_INFO tuple was corrupted. The appropriate idle lists should be verified.

255. TOLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKOWNER	Audit Mode: elev

Problem:

An error was found in the one-to-one linkage of the RLTKOWNER relation.

256. TOSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKOWNER	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITKOWNER tuple. The appropriate idle lists should be verified.

257. TPLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TAPOSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITAPOSDB tuple. The appropriate idle list should be verified.

258. TPSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTPSTAT	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIR_TPSTAT tuple. The appropriate idle lists should be verified.

259. TQSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKQUE	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITKQUE tuple. The appropriate idle lists should be verified.

260. TRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TRNDC	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIDB_TRNDC tuple. The appropriate idle lists should be verified.

261. TSLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITSDB tuple. No idle list is affected.

262. TSSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rITSDB tuple. The appropriate idle lists should be verified.

263. TTSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTPSTAT	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rIR_TPSTAT tuple. The appropriate idle lists should be verified.

264. UCSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the CLU_STAT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

265. UDLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the SUDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

266. UDSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field for the SUDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

267. UPSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the CLAPCRDB relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

268. USSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid syntactic linkage was found in an rUSERDB tuple. The appropriate idle list should be verified.

269. UTSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ATCALL	Audit Mode: elev

Problem:

Linkage field of the ATCALL relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

270. VCSMASRT (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the RLTCPRCV relation tuple is corrupt.

Probable cause:

Broken or dangling linkage.

271. VLLMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the VLR relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

272. XDSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the XDPCSTAT relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

273. XLSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the XLIST relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

274. XNSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the TXN_INFO relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

275. XPSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the XPTMR relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

276. XRSMASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SMXRF	Audit Mode: elev

Problem:

Invalid syntactic linkage was found in an rISMXRF tuple. The appropriate idle lists should be verified.

277. XTSMASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage field of the XLISTMR relation tuple is corrupt.

Probable Cause:

Broken or dangling linkage.

Range: daim**1. IM_BADP2URET (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from a call to the pid2uid() primitive.

2. IM_BADU2PRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from a call to the uid2pid() primitive.

3. IMBIN_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid in_type parameter was passed to the IMactrl() function in the application integrity monitor (AIM).

4. IMBMS_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid ms_type was routed to the IMactrl() function in the application integrity monitor (AIM).

5. IM_LK_CNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The IMlk_cnt variable was corrupted in the application integrity monitor (AIM).

6. IM_LKDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data returned by the lkout_data() primitive, called by the application integrity monitor (AIM), was corrupted.

7. IM_LKRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The lkout_data() RTR primitive called by the application integrity monitor (AIM) returned failure.

8. IM_LOOPCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) activity counter for the operational kernel process (OKP) had a wild written

value in it.

9. INBADPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) could not get the process number of a DMERT application process (DAP) that is critical to the system. AIM requests an S6,H3 (DMERT level 2) initialization.

10. INBADSEQST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) encountered a sequence state that is invalid or is not consistent with the data stored in the Sldapdata[] array.

11. INBAIMPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) encountered a failure when attempting to attach to its port. AIM requests an S6,H3 (DMERT level 2) initialization.

12. INBCMCKPACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received a failure acknowledgement from the communication kernel process (CMKP) when it attempted to attach to its slot for operating system for distributed switching (OSDS) communication. AIM requests an S6,H3 (DMERT level 2) initialization.

13. INBOTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) encountered an unrecognizable value in the ms_otype field of an incoming message.

14. INBSEQSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A sequence state was encountered by the application integrity monitor (AIM) that is an invalid value or is not consistent with the data stored in the Sldapdata[] array.

15. INBTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received a failure acknowledgement from the prtimer() DMERT primitive

when trying to attach to its repetitive timer. AIM requests an S6,H3 (DMERT level 2) initialization.

16. INCONFIGFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) failed to open the configuration manager (CONFIG) shared library.

17. INDUPII (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received an initialization progress message that it had previously received.

18. INECDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) failed to attach to the equipment configuration database (ECD).

19. INFAULTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received a failure return when it tried to send a fault to a DMERT application process (DAP). AIM requests an S6,H3 (DMERT level 2) initialization.

20. INFPTOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization forward progress timers timed out.

21. INITTIMEOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization time allowance was exceeded without the application integrity monitor (AIM) receiving a success indication from the essential components.

22. INMSGUNEX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received an unexpected message of the type used for the system initialization message from the switch integrity monitor (SIM). The message buffer is dumped to the stack.

23. INNOMSGBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) could not get a message buffer from DMERT for sending a message to the communications kernel process (CMKP) telling CMKP to open a slot for operating system for distributed switching (OSDS) communication.

24. INNOTRIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DMERT returned a failure code from the alocmg() or queuem() primitive when the application integrity monitor (AIM) attempted to send an initialization trigger message. AIM requests an S6,H3 (DMERT level 2) initialization.

25. INPMCOMFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) could not send a P_CREAT message to the process manager.

26. INSNDVTFail (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendevent() primitive failed to send an E_ABORT event to a *UNIX*[®] DMERT application process (DAP) that can be terminated.

27. INSNDFLTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendfault() primitive failed to send FLT_SINIT (SIGTERM signal) to a *UNIX*[®] DMERT application process (DAP).

28. INSYSIMSGFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) timed out while waiting to receive the system initialization message from the switch integrity monitor (SIM). A DMERT level 1 initialization is requested.

29. INTMTOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timeout occurred for the application integrity monitor (AIM) to terminate a DMERT application process (DAP) via a message to the DMERT scheduler. A DMERT level 1 initialization is requested.

30. INUNSUPPSEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DMERT application process (DAP) was in a sequence state that was not valid for that DAP.

31. SIALOCFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) could not allocate a DMERT message buffer.

32. SIAMDWFALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) could not get the dapid value of the automatic message accounting (AMA) disk writer (AMDW) process when AIM received a report message from the AMcpteles() function in the operational kernel process (OKP).

33. SIAPPLPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The default case was encountered in a switch on the application parameter in the INsysimsg() function. This indicates an internal software problem. The message buffer for the system initialization message is dumped to the stack.

34. SIASTAUD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal recovery and restart of the application integrity monitor (AIM) was invoked.

35. SIBADPARAM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal application parameter was passed to the function Slinh_admin().

36. SIBADTTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received a message with an invalid TTY message ID. The message buffer is dumped to the stack.

37. SIBDAPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dapid parameter, which is used as an index into the Sldapdata[] array, was passed to the application integrity monitor (AIM) with an invalid value.

38. SIBIN_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid in_type was passed to the INactrl() function in the application integrity monitor (AIM).

39. SIBMS_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid ms_type was in an input message to the application integrity monitor (AIM).

40. SIBOSTCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received an operating system trap (OST) with an invalid OST code.

41. SIBSI_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid si_type was in an initialization utility message. See the file db/MGinumt.h.

42. SIBTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid operating system for distributed switching (OSDS) message type was in an incoming message to the application integrity monitor (AIM).

43. SICONFIGFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A configuration manager (CONFIG) library primitive failed during an attempt to switch AM sides.

44. SIDBRDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the RLMODATT relation for a given SM. The INactrl() or Slinh_admn() function received failure from the DBfrdtup() primitive, or the offset value obtained from the RLMODATT relation was out of range.

45. SIDDRDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the data delivery (DD) access key DDRSMISOL for the given host SM (HSM). The INactrl() or Slinh_admn() function received failure from the DDREAD() primitive.

46. SIDDWERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received a failure return code from the DDwrite() primitive.

47. SIFASRTMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An assert library failed when trying to send assert failure data to the application integrity monitor (AIM). A special event is reserved in AIM for this purpose. This is probably a DMERT message buffer overload problem.

48. SIFAULTED (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) process was faulted by DMERT. The saved state and active message buffer (if any) are dumped to the stack. An internal AIM recovery and restart is invoked.

49. SIFLOWERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected internal to a function.

50. SIINVEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received an invalid event.

51. SIINVINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An automatic DMERT level 0 initialization occurred. This should only occur when manually requested from the emergency action interface (EAI). The message buffer for the system initialization message is dumped to the stack.

52. SIINVMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was encountered in the Slainhmsg() function. The message buffer is dumped to stack.

53. SIINVOSTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed by the Slswcp() operating system trap (OST) primitive.

54. SIINVREQINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received an invalid parameter from the INREQINIT() macro.

55. SIINVRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received an invalid return code from the Slcpside() primitive in the Slswcp() function.

56. SI_KLOCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received a fault indicating that the AM was experiencing a kernel level lockout. AIM requests a DMERT level 1 initialization.

57. SINOTSKBLK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There were no free task blocks for scheduling a timer in the application integrity monitor (AIM) even after a demand audit. An internal AIM recovery and restart will be invoked.

58. SIOVRSTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The timer could not be allocated via the Slatimer() function to limit the duration for DMERT message overload condition. Without this timer, output message volume may be seriously limited.

59. SIQMFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) failed to queue a DMERT message.

60. SISMKPFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) could not obtain the switch maintenance kernel process (SMKP) DMERT process ID to send a message to switch maintenance analysis and recovery strategies (SMARS) to inhibit or allow hardware checks.

61. SITADDRES (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) failed to set up its internal timing that is used to satisfy the switch integrity monitor's (SIM's) sanity timing requirements on AIM. AIM requests a DMERT level 1 initialization.

62. SITADDTSK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) failed to set up its internal timing that is used to time for the switch integrity monitor's (SIM's) acknowledgement of AIM's request for SIM to perform sanity timing on AIM. AIM requests a DMERT level 1 initialization.

63. SITINITFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received an indication from the switch integrity monitor (SIM) that AIM's request for SIM to perform a sanity timer function on AIM was denied. AIM requests a DMERT level 1 initialization.

64. SITINITTIMEOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) failed to receive an acknowledgement from the switch integrity monitor (SIM) to its request for SIM to perform sanity timing on AIM. AIM performs a DMERT level 1 initialization.

65. SITMRINACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The flag used for the SIholdtite() primitive was set, but no timer was active for the primitive. The flag was cleared.

66. SITMROVFLOW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The counter used for the SIholdtite() primitive was out of range. The counter was zeroed.

67. SITMSGBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) failed to get a DMERT message buffer for sending a message to the switch integrity monitor (SIM) to tell SIM to perform sanity timing on AIM. AIM requests a DMERT level 1 initialization.

68. SITMSGQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) failed to queue a DMERT message buffer when sending a message to the switch integrity monitor (SIM) to tell SIM to perform sanity timing on AIM. AIM requests a DMERT level 1 initialization.

69. SITPRMBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received failure from the alocmmsg() primitive when it tried to get a DMERT message buffer for sending a message to the switch integrity monitor (SIM) to tell SIM to print a processor recovery message (PRM).

70. SITPRMQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received failure from the queuem() primitive when it tried to queue a DMERT message buffer for sending a message to the switch integrity monitor (SIM) telling SIM to print a processor recovery message (PRM).

71. SITRESET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor (AIM) received failure when it tried to send its sanity event to the switch integrity monitor (SIM) using the sendevent() primitive. AIM performs a DMERT level 1 initialization.

72. SITTSKACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application integrity monitor's (AIM's) task timer encountered an active task that was marked as not active.

73. SITTSKTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A task timer block had an invalid task number in the task field. The application integrity monitor (AIM) uses task timers for internal timing, and the task field specifies the job being timed. One of the stack frame dumps contains the complete task timer block that was in error.

74. SIUNCONDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure of unconditional switch of AM sides.

Range: dama**1. AMVMFCMKP (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) verification of AMA records utility (VAMARU) *UNIX*® process failed to establish communication with the communication kernel process (CMKP). (Possible CMKP error) This process is re-started.

2. AMVMFCNPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) verification of AMA records utility (VAMARU) *UNIX*® process failed to connect to its message port. (DMERT error) This process is re-started.

3. AMVMFENMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the msgenab() function from the automatic message accounting (AMA) verification of AMA records utility (VAMARU) *UNIX*® process to enable message reception failed. (Possible DMERT error) This process is re-started.

4. AMVMFRCMKP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) verification of AMA records utility (VAMARU) *UNIX*® process could not receive a message from the communication kernel process (CMKP). (CMKP error) This process is re-started.

5. AMVMFSCMKP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) verification of AMA records utility (VAMARU) *UNIX*® process was unable to send a message to the communication kernel process (CMKP). (CMKP error). This process is re-started.

6. AMVMUNKMGTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) verification of AMA records utility (VAMARU) *UNIX*® process received an unrecognized message type. The sending process used an incorrect destination. The unrecognized message is ignored and valid message types are processed.

Range: das**1. EDLCPOPEN (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This problem occurred in the administrative services (AS) measurements external data link communications package (EDLCP) module. During the initialization phase of a read or write process, an attempt to open a channel on an equipped data link failed. This often occurs in labs when a data link is equipped, but the IH link is not assigned to that particular lab. The attempt to open a channel occurs in the main function of the ECreed() and ECwrite() functions.

Range: db**1. BADPRIMCNT (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value was found for the count of active generated key (GK) access method primitives currently operating on a GK relation.

2. DB2MNYFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Too many attempted transactions failed during an unprotected office-dependent data (UODD) growth.

3. DBAC0000 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager (DBM) detected an inconsistency or error condition. The DBM can always recover from these conditions. The error can be found in the stack trace; if additional information was available where the error occurred, it will be dumped through the assert handler.

4. DBAC0001 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database (DB) MEMMAN audit code detected a corrupted access dictionary entry or a corrupted head table in the office-dependent data (ODD). The dump contains the access dictionary entry or the head table that has the invalid blockid. An audit error report will follow the dump.

5. DBAC0007 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure or error condition was returned from an OSSENDMSG() macro call to the operating system for distributed switching (OSDS).

6. DBAC0008 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure or error condition was returned from an OSWGETMSG() macro call to the operating system for distributed switching (OSDS). If this problem occurred during an office-dependent data (ODD) backup, it may not be caused by an impacting problem; that is, it may be caused by a slow resource. If the ODD backup completes successfully, ignore this assert.

7. DBAC0009 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred in the backup code due to invalid system logic.

8. DBAC0010 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect reason (not OSRCREATE) was passed to a process when it was created.

9. DBAC0011 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager (DBM) could not fill the request for blocks of protected memory in the static office-dependent data (ODD). The block ID for the request that could not be filled is dumped. Stop all recent changes and call the product engineering control center (PECC) for the proper ODD growth procedures.

10. DBAC0012 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OPNDC	Audit Mode: elev

Problem:

The database manager (DBM) ran out of open relation blocks (dbopndict). The OPNDC audit is scheduled.

11. DBAC0013 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager (DBM) ran out of access dictionary blocks. All transactions were purged and run-time dictionaries were re-initialized.

12. DBAC0014 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TRNDC	Audit Mode: elev

Problem:

The database manager (DBM) ran out of transaction blocks. The TRNDC audit is scheduled.

13. DBAC0015 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager (DBM) detected an inconsistency in a data page of a hashed relation. The tuple status bitmap indicated that the tuple slot ID was empty, but the first short of the tuple was not 0xffff. The sequential cursor and 200 bytes of the data page will be dumped.

14. DBAC0016 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The default case on a switch statement was encountered. If this problem resulted from a message, the message will be dumped.

15. DBAC0017 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBNO_MATCH) was sent to the user.

16. DBAC0018 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBSYS_ERR) was sent to the user.

17. DBAC0019 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBDUP_KEY) was sent to the user.

18. DBAC0020 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBIN_TRAN) was sent to the user.

19. DBAC0021 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBREL_FULL) was sent to the user.

20. DBAC0022 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (anything but DBEOR) was sent to the user.

21. DBAC0023 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBTRANID_BAD) was sent to the user.

22. DBAC0024 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBRELDESC_BAD) was sent to the user.

23. DBAC0025 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBATTR_BAD) was sent to the user.

24. DBAC0026 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBPOS_UNDEF) was sent to the user.

25. DBAC0027 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBKEY_BAD) was sent to the user.

26. DBAC0028 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBGATYP_FAIL) was received from the DBgattyp() function.

27. DBAC0029 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBFLAG_BAD) was sent to the user.

28. DBAC0030 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBMODE_BAD) was sent to the user.

29. DBAC0031 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBREL_UND) was sent to the user.

30. DBAC0032 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBREL_LOCKED) was sent to the user.

31. DBAC0033 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBTRG_ERR) was sent to the user.

32. DBAC0034 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBNUMREL_BAD) was sent to the user.

33. DBAC0035 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBRELNOEXIST) was sent to the user.

34. DBAC0036 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBNOSUPPORT) was sent to the user.

35. DBAC0037 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBRELNAME_BAD) was sent to the user.

36. DBAC0038 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBVWNAME_BAD) was sent to the user.

37. DBAC0039 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBPCRID_BAD) was sent to the user.

38. DBAC0040 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBPCR_UNKNOWN) was sent to the user.

39. DBAC0041 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBOEMP_REL) was sent to the user.

40. DBAC0042 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBCOPY_BAD) was sent to the user. Failed to copy a buffer to memory.

41. DBAC0043 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to copy data that was not a word size. The error return code was DBCOPY_SIZE.

42. DBAC0044 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The access to the dynamic relation index array was incorrect. The error return code was DBDRLX_FAIL.

43. DBAC0045 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The incorrect entry in the relation index was accessed. The error return code was DBRLX_FAIL.

44. DBAC0047 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful retrieve code (DBbRETRIEVE_FAIL) was received from the DBb_retrieve() function. Failed to retrieve a data block.

45. DBAC0048 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBbTOUCH_FAIL) was received from the DBb_touch() function. Failed to touch a memory page or block.

46. DBAC0049 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBDTCMP_2) was received. The byte size was wrong.

47. DBAC0050 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBDTCMP_3) was received. The bit size was wrong.

48. DBAC0051 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. The bit offset was wrong.

49. DBAC0052 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBDTCMP_5) was received. The value of the bits and the offset was wrong.

50. DBAC0053 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received from the DBb_seize() function.

51. DBAC0054 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation ID was not successfully returned. The return code was DBRID_BAD.

52. DBAC0055 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBSTATIN) was received.

53. DBAC0056 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received from DBSTATDL.

54. DBAC0057 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBAID_BAD) was received. An attribute ID in a dictionary was invalid.

55. DBAC0058 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBDID_BAD) was received. A domain ID in a dictionary was invalid.

56. DBAC0059 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBENID_BAD) was received. An enumeration ID in a dictionary was invalid.

57. DBAC0060 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBSID_BAD) was received. A sub-attribute ID in a dictionary was invalid.

58. DBAC0061 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The max.description count was wrong. The error return code was DBGKEY_2.

59. DBAC0062 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid attribute pointer was encountered. The error return code was DBGKEY_3.

60. DBAC0063 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBGKEY_4) was received. Too many attribute items were encountered.

61. DBAC0064 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A sub-attribute pointer was invalid. The error return code was DBGKEY_5.

62. DBAC0065 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A sub-attribute domain pointer was invalid. The error return code was DBGKEY_6.

63. DBAC0066 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update a dynamic access (DA) head table in a DAuphdtbl() function call. The error return code was DBHDTBL_FAIL.

64. DBAC0067 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBINDUP_FAIL) was received from the DBindup() function. Failed to duplicate a data page when necessary.

65. DBAC0068 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBINGARB_FAIL) was received from the DBingarb() function. Failed to collect "garbage".

66. DBAC0069 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to call the DBinrnx() function was unsuccessful. Failed to obtain an index dictionary entry while executing DBinrnx(). The return is NULL. DBINRNXT_FAIL.

67. DBAC0070 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access a data block. An attempt to call the DBincup() function was unsuccessful. The error return code was DBINCUP_FAIL.

68. DBAC0071 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to call the DBinbladd() function was unsuccessful. Failed to create a head block. The error return code was DBINBLADD_FAIL.

69. DBAC0072 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unsuccessful attempt in DBinfind to establish index level in DBingindex. DBINFIND_FAIL.

70. DBAC0073 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful message was received from the OSCREATE() macro for a reason.

71. DBAC0074 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of data pages was too large for the head table size. The error return code was DBNPAG_SIZE.

72. DBAC0075 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple page size <= dbmaxhsh DB_GCD.

73. DBAC0076 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBFAMIN_FAIL) was received from the DBfamin() function.

74. DBAC0077 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid ID for an SM was received. The error return code was DBIMIN_BAD.

75. DBAC0078 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBFAMD_L_FAIL) was received from the DBfamdl() function.

76. DBAC0079 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBRMFTUP_FAIL) was received from the DBrmftup() function. A tuple was not removed.

77. DBAC0080 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBFAMUP_FAIL) was received from the DBfamup() function.

78. DBAC0081 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Specifies that the maximum time elapsed OSTEIMEOUT.

79. DBAC0082 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The byte offset for a variable tuple on the fixed data page in the RLRC_OEINFO relation was out of range. This was

probably caused by corruption in the office-dependent data (ODD).

80. DBAC0083 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid condition was encountered, the maximum time was out of range, or no time and no condition were specified. The error return code from the OSWGETFROM() or OSSENDMSG() macro was OSERANGE.

81. DBAC0084 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The variable page index on a fixed data page of the RLRC_OEINFO relation was out of range. This is probably caused by corruption in the office-dependent data (ODD).

82. DBAC0085 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The complete message did not fit in (*msg).text and was truncated to (*msg).msghead.length. OSELENGTH.

83. DBAC0086 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message of the specified type was not available. The error return code was OSEMSG.

84. DBAC0087 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unsuccessful return of current process PID OSGETPID.

85. DBAC0089 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid target destroyed the current process. The error return code is OSEPROC.

86. DBAC0090 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The length field in an rIRC_OEINFO tuple was out of range. This is probably caused by corruption in the office-dependent data (ODD).

87. DBAC0091 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A forward linkage on a fixed data page in the RLRC_OEINFO relation was out of range. This is probably caused by office-dependent data (ODD) corruption. This assert only fires during a variable data page compaction.

88. DBAC0092 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid program ID was encountered. The error return code was OSEPROG.

89. DBAC0093 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBAMCLR) was received from the DBamclr() function.

90. DBAC0094 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unsuccessful union structure information was returned. The error return code was (DBUNION_FAIL).

91. DBAC0095 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to retrieve an operating system process ID (OSPID) was unsuccessful. The error return code was DBTRNPID_FAIL.

92. DBAC0096 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to get an attribute description was unsuccessful. The error return code was (DBGATD_FAIL).

93. DBAC0097 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBPREBGN_FAIL) was received.

94. DBAC0098 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A parameter of a range check was invalid. The error return code was DBPARID_FAIL.

95. DBAC0099 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unsuccessful return code for the local pair of DBbgnloc. DBBGNLOC_FAIL.

96. DBAC0100 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBPOSTBGN_FAIL) was received from the DBpostbgn() function.

97. DBAC0101 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No transaction waiting to commit on case COMMITTING. DBCOMMIT_1.

98. DBAC0102 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No current beginners on case COMMITTING. DBCOMMIT_2.

99. DBAC0103 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No relation was waiting to begin. The error return code was DBNO_BEGIN.

100. DBAC0104 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No transactions waiting to commit on case BEGINNING. DBBEG_1.

101. DBAC0105 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

At least one current beginners on case BEGINNING. DBBEG_2.

102. DBAC0106 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No waiting beginners on case BEGINNING. DBBEG_3.

103. DBAC0107 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Return is STABLE (rptr_status = STABLE). DBSTABLE.

104. DBAC0108 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No transaction waiting to commit on case STABLE. DBSTAB_1.

105. DBAC0109 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No current beginners on case STABLE. DBSTAB_2.

106. DBAC0110 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No waiting beginner on CASE STABLE. DBSTAB_3.

107. DBAC0111 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The status selected by RPTR was not COMMITTING. The error return code was DBNOCMT.

108. DBAC0112 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The wcommitr selected by RPTR was not NULL. The error return code was DBNONULL.

109. DBAC0113 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBOSEQPID) was received. Check for transaction abort.

110. DBAC0114 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trn_tid variable from the DBdeqtid() function was incorrect. The error return code was DBTRNTID_FAIL.

111. DBAC0115 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBPRCMT_FAIL) was received while attempting to lock for a remote update.

112. DBAC0116 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBPSTCMT_FAIL) was received while attempting to unlock after a remote update.

113. DBAC0117 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A code check failed to confirm that a parameter resides on processor. The error return code was DBPARDICT.

114. DBAC0118 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unsuccessful return code if RC_LOC fails. DBRC_LOC.

115. DBAC0119 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unsuccessful return code if RC_RMT fails. DBRC_RMT.

116. DBAC0120 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBFAMRD) was received from the DBfamvd() function.

117. DBAC0121 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBHSHRD) was received from the DBhshrd() function.

118. DBAC0122 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBHSHOPN) was received from the DBhshopen() function.

119. DBAC0124 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBSQOPEN) was received from the DBsqopen() function.

120. DBAC0125 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBINOPEN) was received from the DBinopen() function.

121. DBAC0126 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBINRD) was received from the DBinrd() function.

122. DBAC0128 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBOPNLOC) was received from the DBopnloc() function.

123. DBAC0129 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBDDREAD) was received from the DBddread() function.

124. DBAC0130 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The index was too large. The error return code was DBIDX_BUF.

125. DBAC0131 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBDTCMP) was received from the DBdccmp() function.

126. DBAC0132 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBAMUP) was received from the DBamup() function.

127. DBAC0133 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBCLOLOC) was received from the DBcloloc() function.

128. DBAC0134 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A range check of array indices returned failure. The error return code was DBTIDQ_FAIL.

129. DBAC0135 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A queue had only one element, but the dictionary entry did not equal the head. The error return code was DBTIDQ_1.

130. DBAC0136 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code (DBSWBACC) was received from the DBswbacc() function. The access dictionary address failed on the DBb_retrieve() function.

131. DBAC0137 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A memory failure occurred on a retrieve block in the DBdyinit() function. The error return code was DBHDC_FAIL.

132. DBAC0138 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid selector ID (SELID) index into the selector descriptor dictionary was encountered in the DBselvw() or DBnxtva() function. The error return code was DBSELID_BAD.

133. DBAC0139 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBselvw() or DBnxtvtr() function found invalid entries in the descriptor dictionary in the DBget_btup() function. The length on bit offset may be incorrect. The error return code was DBGET_BAD.

134. DBAC0140 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBseluw() or DBnxtvw() function could not find any free entries in the selector dictionary. The error return code was DBSYS_ERR.

135. DBAC0141 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The tuple size was too large for the buffer. The return error code was DBBADTUP_SZ.

136. DBAC0142 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBhashup() function returned failure (DBHASHUP_FAIL).

137. DBAC0143 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMoutmsg() returned failure to the database (DB) craft interface code.

138. DBAC0144 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return (DBSYS_FAIL) was received from the DBsys() function.

139. DBAC0145 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the DBremtrn() function, the cmdntag variable did not contain the expected value. It should have been DBBGNTRN.

140. DBAC0146 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBremtrn() function received failure from the DBlocal() function.

141. DBAC0147 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn default on MGDBDDDES switch in DBremtrn.c.

142. DBAC0148 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn default on MGDBFFN switch in DBremtrn.c.

143. DBAC0149 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn default switch in case MGDBDDEND; cmdntag should be either DBCMT or DBUNCMT, but is not; in DBremtrn.c.

144. DBAC0150 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBremtrn() function variable cmdntag that was received from the DBendtrn() function should have been DBTRNEND, but it was not.

145. DBAC0151 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim default case of OSSENDMSG in DBsys.c from function DBsysim.

146. DBAC0152 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim default case of OSSENDMSG in DBsys.c from function DBsysim.

147. DBAC0153 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn unsuccessful return from DBlocal in case MGDBDDDES from DBremtrn.c.

148. DBAC0154 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn unsuccessful return from DBlocal in case MGDBFFN from DBremtrn.c.

149. DBAC0155 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn unsuccessful return from DBlocal in case MGDBREORG from DBremtrn.c.

150. DBAC0156 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn unsuccessful return from DBlocal in case MGDBREORG when msg.text.dbreorg.relds2 > 0 in file DBremtrn.c.

151. DBAC0157 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn switch default in OSSENDMSG; failure to send response to SM in DBremtrn.c.

152. DBAC0158 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn default on switch of stimuli in DBremtrn; unexpected stimulus. Stimulus should be either WAKEUP or MSG, but is neither.

153. DBAC0159 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn default of switch of the begin/open message OSWGETMSG in DBremtrn.

154. DBAC0160 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn switch default in OSWGETMSG in DBRDNXT2; failure to receive second part of message in DBremtrn.c.

155. DBAC0161 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn switch default of OSWGETMSG in case OSMMSG of switch OSWAIT|OSWAKE1 in DBremtrn.c.

156. DBAC0162 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBim_send default case of OSSENDMSG in DBim_msgs.c from function DBim_send.

157. DBAC0163 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn switch default in OSWGETMSG in DBRDFST2; failure to receive second part of message in DBremtrn.c.

158. DBAC0164 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBim_msgs() function received an unexpected message type from the DBim_send() function. The return error code was DBSYS_ERR.

159. DBAC0165 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn switch default in OSWGETMSG in DBRDCHK2; failure to receive second part of message in DBremtrn.c.

160. DBAC0166 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBim_rec default case of OSWGETMSG in DBim_msgs.c from function DBim_rec DBLOST_MSG.

161. DBAC0167 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBim_msgs() function received an unexpected message type from the DBim_rec() function. The error return code was DBSYS_ERR.

162. DBAC0168 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn switch default in OSSENDMSG ; failure to send response to IM in DBremtrn.c.

163. DBAC0169 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBpdltp default case of OSSENDMSG in DBp_prims.c from function DBpdltp.

164. DBAC0170 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBam_rec default case of OSWGETFROM in DBam_msgs.c from function DBam_rec DBLOST_MSG.

165. DBAC0171 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBp_prims() function received an unexpected message type from the DBpdltp() function. The error return code was BADMSG_TYPE.

166. DBAC0172 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global database (DB) transaction manager received an unexpected message type or a message with unexpected contents.

167. DBAC0173 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBpdltp, DBpintup, DBptdltp or DBptintup default of OSWGETTYPE totally unexpected, cannot wait in DBp_prims.c from function DBpdltp, DBpintup, DBptdltp or DBptintup OSMSGBUG.

168. DBAC0174 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBam_send default case of OSSENDMSG in DBam_msgs.c from function DBam_send.

169. DBAC0175 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBpintup, DBpdtltup, DBptintup or DBptuptup inconsistency in database in DBp_prims.c from function DBpintup, DBpdtltup, DBptintup DBptuptup.

170. DBAC0176 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBpdtltup, DBpintup, DBpuptup, DBpdtltup, DBptintup or DBptuptup inconsistency in database in DBp_prims.c from function DBpdtltup, DBpintup, DBpuptup, DBpdtltup, DBptintup or DBptuptup.

171. DBAC0177 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdfst default case of OSSENDMSG in DBp_prims.c from function DBprdfst.

172. DBAC0178 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdfst default case of OSSENDMSG in DBp_prims.c from function DBprdfst.

173. DBAC0179 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBp_prims() function received an unexpected message type from the DBprdfst() function. The return error code was BADMSG_TYPE.

174. DBAC0180 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdfst unexpected message type from DBp_prims.c from function DBprdfst BADMSG_TYPE.

175. DBAC0181 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdfst, DBprdnxt or DBprdchk attrname is too long in DBp_prims.c from function DBprdfst, DBprdnxt or DBprdchk.

176. DBAC0182 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdnxt default case of OSSENDMSG in DBp_prims.c from function DBprdnxt.

177. DBAC0183 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdnxt default case of OSSENDMSG in DBp_prims.c from function DBprdnxt.

178. DBAC0184 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdnxt unexpected message type from DBp_prims.c from function DBprdnxt BADMSG_TYPE.

179. DBAC0185 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBp_prims() function received an unexpected message type from the DBprdnxt() function. The error return code was BADMSG_TYPE.

180. DBAC0186 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBam_send default case of OSSENDMSG in DBam_msgs.c from function DBam_send.

181. DBAC0187 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBp_prims() function received an unexpected message type from the DBprdtup() or DBprdchk() function. The error return code was BADMSG_TYPE.

182. DBAC0188 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBrmftup DBNO_MATCH for DBFRDTUP case in DBrmftup.c from function DBrmftup.

183. DBAC0189 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBpuptup default case of OSWGETFROM in DBp_prims.c from function DBpuptup. DBLOST_MSG.

184. DBAC0190 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBp_prims() function received an unexpected message type from the DBpuptup() function. The error return code was BADMSG_TYPE.

185. DBAC0191 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBpuptup or DBptuptup default from OSWGETTYPE; msg has been lost in DBp_prims.c function DBpuptup or DBptuptup.

186. DBAC0192 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdchk default case of OSSENDMSG in DBp_prims.c from function DBprdchk.

187. DBAC0193 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdchk unexpected message type from DBp_prims.c from function DBprdchk BADMSG_TYPE.

188. DBAC0194 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBprdchk default case of OSSENDMSG in DBp_prims.c from function DBprdchk.

189. DBAC0195 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBrmftup default case of read failure in DBrmftup.c from function DBrmftup.

190. DBAC0196 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBremtrn OSTEIMEOUT in case OSMSG of DBremtrn.c.

191. DBAC0197 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
DBremtrn OSTYPEOUT in case OSWGETMSG of DBremtrn.c.

192. DBAC0200 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:
Processes running transactions were purged as a result of a dynamic access (DA) linkage failure or the CLR:TRN command.

193. DBAC0201 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The DBuncommit() function failed at a point where the office-dependent data (ODD) may have been corrupted.

194. DBAC0202 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A linkage failure occurred while trying to access one of the five database (DB) transaction dictionaries. Usually, the DBzapalltrans() function is called.

195. DBAC0203 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A valid relation was missing from the office-dependent data (ODD) access dictionary. The dictionary may have been corrupted or built incorrectly.

Action:
If the system is being retrofitted, STOP THE RETROFIT and obtain a rebuilt ODD. Otherwise, call the product engineering control center (PECC) for assistance.

196. DBAC0204 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Transaction data could not be initialized.

Action:
If the system is being retrofitted, STOP THE RETROFIT and obtain a new load. Otherwise, call the product engineering control center (PECC) for assistance.

197. DBAC0205 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Open relation data could not be initialized.

Action:

If the system is being retrofitted, STOP THE RETROFIT and obtain a new load. Otherwise, call the product engineering control center (PECC) for assistance.

198. DBAC0207 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data could not be initialized.

Action:

If the system is being retrofitted, STOP THE RETROFIT and obtain a new load. Otherwise, call the product engineering control center (PECC) for assistance.

199. DBAC0208 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBretrvblk() function failed when it was called from the DBinaccdict() function.

200. DBAC0209 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office-dependent data (ODD) access dictionary appears corrupted. The relation dictionary data could not be initialized.

Action:

If the system is being retrofitted, STOP THE RETROFIT and obtain a rebuilt ODD. Otherwise, call the product engineering control center (PECC) for assistance.

201. DBAC0210 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office-dependent data (ODD) access dictionary appears corrupted. A block ID was not zero and did not fall within the ODD.

Action:

If the system is being retrofitted, STOP THE RETROFIT and obtain a rebuilt ODD. Otherwise, call the product engineering control center (PECC) for assistance.

202. DBAC0211 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The following office parameters may be invalid: DBPRBLOCKS, DBACTBLKS, DBPHYSBLKS, DBDISKBLKS, DBDACTBLKS, and DBDPHYSBLKS.

DBPRBLOCKS, DBACTBLKS, and DBPHYSBLKS should be divisible by 32. Others should be divisible by 4. This indicates that the office dependent data (ODD) was corrupted.

Action:

STOP ALL ACTIONS and contact the product engineering control center (PECC) for assistance.

203. DBAC0212 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBPRBLOCKS and/or DBUNBLOCKS office parameters may be corrupted. The sum of the parameters should be less than 32769. This indicates that the office-dependent data (ODD) was corrupted.

Action:

STOP the retrofit or initialization. Call the product engineering control center (PECC) for assistance.

204. DBAC0213 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office-dependent data (ODD) starting address (DBPRDB) appears corrupted. It should be divisible by 0x200. This indicates that the ODD was corrupted.

Action:

STOP ALL ACTIONS. Call the product engineering control center (PECC) for assistance.

205. DBAC0214 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBPRBLOCKS, DBPHYSBLKS, DBACTBLKS, DBDACTBLKS, DBDPHYSBLKS, or DBDISKBLKS office parameter appears corrupted.

DBACTBLKS should be less than or equal to DBPHYSBLKS and greater than zero. DBDACTBLKS should be less than DBDPHYSBLKS and greater than zero. DBDPHYSBLKS should be less than DBDISKBLKS.

The office-dependent data (ODD) may have been corrupted, and may have to be rebuilt.

Action:

STOP ALL ACTIONS. Contact the product engineering control center (PECC) for assistance.

206. DBAC0215 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBUNBLOCKS office parameter appears corrupted. It must be greater than zero. This indicates that the office-dependent data (ODD) was corrupted.

Action:

STOP ALL ACTIONS. Contact the product engineering control center (PECC) for assistance.

207. DBAC0219 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Default case on switch statement. The database manager (DBM) cannot interpret the message type.

208. DBAC0226 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When a database (DB) disk read or write function fails, the DBdldinchk() function attempts to get the partition number from the file manager. DBdldinchk() failed to get a response. The disk driver and file manager were not functioning normally.

209. DBAC0227 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database (DB) software demand paging (SDP) assert. Disk block ID is out of range. This means that disk block ID passed to one of the sdp functions (DBb_retrieve, DBb_touch, DBb_free, DBb_readasy, and DBb_checkasy) is bad, or the disk block ID field in an entry of buffer control table is corrupted.

210. DBAC0228 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) software demand paging (SDP) problem indicated that a disk partition for storing a disk relation was full and beyond the growth limit.

211. DBAC0229 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) software demand paging (SDP) problem indicated that the paging buffer for disk relations was full. No buffer blocks are in the idle list, or no buffer blocks are in the release list.

212. DBAC0230 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BFDATA	Audit Mode: elev

Problem:

The database (DB) software demand paging (SDP) problem indicates that the paging control table, RLdb_bfdat[], was corrupted.

213. DBAC0231 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In database (DB) software demand paging (SDP), an invalid pointer to a transaction dictionary was detected.

214. DBAC0232 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TRNDC	Audit Mode: elev

Problem:

In database (DB) software demand paging (SDP), a corrupted transaction dictionary was detected.

215. DBAC0233 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A customer originated recent change (CORC) processing call to the DBfrdtup() function failed while trying to read the current tuple before updating.

216. DBAC0234 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Customer originated recent change (CORC) processing of an attribute level update found an invalid attribute type.

217. DBAC0235 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A customer originated recent change (CORC) processing call to the DBfuptup() function failed while trying to update the given tuple.

218. DBAC0236 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A linkage failure occurred when looping through the open dictionary entries for a transaction or freeing the lock set memory (tuple level locking).

219. DBAC0237 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation identifier was passed to customer originated recent change (CORC) processing.

220. DBAC0238 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the address of the lock set (tuple level locking) from the relation queue. The DBgethead() function was called from the DBgetlockset() function.

221. DBAC0239 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid time parameter was passed to the DBgetmem() function.

222. DBAC0240 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to find the given block ID or all entries were used when searching the DBmemlock[] array.

223. DBAC0241 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range address was passed to the DBfreemem() function.

224. DBAC0243 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The tuple size exceeded the allowed size for a simple customer originated recent change (CORC).

225. DBAC0244 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Customer originated recent change (CORC) processing of an attribute level update found a bit field that crossed the word boundary (32 bits).

226. DBAC0245 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Customer originated recent change (CORC) processing of an attribute level update found a character field that was less than or equal to zero.

227. DBAC0246 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In database (DB) software demand paging (SDP), an asynchronous write to disk failed during a DBb_doflush() function call.

228. DBAC0247 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In database (DB) software demand paging (SDP), a check of the status of an asynchronous write to disk failed during a DBb_ckflush() function call.

229. DBAC0248 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In database (DB) software demand paging (SDP), an asynchronous read from disk failed during a DBb_readasy() function call.

230. DBAC0249 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In database (DB) software demand paging (SDP), a check of the status of an asynchronous read from disk failed during a DBb_checkasy() function call.

231. DBAC0258 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TRNDC	Audit Mode: elev

Problem:

A database manager (DBM) or transaction process was purged and the TRNDC audit was scheduled to clean up the DBM control structures.

232. DBAC0259 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid *tupcnt_ptr parameter (number of tuples to operate on) was passed to a database (DB) tuple set primitive. The caller must pass a positive number of tuples to operate on.

233. DBAC0260 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

not applicable

234. DBAC0282 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Standby CMP is not available for office-dependent data (ODD) backup because communication path to the CMP is down (possibly due to a mixed CM vintage e.g. CM1 to CM2 conversion). CMP is most likely operational but has lost communication. No craft intervention is required, and the backup will complete successfully.

235. DBAC0283 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was received. Message type MGDBRSP was expected.

236. DBAC0284 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was received. Message type MGDBGCORC or MGDBXGCORC was expected.

237. DBAC0285 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was received. Message type MGDBXGCCMND was expected.

238. DBAC0286 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBgethead() or DBgetsucc() function returned an unexpected error code while accessing entries from the RLDBGDPIDL relation.

239. DBAC0287 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The customer originated recent change (CORC) log buffer contained invalid data. In the AM and SM, CORC logging buffers log a CORC temporarily before it is written to disk.

240. DBAC0288 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The customer originated recent change (CORC) logging buffer was shipped from an SM to the AM through messages. The data messages were not handled correctly; that is, the CORC message count was mismatched.

241. DBAC0289 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The customer originated recent change (CORC) logging buffer was shipped from an SM to the AM. An invalid CORC logging command message was received, DBBUFCOMP was expected.

242. DBAC0290 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGDBHS has new_pid.procno less than 0 in DBsys.c from function DBsysim.

243. DBAC0291 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGBK01 has new_pid.procno less than 0 in DBsys.c from function DBsysim.

244. DBAC0292 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGBKIM has new_pid.procno less than 0 in DBsys.c from function DBsysim.

245. DBAC0293 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGGODD has new_pid.procno less than 0 in DBsys.c from function DBsysim.

246. DBAC0294 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGDBRT has new_pid.procno less than 0 in DBsys.c from function DBsysim.

247. DBAC0295 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGDBRT has new_pid.procno less than 0 in DBsys.c from function DBsysim.

248. DBAC0296 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBcmsys OSCREATE of GLPGCRF1 has new_pid.procno less than 0 from function DBcmsys.

249. DBAC0297 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGCFR2 has new_pid.procno less than 0 in DBsys.c from function DBsysim.

250. DBAC0298 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim default case of OSSENDMSG in DBsys.c from function DBsysim.

251. DBAC0299 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim default case of OSSENDMSG in DBsys.c from function DBsysim.

252. DBAC0302 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim default case of OSSENDMSG in DBsys.c from function DBsysim.

253. DBAC0303 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim default case on switch statement in DBsys.c from function DBsysim.

254. DBAC0304 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim default case on switch statement in DBsys.c from function DBsysim.

255. DBAC0305 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim read or update of gparm not successful in DBsys.c from function DBsysim.

256. DBAC0306 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation storage class was found in the rel_stgcls field of the access dictionary.

257. DBAC0307 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the part tuple size (vtup_size) variable could not be stored in a char, which is the size of the field used to store vtup_size.

258. DBAC0308 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the tuples per page (tpag) variable was greater than the allowed size for relations with a storage class other than DBORIGLEN. This value must be less than or equal to DBLINKSIZE because the tup num value for a tuple becomes the link value in the linked list of all tuples on a single variable data page.

259. DBAC0309 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The possible range of values for the byte offset of a tuple on a variable data page exceeded the value which can be stored in the byte offset field in the fixed part tuple. The highest value allowed is DBBOFFSIZE.

260. DBAC0310 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the rel_vdpnum variable (number of variable data pages) was too big to fit in the vpage index field. This field size is DBVDPSIZE.

261. DBAC0311 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A boundary was exceeded in the database (DB) storage class code.

262. DBAC0312 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When a global customer originated recent change (CORC) failed, the backout of changes to other copies of the data failed. CORC data may be inconsistent across processors.

263. DBAC0325 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrfmain() function received a failure from the OSSENDMSG() macro call or the wrong data was returned. In either event, rollforward cannot continue. The message containing the incorrect data is dumped.

264. DBAC0326 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the DBrfmain() function, the OSWGETTYPE() macro returned the wrong data. The message will be dumped.

265. DBAC0327 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the DBrfmain() function, errors were found in the data returned from the OSWGETMSG() macro. The invalid data will be dumped.

266. DBAC0367 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write a data delivery (DD) value.

267. DBAC0375 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGRLFD has new_pid.procno less than 0 in DBsys.c from function DBSysim. This is the terminal process in the SM responsible for handling roll forward. Indicates that resources are not available to create the terminal process so try again later.

268. DBAC0379 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBsmrlfrwd() function (the SM terminal process for handling roll forward) received failure or invalid data from a call to the OSSENDMSG() macro. The roll forward cannot continue. The message that caused the problem is dumped.

269. DBAC0380 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBsmrlfrwd() function (the SM terminal process for handling roll forward of an SM) received a value other than OSMSG from the OSWGETTYPE() macro. The message is dumped to the receive only printer (ROP).

270. DBAC0381 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While the DBrfmain() function (the system process for handling roll forward) was rolling forward an SM, the protocol for sending the log data from the AM to the SM detected a problem in the sliding window protocol. The window being acknowledged was not the one being sent. Roll forward cannot continue because of potentially corrupted log data.

271. DBAC0383 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBquetrn() function received an invalid transaction ID.

272. DBAC0384 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBquetrn() function received an invalid message.

273. DBAC0385 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBquetrn() function received an invalid signal from the operating system for distributed switching (OSDS).

274. DBAC0386 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid linkage was found in the database (DB) cache.

275. DBAC0387 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A user tried to delete a tuple through the DBxdltp() function after accessing more than DBNUMLST other tuples before calling it. Could not find the tuple to delete.

276. DBAC0388 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

General queuing error found in relq.

277. DBAC0389 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry was detected in the queuing tables.

278. DBAC0397 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure or error condition was returned from an OSSENDMSG() macro call to the operating system for distributed switching (OSDS) in the CMP for logging messages.

279. DBAC0398 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure or error condition was returned from an OSWGETMSG() macro call to the operating system for distributed switching (OSDS) in the CMP for logging messages.

280. DBAC0400 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrfspmain() function (the rollforward system process) could not get the shared segment requested after calling the DBgetseg() function. Either the logging segment and rollforward segment (LGSG) or the rollforward segment (RFSG) was requested. The rollforward aborted.

Action:

Try entering the EXC:ODDRCVY=ALL,n message, where n is AM or SM=x (x is the SM number being recovered). This will restart the process and the DBgetseg() function call should succeed. See the Input Messages Manual for more information on the EXC:ODDRCVY message.

281. DBAC0401 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logging process received the wrong message ID.

282. DBAC0402 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure or error condition was returned from an OSSENDMSG() macro call to the standby CMP for logging

messages.

283. DBAC0403 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message sent to switch maintenance (SM) failed. This message notifies switch maintenance of the standby CMP rollforward failure. In the DBunxlgar() function, a sendpw() function call to port PT_SMKP failed. In the lgsds() function, an OSSENDMSG() macro call to PIPSMER(SMKP) failed.

Action:

Restart the standby CMP rollforward. If rollforward continues to fail, request a soft switch of the CMP pair.

284. DBAC0404 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function returned a value other than SMDBOK. The physical ID was not received for the requested CMP.

285. DBAC0405 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBrfspsmain() OSCREATE of GLPGAMRF has a new_pid.procno less than 0. This is the AM roll forward terminal process used for applying the AM logfile to the AM in-core memory.

286. DBAC0406 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An OSSENDPHY() macro call returned a failure or invalid data. This call is used in the DBrfspsmain() function to send to the active or standby CMP for rollforward.

287. DBAC0407 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned a failure or invalid data from a call in the CMP or SM rollforward code.

288. DBAC0408 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETTYPE() macro returned a value other than OSMSG in the CMP or SM rollforward code.

289. DBAC0409 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBpiprfsp() OSCREATE of GLPGRFWD has new_pid.prono less than 0 in DBrfsys.c. This is the terminal process in the CMP responsible for handling roll forward.

290. DBAC0410 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBpiprfsp() function (the rollforward system process in the CMP) received a message from soft switch with an action type other than SMACSTOP.

291. DBAC0411 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBrdgparm() function failed in the DBpiprfsp() function. This call attempted to read the active CMP values for the Glrcstart or Glcorstart global parameters. Possibly, a read failure occurred due to a CMP hard switch.

292. DBAC0412 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An OSSENDMSG() macro call from the DBhndlmsg() function returned an unsuccessful value when sending to *UNIX*[®].

293. DBAC0413 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from a sendpw() function call in the DBcmpchk() function.

294. DBAC0414 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from a sendpw() function call while sending a message to switch maintenance to abort a standby CMP roll forward. Since the call failed, the standby should be removed from service until the problem can be corrected. Possible solutions are to soft switch or pump.

295. DBAC0415 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned a failure or invalid data while sending to *UNIX*[®] from the DBrfchk() function in the DBlgosds() function.

296. DBAC0418 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was received in the DBhndlmsg() function.

297. DBAC0422 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DBhndlmsg() function call from the DBrfspmain() function returned something other than GLSUCCESS due to an invalid message type or a get segment failure.

298. DBAC0423 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from the DBreqcntl() function was something other than GLSUCCESS. The requesting SM or CMP could not get control of the AM roll forward process. Roll forward must be restarted.

299. DBAC0424 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple cache commit timed out during the second phase commit. The commit continues, but it may cause a corrupted tuple in the office dependent data (ODD). The cache block and the tuple block are dumped. Use this information to verify and/or correct the tuple in question.

300. DBAC0425 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found in rollforward control. The rollforward process tried to complete before all of the logfile had been applied.

301. DBAC0426 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBlbgntn() function or the DBxbgntn() function from the rollforward function DBrftnbg() returned something other than GLSUCCESS. Check the error log for the appropriate module to identify the failure.

302. DBAC0427 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBgincdec() function or the DBincdec() function from the rollforward function DBrftup() returned something other than GLSUCCESS. Check the error log for the appropriate module to determine the failure.

303. DBAC0428 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBltintup(), DBtintup(), or DBxtintup() function from the rollforward function DBrftup() returned

something other than GLSUCCESS. Check the error log for the appropriate module to determine the failure.

304. DBAC0429 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBltuptup(), DBtuptup(), or DBxtuptup() function from the rollforward function DBrftup() returned something other than GLSUCCESS. Check the error log for the appropriate module to determine the failure.

305. DBAC0430 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBDBltidup(), DBtdltup(), or DBxtidup() function from the rollforward function DBrftup() returned something other than GLSUCCESS. Check the error log for the appropriate module to determine the failure.

306. DBAC0431 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBlendtrn() function or the DBendtrn() function from the rollforward process returned something other than GLSUCCESS. Check the error log for the appropriate module to determine the failure.

307. DBAC0432 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return from the DBrfchk() function was not GLSUCCESS. A message from a processor had the wrong rollforward ID (DBrfid). An abort message was sent to the sending processor. Any *UNIX*[®] processes will time out and the rollforward must be restarted.

308. DBAC0461 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office-dependent data (ODD) error was received while trying to call the DBincdec() function during roll forward. The error will be dumped to the error log. The Glrcstart global parameter and the tuple header will be dumped to the ROP. Manual recovery is needed to increment or decrement the needed attribute, if that is desired.

309. DBAC0462 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid function ID was encountered in roll forward. Either the logfile was corrupted or the pointer into the logfile was invalid. The pointer in the Glrcstart global parameter and the tuple header will be dumped. The data may also be dumped to the error log if the logfile was not completely corrupted.

310. DBAC0463 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation level lock transaction deferred garbage collection queue overflowed. A resource error was returned; however, this also indicates faulty logic.

311. DBAC0464 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid use of a relation's access dictionary was found. The code expected a certain access type, but a logic error occurred when an access dictionary entry with an unexpected access type was used.

312. DBAC0499 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The incore customer originated recent change (CORC) buffer was corrupted.

Data Structures:

The output message contains the following information:

- Logging buffer ID (BUFID)
- Logging buffer starting address (BUFADDR)
- CORC size (CORCSIZE)
- Time of day (TOD)
- Day that the CORC was written to the buffer (DAY)
- CORC type (CORCTYPE)
- Relation ID (RELID)
- Buffer offset (BUFOFFSET)
- Overwritten queue entry (QUEENTRY)

Action:

Perform BKUP:ODD on this processor as soon as possible.

313. DBAC0500 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A nonzero message count indicated that all messages may have been received by the OSbcst() function, but not all messages were successfully processed by the DBbcstrply() function. The current message structure from the DBbsctmsg() function was dumped.

314. DBACCDICSAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A future version of an access dictionary entry was found to be the same as the current version.

315. DBACCUPFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBaccup() function failed. The database manager (DBM) could not update the office-dependent data (ODD) copy of an access dictionary entry.

316. DBADLNKFIELD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid generated key value was found in the link field of a generated key tuple.

317. DBBADACCDICT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is an information only assert. A bad database dictionary entry(s) was found. There is no craft action required. The database manager (DBM) will clean up the database. The bad dictionary entries will be printed on the ROP.

318. DBBAD_ALIGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A free list initialization request has bad memory alignment.

Probable Cause:

DBinitavail fn was called with bad addresses.

Action:

The product engineering control center (PECC) should be contacted for assistance.

319. DBBADATYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to use a relation with an unexpected access type. The relation dictionary entry for the relation is dumped.

320. DBBAD_AVAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBGETAVAIL macro returned a bad free list.

Probable Cause:

A bad memory type was passed to DBGETAVAIL.

Action:

The product engineering control center (PECC) should be contacted for assistance.

321. DBBADDICT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected or non-redundant office-dependent data (ODD) growth detected faulty data dictionary values.

322. DBBADDIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to access an unexpected distribution type. The relation dictionary entry for the relation is dumped. This error is typically from the generated dey bucket reorg.

323. DBBADDRL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A NULL dynamic relation dictionary entry was found when a corresponding relation dictionary entry was found to exist. The relation ID and the contents of the relation dictionary entry for that relation ID are dumped.

324. DBBADLGM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETMSG() macro received an invalid logging message in the operational kernel process (OKP) logging system process.

325. DBBADPHYSREL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation dictionary and access dictionary relation IDs were not the same for a relation that needed its data pages and head pages freed. This error is typically from the DBamabort() function, and is most likely due to an OpView relation that has a dictionary problem.

326. DBBADRTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to access an unexpected relation type. The the relation dictionary entry for the relation is dumped. This error is typically from the DBqcparm() function.

327. DBBADTRGINDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range trigger function index was found in the relation dictionary. The database dictionaries are inconsistent. Call the product engineering control center (PECC) immediately for assistance.

328. DBBDDBCI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected office-dependent data (UODD) growth aborted with the critical information and database manager (DBM) global parameters inconsistent. The following global parameters and symbols were not consistent with respect to each other: DBbeg_prblk, DBunblocks, Gldoddea, and Gloddsa.

329. DBBDGRSZ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Growing the office-dependent data (ODD) (unprotected, non-redundant, or redundant) by the specified size of growth resulted in an inappropriate ODD size.

330. DBBDMTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid office-dependent data (ODD) memory type was specified.

331. DB_BID_ERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The block ID to be freed was out of the block ID range.

332. DBBIGTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The tuple in question was too large for the fixed space allocated for it in memory. This is a compile time problem. The tuple must be smaller or the area must be larger.

333. DBBIGVIEW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recent change (RC) logging data structure only supports views of a certain size. Larger views cannot be logged. Inhibit logging, run the view, and do a backup immediately after the view completes.

334. DBBKUPON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A redundant office-dependent data (RODD) growth was attempted while ODD backup was executing.

335. DBBPRBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the DBbeg_prblk global parameter was inconsistent with respect to the value of the DBunblocks global parameter. DBbeg_prblk should always be greater than or equal to the value of DBunblocks.

336. DBBRDATAPAGE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data pages associated with the generated key (GK) bucket reorg were not completely b_free'd. The acc_head will be NULL'ed and the MEMMAN audit will free the data pages.

337. DBBRELTTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office-dependent data (RODD) bitmap salvage technique (BST) tried to convert a RODD relation of the wrong distribution type.

338. DBBRLMTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to access an unexpected rel_mtyp type. The relation dictionary entry for the relation is dumped. This error is typically from the generated key bucket reorg.

339. DBBRSKLNNUL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data pages associated with the generated key (GK) bucket reorg should have been freed and the acc_head of the dictionary should be DBNULL, but this was not the case. The acc_head was NULL'ed and the MEMMAN audit will free the data pages.

340. DBBRTMPGKPROB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while retrieving the generated key (GK) for a temp_GK_store insert for the GK bucket reorg. The reorg will continue, but the tempGK entry will not be inserted into the new relation. Therefore, any insert that occurred is probably not in the relation after the reorg. The rREL_DICT tuple entry, rIACC_GK tuple entry, and the GK value that was to be inserted are dumped.

341. DBBSTACCUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office-dependent data (RODD) bitmap salvage technique (BST) could not successfully call the DBaccup() function.

342. DBBSTBTRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office-dependent data (RODD) bitmap salvage technique (BST) could not begin a transaction on a redundant relation that needed to be converted.

343. DBBSTCONV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the redundant office-dependent data (RODD) bitmap salvage technique (BST), the BST conversion process failed.

344. DBBSTCOPY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bitmap salvage technique (BST) could not copy the redundant control office-dependent data (ODD) bitmap.

345. DBBSTDDRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bitmap salvage technique (BST) could not read the BST data delivery (DD) bits.

346. DBBSTDDWR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office-dependent data (RODD) bitmap salvage technique (BST) could not write the data delivery (DD) BST bits.

347. DBBSTOPREL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office-dependent data (RODD) bitmap salvage technique (BST) could not open a RODD relation that needed to be converted.

348. DBBSTPARMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the bitmap salvage technique (BST), the redundant office dependent data (RODD) global parameters were inconsistent.

349. DBBSTSMIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office-dependent data (RODD) bitmap salvage technique (BST) could not inhibit interrupts for the time needed to update the RODD global parameters.

350. DBBSTTRNST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the redundant office-dependent data (RODD) bitmap salvage technique (BST), the transtart() function call to begin the update transaction failed.

351. DBBSTZBMAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office-dependent data (RODD) bitmap salvage technique (BST) could not zero out the last half of the RODD bitmap in the RODD control section.

352. DBCYCLINGKBKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A cycle was detected in the bucket linked list of a generated key (GK) relation. A GK tuple on the bucket list pointed to another GK tuple that had a data content value that was less than or equal to the original GK tuple. The bucket lists for GK tuples must be kept sorted in order of increasing data content value.

353. DBDDREADF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure was received from a DDREAD() macro call during a redundant office-dependent data (RODD) or non-redundant ODD (NRODD) growth.

354. DBDDWRITEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DDWRITE() macro call failed during redundant office-dependent data (RODD) growth.

355. DBDISTERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Integrity checking of a relation's distribution type failed. The distribution type did not agree with the processor that was passed in. The database manager (DBM) cannot proceed with the operation.

356. DBDNXTSINTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) set primitive DBxtsintup() failed while trying to insert tuples into the SM.

357. DB_FREE_ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A user tried to free a page that had not been seized.

358. DBFRELIBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupted generated key link field was found in the free list of a generated key relation.

359. DBFRINFALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while attempting to insert a generated key tuple into the free list of a generated key relation.

360. DB_FULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager (DBM) could not fill the request for blocks of unprotected memory in the dynamic office-dependent data (ODD). The block ID for the request that could not be filled is dumped. Stop all recent changes (RCs) and call the product engineering control center (PECC) for assistance.

361. DBGCBADFIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database (DB) system process received a termination message from the generated key collection and compression routine (GKCCR); however, the terminal process was still alive when a new terminal process was being created.

362. DBGETBFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to allocate an operating system (OS) buffer failed. The error code DBRESOURCE was returned. This may result in the failure of one of the *UNIX*[®] processes that interfaces with the database manager (DBM); such as, recent change (RC), office database editor (ODBE), remote memory access system (RMAS), Office Records, or TASC.

If this assert appears frequently, contact the product engineering control center (PECC).

363. DBGK24TIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The generated key collection and compression routine (GKCCR) was inhibited for over 24 hours. GKCCR is

recommended at least once in 24 hours. Allow the GKCCR via ALW:GKCCR or manually execute it via EXC:GKCCR.

364. DBGKCQUEFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The generated key collection and compression routine (GKCCR) was queued for an excessive amount of time behind concurrent primitives on the same generated key relation or behind the office-dependent data (ODD) backup.

365. DBGKCRLOSS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A generated key (GK) relation's reverse index relation was recreated. This may lead to a temporary disruption of the GK link fields until the GK collection routine executes. The invalid link fields will not affect read accesses of the GK relation, but may lead to GK tuples with duplicate data field content.

In addition, MEMMAN audits may appear because the previous head table of the reverse index relation was discarded. The relation dictionary, access dictionary of the GK relation, and access dictionary of the reverse index relation are dumped.

366. DBGKCSYSERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While operating on a generated key relation, an unexpected system error was found.

367. DBGKFCORPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while traversing or inserting into the free list of a generated key relation. This includes corruption of dbaccgk[.acc_freegk, the start of the generated key free list.

368. DBGKNOTONFREE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to remove a generated key tuple from the free list of a generated key relation when the generated key tuple was determined to not actually exist on the free list.

369. DBGKRETErr (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when attempting to translate a generated key into a physical address.

370. DBGTGRST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read DBgrwstate which is located in /no5text/rcv.

371. DBHDNTDUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an unprotected or non-redundant office-dependent data (ODD) growth, the growth process was unable to duplicate a relation's head table.

372. DBINITDDBD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The process could not read or write the DDUNGRW bits or DDNREDGRW bits during initialization of these bits.

373. DBINVMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Redundant office-dependent data (RODD) growth received an invalid message.

374. DBINVRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Redundant office-dependent data (RODD) growth detected an invalid return from a function.

375. DBLGFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A logging attempt failed at the end of the generated key (GK) bucket reorg function. The reorg will commit, but will not roll forward to the standby CMP. The output message provides the relation ID that reorg failed on.

Action:

To preserve the reorg, backup the CMP or manually execute the reorg on the standby CMP using ACCED on that specific relation.

376. DBLGTMPSPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Insufficient temporary recent change (RC) log space was available to hold the tuple changes associated with the transactions in progress. Possibly, a single transaction was too large to log, or a set of concurrent transactions collectively consumed too much temporary log space. Try running large views in sequence with no other RC traffic.

377. DBLGTOTAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The total amount of logging data kept in disk buffers, DBlg_inbuf, was not equal to the sum of the logging data over all active transactions.

378. DBLOSTLM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A loss logging message occurred in the operational kernel process (OKP). This transaction was aborted.

379. DBMAXVIRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of virtual relation IDs which can be placed in a relation list was exceeded during an office-dependent data (ODD) growth.

380. DBMISGKPAG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data page with generated keys less than or equal to the value of the acc_lastagk attribute in the dbaccgk dictionary was missing in a generated key relation.

381. DBMODABN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The first remote SM (RSM) being grown in an office and one or more SMs or host SMs (HSMs) were out of service (OOS) or abnormal.

382. DBMODACC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the source modules access dictionary entry for a relation, or failed to update the growth modules access dictionary entry for a relation.

383. DBMODITUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the growth module. The relation name and tuple number are reported on the receive only printer (ROP).

384. DBMODNXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) primitive DBxrdnxt() failed while trying to read the next tuple in the RLRT_DNMOD relation.

385. DBMODOREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to open a relation on the source module or the growth module.

386. DBMODRTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple from the source module. The relation name and tuple number will be reported on the receive only printer (ROP).

387. DBMODTBGN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to begin a transaction on either the source or growth module.

388. DBMODXSRDFST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) primitive DBxrdfst() failed while trying to read the RLRT_DNMOD relation.

389. DBMSZDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Memory Forecasting Tool has failed due to invalid data in one of its data files.

390. DBMSZMALLOC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Memory Forecasting Tool has failed due to a failing return code from the malloc() system call.

391. DBMSZUDICT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Memory Forecasting Tool has failed due to unexpected data in the *UNIX*[®] version of the database dictionaries.

392. DBMVCACH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while attempting to move blocks of tuple cache structures during unprotected office-dependent data (UODD) growth.

393. DBMVGRFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while attempting to move blocks of data during a non-redundant or unprotected office-dependent data (ODD) growth.

394. DBNFNDTRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not locate the transaction ID of the current process, but the current operation is supposedly part of a transaction primitive.

395. DBNMSGRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-redundant office-dependent data (NRODD) growth did not receive a response to a message from the AM process.

396. DBNR2HSHUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the values of all hashsums for the redundant office dependent data (RODD) following a non-redundant ODD (NRODD) growth move into the commit state.

397. DBNR95_FULL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a growth process, the non-redundant office-dependent data (NRODD) reached 95% full or more.

398. DBNRADDMEM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-redundant office-dependent data (NRODD) growth failed because SM memory must be grown before the ODD can be grown. The receive only printer (ROP) output message indicates that memory must be added.

399. DBNRBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-redundant office-dependent data (NRODD) growth received an invalid message from the AM growth process or

received an unknown source.

400. DBNRBSTRUN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a non-redundant office-dependent data (NRODD) growth, the bitmap for the redundant ODD (RODD) must be cleaned up causing the NRODD growth to stop or abort. The receive only printer (ROP) output message indicates that the bitmap salvage technique (BST) must be run.

401. DBNRCIBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The non-redundant office-dependent data (NRODD) growth aborted with the critical information and database manager (DBM) parameters inconsistent.

Any or all of the following global parameters and symbols may not be consistent with respect to each other: DBrphysblks, DBphysblks, DBrblk, DBrszblk, Glroddea, Glroddsa, Gloddsa, Gloddea, DBrpreblks.

402. DBNRDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a non-redundant office-dependent data (NRODD) growth, integrity checks revealed that a prior stop or abort left the parameters in an inconsistent state. Redundant data in the new growth area remains in that area. It is not known which parameters are correct.

403. DBNRDBCI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The non-redundant office-dependent data (NRODD) growth stopped. The critical information and the database manager (DBM) global parameters are consistent, but the hashsums over the redundant ODD (RODD) and the NRODD may be incorrect.

404. DBNRHSHUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the values of hashsums for the non-redundant office dependent data (NRODD) growth following an NRODD growth moving into the commit state.

405. DBNRMEMREC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During non-redundant office-dependent data (NRODD) growth, integrity checks revealed an inconsistency in system integrity (SI) global parameters or in the database (DB) ODD parameters. This problem may be the result of a prior growth attempt that failed. The parameters could not be updated and recovered.

406. DBNRNOSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The non-redundant office-dependent data (NRODD) growth in the SM could not send a message to the AM process. The message buffer is dumped to the receive only printer (ROP).

407. DBNRPARMBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a non-redundant office-dependent data (NRODD) growth, the database (DB) ODD parameters or the system integrity (SI) global parameters were inconsistent and could not be recovered. This ODD growth must be aborted.

408. DBNRSMTMOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM non-redundant office-dependent data (NRODD) growth process timed out after failing to receive a message or an acknowledgement from the AM during the NRODD growth.

409. DBNSMCMTMOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM non-redundant office-dependent data (NRODD) growth terminal process requested permission from the AM child NRODD growth process to begin the NRODD growth commit, but the message timed out.

410. DBNUNTRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The current process had multiple transactions open; it was not possible to know which transaction should be used.

411. DBOPNOSUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid database primitive was attempted on a relation with a relation type that did not support the type of operation specified; for example, an update on a read-only relation.

412. DBOPVINCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database inconsistency was encountered while assembling the pieces of a virtual relation tuple. A parent relation tuple(s) contained a key that did not exist in the child relation. The child relation ID and the keys are dumped.

413. DBPARGTLAST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple in a parent relation of a child generated key relation was found to contain a generated key attribute value greater than the last allocated generated key (acc_lastagk in the dbaccgk dictionary) for that child generated key relation.

414. DBPARPTBADGK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple in a parent relation of a child generated key relation was found to contain a generated key reference to a corrupted generated key tuple in the child relation.

415. DBPARTCMT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the second phase of a transaction commit, the transaction timed out or the global database manager (GDBM) did not receive all of the replies from all affected SMs. The DBM will abort the transaction and clean up the database.

416. DBPOPDNTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to populate the RLRT_DNTRAN relation in the new SM failed.

417. DBPRDNTAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function that populates the RLPR_DNTRAN relation in the growth or conversion process failed. The relation could not be populated.

418. DBPRNXTSINTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) set primitive DBxstintup() failed while the RLPR_DNTRAN relation was being populated on the growth or converted SM.

419. DBPRXSRDTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) set primitive DBxsrdtup() failed while the RLPR_DNTRAN relation was being populated.

420. DBR95_FULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a growth process, the redundant office-dependent data (RODD) reached 95% full or greater.

421. DBRFREOTPA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Before creating a new reorg terminal process, the rollforward CMP terminal process discovered that a previous rollforward owned reorg terminal process was still alive. The previous process will be destroyed before a new one is created.

422. DBRGABTD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A redundant or non-redundant office-dependent data (ODD) growth was inhibited due to an inconsistency between the incore and the disk size of the redundant ODD.

423. DBRGCLOSF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrdcoff() function failed to close the common object file format (COFF) file.

424. DBRGHMOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was received from the HMoutmsg() function during redundant office-dependent data (RODD) growth.

425. DBRGINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An SM was initialized after a redundant office-dependent data (RODD) growth occurred, but before the RODD was backed up. The SM tried to perform a "fast growth" in the DBinit() function, but this failed. The size of the RODD in the SM that initialized could be inconsistent with the rest of the SMs.

426. DBRGOPENF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrdcoff() function failed to open a common object file format (COFF) file.

427. DBRGRCVRY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A redundant or non-redundant office-dependent data (ODD) growth found an inconsistency between the incore and the disk size of the redundant ODD. The growth recovered from the error and continued.

428. DBRGREADF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrdcoff() function failed to read the common object file format (COFF) file.

429. DBRGSEEKF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrdcoff() function received failure from the fseek() function.

430. DBRGSGRWF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to create the SM terminal process during a redundant office dependent data (RODD) growth.

431. DBRLDCBRL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A relation ID in the relation dictionary was incorrect.

432. DBRLSBFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to release operating system (OS) buffer resources failed. This failure was not expected and may indicate corruption in the program stack. The database (DB) recent change (RC) process will be terminated.

Save information related to this error and contact the product engineering control center (PECC).

433. DBRNUMBD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an unprotected or non-redundant office-dependent data (ODD) growth, an attempt to move data corresponding to an invalid relation dictionary tuple offset occurred.

434. DBRSMOREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The open relation primitive call in the DBrsmbgn() function failed.

435. DBSA2LONG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Too much time elapsed since the stand alone conversion routine received a message in the operational kernel process (OKP).

436. DBSACDNTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the RLRT_DNTRAN relation during stand alone conversion.

437. DBSACOREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to open a relation during stand alone conversion.

438. DBSACSINTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An insert database set primitive failed.

439. DBSACTBGN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A begin transaction failure occurred during stand alone conversion.

440. DBSACTEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An end transaction failure occurred during stand alone conversion.

441. DBSACTUPNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database set primitive returned an incorrect tuple count during stand alone conversion.

442. DBSACUGPR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update a global parameter during stand alone conversion.

443. DBSACUREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown source relation for directory number (DN) translation data was given during stand alone conversion.

444. DBSADNMOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During stand alone conversion for an SM, the routing module tuple for a given directory number (DN) could not be obtained from the RLRTDNMOD relation. The DBxrdtup() function failed.

445. DBSAENMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not send message to the stand alone conversion *UNIX*® process from the operational kernel process (OKP).

446. DBSAGPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A global parameter routine failed.

447. DBSAINVMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an invalid message in the stand alone conversion process in the operational kernel process (OKP).

448. DBSANOMATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The *UNIX*® mate process, which sends messages to the current operational kernel process (OKP) conversion process, did not exist.

449. DBSDWTDFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not send or receive a message. An unexpected return code was returned after calling a message primitive.

450. DBSIFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the Sloddgrow() function failed during an unprotected or non-redundant office-dependent data (ODD) growth.

451. DB_SIZE_ERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The size parameter input to the DBb_free() or DBb_seize() function was too large or zero. The error return code was DB_SIZE_ERR.

452. DBSMCMTMOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM unprotected or non-redundant office-dependent data (ODD) growth terminal process requested permission from the AM child process to begin the commit state of the growth, but the message timed out.

453. DBSNPCORPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The growth snapshot table contained corrupted data values.

454. DBSNPOVFLW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected or non-redundant office-dependent data (ODD) growth relation snapshot table was full and unable to store additional information on access dictionary reader transaction versions.

455. DBSNPVER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected or non-redundant office-dependent data (ODD) growth failed while attempting to verify the contents of the relation snapshot table.

456. DBSTGRST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to set szb4grow in /no5text/rcv/DBgrwstate with the new size of the RODD.

457. DBSZFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error has occurred in the DBsizing() process used by the memory forecasting tool.

Action:

The product engineering control center (PECC) should be contacted for assistance.

458. DBTRIGFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A trigger function failed during the commit or uncommit phase of a transaction. The office equipment status is inconsistent with the desired update. The output message includes the name of the relation that had the trigger error and the phase in which the failure occurred.

459. DBTX1FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Modgrw did not finish copying any relations. Restart modgrw to continue.

460. DBTX2FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Modgrw finished copying RLDB_AMGPD grouptypes, GPDAM_SA_RED and GPD_PART. Restart modgrw to finish copying.

461. DBTX3FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Modgrw has finished copying RLDB_AMGPD grouptypes and GRP_PART data. Restart modgrw to complete copying.

462. DB_TYP_ERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the DBb_seize() function parameters indicates the type of data to be seized. A type other than protected or unprotected was entered.

463. DBUGBADMG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected office-dependent data (UODD) growth process received an invalid message.

464. DBUGDBCI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected office-dependent data (UODD) growth stopped. The critical information and the database manager (DBM) global parameters are consistent, but the hashsums over the non-redundant data may be incorrect.

465. DBUGSHUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the values of all hashsums for the non-redundant office-dependent data (NRODD) following an

unprotected ODD (UODD) growth move into the commit state.

466. DBUGNOCRTRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBsysim OSCREATE of GLPGUGRW has the new process number new_pid.procno less than 0 in DBsys.c from function DBsysim

467. DBUGNOSND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM unprotected office-dependent data (UODD) growth terminal process could not send a message to the AM UODD growth child process.

468. DBUGSMTMOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM growth process timed out after failing to receive a message or an acknowledgement from the AM.

469. DBUMSGRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received.

470. DBUPDCFAIL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from a database (DB) function when the ST:ODDUPD input message or the ST:UPDMHGTRKG input message was executed while growing a multi-module remote switching module (MMRSM) site.

The message structure for the data dumped is aaaaaa FAILURE where:

- aaaaaa is ODDUPD for the ST:ODDUPD input message or UPDMHG for the ST:UPDMHGTRKG input message.
- bbbbbbbbbbbbbb is the name of the DB function returning the error.
- c is the return code from the DB function.
- dddddddddddd is the name of the DB relation involved.
- e is the number (decimal) of the tuple in the relation.
- f is the MMRSM site number (decimal).
- g is the processor module number (decimal). 0=AM

A value of -1 for any field indicates either unknown data or irrelevant data.

Action:

The product engineering control center (PECC) uses this information to locate the cause of the DB problem when growing an MMRSM.

471. DBUPDCFAIL (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from a database (DB) function when the ST:ODDUPD command or the ST:UPDMHGTRKG command was executed while growing a multi-module remote switching module (MMRSM) site.

The message structure for the data dumped is aaaaaa FAILURE where:

- aaaaaa is ODDUPD for the ST:ODDUPD command or UPDMHG for the ST:UPDMHGTRKG command.
- bbbbbbbbbbbb is the name of the DB function returning the error.
- c is the return code from the DB function.
- dddddddddddd is the name of the DB relation involved.
- e is the number (decimal) of the tuple in the relation.
- f is the MMRSM site number (decimal).
- g is the processor module number (decimal). 0=AM

A value of -1 for any field indicates either unknown data or irrelevant data.

Action:

The product engineering control center (PECC) uses this information to locate the cause of the DB problem when growing an MMRSM.

The appropriate action will the relation in question (field "d") into a file. Then the

472. DBUPDDKEY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A duplicate key error code was returned from a DBgintup() primitive call.

473. DBUPDDTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from a DBgdlutp() primitive call. This error could be any of the errors defined in the file db/DBtladefs.h.

474. DBUPDEMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No remote switching modules (RSMs) were found in the multi-module RSM (MMRSM) site. No RSMs were assigned to the RLCLIDAT relation.

475. DBUPDGLTRG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the DBupgparm() function which was called within the DBclidatrg() envelope trigger function.

476. DBUPDITUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from a DBgintup() primitive call. This error could be any of the errors defined in the file db/DBtldefs.h.

477. DBUPDOREL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the DBopnrel() function while opening a database relation.

478. DBUPDRFTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from a DBxrdfst() or DBxrdnxt() primitive call. This error could be any of the errors defined in the file db/DBtldefs.h.

479. DBUPDRTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the DBxrdtup() or DBgrdtup() primitive. This error could be any of the errors defined in the file db/DBtldefs.h.

480. DBUPDSITRG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the Slclidatrg() trigger function within the envelope trigger function DBclidatrg().

481. DBUPDSMTRG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the SMclidattrg() trigger function within the DBclidattrg() envelope trigger function.

482. DBUPDTBGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from a DBxbgntrn() function call while beginning a database (DB) transaction.

483. DBUPDTEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the DBendtrn() function call while committing an update transaction.

484. DBUPDUTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from a DBxuptup() primitive call. The error could be any of the errors defined in the file db/DBtladefs.h.

485. DBUSDONFRE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A generated key tuple marked as being referenced by other parent relation tuples was found to exist on the free list of a generated key relation.

486. DBWLGFUN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid logging function occurred in the operational kernel process (OKP) logging system process. This assert triggers another assert that indicates a loss message must be fired. Verify the in-queue message.

487. DBWT2LG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected office-dependent data (UODD) growth queued to receive exclusive write-permission for a relation, was forced to wait too long for another transaction on the same relation to finish.

488. DBWTIDBD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect relation dictionary tuple offset was found in an entry in the unprotected or non-redundant office-dependent data (ODD) growth relation waiting list data structure.

489. DBWTLFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred involving the unprotected or non-redundant office dependent data (ODD) growth relation waiting list. Probably, the relation waiting list was full.

490. DBXSINSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An insert set primitive call failed.

491. DBXSRDFSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read first set primitive failed.

492. DBXSRDNSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred in a database (DB) read next set primitive call.

493. DBXSRDSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code was received from a database (DB) read set primitive.

494. DBXTRAGKPAGS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data page or intermediate data page existed in a generated key (GK) relation beyond the data page allocated to the acc_lastagk GK tuple.

495. DBXTSINTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the set primitive DBxtsintup() failed while trying to insert tuples into the SM.

496. DHSH_OVFL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Dynamic Hashed relation has reached its maximum insert depth.

Data Structures:
relid, insert_depth, headtable_index.

Action:
Manual reorganization needed, contact local field support.

Range: dbkup**1. BKAMODDGONE (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During recovery of the AM office dependent data (ODD) after an AM ODD backup failed, the official AM ODD is missing. When this happens, the amcmpodd.scr file may or may not contain the correct AM ODD. It is best to recover the AM ODD from tape.

2. BKCMPFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Office dependent data (ODD) backup received an abort message from fault recovery to abort CMP ODD backup. If the ODD backup was on the active CMP and the active CMP is going to be pumped, then an immediate abort of the CMP backup will occur. The ODD files will be in an inconsistent state until fault recovery sends a reply message to continue, then backup control can clean up the files.

If the fault recovery message was received and the standby CMP is going to be pumped, and the ODD backup is in the setup or backup phase, then the ODD backup will be aborted. ODD backup will be allowed to complete if it is in the commit phase and the standby CMP is going to be pumped.

3. BKCMPINH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMP office dependent data (ODD) backups are prohibited at this time. Backup control is waiting for a restart message from fault recovery before ODD backup will be allowed on the AM or CMP.

4. BKFRNOMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Backup control received a message from fault recovery and did not receive a subsequent message in the allocated time frame. As a result, the office dependent data (ODD) files for the CMP will be recovered automatically by backup control.

5. DBAMODDSZE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM office dependent data (ODD) was grown beyond the 6 megabyte limit. This AM ODD growth is aborted. Try growing the AM ODD by a smaller amount.

6. DBAMSCRBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM, CMP, and scratch office dependent data (ODD) files are not correctly linked. Manual intervention is necessary. Check that the AM ODD file is 6 megabytes, the CMP ODD file is 8 megabytes, and the scratch ODD file

for the AM and CMP is 8 megabytes. These sizes do not include the size of the common object file format (COFF) header.

Insure that there is only one file link to each of these ODD files. Any ODD files that are missing must be recreated. If the AM or CMP ODD needs to be recreated, a tape recovery will be necessary unless the data in the scratch ODD file is correct for the respective recreated ODD.

7. DBBDMEMBRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ODDCREATE feature found an invalid memory board type in the RLMODATT relation.

8. DBBKABORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an office dependent data (ODD) backup, more than one link to the scratch file was found. ODD backup was unable to locate the file that is linked to the scratch file. ODD backup is aborting, since trying to use the scratch file may overwrite another SM's ODD.

Seek immediate technical assistance from the appropriate support organization before attempting another backup.

9. DBBKACTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found for the parameter DBactblks.

10. DBBKALLOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Office dependent data (ODD) backup received a failure return code from the falloc() function.

11. DBBKAMGRW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM office dependent data (ODD) growth data delivery (DD) bit was set and prohibited the AM ODD backup from continuing without first doing an AM initialization. Refer to the AM ODD growth procedures.

12. DBBKATMSW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The fmatomsw() function failed during an AM office dependent data (ODD) backup or AM ODD growth. The official file is guaranteed to exist even when fmatomsw() fails. It may be necessary to correct the AM ODD to ensure that it is not in the ODD scratch file.

Check the size of /no5odd/data0/cpodd.out using the fsize() function. If the size is greater than 6 megabytes plus the

size of a common object file format (COFF) header, then the official file must be copied to a new contiguous file. Change the name of the official file to amcmpodd.scr and the newly created file to cpodd.out.

13. DBBKBADMSG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interface module backup process (IMBP) has detected a corrupted message while backing an SM ODD. The NRODD backup in progress was aborted and the ODD backup process will continue to backup the remaining processor ODDs. The processor where ODD backup was aborted will be backed up at the next scheduled backup or can be backed up manually.

14. DBBKBCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The critical information (CI) file contains the beginning and ending addresses of office dependent data (ODD) sections. The CI file sizing information for the ODD was incorrect.

15. DBBKBCIHS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the critical information (CI) hash file.

16. DBBKBFIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. Invalid data was found in a file.

17. DBBKBGD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. Invalid global data was encountered.

18. DBBKBHSH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. Invalid data was found in a hash file.

19. DBBKBLINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an office dependent data (ODD) backup, a scratch file had more than one link to it. The scratch file is either the ODD, the ODD hashsum, the critical information (CI) file, or the CI hashsum file. This means that a previous ODD backup aborted without cleaning up the links. ODD backup will attempt to locate the file that is linked to the

scratch file and restore the links to their normal state. If the file can not be found, the backup will abort.

20. DBBKBODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. Invalid data was found in an ODD file.

21. DBBKBOU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. An invalid output was found.

22. DBBKBP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. An invalid process was passed to AM backup. The process is terminated.

23. DBBKBS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A backup of an illegal or non-existent section number was attempted within an office dependent data (ODD) or ODD hashsum backup common object file format (COFF) file.

24. DBBKBSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During office dependent data (ODD) backup, invalid data was found in an SM state file.

25. DBBKCLRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. ODD backup finished backing up the AM ODD or an SM non-redundant ODD (NRODD) and could not remove the customer originated recent change (CORC) log file associated with the processor being backed up. If this problem occurs in the AM ODD, remove the /log/cpcorc file. If this problem occurs in the SM NRODD, remove the /smlog/imxxxcorc file where xxx is the number of the processor being backed up.

26. DBBKCLRL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. ODD backup finished backing up the AM ODD or an SM non-redundant ODD (NRODD) and could not remove the partition log file for the processor. If this problem occurred

in the AM ODD, remove the /log/cplog file. If this problem occurred in the SM NRODD, remove the /smlog/imxxxrc file, where xxx is the number of the processor being backed up.

27. DBBKCREAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. A create failed.

28. DBBKDACTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found for the parameter DBdactblks.

29. DBBKDDBST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid DDBST (bitmap salvage technique status) value was encountered.

30. DBBKDDNGRW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid DDNREDGRW (non-redundant SM growth indicator) value was encountered.

31. DBBKDDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. A data delivery (DD) read failed.

32. DBBKDDW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. A data delivery (DD) write failed.

33. DBBKDSK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in an office dependent data (ODD) disk bit map.

34. DBBKDSKSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During office dependent data (ODD) backup, the falloc() function found that there was not enough disk space to

complete the backup.

35. DBBKFOpen (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. The Fopen() function failed.

36. DBBKFRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLSCONF relation using fast read.

37. DBBKFSANF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. The Fscanf() function failed.

38. DBBKHMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. The HMoutmsg() function failed.

39. DBBKLCALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. The lcall() function failed.

40. DBBKLINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. A link failed.

41. DBBKMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in an office dependent data (ODD) bit map.

42. DBBKMount (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. A mount failed.

43. DBBKNA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. No acknowledgement was received.

44. DBBKNOPART (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No office dependent data (ODD) partition number was found.

45. DBBKNOISM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No operational SMs were found when trying to backup the redundant office dependent data (RODD).

46. DBBKNOTFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic (unprotected) office dependent data (ODD) growth (ST:U-ODDGRW) occurred since the last ODD backup. Therefore, only a full backup may be executed; a differential backup should automatically escalate to a full-differential backup. A full or full-differential backup is required because the entire backup ODD common object file format (COFF) file must be overwritten with the complete SM static (protected) ODD contents.

An error occurred because the interface module backup process (IMBP) was called with a differential type of backup. It should have previously escalated to a full-differential backup.

47. DBBKNU LINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During office dependent data (ODD) backup, the wrong number of links to an SM file was encountered. The number of links was too high.

48. DBBKODDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The start address of the SM static (protected) office dependent data (ODD) was greater than the start address value for the SM static ODD found in the ODD backup common object file format (COFF) file. Since a dynamic (unprotected) ODD growth (executed using the input message ST:U-ODDGRW) has not occurred since the last backup of this ODD, the starting address of the static ODD (as determined by the AM interface module backup process [IMBP]) is assumed to be in error.

49. DBBKODSA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The start address of the SM static (protected) office dependent data (ODD) was not a multiple of the size of the largest seizable data page (from the DBb_seize() function). The largest seizable page size is given by the #define DBMAXSIZE.

50. DBBKOPEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. Could not open a file.

51. DBBKPROC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the global variable DBcurim was not set to a valid SM or CMP. The variable was returned from the DBbcnxtim() function.

52. DBBKREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. Could not read a file.

53. DBBKRECV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. An invalid message was received.

54. DBBKSEEK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. Could not find the first section header.

55. DBBKSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. An invalid send message process occurred.

56. DBBKSK2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading the backup office dependent data (ODD) or the ODD hashsum common object file format (COFF) file, the backup process was unable to seek to the second section header.

57. DBBKSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. A failure occurred in a stat() function call.

58. DBBKTMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. A timeout occurred while an ODD backup function was waiting for a message. This problem was probably caused by a link failure.

59. DBBKULINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. An unlink failed.

60. DBBKUMOUNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. An unmount failed.

61. DBBKVCP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. A volume copy failed.

62. DBBKVTOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) backup error occurred. Invalid data was found in the /dev/vtoc file.

63. DBBKWRITE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. Could not write to a file.

64. DBCMPHSHBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP office dependent data (ODD) hash files were corrupted. Manual intervention is necessary. Determine if the CMP official, scratch, and/or temporary hash files are in the directory /no5odd/data0. The temporary hash sum file should not be in place at this time. Check the number of links to the official and scratch hash files. After the hash file corruption is corrected, the hash sum files need to be regenerated for the CMP.

65. DBCMPSTBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Office dependent data (ODD) backup for the CMP failed because the status of the active or standby CMP is not suitable at this time. Possibly, the standby CMP is being pumped and removal of the log file by ODD backup would create an inconsistency in the active and standby ODDs. Another possibility is that no CMP is active at this time.

66. DBGR1AIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the aimrc file. Check the status of the affected processor and retry.

67. DBGR1MOU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to mount the /dev/no5odd1/ partition as no5odd. Check the partitions and the aimrc file, and retry.

68. DBGR2MOU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not mount the /dev/no5odd2/ partition as no5odd. Check the partitions and the aimrc file, and retry.

69. DBGRAIMOPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to open the aimrc file. Check the status of the affected processor and retry.

70. DBGRBSCN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The section size does not equal the office dependent data (ODD) size. Check the status of the affected processor and retry.

71. DBGRCLOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to close an office dependent data (ODD) file. Check the status of the affected processor and retry.

72. DBGRCREAT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to allocate enough space for the office dependent data (ODD). Check the partition size. If the partition is full, contact your next level of support. Otherwise, check the status of the affected processor and retry.

73. DBGRDDSR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the backup status bit. Check the affected processor and retry.

74. DBGRDDW2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to set the ODDGRW flag. Check the status of the affected processor and retry.

75. DBGRDDWR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to clear the status bit for growth. Check the status of the affected processor and retry.

76. DBGRFOPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to open an office dependent data (ODD) file. Check the status of the affected processor and retry.

77. DBGRFSEK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to find the file head in the common object file format (COFF) header. Check the status of the affected processor and retry.

78. DBGRGPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in the partitions. Check the partitions and retry.

79. DBGRHM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred. The command processor was not started. Retry the office dependent data (ODD) growth command.

80. DBGRHMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a human machine (HM) output message. Check the status of the affected processor and retry.

81. DBGRLDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the office dependent data (ODD) common object file format (COFF) header. Check the status of the affected processor and retry.

82. DBGRLDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the section size from the common object file format (COFF) header. Check the status of the affected processor and retry.

83. DBGRLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while updating the aimrc file. Check the aimrc file and the status of the affected processor, and retry.

84. DBGRM1SCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to mount the /dev/no5odd1/ partition as scrodd. Check the partitions and the aimrc file, and retry.

85. DBGRM2SCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to mount the /dev/no5odd2/ partition as scrodd. Check the partitions and the aimrc file, and retry.

86. DBGRMNT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to mount a partition as /no5odd/. Check the status of the affected processor.

87. DBGRMODD2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to unmount the /dev/no5odd2/ partition. Check the partitions and retry.

88. DBGRMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to enable a message. Check the status of the affected processor and retry.

89. DBGRNGMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send output messages.

90. DBGRNUODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while writing to an office dependent data (ODD) file. Check the status of the affected processor and retry.

91. DBGROPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to open an office dependent data (ODD) file. Check the status of the affected processor and retry.

92. DBGRPAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to pad an office dependent data (ODD) file. Check the status of the affected processor and retry.

93. DBGRPAR2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in the office dependent data (ODD) partitions. Check the partitions and retry.

94. DBGRPART (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the /no5text/rcv/aimrc file; the office-dependent data (ODD) partition was not found. Check the aimrc file and retry.

95. DBGRPART (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the /etc/aimrc file; the office dependent data (ODD) partition was not found. Check the aimrc file and retry.

96. DBGRPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to connect the port. Check the status of the affected processor and retry.

97. DBGRRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to copy a file correctly. Check the status of the affected processor and retry.

98. DBGRRDAIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the aimrc file. Check the status of the affected processor and retry.

99. DBGRRDMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the global parameter Glmem_sze. Check the status of the affected processor and retry.

100. DBGRRDPHYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the global parameter DBphysblks. Check the status of the affected processor and retry.

101. DBGRRDPRB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the global parameter DBprblocks. Check the status of the affected processor and retry.

102. DBGRREC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to receive a message. Check the status of the affected processor and retry.

103. DBGRRPHYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the global parameter DBphysblks. Check the status of the affected processor and retry.

104. DBGRSCN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to find an office dependent data (ODD) partition in the aimrc file. Check the aimrc file and retry.

105. DBGRSYS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system call failed. Check the partitions and the status of the affected processor and retry.

106. DBGRSYS2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system call failed. Check the partitions and the status of the affected processor and retry.

107. DBGRUMODD1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to unmount the /dev/no5odd1/ partition. Check the partitions and retry.

108. DBGRWIMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the office dependent data (ODD) memory size. Check the status of the affected processor.

109. DBGRWIPHYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBphysblks global parameter was not consistent before update. Check the status of the affected processor.

110. DBGRWODMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the office dependent data (ODD) memory size. Check the status of the affected processor and retry.

111. DBGRWODPHYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the DBphysblks global parameter.

112. DBGRWRIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write a file correctly. Check the status of the affected processor and retry.

113. DBGRWSCN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write the size in the common object file format (COFF) header. Check the status of the affected processor and retry.

114. DBG TGWST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Backup could not read the DBgrwstate file in the /no5text/rcv directory.

115. DBRIMGEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The "rimgen" tool failed to complete successfully when a backup of the relocatable image map (RIM) was required.

Action:

Run the /usr/bin/rimgen tool manually from the user *UNIX*[®] terminal with the verbose ("-v") option. Next, retry the office dependent data (ODD) backup that previously failed. Contact next level of support on the observance of any error messages.

116. DBRPTRCOFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a non-redundant office dependent data (NRODD) backup, the common object file format (COFF) header file for the NRODD had a value that is not consistent with the value in the SM whose NRODD is being backed up to disk. This may have been caused by a failed NRODD growth in this SM or by corruption in the COFF header of the disk ODD file.

Seek immediate technical assistance from the appropriate support organization.

117. DBSTGWST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Backup could not set the szb4grw (actual number of bytes before growth) value to zero in the DBgrwstate file in the /no5text/rcv directory.

Range: dcmap**1. BXSABTFL (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsabort() function failed to abort a BX.25 session.

2. BXSACKFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsack() function failed to verify the correctness of the message passed to this function.

3. BXSACPTFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsaccept() function failed to accept an incoming session establishment offer from a remote user.

4. BXSATTFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsattach() function failed to attach to a BX.25 session layer.

5. BXSCLOFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxskclose() function failed to close a BX.25 session layer.

6. BXSCONFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsconnect() function failed to connect a BX.25 session.

7. BXSDETFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsdetach() function failed to detach a BX.25 session.

8. BXSDISFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsdconnect() function failed to disconnect a BX.25 session.

9. BXSOPNFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxskopen() function failed to open a BX.25 session layer.

10. BXSQUEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxquery() function failed to query a BX.25 session indications.

11. BXSRCVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsreceive() function failed to receive a message.

12. BXSREFFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxsrefuse() function failed to refuse a session establishment request.

13. BXSSNDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxssend() function failed to send data.

14. BXSXSDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bxxsxsend() function failed to send expedited data.

15. CMAPABTFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor data link (APDL) abort failed.

16. CMAPAROOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An array index is out of range.

17. CMAPBADCASE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid switch case was found.

18. CMAPBFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Not used.

19. CMAPBFFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Access buffer full status was returned by the bxsreceive() function.

20. CMAPBINDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Not used.

21. CMAPBLINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A link number is not in the range of valid link numbers.

22. CMAPBMCCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A master control center (MCC) indicator marked as valid was actually invalid.

23. CMAPBPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A remote session partner made a session connect request, but offered unacceptable session parameters.

24. CMAPBXFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No communication occurred between the application processor data link (APDL) and the BX.25 session layer.

25. CMAPCNFGFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A configure library function failed.

26. CMAPDBBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid data was found in the office dependent data (ODD).

27. CMAPDBFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A database primitive failed.

28. CMAPDDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A data delivery primitive failed.

29. CMAPDMSGFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Unable to send or receive a DMERT message.

30. CMAPDXTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The application processor data link (APDL) found an error in the dynamic communications kernel process (CMKP) translation table.

31. CMAPECDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid equipment configuration data (ECD) was found by the BX.25 session layer library functions.

32. CMAPECDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An equipment configuration data (ECD) function call failed.

33. CMAPESCLFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor data link (APDL) request to the application integrity monitor (AIM) for escalation failed.

34. CMAPEVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An application processor data link (APDL) failed to send the event.

35. CMAPEXTFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason code was encountered for the CMapexint() function.

36. CMAPHMFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor data link (APDL) failed to update the master control center (MCC) because of a human/machine (HM) primitive failure.

37. CMAPINTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason code was encountered for the CMapinteg() function.

38. CMAPKFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An application processor data link (APDL) fault was encountered because of a software error.

39. CMAPLLISTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the link list.

40. CMAPLSTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered in the link status table.

41. CMAPNOOPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Not used.

42. CMAPRTSFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No path was defined to the SMaprts() *UNIX*® process.

43. CMAPSENDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Not used.

44. CMAPSXTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor data link (APDL) found an error in the static communications kernel process (CMKP) translation table.

45. CMAPTTYFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor data link (APDL) failed to output a tty message because of human/machine (HM) primitive failures.

46. CMAPUNEQIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unequipped link exists in an rICMAPDATA tuple in the office dependent data (ODD).

Range: dcmdrv**1. CMAUADMA (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM foundation peripheral controller (FPC) handler could not assign a direct memory access (DMA) job number.

2. CMAUCMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid completion message was returned from a peripheral interface controller (PIC) job request.

3. CMAUIOOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid operation code was encountered for a peripheral interface controller (PIC) request.

4. CMAUMTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM foundation peripheral controller (FPC) handler received a message with an invalid subtype, possibly corrupted.

5. CMAUNDST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The destination DMERT process is not attached to a port.

6. CMAUNOOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching in the AM (OSDS-C) is not attached to a port.

7. CMAUNORG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DMERT process sending a message is not attached to a port.

8. CMAUNUCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Messages are being lost because no unit control blocks (UCBs) are available (Gem_link, mtc_in_progress = yes).

9. CMAUPJOB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered in the peripheral interface controller (PIC) job queue push when the pushq1() function was called. The job queue may be full.

10. CMAUPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM foundation peripheral controller (FPC) handler could not attach to a port.

11. CMAUQFLL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message queue was full. The message was probably lost.

Range: dcmkp**1. CMAUKPMT (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communications kernel process (CMKP) had a corrupt or invalid message subtype that was found in the message header.

2. CMAUKPPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communications kernel process (CMKP) could not attach to a port.

3. CMAUSFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communications kernel process (CMKP) received an unrecognizable fault at its "kfault" entry point.

Range: dct**1. CTACCFLGACTDLN (5E14 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnaud() function found wrong DLN access flag(s) for the active DLN. No action is taken.

2. CTACCFLGNOACTDLN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnaud() function found wrong DLN access flag(s) for a not active DLN. No action is taken.

3. CTACKMSKPMMSGNOBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTackmskp() function could not allocate a buffer for a DMERT message to MSKP. No action is taken.

4. CTACKMSKPMMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queuefn() function could not send a CCS transport message acknowledgement on request of the CTackmskp() function. No action is taken.

5. CTACKOUTOFORD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function received an acknowledgment message that was out of order. No action is taken. The message is dropped.

6. CTACKSTOUTOFORD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received an "acknowledgement of start traffic" message that was out of order. No action is taken.

7. CTACTEVNTFLGNOSET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnaud() function found that the DLN active event flag was not set but the message active flag was. No action is taken.

8. CTACTEVNTFLGSET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnaud() function found that the DLN active event flag was not but the message active flag was not. No action is taken.

9. CTBADDLNMTYP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnsend() function found an unknown IMS message type to be send to the DLN. No action is taken.

10. CTBADDLNMTYP (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid direct link node (DLN) message type was received.

11. CTBADIPMTYP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrsendmsg() function received an unexpected IMS interprocess message type. No action is taken.

12. CTBADIPMTYP (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid interprocess message type was encountered.

13. CTBADMSTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid DMERT message type was received.

14. CTBADPAGE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid page was trying to be processed.

15. CTBADPAGEADDR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTlinkupdate() function found an unexpected MCC page display number as an address for HM Functions to which it was supposed to send the updated information. No action is taken.

16. CTBADPAGEPOKE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected MCC page display number was found by the CTpagepoked() function. No action is taken.

17. CTBADPAGEUNEQ (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTlinkupdate() function found an unexpected MCC page display number while it was updating data for an unequipped link node. No action is taken.

18. CTBADRNA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid ring node address (RNA) was encountered.

19. CTBADRNALNUPD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTlinkupdate() function found an unexpected ring node address for which it was supposed to update the MCC page. No action is taken.

20. CTBADRNARCNCCL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrcnccl() function was passed an out of range RNA address. No action is taken.

21. CTBADRNARDLKF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlkf() function was passed an out of range RNA address. No action is taken.

22. CTBADRNARFREQ (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCRfreq() function was passed an out of range RNA address. No action is taken.

23. CTBADRNARINET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrinet() function was passed an out of range RNA address. No action is taken.

24. CTBADRNARTTASK (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrtask() function found an out of range RNA address in the CCrna[] list. No action is taken.

25. CTBADRNRXNET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CRNAVL() macro failed to convert RNA for a specified VL on request of the CCrxnet() function. No action is taken.

26. CTCCIS6MSGSS7LNKCNG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a CCIS6 message on a CCS7 link during a far-end processor congestion. No action is taken.

27. CTCCIS6MSGSS7LNKCNGEND (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a CCIS6 message on a CCS7 link after a far-end processor congestion ended. No action is taken.

28. CTCCIS6MSGSS7OFF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a CCIS6 message in a CCS7 office. No action is taken.

29. CTCMKPPRTIDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DMERT primitive kportid() failed to retrieve the CM kernel process ID on request of the CCrcmkpopen() function. An unexpected return code from kportid() was found. A timer is set to retry this operation.

30. CTCMOPFL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrcmkpack() function found that an attempt to open a communications kernel process (CMKP) slot failed. A timer is set to retry.

31. CTCMOPFL (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to open a communications kernel process (CMKP) slot failed.

32. CTCN7UPDNOSS7LNK (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCr7up() function was requested to process a cN7_UPDATE message while there are no SS7 links in this office. No action is taken.

33. CTCNNOBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not allocate a DMERT message buffer.

34. CTDATAINMEMMSGOUTOFORD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received an "All CNI data in main memory" message that was out of order. No action is taken.

35. CTDBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCpgeupdt() function received an invalid message type.

36. CTDBRDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed during a direct link node (DLN) pump.

37. CTDDCNIINITFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddwork() function found an unexpected value of the DDCNIINIT bit while trying to set/clear the CNI INIT status on the MCC pages. No action is taken.

38. CTDDCNIMININITFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddwork() function found an unexpected value of the DDCNIMIN bit while trying to set/clear the CNI INIT status on the MCC pages. No action is taken.

39. CTDDCNIMINMFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddwork() function found an unexpected value of the DDCNIMIN bit while trying to set/clear the CNI MIN MODE flag on MCC 118 page. No action is taken.

40. CTDDDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddwork() function failed to read a data delivery (DD) bit.

41. CTDDDLNFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddwork() function found an unexpected value of the DDSDLNEQ bit while trying to set/clear the CNI INIT status on the MCC pages. No action is taken.

42. CTDDDLNFAIL (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDSDLNEQ DD key was read and an invalid return was receive in the CCpgeupdt process.

Action:

Return to calling function and continue.

43. CTDDRERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery read failed; that is, the DDREAD() primitive failed.

44. CTDDRERRCNIINIT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDREAD() macro failed to read the status of the DDCNIINIT bit on request of the CCrfull_op() function. No action is taken.

45. CTDDRERRMINMODE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDREAD() macro failed to read the status of the DDCNIMIN bit on request of the CCrfull_op() function. No action is taken.

46. CTDDWERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery write failed; that is, the DDWRITE() primitive failed.

47. CTDDWERR1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to reset DDSDLNEQ bit to DD CLEAR on request of the CCrm skperr() function. No action is taken. Report it to a higher technical support level if it happens frequently. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

48. CTDDWERR2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to set DDSDLNEQ bit to DD SET on request of the CCrhb_shld() function while the DLN heartbeat was in an automatic run mode. No action is taken.

49. CTDDWERR3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to reset DDSDLNEQ bit to DD CLEAR on request of the CCrhb_shld() function while the DLN heartbeat was manually requested to run. No action is taken.

50. CTDDWERR4 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to set DDSDLNEQ bit to DD SET on request of the CCrhb_shld() function while the DLN heartbeat was manually requested to run. No action is taken.

51. CTDDWERR5 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to set DDSDLNEQ bit to DD SET on request of the CCrfull_op() function. No action is taken.

52. CTDDWERR6 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to reset DDSDLNEQ bit to DD CLEAR on request of the CCrfull_op() function. No action is taken.

53. CTDDWERR7 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to set DDCNIOOS bit to DDSET on request of the CTsetdsig() function. No action is taken.

54. CTDDWERR8 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to reset DDCNIOOS bit to DDCLEAR on request of the CTsetdsig() function. No action is taken.

55. CTDDWERR9 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to set DDCCS7OOS bit to DDSET on request of the CTsettcap() function. No action is taken.

56. CTDDWERR10 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to reset DDCCS7OOS bit to DDCLEAR on request of the CTsettcap() function. No action is taken.

57. CTDDWERR11 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to set DDCNITSOOS bit to DDOFFNORMAL on request of the CTsettsig() function. No action is taken.

58. CTDDWERR12 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() primitive failed to reset DDCNITSOOS bit to DDNORMAL on request of the CTsettsig() function. No action is taken.

59. CTDEVTACK (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected DLN acknowledgment was received by the CCrdlnack() function. No action is taken.

60. CTDEVTACK (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected direct link node (DLN) acknowledgment was received from the common network interface (CNI), or an acknowledgment no longer applies because of a transient DLN state change.

61. CTDLNCHGACKNODLNOFF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a DLN configuration change message in a non-DLN office. No action is taken.

62. CTDLNERRMSGUNXSIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCdlnermsg() function encountered an unknown CNI/IMS silence state. No action is taken.

63. CTDLNPMACKNODLNOFF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a DLN database pump acknowledgement message in a non-DLN office. No action is taken.

64. CTDLNPMNODLNOFF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a DLN pump done message in a non-DLN office. No action is taken.

65. CTDLNQERRNODLNOFF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a DLN queue error report message in a non-DLN office. No action is taken.

66. CTDLNSTRTSCNNODLNOFF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a DLN STRTSCN acknowledgement message in a non-DLN office. No action is taken.

67. CTDMERTFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recvw() function in the CTpgeupdt process failed to receive a DMERT message. No action is taken. The CTpgeupdt process keeps waiting for DMERT messages.

68. CTDMERTFAIL (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DMERT message failed in the main function of the CCpgeupdt process

Action:

No action taken. Keep waiting for DMERT messages.

69. CTDNOBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DMERT message buffer could not be allocated.

70. CTDPUMPTO (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrttask() function found that the DLN database pump timed out. No action is taken.

71. CTDPUMPTO (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN) database pump timed out.

72. CTDWATTFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DTwattpas() function returned zero or a negative number of protected application segments in 3B memory. This means the CTpgeupdt process failed to attach to PAS for reading and writing. The CTpgeupdt process exited/died.

73. CTDWATTFAIL (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DTwattpas returned an invalid value which means CCpgeupdt failed to attach to protected application segment (PAS) for reading and writing.

74. CTFSTTPDBRDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBstfst() function called by the CTfillbuf() function returned an unknown value while trying to read the first tuple of a relation being pumped to the DLN. The DLN pump is aborted.

75. CTGETBFail (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the cHgwbuf() function failed.

76. CTGETBFAIL2TRY (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHgwbuf() function did not return a cH_PASS value to the CCrxnet() function on second request after it first returned a retry or no buffer value. The TSV message (for standby VFL maintenance) is not sent.

77. CTGETBFAILDEF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHgwbuf() function returned an unknown value to the CCrxnet() function. The TSV message (for standby VFL maintenance) is not sent.

78. CTGLDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A ring monitor kernel process (RINGMON) global variable was corrupted.

79. CTGLDLNEQ (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmskperr() function received a message from the MSCU indicating that there are no DLNs available. The office is equipped with DLNs so CCringmon will respond by calling recovery software to get a DLN back in-service.

80. CTGLDLNEQ (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Gldlneq global parameter was incorrectly set in one or more SMS.

81. CTGLDLNEQNODLN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmskperr() function received a message from the MSCU indicating that there are no DLNs available. CCringmon will respond by updating the Gldlneq parameter to reflect a non-DLN equipped office.

82. CTGRWQINV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCgrwqack() function was passed an unknown DLN queue name in an input message. No action is taken.

83. CTGRWQINV (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid direct link node (DLN)-AM queue was found during queue growth.

84. CTGRWQTO (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrttask() function found that the DLN-AM queue growth timer has expired. The timer is reset and the DLN-AM queue growth is retried.

85. CTGRWQTO (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN)-AM queue growth timed out.

86. CTHBLLMPROB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN) heartbeat found a discrepancy in the DLN's copy of the logical link map (LLM). Recovery was initiated.

87. CTHBNACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN) heartbeat could not be initiated because an active DLN was not available. Recovery action was initiated.

88. CTHBNMSCU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN) heartbeat found a discrepancy between the DLN's copy of the logical link map (LLM) and the DLN-AM queue headers. A mismatch was found in the LLM message switch control unit (MSCU) selection flag and the DLN MSCU access flag.

89. CTHBTOFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN) heartbeat timed out after several attempts. Recovery action was initiated.

90. CTHDRFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the cHsxhdr() function failed.

91. CTHDRFAIL2TRY (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHsxhdr() function did not return a cH_PASS value to the CCrxnet() function on second request after it first returned a retry or no buffer value. The TSV message (for standby VFL maintenance) is not sent.

92. CTHDRFAILDEF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHsxhdr() function returned an unknown value to the CCrxnet() function. The TSV message (for standby VFL maintenance) is not sent.

93. CTINCMFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive in the system integrity library (Slib) failed.

94. CTINCMFAIL1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "failure in init step message" to AIM on request of the CCrdlnack() function. No action is taken.

95. CTINCMFAIL2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "failure in init step message" to AIM on request of the CCrmsghdr() function. No action is taken.

96. CTINCMFAIL3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "successful in init step message" to AIM on request of the CCrmsghdr() function. No action is taken.

97. CTINCMFAIL4 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "failure in init step message" to AIM on request of the CCrttask() function while finishing the software initialization state. No action is taken.

98. CTINCMFAIL5 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "successful in init step message" to AIM on request of the CCrttask() function while finishing the software initialization state. No action is taken.

99. CTINCMFAIL6 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "failure in init step message" to AIM on request of the CCrttask() function while handling a DLN event message timeout. No action is taken.

100. CTINCMFAIL7 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "failure in init step message" to AIM on request of the CCrproc_create() function. No action is taken.

101. CTINCMFAIL8 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "successful in init step message" to AIM on request of the CCrproc_create() function. No action is taken.

102. CTINCMFAIL9 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "successful in init step message" to AIM on request of the CCrfull_op() function while in RINGMON FPI but not in MIN-MODE in a NON-DLN equipped CNI ring after loading all CNI user software to main memory. No action is taken.

103. CTINCMFAIL10 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "successful in init step message" to AIM on request of the CCrfull_op() function while in RINGMON FPI in a DLN equipped CNI ring after starting the DLN heartbeat. No action is taken.

104. CTINCMFAIL11 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "successful in init step message" to AIM on request of the CCrfull_op() function after min-mode is completed. No action is taken.

105. CTINCMFAIL12 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "failure in init step message" to AIM on request of the CCflt_sinit() function after it failed to open and initialize the CNIUZRCHN communication channel. No action is taken.

106. CTINCMFAIL13 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "failure in init step message" to AIM on request of the CCflt_sinit() function when it found out that RINGMON is not in the software initialization state. No action is taken.

107. CTINCMFAIL14 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcomplete() primitive failed to send a "successful in init step message" to AIM on request of the CCflt_sinit() function after the RINGMON software initialization step completed. No action is taken.

108. CTINIRPTOUTOFORD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received an "initial report complete" message that was out of order. No action is taken.

109. CTINVCCTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTpgeupdt process received a DMERT message from CCringmon, that was of an unexpected type. The message is discarded. The CTpgeupdt process returns to waiting for another DMERT message.

110. CTINVCCTYPE (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received and invalid type in the body of the DMERT message located in main of the CCpgeupdt process.

Probable Cause:

RINGMON sent the wrong type.

Action:

Ignore and return to waiting for another DMERT message.

111. CTINVCNMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ring monitor kernel process (RINGMON) received an invalid common network interface (CNI) message.

112. CTINVDDBIT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected argument (dd_bit) was passed to the CCddwork() function. No action is taken.

113. CTINVDDBIT (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received invalid DD bit from the DMERT message being processed or from a internal function call in the CCpgeupdt process.

Action:

Return to the calling function and continue.

114. CTINVDEVT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid direct link node (DLN) event type was encountered.

115. CTINVDLN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DLNINDX() macro failed to translate the DLN RNA to DLN index on request of the CCrmsghdlr() function. No action is taken.

116. CTINVDLN (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not translate between the direct link node (DLN) ring node address (RNA) and the DLN index.

117. CTINVDLNQ0ST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrinitdlnq() function encountered an invalid DLN-AM queue 0 state. The DLN-AM queue 0 init process is stopped.

118. CTINVDLNQ1ST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrinitdlnq() function encountered an invalid DLN-AM queue 1 state. The DLN-AM queue 1 init process is stopped.

119. CTINVDPM (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmpctrl() function was called to begin a DLN DB pump while a pump was already in progress. No action is taken.

120. CTINVPMP (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to start the pump of the direct link node (DLN) while the pump was in progress.

121. CTINVDSIGST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTsignals() function read an unexpected state for the CNI Direct Signaling Service. No update of the DSIG indicator is done. Continue with the rest of indicators on the 118 MCC page.

122. CTINVDSIGST (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Read an invalid state from CTDSIGSTATE location.

Probable Cause:

CCRINGMON populated the location with an invalid state.

Action:

Do not update the 118 MCC page and continue.

123. CTINVDST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrsetdmap() function was passed an unknown DLN state. No action is taken.

124. CTINVDST (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid direct link node (DLN) state was requested.

125. CTINVEVNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid event was received.

126. CTINVFLT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

AIM did not confirm a SOFTWARE INIT STATE of RINGMON on request of the CCflt_sinit() function. No action is taken.

127. CTINVFLT (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid fault was received.

128. CTINVLKMJ (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTlinkupdate() function found an unexpected link major state. The major and minor link states will be displayed as unavailable (UNAV) and OOS respectively.

129. CTINVLKMJ (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid link major state was encountered.

130. CTINVMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTpgeupdt process received an unexpected DMERT message type. The message is discarded. The CTpgeupdt process returns to waiting for another DMERT message.

131. CTINVMSGTYPE (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an invalid DMERT message type in the main function of the CCpgeupdt process.

Probable Cause:

Some process sent a message to the wrong process.

Action:

Ignore and continue waiting for another message.

132. CTINVQST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid direct link node (DLN)-AM queue state was encountered.

133. CTINVRANGERET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from CTranges function in the CCpgeupdt process.

Action:

Return to waiting for another DMERT message.

134. CTINVREL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrgetrels() function was passed an unknown DLN database relation. No action is taken.

135. CTINVREL (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected database relation was found during a direct link node (DLN) database pump.

136. CTINVSGN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrgetqsize() function encountered an error while trying to determine a DLN-AM queue size. Contact your higher technical support level. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

137. CTINVSGN (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A segment was not in the process's address space.

138. CTINVSIGST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTpgeupdt process received a DMERT message, probably from the CCddupdate() function, that contained an unexpected data delivery bit set. The message is discarded. The CTpgeupdt process returns to waiting for another DMERT message.

139. CTINVSIGST (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid signaling type or state was encountered.

140. CTINVTAPST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTsignals() function read an unexpected state for the CNI TCAP signaling service. No update of the TCAP indicator is done. Continue with the rest of indicators on the 118 MCC page.

141. CTINVTAPST (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Read an invalid state from CTTAPSTATE location.

Probable Cause:
CCRINGMON populated the location with an invalid state.

Action:
Do not update the 118 MCC page and continue.

142. CTINVTSIGST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The CTsignals() function read an unexpected state for the CNI trunk signaling service. No update of the TSIG indicator is done. Continue with the rest of indicators on the 118 MCC page.

143. CTINVTSIGST (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Read an invalid state from CTTSIGSTATE location.

Probable Cause:
CCRINGMON populated the location with an invalid state.

Action:
Do not update the 118 MCC page and continue.

144. CTIOCTLFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The cHioctl() function could not set the logical characteristics of the CNI to applications communications channel on request of the CCrinit_chn() function. No action is taken.

145. CTIOCTLFAIL (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Could not set the logical common network interface (CNI) channel characteristics.

146. CTKEVNTUNKEVNT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The kevent() function was passed an unknown event. No action is taken.

147. CTMGPMSTMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queuemn() function could not send a message to the CCS PM AM process about a DLN switch on request of the CCsndmgpmst() function. No action is taken.

148. CTMSGQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DMERT message could not be queued successfully.

149. CTNDLNACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A negative ACKDLN message was received from the common network interface (CNI) in response to a DLNACT transaction. This is only valid when a transient event occurs.

150. CTNDLNACKCONDRMV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function received a negative DLN acknowledgement to a DLNACT message in response to a conditional removal of the active DLN but no transient event occurred. No action is taken. The message is dropped.

151. CTNDLNACKPHASE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function received a negative DLN acknowledgement to a DLNACT message in response to CNI PHASE message but no transient event occurred. No action is taken. The message is dropped.

152. CTNDLNACKRMV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function received a negative DLN acknowledgement to a DLNACT message in response to a removal of active DLN but no transient event occurred. No action is taken. The message is dropped.

153. CTNDLNACKRST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function received a negative DLN acknowledgement to a DLNACT message in response to a restoration of DLN but no transient event occurred. No action is taken. The message is dropped.

154. CTNDLNACKSTCHG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function received a negative DLN acknowledgement to a DLNACT message which was not directly caused by a CNL event but no transient event occurred. No action is taken. the message is dropped.

155. CTNOACTDLN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No active direct link node (DLN) was found after a remove or a restore.

156. CTNOACTDLNCONDRMV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function found no active DLN after a conditional removal of an active DLN had been acknowledged. No action is taken.

157. CTNOACTDLNRST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function found no active DLN after a restoration of a DLN had been acknowledged. No action is taken.

158. CTNOTCM2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlninit() function encountered an attempt to start active DLN scanning in a non-CM2 office. No action is taken.

159. CTNOTCM2 (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to start active direct link node (DLN) scanning in a non-CM2 office.

160. CTNOTIMER (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrtset() function could not find an empty timer in the CCTimrs[] link list. No timer is set.

161. CTNOTIMER (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No internal timer was available.

162. CTOFLBUNXMSGACTV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTOflboot() function received an off-line boot message that contained an unexpected activity type. The message is discarded and the off-line boot process is aborted.

163. CTOLBDLNPRTFail (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DMERT primitive kportid() failed to retrieve the imsdv.p process ID on request of the CTolbdln() function. An unexpected return code from kportid() was found. No action is taken.

164. CTOLBDLNUNXRC (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTolbrange() function returned an unexpected value to the CTolbdln(). No action is taken.

165. CTOLBRESPMSGDNDFail (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queuemn() function could not send a ringmon off-line boot response message on request of the CTolbresp() function. No action is taken.

166. CTOLBRESPNOMSGBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The alocmmsg() function could not allocate a RTR message buffer on request of the CTolbresp() function for a ringmon off-line boot response. No action is taken.

167. CTOPENFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not open a common network interface (CNI) channel.

168. CTOPENFAIL1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrinit_chn() function found no DMERT application process running after the cHkopen() function returned an error while it was requested to open a CNI to applications communication channel. The error may be: max number of channel already open, invalid function number, the message switch is not running yet, no read list could be obtained, or no old write list could be obtained. No action is taken.

169. CTOPENFAIL2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrinit_chn() function found no DMERT application process running after the cHkopen() function returned an error when it requested to open a CNI to applications communication channel. The error is: channel already open. A timer is set to retry.

170. CTOPENFAIL3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrinit_chn() function found no DMERT application process running after the cHkopen() function returned an error when it requested to open a CNI to applications communication channel. The error is: channel already open. The maximum number of retries has been reached. No action is taken.

171. CTOPENFAIL4 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrinit_chn() function found no DMERT application process running after the cHkopen() function returned a good CNI applications communication channel descriptor. No action is taken.

172. CTOUTOFORD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ring monitor kernel process (RINGMON) received a start traffic message from the signaling link maintenance kernel (SLMK) process that was out of order.

173. CTPORTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DMERT primitive kportid() failed.

174. CTR7UPUNKMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCr7up() function received an unknown message type. No action is taken.

175. CTRCMKPOPENMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queuemn() function could not send a message to the CMKP about a channel open for OSDS communication on request of the CCrcmkpopen() function. The message is dropped but a timer is set to retry.

176. CTRCMKPOPENNOBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrcmkpopen() function could not allocate a buffer for a DMERT message to CMKP. A timer is set to retry.

177. CTRCONFMTMRNOSET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnaud() function found that the DLN reconfiguration timer was not set while the message active flag was set. No action is taken.

178. CTRCONFMTMRSET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnaud() function found that the DLN reconfiguration timer was set while the message active flag was not. No action is taken.

179. CTRCONFTO (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrttask() function found that a DLN reconfiguration request timed out. The DLN recovery is requested.

180. CTRCONFTO (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to reconfigure the direct link node (DLN) timed out.

181. CTRDISPLAYMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queuemn() function could not send a display page update message to the CCpgeupdt process on request of the CCrdisplay() function. The message is dropped but a timer is set to retry.

182. CTRDISPLAYNOMSGBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The alocmmsg() function could not allocate a RTR message buffer on request of the CCrdisplay() function for a ringmon display page update message. A timer is set to retry.

183. CTRDLNCONFREJECT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DLNINDX() macro could not convert RNA to DLN index on request of the CCrdlnconf() function. The request to

change the configuration of a DLN with this RNA is rejected.

184. CTRDLNRDFLBADMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnrcfl() function received a message to remove a standby DLN due to a recent change failure, but the message contained an unexpected message type. No action is taken.

185. CTRDPCMSGNOBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTrdpcmsg() function could not allocate a buffer for a DMERT message to CCMA process. No action is taken.

186. CTRDPCMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queueemn() function could not send a DPC status notification message to the CCMA in OKP on request of the CTrdpcmsg() function. No action is taken.

187. CTREADFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read from the common network interface (CNI) channel failed.

188. CTREADFAILBADCHAN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHrscrn() function returned to the CCreadmsgs() function a value indicating a bad CNIUZRCHN channel while RINGMON process was not awaiting initialization and a DMERT application process ID was valid. The read IMS messages process is stopped.

189. CTREADFAILDEF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHrscrn() function returned to the CCreadmsgs() function an unknown value, or a value indicating: CNIUZRCHN not open, or invalid channel descriptor, or signaling message which cannot be sent, or returned signaling message, or source matched signaling message, or returned signaling message without return bit set discarded, while RINGMON process was not awaiting initialization and a DMERT application process ID was valid. No action is taken.

190. CTREADFAILIPRTN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHrscrn() function returned to the CCreadmsgs() function a value indicating a returned interprocess message. The leaky bucket counter of resending messages was overflowed plus RINGMON process was not awaiting initialization and a DMERT application process ID was valid. The read IMS messages process is stopped and a CNI level 2 initialization is requested.

191. CTREADFAILIPSM (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHrscrn() function returned to the CCreadmsgs() function a value indicating "source matched interprocess message" while the RINGMON process was not awaiting initialization and a DMERT application process ID was valid. No action is taken.

192. CTRGRWQACKBADMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCgrwqack() function received a message to grow DLN-AM queues that contained an unexpected message type. No action is taken.

193. CTRMVACTINVDLNEVNT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnevt() function encountered an "active DLN removed" event for an invalid DLN index. No action is taken.

194. CTRMVDLNREJECT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DLNINDX() macro could not convert RNA to DLN index on request of the CCrmvdlm() function. The removal of an active DLN with this RNA is rejected.

195. CTRMVNACTINVDLNEVNT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnchg() function encountered a "non-active DLN removed" event for an invalid DLN index. No action is taken.

196. CTRNAINC (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrgetrna() function could not return a valid RNA of the active DLN on request of the CCrttask() function when the delay for the DLN StopScan had finished. No action is taken.

197. CTRNAINC (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ring node address (RNA) values of the direct link nodes (DLNs) were inconsistent after a STRTSCN or STRTSWITCH message timed out.

198. CTRNAINCSTRTSCN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrgetrna() function could not return a valid RNA of the active DLN on request of the CCrttask() function while this one tried to resend a STRTSCN message to the DLN. No action is taken.

199. CTRNAINCSTRTSWTCH (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrgetrna() function could not return a valid RNA of the active or standby DLN on request of the CCrttask() function while this one tried to resend a STRTSWITCH message to the DLNs. No action is taken.

200. CTRREADMSGSGUNKMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrreadmsgs() function encountered an unknown message type. No action is taken.

201. CTRSENDGRWMSGSGNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queuemn() function could not send a MSGROW message to the memory manager on request of the CCrsendgrw() function. The message is dropped but a timer is set to retry.

202. CTRSENDGRWNOMSGBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The alocmmsg() function could not allocate a RTR message buffer on request of the CCrsendgrw() function for a CCS ringmon send grow message. A timer is set to retry.

203. CTRSMKPERRNOBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrsmkperr() function could not allocate a buffer for a DMERT message to MSCU SMER in SMKP. No action is taken.

204. CTRSMKPERRMSGSGNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queuemn() function could not send an error report message from the ringmon to MSCU on request of the

CCrsmkperr() function. No action is taken.

205. CTRSSDCMSGNOBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrssdcmsg() function could not allocate a buffer for a DMERT message to SSD system process. No action is taken.

206. CTRSSDCMSGSNDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queueumn() function could not send a signaling status data message to the SSD process in the CMP on request of the CCrssdcmsg() function. No action is taken.

207. CTRSTINVDLNEVNT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnevt() function encountered a "DLN restored" event for an invalid DLN index. No action is taken.

208. CTRSTRTFail (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The _un_trbl() function returned an unexpected value to the CCrestartdlm() function. A DLN restart failed. No action is taken.

209. CTRSTRTFail (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A direct link node (DLN) restart was unsuccessful due to an unexpected return code from the un_trbl() function.

210. CTRSTRTSCNREJECT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DLNINDX() macro could not convert RNA to DLN index on request of the CCstrtschn() function. The request to start the scanning of the active DLN with this RNA is rejected.

211. CTRSWCMPLUNXDLNSW (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrswcmpl() function was passed an unknown DLN switch result. No action is taken.

212. CTRTREQBADMMSGHDRTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrtreq() function received a message to do a standby VFL test over a low speed link that contained an unexpected message header type. No action is taken.

213. CTRTREQBADTTYTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrtreq() function received a message to do a standby VFL test over a low speed link that contained an unexpected message tty type. No action is taken. The message is dropped.

214. CTRTTYBADMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrttymsg() function received a craft message for RINGMON that contained an unexpected tty type. No action is taken.

215. CTSCSTPDRRDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBstnxt() function called by the CTfillbuf() function returned an unknown value while trying to read the successive tuple of a relation being pumped to the DLN. The DLN pump is aborted.

216. CTSNDMGPMSTNOBUF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCsndmgpmst() function could not allocate a buffer for a DMERT message to CCS PM AM process. No action is taken.

217. CTSPARE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A place holder for future use.

218. CTSPARE1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A place holder for future use.

219. CTSS7MSGCCIS6OFF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrmsghdlr() function received a CCS7 message in a CCIS6 office. No action is taken.

220. CTSTATESTATUSDIF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INseqst() primitive did not return an INCREASE value to the CCrproc_create() function. A CNI FPI is requested to clear the problem.

221. CTSTMSGTIMEOUT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrttask() function found too many timeouts/retransmits events waiting for a "start traffic sequence" message. No action is taken.

222. CTSTTRMSGOUTOFORD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnevt() function received a start traffic message that was out of order. No action is taken.

223. CTUKCOND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown condition was passed to a ring monitor kernel process (RINGMON) function.

224. CTUKSPEED (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ring monitor kernel process (RINGMON) could not determine the link speed.

225. CTUKSPEEDLKCNG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTsetsig() function could not determine a SS7 links speed while trying to check TCAP/TSIG congestion state. This link is skipped and the remaining SS7 links are checked.

226. CTUKSPEEDLNKAVL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTsetsig() function could not determine a SS7 links speed while trying to assess TCAP/TSIG availability. This link is skipped and the remaining SS7 links are checked.

227. CTUKTASK (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrttask() function was passed an unknown timing task. No action is taken.

228. CTUKTASK (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown timing task was encountered in the ring monitor kernel process (RINGMON).

229. CTUNIXRTRBADMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCunixmsg_hdlr() function received a RTR message that contained an unexpected message type. No action is taken.

230. CTUNKNDLNEVNT1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The The CCrdlnevt() function encountered an unknown DLN event. No action is taken.

231. CTUNKNDLNEVNT2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnchg() function encountered an unknown DLN event. No action is taken.

232. CTUNKNDLNEVNT3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnack() function encountered an unknown DLN event. No action is taken.

233. CTUNKNDLNEVNT4 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrchkdlnst() function encountered an unknown DLN event. No action is taken.

234. CTUNKNDLNEVNT5 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrchgdlnst() function encountered an unknown DLN event. No action is taken.

235. CTUNXPRETURN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTpagepoked() function received an unexpected return code from the CTranges() function. No action is taken.

236. CTWRITEFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A write to the common network interface (CNI) channel failed.

237. CTWRITEFAIL1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrsendmsg() function found no DMERT application process running after the cHcpx() function failed to transmit an IMS interprocess message to the SLMK process. The cHcpx() function returned an unexpected value or an error other than no buffer available. No action is taken.

238. CTWRITEFAIL3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrsendmsg() function found no DMERT application process running after the cHcpx() function failed to transmit an IMS interprocess message to the SLMK process. The cHcpx() function returned a no buffer error. A timer is set to retry.

239. CTWRITEFAIL4 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnsend() function found no DMERT application process running after the cHcpx() function failed to transmit an IMS interprocess message to the CCTRANS in DLN. The cHcpx() function returned an error other than no buffer available or retry later. No action is taken.

240. CTWRITEFAIL6 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdlnsend() function found no DMERT application process running after the cHcpx() function failed to transmit an IMS interprocess message to the CCTRANS in the DLN. The cHcpx() function returned a retry later or no buffer error. A timer is set to retry.

241. CTWRITEFAIL7 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cHxmit() function, on request of the CCrxnet() function, failed to transmit a VFL maintenance message to the far end on retry while the first try returned a no buffer or try later error. No action is taken. The message is dropped.

242. CTWRITEFAIL8 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrxnet() function received an unexpected return code from the cHxmit() function that was supposed to transmit a VFL maintenance message to the far end. No action is taken. The message is dropped.

Range: dctsp**1. INLBCPNOSM (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

LBPUMP received a text/data request from pump control (PUCR) for a broadcast text pump, but the corresponding SM bit map was empty. LBPUMP will terminate.

2. INPLFMAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) found a log file to pump that had an invalid magic value.

3. INPUABRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an E_ABORT event that terminated the pump.

4. INPUACKF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The completion code in the MGPURACK message was not success (not used).

5. INPUADSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP's addseg() primitive failed.

6. INPUALCS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP's alocseg() primitive failed.

7. INPUALKS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP's alocseg() primitive failed.

8. INPUALOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the INalocseg() function could not find a free segment to allocate.

9. INPUBADSCNAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected section name found in a relocatable file, but that section name is not known to the relocatable image map (RIM). Therefore, the unknown section will NOT be pumped since there is no information as to where it belongs in SM memory.

Probable Cause:

A new peripheral image has been added to "perf.out", but the corresponding changes have not been made in "relo_ptrs". NOTE: "perf.out" is the most likely file to cause this problem, however there are other relocatable files (RODD, log files).

Action:

The unknown section name is displayed on the ROP:

REPT PUMP: UNKNOWN RELOCATABLE SECTION: xxx "/no5odd/cidata/relo_ptrs" needs to be updated with the new relocatable section name and its associated critical info (CI) pointer names. (i.e. "XXX Glxxxxsa Glxxxea"). After "relo_ptrs" has been updated, invoke "rimgen" to regenerate the RIM.

10. INPUBMAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), an invalid magic number was in a disk image file. The file was not swabbed correctly for the 3B processor.

11. INPUCANC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) received a text/data request saying to terminate the previous request.

12. INPUCONP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) failed to connect to a port via the connport() primitive.

13. INPUCOPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP failed to open to the communications kernel process (CMKP).

14. INPUCPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the DMERT primitive sendcpmsg() failed to send a message.

15. INPUDSKB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) encountered an invalid disk buffer state.

16. INPUEISS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CTSPUMP - Unknown or invalid generic issue found in pumplib.

17. INPUEVT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP's event() primitive failed.

18. INPUFCLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) failed to close a disk file via the file manager.

19. INPUFHF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CTSPUMP - FPFAL from FPFH(not used).

20. INPUFILMX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CTSPUMP - more than 16 files for this IM.

21. INPUFIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CTSPUMP - FP rcvd a FINI msg in INreceive(not used).

22. INPUFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP received a fault entry.

23. INPUFOPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) failed to open a disk file via the file manager.

24. INPUFREE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), an attempt to free a segment via the DMERT primitive freeseg() failed.

25. INPUGRSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP's growseg() primitive failed.

26. INPUINVEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) received an invalid event. The pump process is not terminated.

27. INPUINVMS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) received an invalid message. The pump process is not terminated.

28. INPUINVPTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid "pump type" has been detected. Therefore sevent() can not determine which message send function to call.

29. INPULINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), an invalid return was passed from the INtdjob() function to the INlinkq() function.

30. INPULNKQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the INerchk() function found a failure on message link queue pointers.

31. INPUMXB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the text/data byte counter exceeds the maximum number of bytes (16M).

32. INPUNOBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) could not read the RLSMCONF relation, or encountered invalid data in the RLSMCONF relation.

33. INPUNOCRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) found a "dummy" common object file format (COFF) section header for the database customer originated recent change (CORA) logging file, but the "real" COFF section header for the CORA logging file was not found. The CORA log file /smlog/im#cora is missing where "#" is the SM number in the data dump.

34. INPUNOLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication to the SM being pumped was lost. Pump will terminate, but this assert will not fire (that is, the code currently does not call this assert).

35. INPUNOSCN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CTSPUMP - Unable to find expected section name within the file.

36. INPUOACL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) failed to close an AM office dependent data (ODD) file on the offline disk.

37. INPUOAOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) failed to open an AM office dependent data (ODD) file on the offline disk.

38. INPUOARP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) failed to read AM office dependent data (ODD) global parameters from the offline disk.

39. INPUOARR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) failed to read the AM office dependent data (ODD) RLSCONF relation from the offline disk.

40. INPUODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) failed to attach the AM office dependent data (ODD) to the protected application segment (PAS).

41. INPUPAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the INinit() function failed to fully attach to the protected application segment (PAS).

42. INPUPNSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP's punswap() primitive failed.

43. INPUPRI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the DMERT primitive setprior() failed to set the priority of the pump process.

44. INPUREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), a file manager read attempt failed.

45. INPURIMSUMERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CTSPUMP has generated a different "sum" value over the relocatable image map (RIM) data than the sum value stored internally with the RIM.

Probable Cause:

Corruption of the disk file "/no5odd/cidata/rim.out".

Action:

Regenerate the RIM with the following command:

EXEC-UPROC: "/usr/bin/rimgen";

46. INPURQFN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), an invalid return was passed from the INrqfini() function to the INlinkq() function.

47. INPUSAEA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control time slot pump (CTSPUMP) received a text/data request with a starting address that is greater than its ending address.

48. INPUSDPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP's sendport() primitive failed.

49. INPUSEG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the segment number exceeded the maximum value in the INseinfo() function.

50. INPUSFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the DMERT primitive sendfault() failed to send a fault.

51. INPUSMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In control time slot pump (CTSPUMP), the DMERT primitive sendmsg() failed to send a message.

52. INPUSTMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
PUMP's setmap() primitive failed.

53. INPUSZBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The section size is not a multiple of 2048 bytes. All pump files require section sizes to be a multiple of 2K bytes.

Probable Cause:
The file has been corrupted or improperly generated.

Action:
The pump will proceed with other sections but the bad section will not be pumped. Send the assert information to the local support organization to identify the bad section and get the file corrected.

54. INPUTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Control time slot pump (CTSPUMP) timed out while waiting for a response from the SM after sending a FINISH message.

55. INPUULCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
In control time slot pump (CTSPUMP), the DMERT primitive ulockseg() failed to unlock a segment in the pump process.

56. INPUWRDD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
In control time slot pump (CTSPUMP), the DDSWRITE() function failed.

57. INTOFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A pump process was sent a fault, but the fault did not occur within a reasonable amount of time.

Range: ddbgrw**1. DBATTSG (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to connect to the system generation (SG) database.

2. DBBADATYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to use a relation with an unexpected access type.

3. DBBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office dependent data (RODD) bitmap salvage technique (BST) received an invalid message from the SM.

4. DBBADUTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unitttype was encountered.

5. DBBDHMOT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a human machine (HM) output message. Check the affected processor status and retry the growth message.

6. DBBDMOTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An improper office dependent data (ODD) memory type was used.

7. DBBSTCOFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office dependent data (RODD) bitmap salvage technique (BST) could not read the common object file format (COFF) header of the RODD.

8. DBBSTMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office dependent data (RODD) bitmap salvage technique (BST) failed to send a message from the SM to the AM.

9. DBBSTSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office dependent data (RODD) bitmap salvage technique (BST) could not send a message from the AM to the SM.

10. DBBSTTMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bitmap salvage technique (BST) timed out while waiting for a response from the SM.

11. DBCGAINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk insert primitive failed for the RLCGA_STAT relation during ODDCREATE.

12. DBCGANXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk read next primitive failed while reading the RLCGA_STAT relation during ODDCREATE.

13. DBCGARFST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk read first primitive failed during ODDCREATE for the RLCGA_STAT relation.

14. DBCOFFHDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, the DBcpy_cof() function was unable to write the non-redundant common object file format (COFF) file header. The growth will be aborted and all files for the growth SM will be removed.

15. DBDDRDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unprotected office dependent data (UODD) growth error occurred. Could not read the DDUNGRW data delivery bit.

16. DBDDSTBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During initial process setup or actual execution of an office dependent data (ODD) growth, the data delivery function DDswrite() failed to write the value of a data delivery bit.

17. DBDFIFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received from the DBupddfi() function call.

18. DBDISKERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was returned from the disk driver, or the message received was not from the disk driver.

19. DBDISKSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth or non-redundant office dependent data (NRODD) growth, the DBodd_part() function failed to find a mounted SM ODD partition with sufficient contiguous disk space to create an SM ODD file.

20. DBDNINCTUPNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the DBxrdfst() function failed while trying to read the RLRT_DNTRAN relation.

21. DBDNXTSINTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) set primitive DBxtsintup() failed while trying to insert tuples into the SM.

22. DBEQLOCFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBxfrdtup() function failed while trying to read the RLRC_EQLOC relation during ODDCREATE.

23. DBFRCMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to receive a message. The recv() or recvw() function returned a failure code. Check the status of the affected processor and retry.

24. DBGETCLI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM read of the MODCLI relation failed during oddcreat.

Action:

Product engineering control center (PECC) should be contacted for assistance.

25. DBGR1SCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There is more than one link to the office dependent data (ODD) scratch file used by ODD growth and backup. Automatic recovery is being attempted.

26. DBGR2SCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are more than 2 links to the office dependent data (ODD) scratch file used by ODD growth and backup. Automatic recovery can not be completed successfully.

Action:

Seek technical assistance.

27. DBGRALLOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) growth error occurred while trying to re-allocate a file.

28. DBGRATT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not attach to the office dependent data (ODD).

29. DBGRBDVERB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected command was encountered, part of the command line was incorrect. The unprotected office dependent data (UODD) growth process was not started. Retry the UODD growth command.

30. DBGRBSMST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During office dependent data (ODD) growth, invalid data was found in the state file.

31. DBGRCPODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an office dependent data (ODD) growth, the copy of an ODD file has failed.

32. DBGRDACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found for the DBactblks parameter.

33. DBGRDREAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) growth error occurred. A create failed.

34. DBGRDSK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the disk office dependent data (ODD).

35. DBGRDSKCP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A disk office dependent data (ODD) copy failure occurred.

36. DBGRGNHSH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was received from the DBgenhash() function during an office dependent data (ODD) growth.

37. DBGRIALOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred when the falloc() function was called to allocate file space for file.

38. DBGRIDDW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not write the data delivery (DD) bit DDSBKUPCI.

39. DBGRIKEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The wrong key was received from human machine interface (HM).

40. DBGRIMESG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The wrong message type was received from the SM.

41. DBGRIRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The wrong return code was received.

42. DBGRISEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendpw() function failed.

43. DBGRISPR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sprintf() function failed.

44. DBGRITIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recvw() function timed out.

45. DBGRLINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) growth error occurred. A link failed.

46. DBGRNOSCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The scratch file used when doing an office dependent data (ODD) growth or ODD backup is missing.

47. DBGROPEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. Could not open a file.

48. DBGRRDDISK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the global parameter DBdiskblks.

49. DBGRRDDPHYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the global parameter DBdphysblks.

50. DBGRRDUN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Growth could not read the value of the DBunblocks global parameter from the destination SM.

51. DBGRRREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received. Could not read a file.

52. DBGRSCORPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM /no5odd/cpdata/DBgrwstate file contains the states of unprotected, non-redundant, and redundant office dependent data (ODD) growths as well as the redundant bitmap salvage technique (BST). The DBgrwstate file contained inconsistent data or the internal file layout was corrupted.

53. DBGRSCRSZ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During non-redundant office dependent data (NRODD) growth, the ODD scratch file was not allocated to the correct size.

54. DBGRSEEK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to seek to a section of a file.

55. DBGRSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred in a stat() function call.

56. DBGRSTBD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected office dependent data (UODD) growth state structure for the SM UODD being grown, was read from the SM /no5odd/cpdata/DBgrwstate file on disk. The previous UODD size found in the structure was not consistent with the current value of the DBunblocks global parameter on the SM having its UODD grown.

57. DBGRTMPSCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A temporary office dependent data (ODD) file has been found that is not linked to the ODD scratch file.

Action:

Seek technical assistance.

58. DBGRUNLINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) growth error occurred. An unlink failed.

59. DBGRUPDPHYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the global parameter DBdphysblks.

60. DBGRVCP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The vcp command failed.

61. DBGRVTOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBdphysblks global parameter or /dev/vtoc could not be read.

62. DBGRWCONF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An ODDCREATE failure occurred. The rISMCONF tuple for the growth SM had an invalid configuration type.

63. DBGRXSCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The extra link to the office dependent data (ODD) scratch file could not be located during recovery.

Action:

Seek technical assistance.

64. DBGTGRWST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not access a growth state structure in the SM /no5odd/cpdata/DBgrwstate file.

65. DBINCTUPNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBxrdfst() set primitive returned the incorrect number of tuples.

66. DBLLAGET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get a pack record from the system generation (SG) database.

67. DBL_USEINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk insert primitive for the LNK_USE relation failed during oddcreat.

Probable Cause:

Corrupt office dependent data (ODD) skeleton files.

Action:

Product engineering control center (PECC) should be contacted for assistance.

68. DBL_USENXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk read next primitive for the LNK_USE relation failed during oddcreat.

Probable Cause:

Corrupt office dependent data (ODD) skeleton files.

Action:

Product engineering control center (PECC) should be contacted for assistance.

69. DBL_USERFST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk read for the LNK_USE relation failed during oddcreat.

Probable Cause:

Corrupt office dependent data (ODD) skeleton files.

Action:

Product engineering control center (PECC) should be contacted for assistance.

70. DBLVL3DWN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the startup of the office dependent data (ODD) growth user level automatic restart process (ULARP), level 3 communication was down between the AM and the CMP. ODD growth will wait a specified amount of time and try again.

71. DBMEMORY_LOW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Not enough memory boards were available.

72. DBMHDINC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The moving head disk (MHD) pair is in an inconsistent state. One disk should be active and the other should be offline.

73. DBMKNOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The mknod *UNIX*[®] system call failed to create a mount point for a directory.

74. DBMODACC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update accdict, the database access dictionary.

75. DBMODAMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A memory allocation failure occurred.

76. DBMODDEL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated during an SM core growth if oddcreat receives a failure from DBdeltup(), which indicates that an error occurred while deleting a tuple from a relation.

77. DBMODDINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBdintup() function failed.

78. DBMODDNXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBdrdnxt() function failed.

79. DBMODFILE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A file access failure occurred.

80. DBMODGPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A global parameter routine failed.

81. DBMODITUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An insert tuple failure occurred.

82. DBMODNXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) primitive DBxrdnxt() failed while trying to read the next tuple in the RLRT_DNMOD relation.

83. DBMODOPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) open failure occurred.

84. DBMODEREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An open relation failure occurred.

85. DBMODRFST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBdrfst() function failed.

86. DBMODRTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple read failure occurred.

87. DBMODTBGN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A begin transaction failure occurred.

88. DBMODXRDFST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) primitive DBxrdfst() failed while trying to read the RLRT_DNMOD relation.

89. DBMOUNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The mount() function failed to mount a *UNIX*® file system.

90. DBMSGENAB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The msgenab() system call failed.

91. DBNAMTMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a non-redundant office dependent data (NRODD) growth, the AM timed out while waiting for an SM message. It is assumed that the SM NRODD growth process terminated. The ROP message states that the growth message must be re-entered.

92. DBNOOKPCOM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not enable or close the communication between the *UNIX*[®] process and the operational kernel process (OKP) to allow or stop message traffic between SM and AM processes. Check the status of the affected AM processes and retry later.

93. DBNOOPSMS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, no operational SMs could be found in the office.

94. DBNOSTODDG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not set the office dependent data (ODD) growth in-progress flag (the DDRODDGRW data delivery bit). Check the status of the affected processor and retry.

95. DBNOSTUGDD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected office dependent data (UODD) growth process could not commit because it could not set the DDUNGRW data delivery bit.

96. DBNR1RECOV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrecsetup() function failed when it was called from the DBgrwrecov() function while trying to recover the SM office dependent data (ODD) hash files during a non-redundant ODD (NRODD) growth.

97. DBNR2RECOV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBreccomit() function failed when it was called by the DBgrwrecov() function while trying to set up the scratch file during a non-redundant office dependent data (NRODD) growth.

98. DBNR3RECOV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBreccomit() function failed when it was called from the DBgrwrecov() function while trying to recover the SM office dependent data (ODD) hashsum files during a non-redundant ODD (NRODD) growth.

99. DBNR4RECOV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrecsetup() function failed to set up the official and temp files when it was called from the DBgrwrecov() function during a non-redundant office dependent data (NRODD) growth.

100. DBNRBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the AM non-redundant growth process.

101. DBNRCLOSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not close a file. The close() system call failed.

102. DBNRDSEC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, the DBcpy_cof() function could not seek to the non-redundant office dependent data (NRODD) section of the non-redundant common object file format (COFF) file. The growth will be aborted and any files for the growth SM will be removed.

103. DBNRNGMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was lost between the AM and the SM during a non-redundant office dependent data (NRODD) growth.

104. DBNRODDPUR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A previous non-redundant office dependent data (NRODD) growth did not terminate successfully; therefore, the ODD bitmap salvage technique (BST) may not run.

105. DBNRODSHK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, a size was entered for the non-redundant office dependent data (NRODD) in the ODDCREATE input message that attempted to shrink the NRODD from the default size. This is not allowed. The default size for the NRODD will be used and the growth will continue.

106. DBNRODSZ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, a size for the non-redundant office dependent data (NRODD) was entered with an ODDCREATE input message that was not on an 8K boundary. The growth will be stopped.

107. DBNRUPDATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read or update the RLSMCONF relation during an office dependent data (ODD) growth.

108. DBOFFSFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to compute global parameter offsets.

109. DBOFFS_NA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An offset calculation timed out; no acknowledgement was found.

110. DBOPENSEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to open a partition sequence.

111. DBOPTHDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, the DBcpy_cof() function could not seek past the optional header of the non-redundant common object file format (COFF) file. The growth will be aborted and all files for the growth SM will be removed.

112. DBPARTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, the DBno_part() function could not find any mounted SM office dependent data (ODD) partitions.

113. DBPICBINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk insert primitive for the RLPICB relation failed during ODDCREATE.

114. DBPICBNXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk read next primitive for the RLPICB relation failed during ODDCREATE.

115. DBPICBRFST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disk read for the RLPICB relation failed during ODDCREATE.

116. DBPNXTSINTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the database (DB) set primitive DBxtsintup() failed while populating the RLRT_PDNTRAN relation.

117. DBPOPDNTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to populate the RLRT_DNTRAN relation in the new SM failed.

118. DBPOPPDNTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function that populates the RLRT_PDNTRAN relation returned failure.

119. DBPORTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to connect or detach from a port. Check the status of the affected processor and retry.

120. DBPRCALV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM office dependent data (ODD) growth and/or bitmap salvage technique (BST) recovery, the SM /no5odd/cpdata/DBgrwstate file indicated that an SM terminal process was executing an ODD growth or BST. However, no response was received after messages were sent to the process. Assume the SM terminal process no longer exists.

121. DBPRDNTAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function that populates the RLPR_DNTRAN relation in the growth or conversion process failed. The relation

could not be populated.

122. DBPRNXTSINTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) set primitive DBxstintup() failed while populating the RLPR_DNTRAN relation on the growth or converted SM.

123. DBPRXSRDTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the database (DB) set primitive DBxsrdtup() failed while populating the RLPR_DNTRAN relation.

124. DBPVTOT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The partition was not found in /dev/vtoc.

125. DBPXRDTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the database (DB) set primitive DBxrdtup() failed while populating the RLRT_PDNTRAN relation.

126. DBRANGE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, the DBno_part() function received an SM office dependent data (ODD) partition number from the mount command that was not within the valid SM ODD partition number range.

127. DBRCUMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received.

128. DBRDGET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to extract the header record of the system generation (SG) database.

129. DBRGCLOSF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBRdcff() function failed to close the common object file format (COFF) file.

130. DBRGOPENF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBRdcff() function failed to open a common object file format (COFF) file.

131. DBRGREADF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBRdcff() function failed to read the common object file format (COFF) file.

132. DBRGSEEKF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBRdcff() function called the fseek() function, but the fseek() function failed.

133. DBRMFILS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, the Dkfiles() function returned GLFAIL, indicating that it was unable to remove the SM office dependent data (ODD) files for the growth SM.

134. DBRODDPUR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Prior to the bitmap salvage technique (BST), a redundant office dependent data (RODD) growth did not complete.

135. DBRSMOREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the DBrsmbgn() function, the DBopnrel() function was called; the DBopnrel() function failed.

136. DBRSVUCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not reserve the unit control block (UCB). The ursvuch() function call failed.

137. DBSACPRDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the RLPR_DNTRAN relation during stand alone conversion.

138. DBSECHDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, the DBcpy_cof() function could not read a section header from the non-redundant common object file format (COFF) file. The growth will be aborted and the files for the growth SM will be removed.

139. DBSETIO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The setio() function call failed to initialize for physical I/O read of the offline disk.

140. DBSGMATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The block size in /dev/vtoc does not match the size found in the system generation (SG) database.

141. DBSKELFIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, the DBcpy_cof() function could not seek to the beginning of the office dependent data (ODD) skeleton file. The growth will be aborted and all files for the growth SM will be removed.

142. DBSTGRWST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred in an attempt to write the updated growth state structure to the SM /no5odd/cpdata/DBgrwstate file on disk.

143. DBSYSTEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redundant office dependent data (RODD) bitmap salvage technique (BST) encountered a system error.

144. DBUGAMTMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM growth process timed out while waiting for a message from the SM unprotected office dependent data (UODD) growth terminal process.

145. DBUGMGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unprotected office dependent data (UODD) growth process in the AM received an inappropriate message from the SM UODD growth terminal process.

146. DBUGSDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not form a special device. The ugsdf() function call failed.

147. DBUGUCBN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access the unit control block (UCB). The ugucbn() function failed.

148. DBUODDSZ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, a size was input for the unprotected office dependent data (UODD) on the ODDCREATE input message that was not on an 8K boundary. The growth will be stopped.

149. DBUPDAUSR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received while adding a new group partitioned data (GPD) user using the DBaddusr() function.

150. DBUPDCKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, ODDCREATE received a failure from the DBupdckt() function indicating that the RLCKTDATA relation was not updated correctly for the growth SM. The growth will be aborted and all files for the growth SM will be removed.

151. DBUPDDGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received while deleting a group partitioned data (GPD) group using the DBdelgrp() function.

152. DBUPDDTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code was returned from a DBxdltp() or DBgdltp() primitive call.

153. DBUPDDUSR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received while deleting a group partitioned data (GPD) user using the DBdelusr() function.

154. DBUPDEMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No remote switching module (RSM) was assigned to the multi-module RSM (MMRSM) site. The RLCLIDAT relation did not have any RSMs assigned.

155. DBUPDGPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a failure return code while updating a global parameter using the DBupgparm() function.

156. DBUPDL_USE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The oddcreat tool received an error from DBupdl_use() indicating that the relation RLLNK_USE was not updated correctly for the growth SM. The growth will be aborted and all files for the growth SM will be removed.

Probable Cause:

Inability to access AM RLNLINK relation or corrupt office dependent data (ODD) skeleton files.

Action:

Product engineering control center (PECC) should be contacted for assistance.

157. DBUPDPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to close the communication port between *UNIX*[®] and the operational kernel process (OKP).

158. DBUPDPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, ODDCREATE received a failure from the DBupdparms() function indicating that the global parameters were not updated correctly for the growth SM. The growth will be aborted and all files for the growth SM will be removed.

159. DBUPDTEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a failure return code while committing an update transaction using the DBendtrn() function.

160. DBUPDUCOM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

After an update transaction failed to commit, the transaction failed to uncommit and restore the associated relations to their original values.

161. DBUPDUNIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated during an SM core growth if oddcreat receives a failure from DBupdunit() function, which indicates that the relation RLUNIT_CKT was not updated correctly for the growth SM. The growth will be aborted and all files for the growth SM will be removed.

162. DBXSINSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An insert set primitive call failed.

163. DBXSRDFSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read first set primitive failed.

164. DBXSRDNSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) read next set primitive call failed.

165. DBXSRDSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Some errors occurred while using a database (DB) subsystem "read set" primitive.

166. DBXTSINTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to the DBxtsintup() set primitive failed while trying to insert tuples into the SM.

167. DBZAPFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During SM core growth, a call to the DBzaprel() function could not find the access dictionary entry for the relation.

Range: ddg**1. DGPE32 (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-recoverable paging internal error occurred.

2. DGPE33 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Paging received an unexpected message that was not related to paging. The message was discarded.

3. DGPE34 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM paging supervisor internal audit detected a problem. The queue was flushed and paging was reinitialized.

4. DGPE35 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recoverable paging system or system resource problem occurred.

5. DGPE36 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was lost by the system or received out of sequence; or the paging processes were out of step with each other. The current download in progress will be aborted and automatically retried.

6. DGPE37 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-recoverable paging system or system resource problem occurred.

7. DGPE38 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Paging detected a problem with the translation file(s) (could be /no5text/im/ASMpprogxf or /no5text/im/2Kpprogxf or both). Either paging could not access the file(s) or the requested product was missing from one of the two files.

8. DGPE39 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recoverable paging internal error occurred.

9. DGPE40 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Paging detected a problem with the product object file (usually a diagnostic product under /no5text/im/dn or /no5text/im/dn2k). Either the file name and path given in /no5text/im/ASMpprogxf or /no5text/im/2Kpprogxf could not be found or that product had an internal problem.

10. DGPE41 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recoverable internal paging resource problem occurred. This error may mean that the queue was full or there were too many retries.

11. DGPE42 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-AM diagnostic paging supervisor (CP-PAGS) could not send a message.

12. DGPE43 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-recoverable error occurred in the central processor-AM diagnostic paging child process (CP-IMCTL).

13. DGRXE1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) was already in a started state.

14. DGRXE2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) was not in a started state.

15. DGRXE3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) failed in an attempt to send a message to the human/machine interface (HM).

16. DGRXE4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CPREXS) failed in an attempt to send a message to the multi-module routine exercise control process (MM-REXC).

17. DGRXE5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) failed in an attempt to send a message to the deferred maintenance administrator and monitor (DMAM) process.

18. DGRXE6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) received a message from an invalid sender.

19. DGRXE7 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) received an invalid message from the deferred maintenance administrator and monitor (DMAM) process.

20. DGRXE8 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) received an invalid message from the multi-module routine exercise control process (MM-REXC).

21. DGRXE10 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) encountered an unsuccessful database read.

22. DGRXE11 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) equipage table index was out of range.

23. DGRXE12 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) failed to establish communication with the

multi-module routine exercise control process (MM-REXC).

24. DGRXE13 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) encountered an invalid test type.

25. DGRXE14 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor-CM routine exercise scheduler (CP-REXS) summary table index was out of range.

26. DGRXE15 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recvw() function failed in the DGrxrvmsg() function.

Range: dfp**1. INFPNOBSMS (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) requested fast pump (FPUMP) to start a broadcast pump, but the request did not contain any SMs.

2. INPLFMAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) found a log file with an invalid common object file format (COFF) magic number. The log file name is printed on the ROP. This log file cannot be pumped; thus, it cannot be roll-forwarded during INIT. This event is not fatal to the pump since log files are optional. The pump continues without the log file, and the SM may result in RC-BACKOUT.

3. INPUABRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), an E_ABORT event occurred.

4. INPUACKF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the completion code in the MGPURACK message was not success.

5. INPUADSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive addseg() failed.

6. INPUALCS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUMP's alocseg() primitive failed.

7. INPUALKS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), a DMERT primitive failed to lock a segment in main memory.

8. INPUALOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the INalocseg() function could not find a free segment to allocate.

9. INPUBADSCNAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected section name found in a relocatable file, but that section name is not known to the relocatable image map (RIM). Therefore, the unknown section will not be pumped since there is no information as to where it belongs in SM memory.

Probable Cause:

A new peripheral image has been added to "perf.out", but the corresponding changes have not been made in "relo_ptrs". NOTE: "perf.out" is the most likely file to cause this problem, however there are other relocatable files (RODD, log files).

Action:

The unknown section name is displayed on the ROP: REPT PUMP: UNKNOWN RELOCATABLE SECTION: xxx "/no5odd/cidata/relo_ptrs" needs to be updated with the new relocatable section name and its associated critical info (CI) pointer names. (i.e. "XXX Glxxsa Glxxea"). After "relo_ptrs" has been updated, invoke "rimgen" to regenerate the RIM.

10. INPUBLKB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) encountered a text/data request address that was not on a 2K boundary.

11. INPUBMAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), an invalid magic number was found in a disk image file. The file was not swabbed correctly for the 3B processor.

12. INPUCANC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) received a text/data request saying to terminate the previous request.

13. INPUCONP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive connport() failed to connect FPUMP to a valid port.

14. INPUCOPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to open to the communications kernel process (CMKP).

15. INPUCPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive sendcpmsg() failed to send a message.

16. INPUDSKB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) encountered an invalid disk buffer state.

17. INPUEISS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

FPUMP - Unknown or invalid generic issue found in pumplib.

18. INPUEVT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive event() failed.

19. INPUFCLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to close a disk file via the file manager.

20. INPUFDSK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the INfdskhd() function received the buffer state INEMPTY.

21. INPUFHF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) received FPFail from the fast pump facility handler (FPFH).

22. INPUFILMX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

FPUMP - more than 16 files for this IM.

23. INPUFIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) received a FINISH message in the INreceive() function.

24. INPUFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) encountered a fault entry.

25. INPUFODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to attach the AM office dependent data (ODD) to the protected application segment (PAS).

26. INPUFOPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to open a disk file via the file manager.

27. INPUFPAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to attach to the protected application segment (PAS).

28. INPUFREE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP) an attempt to free a segment via the DMERT primitive freeseg() failed.

29. INPUGRSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive event() failed.

30. INPUINVEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) received an invalid event. The pump process is not terminated.

31. INPUINVMS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) received an invalid message. The pump process is not terminated.

32. INPUJTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) or CMPPUMP could not find the jump-to-RAM address.

33. INPULBRQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) or CMPPUMP received an invalid phase 2 text/data request.

34. INPUMXB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the text/data byte counter exceeded the maximum number of bytes (16M).

35. INPUNOBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) could not read the RLSCONF relation, or found invalid data in the RLSCONF relation.

36. INPUNOCRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) found a "dummy" common object file format (COFF) section header for the database customer originated recent change (CORC) logging file, but the "real" COFF section header for the CORC logging file was not found. A CORC log file is missing (/smlog/im#corc where # is the SM number dumped).

37. INPUNOLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication to the SM being pumped was lost. PUMP will terminate, but this assert will not fire (that is, the code currently does not call this assert).

38. INPUNOSCN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

FPUMP - Unable to find expected section name within the file.

39. INPUOACL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to close an AM office dependent data (ODD) file on the offline disk.

40. INPUOAOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to open an AM office dependent data (ODD) file on the offline disk.

41. INPUOARP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to read AM office dependent data (ODD) global parameters from the offline disk.

42. INPUOARR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) failed to read the AM office dependent data (ODD) relation RLSMCONF from the offline disk.

43. INPUPLVL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) or CMPPUMP encountered an invalid pump level in a text/data request.

44. INPUPNSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive punswap() failed to make the pump process unswappable.

45. INPUPRI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive setprior() failed to set the priority of the pump process.

46. INPUPTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) or CMPPUMP encountered an invalid pump type in a text/data request.

47. INPURCVM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), an invalid message was received in the INreceive() function.

48. INPUREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), a file manager read attempt failed.

49. INPURIMSUMERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

FPUMP has generated a different "sum" value over the relocatable image map (RIM) data than the sum value stored internally with the RIM.

Probable Cause:

Corruption of the disk file "/no5odd/cidata/rim.out".

Action:

Regenerate the RIM with the following command:

EXEC-UPROC: "/usr/bin/rimgen";

50. INPUSAEA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) received a text/data request with a starting address that is greater than its ending address.

51. INPUSDPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive sendport() failed to send a message.

52. INPUSEG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), a segment number exceeded the maximum value in the INseginfo() function.

53. INPUSFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive sendfault() failed to send a fault.

54. INPUSMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive sendmsg() failed to send a message.

55. INPUSTMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive setmap() failed.

56. INPUSZBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The section size is not a multiple of 2048 bytes. All pump files require section sizes to be a multiple of 2K bytes.

Probable Cause:

The file has been corrupted or improperly generated.

Action:

The pump will proceed with other sections but the bad section will not be pumped. Send the assert information to the local support organization to identify the bad section and get the file corrected.

57. INPUTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fast pump (FPUMP) timed out while waiting for a response from the SM after sending a FINISH message to the SM.

58. INPUULCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP), the DMERT primitive ulockseg() failed to unlock a segment in the pump process.

59. INPUWRDD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In fast pump (FPUMP) or CMPPUMP, the DDSWRITE() primitive failed.

60. INRIMFND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMPPUMP found a relocatable image map (rim.out) file listed in /no5text/filemaps/cmppmap1. The rim.out file is used for SM broadcast pumps only.

Probable Cause:

Corrupted CMP pump map file.

Action:

CMP pump will terminate. Investigate sanity of CMP pump map file and re-request the pump.

61. INTOFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A pump process was sent a fault, but the fault had not occurred within a reasonable amount of time.

62. INUPINCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMPPUMP detected an inconsistency between the program update (PU) patch counts in the patch count file on the AM disk and the patch counts in the active CMP. The PU is backed out of the standby CMP during pump.

To recover from this inconsistency, run the consistency check on the PU master control center (MCC) page, page 1950. When the consistency check completes, the standby CMP may be restored. This restore will pump the same image as is in the active CMP.

Range: dg**1. DGDATAPROB (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found in transient data. Static office dependent data (ODD) is always assumed to be valid. Normally this problem indicates invalid data in a dynamic relation, but it could also indicate corrupted static data, an invalid input parameter to a function, an invalid return code from a function call, or a relation that could not be read.

Action:

Save the receive only printer (ROP) output and call for technical assistance.

2. DGPE1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was detected by one of the other paging processes. The in-progress download will be aborted.

3. DGPE2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Paging received a message out of sequence or timed out while waiting for a message, or the AM and SM processes are out of synchronization with each other.

4. DGPE3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown message (not related to paging) was received.

5. DGPE4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal paging resource error such as queue full, buffer full, or too many retries occurred.

6. DGPE5 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recoverable internal paging error occurred.

7. DGPE7 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The paging client was purged due to a timeout or single process purge (SPP) of the SM paging supervisor.

8. DGPE9 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A paging non-fatal system resource failure occurred.

9. DGPE11 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A paging fatal system resource error occurred.

10. DGPE12 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A paging non-recoverable error occurred.

11. DGPE13 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid diagnostic (or other user) paged product was received. An invalid .tv or .text address, or other problem was detected during a download of the product.

12. DGRXSE0 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from the human/machine interface (HM) when trying to update a routine exercise (REX) display page (128x, 1290, or 1271-1274).

13. DGRXSE1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) primitive OSsendmsg() failed to send a message from the central processor (CP) to the SM after repeated retry.

14. DGRXSE2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was sent from the central processor (CP) to an SM, but an acknowledgement was not received. This scenario was repeatedly retried before asserting (a 3 minute wait for each acknowledgement).

15. DGRXSE3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was detected in local routine exercise (REX) data.

16. DGRXSE4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) primitive OSatimer() returned an undefined tag.

17. DGRXSE5 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An undefined verbttype was received from the human/machine interface (HM) via the operating system for distributed switching (OSDS) primitive OSwgetmsg().

18. DGRXSE6 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsolicited message type was received from the operating system for distributed switching (OSDS) primitive OSwgetmsg().

19. DGRXSE7 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected during a local audit of the local database for the DGcprxc() function.

20. DGRXSE8 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the routine exercise (REX) scheduling table tuple of the recent change database.

21. DGRXSE9 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The summary reply from the scheduler timed out.

Range: dhm**1. HM1_IMST (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switching module system test (SMST) process failed to connect to the port for receiving input messages.

2. HM2_IMST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switching module system test (SMST) process failed on a call to the msgenab() function.

3. HM3_IMST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switching module system test (SMST) process encountered an input message that was suspect due to its long length.

4. HM4_IMST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switching module system test (SMST) encountered an input message with an unknown message ID.

5. HMALM0 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to connect to a 3B port. See the 5ESS® Switch Input/Output Manual (235-600-700 and 235-600-750) for the OP:ST-PORTS and OP:ST-PROC messages to determine the status of the HMalm() process and port 60. If more than one version of HMalm() is executing, examine the craft interface integrity monitor (CMON) and user level automatic restart process (ULARP) files to determine if more than one entry exists for this process (it should only exist in the CMON file). If another process is connected to port 60, further investigation is required to correct the problem.

6. HMALM1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to communicate with the craft interface integrity monitor (CMON). Problems exist that are external to this process. When the system is operating normally, enter STOP:EXC:DATA,ANY,FN=/no5text/hm/HMalm,UCL; at the master control center (MCC) to kill the alarm process (the CMON process will restart); or enter 15 (craft initialization) on the emergency action interface (EAI) page.

7. HMALM2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cannot enable message reception. Problems exist that are external to this process. When the system is operating normally, enter STOP:EXC:DATA,ANY,FN=/no5text/hm/HMalm,UCL; at the master control center (MCC) to kill the alarm process [the craft interface integrity monitor (CMON) will restart]; or enter 15 (craft initialization) on the emergency action interface (EAI) page.

8. HMALM4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the HMmccupd() function. Unable to update the alarm retire mode on Master Control Center (MCC) page 105. See the 5ESS[®] Switch Input/Output Manual (235-600-700 and 235-600-750) for the SET:ALMMDE message.

9. HMALM5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to send an alarm retire mode request to the alarm control process. When the system is operating normally, use the input message SET:ALMMDE to set the desired state.

10. HMALM6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The alarm process could not communicate with the DMERT process monitoring the scan boards. The process will continue trying if this occurs during its initialization. Use the OP:STATUS:PROCESS command to determine if the process /prc/scsd is active. If this assert message is received during normal operations following an alarm control input command, check the acknowledgement message to determine if the action was completed internal to the alarm process before re-entering the command.

11. HMALM7 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The alarm process was unable to open the file containing alarm label and indicator information. If this occurs during process initialization, the alarm indicators on master control center (MCC) pages 105 and 119 will not be updated. If this occurs following a CHG:ALM command, the acknowledgement message will indicate the action taken by this process. If this occurs when the process is preparing an alarm report, the report will be sent with as much information as is available. This failure indicates problems outside the realm of this process that should be investigated.

12. HMALM8 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The alarm process was unable to read the file containing alarm label and indicator information. If this occurs during process initialization, the alarm indicators on master control center (MCC) pages 105 and 119 will not be updated. If it occurs following a CHG:ALM command, the acknowledgement message will indicate the action taken by this process. If this occurs when the process is preparing an alarm report, the report will be sent with as much information as is available. This failure indicates problems outside the realm of this process that should be

investigated.

13. HMALM9 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the HMmccupd() function. The alarm process was unable to update alarm indicators following a CHG:ALM command. Check the acknowledgement message to determine the status of the request, and repeat the request later if necessary.

14. HMALM10 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the HMquemcc() function. Unable to update alarm indicator labels on master control center (MCC) pages 105 and 119. Problems exist that are external to this process. When the system is operating normally, enter 15 (craft initialization) on the emergency action interface (EAI) page or enter the command STOP:EXC:DATA,ANY,FN=/no5text/hm/HMalm,UCL; to restart the process, which will update the indicators.

15. HMALM11 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to create a file containing alarm data following a reload or software release retrofit. Problems exist that are external to this process. When the system is operating normally, enter 15 (craft initialization) on the emergency action interface (EAI) page or enter the command STOP:EXC:DATA,ANY,FN=/no5text/hm/HMalm,UCL; to restart the process, which will create the file.

16. HMALM12 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to write a file containing alarm data following a reload or software release retrofit. Problems exist that are external to this process. When the system is operating normally, enter 15 (craft initialization) on the emergency action interface (EAI) page or enter the command STOP:EXC:DATA,ANY,FN=/no5text/hm/HMalm,UCL; to restart the process, which will update the file.

17. HMALM13 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the HMack() function. Unable to respond to an input message. Check the receive only printer (ROP) for an acknowledgement message.

18. HMALM14 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmsgtormap() function received a request for an operation to be performed at the SM Alarm Status Unit (ASU), but the operation is not valid.

19. HMALM15 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message from the scanner and signal distributor administrator (SCSDA) process contained a logical group from the equipment configuration data (ECD) that was not recognized by the alarm process. The message was discarded.

20. HMALM16 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An ADMMSG message from the scanner and signal distributor administrator (SCSDA) process contained an unknown message type. The message was discarded.

21. HMALM17 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message from the scanner and signal distributor administrator (SCSDA) process contained a logical group or message type from the equipment configuration data (ECD) that was not recognized by the alarm process. The message was discarded.

22. HMALM18 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The alarm process was unable to locate scan point data in the file containing alarm label and indicator information. If this occurs during process initialization, the alarm indicators on master control center (MCC) pages 105 and 119 will not be updated. If this occurs following a CHG:ALM command, the acknowledgement message will indicate the action taken by this process. If this occurs when the process is preparing an alarm report, the report will be sent with as much information as is available. This failure indicates problems outside the realm of this process that should be investigated.

23. HMALM19 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The process was trying to send a message to the receive only printer (ROP), and received an error return from the HMoutmsg() function. Check master control center (MCC) indicators on pages 105, 115, 116, 118, and 119 for a current alarm status for which messages may have been lost.

24. HMALM20 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMamfanrpt() function failed to access the ECD to read the data related to the AM CU Fan Alarms. Either the User Control Block (UCB) or Option Record (SCOPT_REC) could not be read due to corruption or incorrect population. Review of the stack back trace will determine which record failed.

25. HMALM21 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown error was returned in a message from the scanner and signal distributor administrator (SCSDA) process.

26. HMALM22 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the HMmccupd() function. Unable to update an alarm or inhibit indicator. If an inhibit or allow command was entered, check the acknowledgement message for the status of the request. The request may be repeated later to update the indicator. If an alarm message was received, the command STOP:EXC:DATA,ANY,FN=/no5text/hm/HMalm,UCL; may be entered to restart the process (any alarms will be reported again); or if the scan point can be inhibited, inhibit then allow the scan point [see the receive only printer (ROP) for the message designating the scan point] to report the alarm again and update the indicator.

27. HMALM23 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A remote reset acknowledgement from the scanner and signal distributor administrator (SCSDA) contained invalid data. If a remote reset (CLR) command was entered, check the receive only printer (ROP) for an acknowledgement message. Repeat the command later if necessary.

28. HMALM24 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the HMmccupd() function. Failed to write "INH" to an alarm indicator. Check the receive only printer (ROP) for an acknowledgement message or an automatic inhibit report. Problems exist that are external to this process. If this follows an INH command, re-enter the command when the system is operating normally to update the indicator correctly. If this follows an automatic inhibit message, the process will take automatic actions within 15 minutes.

29. HMALM26 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to locate data in a file containing alarm information. Problems exist that are external to this process. This failure is a result of an input command, check the acknowledgement message and repeat the command when the system is operating normally, if necessary.

30. HMALM27 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the HMmccupd() function. An attempt to update an inhibit indicator failed. Check the receive only printer (ROP) for an acknowledgement message or automatic inhibit report. Problems exist that are external to this process. If the failure is a result of an input command, when the system is operating normally,

repeat the command to update the indicator. If the failure is a result of an automatic inhibit action, this process will take action automatically within 15 minutes.

31. HMALM28 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During initialization of the HM alarm process (HMALM), the advanced mobile phone service (AMPS) initialization function HMampinit() failed to access the display administration process (DAP) shared memory.

Probable Cause:

Failure to open a communication path between operating system for distributed switching (OSDS) and the HMALM process, obtain the shared segment location from the display administration process (DAP) system process, or place the segment into the HMALM process address space.

Action:

Process HMALM will re-initialize itself repeatedly in an attempt to correct the problem. If this assert fires more than a few times, enter 15 (craft initialization) on the emergency action interface (EAI) page.

32. HMALM29 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HM alarm process (HMALM) attempted to send a message containing the critical, major and minor alarm status of the switch to the SM module alarms process (HMMAP), but the sendpw() call failed. The executive cellular process (ECP) will not receive the current alarm status of the switch.

Action:

This failure indicates problems outside the realm of this process that should be investigated.

33. HMIRA_1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

UNIX[®] failure to SPRINTF when printing out an input message acknowledgment.

34. HMIRA_2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The displacement into a field was too large, it exceeded the word size.

35. HMIRA_4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid displacement into a structure, or an invalid shift into the word size occurred.

36. HMIRA_5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*® system failure occurred on a send to IOCMBDP.

37. HMIRA_6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*® system failure occurred on a send to the HMaban() function.

38. HMIRA_7 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The setsize of a getkey was too small.

39. HMIRA_61 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*® system failure occurred on a receive message from the communications kernel process (CMKP).

40. HMIRA_62 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not open the communications kernel process (CMKP).

41. HMIRA_63 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TTY ID is O, which means that the HMCONT field cannot be filled in correctly.

42. HMIRA_65 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default, which is an invalid case, occurred. All possible cases for an enumeration were listed, but none satisfied the switch value.

43. HMIRA_66 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The client returned an invalid message type to the craft shell.

44. HMIRA_67 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The client returned an invalid process ID to the craft shell.

45. HMIRA_b (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The lla_get() primitive returned NULL.

46. HMIRA_c (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The lla_get() primitive returned IDERROR.

47. HMIRA_d (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The lla_nextsg() primitive returned EOS.

48. HMIRA_e (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The lla_nextsg() primitive returned IDERROR.

49. HMMCC_0 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendpw() primitive failed. It is not an indication of error if this assert occurs during a restart of the display administration process (DAP).

50. HMMCC_0 (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendpw() primitive failed.

51. HMMCC_1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The connport() primitive failed.

52. HMMCC_2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendw() primitive failed.

53. HMMCC_3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMMCC process failed to open enhanced confirmation prompt file /no5text/hm/.enhconf. Enhanced confirmation prompts cannot be retrieved into memory.

54. HMMCC_4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMMCC process failed to read a record from enhanced confirmation prompt file /no5text/hm/.enhconf. One or more enhanced confirmation prompts cannot be retrieved into memory.

55. HMMCC_5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMMCC process was unable to copy an enhanced confirmation prompt into memory.

56. HMMCC_6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the HMoutmsg() function.

Range: dhmo**1. HMLOG_0 (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the connport() function. The HMlogmap() function could not connect to its designated port.

2. HMLOG_1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the HMack() function.

3. HMLOG_2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the fopen() primitive. A logfile could not be opened for reading.

4. HMLOG_3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the HMoutmsg() function.

5. HMLOG_4 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a logfile message to the HMsip() function for printing, as requested by a DUMP:DAYLOG input message.

6. HMLOG_5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid verb field was found in an MGHMLPM message.

7. HMLOG_6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal message was sent to the HMlogmap() function.

8. HMLOG_7 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the fclose() function. A logfile could not be closed.

9. HMLOG_8 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cannot enable message reception in a msgenab() function call.

10. HMLOG_9 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMlogmap() function encountered a logfile seek failure.

11. HMLOG_10 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMlogmap() function encountered a logfile read failure.

12. HMSIP_0 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure to connect to the PT_TTYO port occurred in a connport() function call.

13. HMSIP_1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cannot enable message reception in a msgenab() function call.

14. HMSIP_2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred when segments were allocated for a database build.

15. HMSIP_3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database cannot be opened for initialization.

16. HMSIP_6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a message size that is greater than the maximum size allowed.

17. HMSIP_7 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure acknowledgment was received from the communications kernel process (CMKP).

18. HMSIP_8 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A communications kernel process (CMKP) close acknowledgment failed.

19. HMSIP_9 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send an open communication message to the communications kernel process (CMKP).

20. HMSIP_10 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to open a temporary file for a message.

21. HMSIP_11 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to spool a message via splom().

22. HMSIP_13 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return was received from the HMstate() function.

23. HMSIP_15 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was received from a craft interface integrity monitor (CMON) acknowledgment via the sendw() primitive.

24. HMSIP_17 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown duplex multi-environment real-time operating system (DMERT) message type was received.

25. HMSIP_30 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the kill() primitive. A failure occurred while sending a signal to the HMlogmap() function.

26. HMSIP_32 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the fopen() primitive. A logfile could not be opened for writing.

27. HMSIP_33 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the fopen() primitive. A logfile could not be opened for reading.

28. HMSIP_34 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the fclose() primitive. A logfile could not be closed from reading.

29. HMSIP_35 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return size from the fread() function is not the proper size.

30. HMSIP_36 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return value was received from the fseek() function or the rewind() function.

31. HMSIP_37 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return value was received from the fwrite() primitive or the write() primitive.

Range: dmsdrv**1. SMDLCTBDATA (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) peripheral controller (PC) file download sequencer found invalid data in a PC file control table entry.

Probable Cause:

An MSKP environment software error corrupted the control table entry or the PC file download sequencer.

Action:

The control table entry will be reinitialized. Any in-progress PC download from disk request associated with the erroneous control table entry will fail. If necessary, the MSKP PC file audit will eventually recovery any lost AM memory resources. If the assert persists, provide data to the next level of support.

2. SMDLCT_FULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer found the PC download from disk control table full. The PC download from disk request will fail.

3. SMDLCT_HUNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) failed to open to the communications kernel process (CMKP) during the software initialization phase.

4. SMDLDEIB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to download the ethernet interface board (EIB) failed or timed out.

Probable Cause:

The EIB.out image may be corrupted, the ethernet link (physical) to the EIB may be bad, or the EIB may be powered down.

Action:

Running module controller/time slot interchanger (MCTSI) diagnostics will also trigger diagnostics for the EIB. Note that EIB diagnostics will also try to download the EIB. If the download fails, then seek technical assistance for the following steps:

- (1) Verify EIB.out image in *UNIX*® System V is not corrupted. Log in to *UNIX*® System V terminal and check "/opt/ATT3bem/var/EIB.out" file (you can use the "sum" command).
- (2) Log in to *UNIX*® System V terminal and enter the ping command:

```
ping 192.11.150.1 (for side 0)
```

```
ping 192.11.150.2 (for side 1)
```

If response is "is alive" then the EIB ethernet link is okay. Run EIB diagnostics.

- (3) If step 2 fails, then make sure that the ethernet cable is connected to the EIB.
- (4) Replace EIB board.

5. SMDLER_CLOSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer failed to close a file on the AM disk. The PC download from disk request will fail.

6. SMDLER_GROW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer failed to grow an AM memory segment. The PC download from disk request will fail.

7. SMDLER_OPEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer failed to open a file on the AM disk. The PC download from disk request will fail.

8. SMDLER_READ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer failed to read a file from the AM disk to AM memory. The PC download from disk request will fail.

9. SMDLER_SHRINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer failed to grow an AM memory segment. The PC download from disk request will fail.

10. SMDLINDEX_NG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer encountered an out of range PC download control table index. The PC download from disk request will fail.

11. SMDLLASTST_NG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) found a peripheral controller (PC) download file state that was invalid.

12. SMDLMSG_LOST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer did not get an acknowledgement message for a file manager message or memory manager message. The PC download from disk request will fail.

13. SMDLMSGPTR_NG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer received an invalid message buffer pointer. The PC download from disk request will fail.

14. SMDLNEQ_ODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer could not read the office dependent data (ODD) entry for PC n, or PC n is not equipped in the ODD. The PC download from disk request will fail.

15. SMDLNG_ODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer encountered an error in reading the office dependent data (ODD) for the PC. The PC download from disk request will fail.

16. SMDLNOTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer could not get a watchdog timer (or continuity timer) for the PC download from disk request. The PC download from disk request will fail.

17. SMDLRET_NG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMvert() function failed to validate the function pointer. The text image of /no5text/prc/mskp is questionable. Verify the disk and core image.

18. SMDLSMSG_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer could not send a DMERT file manager message or memory manager message. The system primitive `queuem()` did not return SUCCESS. The PC download from disk request will fail.

19. SMDLSTIMULI_NG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid input stimulus to the peripheral controller (PC) download from disk sequencer was encountered. The PC download from disk request will fail.

20. SMDLWAIT_NG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The wait list linkage for peripheral controller (PC) pump file acquisition was invalid. The wait list is a doubly linked list; either the forward or backward pointer was invalid.

21. SMDLWDTOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral controller (PC) download from disk sequencer timed out while waiting for a message acknowledgement. The PC download from disk request will fail.

22. SMEIBPING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet interface board (EIB) failed to respond to a status message request (ping) sent from MSKP.

Probable Cause:

1. The ethernet interface in the *UNIX*® System V may be bad.
2. The ethernet link (physical) to the EIB may be incorrectly connected.
3. The EIB board may be bad.

Action:

MSKP will escalate to an automatic re-download of the EIB image. If MSKP completes the download, then the EIB board may be bad. Request MCTSI diagnostics to run on the SM side where the EIB is not responding to pings. If diagnostics fails, replacement of the EIB board may be required.

23. SMERCMSIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The 3bcmsim process running in *UNIX*® reported an error to message switch kernel process (MSKP). The `SMcmsim_error(3bcmsim_err, data1, data2)` was called to report this error.

Probable Cause:

The cause for the error is provided in first argument passed to `SMcmsim_err()`, see assert stack output to get error code. The error code, Mnemonic (used in 3bcmsim) and explanation follows:

1. SMBPQSIDEBAD - SSENDMSG request has bad bpq side
2. SMBADUNLOAD - unload pointers are bad or queue is empty
3. SMBADOUTBPQPTRS - bad output bpq pointers
4. SMUNITLENBAD - pic units and msg length mismatch
5. SMBADPICCMD - bad opcode in output bpq for a message
6. SMBADBPQPTRS - bad bpq pointers
7. SMMSGTOOBIG - message too big
8. SMINQFULL - input queue is full
9. SMCHANGEDLDP - load pointer change unexpected
10. SMMEMATER - can't attach to job tables
11. SM3BMEMATER - can't attach to 3b memory
12. SMSHREGER - can't attach to shared registers
13. SM2REQFPUMP - got more than one request to pump
14. SMPUMPBCP - NULL bcb pointer for fast pump
15. SMPUMPDMERTMEM - NULL DmertMem pointer for fast pump
16. SMFPUMPFail - call to SMfastpump failed
17. SMBADOP - EIBCNTL got a bad operation code
18. SMLINKERR - SMsip() failed; bad link
19. SMGETPGPTR - call to SMgetpgptr() failed
20. SMCPTO3B - call to SMcopyto3b() failed
21. SMCPFROM3B - call to SMcopyfrom3b() failed
22. SMNULLPTA - NULL PTA passed to 3BCMSIM
23. SMSRCHNLOCK - call to ioas_srchnlock() failed
24. SMETHERERR - ethernet interface error in *UNIX*® SV
25. SMOPENETDEV - failed to open ethernet dev
26. SMREADETDEV - read from ethernet device failed
27. SMWRTETDEV - write to ethernet device failed

28. SMCPIERR - 3bcmsim error when processing CPI request

Action:

Error types 1-9 should be cleared by a re-boot of *UNIX*[®]-RTR. Errors 10-12 May require a re-boot of *UNIX* SV (see below). Error 13-16 may be ignored unless they prevent a successful pump of the SM. If that is the case, may require manual re-boot of *UNIX*[®] RTR. Error 17 should be cleared after a re-boot of *UNIX*[®]-RTR. Error 18 is due to a SIP link error when 3bcmsim tried to send a message to the EIB. MSKP will re-start 3bcmsim or re-boot *UNIX*[®]-RTR to clear problem. Errors 19-22 are due to some memory corruption. A re-boot of *UNIX*[®]-RTR should clear problem. Errors 23 may be due to 3bemulator job queue entries for 3bcmsim may be corrupted. If *UNIX*[®]-RTR re-boot does not clear problem, re-boot *UNIX*[®] SV. Errors 24-27 are due to calls to ethernet *UNIX*[®] SV functions are failing. If problem is not cleared after a *UNIX*[®] SV re-boot, the ethernet board in the workstation may be bad. Seek technical assistance to verify functionality of ethernet board in workstation.

In general, MSKP will try to escalate to a re-start of 3bcmsim or to a re-boot of the *UNIX*[®]-RTR AM, to clear the problem. If the error is not cleared by a re-boot of *UNIX*[®]-RTR, a manual re-boot of *UNIX*[®] SV will be required: go to EIA page and enter poke 58.

24. SMFDLKFP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) request for the foundation peripheral controller (FPC) random access memory (RAM) file from disk failed. Check the disk for the file /no5text/prc/FPCCM20000000 or /no5text/prc/FPCCM100000000; verify their existence and protection modes.

25. SMFDLKMM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) request for the module message processor (MMP) random access memory (RAM) file from disk failed. Check the disk for the file /no5text/prc/MMPCM200000000 or /no5text/prc/MMPCM100000000; verify their existence and protection modes.

26. SMFDLKMS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) request for the message switch control unit (MSCU) random access memory (RAM) file from disk failed. Check the disk for the file /no5text/prc/MSUCM200000000; verify its existence and protection modes.

27. SMFDLKPP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) request for the pump peripheral controller (PPC) random access memory (RAM) file from disk failed. Check the disk for the file /no5text/prc/PPCCM200000000 or /no5text/prc/PPCCM100000000; verify their existence and protection modes.

28. SMFPACKM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send an acknowledgment message to the originator. Could be a problem in the message switch kernel process (MSKP) environment primitive SMmsgack().

29. SMFPBPMB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the foundation peripheral controller (FPC) handler, the immediate return from the SMgetpmort() function failed on reading the post mortem data.

30. SMFPCNSRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read or write block message was sent to the foundation peripheral controller (FPC) handler with the message source field not set. The source field should be set in the message.

31. SMFPCRTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) handler timed out on retrieving core error data.

32. SMFPDELT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete a timer from the message switch kernel process (MSKP). Could be a problem in the MSKP environment timing primitive, or the timer was never on the timing list.

33. SMFPDEQM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to queue a message on the in-progress (IP) queue for the foundation peripheral controller (FPC). Could be a problem in the message switch kernel process (MSKP) environment queue primitive.

34. SMFPEQID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid eqid variable was returned from the message switch kernel process (MSKP). Could be a problem in the MSKP environment or the foundation peripheral controller (FPC) handler.

35. SMFPERTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The error pending flag was set without the error timer being set. Could be a problem in the message switch kernel process (MSKP) environment or the foundation peripheral controller (FPC) handler.

36. SMFPERTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A foundation peripheral controller (FPC) handler timeout error was reported.

37. SMFPHDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the direct memory access (DMA) job number with the segment ID in the message switch kernel process (MSKP) handler.

38. SMFPHSER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not send an error message to switch maintenance error recognition (SMER). Could be a problem between the message switch kernel process (MSKP) environment and the switch maintenance kernel process (SMKP), or the foundation peripheral controller (FPC) handler is sending the wrong size or type of message.

39. SMFPIPMB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data about the post mortem buffer was saved in dynamic data in the foundation peripheral controller (FPC) handler.

40. SMFPIVFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid fault index was returned from the message switch kernel process (MSKP). Could be a problem in the MSKP environment.

41. SMFPMBDM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PMB message address was not found. Could be a problem in the message switch kernel process (MSKP) environment or the foundation peripheral controller (FPC) handler.

42. SMFPMSGGB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid information was encountered in a message from the message switch kernel process (MSKP). Check the dump of the message for incorrect information.

43. SMFPOVFM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to move a message from the overflow queue to the in-progress (IP) queue for the foundation peripheral controller (FPC). Could be a problem in the message switch kernel process (MSKP) environment queue primitive.

44. SMFPPICR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid direct memory access (DMA) number was encountered in a response from the peripheral interface controller (PIC).

45. SMFPQUEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to queue a message on the in-progress (IP) queue for the foundation peripheral controller (FPC). Could be a problem in the message switch kernel process (MSKP) environment queue primitive.

46. SMFPRDST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure was encountered for the foundation peripheral controller (FPC). Could be a problem in the switch maintenance kernel process (SMKP) database primitive.

47. SMFPREQT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get a timer from the message switch kernel process (MSKP). Could be a problem in the MSKP environment timing primitive.

48. SMFPSEGE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the segment ID in the message switch kernel process (MSKP) handler.

49. SMFPSFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A software fault was returned from the message switch kernel process (MSKP). Could be a problem in the MSKP

environment, the foundation peripheral controller (FPC), or the FPC handler.

50. SMFPTEIV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The in-progress (IP) queue was empty or had an invalid entry in the foundation peripheral controller (FPC) handler.

51. SMFPTINX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistent timer value was returned from a message switch kernel process (MSKP) timeout. Could be a problem in the MSKP environment timing primitive, or the timer index in the foundation peripheral controller (FPC) dynamic data is wrong.

52. SMFRAMFP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) request for the foundation peripheral controller (FPC) random access memory (RAM) file from disk failed. Check the disk for the file /no5text/prc/FPCCM20000000 or /no5text/prc/FPCCM100000000; verify their existence and protection modes.

53. SMFRAMMM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) request for the module message processor (MMP) random access memory (RAM) file from disk failed. Check the disk for the file /no5text/prc/MMPCM200000000 or /no5text/prc/MMPCM100000000; verify their existence and protection modes.

54. SMFRAMMS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) request for the message switch control unit (MSCU) random access memory (RAM) file from disk failed. Check the disk for the file /no5text/prc/MSUCM200000000; verify its existence and protection modes.

55. SMFRAMPP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) request for the pump peripheral controller (PPC) random access memory (RAM) file from disk failed. Check the disk for the file /no5text/prc/PPCCM200000000 or /no5text/prc/PPCCM100000000; verify their existence and protection modes.

56. SMFRAMQP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) failed to download the quad-link gateway processor (QGP) random access memory (RAM) file from disk to AM core memory during an AM initialization.

Probable Cause:

Either the QGP RAM file does not exist on disk, is incorrectly specified in the office dependent data (ODD), or a software or hardware error occurred during the download of the QGP disk file to AM core memory. Other error reports will identify the exact nature of the problem.

Action:

Verify the QGP RAM file "/no5text/prc/QGPCM2OPER.out" exists on disk, has a non-zero size, is readable by others, and is contiguous.

Verify a tuple exists for QGP 0-0 in the SPC relation on the AM and that its "pcfilenm" attribute contains "QGPCM2OPER.out".

If the above items prove true, or if the problem recurs after correcting these items in the manner described, then provide error data to the next level of support.

57. SMINITCMSIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Request to the 3bemulator to start the 3bcmsim process (that runs in the *UNIX*® System V environment) has failed.

Probable Cause:

1. The 3bcmsim process may be corrupted.
2. The 3bcmsim process may not have executable permissions.
3. System resources (such as shared memory or semaphores) may be incorrect/corrupted, which prevents 3bcmsim from starting and "attaching" to 3bemulator shared memory.

Action:

Message switch kernel process (MSKP) will automatically escalate to a re-boot of *UNIX*®-RTR. If the problem persists, seek technical assistance to check the following:

1. Log in to a *UNIX*® System V terminal and:
Make sure that 3bcmsim process (in *UNIX*® System V file system "/opt/ATT3bem/bin/3bcmsim") has executable permissions.
Verify that 3bcmsim is not corrupted (use sum command and make sure it matches version from another site).
2. If step "1." fails to correct the problem, then re-boot the *UNIX*® system. Go to the emergency action interface (EAI) page on the MCC and enter poke 58.

58. SMIPDELFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment failed to delete a timer during a communication module processor (CMP) initialization.

59. SMIPINCC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment detected an invalid completion code. An invalid completion code was passed to the SMipsend() function on an error or abort event.

60. SMIPINDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) detected an invalid direct memory access (DMA) job number during the communication module processor (CMP) initialization.

61. SMIPINEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment received an invalid event from a message, response, or timeout.

62. SMIPINET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment detected an invalid communication module processor (CMP) initialization event. An invalid event was passed to one of the CMP initialization functions.

63. SMIPINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment received an invalid timer type during the communication module processor (CMP) initialization.

64. SMIPINPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment detected an invalid communication module processor (CMP) initialization pump type.

65. SMIPINPL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MKSP) environment detected an invalid communication module processor (CMP) initialization pump level.

66. SMIPINPTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment detected an invalid message or response pointer. An invalid message or response pointer was passed to one of the communication module processor (CMP) initialization functions.

67. SMIPINPUCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment received an invalid or failure message from the pump control (PUCR) process or communication module processor (CMP) pump during the CMP initialization.

68. SMIPINST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment detected an invalid communication module processor (CMP) initialization state.

69. SMIPRTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment failed to request a timer during the communication module processor (CMP) initialization.

70. SMIPTONP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment timed out on a non-deferred communication module processor (CMP) initialization.

71. SMIPVERFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment failed to verify that a timer was pending.

72. SMIQDELFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMDeltime() failed to delete an outstanding timer during a quad-link gateway processor (QGP) initialization, indicating the QGP's dynamic initialization data contains an invalid timer index.

Probable Cause:

Either the MSKP environment dynamic data associated with the QGP phase 1/phase 2 initialization is corrupted (most likely) or the MSKP environment timing table is corrupted. Both are indicative of software errors.

Action:

Provide data to the next level of support.

73. SMIQINCC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid completion code was passed to a quad-link gateway processor (QGP) initialization function during the failure or abort of a QGP initialization.

Probable Cause:

A software error occurred during a QGP phase 1/phase 2 initialization failure or abort.

Action:

Provide data to the next level of support.

74. SMIQINDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

sp Problem:

The message switch kernel process (MSKP) environment service routine SMdeldma() failed to delete a DMA job number during a QGP initialization, indicating the QGP initialization control table contains an invalid DMA job number.

Probable Cause:

A software error during QGP phase 1/phase 2 initialization corrupted the QGP initialization control table.

Action:

Provide data to the next level of support.

75. SMIQINEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected or invalid timeout occurred during a quad-link gateway processor (QGP) initialization. While the timeout type is valid, the timeout data disagrees with the QGP's dynamic initialization data.

Probable Cause:

Either a QGP phase 1/phase 2 initialization timer was not correctly deleted (most likely), the message switch kernel process (MSKP) environment dynamic data associated with the QGP phase 1/phase 2 initialization is corrupted, or the MSKP environment timing table is corrupted. All three are indicative of software errors.

Action:

Provide data to the next level of support.

76. SMIQINET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid initialization event - something other than a control, response, timeout, or delayed return event - was passed to a quad-link gateway processor (QGP) initialization function.

Probable Cause:

A software error occurred during the QGP phase 1/phase 2 initialization.

Action:

Provide data to the next level of support.

77. SMIQINFLE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Following an apparently successful download of the quad-link gateway processor (QGP) random access memory (RAM) file from disk, the QGP download from disk delayed return entry function found an invalid number of segments and/or an invalid file size in the image's main segment control table.

Probable Cause:

A software error during the download of the QGP disk file to AM core memory corrupted the main segment control table.

Action:

Provide data to the next level of support.

78. SMIQINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer timeout containing an invalid timeout type was received during a quad-link gateway processor (QGP) initialization.

Probable Cause:

Either a QGP phase 1/phase 2 initialization timer was created with an invalid timeout type (most likely) or the message switch kernel process (MSKP) environment timing table is corrupted. Both are indicative of software errors.

Action:

Provide data to the next level of support.

79. SMIQINPCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The phase 2 and/or phase 3 pump buffer loaded counters in the quad-link gateway processor (QGP) initialization control table are out of range.

Probable Cause:

A software error during QGP phase 1/phase 2 initialization corrupted the QGP initialization control table.

Action:

Provide data to the next level of support.

80. SMIQINPL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid pump level was found in the quad-link gateway processor (QGP) initialization control table.

Probable Cause:

A software error during QGP phase 1/phase 2 initialization corrupted the QGP initialization control table.

Action:

Provide data to the next level of support.

81. SMIQINST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid pump state was found in the quad-link gateway processor (QGP) initialization control table.

Probable Cause:

A software error during QGP phase 1/phase 2 initialization corrupted the QGP initialization control table.

Action:

Provide data to the next level of support.

82. SMIQRTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMreqtime() failed to obtain a timer during phase 1 or phase 2 of a quad-link gateway processor (QGP) initialization.

Probable Cause:

The millisecond time value and/or the timeout entry function parameters passed to SMreqtime() by the QGP phase 1/phase 2 initialization code were invalid (software error), the MSKP environment timing table is corrupted (software error), or a timer could not be obtained from *UNIX*[®]-RTR (UNIX-RTR resource shortage or *UNIX*[®]-RTR software error).

Action:

Provide data to the next level of support.

83. SMIQTORQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link gateway processor (QGP) phase 1/phase 2 initialization timed out. That is, the overall "sanity" timer on the message switch kernel process (MSKP) environment portion of the QGP initialization (SMinit_qgp()) expired.

Probable Cause:

A software error placed the QGP phase 1/phase 2 initialization code in an insane state wherein no forward progress was being made on the QGP initialization.

Action:

Provide data to the next level of support.

84. SMKPADMA_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) failed to assign a direct memory access (DMA) job number. The DMA map table was full, the eqid variable was invalid, the main store (MAS) buffer virtual address was invalid, or the segment ID for the MAS buffer was invalid. The DMA task was aborted.

85. SMKPBADCRAFT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) found the craft attempting to change the unit control block (UCB) record for a message switch (MSG) while the MSG was still active.

86. SMKPCMKP_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) failed to open the communication path through the communications kernel process (CMKP) initialization.

87. SMKPDREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function returned failure.

88. SMKPDGNST_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A diagnostic message received by the message switch kernel process (MSKP) indicated that the unit [message switch control unit (MSCU), foundation peripheral controller (FPC), pump peripheral controller (PPC), or module message processor (MMP)] was in the wrong state. Diagnostics will be terminated.

89. SMKPD Mert (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) call to the ptimer() function failed.

90. SMKPEQID_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid equipment ID was encountered. This will usually result in the hardware recovery of the associated unit.

91. SMKPERDGET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) call to the equipment configuration database (ECD) read primitive lla_rdget() failed.

92. SMKPEUCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) found an incorrect equipment configuration database (ECD) unit control block (UCB) record for a message switch (MSGs).

93. SMKPMBUF_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) failed to get a DMERT message buffer. This might be due to an improper message buffer request, or there are no DMERT message buffers available.

94. SMKPMPORT_NG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) failed to attach to the PT_MSGS system message port. This indicates a serious software problem. The DMERT event entry to MSKP was left disabled. MSKP cannot receive timeout or message events.

95. SMKPMQBAD (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A handlers message queue was found to be invalid.

Probable Cause:

Software error.

Action:

Reinitialize that handlers message queue.

96. SMKPMMSG_UNKN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A unknown message was received by the message switch kernel process (MSKP). The message header will be printed in the assert output and the message will be freed by MSKP.

97. SMKPOORTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid timeout value was encountered.

98. SMKPLAC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) found a timeout value in its timing table that is out of range (OOR) or unsorted, or the table linkage is broken.

99. SMKPTA_NG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) could not get a page table address for a direct memory access (DMA) job. The virtual address of the buffer and/or segment ID for the buffer is invalid. The DMA task was aborted.

100. SMKPRADD_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid function return address [not in the transfer vector (TV) table] was encountered in the peripheral controller (PC) initialization or PC postmortem dump service routine. Control could not be returned to the caller (user).

101. SMKPS7RECOV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Software errors, internal to the message switch kernel process (MSKP), exceeded the threshold. Software level 7 recovery was requested.

102. SMKPSEG_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid segment ID was found in the direct memory access (DMA) map table. The corresponding memory segment could not be unlocked (I/O lock). The entry was re-initialized.

103. SMKPSEQIP_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) sequence-in-progress indicator, used in the peripheral controller (PC) initialization and PC postmortem dump routines, was found in an invalid state. The PC initialization or PC postmortem task was terminated.

104. SMKPSMSG_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) failed to send a DMERT message. Either the destination process does not exist, or the destination process is unable to receive the message.

105. SMKPSW_FLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) received a DMERT software fault. Software recovery, internal to the MSKP, was initiated.

106. SMKPTTBL_FULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) timing table was full. The table was re-initialized and all timers deleted.

107. SMKPTTEN_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry was found in the message switch kernel process (MSKP) timing table. The entry was ignored.

108. SMKPTTLK_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid linkage was found in the message switch kernel process (MSKP) timing table. The table was re-initialized and all timers deleted.

109. SMKPUCBR_UNKN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown unit control block (UCB) record ID in the equipment configuration database (ECD) was received by the message switch kernel process (MSKP) in a DMERT fault message. The message was rejected. This will impact message switch control unit (MSCU) hardware recovery.

110. SMKPUSTRACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment received a message indicating that *UNIX*[®]-RTR (the operating system) was unable to deliver a message sent by MSKP. This problem means that MSKP sent a message to an active *UNIX*[®] process and that *UNIX*[®] process terminated before receiving/processing the message. As part of terminating a *UNIX*[®] process, *UNIX*[®]-RTR returns all messages to the sender marked USRACK (0x80) in the *UNIX*[®]-RTR message header type field (ms_type). The message returned by *UNIX*[®]-RTR is printed as part of the assert output and the message buffer is freed.

Probable Cause:

Abnormal termination of a *UNIX*[®] process.

Action:

If the assert persists, provide data to the next level of support.

111. SMMMABTDGN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMabortdgn() failed to abort diagnostics as requested by the module message processor handler (MMPH).

112. SMMMABTSRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMabortsr() failed to abort an in-progress MSKP service routine as requested by the module message processor handler (MMPH).

113. SMMMBADEQID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment passed an invalid physical ID to one of the module message processor handler's (MMPH) entry points.

114. SMMMBADFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment passed an invalid fault code to the module message processor handler's (MMPH) fault entry point. This fault entry will be ignored.

115. SMMMBCC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid input parameter was passed to a module message processor handler (MMPH) function. This type of error indicates a serious software inconsistency in the MMPH.

116. SMMMBSTE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic status of a module message processor (MMP) was in an invalid state.

117. SMMMBTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid timeout type was encountered. This error indicates a software inconsistency problem in the module message processor handler (MMPH) or message switch kernel process (MSKP) environment.

118. SMMMBXMIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMxmitcmd() function failed to transmit a message from the module message processor handler (MMPH) to

the message switch (MSGs).

119. SMMMDBFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database function DBfrdtup() failed to read the office dependent data (ODD) for a module message processor (MMP). This error could be caused by invalid data in the ODD for an MMP.

120. SMMMDELDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMdeldma() failed to delete a direct memory access (DMA) job number as requested by the module message processor handler (MMPH).

121. SMMMDELTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMdelttime() failed to delete an outstanding timing request for the module message processor handler (MMPH).

122. SMMMDQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMdequemsg() failed to de-queue a message from a module message processor's (MMP) queue as requested by the module message processor handler (MMPH).

123. SMMMEACKM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMmsgack() failed to send an acknowledgment message as requested by the module message processor handler (MMPH).

124. SMMMEASNDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message kernel process (MSKP) service routine SMasndma() failed to assign a direct memory access (DMA) job number for a module message processor (MMP) DMA sequence.

125. SMMMEDEQMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message processor handler (MMPH) de-queued an invalid message from a module message processor's (MMP) queue. This type of error indicates a serious software inconsistency problem in the MMPH.

126. SMMMEDMAJN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMtdeldma() failed to delete an in-progress direct memory access (DMA) job number as requested by the module message processor handler (MMPH).

127. SMMMEFSET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message processor's (MMP) error flag should not be set. This error indicates a serious software inconsistency in the module message processor handler (MMPH).

128. SMMMEGPM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMgetpmort() failed in starting a module message processor's (MMP) post mortem direct memory access (DMA).

129. SMMMEGPTA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMgetpta() failed to get a page table address for a module message processor (MMP) direct memory access (DMA) sequence.

130. SMMMEMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was sent to the module message processor handler (MMPH). This message will be marked failed and returned to the sender.

131. SMMMETIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment entered the module message processor handler (MMPH) with an invalid timing index number.

132. SMMMISEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message processor handler (MMPH) failed a software defensive check on a module message processor (MMP) maintenance (MTCE) sequence. This error indicates a software inconsistency problem in the MMPH.

133. SMMMMTIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message processor handler (MMPH) was processing a message for a module message processor (MMP) and found the MMP's message queue empty. This type of error indicates a serious software inconsistency in the MMPH.

134. SMMMOTIFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMovftoip() failed to move a message from the overflow section to the in-progress section of the message queue for a module message processor (MMP).

135. SMMMPCINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMpcinit() failed to start the download sequence for a module message processor (MMP).

136. SMMMQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMquemsg() failed to queue a message as requested by the module message processor handler (MMPH).

137. SMMMRDSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database routine SMddread() failed to read the dynamic status of a module message processor (MMP) as requested by the module message processor handler (MMPH).

138. SMMMRQTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMreqtime() failed to get a timing request for the module message processor handler (MMPH).

139. SMMMSDMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMsendmsg() failed to send a message as requested by the module message processor handler (MMPH).

140. SMMMSFE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid data value was passed into a module message processor handler (MMPH) function. This value will be changed to some default or maximum value.

141. SMMMTOMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A module message processor (MMP) block message timeout occurred. This type of error indicates a software inconsistency problem, or the module message processor handler (MMPH) sequence timers are too long.

142. SMMMUNLOCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMunlock() failed to unlock 3B memory as requested by the module message processor handler (MMPH).

143. SMMMVREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMvertime() failed to verify if a timing request remains outstanding for the module message processor handler (MMPH).

144. SMMSATTECD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ecd_dbatt() function returned a failure response to the message switch control unit (MSCU) handler when attempting to attach to the data directory and database. This problem may be caused by an equipment configuration database (ECD) problem.

145. SMMSBADEQID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid equipment identifier was passed to a function in the message switch control unit (MSCU) handler.

146. SMMSBADFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler received a fault code from the message switch kernel process (MSKP) or DMERT that it could not identify.

147. SMMSBADSQIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timeout routine in the message switch control unit (MSCU) handler received a sequence in-progress indicator that it did not expect.

148. SMMSBADTEXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler received a fault code from the message switch kernel process (MSKP) or DMERT that it was unable to identify.

149. SMMSBPIQFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A full base priority input queue was detected by the message switch control unit (MSCU) handler via an asynchronous response from the MSCU hardware.

150. SMMSDDREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function returned a failure response to the message switch control unit (MSCU) handler indicating that the database cannot be read.

151. SMMSDELDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMdeldma() function returned a failure response to the message switch control unit (MSCU) handler when attempting to delete a direct memory access (DMA) job number.

152. SMMSDELTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMdelttime() function returned a failure response to the message switch control unit (MSCU) handler when attempting to delete a timer that was set up.

153. SMMSDISAB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The disabintr() function returned a failure response to the message switch control unit (MSCU) handler when attempting to disable the MSCU interrupts.

154. SMMSDQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMdequemsg() function returned a failure response to the message switch control unit (MSCU) handler when attempting to remove a message from the in-progress queue.

155. SMMSEACKM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMmsgack() function returned a failure to the message switch control unit (MSCU) handler indicating that DMERT message buffer resources may be low.

156. SMMSEASNDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMasndma() function returned a failure response to the message switch control unit (MSCU) handler when attempting to assign a direct memory access (DMA) job number.

157. SMMSEATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The atchdata() function indicated that the equipment configuration database (ECD) does not contain two message switch control unit (MSCU) unit control blocks (UCBs). This problem is most likely due to errors in creating or modifying the ECD.

158. SMMSEDMAJN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMmsrs1() function in the message switch control unit (MSCU) handler expected to find a direct memory access (DMA) job number in its restore sequence, but the DMA number was not there.

159. SMMSEECD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler detected an invalid u_mv field in a unit control block (UCB) in the equipment configuration database (ECD).

160. SMMSEGPTA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMgetpta() function returned a failure response to the message switch control unit (MSCU) handler when attempting to get a map table address.

161. SMMSEIATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The atchintr() function returned a failure response to the message switch control unit (MSCU) handler when trying to attach to the MSCU's interrupt.

162. SMMSELLA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The 11a_rdget() function returned a failure response to the message switch control unit (MSCU) handler when attempting to locate the unit control blocks (UCBs) for each record identification number (RID) in the msarray[] array. This problem is probably caused by an equipment configuration database (ECD) problem.

163. SMMSEMPROC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler received a request to perform a job while another job was still in progress.

164. SMMSEMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler received an invalid message. An acknowledgment will be returned to the caller indicating that the operation failed.

165. SMMSENINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The enabintr() function returned a failure response to the message switch control unit (MSCU) handler when attempting to enable the MSCU interrupts.

166. SMMSESND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMsendmsg() function returned a failure response (SMFAIL9) to the message switch control unit (MSCU) handler when requested to send a message to update the peripheral interface controller (PIC) translation table.

167. SMMSETIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read peripheral interface controller (PIC) random access memory (RAM) sequence timed out in the message switch control unit (MSCU) handler and the timer indices are not consistent.

168. SMMSEUCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The 11a_rdgct() function returned an invalid unit control block (UCB) to the message switch control unit (MSCU) handler while searching the msarray[] array for UCBs associated with record identification numbers (RIDs). This problem is probably caused by an equipment configuration database (ECD) problem.

169. SMMSFATAL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A fatal software error was detected in the message switch control unit (MSCU) handler. An error will be reported to MSCU fault recovery.

170. SMMSFILENG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler could not get the random access memory (RAM) file for the MCTU2 from the AM disk. The message switch kernel process (MSKP) environment service routine SMDlfdsk() failed.

171. SMMSFUCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The 11a_rdgct() function cannot locate both message switch control unit (MSCU) unit control blocks (UCBs). This is probably caused by an equipment configuration database (ECD) problem.

172. SMMSINCMVINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler can not determine the vintage of the office. The database parameters SMCM0VINT or SMCM1VINT are in an invalid state.

173. SMMSINCTI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment passed an invalid control table index to the message switch control unit (MSCU) handler's restore (RST) function SMmsrst2(). This index is used to locate the random access memory (RAM) file for the MCTU2 in AM memory (core).

174. SMMSINPFS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler's random access memory (RAM) file history table is in an invalid state.

175. SMMSLCREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that low core is either inaccessible or contains invalid data.

176. SMMSMTIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler attempted to acknowledge a message, but the in-progress queue was empty. An error is reported to MSCU fault recovery.

177. SMMSODDER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler received a read failure return code from the DBfrdtup() primitive. DBfrdtup() could not read data from the office dependent data (ODD) database.

178. SMMSODDNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler received a NO MATCH return code from the database primitive DBfrdtup(). DBfrdtup() could not find a tuple for the MSCU2 in the office dependent data (ODD).

179. SMMSOTIFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMovftop() function returned a failure response to the message switch control unit (MSCU) handler when attempting to move a message from the overflow queue to the in-progress queue.

180. SMMSPUMPNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler detected an invalid restore (RST) sequence. The dynamic data or the in-progress (IP) queued message is corrupted.

181. SMMSQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMquemsg() function returned a failure response to the message switch control unit (MSCU) handler when requested to insert a message into the MSCU overflow queue.

182. SMMSREQTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMreqtime() function returned a failure response to the message switch control unit (MSCU) handler while attempting to set up a timer.

183. SMMSRQTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMreqtime() function returned a failure response to the message switch control unit (MSCU) handler when attempting to set up a timer.

184. SMMSSEQINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid sequence in-progress indicator was detected by the message switch control unit (MSCU) handler.

185. SMMSUNLOCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid segment ID was detected in a message to the message switch control unit (MSCU) handler.

186. SMPIABTDGN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to abort an in-progress diagnostic.

187. SMPIABTSRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to abort an in-progress message switch kernel process (MSKP) environment service routine.

188. SMPIBADEQID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) received an invalid equipment ID.

189. SMPIBADFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) received an invalid fault code.

190. SMPIBCC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) received an invalid completion code.

191. SMPIBTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) received an invalid timeout type.

192. SMPIBXMIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to send a command due to invalid input parameters to the message switch kernel process (MSKP) environment service routine SMxmitcmd().

193. SMPIDELDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to delete a direct memory access (DMA) job number.

194. SMPIDELTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to delete a timer.

195. SMPIDQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to de-queue a message.

196. SMPIEACKM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to acknowledge a message.

197. SMPIEASNDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to assign a direct memory access (DMA) job number.

198. SMPIEDEQMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) de-queued an invalid message.

199. SMPIEDMAJN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to request a time delay deletion of a direct memory access (DMA) job number.

200. SMPIEGPM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to get the post mortem data for the CMP.

201. SMPIEGPTA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to get a page table address for a direct memory access (DMA) request.

202. SMPIEMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) received an invalid message.

203. SMPIETIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) received an invalid or old timeout index.

204. SMPRISEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) detected an invalid maintenance (MTCE) sequence.

205. SMPIMTIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) detected that its message queue was empty while processing a maintenance (MTCE) request.

206. SMPLOTIFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to move a message from the overflow section to the in-progress section of the message queue.

207. SMPIQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to queue a message.

208. SMPIRDSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to read the system state or processor ID for the CMP.

209. SMPIRQTFail (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to request a timer.

210. SMPISDMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to send a message.

211. SMPISFE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) received a software fault.

212. SMPIUNLOCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to unlock a segment.

213. SMPIVREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor handler (CMPH) failed to verify that a timer was pending.

214. SMPPACKM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send an acknowledgment message to the originator. There may be a problem in the message switch kernel process (MSKP) environment primitive SMmsgack().

215. SMPPDELT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete a timer from the message switch kernel process (MSKP). There may be a problem in the MSKP environment timing primitive, or the timer was never on the timing list.

216. SMPPDEQM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to queue a message on the in-progress (IP) queue for the pump peripheral controller (PPC). Could be a problem in the message switch kernel process (MSKP) environment queue primitive.

217. SMPPEQID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid equipment ID was returned from the message switch kernel process (MSKP). There may be a problem in the MSKP environment or the pump peripheral controller handler (PPCH).

218. SMPPERTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The error pending flag was set without the error timer being set. Could be a problem in the message switch kernel process (MSKP) environment or the pump peripheral controller (PPC) handler.

219. SMPPHSER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Can not send an error message to switch maintenance error recognition (SMER). Could be a problem between the message switch kernel process (MSKP) environment and the switch maintenance kernel process (SMKP), or the pump peripheral controller (PPC) handler is sending the wrong size or type of message.

220. SMPPIVFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send an acknowledgment message to the originator. Could be a problem in the message switch kernel process (MSKP) environment primitive SMmsgack().

221. SMPPMBDM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PMB message address was not found. Could be a problem in the message switch kernel process (MSKP) environment or the pump peripheral controller (PPC) handler.

222. SMPPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid information was found in a message from the message switch kernel process (MSKP). Check the message dump for incorrect information.

223. SMPPOVFM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to move a message from the overflow queue to the in-progress (IP) queue for the pump peripheral controller (PPC). Could be a problem in the message switch kernel process (MSKP) environment queue primitive.

224. SMPPICR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid direct memory access (DMA) number was encountered in a response from the peripheral interface controller (PIC).

225. SMPPQUEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to queue a message on the in-progress (IP) queue for the pump peripheral controller (PPC). Could be a problem in the message switch kernel process (MSKP) environment queue primitive.

226. SMPPRDST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure was encountered for the pump peripheral controller (PPC). Could be a problem in the switch maintenance kernel process (SMKP) database primitive.

227. SMPPREQT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get a timer from the message switch kernel process (MSKP). There may be a problem in the MSKP environment timing primitive.

228. SMPPSFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A software fault was returned from a message switch kernel process (MSKP). Could be a problem in the MSKP environment, the pump peripheral controller (PPC), or the PPC handler.

229. SMPPTINX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistent timer index was returned from a message switch kernel process (MSKP) timeout. Could be a problem in the MSKP environment timing primitive or the timer index in the pump peripheral controller (PPC) dynamic data is wrong.

230. SMQGABTSRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMreqtime() failed to abort an in-progress MSKP environment service routine for the quad-link gateway processor (QGP) initialization.

231. SMQGBEQID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment passed an invalid quad-link gateway processor (QGP) equipment ID to one of the QGP handler's entry points.

232. SMQGBFC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment passed the quad-link gateway processor (QGP) handler's process fault entry point an invalid or unexpected fault code.

233. SMQGBTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment passed the quad-link gateway processor (QGP) handler an invalid or unexpected timeout type. This error is indicative of a software inconsistency problem in the QGP handler or the MSKP environment.

234. SMQGBXMIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link gateway processor (QGP) handler failed to transmit a command to the message switch because the message switch kernel process (MSKP) environment service routine SMxmitcmd() failed due to invalid parameters.

235. SMQGDDIIPM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link gateway processor (QGP) handler detected an inconsistency between a QGP's dynamic data and data in the in-progress maintenance request message.

236. SMQGDELDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMdeldma() failed to delete a direct memory access (DMA) job number for the QGP handler.

237. SMQGDELTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) service routine SMdelttime() failed to delete an outstanding timer for the QGP handler.

238. SMQGDQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMdequemsg() failed to dequeue an in-progress quad-link gateway processor (QGP) maintenance message for the QGP handler.

239. SMQGEACKM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMmsgack() failed to acknowledge a message for the QGP handler.

240. SMQGEASNDMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMasndma() failed to obtain a direct memory access (DMA) job number for the quad-link gateway processor (QGP) handler.

241. SMQGEDMAJN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMtdeldma() failed to delete an in-progress direct memory access (DMA) job number for the quad-link gateway processor (QGP) handler.

242. SMQGEFSNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link gateway processor (QGP) handler found a QGP's error reported flag set, but there was no pending error flag timer for the QGP.

243. SMQGEGPM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMgetpmort() failed to start a quad-link gateway processor's (QGP's) post mortem direct memory access (DMA) in the QGP handler.

244. SMQGEGPTA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMgetpta() failed to obtain a page table address for a quad-link gateway processor (QGP) handler direct memory access (DMA) sequence.

245. SMQGEIPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link gateway processor (QGP) handler found invalid data in a QGP's in-progress maintenance request message.

246. SMQGEMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link gateway processor (QGP) handler received a message containing invalid data.

247. SMQGETIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment passed the quad-link gateway processor (QGP) handler an invalid or out of date timer index.

248. SMQGEUAMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While processing a block message timeout, the quad-link gateway processor (QGP) handler found that all QGP units specified in the message had completed the requested action, but the message had not been acknowledged back to its originator; that is, the message was inexplicably "hung" inside the QGP handler.

249. SMQGIPMEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link gateway processor (QGP) handler found a QGP's message queue empty while processing a

maintenance request for that QGP.

250. SMQGISEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link gateway processor (QGP) handler found an invalid or unexpected sequence state in a QGP's sequence in-progress flag.

251. SMQGOTIFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the quad-link gateway processor (QGP) handler, the message switch kernel process (MSKP) environment service routine SMovftop() failed to move a message from the overflow section to the in-progress section of a QGP's message queue.

252. SMQGQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMquemsg() failed to queue a message for the quad-link gateway processor (QGP) handler.

253. SMQGRDSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMddread() failed to read the system state or interrupt inhibit status of a quad-link gateway processor (QGP) for the QGP handler.

254. SMQGRQTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMreqtime() failed to obtain a timer for quad-link gateway processor (QGP) maintenance activity in the QGP handler.

255. SMQGUNLOCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) environment service routine SMunlock() failed to unlock an AM memory segment for the quad-link gateway processor (QGP) handler.

256. SMREQCMSIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to send a command to the 3bcmsim (via the 3bemulator), has failed.

Probable Cause:

1. Shared memory for 3bcmsim job entries in 3bemulator memory space may be corrupted.
2. 3bcmsim may not be running.

Action:

Message switch kernel process (MSKP) will try to restart 3bcmsim.

If the error prevents level 3 communication with the SM, MSKP will request a re-boot of *UNIX*® RTR.

If the problem persists, re-boot *UNIX*® System V:

Go to EIA page and enter poke 58.

If the *UNIX*® re-boot does not clear the problem, then there may be disk corruption. Follow procedures to recover disk from tape backups.

257. SMRSTCMSIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

MSKP is requesting the 3bemulator to re-start the 3bcmsim process.

Probable Cause:

1. MSKP detected that 3bcmsim is not running.
2. MSKP will re-start 3bcmsim, to try to recover from a level 3 link failure (such as no operating system for distributed switching (OSDS) messages between AM and SM).

Action:

If level 3 is not up after several (less than 10) re-starts of 3bcmsim, MSKP will escalate to a re-boot of *UNIX*® RTR.

If the re-boot of *UNIX*® RTR does not clear the problem, seek technical assistance to:

1. Re-start *UNIX*® System V: go to EIA page and enter poke 58.
2. IF "1." does not clear the problem, then make sure that the ethernet interface boards (EIBs) are working and the ethernet connection is correct:

Log in to *UNIX*® System V and ping the EIBs: use the "ping" command,
 ping UN362.0 (side 0),
 ping UN362.1 (side 1)

If the EIB does not answer to the "ping", then check the ethernet cable connection and replace the EIB board.

258. SMVTOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMvtop() call failed (requested by SMbpqptrs() in MSKP) to get a physical address for a base priority queue (BPQ) pointer.

Probable Cause:

Corrupted BPQ pointers or segment/page tables in *UNIX*® RTR memory.

Action:

Message switch kernel process (MSKP) will escalate into a re-boot of *UNIX*® RTR. If problem persists, the software in disk may be corrupted. Follow procedure to recover from disk corruption (dead start procedure).

259. SMWLIST_FILL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) found the message switch (MSGs) random access memory (RAM) code file wait list full.

Range: doff**1. SIHMOUTFAIL (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The /no5text/prc/Sloffn *UNIX*[®] process attempted to print an output message using the HMoutmsg() primitive, but a failure occurred. One off-normal output message is lost for each assert occurrence. The data to be printed for the off-normal report is in the data dump for local data associated with this assert. The lost off-normal output message may be dumped manually to try to get the correct information. No operational problems are caused by this assert.

2. SIINITFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The /no5text/prc/Sloffn *UNIX*[®] process could not initialize correctly and performed suicide. The user level automatic restart process (ULARP) will restart the *UNIX*[®] process until it initializes correctly. The DMERT primitive connport() or msgenab() failed; this would not have allowed the process to have message communication with other processes.

3. SINOBCRESET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The /no5text/prc/Sloffn *UNIX*[®] process could not send a signal to the /no5text/hm/HMsip *UNIX*[®] process. The HMsip() function was probably terminated at the instant of this assert, but it should be re-created by the craft interface integrity monitor (CMON).

The counters used in performing system level brevity control may not have been reset when they should have been. As a result, more output messages may be discarded since the counts are artificially high. The brevity control counters will be reset normally in the next 5 minutes by the periodic timer within the Sloffn() function the function will generate another signal to the HMsip() function.

4. SINOLGRESET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The /no5text/prc/Sloffn *UNIX*[®] process could not send a signal to the /no5text/hm/HMsip *UNIX*[®] process. The HMsip() function was probably terminated at the instant of this assert, but it should be re-created by the craft interface integrity monitor (CMON).

The data in the off-normal logging output message is affected because the counts used to detect an off-normal condition were not reset after checking them. At the next (15 minute) reporting time, the counters will be artificially large because they represent two intervals of logging. This next cycle also causes the reset signal to be sent to the HMsip() function to have the counts decremented. Logging of output messages is not affected.

5. SIUNXPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The /no5text/prc/Sloffn *UNIX*® process received an unexpected message that could not be processed. This represents a problem with the sender of the message. The received message buffer is in the data dump containing the local data associated with this assert. The message is ignored and normal processing is resumed.

6. SIUNXSMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The /no5text/prc/Slimgcomp UN*X process attempted to send a message using the sendpw primitive but there was a failure. The result of this is the loss of response to the Backup Control Process. Eventually this process will timeout or Backup Control will kill it. A new process will be created if more compression requests exist. If a compression is interrupted it will not be retried. To retry this compression, a backup of that processor must be repeated.

Range: dpucr**1. INBPADSG (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) could not allocate one of the segments that was used to access the off-line copy of the RLSMCONF relation to its virtual address range. The RTR addseg() primitive call failed. PUCR is purged to clean up its segment table.

2. INBPALCS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) could not allocate one of the segments that was used to access the off-line copy of the RLSMCONF relation despite having free slots in its segment list. This probably results from having no free segments in the RTR swap space. PUCR is purged to clean up its segment table.

3. INBPALKS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Broadcast pump could not lock the segment allocated for the off-line RLSMCONF relation into memory. Pump control (PUCR) cannot determine the off-line configuration, and the broadcast off-line pump is blocked. PUCR is purged to clean up its segment table.

4. INBPALOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) could not allocate one of the segments that was used to access the off-line copy of the RLSMCONF relation because there were no free slots in its segment list. This may occur after repeated INBPFREE assert errors. PUCR is purged to clean up its segment table.

5. INBPAODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) failed to attach the office dependent data (ODD) segments to its segment table. PUCR will be purged.

6. INBPBADP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) could not read the RLSMCONF relation, or the SM configuration value was invalid. This SM cannot be included in a broadcast pump.

7. INBPBADS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) uses the INoflbss.state variable to track its progress while reading the off-line office dependent data (ODD) during a broadcast off-line text pump. The state variable was in an invalid state. This prevents a clean release of the segments used for reading the off-line disks. PUCR will be purged to clean up its segment table.

8. INBPFREE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) could not release one of the segments that was used to access the off-line copy of the RLSCONF relation. This may result in PUCR using extra memory, and eventually PUCR will not be able to access the off-line office dependent data (ODD). (See the INBPALOC assert).

9. INBPNOSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The first entry on the pump queue was a broadcast text pump, but the corresponding bit map was empty. The queue audit was called.

10. INBPOAOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Broadcast pump failed to open the AM office dependent data (ODD) on the off-line disk. Pump control (PUCR) cannot determine the configuration of the SM on the new software release, and the broadcast pump is blocked. All off-line pumps from the off-line disks will be stopped.

11. INBPOARP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Broadcast off-line pump failed to read the office dependent data (ODD) parameter area from the off-line disk. Pump control (PUCR) cannot determine the SM's configuration on the off-line software release, and the broadcast pump is blocked. All off-line pumps from the off-line disks will be stopped.

12. INBPOARR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Broadcast pump attempted to read the off-line office dependent data (ODD) relation RLSCONF, but the read failed. Pump control (PUCR) cannot determine the SM configuration on the off-line image, and the off-line pump is blocked. All off-line pumps from the off-line disks will be stopped.

13. INBPSIZE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INallocseg() function was called with a size of greater than one segment, or a negative value. Pump control

(PUCR) resets the value to the maximum segment size and proceeds.

14. INBPSMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Broadcast pump attempted to send a message to the file manager while reading the off-line copy of the RLSCONF relation, but the RTR sendmsg() primitive returned failure. All off-line pumps from the off-line disks will be stopped.

15. INBPSTMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) could not set the access mode for one of the memory segments used to access the off-line copy of the RLSCONF relation. The RTR primitive setmap() returned failure. PUCR is purged to clean up its segment table.

16. INBPTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) timed out while attempting to read the RLSCONF relation from the off-line disks. All off-line pumps from the off-line disks will be stopped.

17. INPCABORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) received an E_ABORT event. This assert is expected if CM isolation is entered during an SM pump.

18. INPCAETN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A pump process had a state of created, but the pump type of the active entry is null. An attempt is made to correct the pump type.

19. INPCBPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) encountered an invalid port that was specified with the portid() primitive.

20. INPCCONTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) created a child process and timed out while waiting for the child process to connect to its port.

Probable Cause:

This process did not have a chance to run because of a lack of AM real-time.

Action:

PUCR continues with the next pump request. It will eventually retry this pump request.

21. INPCCRTE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) failed to create a PUMP process.

22. INPCCRTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) timed out while waiting for an acknowledgement of creation (of the FPUMP or CTSPUMP process) from the process manager.

23. INPCDQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In pump control (PUCR), no message was queued for the INDequeue() function.

24. INPCDTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) timed out while waiting for a termination message after terminating a child process.

25. INPCFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) received a fault entry.

26. INPCFTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timeout occurred while waiting for a child process fault acknowledgement.

27. INPCGTMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DMERT primitive getmsg() did not return SUCCESS.

28. INPCINVEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Pump control (PUCR) received an invalid event.

29. INPCINVMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Pump control (PUCR) received an invalid message.

30. INPCMNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Failed to mount the updtmp partition.

31. INPCNODIR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Prior to mounting a partition to a directory, pump control (PUCR) requested status on that directory and received an indication that there were problems with the directory. The partition will not be mounted.

32. INPCNOPUMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A pump process exists for a processor that is not currently pumping. The pump process is faulted.

33. INPCOPN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Pump control (PUCR) failed to open with the communications kernel process (CMKP).

34. INPCORPHAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
During a periodic check, pump control (PUCR) detected that a child process was alive but there were no pump requests in the associated queue.

Probable Cause:
Last pump failed to kill the child process after completion.

Action:
PUCR will kill the orphaned process and continue.

35. INPCPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The connport() primitive failed to connect pump control (PUCR) to a port.

36. INPCPRI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) received failure from the setprior() primitive.

37. INPCQFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not load a pump request into a queue, the queue is full.

38. INPCSCPMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DMERT sendcpmsg() primitive failed.

39. INPCSFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In pump control (PUCR), the sendfault() primitive failed.

40. INPCSMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendmsg() primitive failed.

41. INPCSDPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) received failure from the sendport() primitive.

42. INPCSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid pump process state was detected in the pump queues.

43. INPCSWAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control (PUCR) received failure from the punswap() primitive.

44. INPCTERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to terminate a pump process.

45. INPCTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timeout occurred while waiting for a pump process terminate acknowledgement.

46. INPCTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In pump control (PUCR), an invalid type of pump was requested.

47. INPUEISS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PUCR found an invalid rISMCONF version ID in pumplib

Probable Cause:

The mount offline process (MOP) process did not correctly set this value or MOP was not run prior to executing ST-OPUMP using the offline disks.

Action:

Check that MOP is setting the rISMCONF version correctly.

48. PUCR23 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump control's (PUCR) first-in first-out (FIFO) load pointer was out of range.

Range: drclg**1. DBAUDRECV (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rcvbw() function failed to receive a message from the logging process.

2. DBAUDSENDP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendpw() function failed to send a message from the RCsoddaud() process to the logging process.

3. DBAUDTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The audit type was incorrect.

4. DBLGBD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was encountered.

5. DBLGBDPROC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. An attempt was made to send a message to an invalid processor.

6. DBLGBFD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. Invalid file data was encountered.

7. DBLGBGD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. Invalid semi-global data was encountered.

8. DBLGBMD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid message data was encountered. An unreadable message was received in recent change (RC) or customer originated recent change (CORC) logging.

9. DBLGBPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. Invalid parameter data was encountered.

10. DBLGCLOSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. An attempt to close a file failed.

11. DBLGCORC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid customer originated recent change (CORC) logging data was received by CORC logging.

12. DBLGCREAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. An attempt to create a file failed.

13. DBLGDD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. Data delivery (DD) calls failed.

14. DBLGHMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. The HMoutmsg() function failed.

15. DBLGLSEEK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. The lseek() function failed.

16. DBLGMALLOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The *UNIX*[®] process was not able to allocate the required memory using malloc().

17. DBLGNA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. No acknowledgement was received.

18. DBLGOPEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An open() function call failed to open the requested file.

19. DBLGPSSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sendw() function failed.

20. DBLGQUEFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The customer originated recent change (CORC) job queue was full. In AM CORC logging, a *UNIX*[®] process (rcv/lglog) receives the CORC logging job and puts it into a job queue.

21. DBLGRDGPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBrdgparm() function failed to return the value of the global parameter that was requested. If this happened in response to a roll forward, retry the roll forward using the manual command EXC:ODDRCVY. See the Input Messages Manual for the options to this message.

22. DBLGREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to read from a file, the read() function call failed. The file that was being read will be closed.

23. DBLGRECV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recvw() function failed to return a message of the specified type.

24. DBLGSCALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. A system call failed.

25. DBLGSEEK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change (RC) logging and recovery error occurred. The lseek() function failed.

26. DBLGSENDP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*® process could not send a message through a port to the operating system for distributed switching (OSDS) or to another *UNIX*® process. The sendpw() function call failed.

27. DBLGSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*® stat() function failure occurred in recent change (RC) recovery code.

28. DBLGWRITE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to write to a file, the write() function returned a failure. The file that was being written to will be closed.

29. DBLMFSCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated static office dependent data (SODD) audit's log file merge/fold/sort function failed when attempting to create a temporary file. All related files will be removed automatically, and the incremental audit will proceed normally.

30. DBLMFSLs (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated static office dependent data (SODD) audit's log file merge/fold/sort process (DBlogmfs) failed when attempting to access the logfile status file used in SODD test mode.

31. DBLMFSOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated static office dependent data (SODD) audit's log file merge/fold/sort function found an unexpected

operation within one of the log files. The log file entry will be ignored and the function will proceed normally.

32. DBLMFSRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated static office dependent data (SODD) audit's log file merge/fold/sort function failed when it received an invalid return code from the read() function. All related files will be removed automatically, and the incremental audit will proceed normally.

33. DBLMFSSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated static office dependent data (SODD) audit's log file merge/fold/sort function failed when it received an invalid return code from a system call. All related files will be removed automatically, and the incremental audit will proceed normally.

34. DBLMFSSK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated static office dependent data (SODD) audit's log file merge/fold/sort function failed when it received an invalid return code from the lseek() function. All related files will be removed automatically, and the incremental audit will proceed normally.

35. DBLMFSWR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated static office dependent data (SODD) audit's log file merge/fold/sort function failed when it received an invalid return code from the write() function. All related files will be removed automatically, and the incremental audit will proceed normally.

36. DBLOGTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected log type was encountered during the automated static office dependent data (SODD) audit log file access tree building process. The valid types are CORCLOG, RCLOG, and REDLOG.

37. DBLTCLOSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An automated static office dependent data (SODD) audit log file access functions error occurred. An attempt to close a file failed.

38. DBLTCREAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An automated static office dependent data (SODD) audit log file access functions error occurred. An attempt to create a file failed.

39. DBLTFLUSH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated static office dependent data (SODD) audit log file access tree flush function DBLgflush() returned failure.

40. DBLTLSEEK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An automated static office dependent data (SODD) audit log file access functions error occurred. The lseek() function failed.

41. DBLTMALLOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The malloc() function returned failure on an automated static office dependent data (SODD) audit log file access process request to allocate a 128K buffer.

42. DBLTOPEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An open() function call failed to open the requested file for automated static office dependent data (SODD) audit log file access functions.

43. DBLTREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to read from a file, the read() function call failed for automated static office dependent data (SODD) audit log file access functions.

44. DBLTSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An automated static office dependent data (SODD) audit log file access error occurred. The *UNIX*®stat() function failed.

45. DBLTTAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected function tag was found in the recent change (RC) log file during the automated static office dependent data (SODD) audit log file access tree building process.

46. DBLTWRITE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to write to a file, the write() function call returned a failure for automated static office dependent data (SODD) audit log file access functions.

47. DBNAUDMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recvw() function received a message with the wrong message ID.

48. DBOPENPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the *UNIX*[®] logging processes (lglog, lgcntl, lgcr, or lgroll) could not set up a dynamic port that was requested by the communications kernel process (CMKP). If this problem was caused by an input command, then retry the command.

49. DBRFCMPABT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Roll forward completed unsuccessfully on a mate CMP. The roll forward pseudo update bus function failed; therefore, the mate CMP is OOD. A request to remove the mate CMP from service was sent to switch maintenance.

50. DBRFDDPHY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A physical data delivery (DD) primitive failed for roll forward.

51. DBRFPCRCNV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function was called to convert a CMP logical ID to a physical ID. SMddread() returned something other than SMDBOK.

52. DBRFPHYCNV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function was called to convert a CMP physical ID to a logical ID. SMddread() returned something other than SMDBOK.

53. DBRFSCMPNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBcmpchk() function returned failure indicating that this process was not notified for more data for the standby CMP roll forward in the last ten minutes. The standby CMP went down or hardswitched and did not contact this process. If a hardswitch occurred without starting roll forward, the manual request for roll forward on the new active CMP should be performed.

Range: dsmkp**1. SM7SK_Q_ERR (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) discovered an error in the task queue structure.

2. SM54BADACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an acknowledgment from the wrong person, or received an invalid acknowledgment.

3. SM60BADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DMERT message MS_TYPE is wrong as the input to SMincnt.c.

4. SMAUBADT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface fault recovery (LIFR) received an invalid audit message. This assert is located in the LIFR source file SMIifr.c.

5. SMAUBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface fault recovery (LIFR) received an invalid error request to call SMinker.c. The error message should be from the input/output processor (IOP). This assert is located in the LIFR source file SMIifr.c.

6. SMAUBINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface fault recovery (LIFR) received an initialization request from a function other than initialization configuration. This assert is located in the LIFR source file SMIifr.c.

7. SMAUBMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message was not an INHIBIT or ALLOW request. This assert is located in the link interface fault recovery (LIFR) source file SMli_ia.c.

8. SMAUBREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface fault recovery (LIFR) received an unknown request. This assert is located in the LIFR source file SMLifr.c.

9. SMAUBRMU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid link interface (LI) remove request was encountered. This assert is located in the link interface fault recovery (LIFR) source file SMLifr.c.

10. SMAUBRST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface fault recovery (LIFR) received a restore message that was not from initialization configuration or configuration control. This assert is located in the LIFR source file SMLifr.c.

11. SMAUBSDE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid link interface (LI) side request was encountered. This assert is located in the link interface fault recovery (LIFR) source file SMLi_ia.c.

12. SMAUBSNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid byte count or side was sent to the foundation peripheral controller (FPC). This assert is located in the link interface fault recovery (LIFR) source file SMLiprims.c.

13. SMAUBSTA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The link interface (LI) was requested to be in a state other than active force or active minor. This assert is located in the link interface fault recovery (LIFR) source file SMLirst.c.

14. SMAUBSWT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface fault recovery (LIFR) received an invalid switch message. The link interface (LI) switch message should be from configuration control. This assert is located in the LIFR source file SMLifr.c.

15. SMAUBTYM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid TTY input message was encountered. This assert is located in the link interface fault recovery (LIFR) source file SMLifr.c.

16. SMAUBTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface fault recovery (LIFR) received an unknown request. This assert is located in the LIFR source file SMLifr.c.

17. SMAUCLK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface fault recovery (LIFR) received an invalid network clock (NCLK) message. This assert is located in the LIFR source file SMLifr.c.

18. SMAURFLK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid link interface (LI) network clock (NCLK) request was encountered. This assert is located in the link interface fault recovery (LIFR) source file SMLireflk.c.

19. SMAURTER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown return was received from the SMerr() function. This assert is located in the link interface fault recovery (LIFR) source file SMLinker.c.

20. SMAUTADT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A link interface (LI) configuration status audit timeout occurred. This assert is located in the link interface fault recovery (LIFR) source file SMLiadt.c.

21. SMAUTLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A link interface (LI) timeout occurred from a message sent to the inhibit interrupt administrator (IIA) with the status of the LI interrupts. This assert is located in the link interface fault recovery (LIFR) source file SMLinker.c.

22. SMAUTPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timeout occurred. This assert is located in the link interface fault recovery (LIFR) source file SMIiprims.c.

23. SMBACTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Received the wrong type of message.

24. SMBADACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Switch maintenance control (SMC) received an acknowledgment message with an unrecognizable ms-ident field.

25. SMBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Received a message with the wrong target or state, or the message was received from the wrong group.

26. SMBADODD (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Corrupt ODD or PCD is found.

27. SMBADPAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
During a switch, the wrong case value or parameter was specified.

28. SMBADPCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Peripheral configuration data (PCD) was incorrect.

29. SMBAD_TOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Switch maintenance control (SMC) detected an error in the timing queue structures.

30. SMBAD_USTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Switch maintenance control (SMC) discovered an SMC process in an illegal state.

31. SMBADhHMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message to SM configuration control from the human machine (HM) module alarm process had an invalid action. The message buffer is first on the stack.

32. SMBDCALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMincmf() function code was invalid. The initialization configuration will terminate itself.

33. SMBDINCV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received an invalid initialization level in a message from switch maintenance control (SMC). SMC is implicated.

34. SMBDMSTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The body of a message from the input/output driver (IODRV) to initialize a message interface control unit (MICU) was wrong.

35. SMCILBLCL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The blocking class of a switch maintenance control (SMC) process had an illegal value.

36. SMCMKPCLOF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process failed to send close translation entry request to communications kernel process (CMKP).

Probable Cause:

UNIX® sendpw process failure or CMKP software error.

Action:

Provide data to the next level of support.

37. SMCMKPNOACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process failed to receive acknowledgement after sending a request to communications kernel process (CMKP) to acquire translation entry.

Probable Cause:

UNIX[®] recvw process failure.

Action:

Try opst-qlnet command again. If a failure results again, then provide data to the next level of support.

38. SMCMKPOPNF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communications kernel process (CMKP) could not open a translation entry for the quad-link packet switch fault recovery (QLFR) craft *UNIX*[®] process.

Probable Cause:

System resource shortage.

Action:

Provide data to the next level of support.

39. SMCNOPFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) received a failure acknowledgment in response to the CMOPEN message.

40. SMCNOPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) attempted to send a message to a DMERT process, but found the process had not attached to its port.

41. SMCNTDGN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet switching module (PSM) could not send a message to diagnostics.

42. SMCONAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not connect to the port PT-APRTS in the *UNIX*[®] process SMaprts().

43. SMCPRCSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance kernel process (SMKP) received a software fault or a DMERT level was running. All switch maintenance control (SMC) data structures with the wrong description will be initialized.

44. SMCRIT_VIOL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch maintenance control (SMC) user process attempted to enter a critical region while in an illegal state. A second occurrence should cause a switch maintenance kernel process (SMKP) initialization.

45. SMCSWFLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance kernel process (SMKP) received a software fault while switch maintenance control (SMC) was running. All SMC data structures will be initialized.

46. SMDMACTION (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The action field of an input message contained an unknown action.

47. SMDMAMVRFERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process received an invalid input parameter from SMDmam/SMstout/SMstqnet function.

Probable Cause:

Software error.

Action:

Provide data to the next level of support.

48. SMDMBADLOG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered in the physical to logical translation for a valid unit.

49. SMDMBADQREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid request was found on the deferred maintenance administrator and monitor (DMAM) queue. The request will be aborted.

50. SMDMCMKP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The deferred maintenance administrator and monitor (DMAM) failed to establish communication with the communications kernel process (CMKP).

51. SMDMCONPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to connect to a port failed.

52. SMDMDDREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DDread() function.

53. SMDMDLINF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request on the deferred maintenance administrator and monitor (DMAM) queue was not found in the dual link interface (DLI) history array. The request will be aborted.

54. SMDMETYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown event type was received by the deferred maintenance administrator and monitor (DMAM).

55. SMDMFRDTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return was received from the DBfrdtup() function.

56. SMDMGDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Global data used by deferred maintenance administrator and monitor (DMAM) functions was out of range.

57. SMDMILLID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal unit identification was received for updating maintenance display pages.

58. SMDMINVDLI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid request was found in SMdimp[], the dual link interface (DLI) history array. Running DLI requests may be aborted.

59. SMDMINVUNIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit type was received by the deferred maintenance administrator and monitor (DMAM).

60. SMDMIPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to a deferred maintenance administrator and monitor (DMAM) function.

61. SMDMMSGEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the msgenab() function failed.

62. SMDMMSTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received that had an unrecognizable type.

63. SMDMNODSPY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

All database reads failed; therefore, no master control center (MCC) display pages exist.

64. SMDMNOTFND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A completed request was not found in the deferred maintenance queue.

65. SMDMODDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Call to DTattodd() failed.

66. SMDMONCREATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The deferred maintenance administrator and monitor (DMAM) failed to create the diagnostic monitor (DMON) process.

67. SMDMOUTMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the HMoutmsg() primitive call.

68. SMDMPARAM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A deferred maintenance administrator and monitor (DMAM) function received an invalid parameter from the calling function.

69. SMDMPASFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Call to DTattpas() failed.

70. SMDMQSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send the next queued request.

71. SMDMREADST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was received on a return from the SMreadst() function for an equipped unit.

72. SMDMSCPCHK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred when sending a request to the packet switching module (PSM) to read scan points. The state of the unit presently being diagnosed may be invalid.

73. SMEECDAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The equipment configuration database (ECD) had an empty option. The record identification number (RID) is needed for the *UNIX*[®] process SMaprts() to initialize master control center (MCC) pages 117 and 118.

74. SMFAILREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet switching module (PSM) failed to send a request to the deferred maintenance administrator and monitor (DMAM).

75. SMFSMPRCVF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process received a failure return while waiting for MGQLSTATE message sent from the switch module processor (SMP). This failure return was not caused by the 60-second timer.

Probable Cause:

Software error.

Action:

Provide data to the next level of support.

76. SMFULLARY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The array of structures was full.

77. SMGTMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A general problem occurred in the message interfaces in the *UNIX*[®] process SMaprts().

78. SMHMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Human machine (HM) function calls are returning errors to the *UNIX*[®] process SMaprts().

79. SMIASTDBRDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) status output process SMIIAU received a data read failure from the SMddread() function.

80. SMIASTOBRPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) status output *UNIX*® process SMIIAU received a message that contains an unknown type.

81. SMIASTONP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) status output process SMIIAU could not connect to a port.

82. SMIIAAUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit status table audit (IIATAB) detected an uncorrectable error in the data. This probably indicates data corruption throughout the peripheral configuration data (PCD).

83. SMIIONAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) off-normal list process found a unit that was in an off-normal, illegal state. The IIA audit will be run.

84. SMIIONLP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) off-normal list process could not attach to its port (PT_SMONL).

85. SMIIONLRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) off-normal list process received a message that it could not identify.

86. SMIIONNR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) off-normal list process could not obtain a record from the peripheral configuration data (PCD).

87. SMIIONPCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) off-normal list process could not attach to the peripheral configuration data (PCD).

88. SMIISOBM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) status output process received a message that it could not identify.

89. SMIISOCARD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) status output process could not access the peripheral configuration data (PCD).

90. SMIISONOPCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) status normal list process could not attach to the peripheral configuration data (PCD).

91. SMIISONP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) status output process could not attach to its port (PT_SMST).

92. SMINITSCSDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet switching module (PSM) could not initialize with the scan and signal distributor administrator (SCSDA).

93. SMINPSTINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface *UNIX*[®] process received an invalid state input from SMstout.

Probable Cause:

Software error in either SMiopv.ity or SMstout screening logic.

Action:

Provide data to the next level of support.

94. SMINVCLOACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process received an invalid acknowledgement after sending a request to the communications kernel process (CMKP) to close translation slot.

Probable Cause:
Software error.

Action:
Provide data to the next level of support.

95. SMINVDIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The scanner and signal distributor administrator (SCSDA) could not change the distribute points.

96. SMINVSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A request was in an invalid state.

97. SMKP73 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Could not connect to the port PT_SMNO5 in the *UNIX*[®] () user SMno5fm().

98. SMKP74 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Could not enable message processing to the *UNIX*[®] process SMno5fm().

99. SMKP75 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Could not initialize the *UNIX*[®] process SMno5fm(). This involves interfaces with the switch maintenance kernel process (SMKP) and the scanner and signal distributor (SC/SD) administrator.

100. SMKP76 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A general problem occurred in the message interfaces of the *UNIX*[®] user SMno5fm() with keeping the power switch and the configuration of the switch maintenance kernel process (SMKP) in synchronization with each other.

101. SMKP77 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The *UNIX*[®] process SMno5fm() received an unknown message.

102. SMKP78 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

UNIX[®] primitives failed.

103. SMKP79 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The UNIX[®] process SMno5fm() could not communicate with the scanner and signal distributor (SC/SD) administrator.

104. SMKP80 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The UNIX[®] process SMno5fm() received an invalid message from the configuration of the switch maintenance kernel process (SMKP).

105. SMKP81 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The UNIX[®] process SMno5fm() could not communicate with the switch maintenance kernel process (SMKP).

106. SMKP88 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not attach to the process control block (PCB) from the SMno5fm() function.

107. SMKP89 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The configuration of the switch maintenance kernel process (SMKP) received an invalid message from craft and could not determine what to do.

108. SMKP90 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

After trying for two minutes to call human machine (HM) primitives, CONFIG could not receive an HMOK; acknowledgement of success. Master control center (MCC) page 115 may be incorrect.

109. SMLINKBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message to SM configuration control had an invalid link field. The message buffer is first on the stack.

110. SMMAPBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid linkmap was received from the SM in an SMINITTYPE message. The message buffer is first on the stack.

111. SMMEAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not enable the message process to the *UNIX*[®] user SMaprts().

112. SMNCADPR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The status of the primary reference was incorrect. This assert is located in the network clock (NCLK) source file SMnc_audit.c for the SMnc_audit() function.

113. SMNCADSR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The status of the secondary reference was incorrect. This assert is located in the network clock (NCLK) source file SMnc_audit.c for the SMnc_audit() function.

114. SMNCADUN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached while switching on the unit argument. This assert is located in the network clock (NCLK) source file SMnc_audit.c for the SMnc_audit() function.

115. SMNCADXC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The status of the cross_couple reference was incorrect. This assert is located in the network clock (NCLK) source file SMnc_audit.c for the SMnc_audit() function.

116. SMNCANYM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message acknowledgment timed out. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMcomm_nc() function.

117. SMNCCMFP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the func_ptr argument. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMcomm_nc() function.

118. SMNCCMMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the message type of a user input request. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMcomm_nc() function.

119. SMNCDMMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the message header member ms_type. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMcomm_nc() function.

120. SMNCFRAC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral configuration data (PCD) did not indicate the correct active clock. This assert is located in the network clock (NCLK) source file SMncflt_rcv.c for the SMncflt_rcv() function.

121. SMNCFRAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network clock (NCLK) fault recovery determined that a second asynchronous report message came from the same clock. This assert is located in the NCLK source file SMncflt_rcv.c for the SMncflt_rcv() function.

122. SMNCFRRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The fault recovery program did not find the right combination of remove or switch of the clocks. This assert is located in the network clock (NCLK) source file SMncflt_rcv.c for the SMncflt_rcv() function.

123. SMNCFRSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral configuration data (PCD) did not indicate the correct standby clock. This assert is located in the network clock (NCLK) source file SMncflt_rcv.c for the SMncflt_rcv() function.

124. SMNCIMRF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The default was reached when switching on the reference argument. This assert is located in the network clock (NCLK) source file SMncflt_rcv.c for the SMnc_iaa_msg() function.

125. SMNCINCL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the parameters passed to the SMia_clk() function had an unexpected value. This assert is located in the network clock (NCLK) source file SMia_nclk.c for the SMia_clk() function.

126. SMNCINRF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the parameters passed to the SMia_ref() function had an unexpected value. This assert is located in the network clock (NCLK) source file SMia_nclk.c for the SMia_ref() function.

127. SMNCLBTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message acknowledgment timed out. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMcomm_nc() function.

128. SMNCMDMD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the channel control block (CCB) indicated that the mode or digital phase lock loop (DPLL) status was incorrect. This assert is located in the network clock (NCLK) source file SMrout2_nc.c for the SMnc_md_dis() function.

129. SMNCPSRF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The argument reference was not equal to SMTIP, SMTIS, or X_CPL. This assert is located in the network clock (NCLK) source file SMia_nclk.c for the SMref_state() function.

130. SMNCRCL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the clock variable was not equal to 0 or 1. This assert is located in the network clock (NCLK) source file SMswitch_nc.c for the SMnclk_rmv() function.

131. SMNCRDCL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the parameters passed to the SMiaucclk() function contained an unexpected value. This assert is located in the network clock (NCLK) source file SMiia_nclk.c for the SMiaucclk() function.

132. SMNCRDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the parameters passed to the SMiaurcf() function contained an unexpected value. This assert is located in the network clock (NCLK) source file SMiia_nclk.c for the SMiaurcf() function.

133. SMNCRICE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the cfg_pl_error variable, an unknown network clock (NCLK) communication error. This assert is located in the NCLK source file SMrst_int_nc.c for the SMrst_int_nc() function.

134. SMNCRICS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the nc_st variable. This assert is located in the network clock (NCLK) source file SMrst_int_nc.c for the SMrst_int_nc() function.

135. SMNCRIDS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the network clock (NCLK) read of the SMrdret[ip] array. This assert is located in the NCLK source file SMrst_int_nc.c for the SMrst_int_nc() function.

136. SMNCRIPS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the npri_state variable. This assert is located in the network clock (NCLK) source file SMrst_int_nc.c for the SMrst_int_nc() function.

137. SMNCRIRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the ref_ptr argument. This assert is located in the network clock (NCLK) source file SMrst_int_nc.c for the SMrst_int_nc() function.

138. SMNCRISS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the nsec_state variable was out of range. This assert is located in the network clock (NCLK) source file SMrst_int_nc.c for the SMrst_int_nc() function.

139. SMNCRIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the state argument. This assert is located in the network clock (NCLK) source file SMrst_int_nc.c for the SMrst_int_nc() function.

140. SMNCRITL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the tms_li argument. This assert is located in the network clock (NCLK) source file SMrst_int_nc.c for the SMrst_int_nc() function.

141. SMNCRIXS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the nxcpl_state variable. This assert is located in the network clock (NCLK) source file SMrst_int_nc.c for the SMrst_int_nc() function.

142. SMNCRPRF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The argument reference was not equal to SMTIP, SMTIS, or X_CPL. This assert is located in the source file SMiia_nclk.c for the SMref_pest() function.

143. SMNCRRAC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The active clock did not agree with the clock that the peripheral configuration data (PCD) indicated was active. This assert is located in the network clock (NCLK) source file SMswitch_nc.c for the SMref_rm_fst() function.

144. SMNCRRER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the error variable. This assert is located in the network clock (NCLK) source file SMswitch_nc.c for the SMref_rm_rst() function.

145. SMNCRRF1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the reference argument. This assert is located in the network clock (NCLK) source file SMswitch_nc.c for the SMref_rm_rst() function.

146. SMNCRRWC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the which_elk argument. This assert is located in the network clock (NCLK) source file SMswitch_nc.c for the SMref_rm_rst() function.

147. SMNCRWTD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message acknowledgment timed out. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMcomm_nc() function.

148. SMNCSCER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMnclk_sw() function failed to switch the clocks. An audit is run to determine the state of the clocks. This assert is located in the network clock (NCLK) source file SMswitch_nc.c for the SMnclk_sw() function.

149. SMNC SHMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the subheader member mstype. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMcomm_nc() function.

150. SMNC SMMD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the mode argument. This assert is in the network clock (NCLK) source file SMswitch_nc.c for the SMmode_sw_nc() function.

151. SMNCSPCM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message sent to the clock was not understood. This assert is located in the source file SMnc_comm.c at the entry point for the network clock (NCLK) function SMsupnc().

152. SMNCSPFN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the function argument. This assert is located in the network clock (NCLK)

source file SMnc_comm.c for the SMSupnc() function.

153. SMNCSPMD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the mode variable. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMSupnc() function.

154. SMNCSPPR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached. This assert is located in the network clock (NCLK) source file SMac_comm.c in the SMSupnc() function.

155. SMNCSRER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMref_sw_nc() function failed to switch the references. An audit will be run to determine the state of the references. This assert is located in the network clock (NCLK) source file SMswitch_nc.s for the SMref_sw_nc() function.

156. SMNCSRRF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the reference argument. This assert is located in the network clock (NCLK) source file SMswitch_nc.c for the SMref_sw_nc() function.

157. SMNCTGUN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the subheader member tg_un. This assert is located in the network clock (NCLK) source file SMnc_comm.c for the SMcomm_nc() function.

158. SMNCTTYO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default was reached when switching on the verb argument. This assert is located in the network clock (NCLK) source file SMncttyout.c for the SMnctty_out() function.

159. SMNO_AIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) could not get the process ID for the application integrity monitor (AIM) by using

its port number.

160. SMNO_CMKP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) could not get the process ID for the communications kernel process (CMKP) by using its port number.

161. SMNODBPCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) could not attach to the peripheral configuration data (PCD) database.

162. SMNOEQUIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A peripheral configuration data (PCD) error occurred. A record is marked unequipped when it should be marked equipped.

163. SMNOEVTNO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An event number did not exist in the array of structures.

164. SMNOLG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical group name did not exist in the array of structures.

165. SMNOMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An SM failed to receive a message. A new message was unsuccessful. No message was available for INIT_CONF in the buffer.

166. SMNOMSGE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) could not identify a message that it was attempting to route.

167. SMNONPCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) received an error acknowledgment while loading the peripheral configuration data (PCD) or getting input/output driver (IODRV) coins.

168. SMNOPC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No peripheral controllers (PCs) exist in a message switch peripheral unit (MSPU) community.

169. SMNOPCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tried to access a nonexistent record.

170. SMNO_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) could not attach to the switch maintenance kernel process (SMKP) port.

171. SMNOSCAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet switching module (PSM) received invalid scan data.

172. SMNOSLOTAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Equipment configuration database (ECD) manager functions could not get the peripheral controller (PC) ID for the *UNIX*[®] process SMaprts().

173. SMNO_TQE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The free list for task blocks is empty. Switch maintenance control (SMC) cannot schedule new tasks.

174. SMOPENAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The equipment configuration database (ECD) could not be opened by the *UNIX*[®] process SMaprts().

175. SMPCDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Low level access (LLA) returned IDERROR.

176. SMPHYTOLOGF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process get failure return from SMphy2log() which translates equipment IDs from physical to logical.

Probable Cause:

Software error.

Action:

Provide data to the next level of support.

177. SMQATODDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process failed to attach to office dependent data (ODD).

Probable Cause:

Unknown.

Action:

Try QLFR out-of-service (OOS) report command again. If the failure repeats, then provide the data to the next level of support.

178. SMQATPASF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process failed to attach to protected application segment (PAS).

Probable Cause:

Unknown.

Action:

Try QLFR out-of-service (OOS) report command again. If the failure repeats, then provide the data to the next level of support.

179. SMQINVNTWK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process received invalid network input from SMstout.

Probable Cause:

Software error in SMiopv.ity file or SMstout screening logic.

Action:

Provide data to the next level of support.

180. SMQNETCREATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The deferred maintenance administrator and monitor (DMAM) failed to create the quad-link packet switch fault recovery (QLFR) craft interface (SMQNTWKOUT) terminal process.

Probable Cause:

Possible causes are listed below:

- 1) The SMqntwkout product is not properly installed in /no5text/prc on the AM.
- 2) The SMqntwkout product was not made executable.
- 3) Software error.

Action:

Provide data to the next level of support.

181. SMQUBADMSGTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

QLFR Craft interface terminal process received an unexpected message type either from SMstout for input message type or from QLFR-SMP for MGQLSTATE message.

Probable Cause:

Software error in SMstout or SMqlsp.

Action:

Provide data to the next level of support.

182. SMQUENMSGF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process failed to enable message reception.

Probable Cause:

UNIX[®] process message enable failed.

Action:

Provide data to the next level of support.

183. SMQUINVDQLST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link packet switch fault recovery (QLFR) craft interface terminal process received an unexpected DQLNK

(inter-SM QLPS Link) from QLFR-SMP or read an unexpected QLNK status from AM peripheral configuration data (PCD).

Probable Cause:
Software error or data corruption.

Action:
Provide data to the next level of support.

184. SMQUINVPST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Quad-link packet switch fault recovery (QLFR) craft interface terminal process read an unexpected PIPE (QLPS pipe) state from the AM peripheral data (PCD) or was unable to read the SM version of the QPIPE state.

Probable Cause:
Software error or data corruption.

Action:
Provide data to the next level of support.

185. SMQUSNDSMPF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
QLFR Craft interface terminal process failed to send DQLNK request message to specific SMP. The failure is not caused by a SM in isolation status.

Probable Cause:
UNIX® message send process failed.

Action:
Provide data to the next level of support.

186. SMQUSTFERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Quad-link packet switch fault recovery (QLFR) craft interface terminal process has an invalid QLNK/DQLNK state conversion flag set.

Probable Cause:
Software error in SMqntwkout product.

Action:
Provide data to the next level of support.

187. SMQUTIMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The request timed out; flash the request in progress (RQIP) lamp for eight seconds.

188. SMRTSAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMaprts() function could not communicate with the engineering and administrative data acquisition system (EADAS) channel *UNIX*[®] RTR administrative process (ECAP) to update the status of the synchronous data link (SDL) for automatic message accounting recent change (AMARC). This assert may occur once after an initialization. No further action is required unless the assert continues.

189. SMSTCAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The strcpy() function returned an error to the SMaprts() function. Master control center (MCC) pages 117 and 118 will not be initialized correctly.

190. SMTQ_OVFLW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) detected a user process with too many tasks on its queue. SMC will remove the lowest priority task from the queue.

191. SMUECDAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The equipment configuration database (ECD) manager functions did not respond to the *UNIX*[®] process SMaprts().

192. SMUNK_ACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) received an acknowledgment that it could not identify.

193. SMUNK_EVNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) received an event entry that it did not recognize.

194. SMUNK_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) could not identify a message that was sent to it.

195. SMUNKMTST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function returned an unknown maintenance state.

196. SMUNK_TOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) received a timeout while its timing queue was empty. More than one occurrence of this assert should result in a switch maintenance kernel process (SMKP) initialization.

197. SMUNREC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*[®] message receive process failed.

198. SMUNSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*[®] message send process failed.

199. SMURECAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The *UNIX*[®] primitive recvw() failed.

200. SMUSER_ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch maintenance control (SMC) user process did something illegal.

201. SMUSER_Q_ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance control (SMC) discovered an error in the SMC user queue structure.

202. SMWGFUNC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet switching module (PSM) received the wrong function.

203. SMWGMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet switching module (PSM) received the wrong message.

Range: dup**1. UPIDSCUD (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the user level automatic restart process (ULARP), the *UNIX*® process UPsetindctr() could not do one of the following:

- open the central update database file
- read the central update database file
- send a message to the SM or CMP
- receive a message from the SM or CMP

Additional information about the error condition will print on the receive only printer (ROP).

Range: dxslim**1. XTMSLIMCPP (5E14 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLIM disk file handler has partition checking trouble.

2. XTMSLIMFP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLIM file handler disk partition is full.

3. XTMSLIMIPP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLIM file handler has disk partition mount problems.

4. XTMSLIMMET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLIM disk file handler has message trouble.

5. XTMSLIMPSU (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLIM disk file handler process has gone into an undefined state.

6. XTMSLIMRMT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLIM disk file handler has message reception trouble.

7. XTMSLIMSMT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLIM disk file handler has message sending trouble.

Range: dxtera**1. XTMTERALOG (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to create or open a machine detected interoffice irregularities (MDII) log.

2. XTMTERAPDK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to position the log file for write and read.

3. XTMTERARDK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the log file.

4. XTMTERASEG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to put the named segment into the address space.

5. XTMTERAUX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the *UNIX*[®] process for logging machine detected interoffice irregularities (MDII) packets.

6. XTMTERAWDK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write the log file.

7. ASSERT DESCRIPTIONS FOR RANGES FC - PC

INTRODUCTION

The Assert Descriptions section contains, for each assert, a description of the problem that caused the assert to fail.

A manual action assert description consists of a Problem section which describes the problem, a Data Structures section which identifies the relations that were involved, and an Action section which describes how to fix the problem. Since a manual action assert usually reports office dependent data (ODD) related problems, it can be fixed manually at the office.

A defensive check failure (DCF) assert, however, typically reports software errors that cannot be fixed at the office and may necessitate contacting your next level of support, particularly if it fires often. A DCF assert description contains a description of the problem; but it does not contain a Data Structures or Action section.

The asserts are divided into ranges. The assert ranges are organized alphabetically in this section; then the asserts within each range are listed alphabetically by mnemonic and are presented in the following manner:

MNEMONIC: (software release)

```

(a)                (b)
Recovery Action: (c)      SPP: (d)      Audit: (e)      Audit Mode: (f)
Problem:
(g)
```

where:

(a)	Lists the mnemonic that identifies the assert.
(b)	Lists the software release(s) that this assert is found in.
(c)	Describes the recovery action that is triggered by the assert. Possible values are si The system invoked a selective initialization. spp The system initiated a single process purge. rpi The system returned control to the program at the point of interrupt; escalation possibly occurred. If a dash precedes "rpi," no escalation occurred.
(d)	Indicates whether the assert initiated a single process purge (SPP) of a nonrunning process. Values are "y" for yes and "n" for no.
(e)	Lists the audit scheduled to run (if any) as a result of the assert failure. Currently, each assert may invoke only one audit. If no audit is scheduled, the value is "null."
(f)	Describes the mode the scheduled audit will run in. Possible values are elev The audit will run in the elevated segmented mode. nonseg The audit will run in the nonsegmented mode. null No audit is scheduled.
(g)	Contains an explanation of the problem that caused the assert to fail. Descriptions of manual action asserts contain additional information describing the data structures that are affected and the action(s) needed to solve the problem.

The technical content of this section is constantly updated. Addendums to this section of the manual have a high priority and are distributed promptly.

Range: fc**1. BADDALBPID (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The process ID (PID) in the D-channel application linkage block (DALB) does not match the PID received in the message header. The PID from the DALB is dumped and the DALB audit is scheduled to run.

2. BFGACB_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACB_PORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLACB_PORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the feature ID (FID), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The automatic call back calling (ACBC) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ACBC feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLACB_PORT relation where RLacb_port.lport is RLfc_line.lport, RLacb_port.lpt_type is RLfc_line.lpt_type, and RLacb_port.feaut_id is the ACBC feature ID.

When the ACBC feature is assigned to a line using a BFG, the BFG keys are used to read the RLACB_PORT relation where RLacb_port.lport is RLfc_line.bfgid, RLacb_port.lpt_type is LPT_BFG, and RLacb_port.feaut_id is the ACBC feature ID.

An attempt to read the RLACB_PORT relation using the BRCS feature group (BFG) keys was made because the ACBC feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

- (1) Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
- (2) Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). ACBC is a terminal feature.
- (3) If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.
- (4) If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.
- (5) If trmbfg is DBYES and the BFG ID values match, an rIACB_PORT tuple should exist for the BFG keys.

Insert the appropriate rIACB_PORT tuple.

3. BFGACCT_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACCT_PRT tuple is missing that is keyed with the logical port (lport) equal to the business and residential services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLACCT_PRT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The account code (ACCT) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ACCT feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLACCT_PRT relation where RLacctprt.lport is RLfc_line.lport and RLacctprt.lpt_type is RLfc_line.lpt_type.

When the ACCT feature is assigned to a line via a BFG, the BFG keys are used to read the RLACCT_PRT relation where RLacctprt.lport is RLfc_line.bfgid and RLacctprt.lpt_type is LPT_BFG.

An attempt to read the RLACCT_PRT relation using the BRCS feature group (BFG) keys was made because the ACCT feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). ACCT is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rIACCT_PRT tuple should exist for the BFG keys. Insert the appropriate rIACCT_PRT tuple.

4. BFGARPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIARPORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLARPORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The automatic route selection (ARS) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ARS feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLARPORT relation where RLarport.lport is RLfc_line.lport and RLarport.lpt_type is RLfc_line.lpt_type.

When the ARS feature is assigned to a line via a BFG, the BFG keys are used to read the RLARPORT relation where RLarport.lport is RLfc_line.bfgid and RLarport.lpt_type is LPT_BFG.

An attempt to read the RLARPORT relation using the BRCS feature group (BFG) keys was made because the ARS feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). ARS is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rIARPORT tuple should exist for the BFG keys. Insert the appropriate rIARPORT tuple.

5. BFGATH_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLATH_PRT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLATH_PRT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The authorization code (ATH) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ATH feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLATH_PRT relation where RLathprt.lport is RLfc_line.lport and RLathprt.lpt_type is RLfc_line.lpt_type.

When the ATH feature is assigned to a line via a BFG, the BFG keys are used to read the RLATH_PRT relation where RLathprt.lport is RLfc_line.bfgid and RLathprt.lpt_type is LPT_BFG.

An attempt to read the RLATH_PRT relation using the BRCS feature group (BFG) keys was made because the ATH

feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). ATH is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rIATH_PRT tuple should exist for the BFG keys. Insert the appropriate rIATH_PRT tuple.

6. BFGCW_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rICW_PORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLCW_PORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the call waiting (CW) feature ID (FID), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The call waiting (CW) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the CW feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLCW_PORT relation where RLcw_port.lport is RLfc_line.lport and RLcw_port.lpt_type is RLfc_line.lpt_type.

When the CW feature is assigned to a line via a BFG, the BFG keys are used to read the RLCW_PORT relation where RLcw_port.lport is RLfc_line.bfgid and RLcw_port.lpt_type is LPT_BFG.

An attempt to read the RLCW_PORT relation using the BRCS feature group (BFG) keys was made because the CW feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). CW is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID

given in the ROP output. If the BFG ID values do not match, contact the next level of support.

5. If trmbfg is DBYES and the BFG ID values match, an rICW_PORT tuple should exist for the BFG keys. Insert the appropriate rICW_PORT tuple.

7. BFGEDS_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLEDs_PORT tuple is missing for the business and residential custom services (BRCS) feature group (BFG). For the keys for this tuple, lead_module is 0, ltm_type is LTM_ISDN, and ltm_idx is bfgid.

The bfgid is obtained from the primary directory number (DN) integrated services digital network (ISDN) basic rate interface (BRI) line's rLIS_LINE tuple or from the analog line's rLFC_LINE tuple.

Data Structures:

RLEDs_PORT, RLIS_LINE, RLFC_LINE.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLEDs_PORT relation with the actual keys used to access the relation. The BFGID part of the key should match the bfgid attribute in the RLIS_LINE relation, which is keyed with the ltm_idx of the specified lead_module assigned the BFGID or the bfgid attribute in the RLFC_LINE relation, which is keyed with the port for the actual ltm_idx.

Verify that the tuple in question exists. If the tuple does not exist, it must be added if the rLIS_LINE tuple indicates that a BFG is assigned.

8. BFGIDP_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLIDP_PORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLIDP_PORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The individual dialing plan (IDP) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the IDP feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLIDP_PORT relation where RLidp_port.lport is RLfc_line.lport and RLidp_port.lpt_type is RLfc_line.lpt_type.

When the IDP feature is assigned to a line via a BFG, the BFG keys are used to read the RLIDP_PORT relation where RLidp_port.lport is RLfc_line.bfgid and RLidp_port.lpt_type is LPT_BFG.

An attempt to read the RLIDP_PORT relation using the BRCS feature group (BFG) keys was made because the IDP feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). IDP is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rIIDP_PORT tuple should exist for the BFG keys. Insert the appropriate rIIDP_PORT tuple.

9. BFGMDR_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMDR_PORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLMDR_PORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The message detail recording (MDR) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the MDR feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLMDR_PORT relation where RLmdr_port.lport is RLfc_line.lport and RLmdr_port.lpt_type is RLfc_line.lpt_type.

When the MDR feature is assigned to a line via a BFG, the BFG keys are used to read the RLMDR_PORT relation where RLmdr_port.lport is RLfc_line.bfgid and RLmdr_port.lpt_type is LPT_BFG.

An attempt to read the RLMDR_PORT relation using the BRCS feature group (BFG) keys was made because the MDR feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). MDR is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rIMDR_PORT tuple should exist for the BFG keys. Insert the appropriate rIMDR_PORT tuple.

10. BFGMWPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rlmwport tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLMWPORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the feature ID (FID), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The multiway (MW) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the MW feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLMWPORT relation where RLmwport.lport is RLfc_line.lport, RLmwport.lpt_type is RLfc_line.lpt_type, and RLmwport.feaid is the MW feature ID.

When the MW feature is assigned to a line via a BFG, the BFG keys are used to read the RLMWPORT relation where RLmwport.lport is RLfc_line.bfgid, RLmwport.lpt_type is LPT_BFG, and RLmwport.feaid is the MW feature ID.

An attempt to read the RLMWPORT relation using the BRCS feature group (BFG) keys was made because the MW feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). MW is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rlmwport tuple should exist for the BFG keys. Insert the appropriate rlmwport tuple.

11. BFGPF_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rlpf_port tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLPF_PORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The private facility access (PFA) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the PFA feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLPP_PORT relation where RLpf_port.lport is RLfc_line.lport and RLpf_port.lpt_type is RLfc_line.lpt_type.

When the PFA feature is assigned to a line via a BFG, the BFG keys are used to read the RLPP_PORT relation where RLpf_port.lport is RLfc_line.bfgid and RLpf_port.lpt_type is LPT_BFG.

An attempt to read the RLPP_PORT relation using the BRCS feature group (BFG) keys was made because the PFA feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). PFA is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rPP_PORT tuple should exist for the BFG keys. Insert the appropriate rPP_PORT tuple.

12. BFGPP_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rPP_LTM tuple is missing for the business and residential custom services (BRCS) feature group (BFG). For the keys for this tuple, lead_module is 0, ltm_type is LTM_ISDN, and ltm_idx is bfgid.

The bfgid is obtained from the RLFC_LINE relation for analog lines and primary directory number (DN) integrated services digital network (ISDN) basic rate interface (BRI) lines. If the ISDN DN is not primary, then the bfgid is obtained from the RLIS_LINE relation.

Data Structures:

RLPP_LTM, RLFC_LINE, RLIS_LINE.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLPP_LTM relation with the actual keys used to access the relation. The BFGID part of the key should match the bfgid attribute in the RLFC_LINE relation, which is keyed with the port assigned the BFGID or the bfgid attribute in the RLIS_LINE relation, which is keyed with the ltm_idx on the specified lead_module assigned the BFGID.

Verify that the rPP_LTM tuple in question exists. If the tuple does not exist, it must be added if the rLFC_LINE tuple indicates that the port has a BFG assigned or if the rLIS_LINE tuple indicates that the DN has a BFG assigned.

13. BFGPU_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPU_LTM tuple is missing for a business and residential custom services (BRCS) feature group (BFG). For the keys for this tuple, lead_module is 0, ltm_type is LTM_ISDN, and ltm_idx is bfgid.

The bfgid is obtained from the RLFC_LINE relation for analog lines and primary directory number (DN) integrated services digital network (ISDN) basic rate interface (BRI) lines. If the ISDN DN is not primary, then the bfgid is obtained from the RLIS_LINE relation.

Data Structures:

RLPU_LTM, RLFC_LINE, RLIS_LINE.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLPU_LTM relation with the actual keys used to access the relation. The BFGID part of the key should match the bfgid attribute in the RLFC_LINE relation, which is keyed with the port assigned the BFGID or the bfgid attribute in the RLIS_LINE relation, which is keyed with the ltm_idx on the specified lead_module assigned the BFGID. Verify that the tuple in question exists. If the tuple does not exist, it must be added if the rIFC_LINE tuple indicates that the port has a BFG assigned or if the rIS_LINE tuple indicates that the DN has a BFG assigned.

14. BFGPU_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPU_PORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLPU_PORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport and lpt_type), the feature ID (FID), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The call pickup (CPU) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the CPU feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLPU_PORT relation where RLpu_port.lport is RLfc_line.lport, RLpu_port.lpt_type is RLfc_line.lpt_type, and RLpu_port.feaid is the CPU feature ID.

When the CPU feature is assigned to a line via a BFG, the BFG keys are used to read the RLPU_PORT relation where RLpu_port.lport is RLfc_line.bfgid, RLpu_port.lpt_type is LPT_BFG, and RLpu_port.feaid is the CPU feature ID.

An attempt to read the RLPU_PORT relation using the BRCS feature group (BFG) keys was made because the CPU feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and

party of the line in question.

2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). CPU is a terminal feature.

3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.

4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should match the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.

5. If trmbfg is DBYES and the BFG ID values match, an rIPU_PORT tuple should exist for the BFG keys. Insert the appropriate rIPU_PORT tuple.

15. DAANILHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

Could not read an rIAN_ILHB tuple with a dynamic access (DA) macro. The tuple was just inserted by the DBfintup() function. The FCLINE audit is run to correct the problems.

16. DAANOLHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

Could not read an rIAN_OLHB tuple with a dynamic access (DA) macro. The tuple was just inserted by the DBfintup() function. The FCLINE audit is run to correct the dynamic data problems.

17. DAISILHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

Could not read an rIIS_ILHB tuple with a dynamic access (DA) macro. The tuple was just inserted by the DBfintup() function. The FCLINE audit is run to correct the dynamic data problems.

18. DAISOLHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

Could not read an rIIS_OLHB tuple with a dynamic access (DA) macro. The tuple was just inserted by the DBfintup() function. The FCLINE audit is run to correct the dynamic data problems.

19. DCAPXAMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates that either the tuple is missing from relation RLAPXAMAP, or the key used to read this relation was not set properly. Attempts to map the AUTOPLEX[®] executive cellular processor (ECP) announcement identification number to 5ESS[®] switch route type will fail.

Data Structures:

Relation: RLAPXAMAP. Key: apx_annc - AUTOPLEX[®] ECP announcement identification number.

Action:

If the key used is correct, use RC/V (or ODBE, if necessary) View 10.38 (ECP ANNOUNCEMENT ROUTE INDEX) to insert the tuple in RLAPXAMAP.

20. DC_APXCTBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APXCTBL	Audit Mode: elev

Problem:

The DA primitive DAGETAPXCTBL used to obtain a pointer to the APXCTBL tuple was unsuccessful. The key used to obtain the tuple will be printed on the ROP and the APXCTBL audit will be scheduled. The assert will return to the point of the interrupt.

21. DCAPXTMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates that the tuple is missing from relation RLAPXTMAP, or the key used to read this relation was not set properly. Attempts to map *AUTOPLEX*[®] executive cellular processor (ECP) tone identification number to 5ESS[®] switch tone type will fail.

Data Structures:

Relation: RLAPXTMAP. Key: apx_tone - *AUTOPLEX*[®] ECP tone identification number.

Action:

If the key used is correct, use ODBE to insert the tuple in relation RLAPXTMAP. This relation is not Recent Changeable.

For questions on the ODBE tool, contact next level support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

22. DCBADDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function that was called by the digital cellular *AUTOPLEX*[®] terminal processor returned a failure that indicates that a bad data has been passed to it.

Probable Cause:

Data corruption.

Action:

None.

23. DCBADTKST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function TMdcs2ecp() passed back an invalid status. The status will be printed on the ROP.

24. DCGETCBDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful attempt was made to remove a CBDB tuple from the idle list.

Probable Cause:

System overload

Action:

The call can not be continued. Purge the call.

25. DC_GPAXDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GPAXDB	Audit Mode: elev

Problem:

The DA primitive DAGTGPAXDB used to obtain a pointer to the GPAXDB tuple was unsuccessful. The key used to obtain the tuple will be printed on the ROP and the GPAXDB audit will be scheduled. The assert will return to the point of the interrupt.

26. DCGPAXHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to move links of a GPAXDB.

Probable Cause:

General system failure.

Action:

Generate printing assert and return

27. DCGPVACANT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A GPAXDB was expected to be found and was not found.

Probable Cause:

Incorrect user interface.

Action:

The assert need only report. The detector should generate a trouble report.

28. DCGRP_PRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Read of RLGROUP_PORT failed. The keys used to read RLGROUP_PORT will be printed to the ROP.

29. DCINVDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital cellular switch input mapper encountered unexpected data while processing an input.

Probable Cause:
Data corruption.

30. DCLINKBUSY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: elev

Problem:
Unable to link a tuple of the RLAPXCTBL relation to the linked list of BUSY tuples.

Probable Cause:
Data corruption.

Action:
The audit for the RLAPXCTBL has been requested. The process will not be purged.

31. DCLINKIDLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: elev

Problem:
Unable to link a tuple of the RLAPXCTBL relation to the IDLE list.

Probable Cause:
Data corruption.

Action:
An audit of the RLAPXCTBL relation has been scheduled. The process will NOT be purged.

32. DCLNCBPC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
An unsuccessful attempt was made to link the call build-up data block (CBDB) and the process control block link area (PCBLA).

Probable Cause:
System overload.

Action:
The call can not be continued. Purge the call.

33. DCNOPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Call to DA primitive DAfownpc was unsuccessful. The port member passed to the DAfownpc will be printed to the ROP.

34. DCOSSENDFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
OSSENDMSG failed to send a message.

Probable Cause:

There is a severe system problem.

Action:

Purge the calling process to clean up the system. When a protocol breakdown occurs, the system is in an indeterminate state with respect to the call as a whole.

35. DC_PCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The DA primitive DAGETPCBLA used to obtain a pointer to the process control block link area (PCBLA) tuple was unsuccessful. This assert will print the PCBLA key, which was passed to the primitive, on the ROP and schedule the PCBLA audit. The assert will return to the point of the interrupt.

36. DCPUTCDBD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not put the call build-up data block (CBDB) back on the idle list.

Probable Cause:

System overload

Action:

Cannot continue with call. Purge the call.

37. DCQIWKEY (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The APX terminating terminal process (APX_TP) received unexpected message data which requires Q.931/integrated digital services network (ISDN) user part (ISUP) interworking. The outgoing message may be incorrect.

Action:

Generate printing assert and return.

38. DCSLOOPFSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of internal messages processed in the advanced mobile phone service (AMPS) finite state machine driver for a single external stimulus has exceeded the number expected.

Probable Cause:

The finite state machine may be caught in a loop.

Action:

No audits have been requested. The process will not be purged.

39. DCSREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to launch an APXS system process for an unacceptable reason.

Probable Cause:

Operating system for distributed switching (OSDS) process launching failure.

Action:

No audits have been requested. Process will not be purged, but will terminate on return from assert processing.

40. DCSVFSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the finite state machine driver in the APXS system process.

Probable Cause:

An error was detected in the FSM model by the FSM driver.

Action:

No audits have been requested. The process will not be purged.

41. DCTKMEMBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the trunk group or the trunk member can't be located in the GPAXDB tuple.

42. DCTMRFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

There was a system failure acquiring a timer.

Probable Cause:

System overload

Action:

Purge the call.

43. DCTREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to launch or restart an advanced mobile phone service (AMPS) terminal process for an unacceptable reason.

Probable Cause:

Operating system for distributed switching (OSDS) process launching failure.

Action:

No audits have been requested. The process will not be purged, but will terminate on return from assert processing.

44. DCTRKSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return for TMdcs2ecp indicates that the status for the port member passed to it cannot be verified. The port member will be printed to the ROP.

45. DCUNEXPINP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital cellular switch input mapper calculated an unexpected input for the current state.

Probable Cause:

Corrupted data.

Action:

Return to the calling function.

46. DCUNEXPINP (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital cellular switch input mapper calculated an unexpected input for the current state.

Probable Cause:

Corrupted data.

Action:

Purge the call.

47. DCUNEXPMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital cellular switch input mapper received an unexpected message, but not from the executive cellular processor.

Probable Cause:

Bad message data.

Action:

Return to the calling function.

48. DCUNEXPMSG (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital cellular switch input mapper received an unexpected message, but not from the executive cellular processor.

Probable Cause:

Bad message data.

Action:
Purge the call.

49. DCUNLKBUSY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: elev

Problem:
Unable to unlink a tuple of the RLAPXCTBL relation from the BUSY linked list.

Probable Cause:
Data corruption.

Action:
The audit for the RLAPXCTBL has been scheduled. The process will NOT be purged.

50. DCUNLKIDLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: elev

Problem:
Unable to unlink a tuple of the RLAPXCTBL relation from the IDLE linked list.

Probable Cause:
Data corruption, or exhaustion of idle entries.

Action:
The audit of the RLAPXCTBL relation has been scheduled. The process will NOT be purged.

51. FBDNFEATS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An rIDN_FEATS tuple with the given keys could not be found in the static database. The tuple is missing or the keys used to access the tuple are invalid. The keys used to read the tuple are printed on the ROP. The ltm_type has two possible values. If the type is LTM_OTHER, a 0 is printed; if the type is LTM_ISDN, a 1 is printed.

Data Structures:
RLDN_FEATS. Key fields: lead_module, ltm_type, ltm_idx, range.

The lead_module key is the SM number, ltm_type is the logical termination index type, ltm_idx is the logical termination index, and range indicates the group of five tuples (0-4).

Action:
Verify that the keys printed on the ROP are valid. The lead_module must be between 1 and 192, ltm_type will be 0 or 1, ltm_idx must be between 1 and 4095, and range should be 0. When the range is 0, there must be an rIFC_LINE tuple for the associated port with the brc_dn attribute set to DBYES.

Use ODBE in the batch read (BR) mode to read the RLFC_LINE relation into a *UNIX*® file. Use a *UNIX*® editor to locate the tuple with the ltm_type and ltm_idx attributes printed on the ROP. If the located tuple has the brc_dn attribute marked DBNO, file a trouble report. If the brc_dn attribute in the rIFC_LINE tuple is DBYES, zero the brc_dn bit (DBNO) in the rIFC_LINE tuple and check for other rIDN_FEATS tuples that have the same keys with one of the other four possible ranges (1, 2, 3, 4). Note the assigned features in any rIDN_FEATS tuples that are

found. Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) or View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]) to re-insert the features.

52. FC0000 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A general office dependent data (ODD) read failure occurred in one of several possible functions.

Data Structures:

The asserting function identifies the relation involved.

Function	Relation	Key Fields
FCe_mcric()	RLFC_TRUNK	port.member, port.module
FCe_sidchk()	RLFC_TRUNK	port.member, port.module
FCe_uuichk()	RLFC_TRUNK	port.member, port.module
MCctoneon()	RLTONETIME	tonetype
MCdialerr()	RLFC_LINE	port.member, port.module, party
MCconflict()	RLIDP_CNFL	idp_gpid, table_id, num_dig
MCtwoconf()	RLIDP_CNFL	idp_gpid, table_id, num_dig
ISmc1tch()	Information only	
FCuntrn()	RLUNDTRE	ar_gpid, previous, digit
FCqdl_iftn()	RLQU_DLY	grpnum, grptype
FCqdl_set()	RLQU_DLY	grpnum, grptype
FCca_fs()	RLFCCAUCTK	port.member, port.module
FCck_fs()	RLKEY_TALK	keytrk.member, keytrk.module
FCns_ani()	RLRT_TRKG	grpnum
FCns_cani()	RLFCCAUCTK	port.member, port.module
FCns_route()	RLNMIMPDGTS	prefix, trntbl, steering
MCcftocall()	RLFC_TRUNK	port.member, port.module

The data dump layouts to determine the key values can be found in the 5ESS[®] Switch Translations Data Manual.

Action:

The solution can be found by consulting the associated assert mnemonic.

Relation	Mnemonic
RLFC_TRUNK	FP_TRUNK
RLFC_LINE	ISFCLINE
RLTONETIME	FPTONETY
RLQU_DLY	FCQU_DLY
RLRT_TRKG	See information below
RLIDP_CNFL	FCIDP_CNFL
RLFCCAUCTK	See information below
RLKEY_TALK	See information below
RLNMIMPDGTS	See information below

The ISmc1tch() function asserts if a timer fails to set up; no manual action is required.

The MCconflict() and MCtwoconf() functions print two data buffers. The first contains the keys to the RLIDP_CNFL relation and the second contains the keys to the port (member - 2 bytes offset 0, module - 8 bits offset 3).

The FCuntrn() function asserts on failures other than DBNO_MATCH. If this error occurs, contact your next level of support.

In the RLRT_TRKG relation, the value of the far end NXX should be between 199 and 999 decimal. Use RC/V View 5.1 (TRUNK GROUP) to update the far end NXX. If the far end NXX is between 199 and 999, escalate to the next level of support.

For the RLFCCAUCTK, RLKEY_TALK, and RLNMIMPDGTS relations, use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the relation with the actual keys used to access the relation. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

The RLFCVAVCTK relation is updated by RC/V View 5.1 and View 5.5 (TRUNK MEMBER).

The RLKEY_TALK relation is updated by RC/V View 5.5.

The RLNMIMPDGTS relation is updated by RC/V View 9.5 (INCOMING TRUNK DIGITS [OFFICE DIALING]) and View 9.3 (LOCAL DIGIT [OFFICE DIALING]).

53. FC0003 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading the RLFC_LINE relation, a failure was returned. Either the tuple was missing or an error occurred when setting the keys.

Data Structures:

RLFC_LINE. Key fields: port.member, port.module, party.

The key values are printed as part of the ROP message. In the first word of the dump, bytes(0-1) contain port.member, byte(2) is filler, and byte(3) contains port.module. Byte(0), bits(0-4), of the second word contains party.

Action:

Use RC/V (or ODBE, if necessary) to verify that the keys are valid. If the tuple is missing, insert it.

This relation is updated by the following views:

- 12.8 (BFG ADMINISTRATION)
- 23.2 (DIGITAL SUBSCRIBER LINE)
- 21.30 (OSPS-DSL PORT)
- 1.12 (BRCS FEATURE ACTIVATION [LINE ASSIGNMENT])
- 5.12 (BRCS FEATURE ACTIVATION [TRUNK MEMBER])
- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
- 4.29 (ATTENDANT MLHG/BUSY LAMP FIELD RANGE DN ASSIGNMENT)
- 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE LIST)
- 1.9 (MULTIPLE DIRECTORY NUMBER WITH DISTINCTIVE RINGING)
- 3.5 (MULTIPLE HUNT GROUP [LINE ASSIGNMENT])
- 3.3 (MULTIPLE TN FOR MULTILINE HUNT GROUPS)
- 1.32 (TWO TELEPHONE NUMBER SWAP)
- 1.5 (PBX-DID LINE [LINE ASSIGNMENT])
- 1.6 (COMPOSITE LINE [LINE ASSIGNMENT])

54. FC0004 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_TRUNK relation, or an rLFC_TRUNK tuple was missing.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

In the first word of the data dump, the first two bytes are port.member, the next byte is filler, and the next byte is

port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the keys in the RLFC_TRUNK relation with the actual keys used. If the tuple is missing, insert it. If the keys used to access the relation were set incorrectly, notify the next level of support.

This relation is updated by the following RC/V views:

- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
- 5.1 (TRUNK GROUP)
- 5.5 (TRUNK MEMBER)

55. FC0005 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLDA_TIMER relation, or an rIDA_TIMER tuple was missing.

Data Structures:

RLDA_TIMER. Key fields: servclass, signal, sigtype.

In the data dump, the first word is the critical field, the second word is partial, the third word is permsig, the fourth word is ovlpart, and the fifth word is ovlperm.

In the sixth word of the dump, the first byte is servclass, the next four bits are filler, the next two bits are sigtype, and the next two bits are startsig.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the keys in the RLDA_TIMER relation with the actual keys used. If the tuple is missing, insert it.

If the keys used to access the relation were set incorrectly, notify the next level of support. The signal for lines is always FCSSNULL; the start signal is not applicable. This relation is updated by RC/V View 8.5 (TIMING).

56. FC0010 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_PORTTYP relation, or an rLFC_PORTTYP tuple was missing.

Data Structures:

RLFC_PORTTYP. Key fields: port.member, port.module, servclass

In the first word of the data dump, the first two bytes are port.member, the next byte is filler, and the next byte is port.module. In the next word, the first two bytes are sleevld (no concern) and the next byte is servclass.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the keys in the RLFC_PORTTYP relation with the actual keys used. If the tuple is missing, insert it. If the keys used to access the relation were set incorrectly, notify the next level of support.

This relation is updated by the following views:

8.11 (REMOTE ALARM ASSIGNMENT)
 8.13 (MSU/MMSU SCAN POINT ASSIGNMENT)
 21.34 (OSPS DSL PACKET SWITCHING ASSIGNMENT)
 8.10 (CARRIER GROUP ALARM)
 23.2 (DIGITAL SUBSCRIBER LINE)
 24.7 (DSL AP COMMUNICATIONS DATA)
 21.30 (OSPS-DSL PORT)
 8.7 (DIAL TONE DELAY)

57. FC0015 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the key used to read the RLDA_DIGSTRT relation, or an rIDA_DIGSTRT tuple was missing.

Data Structures:

RLDA_DIGSTRT. Key field: digtree.

In the first word of the data dump, the first two bytes are pretable and the next two bytes are printable. In the second word, the first twelve bits are filler and the next four bits are digtree.

Action:

Use RC/V (or ODBE, if necessary) to crosscheck the keys in the RLDA_DIGSTRT relation with the actual keys used. The key, digtree, is in the RLFC_LINE relation based on the port.

58. FC2CF_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The forward-to directory number (FWDTONDN) associated with an auto-activated call forwarding (CF) feature for a primary directory number (DN) or multi-line hunt group (MLHG) member is invalid for one of the following reasons:

1. The length of the FWDTONDN is 0.
2. The FWDTONDN digits are invalid for the dialing plan associated with the line.
3. The FWDTONDN digits contain a dialed code that is not allowed for the specified call forwarding feature. The failed call results in reorder tone error treatment and a transient call lost report associated with the line that has the call forwarding feature assigned.

Notes: Transient call lost reports are not printed for call forwarding don't answer CF features.

The term "auto-activated" means the customer is not allowed to change the FWDTONDN or activation status, except through a service order.

Data Structures:

RLCF_LTM. Key fields: l_mod, ltm_idx, ltm_type, fid.

The ROP output provides the keys to the associated rICF_LTM tuple, logical port, logical port type, and (for #2 and #3) the expanded FWDTONDN digits that caused the failure. "NOT SPECIFIED" is printed as the FWDTONDN when the length of the FWDTONDN is 0.

Action:

1. Disable the call forwarding feature on the DN that caused the failure.
 - a. Use the CF feature ID provided on the ROP output (FID) to read the RLfid2NAME relation in the CMP with ODBE where RLfid2name.facid is the CF feature ID, RLfid2name.class is FACBRCS, and RLfid2name.subclass is SCL_FEAT.
 - b. If an rLFID2NAME tuple does not exist for the CF feature ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
 - c. Enter the following input message to determine the DN associated with the LPORT and LPT_TYPE on the ROP: OP:CONV,LPORT=a-b-c; (where a is the L_MOD from the ROP, b is the LPORT from the ROP, and c is the LPT_TYPE - ISDN or OTHER. If the LPT_TYPE from the ROP is 0, enter OTHER; if the LPT_TYPE from ROP is 1, enter ISDN.)
 - d. If the output from the OP:CONV indicates that the LPORT/LPT_TYPE combination is a MLHG line, use the MLHG group and member as keys to RC/V 1.12 (BRCS FEATURE ACTIVATION [LINE ASSIGNMENT]) to update the "A" or active status for the CF feature obtained from step "a" to N.

If the output from the OP:CONV indicates that the LPORT/LPT_TYPE combination is not a MLHG line, use the DN as the key to RC/V 1.12 (BRCS FEATURE ACTIVATION LINE ASSIGNMENT) to update the "A" or active status for the CF feature obtained from step "a" to N.

2. Contact the next level of support to analyze and help correct the FWDTONDN. The data in the ROP output and the

associated transient call lost report are essential in determining why the FWDTODN is incorrect.

59. FC0033 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received, the message header is dumped. Or, the FCbailout() function was called to dump the stack because the stack was lost after the restart to the FCreblout() function.

60. FC0034 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

For an announcement or busy verify termination, the ownership relation was not RLRTCONTROL or RLRTCAMPON.

61. FC0039 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of an enumeration was out of range.

62. FC3CF_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The forward-to directory number (FWDTODN) associated with an auto-activated call forwarding (CF) feature for a secondary-only directory number (DN) is invalid for one of the following reasons:

1. The length of the FWDTODN is 0.
2. The FWDTODN digits are invalid for the dialing plan associated with the line.
3. The FWDTODN digits contain a dialed code that is not allowed for the specified call forwarding feature. The failed call results in reorder tone error treatment and a transient call lost report associated with the line that has the call forwarding feature assigned.

Notes: Transient call lost reports are not printed for call forwarding don't answer CF features.

The term "auto-activated" means the customer is not allowed to change the FWDTODN or activation status except through a service order.

The term "secondary-only DN" means the DN is not a primary DN on any other integrated services digital network (ISDN) station or analog line.

Data Structures:

RLCF_LTM. Key fields: l_mod, ltm_idx, ltm_type, fid.

The ROP output provides the keys to the associated rLCF_LTM tuple, the associated DN, and (for #2 and #3) the expanded FWDTODN digits that caused the failure. "NOT SPECIFIED" is printed as the FWDTODN when the length of the FWDTODN is 0.

Action:

1. Disable the call forwarding feature on the DN that caused the failure.
 - a. Use the CF feature ID provided on the ROP output (FID) to read the RLFID2NAME relation in the CMP with ODBE where RLfid2name.facid is the CF feature ID, RLfid2name.class is FACBRCS, and RLfid2name.subclass is SCL_FEAT.
 - b. If an rLFID2NAME tuple does not exist for the CF feature ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
 - c. Use the DN as the key to RC/V View 1.12 (BRCS FEATURE ACTIVATION LINE ASSIGNMENT) to update the "A" or active status for the CF feature obtained from step "a" to N.
- 2) Contact the next level of support to analyze and help correct the FWDTODN. The ROP output and the associated transient call lost report are essential in determining why the FWDTODN is incorrect.

63. FC4CF_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The forward-to directory number (FWDTODN) associated with an auto-activated call forwarding (CF) feature for a secondary-only multi-line hunt group (MLHG) member is invalid for one of the following reasons:

1. The length of the FWDTODN is 0.
2. The FWDTODN digits are invalid for the dialing plan associated with the line.
3. The FWDTODN digits contain a dialed code that is not allowed for the specified call forwarding feature. The failed call results in reorder tone error treatment and a transient call lost report associated with the line that has the call forwarding feature assigned.

Notes: Transient call lost reports are not printed for call forwarding don't answer CF features.

The term "auto-activated" means the customer is not allowed to change the FWDTODN or activation status except through a service order.

The term "secondary-only MLHG member" means a primary directory number (DN) exists on the integrated services digital network (ISDN) station that is associated with the MLHG member.

Data Structures:

RLCF_LTM. Key fields: l_mod, ltm_idx, ltm_type, fid.

The ROP output provides the keys to the associated rLCF_LTM tuple, the associated MLHG and MEM, and (for #2 and #3) the expanded FWDTODN digits that caused the failure. "NOT SPECIFIED" is printed as the FWDTODN when the length of the FWDTODN is 0.

Action:

1. Disable the call forwarding feature on the DN that caused the failure.
 - a. Use the CF feature ID provided on the ROP output (FID) to read the RLFID2NAME relation in the CMP with ODBE where RLfid2name.facid is the CF feature ID, RLfid2name.class is FACBRCS, and RLfid2name.subclass is SCL_FEAT.
 - b. If an rLFID2NAME tuple does not exist for the CF feature ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
 - c. Use the MLHG and MEM as the key to RC/V View 1.12 (BRCS FEATURE ACTIVATION [LINE ASSIGNMENT])

to update the "A" or active status for the CF feature obtained from step "a" to N.

2. Contact the next level of support to analyze and help correct the FWDTODN. The ROP output and the associated transient call lost report are essential in determining why the FWDTODN is incorrect.

64. FC4WDAC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in the distinctive ringing type assigned to the local area signaling services (LASS) automatic callback (AC) feature for this port. Types DR_A, DR_B, DR_C, and DR_D can not be assigned to ports with a class of service (COS) of FC_4WIRE_INDV. Types DR_E and DR_F can only be assigned to ports with a COS of FC_4WIRE_INDV.

Data Structures:

RLAC_PORT. Key fields: lport, lpt_type, ring_typ.

Action:

Use RC/V to change the distinctive ringing type to a valid value for this port; or, if this feature was added through RC/V or office data administration (ODA), contact the next level of support.

65. FC4WDAR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in the distinctive ringing type assigned to the local area signaling services (LASS) automatic recall (AR) feature for this port. Types DR_A, DR_B, DR_C, and DR_D can not be assigned to ports with a class of service (COS) of FC_4WIRE_INDV. Types DR_E and DR_F can only be assigned to ports with a COS of FC_4WIRE_INDV.

Data Structures:

RLAR_PORT. Key fields: lport, lpt_type, ring_typ.

Action:

Use RC/V to change the distinctive ringing type to a valid value for this port; or, if this feature was assigned through RC/V or office data administration (ODA), contact your next level of support.

66. FC4WDRACB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The distinctive ringing type assigned to the automatic call back (ACB) feature for this port was invalid.

Types DR_A, DR_B, DR_C, and DR_D can not be assigned to ports with a class of service (COS) of FC_4WIRE_INDV. Types DR_E and DR_F can only be assigned to ports with a COS of FC_4WIRE_INDV.

Data Structures:

RLACB_PORT. Key fields: port, feat_id, ring_typ.

Action:

Use RC/V to change the distinctive ringing type to a valid value for this port.

67. FC0050 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Modular feature construction (MFC)/feature execution (FEX) received an error return code from a dynamic access (DA) primitive. Possibly, an invalid linkage was found in the RLPCBLA-RLAPB relation set. FEX could not recover from this error.

68. FC0052 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Feature execution (FEX) called the DARhpcap() function to get an associated process block (APB) from the APB idle list. The owner key that was passed to DARhpcap() was out of the range.

69. FC0053 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Modular feature construction (MFC)/feature execution (FEX) failed in the OSrestart() function.

70. FC0054 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Modular feature construction (MFC)/feature execution (FEX) had an invalid digit analysis request flag. MFC/FEX could not invoke digit analysis or parameter collection.

71. FC0055 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The mcc_pending bit was set, but there was no MCBRCSREQ message.

72. FC0056 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No root feature model (FM) was found in a master control center (MCC) terminal process.

73. FC0057 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A subprocess had an invalid state and caused a single process purge. The process control block link area (PCBLA) and related call leg data block (CLDB)/model data blocks (MDBs) are dumped on the ROP. The layout of the CLDB/MDB data is found in fc/hdr/MCcmmsgtxt.L in the typedef named MCASRT_APB.

74. FC0059 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Too many JOINSTATes were encountered in a master control center (MCC) terminal process. It might be an infinite loop of "JOIN".

75. FC0075 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) read error occurred. An rlcw_cf tuple was missing.

Data Structures:

RLCW_CF. Key field: feat_id.

In the data dump, the first field contains the feat_id and the second field contains the port and module number.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the call waiting construct feature in the RLCW_CF relation. The missing tuple indicates that the feature is not constructed or the feature assigned to the line is incorrect.

76. FC0076 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A line had the call waiting feature invoked, but the rlcw_cf tuple contained an error. The first data dump message contains the assert error code and the second data dump message contains the port name.

77. FC0079 (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An RLARSCRN tuple is missing. The line or trunk had an automatic route selection (ARS) feature assigned, but no associated RLARSCRN tuple exists for this ARS port.

Data Structures:

RLARSCRN. Key fields: ar_gpid, ars_idx, ars_si.

The first raw data dump shows the RLARSCRN tuple expected but not found. The first two bytes are the ARS group ID and the third byte plus the first six bits of the fourth byte comprise the route index. The last five bits of the eighteenth byte comprise the ARS screening index.

The first two bytes of the second raw data dump are the port member of this line or trunk, the fourth byte is the module number of the port.

Action:

Use RC/V View 1.21 (ARS LINE PARAMETER) or View 5.21 (ARS TRUNK PARAMETER) to determine the ARGPNAMe.

Use RC/V (or ODBE, if necessary) View 10.6 (ARS GROUP SCREENING INDEXES) to insert an RLARSCRN tuple with the ARGPNAMe, route index, and ARS screening index as keys.

78. FC0080 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line had an automatic route selection (ARS) feature assigned, but no rIARCF tuple was associated with this line.

Data Structures:

RLARCF. Key field: feat_id.

The first data dump contains the rIARCF tuple that was expected but not found. The first two bytes are the ARS constructed feature ID. The first two bytes of the second data dump are the member of the port and the third byte is the module of this port.

Action:

Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) to find the feature name associated with this port. If the feature does not exist, use the feature name on RC/V View 12.11 (AUTOMATIC ROUTE SELECTION FEATURE DEFINITION) (or ODBE, if necessary) to define a new ARS feature.

79. FC0081 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read error occurred when attempting to read the static data for a multiway (MW) constructed feature for a port.

Data Structures:

RLMWCF. Key field: feat_id.

The first raw data dump shows, in hex, the tuple for which the read error occurred. The first 2 bytes are the constructed feature identifier. (To identify the fields in the RLMWCF relation, see the "Data Structure Field Layouts" section of the 5ESS[®] Switch Audits Manual.)

Action:

Using ODBE to look at the AM relation RLFID2NAME, use the feat_id found in the data dump to determine the feature name assigned to the feat_id. Refer to the "Multiway Calling Preconstructed Feature Definition" table in the 5ESS[®] Business and Residence Custom Features User's Guide to find the attributes associated with that feature name and the values for the attributes.

Use ODBE to insert a tuple in the RLMWCF relation for the feat_id according to the values found for the attributes in the User's Guide.

80. FC0082 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading the static data for a multiway (MW) constructed feature for a specific port, the tuple was not found.

Data Structures:

RLMWCF. Key field: feat_id.

The first raw data dump shows the tuple expected but not found. The first 2 bytes are the MW constructed feature ID. To identify the fields in the RLMWCF relation, refer to the "Data Structure Field Layouts" section in the 5ESS[®] Switch Audits Manual. The first 2 bytes of the second raw data dump are the internal port name of the line on which the feature is assigned.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the feature ID dumped and the port to determine the appropriate

feature ID.

81. FC0084 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLMWPORT tuple is missing. The keys are the logical port (lport), logical port type (lpt_type), and feature ID (feat_id).

Data Structures:

RLFC_LINE, RLFC_PORTTYP, RLMWCF, RLMWPORT, RLTRMFEATS.

The ROP output provides a raw data dump of the tuple expected but not found. The first raw data dump shows the rLMWPORT tuple keys - the first 2 bytes are the lport (12 bits) and lpt_type (4 bits), and the next 2 bytes are the multiway (MW) feature ID. See the Audits Manual - Data Structure Field Layout section for the RLMWPORT relation to identify the fields in the relation.

The second raw data dump is the originating port for the line or trunk attempting to use the MW feature. The first 2 bytes are the port name.

Action:

Use ODBE to verify the existence of a tuple in the RLFC_LINE or RLFC_TRUNK relation and an rIFC_PORTTYP tuple for the originating port key.

Use ODBE to verify the existence of an rLTRMFEATS tuple with the logical port (lport) and logical port type (lpt_type) as keys. This tuple(s), range being 0 through 6, must have a feat_id attribute that is equivalent to RLtrmfeats.ftent[n].fid.

Use ODBE to verify the existence of an rLMWCF tuple with this feat_id as the key value. Insert the appropriate rLMWPORT tuple.

82. FC0091 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call pickup originating feature was assigned to a line in the RLBRCFEATS relation, but no constructed feature data associated with the feature ID was found in the RLPUT_CF relation. This is an office data inconsistency.

Data Structures:

RLPUT_CF.

The first data dump contains the feature ID that was expected but not found in the RLPUT_CF relation. In the Audits Manual, see the Data Structure Fields Layouts section for the RLPUT_CF relation to identify the feature ID. Overlay this template on the data dump starting at the first byte.

The first two bytes of the second data dump message are the internal port name of the line that is missing feature data.

Action:

Use RC/V (or ODBE, if necessary) to examine the pickup feature data on the indicated line.

83. FC0092 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The auto-call-back calling feature system process entry function FCacb_timr() received an invalid reason code argument when the process was restarted.

84. FC0093 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The auto-call-back calling feature system process entry function FCacb_timr() received an operating system for distributed switching (OSDS) message of an unrecognized type.

85. FC0094 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An auto-call-back calling feature dynamic data entry in the FCacb_cmp[] array was inconsistent with a corresponding entry in the FCacb_call.data[] array. The entry being scanned will be initialized.

86. FC0097 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The auto-call-back calling feature retrieved an rIACB_PORT tuple with an invalid ring_typ value.

Data Structures:

RLACB_PORT. Key fields: port, feat_id.

Action:

The tuple buffer copy was dumped to provide the key values that were used to access the RLACB_PORT relation. The dump includes the port (hex offset 0), feat_id (hex offset 4), ring_max (hex offset 7, 5 bits), and ring_typ (hex offset 7, 2 bits). The total number of bytes is 0x08.

87. FC0099 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A specific distinctive ringing constructed feature was assigned to a line in the RLBRCFEATS relation. The corresponding rIDR_CF tuple could not be found.

Data Structures:

RLDR_CF. Key fields: port.member, port.party, port.module, feat_id.

The first data dump contains the feature that was expected but not found in the RLDR_CF relation. In the Audits Manual, see the Data Structure Field Layouts section for the RLDR_CF relation to identify the feature ID. Overlay this template on the data dump starting at the first byte. The first two bytes of the second dump message are the internal port name of the line that is missing feature data.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the feature ID dumped and the port to determine the appropriate feature ID.

88. FC0106 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Required digits were corrupted.

89. FC0107 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rIRT_TRKG tuple for this trunk group number was missing.

Data Structures:

RLRT_TRKG. Key field: grpnum. The grpnum is in bytes 1 and 2 of the data dump.

Action:

Use RC/V to check the key used to access the RLRT_TRKG relation. If the tuple for this key should exist, insert the tuple.

90. FC0108 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rIRT_TRKG tuple for this trunk group contained an invalid value for the ncd_scrn attribute.

Data Structures:

RLRT_TRKG.

In the data dump, the grpnum is in bytes 1 and 2, the orig_lata is in the last 4 bits of byte 12, and the ncd_scrn is in the first 2 bits of byte 17.

Action:

Use RC/V to check the value of the ncd_scrn field for the RLRT_TRKG relation. The acceptable values are defined in domain DMncdscrn.

91. FC0110 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rICC_ONPA tuple was missing.

Data Structures:

RLCC_ONPA. Key field: pseudo_npa.

The data dump includes the following information:

Byte	Name	Value (hex)	Description
0	pseudo_npa	0	Left-most byte of X code.
1	pseudo_npa	0 - 9	Right-most byte of X code.
2	orig_npa[0]	30 - 39	Left-most digit of NPA.
3	orig_npa[1]	30 - 39	Middle digit of NPA.
4	orig_npa[2]	30 - 39	Right-most digit of NPA.

NOTE: The X code is the right-most digit in a numbering plan area (NPA) in the form "00X".

Action:

For the key, determine the correct originating NPA. Use the key to access the RLCC_ONPA relation, then add or

correct the originating NPA.

92. FC0111 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services office (OSO)/inward wide area telecommunications service (INWATS) call is determined by two destination types: FCOSOIWT (AT&T-C OSO/INWATS call) or FCINWATS (non-AT&T-C OSO/INWATS call).

The special area code (SAC) of an OSO/INWATS call should be 800 or 00X, where X is 0 through 9. The destination type was FCOSOIWT or FCINWATS, but the SAC was not 800 or 00X.

Data Structures:

The data dump includes the following information:

First Field:

Byte	Name	Value	Description
0	dest_type	0	Left-most byte
1	dest_type	M or N*	Right-most byte of dest_type

*M = current enum value for FCOSOIWT

N = current enum value for FCINWATS

Second Field:

Byte	Name	Value (hex)	Description
0	dn[0]	30, 38	Left-most digit of SAC (0 or 8)
1	dn[1]	30	Middle digit of SAC (0)
2	dn[2]	30 - 39	Right-most digit of SAC (0 - 9)

93. FC0112 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Feature control (FC) operator services office (OSO)/inward wide area telecommunications service (INWATS) received an OSMSG message with an incorrect message type or other invalid data.

Data Structures:

The data dump includes the following information:

Byte	Name	Value	Description
0,1	procno		Processor number
2	pcrid		Processor ID
3	uniq		Uniqueness
4,5	type	MGCCSDS or MGIWFAIL	Type of message
6	priority	0	Priority
7	length		Length of message text
8 →			Message text

94. FC0114 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received from the far process (which is the process at the other end of the call). In this case, the far process can be either the originating or terminating process. Additional data from up to 5 model data

blocks (MDBs) will be dumped. If this is a recurrent message, notify your next level of support.

95. FC0115 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received from the far process (which is the process at the other end of the call). In this case, the far process can be either the originating or terminating process. Additional data from up to 5 model data blocks (MDBs) will be dumped. If this is a recurrent message, notify your next level of support.

96. FC0116 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGLNQ_TERM message was not present.

97. FC0117 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid state was encountered for a delay announcement on a queued call.

98. FC0118 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) primitive failed to access the queue owner block from the queue member block. Possibly, an invalid linkage was found between the two blocks. The program will clean up the problem.

99. FC0127 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An associated process block (APB) field was in error.

100. FC0129 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A model with the given mdb_tag could not be found.

101. FC0155 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The terminating nailup terminal process (TP) did not receive a MGNU_TERM message.

102. FC0156 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A nail-up terminal process (TP) was entered for the wrong reason.

103. FC911TBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The GI911dtim office parameter that specifies delay timing on basic 911 and enhanced 911 calls is set to an invalid value. The call will proceed without any delay timing.

Action:

Use RC/V View 8.1 (OFFICE PARAMETER) to initialize the 911 DELAY field to a valid value.

The value for the GI911dtim parameter printed on the ROP is in milliseconds and the value entered on the RC/V screen is in seconds. The valid values for GI911dtim are 0 ms, 1000 ms, 2000 ms, and 3000 ms. These values are equivalent to 0 seconds, 1 second, 2 seconds, and 3 seconds in the 911 DELAY field, respectively.

104. FCACB_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLACB_CF relation, a failure code of DBNO_MATCH was returned. An rIACB_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLACB_CF. Key fields: feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

105. FCACB_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACB_PORT tuple is missing that is keyed with the logical port (lport) and logical port type (lpt_type).

Data Structures:

RLACB_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - lport, lpt_type, and the feature ID (fid).

Action:

The automatic call back calling (ACBC) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ACBC feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLACB_PORT relation where RLacb_port.lport is RLfc_line.lport, RLacb_port.lpt_type is RLfc_line.lpt_type, and RLacb_port.featt_id is the ACBC feature ID.

An attempt to read the RLACB_PORT relation using the original (non-BFG) keys was made because the ACBC feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

- (1) Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party for the line in question.
- (2) Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). ACBC is a terminal feature.
- (3) If the brc_trm value from the RLFC_LINE relation is DBNO, contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.
- (4) If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should equal the lport and lpt_type in the ROP output. If the values do not match, further office-dependent data (ODD) inconsistencies may exist. Contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.
- (5) If brc_trm is DBYES and the lport and lpt_type values match, an rIACB_PORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rIACB_PORT tuple.

106. FCAC_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAC_CF relation, a failure code of DBNO_MATCH was returned. An rIAC_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLAC_CF. Key field: feature.

Action:

This is a database inconsistency that can only be corrected by manual action. The affected RC/V view is View 12.47 (LASS AUTOMATIC CALLBACK FEATURE DEFINITION).

107. FCACCT_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACCT_CF tuple is missing. The port attempting to use the account code (ACCT) has an ACCT feature assigned, but no rIACCT_CF tuple exists that is associated with the ACCT feature ID. The ACCT feature ID exists in the RLTRMFEATS relation for the dialing port.

Data Structures:

RLACCT_CF, RLFID2NAME.

The ROP output indicates the SM number (MOD), the source file and line number, the key used to read the relation, the feature ID (FID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use ODBE to cross-check the data in the indicated SM and AM. Use the ACCT feature ID provided in the ROP output to read the RLFID2NAME relation in the AM where RLfid2name.facid is the ACCT feature ID, RLfid2name.class is FACBRCS, and RLfid2name.subclass is SCL_NULL.

If an rIFID2NAME tuple does not exist for the ACCT feature ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

If an rLFID2NAME tuple exists for the ACCT feature ID, insert the appropriate rACCT_CF tuple in the indicated SM. Since RLACCT_CF is an SM redundant relation, the values for RLACCT_CF can be found by reviewing the same tuple in another SM.

108. FCACCT_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical port attempting to use the account code (ACCT) feature has an ACCT feature assigned. The ACCT feature ID exists in the RLTRMFEATS relation for the dialing port.

The logical port is assigned to an ACCT group, but the ACCT group ID in the rACCT_PRT tuple is invalid or an rACCT_GP tuple is missing.

Data Structures:

RLACCT_PRT, RLACCT_GP, RLDB_AMGPD, RLDB_IMGPD, RLDB_GPDUS, RLTRMFEATS.

The ROP output indicates the SM number (MOD), the source file and line number, the key used to read the relation, the ACCT group ID (GROUP ID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use ODBE to cross-check the data in the indicated SM and AM. Use the ACCT group ID provided in the ROP output to read the RLfid2NAME relation in the AM where RLfid2name.facid is the ACCT group ID, RLfid2name.class is FACACCT, and RLfid2name.subclass is SCL_NULL.

If an rLFID2NAME tuple does not exist for the ACCT group ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

If an rLFID2NAME tuple does exist for the ACCT group ID, insert the appropriate rACCT_GP tuple in the indicated SM where RLacct_gp.gpid is the ACCT group ID.

Since the RLACCT_GP relation is a group partitioned relation, the RLDB_AMGPD, RLDB_IMGPD, and RLDB_GPDUS group partitioned control relations may also need to be updated.

109. FCACCT_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rACCT_PRT tuple is missing. The keys are the logical port (lport) and logical port type (lpt_type).

Data Structures:

RLACCT_PRT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the lport and lpt_type keys used to read this relation.

Action:

The account code (ACCT) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ACCT feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLACCT_PRT relation: RLacct_prt.lport=RLfc_line.lport and RLacct_prt.lpt_type=RLfc_line.lpt_type.

An attempt to read the RLACCT_PRT relation using the original (non-BFG) keys was made because the ACCT feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to get the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). ACCT is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should equal the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rIACCT_PRT tuple should exist for the original (non-BFG) keys. Insert the appropriate RLACCT_PRT tuple.

110. FCACCT_RTG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical port attempting to use the account code (ACCT) feature has an ACCT feature assigned. The ACCT feature ID exists in the RLTRMFEATS relation for the originating port.

The logical port is assigned to an account code associated code routing table in an rIACCT_PRT tuple, but the ACCT table ID in the rIACCT_PRT tuple is invalid or an rIACCT_RTG tuple is missing.

Data Structures:

RLACCT_PRT, RLACCT_RTG, RLDB_AMGPD, RLDB_IMGPD, RLDB_GPDUS, RLTRMFEATS.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the ACCT routing table ID (TABLE ID), the originating logical port (LPORT) and the logical port type (LPT TYPE).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and AM. Use the ACCT table ID provided in the ROP output to read the RLfid2NAME relation in the AM where RLfid2name.facid is the ACCT table ID, RLfid2name.class is FACRTTAB, and RLfid2name.subclass is SCL_NULL.

If an rIFID2NAME tuple does not exist for the ACCT table ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

If an rIFID2NAME tuple does exist for the ACCT table ID, insert the appropriate rIACCT_RTG tuple in the indicated SM where RLacct_rtg.cdtblid is the ACCT table ID.

Since RLACCT_RTG is a group partitioned relation, the RLDB_AMGPD, RLDBIMGPD, and RLDB_GPDUS group partitioned control relations may also need to be updated.

111. FCACDAFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The user is not allowed to dial the directory number (DN) found in the incoming line history block (ILHB) for the local area signaling services (LASS) automatic callback (AC) feature. The ILHB contains a 10-digit public DN.

The DN to run through digit analysis was derived using the network management (NM) default number plan area (NPA) on RC/V View 8.1 (OFFICE PARAMETERS MISCELLANEOUS), the local digit interpreter table (LDIT) implied NPA data on RC/V View 9.3 (LOCAL DIGIT OFFICE DIALING), and the LASS prefix index (LASSPFX) on RC/V View 8.20 (LASS PREFIX EXCEPTION LIST).

If digit analysis on that derived DN was successful, screening and routing was done. The screening data is on RC/V View 10.10 (SCREENING CHARGING). The routing data is on RC/V Views 10.10 and 10.2 (ROUTE INDEX ROUTING).

Action:

1. Use the customer data printed on the ROP to determine the LDIT value for the user. Use the rate area exception (RAX) and line class code (LCC) values from RC/V View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]) to get the digit analysis selector (DAS) value on RC/V View 4.1 (LINE CLASS CODE). Use the DAS to get the LDIT value from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR OFFICE DIALING).

Access RC/V View 9.2 (PREFIX/FEATURE DIGIT OFFICE DIALING) and RC/V View 9.3 with incoming digits as follows:

Possible ways to dial a public DN are: NXX-XXXX, 1+NXX-XXXX, NPA-NXX-XXXX, and 1+NPA-NXX-XXXX. This algorithm is used to determine correct way.

If the (NPA in the ILHB)=(NM default NPA),

a. try NXX-XXXX first. Check the implied NPA fields from LDIT using the prefix NONE. If this data shows that the implied NPA is the NM default NPA, use NXX-XXXX. Verify that screening and routing succeed for this DN for the user by reviewing RC/V View 10.10 and RC/V View 10.2.

b. Try 1+NXX-XXXX second. Check the implied NPA fields from LDIT using the prefix 1+. If this data shows that the implied NPA is the NM default NPA, use 1+NXX-XXXX. Verify that screening and routing succeed for this DN for the user by reviewing RC/V View 10.10 and View 10.2.

If the (NPA in the ILHB)!(NM default NPA),

a. try NXX-XXXX first. Check the implied NPA fields from LDIT using the prefix NONE. If this data shows that the implied NPA is the NPA in the ILHB, use NXX-XXXX. Verify that screening and routing succeed for this DN for the user by reviewing RC/V View 10.10 and View 10.2.

b. try 1+NXX-XXXX second. Check the implied NPA fields from LDIT using the prefix 1+. If this data shows that the implied NPA is the NPA in the ILHB, use 1+NXX-XXXX. Verify that screening and routing succeed for this DN for the user by reviewing RC/V View 10.10 and View 10.2.

If not found above, use all 10 digits. Use the LASSPFX to determine if 1+ is needed. If so, use 1+NPA-NXX-XXXX. Otherwise, use NPA-NXX-XXXX. Verify that screening and routing succeed for this DN for the user by reviewing RC/V View 10.10 and View 10.2.

2. Verify that the user's LDIT, LCC, and RAX allow dialing the DN as described above. If not and this is desired, add the appropriate DN scheme to the user's dialing plan.

112. FCACDDIS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the automatic call distribution (ACD) seizure display relation RLACDDISP.

Data Structures:

RLACDDISP. The ROP output indicates the SM number (MOD), the source file and line number where the RLACDDISP relation was read, and the seizure display index (DISPX) used to read this relation.

Action:

Use RC/V View 21.26 (SEIZURE) to create a new seizure display with the DISPX indicated on the ROP.

113. FCACPFIX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACPFIX tuple is missing or contains invalid data.

Data Structures:

RLACPFIX. Key field: dummy key (there is only one rIACPFIX tuple).

Action:

If the rIACPFIX tuple is missing, insert the tuple via RC/V View 8.20 (LASS PREFIX EXCEPTION LIST).

If the rIACPFIX tuple is not missing, then one of the exceptions fields has invalid data. Insert the valid data via RC/V View 8.20. The exception field is an NPA or an NPANXX. Only 3 or 6 digits are valid for this field.

114. FCAC_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAC_PORT relation, a failure code of DBNO_MATCH was returned. An rIAC_PORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLAC_PORT. Key fields: lport, lpt_type.

Action:

This is a database inconsistency that can only be corrected by manual action. Add an rIAC_PORT tuple with the lport and lpt_type keys from the ROP output and specify the ring type.

115. FCAD1S_IDP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAD1S_IDP relation, a failure code of DBNO_MATCH was returned. An rIAD1S_IDP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLAD1S_IDP. Key fields: abbreviated 1-digit dialing (AD1) ID, AD code.

Action:

This is a database inconsistency that can only be corrected by manual action.

116. FCAD2S_IDP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAD2S_IDP relation, a failure code of DBNO_MATCH was returned. An rIAD2S_IDP

tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLAD2S_IDP. Key fields: AD2 ID, ten digit code, one digit code.

The abbreviated 2-digit dialing (AD2) ID is the first data item dumped, the ten digit code is the second data item dumped, and the one digit code is the third data item dumped.

Action:

This is a database inconsistency that can only be corrected by manual action.

117. FCAHHCE9 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: E911DB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAahhce9() failed to add an enhanced 911 (E911) data block tuple rIE911DB to the idle list. The E911DB audit will be scheduled. A call in progress normally will not be affected since an rIE911DB tuple is not critical to the continuation of the call. However, if the E911DB audit initiates a process control block link area (PCBLA) audit, the call could be torn down.

118. FCAISSMISS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incoming intercept call was sent to reorder because of an office engineering problem. The call arrived over a trunk group member with a trunk class of INAISTRK on a basic SM. This class of trunk should always be terminated on a standard or loaded SM.

Data Structures:

RLFC_TRUNK. Key field: port.

Action:

The SM number, trunk group number, and trunk member number are printed on the ROP. The SM number should be for a basic SM. To verify this, use ODBE to review the parameter Glconfigname on this SM. If the Glconfigname parameter is set to D_BASIC, then the SM is a basic SM. If the affected SM is not a basic SM, contact your next level of support.

If the SM number printed is for a basic SM, then the trunk group member needs to be moved to a standard or loaded SM. If the hardware needed to terminate the trunk group member is available on a standard or loaded SM, use RC/V View 5.5 (TRUNK MEMBER) to delete the member then regrow it on the new SM.

If the hardware is not available, contact the originating office so that the trunk can be taken out of service at the other end.

119. FCALOSRVOT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function call to OAalo_srvot() from FCtrl_trig(), returned GLFAIL. OAalo_srvot() allocates SRVOT tuples and this administration is dependent on the global Gltrkcnt, which may be updated whenever FCtrl_trig() is invoked by RC/V.

Probable Cause:

Causes include an incorrect parameter ID passed, an incorrect transaction ID parameter passed, unable to get the

new tuple count from OAresizerel(), or unable to update a global parameter.

Action:
None.

120. FCANCHDENTRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility / service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed. An invalid command entry in the phrase/command list of an rIANNNC_HDR tuple was encountered.

The entry was interpreted as a command since it had a value greater than 16383, but was not recognized as a valid command or was specified to repeat a digit string when no digit string expansion had been previously specified.

Data Structures:

RLANNC_HDR. Key fields: application, announcement header ID

Action:

Use RC/V View 8.61 (ANNOUNCEMENT HEADER PHRASE LIST) to correct the rIANNNC_HDR tuple associated with the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements including the indicated announcement header.

All SMs equipped with DSU2-RAF/SAS units for this application should have this relation redundantly populated (unless growth is in progress). If another SM includes an rIANNNC_HDR tuple with the same key values, its contents can be copied to this SM. Further information can be found in the 5ESSTM Translations and Dynamic Data Manual.

121. FCANCHDID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility / service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software could not retrieve the rIANNNC_HDR tuple associated with the key values indicated.

Data Structures:

RLANNC_HDR. Key fields: application, announcement header ID

Action:

Use RC/V View 8.61 (HEADER PHRASE) to insert an rIANNNC_HDR tuple using the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements which include the indicated announcement header.

As well, all SMs that provide announcements for this application must be found in the corresponding tuple in rIANNNC_APL. Use RC/V view 8.64 (APPLICATION LIST) to update the list of valid SMs using this application as the key value.

All SMs equipped with DSU2-RAF/SAS units for this application should have the relation rIANNNC_HDR redundantly populated (unless growth is in progress). If another SM includes a tuple in the RLANNC_HDR relation with the same key values, its contents can be copied to this SM. Further information can be found in the 5ESSTM Translations and Dynamic Data Manual.

122. FCANCINENTRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility / service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software encountered an invalid inflection command entry in the phrase/command list of an rLANNC_DIG tuple.

Data Structures:

RLANNC_DIG. Key fields: application, digit inflection ID.

Action:

Use RC/V View 8.60 (DIGIT INFLECTION) to correct the rLANNC_DIG tuple associated with the SM and key values given in the ROP output message. This tuple should specify the inflection scheme to be applied to digit strings of the type indicated.

All SMs equipped with DSU2-RAF/SAS units for this application should have this relation redundantly populated (unless growth is in progress). If another SM includes a tuple in the RLANNC_DIG relation with the same key values, its contents can be copied to this SM. Further information can be found in the 5ESS[®] Switch Translations and Dynamic Data Manual.

123. FCANCINID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility / service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software could not retrieve the rLANNC_DIG tuple associated with the key values indicated.

Data Structures:

RLANNC_DIG. Key fields: application, digit inflection ID

Action:

Use RC/V View 8.60 (DIGIT INFLECTION) to insert an rLANNC_DIG tuple with the SM and key values given in the ROP output message. This tuple should specify the inflection scheme to be applied to digit strings of the type indicated.

All SMs equipped with DSU2-RAF/SAS units for this application should have this relation redundantly populated (unless growth is in progress). If another SM includes a tuple in the RLANNC_DIG relation with the same key values, its contents can be copied to this SM. Further information can be found in the 5ESSTM Translations and Dynamic Data Manual.

124. FCANCTRENTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility / service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software encountered an invalid command entry in the phrase/command list of an rLANNC_TRL tuple.

The entry was interpreted as a command since it had a value greater than 16383, but was not recognized as a valid command or specified to repeat a digit string when no digit string expansion had been previously specified (in the announcement trailer).

Data Structures:

RLANNC_TRL. Key fields: application, announcement trailer ID

Action:

Use RC/V View 8.62 (ANNOUNCEMENT TRAILER PHRASE LIST) to correct the rLANNC_TRL tuple associated with the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements including the indicated announcement trailer.

All SMs equipped with DSU2-RAF/SAS units for this application should have this relation redundantly populated (unless growth is in progress). If another SM includes a tuple in the RLANNC_TRL relation with the same key values, its contents can be copied to this SM. Further information can be found in the 5ESSTM Translations and Dynamic Data Manual.

125. FCANCTRID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility / service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software could not retrieve the rLANNC_TRL tuple associated with the key values indicated.

Data Structures:

RLANNC_TRL. Key fields: application, announcement trailer ID

Action:

Use RC/V View 8.62 (ANNOUNCEMENT TRAILER PHRASE LIST) to insert an rLANNC_TRL tuple using the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements which include the indicated announcement trailer.

All SMs equipped with DSU2-RAF/SAS units for this application should have this relation redundantly populated (unless growth is in progress). If another SM includes a tuple in the RLANNC_TRL relation with the same key values, its contents can be copied to this SM. Further information can be found in the 5ESSTM Translations and Dynamic Data Manual.

126. FCAPCCC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Tried to get a head link for the member rCCBCOM tuple from its owner rPCBLA tuple using the DAGhpccc() function. DAGhpccc() returned an unexpected failure indicating possible invalid linkage from the rPCBLA tuple to the rCCBCOM tuple.

127. FCARALTFRL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple missing from the automatic route selection (ARS) alternate facility restriction level (FRL) relation RLARALTFRL.

Data Structures:

RLARALTFRL, RLARGRP.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - ARS group ID (GROUP ID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

The logical port attempting to use the alternate FRL feature has an rIARGRP tuple (keyed with the ARS group ID) that indicates the alternate FRL feature is allowed and active.

Use the ROP output to verify that the logical port does have the alternate FRL feature assigned and active by looking at RC/V View 10.5 (AUTOMATIC ROUTE SELECTION GROUP PARAMETERS). If alw_alt_frl and alt_frl are both YES, a tuple needs to be populated for this ARS group on RC/V View 10.8 (ARS ALTERNATE FACILITY RESTRICTION LEVELS).

128. FCARCBADPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter value was passed to a local area signaling services (LASS) automatic callback/automatic recall (AC/AR) function.

129. FCARCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLARCF relation, a failure code of DBNO_MATCH was returned. An rIARCF tuple is missing or the keys used to access the relation were not set properly.

Data Structures:

RLARCF. Key fields: feature ID.

Action:

This is a database inconsistency. Verify that the key on the ROP is valid. Use RC/V View 12.11 (AUTOMATIC ROUTE SELECTION FEATURE DEFINITION) to assign the rIARCF tuple.

130. FCAR_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAR_CF relation, a failure code of DBNO_MATCH was returned. An rIAR_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLAR_CF. Key field: feature.

Action:

This is a database inconsistency that can only be corrected by manual action. The affected RC/V view is View 12.48 (LASS AUTOMATIC RECALL FEATURE DEFINITION).

131. FCARCOMPUNXP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A local area signaling services (LASS) automatic callback/automatic recall (AC/AR) function was called with an unexpected event for the specified entry in the FCcamplist[] array. The entry is the wrong type, or is in the wrong state for this event.

132. FCARCMMSGUNXP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message type or an unexpected value in a message was passed to a local area signaling services (LASS) automatic callback/automatic recall (AC/AR) function.

133. FCARCOSMGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call by a local area signaling services (LASS) automatic callback/automatic recall (AC/AR) function to the OSSENDMSG() macro failed for a reason other than resource overload.

134. FCARGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During automatic route selection (ARS) initialization for a call, a database read of the RLARGP relation (which contains information about the ARS group ID) failed to find a tuple. Calls for the indicated ARS group ID will not complete until this problem is corrected.

Data Structures:

RLARGP. Key field: arsgpid.

The ROP output provides the ARS group ID (arsgpid), the logical port, and the logical port type.

Action:

The logical port attempting to use the ARS feature has an ARS feature assigned. The ARS feature ID exists in the RLTRMFEATS relation for the originating port.

The logical port is assigned to a valid ARS group (an rIARPORT tuple exists), but the ARS group ID in the rIARPORT tuple is not valid or an rIARGP tuple is missing. For leased network calls (ln_type field in the rIFC_TRUNK tuple is not LN_NULL), the ARS group ID in the rINET_GPID tuple is not valid or an rIARGP tuple is missing.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and CMP.

1. Use the ARS group ID provided in the ROP output to read the RLFID2NAME relation in the CMP where RLfid2name.facid is the ARS group ID, RLfid2name.class is FACARS, and RLfid2name.subclass is SCL_NULL.
2. If an rLFID2NAME tuple does not exist for the ARS group ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
3. If an rLFID2NAME tuple does exist for the ARS group ID, insert the appropriate rIARGP tuple in the indicated SM where RLargp.ar_gpid is the ARS group ID.

Since the RLARGP relation is a group partitioned relation, the RLDB_AMGPD, RLIMGPD, and RLDB_GPDUS group partitioned control relations may also need to be updated.

There is no RC/V procedure to correct this error. For details on ARS data population, refer to the "BRCS Feature Definitions" section of the 5ESS® Switch Recent Change Procedures Text Interface manual.

135. FCARLNSI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During automatic route selection (ARS) initialization for a call, a database read of the RLAR_LNSI relation, which contains information about the ARS screening index (SI), failed to find a tuple. LN calls for the indicated switch type (access or via) will not complete until this problem is corrected.

Data Structures:

RLAR_LNSI. Key fields: ln_node, data_call.

The logical port is dumped.

Action:

Determine which data is incorrect - the ln_type field in the RLFC_TRUNK relation from which the ln_node attribute is derived, or the data_call field. Read the RLFC_TRUNK relation keyed by the logical port (lport). If the ln_type is incorrect, notify your next level of support.

If data_call is incorrect, notify the LN network control point (NCP) as this information is sent to the LN action point (ACP) from the LN NCP.

If both ln_type and data_call are correct, insert a new rLAR_LNSI tuple using RC/V View 10.22 (LEASED NETWORK ROUTING).

136. FCARPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLARPORT tuple is missing that is keyed with the logical port (lport) and logical port type (lpt_type).

The automatic route selection (ARS) business and residential custom services (BRCS) feature can be directly assigned to a line or trunk, or assigned via a BRCS feature group (BFG). When the ARS feature is directly assigned to a line, the original (non-BFG) keys are used to read the RLARPORT relation where RLarport.lport=RLfc_line.lport and RLarport.lpt_type=RLfc_line.lpt_type.

When the ARS feature is assigned to a trunk, the keys are RLarport.lport=RLfc_trunk.lport and RLarport.lpt_type=LPT_OTHER=0.

An attempt to read the RLARPORT relation using the original (non-BFG) keys was made because the ARS feature is thought to be assigned directly to the line or trunk. In most cases, this call will be blocked.

Data Structures:

RLARPORT, RLFC_LINE, RLFC_TRUNK, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, the keys used to read this relation (lport and lpt_type), and the global port number (PORT).

Action:

Use ODBE to crosscheck the data in the indicated SM.

1. Use the original lport (if not 0) and lpt_type keys from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.

2. For lines, use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). For trunks, read the RLFC_TRUNK relation to find the logical port (lport) and the indicator for BRCS terminal features (brc_trm). The lpt_type is 0 for trunks. ARS

is a terminal feature.

3. If the brc_trm value from RLFC_LINE (or RLFC_TRUNK) is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE (or RLFC_TRUNK) is DBYES, then the lport and lpt_type from RLFC_LINE (or RLFC_TRUNK) should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rIARPORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rIARPORT tuple.

NOTE: If this is an Electronic Tandem Network (ETN) on Primary Rate Interface (PRI) call and the value for lport is 0, the switch may be attempting to send the traveling class mark (TCM) information element (IE) out in the SETUP message; but there is no ARS feature assigned to the outgoing trunk and the inhibit_tcm bit is not set. To prevent this assert for this specific case, at least one of these conditions should be true.

137. FCAR_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAR_PORT relation, a failure code of DBNO_MATCH was returned. An rIAR_PORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLAR_PORT. Key fields: lport, lpt_type.

Action:

This is a database inconsistency that can only be corrected by manual action. Add an rIAR_PORT tuple with the lport and lpt_type keys from the ROP output and specify the ring type.

138. FCARSCRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLARSCRN relation, a failure code of DBNO_MATCH was returned. An rIARSCRN tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLARSCRN. Key fields: group ID, index, screen index.

Action:

This is a database inconsistency that can not be corrected by a simple RC/V procedure. For details on automatic route selection (ARS) data population, refer to the "BRCS Feature Definitions" section of the 5ESS® Switch Recent Change Procedures Text Interface manual.

139. FCARTCM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to use the traveling class mark (TCM) feature, the automatic route selection (ARS) logical port information relation RLARPORT had a tuple with a valid ARS group ID (argpid) and a tcmn value of 1 (which means the TCM feature is allowed, active, and must be used). However, the TCM conversion relation information has not been fully supplied; that is, an rIARTCM tuple is missing or has incorrect data for the group used by this

port.

Data Structures:

RLARTCM, RLARPORT.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the ARS group ID (GROUP ID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use the data in the ROP output and RC/V View 5.21 (AUTOMATIC ROUTE SELECTION TRUNK PARAMETERS) to verify that the logical port has the TCM feature allowed.

If the tcmin value equals 1, use RC/V View 10.9 (ARS TRAVELING CLASS MARKS [CONVERSION FROM 1-DIGIT TCM]) to populate an rLARTCM tuple for the ARS group specified. If an rLARTCM tuple already exists for the specified ARS group, then re-populate the data.

140. FCASPAMNST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application type in the rLNS_TRIG tuple associated with an advanced services platform (ASP) trigger is not ASP. During ASP originating trigger detection for the following triggers:

- (a) off_hook_immediate (OHI)
- (b) off_hook_delay (OHD)
- (c) originating_busy_line (OBL)
- (d) originating_no_answer (ONA)
- (e) direct link access trigger (DAL)
- (f) terminating_busy_line (TBL)
- (g) terminating_no_answer (TNA)

the call will proceed as a non-ASP call.

During ASP access code trigger validation for custom dialing plan (CDP) or feature code dialing (FCD) triggers, and for shared interoffice trunk (SIOT) triggers or direct link access triggers, the call in progress will receive standard switch error treatment.

Data Structures:

RLASP_PORT. Key fields: lport, lpt_type
 RLASP_LTM. Key fields: module, ltm_itx, ltm_type
 RLNS_TRIG. Key field: trignum
 RLDAPRLFNL. Key field: previous
 RLDAPRMFNL. Key field: previous
 RLIDP_DTRE. Key fields: idp_gpid, table_id, digit
 RLIDP_CNFL. Key fields: idp_gpid, table_id, num_dig
 RLFC_LINE. Key fields: port.member, port.module, party
 RLFC_TRUNK. Key fields: port.member, port.module

Action:

One of two problems occurred.

- (1) The app_typ field in the specified rINS_TRIG tuple is incorrect and should be corrected using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number specified as the key to the rINS_TRIG tuple is incorrect and should be corrected in the appropriate RC/V views. The trigger number should specify an rINS_TRIG tuple that has the ASP application type.

Follow these steps to identify and correct the problem.

- (1) Consult the office records to determine if the application type associated with the trigger number printed on the ROP should be ASP. If it should, problem #1 occurred and the APPLICATION field should be changed on RC/V View 9.35 using the trigger number specified as the key.
- (2) If the rINS_TRIG tuple is set up correctly, problem #2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - (a) RLASP_PORT for OHI, OHD, OBL or ONA triggers
 - (b) RLPRLFNL or RLPRMFNL for FCD triggers
 - (c) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (d) RLFC_TRUNK or global parameter Glsitrig for SIOT triggers
 - (e) RLFC_TRUNK for direct link access triggers (DAL)
 - (f) RLASP_LTM for TBL or TNA triggers
- (3) Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
- (4) If the ROP output specifies an OHI, OHD, OBL, ONA trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the Master Control Center (MCC) OP:CONV command.
 - (b) Obtain the ASP feature.

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) using the trunk group number and member as keys.

- (c) Correct the trigger number.

For lines, change the OHI, OHD, OBL or ONA TRIG NBR (depending on the trigger specified) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and the FEATURE obtained in step 4b as keys.

For trunks, change the OHD TRIG NBR to the value from the office records using RC/V View 5.64

(ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) using the trunk group and member obtained in step 4a and the FEATURE obtained in step 4b as keys.

(5) If the ROP output specifies an FCD trigger:

- (a) Obtain the PDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR (OFFICE DIALING)), using the digit analysis selector (DAS) printed on the ROP as the key.
- (b) Change the TRIG NBR field to the value from the office records via RC/V View 9.2 (PREFIX/FEATURE DIGIT (OFFICE DIALING)), using the PDIT from step 5a and the DIAL_CODE from the ROP as the keys.

(6) If the ROP output specifies a CDP trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the DN using the MCC OP:CONV command.
- (b) Obtain the IDP feature:

For lines, obtain the FEATURE from RC/V View 1.8 or RC/V View 1.11 using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 using the trunk group number as the key or from RC/V View 5.11 using the trunk group number and member as keys.

- (c) Obtain the IDP group name:

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 6a and the FEATURE from step 6b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 6a and the FEATURE from step 6b as the keys.

- (d) Change the TRIG NBR field to the value from the office records using RC/V View 9.13 (IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)) using the IDP GROUP NAME from step 6c and the DIAL_CODE from the ROP as the keys.

(7) If the ROP output specifies a SIOT trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number using the MCC OP:CONV command.
- (b) Examine the TRIG NBR field on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If this field is not 0, change it to the correct value based on the office records.
- (c) If the TRIG NBR field is 0, the trigger number was obtained from the Glsitrig office parameter. Correct this parameter by setting the INT OFC TRG field on RC/V View 8.49 (ASP PARAMETERS) to the correct value.

(8) If the ROP output specifies a direct link access trigger:

- (a) Using the trunk group number reported on the ROP as the key to RC/V View 5.1 (TRUNK GROUP), examine the TRIG NBR field. If the field is not 0, change it to the correct value based on the office

records

(9) If the ROP output specifies a TBL or TNA trigger:

(a) Specify the MEMBER and MODULE printed on the ROP to obtain the directory number (DN) using the MCC OP:CONV command.

(b) Obtain the ASP feature:

Obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) or RC/V View 23.8 (DSL/BRCS ASSIGNMENT) using the DN as the key.

(c) Correct the trigger number:

Change the TBL or TNA TRIG NBR (depending on the trigger specified in the ROP output) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 9a and FEATURE obtained in step 9b as keys. Alternatively, the TBL or TNA TRIG NBR fields may be updated directly on the 1.8 or 23.8 forms from step 9b.

141. FCASPAMNST (5E13 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application type in the rLNS_TRIG tuple associated with an advanced services platform (ASP) trigger is not ASP. During ASP originating trigger detection for the following triggers:

- (a) off_hook_immediate (OHI)
- (b) off_hook_delay (OHD)
- (c) originating_busy_line (OBL)
- (d) originating_no_answer (ONA)
- (e) direct link access trigger (DAL)

the call will proceed as a non-ASP call.

During ASP access code trigger validation for custom dialing plan (CDP) or feature code dialing (FCD) triggers, and for shared interoffice trunk (SIOT) triggers or direct link access triggers, the call in progress will receive standard switch error treatment.

Data Structures:

RLASP_PORT. Key fields: lport, lpt_type

RLNS_TRIG. Key field: trignum

RLDAPRLFNL. Key field: previous

RLDAPRMFNL. Key field: previous

RLIDP_DTRE. Key fields: idp_gpid, table_id, digit

RLIDP_CNFL. Key fields: idp_gpid, table_id, num_dig

RLFC_LINE. Key fields: port.member, port.module, party

RLFC_TRUNK. Key fields: port.member, port.module

Action:

One of two problems occurred.

- (1) The app_typ field in the specified rINS_TRIG tuple is incorrect and should be corrected via RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number specified as the key to the rINS_TRIG tuple is incorrect and should be corrected in the appropriate RC/V views. The trigger number should specify an rINS_TRIG tuple that has the ASP application type.

Follow these steps to identify and correct the problem.

- (1) Consult the office records to determine if the application type associated with the trigger number printed on the ROP should be ASP. If it should, problem #1 occurred and the APPLICATION field should be changed on RC/V View 9.35 using the trigger number specified as the key.
- (2) If the rINS_TRIG tuple is set up correctly, problem #2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - (a) RLASP_PORT for OHI, OHD, OBL or ONA triggers
 - (b) RLPRLFNL or RLPRMFNL for FCD triggers
 - (c) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (d) RLFC_TRUNK or global parameter Glsitrig for SIOT triggers
 - (e) RLFC_TRUNK for direct link access triggers (DAL)
- (3) Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
- (4) If the ROP output specifies an OHI, OHD, OBL, ONA trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the Master Control Center (MCC) OP:CONV command.
 - (b) Obtain the ASP feature.

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) using the trunk group number and member as keys.

- (c) Correct the trigger number.

For lines, change the OHI, OHD, OBL or ONA TRIG NBR (depending on the trigger specified) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and the FEATURE obtained in step 4b as keys.

For trunks, change the OHD TRIG NBR to the value from the office records using RC/V View 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) using the trunk group and member obtained in step 4a and the FEATURE obtained in step 4b as keys.

(5) If the ROP output specifies an FCD trigger:

- (a) Obtain the PDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR (OFFICE DIALING)), using the digit analysis selector (DAS) printed on the ROP as the key.
- (b) Change the TRIG NBR field to the value from the office records via RC/V View 9.2 (PREFIX/FEATURE DIGIT (OFFICE DIALING)), using the PDIT from step 5a and the DIAL_CODE from the ROP as the keys.

(6) If the ROP output specifies a CDP trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the DN using the MCC op:conv command.
- (b) Obtain the IDP feature:

For lines, obtain the FEATURE from RC/V View 1.8 or RC/V View 1.11 using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 using the trunk group number as the key or from RC/V View 5.11 using the trunk group number and member as keys.

- (c) Obtain the IDP group name:

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 6a and the FEATURE from step 6b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 6a and the FEATURE from step 6b as the keys.

- (d) Change the TRIG NBR field to the value from the office records via RC/V View 9.13 (IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)) using the IDP GROUP NAME from step 6c and the DIAL_CODE from the ROP as the keys.

(7) If the ROP output specifies a SIOT trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number via the MCC op:conv command.
- (b) Examine the TRIG NBR field on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If this field is not 0, change it to the correct value based on the office records.
- (c) If the TRIG NBR field is 0, the trigger number was obtained from the Glsitrig office parameter. Correct this parameter by setting the INT OFC TRG field on RC/V View 8.49 (ASP PARAMETERS) to the correct value.

(8) If the ROP output specifies a Direct Link Access Trigger:

- (a) Using the trunk group number reported on the ROP as the key to RC/V View 5.1 (TRUNK GROUP),

examine the TRIG NBR field field. If the field is not 0, change it to the correct value based on the office records.

142. FCASPAMNST (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application type in the rINS_TRIG tuple associated with an advanced services platform (ASP) trigger is not ASP. During ASP originating trigger detection for the following triggers:

- (a) off_hook_immediate (OHI)
- (b) off_hook_delay (OHD)
- (c) originating_busy_line (OBL)
- (d) originating_no_answer (ONA)

the call will proceed as a non-ASP call.

During ASP access code trigger validation for custom dialing plan (CDP) or feature code dialing (FCD) triggers, and for shared interoffice trunk (SIOT) triggers, the call in progress will receive standard switch error treatment.

- (d) RLFC_TRUNK or global parameter Glsitrig for SIOT triggers
- (3) Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
- (4) If the ROP output specifies an OHI, OHD, OBL, ONA trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the master control center (MCC) op:conv command.
 - (b) Obtain the ASP feature.

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 [BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)] using the trunk group number and member as keys.

- (c) Correct the trigger number.

For lines, change the OHI, OHD, OBL or ONA TRIG NBR (depending on the trigger specified) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and the FEATURE obtained in step 4b as keys.

For trunks, change the OHD TRIG NBR to the value from the office records using RC/V View 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) using the trunk group and member obtained in step 4a and the FEATURE obtained in step 4b as keys.

- (5) If the ROP output specifies an FCD trigger:
 - (a) Obtain the PDIT from RC/V View 9.1 [DIGIT ANALYSIS SELECTOR (OFFICE DIALING)], using the digit analysis selector (DAS) printed on the ROP as the key.
 - (b) Change the TRIG NBR field to the value from the office records using RC/V View 9.2 [PREFIX/FEATURE DIGIT (OFFICE DIALING)], using the PDIT from step 5a and the DIAL_CODE from the ROP as the keys.
- (6) If the ROP output specifies a CDP trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the DN using the MCC op:conv command.
 - (b) Obtain the IDP feature:

For lines, obtain the FEATURE from RC/V View 1.8 or RC/V View 1.11 using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 using the trunk group number as the key or from RC/V View 5.11 using the trunk group number and member as keys.

- (c) Obtain the IDP group name:

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 6a and the FEATURE from step 6b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 6a and the FEATURE from step 6b as the keys.

- (d) Change the TRIG NBR field to the value from the office records using RC/V View 9.13 [IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)] using the IDP GROUP NAME from step 6c and the DIAL_CODE from the ROP as the keys.

- (7) If the ROP output specifies a SIOT trigger:
- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number using the MCC op:conv command.
 - (b) Examine the TRIG NBR field on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If this field is not 0, change it to the correct value based on the office records.
 - (c) If the TRIG NBR field is 0, the trigger number was obtained from the Glsitrig office parameter. Correct this parameter by setting the INT OFC TRG field on screen 4 of RC/V View 8.1 (OFFICE PARAMETERS) to the correct value.

143. FCASPAMNST (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application type in the rINS_TRIG tuple associated with an advanced services platform (ASP) trigger is not ASP. During ASP originating trigger detection for off_hook_immediate (OHI) or off_hook_delayed (OHD) triggers, the call will proceed as a non-ASP call.

During ASP access code trigger validation for custom dialing plan (CDP) or feature code dialing (FCD) triggers, and for shared interoffice trunk (SIOT) triggers, the call in progress will receive standard switch error treatment.

Data Structures:

RLASP_PORT. Key fields: lport, lpt_type.
 RLNS_TRIG. Key field: trignum.
 RLDAPRLFNL. Key field: previous.
 RLDAPRMFNL. Key field: previous.
 RLIDP_DTRE. Key fields: idp_gpid, table_id, digit.
 RLIDP_CNFL. Key fields: idp_gpid, table_id, num_dig.
 RLFC_LINE. Key fields: port.member, port.module, party.
 RLFC_TRUNK. Key fields: port.member, port.module.

Action:

One of two problems occurred.

1. The app_typ field in the specified rINS_TRIG tuple is incorrect and should be corrected via RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
2. The trigger number specified as the key to the rINS_TRIG tuple is incorrect and should be corrected in the appropriate RC/V views. The trigger number should specify an rINS_TRIG tuple that has the ASP application type.

Follow these steps to identify and correct the problem:

1. Consult the office records to determine if the application type associated with the trigger number printed on the ROP should be ASP. If it should, problem #1 occurred and the APPLICATION field should be changed on RC/V View 9.35 using the trigger number specified as the key.
2. If the rINS_TRIG tuple is set up correctly, problem #2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - a. RLASP_PORT for OHI and OHD triggers
 - b. RLPRLFNL or RLPRMFNL for FCD triggers

- c. RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - d. RLFC_TRUNK or global parameter Glsitrig for SIOT triggers
3. Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
4. If the ROP output specifies an OHI or OHD trigger:
- a. Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) via the master control center (MCC) op:conv command.
 - b. Obtain the ASP feature.

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]) using the trunk group number and member as keys.

- c. Correct the trigger number.

For lines, change the OHI or OHD TRIG NBR (depending on the trigger specified) to the value from the office records via RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and the FEATURE obtained in step 4b as keys.

For trunks, change the OHD TRIG NBR to the value from the office records via RC/V View 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) using the trunk group and member obtained in step 4a and the FEATURE obtained in step 4b as keys.

5. If the ROP output specifies an FCD trigger:
- a. Obtain the PDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]), using the digit analysis selector (DAS) printed on the ROP as the key.
 - b. Change the TRIG NBR field to the value from the office records via RC/V View 9.2 (PREFIX/FEATURE DIGIT [OFFICE DIALING]), using the PDIT from step 5a and the DIAL_CODE from the ROP as the keys.
6. If the ROP output specifies a CDP trigger:
- a. Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the DN via the master control center (MCC) op:conv command.
 - b. Obtain the IDP feature:

For lines, obtain the FEATURE from RC/V View 1.8 or RC/V View 1.11 using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 using the trunk group number as the key or from RC/V View 5.11 using the trunk group number and member as keys.

- c. Obtain the IDP group name:

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 6a and the FEATURE from step 6b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 6a and the FEATURE from step 6b as the

keys.

d. Change the TRIG NBR field to the value from the office records via RC/V View 9.13 (IDP DIALED CODE ASSIGNMENT [INDIVIDUAL DIALING]) using the IDP GROUP NAME from step 6c and the DIAL_CODE from the ROP as the keys.

7. If the ROP output specifies a SIOT trigger:

a. Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number via the master control center (MCC) op:conv command.

b. Examine the TRIG NBR field on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If this field is not 0, change it to the correct value based on the office records.

c. If the TRIG NBR field is 0, the trigger number was obtained from the Glsitrig office parameter. Correct this parameter by setting the INT OFC TRG field on screen 4 of RC/V View 8.1 (OFFICE PARAMETERS) to the correct value.

144. FCASPANN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either a rISSP_ANN tuple is missing or the AIN Toll-Free feature is not unlocked. For the missing rISSP_ANN tuple case, the service control point (SCP) sent a message to the service switching point (SSP) to play an advanced services platform (ASP) announcement. The announcement code was not recognized by the switch; consequently, the announcement can not be played. The call is given reorder tone or standard switch error treatment.

Data Structures:

RLSSP_ANN. Key fields: announcement code, sm.

Action:

Insert an rISSP_ANN tuple with the keys given on the ROP via RC/V View 10.17 (NETWORK ANNOUNCEMENTS). To find the SM number, read RC/V View 8.64 (ANNOUNCEMENT APPLICATION SM LIST) and enter ASP as the application. For the AIN Toll-Free feature locked case, the SCP has instructed the SSP to route the ASP call to a 13A or equivalent announcement. The AIN Toll-Free feature must be unlocked to route an ASP call to a 13A or equivalent announcement.

Action:

Unlock the AIN Toll-Free feature via RC/V 8.22 (SECURED FEATURE UPDATE). Use the existing secured feature procedures to unlock the security lock (SFID=236) for this feature.

145. FCASPCARTRG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem: The trigger number provided as the key to read the RLNS_RTIG relation is invalid or the rLNS_TRIG tuple specified does not exist. During validation of advanced services platform (ASP) carrier trigger the trigger tuple did not exist. The call will proceed as a non-ASP call

Data Structures:

RLNS_TRIG. Key Field: trignum. RLFC_CARR. Key Field: carrier.

Action:

One of two problems occurred:

- (1) The specified rINS_TRIG tuple is missing and must be inserted using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number specified as the key to the rINS_TRIG tuple RC/V view 9.35, is incorrect and must be corrected using the appropriate RC/V views.

Follow these steps to identify and correct the problem:

- (1) Consult the office records to determine if the trigger number printed on the ROP is a valid value. If it is valid, problem 1 occurred and the rINS_TRIG tuple corresponding to this trigger number should be added using the information provided in the office records. Add the tuple using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) If the trigger number is not a valid value or if it is 0, problem 2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - (a) a. RLFC_CARR for carrier triggers
- (3) Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
- (4) Correct the trigger number: Change the trigger number specified for the carrier reported on the ROP. Use the carrier as the key to RC/V View 10.3 (INTER-LATA CARRIER). Change the trigger number value based on the office records.

146. FCASPCPFB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The advanced services platform (ASP) feature code dialing (FCD) and custom dialing plan (CDP) triggers are not supported from custom integrated services digital network (ISDN) originations for R0D1 protocol. The trigger number associated with the FCD and CDP triggers should only be populated with R0 protocol. The call will be provided with standard switch error treatment.

Data Structures:

RLNS_TRIG

Action:

Check the trigger number associated with the FCD and CDP triggers on RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION) to ensure that the FCD and CDP triggers that are assigned to custom ISDN have a trigger number with R0 protocol.

147. FCASPCPOHD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The advanced services platform (ASP) offhook delay trigger (OHD) is not supported from custom integrated services digital network (ISDN) originations for R0D1 protocol. The trigger number associated with the OHD trigger should only be populated with R0 protocol. The call will be provided with standard switch error treatment.

Data Structures:

RLNS_TRIG

Action:

The advanced services platform (ASP) offhook delay trigger (OHD) is not supported from standard integrated services digital network (ISDN) originations for R0 protocol. The trigger number associated with the OHD trigger should only be populated with R0D1 protocol.

148. FCASPCUTTHUTRG (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following occurred during validation of the ASP Cutthru trigger:

- (1) Invalid trigger Number:
The trigger number provided as the key to read the RLNS_TRIG relation is invalid.
- (2) Invalid Protocol:
The ASP protocol in the RLNS_TRIG tuple associated with the Cut-Thru trigger is not valid.
- (3) Invalid Application:
The application type in the RLNS_TRIG tuple associated with cut-thru trigger is not ASP.

Data Structures:

RLNS_TRIG. Key field: trigger number
RLFC_TRUNK. Key field: trunk group number

Action:

- (1) Invalid trigger Number:
Problem 1. The specified RLNS_TRIG tuple is missing and must be inserted using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).

Problem 2. The trigger number specified as the key to the RLNS_TRIG RC/V view 9.35, is incorrect and must be corrected using the appropriate RC/V views.

Follow these steps to identify and correct the problem:

- (1) Consult the office records to determine if the trigger number printed on the ROP is a valid value. If it is valid, problem 1 occurred and the RLNS_TRIG tuple corresponding to this trigger number should be added using the information provided in the office records. Add the tuple using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) If the trigger number is not a valid value or if it is 0, problem 2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - (a) RLFC_TRUNK for Cutthru Triggers
- (3) Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
- (4) Correct the trigger number:

Change the trigger number specified for the trunk group reported on the ROP. Use the trunk group as the key to RC/V view 5.1. Change the trigger number value based on the office records.

- (2) Invalid Protocol:
Check the trigger number associated with the trunk group on RC/V 5.1 to ensure that the trunk group has a trigger number with a protocol of R0D1.
- (3) Invalid Application:
Change the application for the given trigger number using RC/V view 9.35 or correct the ASP office type using 8.49 (ASP parameter).

149. FCASPDFANNC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The announcement code specified for the advanced services platform (ASP) 3/6/10/N11 Digit Trigger (DNT) trigger default routing treatment is invalid. The 3/6/10/N11 digit trigger will not default route to the announcement and the call will be provided with reorder or with standard switch error treatment if the default routing treatment is ARAF, or will be routed to the dialed or specified directory number (DN) if the default routing treatment is ANDL or ANSP.

Data Structures:

RLDAPRMFNL, RLDAPRLFNL, RLDPRM_G, RLDPRL_G, RLSSP_ANN

Action:

Check the announcement code associated with the 3/6/10/N11 trigger. The announcement code can be found on the RC/V view associated with the 3/6/10/N11 trigger in the dialing plan identified by the DAS printed at the ROP. The possible RC/V views are:

9.2 (PREFIX / FEATURE DIGIT) 9.3 (LOCAL DIGIT) 9.9 (REMAINING DIGIT) 9.6
(RC_INTERNATIONAL_DIRECT_DISTANCE_DIALING) 9.15 (MULTIPLE LOCAL DIGIT)

Insert a rSPP_ANN tuple with the keys of ANNC CODE and SM given on the ROP via RC/V View 10.17 (NETWORK ANNOUNCEMENTS). To find the SM number, read RC/V View 8.64 (ANNOUNCEMENT APPLICATION SM LIST) and enter ASP as the application.

If insertion of a new announcement is undesirable, update the invalid ANNC CODE to a valid ANNC CODE provisioned on RC/V View 10.17.

150. FCASPDFDNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Default Routing has been specified for an advanced services platform (ASP) 3/6/10/N11 Digit Trigger (DNT) trigger. ASP Default Routing is not supported for R0 protocol. The 3/6/10/N11 digit trigger will not default route and the call will be provided with reorder or standard switch error treatment.

Data Structures:

RLNS_TRIG KEY: TRIG NBR

Action:

Check the trigger number associated with the 3/6/10/N11 trigger. The trigger number can be found on the RC/V view associated with the 3/6/10/N11 trigger in the dialing plan identified by the DAS printed on the ROP.

The possible RC/V views are:

9.2 (PREFIX / FEATURE DIGIT) 9.3 (LOCAL DIGIT) 9.9 (REMAINING DIGIT) 9.6

(RC_INTERNATIONAL_DIRECT_DISTANCE_DIALING) 9.15 (MULTIPLE LOCAL DIGIT)

Check the trigger number associated with the 3/6/10/N11 trigger on RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION) to ensure that the trigger that is assigned to the 3/6/10/N11 is R0D1 protocol.

151. FCASPDFSPDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The specified directory number (DN) designated as the 3/6/10/N11 digit default routing treatment is invalid for one of the following reasons:

1. The SPEC_DN digits are invalid for the dialing plan associated with the originator.
2. The SPEC_DN digits translate to digits that will route to an operator.
3. The SPEC_DN digits translate to digits that cut through to a carrier.
4. The SPEC_DN digits translate to digits that specify B911 or E911.
5. The SPEC_DN digits contain an access code

The failed call results in reorder tone error treatment or standard switch error treatment

Data Structures:

RLDAPRMFNL, RLDAPRLFNL, RLDPRM_G, RLDPRL_G

Action:

Check the SPECIFIED DN associated with the dialed 3/6/10/N11 trigger and verify that the digits are a valid digit string. The SPECIFIED DN can be located on the following views:

9.2 (PREFIX / FEATURE DIGIT) 9.3 (LOCAL DIGIT) 9.9 (REMAINING DIGIT) 9.6
(RC_INTERNATIONAL_DIRECT_DISTANCE_DIALING) 9.15 (MULTIPLE LOCAL DIGIT)

152. FCASPEAOHD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An advanced services platform (ASP) call was attempted on a private equal access multi-frequency (EAMF) trunk and the ASP off_hook_delay (OHD) trigger is not provisioned for that trunk. The call in progress will receive standard switch error treatment.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

RLASP_PORT. Key fields: lport, lpt_type.

Action:

One of three problems occurred.

1. The trunk is incorrectly provisioned as an unrestricted equal access trunk.
2. No ASP originating feature is assigned to the trunk, or the feature was deactivated.
3. The ASP OHD trigger is not defined in the ASP originating feature assigned to the trunk.

Follow these steps to identify and correct the problem:

1. Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member via the master control center (MCC) op:conv command.
2. Consult the office records to determine if the trunk group specified should be defined as unrestricted equal access. If it should not, problem #1 occurred. Change the UNRES_EA field to N on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number from step 1 as the key.
3. If the trunk is correctly provisioned as unrestricted equal access, determine whether an ASP originating feature was assigned to the trunk via RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key, or View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]) using the trunk group number and member as keys. If the feature is not assigned or is not active, problem #2 occurred.

If the feature is not active, activate it on RC/V View 5.4 or View 5.11 by setting the associated A field to Y. If the feature is not assigned, define and assign the feature using the office records for the source information and the following RC/V views:

- a. View 12.64 (ADVANCED SERVICES PLATFORM FEATURE DEFINITION) if the ASP originating feature was not defined.
 - b. View 5.4 or 5.11 to assign the feature to the trunk.
 - c. View 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) to define the OHD trigger within the ASP originating feature.
4. If the ASP originating feature is assigned and active, the OHD trigger is not defined in the feature and problem #3 occurred. Change the OHD TRIG NBR field to the value specified in the office records via RC/V View 5.64 using the feature from View 5.4 or View 5.11 (step 3) and the trunk group number and member from step 1 as keys.

153. FCASP_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rASP_LTM tuple is missing. One of the keys is not populated or is populated incorrectly. An advanced services platform (ASP) terminating feature ID exists in the RLDN_FEATS relation for the directory number (DN) or multi-line hunt group (MLHG) indicated by the keys to the rASP_LTM tuple.

Data Structures:

RLASP_LTM. Key fields: lead_module, ltm_idx, ltm_type.

The ROP output provides the lead_module which is the SM associated with the DN's port if a line or with the lead member of a MLHG, the ltm_idx which is from the RLFC_LINE relation (keyed by the port), and the ltm_type which is from the RLFC_LINE relation.

Action:

This is a database inconsistency that must be corrected by manual action. Use RC/V (or ODBE, if necessary) to insert an rASP_LTM tuple in the SM specified by the lead_module key with the values specified on the ROP. All other values may be left unpopulated with the default values. Use RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) to update the ASP terminating trigger line parameters for the DN or MLHG.

154. FCASPMNST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trigger number provided as the key to read the RLNS_TRIG relation is invalid or the rINS_TRIG tuple specified does not exist.

During advanced services platform (ASP) originating trigger detection for the following triggers:

- (a) off_hook_immediate (OHI)
- (b) off_hook_delay (OHD)
- (c) originating_busy_line (OBL)
- (d) originating_no_answer (ONA)
- (e) direct-link access
- (f) terminating_busy_line (TBL)
- (g) terminating_no_answer (TNA)

the call will proceed as a non-ASP call.

During ASP access code trigger validation for custom dialing plan (CDP), feature code dialing (FCD) triggers, shared interoffice trunk (SIOT) triggers or direct link access triggers, the call in progress will receive standard switch error treatment.

Data Structures:

RLASP_PORT. Key fields: lport, lpt_type
 RLASP_LTM. Key fields: module, ltm_idx, ltm_type
 RLNS_TRIG. Key field: trignum
 RLDAPRLFNL. Key field: previous
 RLDAPRMFNL. Key field: previous
 RLDP_DTRE. Key fields: idp_gpid, table_id, digit
 RLDP_CNFL. Key fields: idp_gpid, table_id, num_dig
 RLFC_LINE. Key fields: port.member, port.module, party
 RLFC_TRUNK. Key fields: port.member, port.module

Action:

One of two problems occurred:

- (1) The specified rINS_TRIG tuple is missing and must be inserted via RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected via the appropriate RC/V views.

Follow these steps to identify and correct the problem:

- (1) Consult the office records to determine if the trigger number printed on the ROP is a valid value. If it is valid, problem 1 occurred and the rINS_TRIG tuple corresponding to this trigger number should be added using the information provided in the office records. Add the tuple using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).

- (2) If the trigger number is not a valid value or if it is 0, problem 2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - (a) RLASP_PORT for OHI, OHD, OBL or ONA triggers
 - (b) RLPRLFNL or RLPRMFNL for FCD triggers
 - (c) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (d) RLFC_TRUNK or global parameter Glsitrig for SIOT triggers
 - (e) RLFC_TRUNK for Direct Link Access Triggers (DAL)
 - (f) RLASP_LTM for TBL or TNA triggers
- (3) Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
- (4) If the ROP output specifies an OHI, OHD, OBL or ONA trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the Master Control Center (MCC) OP:CONV command.
 - (b) Obtain the ASP feature:

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) using the trunk group number and member as keys.
 - (c) Correct the trigger number:

For lines, change the OHI, OHD, OBL or ONA TRIG NBR (depending on the trigger specified in the ROP output) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and FEATURE obtained in step 4b as keys.

For trunks, change the OHD TRIG NBR to the value from the office records using RC/V View 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) using the trunk group and member obtained in step 4a and FEATURE obtained in step 4b as keys.
- (5) If the ROP output specifies an FCD trigger:
 - (a) Obtain the PDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR (OFFICE DIALING)) using the digit analysis selector (DAS) printed on the ROP as the key.
 - (b) Change the TRIG NBR field to the value from the office records using RC/V View 9.2 (PREFIX/FEATURE DIGIT (OFFICE DIALING)) using the PDIT from step 5a and the DIAL_CODE from the ROP as the keys.
- (6) If the ROP output specifies a CDP trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and

member or the DN using the MCC OP:CONV command.

- (b) Obtain the IDP feature:

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT VIEW) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) using the trunk group number and member as keys.

- (c) Obtain the IDP group name:

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 6a and the FEATURE from step 6b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 6a and the FEATURE from step 6b as the keys.

- (d) Change the TRIG NBR field to the value from the office records using RC/V View 9.13 (IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)), using the IDP GROUP NAME from step 6c and the DIAL_CODE from the ROP as the keys.

- (7) If the ROP output specifies a SIOT trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number using the MCC OP:CONV command.
- (b) Examine the TRIG NBR field on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If this field is not 0, change it to the correct value based on the office records.
- (c) If the TRIG NBR field is 0, the trigger number was obtained from the Glsitrig office parameter. Correct this parameter by setting the INT OFC TRG field on RC/V View 8.49 (ASP PARAMETERS) to the correct value.

- (8) If the ROP output specifies a Direct Link Access (DAL) trigger:

- (a) Using the trunk group number printed on the ROP, examine the TRIG NBR field of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If the value is not 0, change it to the correct value based on the office records.

- (9) If the ROP output specifies a TBL or TNA trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the directory number (DN) using the MCC OP:CONV command.

- (b) Obtain the ASP feature:

Obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) or RC/V View 23.8 (DSL/BRCS ASSIGNMENT) using the DN as the key.

- (c) Correct the trigger number:

Change the TBL or TNA TRIG NBR (depending on the trigger specified in the ROP output) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 9a and FEATURE obtained in step 9b as keys. Alternatively, the TBL or TNA TRIG NBR fields may be updated directly on the 1.8 or 23.8 forms from step 9b.

155. FCASPMTNST (5E13 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trigger number provided as the key to read the RLNS_TRIG relation is invalid or the rINS_TRIG tuple specified does not exist.

During advanced services platform (ASP) originating trigger detection for the following triggers:

- (a) off_hook_immediate (OHI)
- (b) off_hook_delay (OHD)
- (c) originating_busy_line (OBL)
- (d) originating_no_answer (ONA)
- (e) direct-link access

the call will proceed as a non-ASP call.

During ASP access code trigger validation for custom dialing plan (CDP), feature code dialing (FCD) triggers, shared interoffice trunk (SIOT) triggers or direct link access triggers, the call in progress will receive standard switch error treatment.

Data Structures:

RLASP_PORT. Key fields: lport, lpt_type
 RLNS_TRIG. Key field: trignum
 RLDAPRLFNL. Key field: previous
 RLDAPRMFNL. Key field: previous
 RLIDP_DTRE. Key fields: idp_gpid, table_id, digit
 RLIDP_CNFL. Key fields: idp_gpid, table_id, num_dig
 RLFC_LINE. Key fields: port.member, port.module, party
 RLFC_TRUNK. Key fields: port.member, port.module

Action:

One of two problems occurred:

- (1) The specified rINS_TRIG tuple is missing and must be inserted via RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected via the appropriate RC/V views.

Follow these steps to identify and correct the problem:

- (1) Consult the office records to determine if the trigger number printed on the ROP is a valid value. If it is valid, problem 1 occurred and the rINS_TRIG tuple corresponding to this trigger number should be added using the information provided in the office records. Add the tuple using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) If the trigger number is not a valid value or if it is 0, problem 2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - (a) RLASP_PORT for OHI, OHD, OBL or ONA triggers
 - (b) RLPRLFNL or RLPRMFNL for FCD triggers
 - (c) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (d) RLFC_TRUNK or global parameter Glsitrig for SIOT triggers
 - (e) RLFC_TRUNK for direct link access triggers (DAL)
- (3) Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
- (4) If the ROP output specifies an OHI, OHD, OBL or ONA trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the Master Control Center (MCC) OP:CONV command.
 - (b) Obtain the ASP feature:

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) using the trunk group number and member as keys.
 - (c) Correct the trigger number:

For lines, change the OHI, OHD, OBL or ONA TRIG NBR (depending on the trigger specified in the ROP output) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and FEATURE obtained in step 4b as keys.

For trunks, change the OHD TRIG NBR to the value from the office records via RC/V View 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) using the trunk group and member obtained in step 4a and FEATURE obtained in step 4b as keys.
- (5) If the ROP output specifies an FCD trigger:
 - (a) Obtain the PDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR (OFFICE DIALING)) using the digit analysis selector (DAS) printed on the ROP as the key.
 - (b) Change the TRIG NBR field to the value from the office records via RC/V View 9.2 (PREFIX/FEATURE DIGIT (OFFICE DIALING)) using the PDIT from step 5a and the DIAL_CODE from the ROP as the keys.

(6) If the ROP output specifies a CDP trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the DN via the MCC OP:CONV command.
- (b) Obtain the IDP feature:

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT VIEW) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) using the trunk group number and member as keys.

- (c) Obtain the IDP group name:

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 6a and the FEATURE from step 6b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 6a and the FEATURE from step 6b as the keys.

- (d) Change the TRIG NBR field to the value from the office records via RC/V View 9.13 (IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)), using the IDP GROUP NAME from step 6c and the DIAL_CODE from the ROP as the keys.

(7) If the ROP output specifies a SIOT trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number via the MCC OP:CONV command.
- (b) Examine the TRIG NBR field on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If this field is not 0, change it to the correct value based on the office records.
- (c) If the TRIG NBR field is 0, the trigger number was obtained from the Glsitrig office parameter. Correct this parameter by setting the INT OFC TRG field on RC/V View 8.49 (ASP PARAMETERS) to the correct value.

(8) If the ROP output specifies a direct link access (DAL) trigger:

- (a) Using the trunk group number printed on the ROP, examine the TRIG NBR field of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If the value is not 0, change it to the correct value based on the office records.

156. FCASPMTNST (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trigger number provided as the key to read the RLNS_TRIG relation is invalid or the rINS_TRIG tuple specified does not exist. During advanced services platform (ASP) originating trigger detection for the following triggers:

 RLFC_TRUNK. Key fields: port.member, port.module.

Action:

One of two problems occurred:

- (1) The specified rINS_TRIG tuple is missing and must be inserted using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected using the appropriate RC/V views.

Follow these steps to identify and correct the problem:

- (1) Consult the office records to determine if the trigger number printed on the ROP is a valid value. If it is valid, problem 1 occurred and the rINS_TRIG tuple corresponding to this trigger number should be added using the information provided in the office records. Add the tuple using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) If the trigger number is not a valid value or if it is 0, problem 2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - (a) RLASP_PORT for OHI, OHD, OBL or ONA triggers
 - (b) RLPRLFNL or RLPRMFNL for FCD triggers
 - (c) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (d) RLFC_TRUNK or global parameter Glsitrig for SIOT triggers
- (3) Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.
- (4) If the ROP output specifies an OHI, OHD, OBL or ONA trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the master control center (MCC) op:conv command.
 - (b) Obtain the ASP feature:

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 [BRCS FEATURE ASSIGNMENT (LINE)] using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 [BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)] using the trunk group number and member as keys.

- (c) Correct the trigger number:

For lines, change the OHI, OHD, OBL or ONA TRIG NBR (depending on the trigger specified in the ROP output) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and FEATURE obtained in step 4b as keys.

For trunks, change the OHD TRIG NBR to the value from the office records using RC/V View 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) using the trunk group and member obtained in step 4a and FEATURE obtained in step 4b as keys.

- (5) If the ROP output specifies an FCD trigger:

- (a) Obtain the PDIT from RC/V View 9.1 [DIGIT ANALYSIS SELECTOR (OFFICE DIALING)] using the digit analysis selector (DAS) printed on the ROP as the key.
- (b) Change the TRIG NBR field to the value from the office records using RC/V View 9.2 [PREFIX/FEATURE DIGIT (OFFICE DIALING)] using the PDIT from step 5a and the DIAL_CODE from the ROP as the keys.

- (6) If the ROP output specifies a CDP trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the DN using the MCC op:conv command.
- (b) Obtain the IDP feature:

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 [BRCS FEATURE ASSIGNMENT (LINE)] using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT VIEW) using the trunk group number as the key or from RC/V View 5.11 [BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)] using the trunk group number and member as keys.

- (c) Obtain the IDP group name:

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 6a and the FEATURE from step 6b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 6a and the FEATURE from step 6b as the keys.

- (d) Change the TRIG NBR field to the value from the office records using RC/V View 9.13 [IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)], using the IDP GROUP NAME from step 6c and the DIAL_CODE from the ROP as the keys.

- (7) If the ROP output specifies a SIOT trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number using the MCC op:conv command.
- (b) Examine the TRIG NBR field on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If this field is not 0, change it to the correct value based on the office records.
- (c) If the TRIG NBR field is 0, the trigger number was obtained from the Glstrig office parameter. Correct this parameter by setting the INT OFC TRG field on screen 4 of RC/V View 8.1 (OFFICE PARAMETERS) to the correct value.

157. FCASPMTNST (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trigger number provided as the key to read the RLNS_RTIG relation is invalid or the rINS_TRIG tuple specified does not exist. During advanced services platform (ASP) originating trigger detection for off_hook_immediate (OHI) or off_hook_delayed (OHD) triggers, the call will proceed as a non-ASP call.

During ASP access code trigger validation for custom dialing plan (CDP) or feature code dialing (FCD) triggers and for shared interoffice trunk (SIOT) triggers, the call in progress will receive standard switch error treatment.

Data Structures:

RLASP_PORT. Key fields: lport, lpt_type.
 RLNS_TRIG. Key field: trignum.
 RLDAPRLFNL. Key field: previous.
 RLDAPRMFNL. Key field: previous.
 RLIDP_DTRE. Key fields: idp_gpid, table_id, digit.
 RLIDP_CNFL. Key fields: idp_gpid, table_id, num_dig.
 RLFC_LINE. Key fields: port.member, port.module, party.
 RLFC_TRUNK. Key fields: port.member, port.module.

Action:

One of two problems occurred:

- (1) The specified rINS_TRIG tuple is missing and must be inserted via RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected via the appropriate RC/V views.

Follow these steps to identify and correct the problem:

- (1) Consult the office records to determine if the trigger number printed on the ROP is a valid value. If it is valid, problem 1 occurred and the rINS_TRIG tuple corresponding to this trigger number should be added using the information provided in the office records. Add the tuple via RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) 2. If the trigger number is not a valid value or if it is 0, problem 2 occurred. Correct the relation from which the trigger number was obtained as follows:
 - (a) RLASP_PORT for OHI and OHD triggers
 - (b) RLPRLFNL or RLPRMFNL for FCD triggers
 - (c) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (d) RLFC_TRUNK or global parameter Glsitrig for SIOT triggers
- (3) 3. Consult the office records to determine the correct trigger number to be inserted into the appropriate relation.

(4) 4. If the ROP output specifies an OHI or OHD trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) via the master control center (MCC) op:conv command.
- (b) Obtain the ASP feature:

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]) using the trunk group number and member as keys.

- (c) Correct the trigger number:

For lines, change the OHI or OHD TRIG NBR (depending on the trigger specified in the ROP output) to the value from the office records via RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and FEATURE obtained in step 4b as keys.

For trunks, change the OHD TRIG NBR to the value from the office records via RC/V View 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) using the trunk group and member obtained in step 4a and FEATURE obtained in step 4b as keys.

(5) 5. If the ROP output specifies an FCD trigger:

- (a) Obtain the PDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) using the digit analysis selector (DAS) printed on the ROP as the key.
- (b) Change the TRIG NBR field to the value from the office records via RC/V View 9.2 (PREFIX/FEATURE DIGIT [OFFICE DIALING]) using the PDIT from step 5a and the DIAL_CODE from the ROP as the keys.

(6) 6. If the ROP output specifies a CDP trigger:

- (1) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the DN via the master control center (MCC) op:conv command.
- (2) Obtain the individualized dialing plan (IDP) feature:

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT VIEW) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]) using the trunk group number and member as keys.

- (3) Obtain the IDP group name:

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 6a and the FEATURE from step 6b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 6a and the FEATURE from step 6b as the keys.

- (4) Change the TRIG NBR field to the value from the office records via RC/V View 9.13 (IDP DIALED CODE ASSIGNMENT [INDIVIDUAL DIALING]) using the IDP GROUP NAME from step 6c and the DIAL_CODE from the ROP as the keys.
- (7) 7. If the ROP output specifies a SIOT trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number using the master control center (MCC) op:conv command.
 - (b) Examine the TRIG NBR field on screen 4 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number as the key. If this field is not 0, change it to the correct value based on the office records.
 - (c) If the TRIG NBR field is 0, the trigger number was obtained from the Glsitrig office parameter. Correct this parameter by setting the INT OFC TRG field on screen 4 of RC/V View 8.1 (OFFICE PARAMETERS) to the correct value.

158. FCASPNOBIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The service control point (SCP) requested billing for the advanced services platform (ASP) dialed number trigger (DNT) call, but the service switching point (SSP) could not construct a 10-digit directory number (DN) from the dialed DNT. The SCP did not return an alternate billing number.

The call will proceed without honoring the SCP requested billing associated with the missing billing information.

Action:

Notify the SCP service provider of the discrepancy. The problem must be corrected in the SCP service logic. No action on the switch is required.

159. FCASPPMNST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A conflict exists with the advanced intelligent network (AIN) release (protocol) specified in the rINS_TRIG tuple for an advanced services platform (ASP) feature code dialing (FCD), custom dialing plan (CDP), originating busy line (OBL), originating no answer (ONA), terminating busy line (TBL) or terminating no answer (TNA) trigger.

For ASP FCD or CDP the release must be AIN R0D1 if the action specifies variable digit collection, or query immediately. The digit collection mechanism will be changed to normal (collect digits according to the subscriber's dialing plan) and the ASP call will proceed.

For OBL or ONA trigger, the AIN release protocol specified in the rINS_TRIG tuple must be R0D1.

For direct link access (DAL) triggers, the AIN protocol specified in the rINS_TRIG tuple must be R0D1.

For TBL or TNA triggers, the AIN release protocol specified in the rINS_TRIG tuple must be R0D1.

Data Structures:

RLNS_TRIG. Key field: trignum
 RLDAPRLFNL. Key field: previous

RLDAPRMFNL. Key field: previous
 RLIDP_DTRE. Key fields: idp_gpid, table_id, digit
 RLIDP_CNFL. Key fields: idp_gpid, table_id, num_dig
 RLFC_LINE. Key fields: port.member, port.module, party
 RLFC_TRUNK. Key fields: port.member, port.module
 RLASP_LTM. Key fields: module, ltm_itx, ltm_type

Action:

One of following problems occurred.

- (1) The protocol field in the specified rINS_TRIG tuple is incorrect and must be corrected using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) For FCD or CDP, the trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected in the appropriate digit analysis RC/V views. The trigger number should specify an rINS_TRIG tuple that has the correct protocol.
- (3) For FCD or CDP, the action specified is incorrect and must be corrected in the appropriate digit analysis RC/V views. The action should specify normal digit collection.
- (4) For OBL or ONA, the trigger number specified as the key to the rINS_TRIG tuple is incorrect and should be corrected in the appropriate RC/V views. The trigger number should specify an rINS_TRIG tuple that has the R0D1 release protocol. (See item 6 below)
- (5) For a direct link access trigger, the trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected in RC/V view 5.1 (TRUNK GROUP). The trigger number should specify an rINS_TRIG tuple that has the correct protocol.

Follow these steps to identify and correct the problem.

- (1) Consult the office records to determine if the protocol associated with the trigger number printed on the ROP should be R0D1. If it should, problem #1 occurred. Change the AIN REL field on RC/V View 9.35 using the trigger number specified as the key.
- (2) If the rINS_TRIG tuple is set up correctly, the problem is with the trigger number or the action; problem #2, problem #3 or problem #4 occurred. The field in error should be corrected in one the following views:
 - (a) RLPRLFNL or RLPRMFNL for FCD triggers
 - (b) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (c) RLASP_PORT for OBL or ONA triggers (See item 6 below)
 - (d) RLFC_TRUNK for direct link access (DAL) triggers
 - (e) RLASP_LTM for TBL or TNA triggers
- (3) Consult the office records to determine the correct trigger number or action to be inserted in the appropriate view.
- (4) If the ROP output specifies an FCD trigger:
 - (a) Obtain the PDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR (OFFICE DIALING)) using the digit analysis selector (DAS) printed on the ROP as the key.

- (b) Change the TRIG NBR field or the ACTION field to the value from the office records via RC/V View 9.2 (PREFIX/FEATURE DIGIT (OFFICE DIALING)) using the PDIT from step 4a and the DIAL_CODE from the ROP as the keys.

(5) If the ROP output specifies a CDP trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the Master Control Center (MCC) OP:CONV command.
- (b) Obtain the IDP feature.

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) using the trunk group number and member as keys.

- (c) Obtain the IDP group name.

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 5a and the FEATURE from step 5b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 5a and the FEATURE from step 5b as the keys.

- (d) Change the TRIG NBR field or the ACTION field to the value from the office records using RC/V View 9.13 (IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)) using the IDP GROUP NAME from step 5c and the DIAL_CODE from the ROP as the keys.

(6) If the ROP output specifies an OBL or ONA trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the directory number (DN) using the MCC OP:CONV command.
- (b) Obtain the ASP feature.

Obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

- (c) Correct the trigger number.

Change the OBL or ONA TRIG NBR (depending on the trigger specified) to the value from the office records via RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 6a and the FEATURE obtained in step 6b as keys.

(7) If the ROP output specifies a Direct Link Access (DAL) Trigger:

- (a) Using the trunk group number printed on the ROP as the key to RC/V View 5.1 (TRUNK GROUP), change the TRIG NBR to the correct value based on the office records

(8) If the ROP output specifies a TBL or TNA trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the directory number (DN) using the MCC OP:CONV command.
- (b) Obtain the ASP feature:

Obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) or RC/V View 23.8 (DSL/BRCS ASSIGNMENT) using the DN as the key.
- (c) Correct the trigger number:

Change the TBL or TNA TRIG NBR (depending on the trigger specified in the ROP output) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 8a and FEATURE obtained in step 8b as keys. Alternatively, the TBL or TNA TRIG NBR fields may be updated directly on the 1.8 or 23.8 forms from step 8b.

160. FCASPPMNST (5E13 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A conflict exists with the advanced intelligent network (AIN) release (protocol) specified in the rINS_TRIG tuple for an advanced services platform (ASP) feature code dialing (FCD), custom dialing plan (CDP), originating busy line (OBL) or originating no answer (ONA) trigger.

For ASP FCD or CDP the release must be AIN R0D1 if the action specifies variable digit collection, or query immediately. The digit collection mechanism will be changed to normal (collect digits according to the subscriber's dialing plan) and the ASP call will proceed.

For OBL or ONA trigger, the AIN release protocol specified in the rINS_TRIG tuple must be R0D1.

For direct link access (DAL) triggers, the AIN protocol specified in the rINS_TRIG tuple must be R0D1.

Data Structures:

One of following problems occurred.

- (1) The protocol field in the specified rINS_TRIG tuple is incorrect and must be corrected via RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) For FCD or CDP, the trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected in the appropriate digit analysis RC/V views. The trigger number should specify an rINS_TRIG tuple that has the correct protocol.

- (3) For FCD or CDP, the action specified is incorrect and must be corrected in the appropriate digit analysis RC/V views. The action should specify normal digit collection.
- (4) For OBL or ONA, the trigger number specified as the key to the rINS_TRIG tuple is incorrect and should be corrected in the appropriate RC/V views. The trigger number should specify an rINS_TRIG tuple that has the R0D1 release protocol. (See item 6 below)
- (5) For a direct link access trigger, the trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected in RC/V View 5.1 (TRUNK GROUP). The trigger number should specify an rINS_TRIG tuple that has the correct protocol.

Follow these steps to identify and correct the problem.

- (1) Consult the office records to determine if the protocol associated with the trigger number printed on the ROP should be R0D1. If it should, problem number 1 occurred. Change the AIN REL field on RC/V View 9.35 using the trigger number specified as the key.
- (2) If the rINS_TRIG tuple is set up correctly, the problem is with the trigger number or the action; problem number 2, problem number 3 or problem number 4 occurred. The field in error should be corrected in one the following views:
 - (a) RLPRLFNL or RLPRMFNL for FCD triggers
 - (b) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (c) RLASP_PORT for OBL or ONA triggers (See item 6)
 - (d) RLFC_TRUNK for Direct Link Access (DAL) triggers
- (3) Consult the office records to determine the correct trigger number or action to be inserted in the appropriate view.
- (4) If the ROP output specifies an FCD trigger:
 - (a) Obtain the PDIT from RC/V View 9.1 [DIGIT ANALYSIS SELECTOR (OFFICE DIALING)] using the digit analysis selector (DAS) printed on the ROP as the key.
 - (b) Change the TRIG NBR field or the ACTION field to the value from the office records using RC/V View 9.2 (PREFIX/FEATURE DIGIT (OFFICE DIALING)) using the PDIT from step 4a and the DIAL_CODE from the ROP as the keys.
- (5) If the ROP output specifies a CDP trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the Master Control Center (MCC) OP:CONV command.
 - (b) Obtain the IDP feature.

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 [BRCS FEATURE ASSIGNMENT (LINE)] using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) using the trunk group number and member as keys.

- (c) Obtain the IDP group name.

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 5a and the FEATURE from step 5b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 5a and the FEATURE from step 5b as the keys.

- (d) Change the TRIG NBR field or the ACTION field to the value from the office records using RC/V View 9.13 [IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)] using the IDP GROUP NAME from step 5c and the DIAL_CODE from the ROP as the keys.

- (6) If the ROP output specifies an OBL or ONA trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the directory number (DN) using the MCC OP:CONV command.

- (b) Obtain the ASP feature.

Obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

- (c) Correct the trigger number.

Change the OBL or ONA TRIG NBR (depending on the trigger specified) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 6a and the FEATURE obtained in step 6b as keys.

- (7) If the ROP output specifies a direct link access (DAL) trigger:

- (a) Using the trunk group number printed on the ROP as the key to RC/V View 5.1 (TRUNK GROUP), change the TRIG NBR to the correct value based on the office records

161. FCASPPMNST (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A conflict exists with the advanced intelligent network (AIN) release (protocol) specified in the rINS_TRIG tuple for an advanced services platform (ASP) feature code dialing (FCD), custom dialing plan (CDP), originating busy line (OBL) or originating no answer (ONA) trigger.

For ASP FCD or CDP the release must be AIN R0D1 if the action specifies variable digit collection, or query immediately. The digit collection mechanism will be changed to normal (collect digits according to the subscriber's dialing plan) and the ASP call will proceed.

For OBL or ONA trigger, the AIN release protocol specified in the rINS_TRIG tuple must be R0D1.

Data Structures:

RLNS_TRIG. Key field: trignum.
RLDAPRLFNL. Key field: previous.

RLDAPRMFNL. Key field: previous.

RLIDP_DTRE. Key fields: idp_gpid, table_id, digit.

RLIDP_CNFL. Key fields: idp_gpid, table_id, num_dig.

RLFC_LINE. Key fields: port.member, port.module, party.

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

One of four problems occurred.

- (1) The protocol field in the specified rINS_TRIG tuple is incorrect and must be corrected using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) For FCD or CDP, the trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected in the appropriate digit analysis RC/V views. The trigger number should specify an rINS_TRIG tuple that has the correct protocol.
- (3) For FCD or CDP, the action specified is incorrect and must be corrected in the appropriate digit analysis RC/V views. The action should specify normal digit collection.
- (4) For OBL or ONA, the trigger number specified as the key to the rINS_TRIG tuple is incorrect and should be corrected in the appropriate RC/V views. The trigger number should specify an rINS_TRIG tuple that has the R0D1 release protocol. (Refer to item 6.)

Follow these steps to identify and correct the problem.

- (1) Consult the office records to determine if the protocol associated with the trigger number printed on the ROP should be R0D1. If it should, problem #1 occurred. Change the AIN REL field on RC/V View 9.35 using the trigger number specified as the key.
- (2) If the rINS_TRIG tuple is set up correctly, the problem is with the trigger number or the action; problem #2, problem #3 or problem #4 occurred. The field in error should be corrected in one the following views:
 - (a) RLPRLFNL or RLPRMFNL for FCD triggers
 - (b) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
 - (c) RLASP_PORT for OBL or ONA triggers (See item 6 below)
- (3) Consult the office records to determine the correct trigger number or action to be inserted in the appropriate view.
- (4) If the ROP output specifies an FCD trigger:
 - (a) Obtain the PDIT from RC/V View 9.1 [DIGIT ANALYSIS SELECTOR (OFFICE DIALING)] using the digit analysis selector (DAS) printed on the ROP as the key.
 - (b) Change the TRIG NBR field or the ACTION field to the value from the office records using RC/V View 9.2 [PREFIX/FEATURE DIGIT (OFFICE DIALING)] using the PDIT from step 4a and the DIAL_CODE from the ROP as the keys.
- (5) If the ROP output specifies a CDP trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) using the master control center (MCC) op:conv command.
 - (b) Obtain the IDP feature.

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT (LINE)) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 [BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)] using the trunk group number and member as keys.

- (c) Obtain the IDP group name.

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE PARAMETERS) using the DN from step 5a and the FEATURE from step 5b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 5a and the FEATURE from step 5b as the keys.

- (d) Change the TRIG NBR field or the ACTION field to the value from the office records using RC/V View 9.13 [IDP DIALED CODE ASSIGNMENT (INDIVIDUAL DIALING)] using the IDP GROUP NAME from step 5c and the DIAL_CODE from the ROP as the keys.

- (6) If the ROP output specifies an OBL or ONA trigger:

- (a) Specify the MEMBER and MODULE printed on the ROP to obtain the directory number (DN) using the master control center (MCC) op:conv command.
(b) Obtain the ASP feature.

Obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 [BRCS FEATURE ASSIGNMENT (LINE)] using the DN as the key.

- (c) Correct the trigger number.

Change the OBL or ONA TRIG NBR (depending on the trigger specified) to the value from the office records using RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 6a and the FEATURE obtained in step 6b as keys.

162. FCASPPMNST (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A conflict exists between the advanced intelligent network (AIN) release (protocol) specified in the RLNS_TRIG tuple and the digit collection mechanism specified for an advanced services platform (ASP) custom dialing plan (CDP) or feature code dialing (FCD) trigger. If the CDP or FCD action specifies variable digit collection or query immediately, the AIN release must be R0D1.

The digit collection mechanism will be changed to normal (collect digits according to the subscriber's dialing plan) and the ASP call will proceed.

Data Structures:

RLNS_TRIG. Key field: trignum.
RLDAPRLFNL. Key field: previous.
RLDAPRMFNL. Key field: previous.
RLIDP_DTRE. Key fields: idp_gpid, table_id, digit.
RLIDP_CNFL. Key fields: idp_gpid, table_id, num_dig.
RLFC_LINE. Key fields: port.member, port.module, party.
RLFC_TRUNK. Key fields: port.member, port.module.

Action:

One of three problems occurred.

- (1) The protocol field in the specified rINS_TRIG tuple is incorrect and must be corrected using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number specified as the key to the rINS_TRIG tuple is incorrect and must be corrected in the appropriate digit analysis RC/V views. The trigger number should specify an rINS_TRIG tuple that has the correct protocol.
- (3) The action specified is incorrect and must be corrected in the appropriate digit analysis RC/V views. The action should specify normal digit collection.

Follow these steps to identify and correct the problem:

- (1) Consult the office records to determine if the protocol associated with the trigger number printed on the ROP should be R0D1. If it should, problem #1 occurred. Change the AIN REL field on RC/V View 9.35 using the trigger number specified as the key.
- (2) If the rINS_TRIG tuple is set up correctly, the problem is with the trigger number or the action; problem #2 or problem #3 occurred. The field in error should be corrected in one the following views:
 - (a) RLPRLFNL or RLPRMFNL for FCD triggers
 - (b) RLIDP_DTRE or RLIDP_CNFL for CDP triggers
- (3) Consult the office records to determine the correct trigger number or action to be inserted in the appropriate view.
- (4) If the ROP output specifies an FCD trigger:
 - (a) Obtain the PDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) using the digit analysis selector (DAS) printed on the ROP as the key.
 - (b) Change the TRIG NBR field or the ACTION field to the value from the office records via RC/V View 9.2 (PREFIX/FEATURE DIGIT [OFFICE DIALING]) using the PDIT from step 4a and the DIAL_CODE from the ROP as the keys.
- (5) If the ROP output specifies a CDP trigger:
 - (a) Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) via the master control center (MCC) op:conv command.
 - (b) Obtain the IDP feature.

For lines, obtain the FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) using the DN as the key.

For trunks, obtain the FEATURE from RC/V View 5.4 (BRCS TRUNK GROUP ASSIGNMENT) using the trunk group number as the key or from RC/V View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]) using the trunk group number and member as keys.
 - (c) Obtain the IDP group name.

For lines, obtain the IDP GROUP NAME from RC/V View 1.26 (INDIVIDUAL DIALING PLAN LINE

PARAMETERS) using the DN from step 5a and the FEATURE from step 5b as the keys.

For trunks, obtain the IDP GROUP NAME from RC/V View 5.26 (INDIVIDUAL DIALING PLAN TRUNK PARAMETERS) using the trunk group number and member from step 5a and the FEATURE from step 5b as the keys.

- (d) Change the TRIG NBR field or the ACTION field to the value from the office records via RC/V View 9.13 (IDP DIALED CODE ASSIGNMENT [INDIVIDUAL DIALING]) using the IDP GROUP NAME from step 5c and the DIAL_CODE from the ROP as the keys.

163. FCASPPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLASP_PORT tuple is missing that is keyed with logical port (lport) and logical port type (lpt_type).

During advanced services platform (ASP) originating trigger detection for off_hook_immediate (OHI) or off_hook_delayed (OHD) triggers, the call will proceed as a non-ASP call.

During ASP access code trigger validation for custom dialing plan (CDP) or feature code dialing (FCD) triggers, the call in progress will receive standard switch error treatment.

Data Structures:

RLASP_PORT. Key fields: lport, lpt_type.

RLLPT_PT. Key fields: lport, lpt_type.

RLFC_LINE. Key fields: port.member, port.module, party.

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

There is no RC/V procedure to fix this error.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Find the port, party, and mnemonic for the lpt_type of the line or trunk in question by reading the RLLPT_PT relation using the lport and lpt_type keys printed on the ROP.

2. Obtain the lport and lpt_type for the line or trunk for comparison to the values printed on the ROP as follows:

For lines, read the RLFC_LINE relation to get the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm) where member is the port from the RLLPT_PT relation (step 1), module is the SM printed on the ROP, and party is the party from RLLPT_PT (step 1).

For trunks, read the RLFC_TRUNK relation to get the logical port (lport) and the indicator for BRCS terminal features (brc_trm) where member is the port from the RLLPT_PT relation (step 1) and module is the SM printed on the ROP. For trunks, the lpt_type is not meaningful.

3. If the brc_trm value from the RLFC_LINE (or the RLFC_TRUNK) relation is DBNO, contact the next level of support.

4. If the brc_trm value from RLFC_LINE (or RLFC_TRUNK) is DBYES, the lport and lpt_type from RLFC_LINE (or RLFC_TRUNK) should match the lport printed on the ROP and the lpt_type mnemonic from step 1. For trunks, the lpt_type comparison is not meaningful. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

5. If brc_trm is DBYES and the lport and lpt_type values match, an rIASP_PORT tuple should exist. For lines, RLasp_port.lport is RLfc_line.lport and RLasp_port.lpt_type is RLfc_line.lpt_type. For trunks, RLasp_port.lport is RLfc_trunk.lport and RLasp_port.lpt_type is 0. Insert the appropriate rIASP_PORT tuple.

164. FCASPSKMNST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A conflict exists between the service key and the advanced intelligent network (AIN) release (protocol) specified in the rINS_TRIG tuple for an advanced services platform (ASP) off_hook_immediate (OHI) trigger. For ASP release R0 OHI, the service key must be ANI. For ASP release R0D1 OHI, the service key is not relevant. The call will proceed as a non-ASP call.

Data Structures:

RLASP_PORT. Key fields: lport, lpt_type.

RLNS_TRIG. Key field: trignum.

RLFC_LINE. Key fields: port.member, port.module, party.

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

One of two problems occurred.

1. The service key and/or protocol fields in the specified rINS_TRIG tuple are incorrect.
2. The trigger number specified as the key to the rINS_TRIG tuple is incorrect. The trigger number should specify an rINS_TRIG tuple that has the correct protocol/service key combination.

Follow these steps to identify and correct the problem.

1. Consult the office records to determine if the protocol associated with the trigger number printed on the ROP should be R0 or if the service key should be ANI. If either are true, change the AIN REL field and/or the SERV KEY field accordingly on RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION) using the trigger number specified as the key.
2. If the rINS_TRIG tuple is set up correctly, the problem is with the trigger number specified in the rIASP_PORT tuple.
3. Consult the office records to determine the correct trigger number to be inserted in the rIASP_PORT tuple.
4. Correct the problem.
 - a. Specify the MEMBER and MODULE printed on the ROP to obtain the trunk group number and member or the directory number (DN) via the master control center (MCC) op:conv command.
 - b. Obtain the ASP FEATURE from RC/V View 1.8 (ANALOG LINE BRCS ASSIGNMENT) or RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) using the DN as the key.
 - c. Correct the OHI TRIG NBR field to the value from the office records via RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) using the DN obtained in step 4a and the FEATURE obtained in step 4b as keys.

165. FCASPSTDOHD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The advanced services platform (ASP) offhook delay trigger (OHD) is not supported from standard integrated

services digital network (ISDN) originations for R0 protocol. The trigger number associated with the OHD trigger should only be populated with R0D1 protocol. The call will be provided with standard switch error treatment.

Data Structures:
RLNS_TRIG.

Action:

Check the trigger number associated with the OHD trigger on RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION) to ensure that the OHD trigger that is assigned to standard ISDN has a trigger number with R0D1 protocol.

166. FCASP_TPLNK (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

During a call, an attempt to access the RLASP_TP relation failed, due to the linkage from the the RLPCBLA relation to this relation is found out of range.

The RLASP_TP relation is dynamically linked to the RLPCBLA relation during calls which are being monitored for ASP office-wide busy or no-answer events or ASP calls with a next-event list or send to resource (both local and External).

The affected call cannot monitor for events without the data in the RLASP_TP relation. The TCAP transaction will be gracefully closed but the call will continue. However, STOR calls cannot continue and are gracefully killed. The PCBLA audit will be scheduled to run in the elevated mode.

Probable Cause:

Bad PCBLA to ASP_TP linkage found.

Action:

PCBLA AUDIT is scheduled to run. No other action is required if this assert occurs singularly. If this assert starts to roll, contact your next level of support.

167. FCATCMSGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid common channel signaling (CCS) direct signaling message was received by the FCatcset() function for an ALLIANCE teleconferencing (add-on or meet-me) call. The message could not be understood. The message head and contents will be dumped.

168. FCATCOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An integrated services digital network (ISDN) station set was given a class of service value of ISDN attendant.

Data Structures:

RLPCBLA. Key fields: port.member, termno.

Action:

Use RC/V to change this line to an ISDN class of service, not an ISDN attendant class of service.

169. FCATCRTIBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The routing index for an ALLIANCE teleconferencing add-on call (typically dialed 700-456-xxxx) is missing or does not contain the delete/prefix information to construct an INWATS database 10 digit query number (typically 800-050-xxxx).

Data Structures:

RLRT_ROUTING.

Action:

Insert a routing tuple for the dumped key or update the delete/prefix information for the existing key to obtain a valid INWATS database query number (e.g. delete=6, prefix=800050).

170. FCATER01 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid rIMONI_BLF tuple read occurred.

Data Structures:

RLMONI_BLF. Key field: mbuff (buffer containing the tuple).

Action:

No rIMONI_BLF tuple was found for the key mbuff.hgid that is printed on the ROP. An RLFC_LINE relation mismatch occurred. The rIMONI_BLF tuple for the mbuff.hgid key is missing or the rIFC_LINE tuple parameter busymon was incorrectly set to DBYES for this directory number (DN).

171. FCATGP_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The authorization code (ATH) group ID in an rIATH_PRT tuple is zero. The logical port attempting to use the ATH feature was assigned to an ATH feature in the rIATH_PRT tuple, but it was not assigned to a valid ATH group ID. The ATH feature ID exists in the RLTRMFEATS relation for the originating logical port.

Data Structures:

RLATH_PRT.

The ROP output indicates the SM number (MOD), the source file and line number, the originating logical port (LPORT), the logical port type (LPT TYPE), and the invalid ATH group ID (GROUP ID).

Action:

Use RC/V (or ODBE, if necessary) to find the entity for the logical port.

1. Use the lport and lpt_type provided in the ROP output to read the RLLPT_PT relation to find the port and party.
2. Use the OP:CONV master control center (MCC) command to find the entity for the port - telephone number (TN), multi-line hunt group (MLHG), or trunk.

OP:CONV,PORT="mod"-h"port"

where "mod" is the SM number and "port" is the port found in the RLLPT_PT relation.

Use RC/V View 1.41 (AUTHORIZATION CODE LINE PARAMETERS) or View 5.41 (AUTHORIZATION CODE TRUNKS PARAMETERS) to assign a valid ATH group ID to this entity.

172. FCATH_CACHE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The authorization code (ATH) capability maintains a cache on each SM. This cache contains a subset (400) of the ATH tuples from the AM disk relation RLATH_CODE. Due to wild writes, the cache data associated with a given SM was corrupted.

Data Structures:

RLATH_CODE.

Action:

If this asserts occurs four times in an hour on the same SM, the craft should do a single process purge.

The system process for ATH is defined in GLspaths.h. The current process ID (PID) for that system process is 295. Enter the following input message: INIT:SM=a,SSP,PID=295 (a = the SM number). When the system process starts, the cache associated with that SM is initialized.

173. FCATH_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLATH_CF tuple is missing. The port attempting to use the authorization code (ATH) has an ATH feature assigned, but no rLATH_CF tuple exists that is associated with the ATH feature ID. The ATH feature ID exists in the RLTRMFEATS relation for the dialing port.

Data Structures:

RLATH_CF, RLFID2NAME.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the feature ID (FID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and AM. Use the ATH feature ID provided in the ROP output to read the RLFID2NAME relation in the AM where RLfid2name.facid is the ATH feature ID, RLfid2name.class is FACBRCS, and RLfid2name.subclass is SCL_NULL.

If an rLFID2NAME tuple does not exist for the ATH feature ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

If an rLFID2NAME tuple does exist for the ATH feature ID, insert the appropriate rLATH_CF tuple in the indicated SM. Since rLATH_CF is an SM redundant relation, the values for the rLATH_CF tuple can be found by reviewing the same tuple in another SM.

174. FCATH_FCOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the authorization code (ATH) feature class of service (FCOS) relation RLATH_FCOS. The port attempting to use the ATH feature has the ATH feature assigned. The ATH feature ID is in the RLTRMFEATS

relation for the dialing port.

The port is assigned to an ATH group. This port has an rIATH_PRT tuple with the gpid equal to xxx and there is an rIATH_GRP tuple with gpid xxx, but the ATH FCOS information was not supplied. An rIATH_FCOS tuple does not exist for the group specified by the rIATH_GRP tuple.

Data Structures:

RLATH_FCOS. Key fields: group ID, fcos.

RLATH_GRP. Key field: group ID.

Action:

This is an office data inconsistency. Use the group ID from the dump and RC/V View 1.41 (AUTHORIZATION CODE LINE PARAMETERS) or View 5.41 (AUTHORIZATION CODE TRUNKS PARAMETERS) to find the ATH associated code table name.

Define a new ATH FCOS via RC/V View 4.19 (AUTHORIZATION CODES FEATURE CLASS OF SERVICE PARAMETERS).

If the ATH feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

175. FCATH_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical port attempting to use the authorization code (ATH) feature has an ATH feature assigned. The ATH feature ID exists in the RLTRMFEATS relation for the originating port.

The logical port is assigned to an ATH group in an rIATH_PRT tuple, but the ATH group ID is invalid or an rIATH_GRP tuple is missing.

Data Structures:

RLATH_PRT, RLATH_GRP, RLDB_AMGPD, RLDB_IMGPD, RLDB_GPDUS, RLTRMFEATS.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the ATH group ID (GROUP ID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and AM. Use the ATH group ID provided in the ROP output to read the RLfid2NAME relation in the AM where RLfid2name.facid is the ATH group ID, RLfid2name.class is FACATH, and RLfid2name.subclass is SCL_NULL.

If an rIFID2NAME tuple does not exist for the ATH group ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

If an rIFID2NAME tuple does exist for the ATH group ID, insert the appropriate rIATH_GRP tuple in the indicated SM where RLath_grp.athgpid is the ATH group ID.

Since the RLATH_GRP relation is a group partitioned relation, the RLDB_AMGPD, RLDB_IMGPD, and RLDB_GPDUS group partitioned control relations may also need to be updated.

176. FCATH_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLATH_PRT tuple is missing. The keys are the logical port (lport) and the logical port type (lpt_type).

Data Structures:

RLATH_PRT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the lport and lpt_type keys used to read this relation.

Action:

The authorization code (ATH) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ATH feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLATH_PRT relation - RLathprt.lport=RLfc_line.lport and RLathprt.lpt_type=RLfc_line.lpt_type.

An attempt to read the RLATH_PRT relation using the original (non-BFG) keys was made because the ATH feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to get the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). ATH is a terminal feature.
3. If the brc_trm value from the RLFC_LINE relation is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rLATH_PRT tuple should exist for the original (non-BFG) keys. Insert the appropriate rLATH_PRT tuple.

177. FCAUDALB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

An error occurred while accessing an rLDALB tuple.

Probable Cause:

A failure was returned by either DAghdpda or DAGsdpda in the frame relay call activity check software.

Action:

Assert and request the DALB audit.

178. FCBAD4WIRE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_4WIRE relation or the rIFC_4WIRE tuple was missing.

Data Structures:

RLFC_4WIRE. Key fields: port.member, port.module.

In the first word of the data dump, the first two bytes represent port.member, the next byte is filler, and the next byte is port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the keys in the relation with the actual keys used. If the tuple is missing, insert it. If the keys used to access the relation were set incorrectly, notify the next level of support.

This relation is updated by the following RC/V views:

- 1.1 (INDIVIDUAL LINE)
- 1.2 (MLHG LINE)
- 1.3 (PARTY LINE)
- 1.4 (COIN LINE)
- 1.5 (PBX-DID LINE)
- 1.6 (COMPOSITE LINE)
- 26.11 (AUTO CHARGE QUOTE)

179. FCBADACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action was encountered.

180. FCBADAVMWIPQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message waiting indicator (MWI) terminal process (TP) analog visual MWI pending queue (AVMWIOPQ) indices were corrupted. The indices have extended past the limit of the maximum number of AVMWIPQ entries or they are no longer synchronized. The MWI TP will re-initialize the AVMWIPQ.

181. FCBADCDST (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A codeset IE was found out of order.

Probable Cause:

The incoming Q.933 message contained invalid contents.

Action:

Assert.

182. FCBADMFRASP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote access system process (RASP) received a MGCALLFEAT message requesting the remote invocation of a modular feature type not currently provided remote access. This request was ignored.

183. FCBADMOD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Feature execution (FEX) is looking for a model, but the model does not exist or more than one instance of the model is found (that is, multiple CC models). FEX could not recover from this error.

184. FCBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was encountered.

185. FCBADMWCRCPQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message waiting indicator (MWI) terminal process (TP) customer originated recent change (CORC) pending queue (MWICORCPQ) indices were corrupted. The indices have extended past the limit of the maximum number of MWICORCPQ entries or they are no longer synchronized. The MWI TP will initialize the MWICORCPQ.

186. FCBADMWIREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message waiting indicator (MWI) terminal process (TP) received an invalid operating system for distributed switching (OSDS) message. For example, the message may have been too long.

187. FCBADNRST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid NEAR model state for the expected call scenario was found while dropping back to a 2-way call from a multiway (MW) call via the MCdcomst() function. The call dropped back to a POTS feature model (PFM) state (MCPWSIG) that tears down the call. The MW model associated process block (APB), the call coordination (CC) model APB, and the CC state are dumped to the ROP for analysis.

188. FCBADNS_TN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TN	Audit Mode: elev

Problem:

Invalid linkages were discovered in the RLNS_TN relation.

189. FCBADOCDS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid origination class of service was encountered.

190. FCBADOSRET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received from OSWGETMSG().

Probable Cause:

One of the following terminal processes in the FC subsystem received an unexpected return value from the macro OSWGETMSG():

- The frame relay terminal process (fc/FCfr)
- The ISLP terminal process (fc/DCislp)
- The AUTOPLEX[®] terminal process (fc/DC*)

Action:

Assert and return to calling process.

191. FCBADOSRET (5E12 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received from OSwgetmsg[].

Probable Cause:

An unexpected return value was received from the OSwgetmsg[] macro in the frame relay terminal process.

Action:

Assert and return to calling process.

192. FCBADPARM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to a function.

193. FCBADPCRRASP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote access system process received an error return when sending an external message indicating that the SM to receive the message is not in service. This SM was selected by the FCsel_sm() function using the RLDB_AMGPD relation and should be in service.

194. FCBADPTRSPP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid pointer (probably a NULL pointer) was discovered. Before the pointer is used, this process is purged. Examination of the code should indicate the pointer in question.

195. FCBADQMUSIC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to use a port as a music source for a multi-line hunt group (MLHG) queue. One of three problems occurred:

1. The rIFC_PORTTYP tuple was not found.
2. The rIFC_PORTTYP tuple was read, but the logical port type (lp_type) did not show it as a recorded announcement (PCRECDANN) trunk.
3. The rIFC_PORTTYP tuple was read, but it was not marked as a music port.

Because of the failure, silence was given in place of music.

Data Structures:

RLFC_PORTTYP. Key fields: port.module, port.member.

RLQU_DLY. Key field: portgrp.grpnum, portgrp.grptype.

The portgrp.grpnum is the number of the MLHG trying to use the port.

Action:

1. Verify that the music port given on RC/V View 3.40 (MLHG MODULAR QUEUING) for the group is valid. (Check fields "MUSIC SOURCE TGN" and "MUSIC SOURCE MEMB".)
2. Verify that the rIFC_PORTTYP tuple keys are valid.
3. Use RC/V to insert this port using RC/V View 5.1 (TRUNK GROUP) and View 5.5 (TRUNK GROUP MEMBER).
4. Use RC/V View 5.1 to change the trunk service class (TRK CLASS) to ANNCMNT.
5. Use RC/V View 5.5 to set the MUSIC SOURCE field to Y.

196. FCBADQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queue value obtained from the RLPU_PORT or RLPU_LTM relation is invalid; although, a tuple was found that matched the keys that were populated in the tuple buffer.

Data Structures:

The data dump is different depending on the relation just read.

RLPU_LTM. Key fields: lead module (first item), ltm index (second item), ltm type (third item), feature ID (fourth item), queue value (fifth item).

RLPU_PORT. Key fields: port's module (first item), port's member (second item), 0 (place holder, third item), feature ID (fourth item), queue value (fifth item).

Action:

This is a database inconsistency that can only be corrected by manual action.

197. FCBADRBREAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid ringback reason was received by the FCcpnbn_chk() function. FCcpnbn_chk() normally populates the

integrated services digital network (ISDN) Q.931 calling party number information element with the far party's directory number on ringback due to an auto callback, auto recall, or automatic callback calling invocation. The ringback reason will be dumped in the stack frame as a parameter to the function. FCcpnbn_chk() will return without populating the calling party number information element.

198. FCBADREAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid transaction reason was passed to a trigger function. Failure was returned and the transaction failed.

199. FCBADSRCTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGODDCMND message received by the MCcf_work() function contained an invalid srctyp value. MCcf_work() received this message from the FCpvnalw() or FCaspdrig() function when RC/V View 8.17 (DIRECT SIGNALING APPLICATION) inserted the CCPVN application or deleted the CCAINR01 application. The message is ignored.

The message received is dumped. The message header is in the first eight bytes of the dump and contains in order: process number for the sending process (2 bytes), processor ID for the sending process (1 byte), uniqueness field for the sending process (1 byte), message type (2 bytes), message priority (1 byte), and text length (1 byte).

The next 20 bytes contain the text of the message; only the srctyp field in the fifteenth and sixteenth bytes should be populated.

200. FCBADSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid program state was encountered.

201. FCBADTMR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid timer tag was encountered.

202. FCBADVALUE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rITATYPE tuple contained an invalid tone in the pctone field.

Data Structures:

RLTATYPE. Key field: tatype.

Action:

Use RC/V (or ODBE, if necessary) to correct the pctone field. The RLTATYPE relation is updated by RC/V View 10.1 (FIXED ROUTE).

203. FCBASP_TP (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: ASPTP	Audit Mode: elev

Problem:

An error indicated invalid linkages in the RLASP_TP relation occurred when ASP software tried to link an RLASP_TP tuple to the PCBLA tuple.

Probable Cause:

Either pre-existence or bad PCBLA-ASP_TP linkage in PCBLA cause the current attempt to failed or the linkage field in ASP_TP is bad.

Action:

The ASP_TP audit will be scheduled to clean up the linkage problem The PCBLA audit will be scheduled to clean up the linkage problem.

204. FCBCR_NS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

An error indicating an invalid linkage from the call record to the RLNS_IDX relation occurred when the network services (NS) software tried to retrieve an rINS_IDX tuple that was linked to the call record. The call record audit is scheduled to clean up the linkage problem.

205. FCBDACTN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data on the display terminal process stack was corrupted while the multi-line hunt group (MLHG) queue status display feature was in use. The action associated with the MLHG queue status feature button is no longer valid. The MLHG queue status display feature terminates for the duration of this call and the customer premises equipment (CPE) using the display feature returns to the NORMAL mode. Contact the next level of support if this assert continues to fire.

206. FCBDFRAME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DISPDB	Audit Mode: elev

Problem:

Data in the display data block was corrupted while running the multi-line hunt group (MLHG) queue status display feature. The parameter lqframe in the display data block (indicates which of the five frames of MLHG queue status data to display) is invalid. The MLHG queue status display feature continues with the first frame of data. The MLHG queue status data displayed on the customer premises equipment (CPE) may be invalid. The contents of the display data block are dumped. The display data block audit is scheduled. Contact the next level of support if this assert continues to fire.

207. FCBFGPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation RLCKT_PORT was read with the intent of retrieving a global business and residence custom services (BRCS) feature group (BFG) port name (default service). This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

208. FCBFGSC_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISC_PORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID), the logical port type (lpt_type) equal to LPT_BFG (2), and the feature ID.

Data Structures:

RCSC_PORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport, lpt_type), the BFGID, the feature ID, and the original (non-BFG) keys for this relation.

Action:

A one-digit or two-digit speed calling (SC) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the SC feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLSC_PORT relation where RLsc_port.lport is RLfc_line.lport, and RLsc_port.lpt_type is RLfc_line.lpt_type.

When the SC feature is assigned to a line via a BFG, the BFG keys are used to read the RLSC_PORT relation where RLsc_port.lport is RLfc_line.bfgid and RLsc_port.lpt_type is LPT_BFG.

The feature ID is also a key to the RLSC_PORT relation, regardless of whether the feature was assigned via a BFG.

An attempt to read the RLSC_PORT relation using the BRCS feature group (BFG) keys was made because the data indicates that the SC feature exists in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the following data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg). SC is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should equal the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rISC_PORT tuple should exist for the BFG keys. Insert the appropriate rISC_PORT tuple.

209. FCBKLATANUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Local access and transport area (LATA) mapping was turned on and the LATA number for the back number was either 0 or 1 which are invalid values for an originating number. The 0 value indicates no LATA number and value 1 is applicable for terminating LATAs only.

Data Structures:

RLFCNPAMAP. Key fields: back number NPA, back number NXX.

Glatmap (global parameter).

Action:

Turn off LATA mapping or correct the data in the RLFCNPAMAP relation.

LATA mapping can be turned off using the LATA MAP field on RC/V View 8.9 (OSPS OFFICE PARAMETERS).

RC/V View 26.1 (OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS) contains the data for the RLFCNPAMAP relation. In order to use LATA mapping on this switch, all back number NPAs and NXXs must be populated with the appropriate LATA number they correspond to. The latanum field in the RLFCNPAMAP relation must be populated with the same value that is populated in the local digit interpreter table (LDIT); that is, the terminating LATA (term_lata) attribute for the NPA-NXX in RC/V View 9.3 (LOCAL DIGIT OFFICE DIALING).

Data printed on the ROP consists of the back number NPA, back number NXX, and the LATA number currently populated.

210. FCBLLTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message service system (MSS)/electronic directory service (EDS) system process could not create the MSS/EDS billing terminal process (TP) due to an invalid program ID for the billing TP.

211. FCBNETGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A network automatic route selection (ARS) ID was received from the network control point (NCP) in a query response for the leased network (LN) action point (ACP) that does not have a corresponding internal ARS group ID in the RLNET_GPID relation. The affected call was sent to reorder. No LN QRY calls that received the indicated network ARS ID will complete until this problem is corrected.

Data Structures:

RLNET_GPID. Key field: gpid.

Action:

Determine the corresponding internal ARS group ID for the network ARS ID indicated. Use RC/V View 10.5 (AUTOMATIC ROUTE SELECTION GROUP PARAMETERS) to resolve the problem by updating or inserting the rINET_GPID tuple to support the LN customer network ID.

212. FCBNS_BILL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSBILL	Audit Mode: elev

Problem:

An error indicating invalid linkages in the RLNS_BILL relation occurred when the network services (NS) software tried to retrieve an rINS_BILL tuple. The AUNSBILL audit is scheduled to clean up the linkage problem.

213. FCBNS_DB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSDB	Audit Mode: elev

Problem:

An error indicating invalid linkages in the RLNSDB relation occurred when the network services (NS) software tried to retrieve an rINSDB tuple. The NSDB audit will be scheduled to clean up the linkage problem.

214. FCBNS_IDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSIDX	Audit Mode: elev

Problem:

An error indicating invalid linkages in the RLNS_IDX relation occurred when the network services (NS) software tried to retrieve an rINS_IDX tuple. The AUNSIDX audit is scheduled to clean up the linkage problem.

215. FCBNS_TAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TATDB	Audit Mode: elev

Problem:

An error indicating invalid linkages in the RLATATDB relation occurred when the network services (NS) software tried to retrieve an rLATATDB tuple. The AUTATDB audit is scheduled to clean up the linkage problem.

216. FCB_PSEUDO (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global parameter, PSEUDO_CARR contains a value not found in the RLFC_CARR relation. No routing information can be found for advanced services platform (ASP) equal access customer calls.

Data Structures:

Glpseudo_carr, RLFC_CARR.

Action:

Check the global parameter, PSEUDO_CARR on View 8.49 (ASP PARAMETERS). If it is a value other than null, insert this value (which is the carrier identification code) into the RLFC_CARR relation on View 10.3 (INTER-LATA CARRIER FEATURE) as a carrier ID with a carrier type "PSEUDO" and feature group of "FGD". Keys to View 10.3 are CARRID and FEATGRP. If the global parameter, PSEUDO_CARR is null, then go to ICF form 5305 of the office records and find a carrier ID with carrier type "PSEUDO" and feature group of "FGD". Using the carrier ID found in the ICF form update Glpseudo_carr on View 8.49 (ASP PARAMETERS).

217. FCB_PSEUDO (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global parameter, PSEUDO_CARR contains a value not found in the RLFC_CARR relation. No routing information can be found for advanced services platform (ASP) equal access customer calls.

Data Structures:

Glpseudo_carr, RLFC_CARR

Action:

Check the global parameter, PSEUDO_CARR on RC/V View 8.1 (OFFICE PARAMETER). If it is a value other than null, insert this value (which is the carrier identification code) into the RLFC_CARR relation on RC/V View 10.3 (INTER-LATA CARRIER FEATURE) as a carrier ID with a carrier type "PSEUDO" and feature group of "FGD". Keys to RC/V View 10.3 are CARRID and FEATGRP. If the global parameter, PSEUDO_CARR is null, then go to ICF form 5305 of the office records and find a carrier ID with carrier type "PSEUDO" and feature group of "FGD". Using the carrier ID found in the ICF form update Glpseudo_carr on RC/V View 8.1 (OFFICE PARAMETERS).

218. FCBQRY_CNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSIDX	Audit Mode: elev

Problem:

The qry_cnt in an rINS_IDX tuple exceeds the maximum limit of FCMXSTRIG. During call processing, data in the RLNS_IDX relation and the data linked to this structure was corrupted. The AUNSIDX audit will be scheduled to clean up the RLNS_IDX relation.

219. FCB_TATDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TATDB	Audit Mode: elev

Problem:

An error indicating invalid linkages in the RLATATDB relation occurred when the advanced services platform (ASP) software tried to link an rTATDB tuple. The AUTATDB audit will be scheduled to clean up the linkage problem. This problem may have been caused by a software error or data corruption in dynamic data memory.

220. FCBTN_INFO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TNINFO	Audit Mode: elev

Problem:

An error indicating invalid linkages in the RLTN_INFO relation occurred when the network services (NS) software tried to retrieve an rTN_INFO tuple. The AURNINFO audit is scheduled to clean up the linkage problem.

221. FCBTRANS (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: ASPTRANS	Audit Mode: elev

Problem:

An error indicating invalid linkages in the RLASPTRANS relation occurred when ASP software tried to link an RLASPTRANS tuple to an RLASP_TP tuple.

Probable Cause:

Either pre-existence or bad ASP_TP-ASPTRANS linkage in ASP_TP caused the current attempt to fail or the linkage field in ASPTRANS is bad.

Action:

The ASPTRANS audit will be scheduled to clean up the linkage problem.

222. FCBTRK_DATA (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global parameter Glpvn_ofc indicates that this office is not an advanced services platform office (NON-ASP OFFICE), yet an equal access customer trunk is defined in the office-dependent data (ODD). The associated ASP call will be killed.

Data Structures:

RLFC_TRUNK. Key field: tgroup

The RLFC_TRUNK relation is accessed using the RLRT_TRKG relation. The global parameter Glpvn_ofc and the tgroup key attribute are printed.

Action:

If this office is an advanced services platform (ASP) office, the ASP OFC field in RC/V View 8.49 (ASP PARAMETERS) should be updated to indicate that the office is a service switching point (SSP) office.

If this office is not an ASP office, the UNRES EA field in RC/V View 5.1 (TRUNK GROUP) should be N.

223. FCBTRK_DATA (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global parameter Glpvn_ofc indicates that this office is not an advanced services platform office (NON-ASP OFFICE), yet an equal access customer trunk is defined in the office dependent data (ODD). The associated ASP call will be killed.

Data Structures:

RLFC_TRUNK. Key field: tgroup.

The RLFC_TRUNK relation is accessed via the RLRT_TRKG relation. The global parameter Glpvn_ofc and the tgroup key attribute are printed.

Action:

If this office is an advanced services platform (ASP) office, the ASP OFC field in RC/V View 8.1 (OFFICE PARAMETERS) should be updated to indicate that the office is a Service Switching Point (SSP) office.

If this office is not an ASP office, the UNRES EA field in RC/V View 5.1 (TRUNK GROUP) should be N.

224. FCCAL_INFO (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CALINFO	Audit Mode: elev

Problem:

Failed to link a RLCAL_INFO tuple to the tail of idle list.

Probable Cause:

Data corruption.

Action:

The RLCAL_INFO key (cal_idx) will be printed on the ROP and the AUCALINFO audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

225. FCCAR_GENAV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Due to corrupted messages between processes, the computer access restriction (CAR) feature was incorrectly labeled as a "generally available" feature rather than a "subscription only" feature. CAR is one of the local area signaling services (LASS) selective features. When this assert occurs, contact your next level of support.

226. FCCARRTRIG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ASP protocol in the rINS_TRIG tuple associated with the carrier trigger is not valid. During validation of the trigger, the protocol was identified to be of type R0. The trigger associated with the carrier trigger should only be populated with protocol of R0D1. The call will be provided with standard switch error treatment.

Data Structures:

RLFC_CARR.

Action:

Check the trigger number associated with the carrier on RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION) to ensure that the carrier has a trigger number with a protocol of R0D1

227. FCCARTONE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

400 Hz carrier tone requested but not provisioned as system tone for MF account code collection on LATA trunks.

ACCT PROMPT (in RC/V View 5.1 [TRUNK GROUP]) == CARRIER or ACCT PROMPT (in RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]) == CARRIER but the field CARRIER TONE (in RC/V View 8.1) == N

The TRUNK GROUP and trunk group MEMBER NUMBER are printed in this assert. The TRUNK GROUP can be used as key to RC/V View 5.1

Data Structures:

- Global parameter, Glcartone
- rIFC_TRUNK.acctprompt
- Global parameter, Glactprmt

Action:

There are two options,

- Set the value of "CARRIER TONE" in RC/V View 8.1 to "Y"
- If "ACCT PROMPT" in RC/V View 5.1 is set to "GLOBAL" then set the value of "ACCT PROMPT" in RC/V View 8.1 to "BEEP2" else set the value of "ACCT PROMPT" in RC/V View 5.1 to "BEEP2"

228. FCCBCPIDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The process ID (PID) of the process that is controlling the call matches the PID of the process that is attempting a transfer or conference. In the POTS feature model, the PIDs should never be the same. The controlling call will be purged while the other call leg will be preserved. The PID of the controller and the received message will be printed.

229. FCCDVTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

As a result of an invalid program ID, local area signaling services (LASS) screen list editing (SLE) craft directory number (DN) validation could not create the terminal process (TP) needed to respond to an input message (IM). If this is a recurrent message, contact your next level of support.

230. FCCDVTRG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The local area signaling services (LASS) screen list editing (SLE) craft directory number (DN) validation terminal process did not receive the expected trigger message and was forced to terminate. If this is a recurrent message, contact your next level of support.

231. FCCDVUNX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The local area signaling services (LASS) screen list editing (SLE) craft directory number (DN) validation terminal process (TP) received an unexpected message and could not process the validation request. If this message is recurrent, contact your next level of support.

232. FCCF_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCF_CF relation, a failure code of DBNO_MATCH was returned. An rICF_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCF_CF. Key fields: feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

233. FCCFCWINTMSG (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call forwarding don't answer/call waiting (CFDA/CW) received an internal message from one of its sibling models that it does not recognize. The CFDA/CW does not know what to do with this message, as it did not expect it. The CFDA/CW model data block (MDB) will be dumped.

Probable Cause:

Possible software bug.

Action:

No audits have been requested. The process will not be purged.

234. FCCFGPCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAgetpcbla() function failed to obtain an idle process control block link area (PCBLA) in the IScreatprc() function for call forwarding ping ring.

The call forwarding base station's terminal equipment data block (TEDB) is not bound to a terminal endpoint identifier linkage area (TEILA), so an attempt was made to create a new process to send a SETUP message to stimulate the ping ring. No PCBLA could be obtained for the new process, so no ping ring is provided.

235. FCCFGTDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to use the dynamic access (DA) primitive DAgoteda() inside the RTLP2VPORT() macro failed. This occurred during an attempt to create an integrated services digital network (ISDN) call forwarding (CF) ping ring process.

236. FCCFIDLERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to idle an RLCFSCOP tuple that was already linked to the idle list. The RLCFSCOP key (slot) will be dumped in the stack frame as a parameter to the function.

237. FCCF_LDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DBNO_MATCH code was returned when an attempt was made to read the RLCF_LDN relation. The rICR_LDN tuple is missing or the keys used to read the relation were not set properly.

Data Structures:

RLCF_LDN. Key fields: group number, subgroup number.

Action:

This is a data inconsistency problem that can be corrected through RC/V (or ODBE, if necessary).

238. FCCFLNTRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CFLNTRM	Audit Mode: elev

Problem:

Failed to link a RLCFLNTRM tuple to a RLCFSCOP tuple or unlink a RLCFLNTRM tuple from a RLCFSCOP tuple and add to the idle list.

Probable Cause:

Data corruption.

Action:

The RLCFLNTRM key (slot_Int) will be printed on the ROP and the AUCFLNTRM audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

239. FCCF_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCF_LTM relation, a failure code of DBNO_MATCH was returned. An rICF_LTM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCF_LTM. Key fields: lead module, LTM index, LTM type, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

240. FCCFOVLNTRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are not enough tuples in RLCFLNTRM to support the forwarding traffic in the specified SM. Forwarding attempts that could not obtain a RLCFLNTRM tuple will usually result in continuous audible treatment to the call originator for the call forwarding don't/no answer (CFDA) feature and busy tone for the call forwarding over private facilities (CFPF) feature.

Data Structures:

Glcflntrm - total number of tuples that currently exist in the relation. FCcflnov - number of blocked CFDA and CFPF call forwardings during the past minute.

Action:

The number of RLCFLNTRM tuples may need to be increased using RC/V view SREINCR. The number of blocked forwarding attempts may be used to help determine the number of additional RLCFLNTRM tuples required.

Consult the 5ESS® Switch Administration and Engineering Guidelines or the next level of support for assistance in determining the correct number of RLCFLNTRM tuples.

241. FCCFOVSCOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are not enough tuples in RLCFSCOP to support the forwarding traffic in this SM. Forwarding attempts that could not obtain a RLCFSCOP tuple will result in BUSY or continuous audible treatment to the call originator.

Data Structures:

Glcfsco - total number of tuples that currently exist in the relation. FCcfovscf - number of blocked call forwardings during the past minute. FCcfovacd - number of blocked automatic call distribution (ACD)/business and residential custom services (BRCS) forwardings during the past minute. FCcfovasp - number of blocked advanced services platform (ASP) forwardings during the past minute. FCcfovlass - number of blocked local area signaling services (LASS) forwardings during the past minute.

Action:

The number of RLCFSCOP tuples may need to be increased using RC/V View SREINCR. The number of blocked forwarding attempts may be used to help determine the number of additional RLCFSCOP tuples required. Consult the 5ESS® Switch Administration and Engineering Guidelines or the next level of support for assistance in determining the correct number of RLCFSCOP tuples.

242. FCCFPF_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCFPF_LTM relation, a failure code of DBNO_MATCH was returned. An rICFPF_LTM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCFPF_LTM. Key fields: CFPF lead module, CFPF logical termination index, CFPF logical terminating type, CFPF feature identifier.

Action:

This is a database inconsistency that can only be corrected by manual action. Using the feature name associated with the call forwarding over private facilities (CFPF) feature identifier as the key, examine the CFPF ALWD field on RC/V View 12.12 (CALL FORWARDING FEATURE DEFINITION).

If the field indicates that CFPF is allowed and the CFPF feature is assigned to the line associated with the dumped logical terminating type and logical terminating index, use RC/V (or ODBE, if necessary) to insert an rICFPF_LTM tuple with the specified keys. RC/V View 1.22 (CALL FORWARDING LINE PARAMETERS) is affected.

243. FCCFSCOP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CFSCOP	Audit Mode: elev

Problem:

Failed to link a RLCFSCOP tuple to one of the busy lists, unlink a RLCFSCOP tuple from the busy list or traverse the busy lists.

Probable Cause:

Data corruption.

Action:

The RLCFSCOP key (slot) will be printed on the ROP and the AUCFSCOP audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

244. FCCHRGIDXEXP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCHRGIDXEXP relation to get the charge table index using the charge index, a failure of DBNO_MATCH was returned. An rLCHRGIDXEXP tuple is missing for the charge_x key. The call will be continued, but it will be free (no_charge) to the customer.

Data Structures:

RLCHRGIDXEXP. Key field: charge_x.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the charge_x key for correctness. If the rLCHRGIDXEXP tuple is missing, use RC/V View 10.11 (CHARGE IDX EXPANSION) or use ODBE for the RLCHRGIDXEXP relation to add the missing tuple.

245. FCCKT_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation RLCKT_PORT was read with invalid key values, (ckname, port_indx) or a tuple is missing from this relation. This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

246. FCCLMDSP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid dynamic database read occurred during call processing. The feature control (FC) feature execution (FEX)

environment received an error return code from a dynamic access (DA) primitive. The linkage in the call leg data block (CLDB) to model data block (MDB) set may be corrupted. FEX could not recover from this error.

247. FCCLSUSPP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to link or unlink an rISTPDB tuple from the call leg data block (CLDB). Also, failed to access the rISTPDB tuple through the linkage from the CLDB when the tuple exists. An audit will be scheduled to clean up the data block.

248. FCCNAMDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CNAMDATA	Audit Mode: elev

Problem:

A tuple in the RLCNAMDATA dynamic relation could not be found with the given key. The key used to access the relation is invalid, or a user that is assigned the incoming call line identification (ICLID) calling name (CNAM) feature has a tuple in the static relation RLICLIDIDX with no corresponding rICNAMDATA tuple. The audit on dynamic relation RLCNAMDATA will be scheduled. The key ic_idx for the rICNAMDATA tuple will be printed on the ROP. Call processing will continue as normal.

249. FC_COINCHG (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_COINCHG relation to get charge data using the charge table index (chrgtbl_x), a DBNO_MATCH failure code was returned. An rFC_COINCHG tuple is missing for the chrgtbl_x. For coin line, the call will continue; but the call will be free (no charge) to the customer.

Data Structures:

RLFC_COINCHG. Key field: chrgtbl_x.

Action:

Use the CHARGE_X value from the ROP output associated with the MANUAL ACTION ASSERT to review RC/V View 10.11 [CHARGE INDEX EXPANSION (CHARGING)]. Use the MBI field from RC/V View 10.11 to review RC/V View 10.13 [COIN CHARGING (CHARGING)].

Three things can be wrong:

- (A) The AMATYPE field is NOT LOCN, DA411, DA555, FGDOL, or FGBOL on RC/V 10.11. Change the AMATYPE to be one of the five listed above.
- (B) The MBI field is 0 on RC/V 10.11. The MBI needs to be a valid non-zero number. You have two choices:
 - (1) Use RC/V 10.11 to set the MBI to a valid value found on the office records form 53024. To get the form type the following at the MCC `op:ofr:form=53024,device="report"`
 - (2) Make up your own value. Use RC/V 10.13 to insert a new MBI. and set the following as indicated or be creative:

```

CHGTYPE    FREE
LOCINTTM   0
LOCOVERTM  0

```

and then update RC/V 10.11 using the CHARGE_X value printed on the ROP and change the MBI field to the value you just inserted on RC/V 10.13.

- (C) The MBI field is NOT 0 on RC/V 10.11 and it does NOT exist on RC/V 10.13. To fix this use either choice 1 or 2 as described under possibility A above.

250. FC_COINCHG (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_COINCHG relation to get charge data using the charge table index (chrgtabl_x), a DBNO_MATCH failure code was returned. An rLFC_COINCHG tuple is missing for the chrgtabl_x. For coin line, the call will continue; but the call will be free (no charge) to the customer.

Data Structures:

RLFC_COINCHG. Key field: chrgtabl_x.

Action:

Use the CHARGE_X value from the ROP output associated with the MANUAL ACTION ASSERT to review RC/V View 10.11 [CHARGE INDEX EXPANSION (CHARGING)]. Use the MBI field from RC/V View 10.11 to review RC/V View 10.13 [COIN CHARGING (CHARGING)]. Three possibilities can occur:

- (A) The MBI field is 0 on RC/V 10.11. The MBI needs to be a valid non-zero number. You have two choices:
- (1) Use RC/V 10.11 to set the MBI to a valid value found on the office records form 53024. To get the form type the following at the MCC `op:o fr:form=53024,device="report"`
 - (2) Make up your own value. Use RC/V 10.13 to insert a new MBI. and set the following as indicated or be creative:

```
CHGTYPE    FREE
LOCINTTM 0
LOCOVERTM 0
```

 and then update RC/V 10.11 using the CHARGE_X value printed on the ROP and change the MBI field to the value you just inserted on RC/V 10.13.
- (B) The MBI field is NOT 0 on RC/V 10.11 and it does NOT exist on RC/V 10.13. To fix this use either choice 1 or 2 as described under possibility A above.
- (C) The MBI field is NOT 0 on RC/V 10.11 and it DOES exist on RC/V 10.13. This is a software problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

251. FC_COINCHG (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_COINCHG relation to get charge data using the charge table index (chrgtabl_x), a DBNO_MATCH failure code was returned. An rLFC_COINCHG tuple is missing for the chrgtabl_x. For coin line, the call will continue; but the call will be free (no charge) to the customer.

Data Structures:

RLFC_COINCHG. Key field: chrgtable_x

Action:

The fields to be obtained from the RLFC_COINCHG relation are fcc_cltp, fcc_inpd, and fcc_ovpd using the key chrgtabl_x.

Use RC/V (or ODBE, if necessary) to crosscheck the keys used to access the RLFC_COINCHG relation with the actual keys in the relation. If the tuple is missing, use RC/V View 10.13 (COIN CHARGING) to add the tuple.

252. FCCOPER_SIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A coin call to an operator position was routed over a trunk that does not support coin collection signaling. The dialed digits are printed on the ROP.

253. FCCORC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During call forwarding (CF) activation, the rIDN_FEATS, rICF_LTM, and/or rIMHG_CF tuples are updated. The update was incomplete and the data might be inconsistent among these tuples. One of the customer originated recent changes (CORCs) failed to update.

Data Structures:

RLCF_LTM or RLDN_FEATS. Key fields: lead module, ltm index, ltm type, feature ID.

Action:

De-activate the feature using access code or RC/V View 1.8 (ANALOG LINE/BRCS ASSIGNMENT) for non-multi-line hunt group (MLHG), or View 3.6 (MULTI-POSITION BUSY KEY LINE ASSIGNMENT) or View 3.8 (DSL/BRCS ASSIGNMENT) for MLHG.

254. FCCOT_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCOT_CF relation, a failure code of DBNO_MATCH was returned. An rICOT_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCOT_CF. Key field: feature.

Action:

This is a database inconsistency that can only be corrected by manual action.

255. FCCOTCLASS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Terminal maintenance (TM) returned a line class type that is invalid for customer originated trace (COT). The process control block link area (PCBLA) will be dumped. COT will allow the trace; however, the field in the trace message that should contain the equipment number will contain question marks.

Action:

Contact the next level of support.

256. FCCOTDISP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Customer originated trace (COT) could not send the display to an integrated services digital network (ISDN) terminal due to a packet switching (PS) failure.

Action:

Contact the next level of support.

257. FCCOTRESP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The customer originated trace (COT) response type is invalid. This problem is found by the FCcotresp(), MCcotresp(), or IScotresp() function. Re-order will be provided.

Action:

Contact the next level of support.

258. FCCOTTMEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Terminal maintenance (TM) could not produce the equipment number for the line that activated customer originated trace (COT). The process control block link area (PCBLA) will be dumped. COT will allow the trace; however, the field in the trace message that should contain the equipment number will contain question marks.

Action:

Contact the next level of support.

259. FCCPNBNCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rICPNBN_CF tuple is missing or the key (FID) is wrong.

Data Structures:

RLCPNBN_CF. Key field: fid.

RLDN_FEATS. Key fields: lead_module, ltm_type, ltm_idx, range.

RLFID2NAME. Key fields: facid, class, subclass.

The ROP output provides the feature identifier (FID) used to read the RLCPNBN_CF relation, the LEAD MODULE of the directory number that is being called or activating/deactivating the calling party number/billing number (CPN/BN) feature, the LTM_IDX of the directory number, the LTM_TYPE of the directory number, and the BFGID (BRCS feature group identifier) of the directory number that is being called or activating/deactivating the CPN/BN feature.

Action:

Use RC/V (or ODBE, if necessary) to fix the problem.

1. Use ODBE for processor 0 and the RLFD2NAME relation to determine if this is a valid feature identifier (FID) for the calling party number/billing number (CPN/BN) feature. For the RLFD2NAME keys (facid, class, subclass), use the FID value from the ROP for the facid key, use FACBRCS for the class, and use SCL_FEAT for subclass.

If the rLFID2NAME tuple with these keys is found, the FID is valid; go to step 2. If a tuple is not found, go to step 3.

2. If the FID is found in the RLFD2NAME relation, use ODBE for the SM that generated the assert and the RLCPNBN_CF relation to determine if a tuple exists for this FID.

If an rLCPNBN_CF tuple does not exist, consult the office records to determine if a CPN/BN feature should exist for this FID. If a CPN/BN feature should exist, insert the tuple along with the appropriate options (consult the office records for the correct option information).

If a tuple exists in RLCPNBN_CF, contact the next level of support.

3. Determine if the invalid FID is in the RLDN_FEATS relation by using ODBE for the SM that generated the assert and the RLDN_FEATS relation. Use the lead_module, ltm_type, and ltm_idx keys from the ROP. Use 0 for the range key.

Check each ftentX.fid attribute for the invalid FID where "X" can be the values 1 through 6. If there are more than 6 features for this ltm_idx, other rLDN_FEATS tuples may have to be read using the next value for the range key. When a ftentX.fid of 0 is found, there are no more features.

If the FID is not found, go to step 4. If the FID is found in RLDN_FEATS, contact the next level of support.

4. If the FID is not found in the RLDN_FEATS relation and the BFGID is greater than 0, check the rLDN_FEATS tuple(s) associated with the BFGID. Use 0 for the lead_module key and use the BFGID value for the ltm_idx key. Repeat the procedure in step 3. If the FID is found in RLDN_FEATS, contact the next level of support.

260. FCCPPOPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Failed to couple the port with the process with the DACppopc() function. The process control block link area (PCBLA) audit will be scheduled.

261. FCCR_STUCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Feature execution (FEX) detected a dead-linked (abandoned) call record. Additional data from up to five model data blocks (MDBs) is dumped. Contact your next level of support.

262. FCCW_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCW_CF relation, a failure code of DBNO_MATCH was returned. An rLCW_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCW_CF. Key fields: feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

263. FCCW_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rlcw_PORT tuple is missing that is keyed with the logical port (lport) and logical port type (lpt_type).

Data Structures:

RLCW_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - lport, lpt_type, and the feature ID (FID).

Action:

The call waiting (CW) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the CW feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLCW_PORT relation where RLcw_port.lport is RLfc_line.lport, RLcw_port.lpt_type is RLfc_line.lpt_type, and RLcw_port.feaid is the CW feature ID.

An attempt to read the RLCW_PORT relation using the original (non-BFG) keys was made because the CW feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). CW is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rlcw_PORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rlcw_PORT tuple.

264. FCDALCARTONE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

400 Hz Carrier tone requested but not provisioned as system tone for Start Signal on DAL trunks.

The "CT FOR DT" field in RC/V View 5.1 (TRUNK GROUP) is set to "Y" but the field "CARRIER TONE" in RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] is set to "N".

The TRUNK GROUP and trunk group MEMBER NUMBER are printed in this assert. The TRUNK GROUP can be used as the key to RC View 5.1

Data Structures:

- Global parameter, Glcartone
- rIFC_TRUNK.ct_for_dt

Action:

There are two options,

- Set the value of "CARRIER TONE" in RC/V View 8.1 to "Y"
- Set value of "CT FOR DT" in RC/V View 5.1 to "N"

265. FCDAORAF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A digit overflow occurred while expanding the variable information for variable announcements.

Data Structures:

The following data will be dumped: ann_id: the announcement ID.

Action:

The specified announcement ID causes the digit array overflow. Either there are too much digit commands in the announcement or there is too much variable information to be inserted in the announcement.

266. FCDB_AMGPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of DBNO_MATCH was returned when the RLDB_AMGPD relation was read. An rIDB_AMGPD tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLDB_AMGPD. Key fields: group type, group ID.

Action:

Verify that the keys printed on the ROP are valid. The group type must be in the range 1-64 and the group ID in the range 1-65535. If the keys are valid, use ODBE to verify that the rIDB_AMGPD tuple does not exist, then insert the tuple. If the keys are not valid, file a trouble report.

267. FCDCAVTER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An integrated services digital network (ISDN) attendant attempted to assign an attendant control of voice terminals (ACVT) direct connect restriction level to an analog line that does not have an ACVT error treatment of RERTE. The analog line must have ACVT error treatment RERTE and must specify an ERROR TN for the direct connect capability to function.

Data Structures:

The port that the attendant tried to assign the direct connect restriction level to is in the gport field of the

MGACVT_REQ message and is printed in the assert.

Action:

Use the OP:CONV input message with the port and SM number in the assert message to convert the port to a directory number. Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) to find the ACVT feature assigned to the line. Use RC/V View 1.46 (ISDN ATTENDANT CONTROL OF VOICE TERMINALS LINE PARAMETERS) to change the ACVT error treatment for the directory number to ERROR TYPE = RERTE and specify an ERROR TN.

268. FCDEFAULT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch statement defaulted when it should not have done so.

269. FCDESTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid destination type (dest_type) was found in the route request message when entering a multiway (MW) call via the ISdmw() function. The only valid values at this point in the call are FCDIALCODE or FCBUTTON. The route request message is dumped to the ROP for analysis.

270. FCDIOPRFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLFC_DIOPR base relation in the intermediate switching point (ISP) feature.

271. FCDIOPRREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLFC_DIOPR relation could not be found in the database. An attempt was made to obtain information about an operator system.

Data Structures:

RLFC_DIOPR. Key fields: carr_id, bcarrier.

The carr_id (carrier ID) key is from the RLFC_OPRTK relation which is accessed by the trunk group. The bcarrier field is yes for a feature group B (FGB) carrier and no if this is not an FGB carrier.

Action:

Add the RLFC_DIOPR relation according to RC/V procedures.

272. FCDIOPRTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIFC_DIOPR tuple is missing. An attempt was made to obtain routing information about the operator trunks. The tuple for the specific carrier ID could not be found.

Data Structures:

RLFC_DIOPR. Key fields: carr_id, bcarrier.

The carr_id key is the carrier ID from the RLFC_OPRTK relation which is accessed by the trunk group. The bcarrier key will always be no because this assert only prints for non-feature group B (FGB) carriers.

Action:

Use RC/V View 26.25 (ACCESS TANDEM ROUTE INFO. FOR PRIMARY & ALTERNATE TOLL & ASSIST O.S.) to crosscheck the key set used for accessing the RLFC_DIOPR relation with the actual keys for the relation. Verify that this tuple does or does not exist. Add the tuple if it is missing.

273. FCDISERV (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rDISERV tuple is corrupted or missing. A call type of QUERY was determined from the office dialing plan (ODP) which indicates a query should be made to an external database to obtain routing information. The rDISERV tuple should indicate the type of service based on the type of call and the type_ci_call field on RC/V View 9.3 (LOCAL DIGIT OFFICE DIALING) or RC/V View 9.9 (REMAINING DIGIT OFFICE DIALING).

Data Structures:

RLDISERV. Key field: destination index.

Action:

This is a database inconsistency that must be corrected by manual action. The destination index on the ROP indicates the type of call for which a query should be made to the external database. Update or insert the rDISERV tuple based on the type of call and the type_ci_call field value on RC/V View 9.3 (LOCAL DIGIT OFFICE DIALING) or RC/V View 9.9 (REMAINING DIGIT OFFICE DIALING).

274. FCDISERV (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rDISERV tuple is corrupted or missing. A call type of QUERY was determined from the office dialing plan (ODP) which indicates a query should be made to an external database to obtain routing information. The rDISERV tuple should indicate the type of service based on the type of call and the type_ci_call field on RC/V View 9.3 (LOCAL DIGIT OFFICE DIALING).

Data Structures:

RLDISERV. Key field: destination index.

Action:

This is a database inconsistency that must be corrected by manual action. The destination index on the ROP indicates the type of call for which a query should be made to the external database. Update or insert the rDISERV tuple based on the type of call and the type_ci_call field value on RC/V View 9.3 (LOCAL DIGIT OFFICE DIALING).

275. FCDNBFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rLDN_FEATS tuple failed.

Data Structures:

RLDN_FEATS. Key fields: lead module, ltm index, ltm type.

Action:

The ROP report shows the keys used to access the rIDN_FEATS relation as well as the business and residential custom services (BRCS) feature group (BFG) ID associated with the keys.

Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) to verify the features on the line. If these features are correct, use ODBE with the keys to verify the existence of an rIDN_FEATS tuple. If the tuple does not exist, verify that the rIFC_LINE tuple for the line with the same ltm_index and ltm_type has the dnbfg field set to DBNO.

276. FCDNFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIDN_FEATS tuple failed.

Data Structures:

RLDN_FEATS. Key fields: lead module, ltm_index, ltm_type.

The D channel port name will also be printed on the ROP. It will be zero if this data was unavailable.

Action:

Verify the features on the line with RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE). If the features are correct, use ODBE with the keys printed on the ROP to verify the existence of an rIDN_FEATS tuple.

If the rIDN_FEATS tuple does not exist, verify that the rIFC_LINE tuple with the same ltm_index and ltm_type has the brc_dn field set to DBNO.

277. FCDNINCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found in the RLDN_FEATS relation. This relation holds data for business and residential custom services (BRCS) features assigned to directory numbers (DNs). Each rIDN_FEATS tuple holds up to six feature entries. If more than six BRCS features are assigned to a DN, multiple rIDN_FEATS tuples are used to hold the feature entries for the DN.

The feat_cnt field in the first rIDN_FEATS tuple (range 0) indicates the number of features that should exist for the DN. For example, if 14 BRCS features are assigned to a DN, three rIDN_FEATS tuples are used to store the BRCS feature data. The first tuple (range 0) has feat_cnt=14 and contains the first six feature entries. The second tuple (range 1) contains the next six feature entries, and the third tuple (range 2) contains the final two feature entries.

An attempt to read one of the additional rIDN_FEATS tuples (range>0) failed. An rIDN_FEATS tuple is missing or the feat_cnt in the first tuple is incorrect. The ROP output provides the tuple keys as well as the actual number of feature entries found.

If this problem occurs during a call, the call will not be torn down and an attempt will be made to process the BRCS features that were successfully read.

Data Structures:

RLDN_FEATS. Key fields: module, ltm_type, ltm_idx, range.

The ROP output provides the MODULE (lead module, 0 for BFG tuples), the LTM_TYPE (logical termination type), the LTM_IDX (logical termination index), the RANGE (a number from 0-4 used to distinguish multiple tuples assigned to a DN), and the CNT (the count of the number of feature entries found).

Action:

If the MODULE is 0, this is a BRCS feature group (BFG) rIDN_FEATS tuple. In this case, the LPT_IDX is the BFG ID.

If the MODULE is non-zero, this is not a BFG tuple. If the LTM_TYPE is LTM_OTHER (0), use the LTM_IDX to read the RLLTM_PORT relation using ODBE in order to determine the port and party. If the LTM_TYPE is LTM_ISDN (1), use the LTM_IDX and MODULE to read the RLIS_LINE relation using ODBE.

Examine the first rIDN_FEATS tuple (range=0) using ODBE. The lead MODULE, LTM_TYPE, and LTM_IDX keys are printed on the ROP. If the feat_cnt field in the first tuple is incorrect, use ODBE to update the tuple to the correct count. The correct count will be CNT.

If the feat_cnt field in the first rIDN_FEATS tuple is correct, then one or more rIDN_FEATS tuples are missing. Update the rIDN_FEATS tuple (range=0) using ODBE. Set the feat_cnt attribute to the value of CNT. This update allows RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) to display the DN features that were found for this LTM_IDX. This is a temporary fix until the missing features can be determined.

The missing feature entries must be added to the RLDN_FEATS relation based on the office records. The feat_cnt in tuple 0 must be updated using ODBE once the correct number of features is determined. The data for each missing DN feature depends on the feature. Contact your next level of support for assistance in restoring these rIDN_FEATS tuples.

278. FCDDR_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDR_CF relation, a failure code of DBNO_MATCH was returned. An rIDR_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLDR_CF. Key fields: feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

279. FCDSPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIDSP_MSG tuple is missing, the keys used to read this relation are not valid, or the length of the display exceeds the maximum allowed. RC/V View 8.65 (DISPLAY MESSAGE) provides the maximum length.

Feature operation is not interrupted; however, the missing integrated services digital network (ISDN) displays will not be presented to the user.

Data Structures:

RLDSP_MSG. Key fields: dsp_type, dsp_id.

Action:

If the data from the ROP output does not exist on RC/V View 8.65 (DISPLAY MESSAGE), insert the rIDSP_MSG tuple.

If the data from the ROP output does exist, but the length exceeds the maximum allowed; update the rIDSP_MSG tuple so that the length is less than or equal to the maximum allowed.

If the keys printed are invalid, contact your next level of support.

280. FCDSU2NRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to activate or de-activate an analog visual message waiting indicator (AVMWI), an attempt to send analog advanced services platform (ASP) display data, or an attempt to send display information to an analog incoming calling line identification (ICLID) calling number display (CND) by sending a frequency shift key (FSK) signal to the analog customer premise equipment (CPE) port failed.

The request was issued with the expectation that the digital service unit model 2 (DSU2) equipment/transceiver (XCVR) circuits were currently part of the SM.

The failure occurred due to one of the following reasons:

1. The SM on which the port resides does not have a DSU2. The message service system (MSS) feature with AVMWI or the line identification (LID) feature with ICLID should not be assigned to analog ports on this SM.
2. The SM on which the port resides does have a DSU2, but no transceiver circuits are assigned. The DSU2 needs to be reconfigured to include XCVR circuits.

Data Structures:

RLMDX_CF, RLMDX_GRP, RLMDX_PORT, RLDN_FEATS, RLCKTDATA, RLTDCE_CKT, RLCTB_ECCKT, RLXCVR_CKT, RLPICB, RLRC_EQLOC, RLICLIDIDX, RLCNDDATA.

Action:

The ROP output provides a message that there is an invalid AVMWI, ASP, or ICLID CND request and either no DSU2 or no transceiver circuits exist, the port number, and the parameters used to read the RLMDX_PORT or RLICLIDIDX relation.

281. FCE9BADSFSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation RLE911_SFG could not be read. This relation must be available when the office is an E911 office as specified on RC/V View 8.1.

Data Structures:

RLE911_SFG

Action:

Use RC/V View 7.3 (PFA SIMULATED FACILITY GROUP) to insert an E911 line and trunk simulated facility group (SFG). Use RC/V View 8.1 (OFFICE PARAMETERS [MISCELLANEOUS]) to identify the new SFG as the E911 line or trunk SFG.

282. FCE9DA_ERR (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dialing plan translation error was found for the dialed digits "911". The dialed digits indicate that this is an emergency 911 call but the office dialing plan (ODP) is not correctly translating these digits as an emergency 911 call. This assert is associated with the E911 Call Error Detection and Alarm Special Feature ID 293 on RC/V View

8.22 (SECURED FEATURE UPGRADE).

Possible dialing plan errors are:

- (1) a destination type (CALL TYPE) other than FC911 was translated for the digits "911"
- (2) the digits "911" are translated as part of a longer string causing the user dialing "911" to time out receiving partial dial treatment
- (3) the digits "911" received VACANT code treatment or another digit analysis error was detected

Data Structures:

```
RLDAPRMFNL
RLDAPRLFNL
RLDPRM_G
RLDPRL_G
```

Action:

- (1) Consult the office records to determine if the digits "911" are defined correctly for E911 emergency dialing. If an error can be identified visually, go to step 4 to make the correction.
- (2) Determine which digit analysis tables are used to translate "911" digits by consulting the office records or from the user's digit analysis selector (DAS) field on RC/V view 4.1 (LINE CLASS CODE) if the originating port is a line or RC/V view 5.1 (TRUNK GROUP) if the originating port is a trunk.
- (3) Examine the digit analysis tables identified in step 2 to determine why the "911" digits failed digit analysis or resulted in a destination type other than FC911 (CALL TYPE: 911). Also, identify the corrections to be made to the digit analysis tables.

The RC/V views to use for this examination include:

- (a) RC/V view 9.1 (DIGIT ANALYSIS SELECTOR (OFFICE DIALING)) using the DAS from step 2 as the key.
- (b) RC/V view 9.2 (PREFIX/FEATURE DIGIT (OFFICE DIALING)) using the PDIT from RC/V view 9.1 and the digits being translated as the keys. Or, RC/V view 9.5 (INCOMING TRUNK DIGITS) using the INC DIT from RC/V view 9.1 and "911" digits as the keys.
- (c) RC/V view 9.3 (LOCAL DIGIT (OFFICE DIALING)) using the LDIT from RC/V view 9.1 and "911" digits as the keys.

Determine if the "911" digits are translated with CALL TYPE: NORMAL on the appropriate view. If this is a valid destination type in the office, then set the Optioned Feature ID 716 "Inhibit Dialing Plan Check" on RC/V View 8.31 (OPTIONED FEATURES) to ACTIVE: Y(ES).

- (4) If the error is in the digit analysis tables, make the identified corrections to the tables using the views specified in step 3.

283. FCE9DASBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rIDA_DIGSTRT tuple with a key equal to the value of the global office parameter Gle911das, does not exist. This tuple is required for translation of all enhanced 911 (E911) primary, alternate, reroute, and selective transfer directory numbers (DNs); therefore, all E911 routing using those DN's will fail and the originator will receive reorder.

Data Structures:

RLDA_DIGSTRT. Key field: digtree.

Action:

If the Gle911das global parameter printed on the ROP as DIGTREE is not correct based on office records, define the parameter correctly using screen 8 of RC/V View 8.1 (OFFICE PARAMETER [MISCELLANEOUS]). The Gle911das parameter appears as E911 DAS on this screen.

If the Gle911das global parameter is correct, contact the next level of support to add the appropriate rIDA_DIGSTRT tuple via RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) using the digit analysis selector (DAS) printed on the ROP as DIGTREE for the key. Other related digit analysis tables may also need to be added.

284. FCE9DNBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An enhanced 911 (E911) primary, alternate, reroute, or selective transfer directory number (DN) from the relation specified failed digit analysis or resulted in a destination type other than FCNORMAL.

If the call being routed is an E911 origination, it will be routed to an E911 alternate route if available; otherwise, the caller will receive reorder.

If the call is an anonymous call to an E911 public safety answering point (PSAP) (the caller dialed the PSAP DN directly instead of dialing 911) that was rerouted because the PSAP was busy or out of service, the caller will receive reorder.

If the call is a transfer from an E911 PSAP, the transfer will fail and the original two-way call will be maintained.

Data Structures:

RLE911PSAP. Key field: tgn.

RLE911SA. Key fields: sm, das.

RLESNTRAN. Key field: esn.

RLDA_DIGSTRT. Key field: digtree (das).

Action:

1. Consult the office records to determine if the DN printed on the ROP is defined accurately for the specific instance of the relation indicated. If an error can be identified visually, go to step 5 to make the correction.

2. Determine which digit analysis tables are used to translate E911 DN's by consulting the office records or from the E911 digit analysis selector (DAS) field on RC/V View 8.1 (OFFICE PARAMETER MISCELLANEOUS). This DAS is the key to the appropriate rIDA_DIGSTRT tuple.

3. Examine the digit analysis tables identified in step 2 to determine why the DN printed on the ROP is failing digit analysis or resulting in a destination type of other than FCNORMAL. Also, identify the corrections to be made to the digit analysis table or the DN. The RC/V views to use for this examination include:

a. View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) using the DAS from step 2 as the key.

b. View 9.2 (PREFIX/FEATURE DIGIT [OFFICE DIALING]) using the PDIT from View 9.1 and the digits being translated as the keys. Or, View 9.5 (INCOMING TRUNK DIGITS) using the INC DIT from View 9.1 and the digits

being translated as the keys.

c. View 9.3 (LOCAL DIGIT [OFFICE DIALING]) using the LDIT from View 9.1 and the digits being translated as the keys.

4. If the error is in the digit analysis tables, make the identified corrections to the tables using the views specified in step 3. 5. Otherwise, make the identified corrections to the DN in the specified tuple of the appropriate relation (relation name and keys printed on the ROP).

a. RLE911PSAP - Enter the corrected PSAP RERTE DN on screen 6 of RC/V View 5.1 (TRUNK GROUP) using the TGN printed on the ROP as the key.

b. RLE911SA - Enter the corrected DN in the appropriate field of RC/V View 9.40 (SELECTIVE ROUTING AND TRANSFER DATA FOR ESN [SM/DAS]) using the SM and DAS printed on the ROP as the keys.

c. RLESNTRAN - Enter the corrected DN in the appropriate field of RC/V View 9.40 (SELECTIVE ROUTING AND TRANSFER DATA FOR ESN [SM/DAS]) using the ESN printed on the ROP as the key.

285. FCE9ESCOBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The emergency service central office (ESCO) provided as the key to read the RLESCO relation is zero or the rLESCO tuple specified does not exist. The RLESCO relation is used by enhanced 911 (E911) to determine if E911 selective or default routing should occur, and for default routing, the emergency service number (ESN) that should be used to obtain the routing data.

If the RLESCO relation can not be read, the following will occur for the E911 call in progress:

1. For line originations and for non-dedicated trunk originations, route the call using the E911 standalone data.

2. For dedicated trunk originations, obtain the ESCO from the rLDA_DIGSTRT tuple associated with the trunk.

a. If an rLESCO tuple can be read using this new ESCO as the key, route the call as specified.

b. If an rLESCO tuple can not be read using this new ESCO as the key, route the call using the E911 standalone data. If this condition occurs, the assert fires twice - once for the invalid or 0 ESCO in the RLFC_TRUNK relation and once for the invalid or 0 ESCO in the RLDA_DIGSTRT relation.

Data Structures:

RLESCO. Key field: esco.

RLFC_TRUNK. Key fields: port.member, port.module.

RLFC_LINE. Key fields: port.member, port.module, party.

RLDA_DIGSTRT. Key field: digtree (das).

Action:

The specified rLESCO tuple is missing, the pointer to the rLESCO tuple in the rLDA_DIGSTRT or rLFC_TRUNK tuple is incorrect, or the pointer to the rLDA_DIGSTRT tuple in the rLFC_LINE or rLFC_TRUNK tuple is incorrect.

Follow these steps to identify and correct the problem:

1. Consult the office records to determine if the ESCO printed on the ROP is a valid value. If it is valid, the rLESCO tuple that corresponds to this ESCO should be added. Use the information provided in the office records to add the tuple via RC/V View 9.41 (EMERGENCY SERVICE CENTRAL OFFICE).

2. If the ESCO is not a valid value or if it is 0, correct the relation from which the ESCO was obtained. This relation is

RLDA_DIGSTRT for lines and non-dedicated trunks and RLFC_TRUNK for dedicated E911 trunks. Determine the relation to correct as follows:

- a. Specifying the MEMBER and MODULE printed on the ROP, use the master control center (MCC) op:conv command to determine if the origination was from a line or a trunk.
- b. If this was a line origination, the ESCO value was obtained from the RLDA_DIGSTRT relation. Proceed to step 3.
- c. If this was a trunk origination, examine the ESCO field on screen 6 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number from the op:conv command. If the ESCO is 0 or blank, the ESCO value was derived from the RLDA_DIGSTRT relation. Proceed to step 3.

If the ESCO field is populated on RC/V View 5.1, but does not match the ESCO value printed; the ESCO was obtained from the RLDA_DIGSTRT relation. Proceed to step 3.

- d. Otherwise, the ESCO was obtained from the RLFC_TRUNK relation.

3. If the ESCO was obtained from the RLDA_DIGSTRT relation, consult the office records to determine if the correct digit analysis tables are being used. That is, is the digit analysis selector (DAS) printed on the ROP correct for the line or trunk in question? If the DAS is incorrect, change it on the appropriate view.

a. RLFC_LINE (line origination) - Obtain the line class code (LCC) from RC/V View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]) using the directory number (DN) from the op:conv command in step 2a and the PARTY printed on the ROP as keys. Change the DAS on RC/V View 4.1 (LINE CLASS CODE) using the LCC as the key.

b. RLFC_TRUNK (trunk origination) - Change the DAS on RC/V View 5.1 (TRUNK GROUP) using the trunk group number from the op:conv command in step 2a as the key.

4. If the ESCO was valid in step 1 and the DAS was correct in step 3, use information from the office records to correct the ESCO in the specified tuple of the appropriate relation identified in step 2.

a. RLDA_DIGSTRT - Enter the correct ESCO via RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) using the DAS printed on the ROP as the key.

b. RLFC_TRUNK - Enter the correct ESCO on screen 6 of RC/V View 5.1 (TRUNK GROUP) using the trunk group number from the op:conv command in step 2a as the key.

286. FCE9OPBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database inconsistency exists between the enhanced 911 (E911) office option parameter Gle911op and the office dialing plan (ODP). The ODP indicates that the call is an E911 call, but the Gle911op parameter is set to E9_INACT, specifying that the office does not support E911 calls. The E911 call in progress will receive reorder or busy.

Action:

The ODP is set up to translate E911 calls when it should not be, or the Gle911op parameter was not initialized for E911 processing in the entire office or in the SM in which the E911 call is originating.

Consult the office records to determine if the ODP should be set up to translate E911 calls. If the ODP should not translate E911 calls, correct the appropriate ODP tables. Start with RC/V View 9.1 (DIGIT ANALYSIS SELECTOR) using the digit analysis selector (DAS) printed on the ROP as the key.

If ODP should translate E911 calls, the Gle911op parameter is incorrect. If the E911 OPTION on screen 8 of RC/V View 8.1 (OFFICE PARAMETER) is set to INACTIVE, the office parameter was not initialized for E911 processing.

Change E911 OPTION to ESA or NONESA, depending on the office records.

If the E911 OPTION specified in View 8.1 is set to ESA or NONESA, the SM office parameter is out of sync with the rest of the office and is not initialized. Use RC/V (or ODBE, if necessary) to update the Gle911op parameter for the SM printed on the ROP to E9_NONESA or E9_ESA, depending on the office records.

287. FCE9QRYBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid query status was returned by the enhanced 911 (E911) global routing system process. The query status will be printed on the ROP. Selective routing for the E911 call in progress will fail and the call will be routed using the E911 stand alone data.

288. FCE9SABAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rLE911SA tuple with the following keys does not exist - SM is the current SM and the digit analysis selector (DAS) is 0.

Since this rLE911SA tuple does not exist, the tuple corresponding to a DAS of 0 must exist for E911 stand alone routing. Therefore, the E911 call currently in progress will fail and the originator will receive reorder.

Data Structures:

RLE911SA. Key fields: sm, das.

Action:

Use the SM and DAS printed on the ROP as keys to insert the missing rLE911SA tuple via RC/V View 9.40 (SELECTIVE ROUTING AND TRANSFER DATA FOR ESN [SM/DAS]). Consult the office records for information to enter on this view.

289. FCE911INVNPA (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLNPA2NPD relation, a failure code of DBNO_MATCH was returned. An RLNPA2NPD tuple is missing or the key used to read this relation was not set properly. The RLNPA2NPD relation is used by the Numbering Plan Area (NPA) to Numbering Plan Digit (NPD) Translation Table for Enhanced 911 (E911) Calls feature (SFID 337) to translate a 3 digit NPA to a 1 digit NPD for incoming signaling system 7 (SS7) calls. For wireline SS7 trunk calls received at the E911 tandem Switch, the NPA of the automatic number identification (ANI) is used as the key to the relation. For wireless SS7 trunk calls, the mobile directory number (MDN) or pseudo ANI is used. The NPD derived is outputted to 8-digit centralized automatic message accounting (CAMA) public safety answering points (PSAPs).

Data Structures:

RLNPA2NPD: Key Field: npa

Action:

This is a database inconsistency that can be corrected by manual action. Verify that the key (NPA) printed on the ROP is populated on RC/V View 9.42 using the NPA as the key.

290. FCE911PSAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered when reading the RLE911PSAP relation. The key (tgn) is wrong or an rLE911PSAP tuple is missing.

Data Structures:

RLE911PSAP. Key field: tgn.

RLFC_TRUNK. Key fields: port.member, port.module.

RLRT_TRKG. Key field: tgn.

The ROP output provides the trunk group number (TGN) key that is obtained from the rLFC_TRUNK tuple associated with the port, and the PORT (the trunk port associated with the call).

Action:

The rLE911PSAP tuple should only be populated if the terminating trunk group is connected to an enhanced 911 (E911) public safety answering point (PSAP).

Follow these steps to use RC/V to fix the problem:

1. Use RC/V View 5.1 (TRUNK GROUP) to check the centralized automatic message accounting (CAMA) PSAP field. If this field is Y, all members of the trunk group must have the cama_psap attribute set to DBYES in the RLFC_TRUNK relation and an rLE911PSAP tuple must exist in all SMs and in the CMP for the trunk group. To correct this problem, follow steps 2 through 5.

If the CAMA PSAP field is set to N, all members of the trunk group must have the cama_psap attribute set to DBNO in the RLFC_TRUNK relation and an rLE911PSAP tuple must not exist for the trunk group. Follow steps 6 and 7 to correct this problem.

2. Remove all members from the trunk group using RC/V View 5.5 (TRUNK MEMBER).

3. On RC/V View 5.1, set the CAMA PSAP field to N and update the trunk group.

4. On RC/V View 5.1, set the CAMA PSAP field to Y and update the trunk group. This should cause an rLE911PSAP tuple to be populated in all SMs.

5. On RC/V View 5.5, add the members back to the trunk group. This should cause the cama_psap attribute to be set to DBYES for each member.

6. Remove all members from the trunk group using RC/V View 5.5.

7. On View 5.5, add the members back to the trunk group. This should cause the cama_psap attribute to be set to DBNO for each member.

Follow these steps to use ODBE to fix the problem:

1. Read the RLFC_TRUNK relation using the PORT and SM number from the ROP as the key. If the cama_psap attribute is set to DBYES, the tgroup attribute must be a valid CAMA PSAP trunk group. If not, correct the tgroup attribute. If it is valid and matches the TGN, then continue.

2. Read the RLRT_TRKG relation using the TGN as the key on the failing SM. If the cama_psap attribute is set to DBYES, then an rLE911PSAP tuple must exist and the cama_psap attribute in the rLFC_TRUNK tuple must be set to DBYES.

3. If the cama_psap attribute in the rLRT_TRKG tuple is set to DBNO, an rLE911PSAP tuple must not exist for this trunk group and the cama_psap attribute in the rLFC_TRUNK tuple must be set to DBNO.

4. Since the RLRT_TRKG and RLE911PSAP relations are SM redundant, each SM and the CMP must have the same data.

291. FCEDSLTKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLEDLSTRKG relation, a failure code of DBNO_MATCH was returned. An rLEDLSTRKG tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLEDLSTRKG. Key field: trunk group number (grpnum).

RLFC_TRUNK. Key fields: port.member, port.module.

RLPORT_GROUP. Key fields: port.member, port.module.

RLFC_PORTTYP. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to verify that the trunk group number is valid. The port member and port module dumped on the ROP are used to read the RLPORT_GROUP and RLFC_TRUNK relations. If both relations indicate the port is a member of the trunk group dumped on the ROP, then the trunk group number is probably valid.

If the trunk group number is valid and it has a service class of FCEDSL or FCEDSLHM and a logical port type of PCTBCHAN in the RLFC_PORTTYP relation, check the RLEDLSTRKG relation to see if a tuple exists. If the rLEDLSTRKG tuple is not populated, insert one (consult the office records).

If the trunk group assigned to the port in the RLFC_TRUNK relation is different than the one in the RLPORT_GROUP relation, consult the office records and correct it.

After correction, manually restore the trunk back to service using the master control center (MCC) command rst:trk,tg=grpnum (where grpnum is the trunk group number that was printed on the ROP).

292. FCERDISP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLASPDISP relation failed during an SM full initialization.

293. FCERFRNAMA (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLFRN_AMA relation failed during an SM full initialization.

294. FCERNS_BILL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLNS_BILL relation failed during an SM full initialization.

295. FCERNSDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLNSDB relation failed during an SM full initialization.

296. FCERNS_IDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLNS_IDX relation failed during an SM full initialization.

297. FCERRMSGSIZE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message size passed to the FCrelayfar() function plus the size of the message header (OSMESSAGE) exceeded the current size of a large message text (356 bytes). The size of the message and the message buffer are reported. The FCrelayfar() function returns GLFAIL to the caller. The caller will decide what to do with the call.

298. FCERTATDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLATATDB relation failed during an SM full initialization.

299. FCERTN_INFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLTN_INFO relation failed during an SM full initialization.

300. FCERTRANS (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLASPTRANS relation failed during an SM full initialization.

301. FCERTXNIF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLTXN_INFO relation failed during an SM full initialization.

302. FC_FACIDS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSMFACIDS relation, a failure code of DBNO_MATCH was returned. An rLSMFACIDS tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLSMFACIDS. Key fields: facid, class, subclass.

Action:

This is a database inconsistency that can only be corrected by manual action.

303. FCFCPORTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_PORTTYP relation to get the coin station type (lp_type) using the port module and port member, a failure of DBNO_MATCH was returned. An rLFC_PORTTYP tuple is missing for this port. For a coin line, the call will be terminated gracefully and the coin will be returned to the customer.

Data Structures:

RLFC_PORTTYP. Key fields: port.module (SM #), port.member (port #).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the keys used to access the RLFC_PORTTYP relation with the actual keys for the relation. Use RC/V View 1.1 (LINE ASSIGNMENT INDIVIDUAL LINE) to assign this port. If the tuple was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

304. FCFLNPAMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLFCNPAMAP relation in the intermediate switching point (ISP) feature.

305. FCFPCCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

An unsuccessful attempt was made to follow the link from the process control block link area (PCBLA) to the call build up data block (CBDB). The CBDB could not be found; consequently, it could not be unlinked and released. Failure to release the CBDB does not affect the current call.

306. FCFRLRNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The facility restriction level (FRL) received from the originating terminal process (OTP) is out of range. The valid range is 1-16. The FRL is in the MGTK_TERM (trunk termination) message, brcs_data information element (IE). This error was found in the terminating terminal process (TTP) while converting the incoming FRL to an outgoing traveling classmark (TCM) value for the SETUP message that is populated in the TTP.

This assert is called from the FCtcm_conv() function that is located in the fc/FCars/FCpopetrn.c file. It dumps the values of the arport.lport, arport.lpt_type, and the FRL passed.

The TCM field in the outgoing SETUP message (TCM IE) was populated to an error condition (GLFAIL), since the FRL value passed is not valid. Contact your next level of support.

307. FCFRUNEXP (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was returned by VFSMruninstance(), an unexpected stimulus was received by VFSMruninstance, or an unexpected event was received by VFSMruninstance().

Probable Cause:

An unexpected message was received by the frame relay terminal process.

Action:

Assert and return to calling process.

308. FCGENRATNF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is not populated in the relation FC_GENRA.

Data Structures:

The following data will be dumped: rt_type: route type for which a tuple is missing. ann_var: announcement variant.

Action:

Insert the tuple in FC_GENRA using RC/V view ANGRA. If rt_type is FC001APX-FC099APX then ann_var is received from the ECP announcement message's preferred language parameter.

309. FCGENSCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLGENSCA relation, a failure code of DBNO_MATCH was returned. An rLGENSCA tuple is missing or the keys used to read this relation were not set properly. The key values sca_idx and range, along with ltm_index and ltm_type will be printed on the ROP. Structures: RLGENSCA. Key fields: sca_idx, range.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call acceptance (SCA)/computer access restriction (CAR) feature, no action is required.

Otherwise, this is a database inconsistency that can only be corrected by manual action. Contact your next level of support.

310. FCGENSCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLGENSCF relation, a failure code of DBNO_MATCH was returned. An rLGENSCF tuple is missing or the keys used to read this relation were not set properly. The key values scf_idx and range, along with ltm_index and ltm_type are printed on the ROP.

Data Structures:

RLGENSCF. Key fields: scf_idx, range.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call forwarding (SCF) feature, no action

is required.

Otherwise, this is a database inconsistency that can only be corrected by manual action. Contact your next level of support.

311. FCGENSCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLGENSCR relation, a failure code of DBNO_MATCH was returned. An rLGENSCR tuple is missing or the keys used to read this relation were not set properly. The key values scr_idx and range, along with the ltm_index and ltm_type will be printed on the ROP.

Data Structures:

RLGENSCR. Key Fields: scr_idx, range

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call rejection (SCR) feature, no action is required.

Otherwise, this is a database inconsistency that can only be corrected by manual action. Contact your next level of support.

312. FCGENSDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLGENSDA relation, a failure code of DBNO_MATCH was returned. An rLGENSDA tuple is missing or the keys used to read this relation were not set properly. The key values sda_idx and range, along with the ltm_index and ltm_type will be printed on the ROP.

Data Structures:

RLGENSDA. Key fields: sda_idx, range.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective distinctive alerting (SDA) feature, no action is required.

Otherwise, this is a database inconsistency that can only be corrected by manual action. Contact your next level of support.

313. FCGETCBDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful attempt was made to remove an rICBDB tuple from the idle list. The call can not continue because the rICBDB tuple is needed to store the FCsemiglob[] array data.

314. FCGHCLMD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLDB	Audit Mode: elev

Problem:

An error was encountered when using the dynamic access (DA) primitive DAGhclmd(). The key passed in (CLDB cldb_id) will be printed on the ROP and the AUCLDB audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

315. FCGHPCCL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An error was encountered when using dynamic access (DA) primitive DAGhpccl(). The key passed in (PCBLA procnum) will be printed on the ROP and the AUFC_PCBLA audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

316. FCGRPNET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a leased network (LN) common channel signaling (CCS) LN_NOQRY trunk origination, the automatic route selection (ARS) local group ID associated with this LN office does not have a corresponding rIGPID_NET tuple. The affected call was sent to reorder.

Data Structures:

RLGPID_NET. Key field: argp.

Action:

Determine the validity of the ARS group ID indicated. Use RC/V View 10.5 (AUTOMATIC ROUTE SELECTION GROUP PARAMETERS) to insert the missing rIGPID_NET tuple.

317. FCGSCLMD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MDB	Audit Mode: elev

Problem:

An error was encountered when using the dynamic access (DA) primitive DAGsclmd(). The key passed in (MDB mdb_id) will be printed on the ROP and the AUMDB audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

318. FCGSPCCL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLDB	Audit Mode: elev

Problem:

An error was encountered when using dynamic access (DA) primitive DAGspccl(). The key passed in (CLDB cldb_id) will be printed on the ROP and the AUCLDB audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

319. FCHCALIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the user to update the multi-line hunt group (MLHG) relation RLLSFSCA via a screen list editing (SLE) session failed.

Data Structures:

RLLSFHCA. Key field: grpnum.

Action:

Use RC/V View 4.48 (LASS SELECTIVE FEATURE SCREENING LIST) in the update mode to copy the directory numbers (DNs) from the RLLSFCSA relation (for member 1 of the MLHG) to the RLLSFHCA relation. The fields needed in RC/V View 4.48 are DN, FEATURE, MLHG, and MEMBER.

320. FCHCFLIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the user to update the multi-line hunt group (MLHG) relation RLLSFHCF via a screen list editing (SLE) session failed.

Data Structures:

RLLSFHCF. Key field: grpnum.

Action:

Use RC/V View 4.48 (LASS SELECTIVE FEATURE SCREENING LIST) in the update mode to copy the directory numbers (DNs) from the RLLSFSCF relation (for member 1 of the MLHG) to the RLLSFHCF relation. The fields needed in RC/V View 4.48 are DN, FEATURE, MLHG, and MEMBER.

321. FCHCRLIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the user to update the multi-line hunt group (MLHG) relation RLRLFHCR via a screen list editing (SLE) session failed.

Data Structures:

RLLSFHCR. Key field: grpnum.

Action:

Use RC/V View 4.48 (LASS SELECTIVE FEATURE SCREENING LIST) in the update mode to copy the directory numbers (DNs) from the RLLSFSCR relation (for member 1 of the MLHG) to the RLLSFHCR relation. The fields needed in RC/V View 4.48 are DN, FEATURE, MLHG, and MEMBER.

322. FCHCSUAUD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STPDB	Audit Mode: elev

Problem:

Failed to return an rISTPDB tuple to the idle list. The AUSTPDB audit will be scheduled to clean up the data block. The call will continue.

323. FCHDALIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the user to update the multi-line hunt group (MLHG) relation RLLSFHDA via a screen list editing (SLE) session failed.

Data Structures:

RLLSFHDA. Key field: grpnum.

Action:

Use RC/V View 4.48 (LASS SELECTIVE FEATURE SCREENING LIST) in the update mode to copy the directory numbers (DNs) from the RLLSFSDA relation (for member 1 of the MLHG) to the RLLSFHDA relation. The fields needed in RC/V View 4.48 are DN, FEATURE, MLHG, and MEMBER.

324. FCHI_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rHI_CF tuple is missing (home intercom/single line variety feature only), or the keys used to read this relation are incorrect. Activation of home intercom (HI) calls is blocked and reorder is given.

Data Structures:

RLHI_CF. Key field: fid.

The FID is the first data item printed on the ROP, port.member is the second item, port.module is the third, and party is the fourth.

Action:

Use RC/V (or ODBE, if necessary) to check the RLHI_CF relation using the FID value printed on the ROP as the key. If the tuple is not found, insert one. Convert the port information into a directory number (DN), then use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) to assign any pre-constructed HI feature to this DN.

325. FCHOTELFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLFC_HOTEL relation in the intermediate switching point (ISP) feature.

326. FCHTLREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLFC_HOTEL relation cannot be found. Attempt was made to obtain data about an automated central quotation system (ACQS) establishment or to verify the back number was or was not from an ACQS establishment. This problem is caused because the RLFC_HOTEL relation is not in the database.

Data Structures:

RLFC_HOTEL, key= back number.

Action:

Add the relation according to RC/V procedures.

327. FCHTLTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLFC_HOTEL relation. Attempt was made to obtain data about an automated central quotation system (ACQS) establishment or to verify the back number was or was not from an ACQS establishment. This problem is caused because the tuple for the specified back number could not be found in trying to obtain data about an ACQS establishment.

Data Structures:

RLFC_HOTEL, key= back number.

Action:

Verify that the back number is from an ACQS establishment and if so, enter it into the database using RC/V.

328. FCICBGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcldb global parameter using the DBrfgparm() function when it was called from the FCincbdb() function in fc/FCtrigint/FCincbdb.c. Contact your next level of support.

329. FCICBGP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcldb global parameter using the DBrfgparm() function when it was called from the FCincbdb() function in fc/FCtrigint/FCincbdb.c. Contact your next level of support.

330. FCICBGP3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcldb global parameter using the DBrfgparm() function when it was called from the FCincbdb() function in fc/FCtrigint/FCincbdb.c. Contact your next level of support.

331. FCICBGP4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcldb global parameter using the DBrfgparm() function when it was called from the FCincbdb() function in fc/FCtrigint/FCincbdb.c. Contact your next level of support.

332. FCIDP_ACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIDP_ACT relation, a failure code of DBNO_MATCH was returned. An rLIDP_ACT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIDP_ACT. Key fields: group ID, set number.

Action:

This is a database inconsistency that can only be corrected by manual action.

333. FCIDP_AERT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line has an individualized dialing plan (IDP) with alternate code treatment (ACT). The ACT is reroute, but there is no data associated with this IDP group in the RLIDP_AERT relation. The call will default to reorder treatment instead of being rerouted.

Data Structures:

RLIDP_ART. Key fields: idp_gpuid, actsetnum.

Action:

Use RC/V (or ODBE, if necessary) to determine the IDP group name from the ROP output.

1. Use the idp_gpuid provided in the ROP output to read the RLFID2NAME in the AM where facid is the idp_gpuid, class is FACDPLAN, and subclass is SCL_NULL.
2. Use the IDP group name as the key for RC/V View 9.10 (IDP GROUP DEFINITION). Verify that the IDP group is defined and ACTALW is set to Y. If this group is not defined, further office dependent data (ODD) inconsistencies may exist.
3. Use RC/V View 9.11 (IDP ALTERNATE CODE TREATMENT) keyed by the IDP group name and the ACTSETNUM printed on the ROP. If the ACTTREAT (error treatment) field is set to REROUTE, but the REROUTE field is null, then a directory number (DN) to be routed to must be defined.

334. FCIDP_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLID_CF relation, a failure code of DBNO_MATCH was returned. An rIID_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLID_CF. Key field: feature ID.

Action:

Use RC/V (or ODBE, if necessary) in the AM to find the corresponding rIID_OPTS tuple. Use the feature ID from the ROP output as the key to this relation.

If the rIID_OPTS tuple exists, use the information from this tuple to populate the rIID_CF tuple keyed by the same feature ID. The RLID_CF relation is on the SM indicated in the ROP output.

If the rIID_OPTS tuple does not exist, use RC/V View 12.17 (INDIVIDUAL DIALING FEATURE DEFINITION) to define the individualized dialing feature. If there is a problem with this feature definition, contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

335. FCIDP_DTRE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIDP_DTRE relation, a failure code of DBNO_MATCH was returned. An rIIDP_DTRE tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIDP_DTRE. Key fields: group ID, table ID, digit.

Action:

This is a database inconsistency that can only be corrected by manual action.

336. FCIDP_ERT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line has an individualized dialing plan (IDP) with alternate code treatment (ACT). The ACT is reroute, but there is no data associated with this IDP group in the RLIDP_ERT relation. The call will default to reorder treatment instead of being rerouted.

Data Structures:

RLIDP_ERT. Key field: idp_gpuid.

Action:

Use RC/V (or ODBE, if necessary) to determine the IDP group name from the ROP output.

1. Use the idp_gpuid provided in the ROP output to read the RLFID2NAME relation in the AM where facid is the idp_gpuid, class is FACDPLAN, and subclass is SCL_NULL.
2. Use the IDP group name as the key for RC/V View 9.10 (IDP GROUP DEFINITION). If this group is not defined, further office dependent data (ODD) inconsistencies may exist. Verify that the IDP group is defined and (a) ERRTREAT is set to IDREROUTE, or (b) the DPATALW is set to Y and DPATTREAT is set to IDREROUTE.
3. If condition (a) or condition (b) is met, but the corresponding field ERRTE or DPATRTE is null, then a directory number (DN) to be routed to must be defined.

337. FCIDP_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIIDP_GP tuple is missing.

Data Structures:

RLDB_AMGPD, RLDB_IMGPD, RLDB_GPDUS, RLIDP_GP, RLIDP_PORT, RLTRMFEATS.

The ROP output indicates the SM number (MOD), the source file and line number, and the key used to read the relation - the individualized dialing plan (IDP) group ID (GROUP ID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

The logical port attempting to use the individual dialing plan (IDP) feature has an IDP feature assigned. The IDP feature ID exists in the RLTRMFEATS relation for the originating port.

The logical port is assigned to an IDP group (an rIIDP_PORT tuple exists), but the IDP group ID in the rIIDP_PORT tuple is not valid or an rIIDP_GP tuple is missing.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and AM.

1. Use the IDP group ID provided in the ROP output to read the RLFID2NAME relation in the AM where RLfid2name.facid is the IDP group ID, RLfid2name.class is FACDPLAN, and RLfid2name.subclass is SCL_NULL.
2. If an rLFID2NAME tuple does not exist for the IDP group ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
3. If an rLFID2NAME tuple does exist for the IDP group ID, insert the appropriate rIIDP_GP tuple in the indicated SM where RLidp_gp.idp_gpuid is the IDP group ID.

Since the RLIDP_GP relation is a group partitioned relation, the RLDB_AMGPD, RLDB_IMGPD, and RLDB_GPDUS group partitioned control relations may also need to be updated.

338. FCIDP_ICOM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIDP_ICOM relation, a failure code of DBNO_MATCH was returned. An RLIDP_ICOM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIDP_ICOM. Key fields: group ID, ICOM rang.

Action:

This is a database inconsistency that can only be corrected by manual action.

339. FCIDP_MBGE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

It was discovered that there was an intercom origination attempt to an International destination from a Centrex Multi-Business Group Entity (MBGE) which is not allowed. This can happen only if the translation data is setup incorrectly.

Data Structures:

RLIDP_ICOM

Key Fields: idp_gp, icom_range

Supplementary Information: Called DN, Terminal Group ID, MBG ID, port

Action:

- (1) Use the IDP group ID and the ICOM range provided in the ROP to read the RLfid2NAME relation in the CMP where RLfid2name.facid is the IDP group ID, RLfid2name.class is FACDPLAN and RLfid2name.subclass is SCL_NULL.
- (2) Go to RC View 9.12 [IDP INTERCOM (INDIVIDUAL DIALING)] and remove the invalid intercom digits for this IDP group.

340. FCIDP_MBGE (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

It was discovered that there was an intercom origination attempt to Inter-LATA or International destination from a Centrex multi-business group entity (MBGE), which is not allowed. This can happen only if the translation data is set up incorrectly.

Data Structures:

RLIDP_ICOM Key Fields: idp_gp, icom_range Supplementary Information: Called DN, terminal group ID, MBG ID, port.

Action:

1. Use the IDP group ID and the ICOM range provided in the ROP to read the RLfid2NAME relation in the CMP where RLfid2name.facid is the IDP group ID, RLfid2name.class is FACDPLAN and RLfid2name.subclass is SCL_NULL.

2. Go to RC View 9.12 and remove the invalid intercom digits for this IDP group.

341. FCIDP_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLIDP_PORT tuple is missing that is keyed with the logical port (lport) and logical port type (lpt_type).

Data Structures:

RLIDP_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - lport and lpt_type.

Action:

The individualized dialing plan (IDP) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the IDP feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLIDP_PORT relation where RLidp_port.lport=RLfc_line.lport and RLidp_port.lpt_type=RLfc_line.lpt_type.

An attempt to read the RLIDP_PORT relation using the original (non-BFG) keys was made because the IDP feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). IDP is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rLIDP_PORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rLIDP_PORT tuple.

342. FCIDPRDTRE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The possible problems associated with this assert are listed below.

1. An rLIDPRDTRE tuple is missing.
2. The data in the rLIDPRDTRE tuple is incorrect.

3. After digit analysis of an extension derived from a 10-digit public directory number (DN) using the RLIDPRDTRE and RLIDPRICOM relations, it was discovered that the DN derived from these relations is not a public DN. Since the DN used to derive the extension is public, the DN resulting from the RLIDP_DTRE and RLIDP_ICOM relations must be public.
4. After digit analysis of an extension derived from a 10-digit public DN using the RLIDPRDTRE and RLIDPRICOM relations, it was discovered that the DN derived from these relations was not the same DN that was used to derive the extension. The reverse intercom (extension) data is not in sync with the forward intercom data.
5. An extension number derived from a 10-digit public DN using the RLIDPRDTRE and RLIDPRICOM relations did not go through individualized dialing plan (IDP) digit analysis as an extension. The IDP digit trees for the user do not match the data that is in the RLIDPRDTRE and/or RLIDPRICOM relation.
6. An extension number that was not derived from the public DN went through IDP digit analysis as an extension. The IDP digit trees for the user made the public DN go through as an extension even though the RLIDPRDTRE and RLIDPRICOM relations were not built to derive an extension.
7. An extension number was derived from a 10-digit public DN using the RLIDPRDTRE and RLIDPRICOM relations; however, this number was not built into the IDP digit analysis trees (RLIDP_DTRE and RLIDP_ICOM). Therefore, the reverse intercom (extension) trees do not match the forward intercom data. The end user may complain of being routed to an unexpected location. This could happen in the call forwarding case when an extension is derived for the call forward to DN, the IDP of the user has USEOFFC as the error treatment, and the extension looks like a number defined in the office dialing plan.

Data Structures:

RLIDPRDTRE. Key fields: IDP group ID, table ID, digit.

RLIDPRICOM. Key field: IDP group ID.

RLIDP_DTRE, RLIDP_ICOM.

For problems 1 and 2, the keys and the NPANXX of the 10-digit public DN used to derive the extension will be printed on the ROP.

For problems 3 through 7, the NPANXX of the 10-digit public DN used to derive the extension will be printed on the ROP.

Action:

For problems 1 or 2, the assert fires in the MCid_intcm() function (MCrvicom.c). Verify that the rLIDPRDTRE tuple is not missing or that the tuple's data is correct via RC/V View 9.27 (IDP REVERSE CODE ASSIGNMENT).

For problem 3, the assert fires in the MCintercom() function (MCintercom.c). Verify that the extension derived from the output NPANXX and/or NXX via the RLIDPRDTRE and RLIDPRICOM relations results in the same public DN derived from the RLIDP_DTRE and RLIDP_ICOM relations. The RC/V views that are not in sync are: View 9.12 (IDP INTERCOM), View 9.13 (IDP DIALED CODE ASSIGNMENT), View 9.26 (IDP REVERSE INTERCOM RANGE), and View 9.27 (IDP REVERSE CODE ASSIGNMENT).

For problems 4 or 7, the assert fires in the MCid_ckext() function (MCrvicom.c). Verify that the extension derived for the output NPANXX via RC/V Views 9.26 and 9.27 (for the RLIDPRDTRE and RLIDPRIDOM relations) results in the same public DN derived via RC/V Views 9.12 and 9.13 (for the RLIDP_DTRE and RLIDP_ICOM relations). Or, verify that the extension is built in the IDP group with ICMUSE as the action on RC/V View 9.13 with an appropriate range description on RC/V View 9.12. Fix the problem via RC/V Views 9.12, 9.13, 9.26, and 9.27 by (a) inserting the missing data, (b) deleting the unwanted data, or (c) correcting the data.

For problems 5 or 6, determine if an extension can be derived for the output NPANXX from RC/V Views 9.26 and 9.27. If so, verify that the extension derived from the RLIDPRDTRE and RLIDPRICOM relations has ICMUSE as the action on RC/V View 9.13 with an appropriate range description on RC/V View 9.12. Otherwise, if an extension

cannot be derived from the NPANXX, verify that the (dialable form of the) DN does not have ICMUSE as the action on RC/V View 9.13.

343. FCIDPRICOM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIDPRICOM relation, a failure code of DBNO_MATCH was returned. An rIIDPIRCOM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIDPIRCOM. Key fields: RICOM_RNG, IDP_GPID.

Action:

This is a database inconsistency that can only be corrected by manual action. Add an rIIDPIRCOM tuple with the RICOM_RNG and IDP_GPID keys on the ROP output.

344. FCIMPDGTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rINMIMPDGT tuple was read successfully, but at least one of its attributes is incorrect. It is suspected that the nxx attribute contains nulls, and the call for which this tuple was accessed had less than seven digits (an abbreviated signaling call). For abbreviated signaling calls, the nxx attribute MUST be filled in with the office code of the final destination; nulls (' ') are not acceptable.

Data Structures:

RLNMIMPDGT. Key fields: trntbl, steering, prefix.

The keys and nxx attribute of the tuple in error are dumped in this order: 1. trntbl (type DMTRNTBL), 2. steering (an array of length 3, type DMNXX, padded on the RIGHT with nulls), 3. prefix (type DMPREFIX, 3 bits), and 4. nxx (an array of length 3, type DMNXX).

Action:

Examine RC/V View 9.5 (INCOMING TRUNK DIGITS OFFICE DIALING) for correctness, specifically the "implied nxx" field. The nxx field must be filled in with the office code of the final destination.

345. FCINASP_TP (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: ASPTP	Audit Mode: elev

Problem:

The dynamic access primitive DAahhcj() failed to add an rIASP_TP tuple to the idle list

Probable Cause:

This might occur when the existing office is grown to be a service switching point (SSP). The trigger function tries to allocate the dynamic structure RLASP_TP and add it to the idle list. The problem might also occur when the call is torn down and this dynamic resource is released and returned to the idle list.

Action:

The ASPTP audit is scheduled to clean up.

346. FCINMSGMWI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message waiting indicator (MWI) terminal process (TP) received an operating system for distributed switching (OSDS) message type that is not valid for the MWI TP to process. (The type was not MGINTPCM.)

347. FCINNS_BILL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSBILL	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAahninb() failed to add an rINS_BILL tuple to the idle list. This might occur when the existing office is grown to be a service switching point (SSP). The trigger function tries to allocate the dynamic structure RLNS_BILL and add it to the idle list. This problem might also occur when the call is torn down and this dynamic resource is released and returned to the idle list.

348. FCINNS_IDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSIDX	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAathcni() failed to add an rINS_IDX tuple to the idle list. This might occur when the existing office is grown to be a service switching point (SSP). The trigger function tries to allocate the dynamic structure RLNS_IDX and add it to the idle list. This might also occur when the call is torn down and this dynamic resource is released and returned to the idle list.

349. FCINSATCALL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ATCALL	Audit Mode: elev

Problem:

A failure occurred while trying to insert, add, link, or idle a rLATCALL tuple. The ATCALL audit is scheduled to clean up the RLATCALL relation.

350. FCINSDISP (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: ASPDISP	Audit Mode: elev

Problem:

An attempt to insert, add, link, or idle rASPDISP tuples failed. The ASPDISP audit is scheduled to clean up the RLASPDISP relation. This assert can fire when using RC/V View 8.17 (DIRECT SIGNALING APPLICATION) to insert the advanced services platform (ASP) 0.1B application. The assert can also fire when the call is torn down and this dynamic resource is released and returned to the idle list.

351. FCINSDYN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfintup() function failed to insert a tuple in a dynamic relation. The stack dumped has the relation ID for which the insert failed.

352. FCINSFRNAMA (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: FRNAMA	Audit Mode: elev

Problem:

An attempt to insert, add, link, or idle RLFRN_AMA tuples failed. The AUFRNAMA audit is scheduled to clean up the

RLFRN_AMA relation. This assert can fire when using RC/V 8.17 (Direct Signaling Application) to insert the Advanced Services Platform (ASP) 0.1B application. The assert can also fire when the call is torn down and this dynamic resource is released and returned to the idle list.

353. FCINSNSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSDB	Audit Mode: elev

Problem:

An attempt to insert, add, link, or idle rINSDB tuples failed. The NSDB audit is scheduled to clean up the relation so that the advanced services platform (ASP) capability can be successfully inserted. This problem occurs when using RC/V View 8.17 (DIRECT SIGNALING APPLICATION) to delete or insert ASP capabilities. This problem might also occur when the call is torn down and this dynamic resource is released and returned to the idle list.

354. FCINSTATDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TATDB	Audit Mode: elev

Problem:

An attempt to insert, add, link, or idle rTATDB tuples failed. The TATDB audit is scheduled to clean up the RLSTATDB relation. This assert can fire when using RC/V View 8.17 (DIRECT SIGNALING APPLICATION) to insert the advanced services platform (ASP) 0.1B application. The assert can also fire when the call is torn down and this dynamic resource is released and returned to the idle list.

355. FCINSTRANS (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: ASPTRANS	Audit Mode: elev

Problem:

An attempt to insert, add, link, or idle rIASPTRANS tuples failed. The ASPTRANS audit is scheduled to clean up the RLASPTRANS relation. This assert can fire when using RC/V View 8.17 (DIRECT SIGNALING APPLICATION) to insert the advanced services platform (ASP) 0.1B application. The assert can also fire when the call is torn down and this dynamic resource is released and returned to the idle list.

356. FCINSTXNIF (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: TXNINFO	Audit Mode: elev

Problem:

An attempt to insert, add, link, or idle rITXN_INFO tuples failed. The TXN_INFO audit is scheduled to clean up the RLTXN_INFO relation. This assert can fire when using RC/V View 8.17 (DIRECT SIGNALING APPLICATION) to insert the advanced services platform (ASP) 0.1B application. The assert can also fire when the call is torn down and this dynamic resource is released and returned to the idle list.

357. FCINTN_INFO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TNINFO	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAahnitn() failed to add an rITN_INFO tuple to the idle list. This might occur when the existing office is grown to be a service switching point (SSP). The trigger function tries to allocate the dynamic structure RLTN_INFO and add it to the idle list. This problem might also occur when the call is torn down and this dynamic resource is released and returned to the idle list.

358. FCINVAPDATA (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: INVAPDATA	Audit Mode: elev

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A rICMAPDATA tuple is missing or an invalid key was used to read the relation.

Data Structures:

The key of AP site ID will be printed out on the receive-only printer (ROP).

Action:

A read of the rICMAPDATA relation to retrieve AP site information has failed. The return from this read was DBNO_MATCH. This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

359. FCINV_GPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The account code (ACCT) group ID in an rIACCT_PRT tuple is zero.

The logical port attempting to use the ACCT feature has the ACCT feature assigned. The ACCT feature ID exists in the RLTRMFEATS relation for the originating logical port.

The logical port was assigned an ACCT feature in an rIACCT_PRT tuple, but the logical port was not assigned to a valid ACCT group. The ACCT group ID is zero.

Data Structures:

RLACCT_PRT.

The ROP output indicates the SM number (MOD), the source file and line number, the originating logical port (LPORT), the logical port type (LPT TYPE), and the invalid ACCT group ID (GROUP ID).

Action:

Use RC/V (or ODBE, if necessary) to find the entity for the logical port. Use the lport and lpt_type provided in the ROP output to read the RLLPT_PT relation to get the port and party.

Use the following OP:CONV master control center (MCC) command to find the entity for the port; that is, telephone number (TN), multi-line hunt group (MLHG), or trunk.

OP:CONV,PORT="mod"-h"port"

In this command, "mod" is the SM number and "port" is the port found in the RLLPT_PT relation.

Use the appropriate RC/V view to assign a valid ACCT group ID to this entity - View 1.42 (ACCOUNT CODE LINE PARAMETERS) or View 5.42 (ACCOUNT CODE TRUNK PARAMETERS).

360. FCINVMSGRASP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected request message was received by the remote access system process (RASP). The request message was ignored.

361. FCINVMWITP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The message waiting indicator (MWI) terminal process (TP) entry function was entered with an invalid reason. The reason for entry was not the creation of the MWI TP.

362. FCINVMWRFTP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The analog visual message waiting indicator refreshing (AVMWIR) terminal process (TP) entry function was entered with an invalid reason. The reason for entry was not the creation of the AVMWIR TP.

363. FCINVSLOT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid (out-of-range) RLCFSCOP key (slot) was passed as a parameter to a call forwarding function. The RLCFSCOP key will be dumped in the stack frame as a parameter to the function.

364. FCINVTNSC2DAS (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Missing terminating selection code (TNSC) to DAS translation A return code of DBNO_MATCH was returned from DBfrdtup while reading the RLLDPTNSC relation with a NSC returned TNSC as the key.

Data Structures:

TNSC value returned from SCP

Action:

Insert new TNSC value as key on RC/V View 8.53.

365. FCIPNSTRIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect protocol value is present in the RLNS_TRIG relation. The value must be TC_R0D1 for the NESS application.

Data Structures:

RLNS_TRIG. Key field: trigger number.

Action:

Use RC/V View 9.35 to change the protocol associated with the referenced trigger to TC_R0D1 (i.e., Release 0.1B).

366. FCISPRTIBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while reading the RLRT_SCRNING relation for an intermediate switching point (ISP) stand-alone call. A route index (RTI) of REGL (0) was returned by RC/V View 10.10 (SCREENING [CHARGING]) for the given screen index, code index, and prefix. Since REGL is not a valid value for an ISP stand-alone call, the call cannot be routed. The call will be sent to reorder.

Data Structures:

RLRT_SCRNING. Key fields: screen_x, dest_x.

The screen_x key is from the RLFC_OPRTK relation which is accessed by the trunk group. The dest_x key is from the RLFC_DIOPR relation which is accessed by the carrier ID and feature group. The prefix parameter is None or 1+ (as in this case).

Action:

Use RC/V (or ODBE, if necessary) to change the RTI to a valid non-REGL value for the given screen index, code index, and prefix, or change one or both of the keys (screen index and code index) for this call. This will allow RC/V View 10.10 to return a valid non-REGL RTI.

367. FCISPSCRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the keys used to read the RLRT_SCRNING relation or the rIRT_SCRNING tuple is missing for an intermediate switching point (ISP) call.

Data Structures:

RLRT_SCRNING. Key fields: scrn_idx, dest_idx, FCPFX_NONE.

The scrn_idx key is from the RLFC_OPRTK relation which is accessed by the trunk group. The dest_idx key is from the RLFC_DIOPR relation which is accessed by the carrier ID. FCPFX_NONE is a constant.

Action:

Use RC/V (or ODBE, if necessary) to crosscheck the key set used for accessing the RLRT_SCRNING relation with the actual keys for the relation. Verify that this tuple does or does not exist. Add the tuple if it is missing.

368. FCIVLFEATCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of business and residential custom services (BRCS) feature entries requested exceeds the maximum number of features allowed. The feature count value (tup_ptr->feat_cnt) that was passed to the FCpfrdtup() function was initialized incorrectly, or the feature count (feat_cnt attribute) in the rIDN_FEATS or rTRMFEATS tuple is incorrect. The FCpfrdtup() function will return failure to the calling function which may or may not complete the phone call.

369. FCLNADB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ADB	Audit Mode: elev

Problem:

Failed to link an rIADB tuple to the idle list. An audit was scheduled to recover the list.

370. FCLNAPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APB	Audit Mode: elev

Problem:

Failed to link associated process block (APB) to idle list.

Probable Cause:

Corrupted APB list linkage.

Action:

APB audit will be requested to clean up.

371. FCLNARPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During automatic route selection (ARS) initialization for leased network (LN) query (LN_QRY) or intermachine (LN_IMT) calls, a database read of the RLARPORT relation failed to find a tuple. The affected call was sent to reorder. LN calls for the indicated trunk will not complete until this problem is corrected.

Data Structures:

RLARPORT. Key fields: lport, lpt_type.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. To find the port of the trunk in question, read the RLLPT_PT relation using the original keys (lport and lpt_type) from the ROP output.
2. Read the RLFC_TRUNK relation (where RLfc_trunk.port.member is RLlpt_pt.port and RLfc_trunk.port.module is the SM number) to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brcs_trm). ARS is a BRCS terminal feature.
3. The brc_trm value from RLFC_TRUNK must be DBYES. If it is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_TRUNK is DBYES, then the lport and lpt_type from RLFC_TRUNK must equal the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rLARPORT tuple must exist for the original keys where RLarport.lport is RLfc_trunk.lport and RLarport.lpt_type is RLfc_trunk.lpt_type. Insert the appropriate rLARPORT tuple.

There is no RC/V procedure to fix this error. For details on ARS data population, refer to the "BRCS Feature Definitions" section of the 5ESS® Switch Recent Change Procedures Text Interface manual.

372. FCLNBRCS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCSDB	Audit Mode: elev

Problem:

Failed to link an rIBRCSDB tuple to the idle list. An audit was scheduled to recover the list.

373. FCLNBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the leased network (LN) transaction handler function FCIntrhdlr() which was communicating with the network control point (NCP) to get routing information. The call affected was sent to reorder.

Action:

No action is required if this assert occurs singularly. If this assert starts to roll, call your next level of support.

374. FCLNCBDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to insert an rICBDB tuple into the idle list. An audit was scheduled to clean up.

375. FCLNCBPC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

An unsuccessful attempt was made to link an rICBDB tuple and an rPCBLA tuple. As a result, the FCsemiglob[] array data that is stored in the rICBDB tuple can not be accessed. The call can not be completed; it is terminated with a single process purge.

376. FCLNCLDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLDB	Audit Mode: elev

Problem:

Failed to link an rICLDB tuple to the idle list. An audit was scheduled to recover the list.

377. FCLNDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

Failed to link an rIDALB tuple to the idle list. An audit was scheduled to clean up the list.

378. FCLNEDSLANI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A leased network (LN) call requiring a query to the LN network control point (NCP) was made on an extended digital subscriber line (ESDL) trunk, but the trunk does not have a 10-digit automatic number identification (ANI). At the action point (ACP) for the LN application, the ANI for a LN query (QRY) call must be 10 digits to allow primary rate interface (PRI) access to the LN. The affected call was sent to reorder. No LN QRY calls will complete for the indicated trunk group until this problem is corrected.

Data Structures:

RLDSLTRKG. Key field: trunk group number.

The port.member and port.module for the trunk used in the call, as well as the number of ANI digits used in the call are dumped.

Action:

If the trunk group is a LN QRY group, use RC/V View 5.1 (TRUNK GROUP) to update the "BILLING DN" field with a 10-digit ANI. (Refer to the population rules for the RLFC_TRUNK relation in the 5ESS® Switch Translation Data Manual for instructions on how to construct the ANI.)

If the trunk is not a valid LN QRY trunk, notify your next level of support.

379. FCLNFFINTF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Call processing vs leased network (LN) transaction handler interface problems occurred. A transaction initialization is requested by call processing without passing a route request message pointer (struct mgRT_REQ *) and/or a digit collection data block (DCDB) buffer pointer (FC_DCDB *). The call affected was sent to reorder.

Action:

If this assert starts to roll, call your next level of support.

380. FCLNFINTF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The leased network (LN) transaction handler is processing an invalid call status. The interface buffer (FCTRCPINTF) which contains relevant information regarding the call being processed is dumped. The call is sent to reorder.

Action:

No action is required if this assert occurs singularly. If this assert starts to roll, call your next level of support.

381. FCLNISDNANI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A leased network (LN) call requiring a query to the LN network control point (NCP) was made on a integrated services digital network (ISDN) line, but the line does not have a 10-digit automatic number identification (ANI). This allows base rate interface (BRI) access to the LN. At the action point (ACP) for the LN application, the ANI for a LN query (QRY) call must be 10 digits. The affected call was sent to reorder. No LN calls will complete for the indicated line until this problem is corrected.

Data Structures:

RLFC_LINE. Key fields: port.member, port.module, party.

The number of ANI digits used for the call is also dumped.

Action:

Use RC/V (or ODBE, if necessary) to supply a 10-digit ANI to the line or update the line's LN type. If the BRI/ISDN line should remain a LN QRY facility, use RC/V View 23.2 (DIGITAL SUBSCRIBER LINE) for individual lines and RC/V View 3.5 (MULTILINE HUNT GROUP LINE ASSIGNMENT) for multi-line hunt groups to update the billing number field. (Refer to the population rules for the RLFC_LINE relation in the 5ESS[®] Switch Translations Data Manual for instructions on how to construct the ANI.) This modification can also be done using ODBE to update the line's rLISLINEDN tuple with a 10-digit ANI in the billdn attribute.

If the ISDN line is not a valid LN QRY line, use RC/V View 23.2 (DIGITAL SUBSCRIBER LINE) to update the LN TYPE field to the appropriate value. This modification can also be done using ODBE to update the ln_type attribute in the rLFC_LINE tuple to the appropriate value.

382. FCLNLSCMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LSCMDB	Audit Mode: elev

Problem:

Failed to link an rLSCMDB tuple to the idle list. An audit was scheduled to recover the list.

383. FCLNMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MDB	Audit Mode: elev

Problem:

Failed to link an rIMDB tuple to the idle list. An audit was scheduled to recover the list.

384. FCLNNOCAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A route fail message returned from the routing and terminal allocation (RTA) process for leased network query (LN_QRY) or leased network no query (LN_NOQRY) calls, indicates that carrier selection should be done. However, carrier selection is not allowed for LN calls. An invalid tuple with a non-zero carrier_id is populated for the given route index in the RLRT_MCRT relation. The affected call was sent to reorder. LN calls that use the indicated route index will not complete until this problem is corrected.

Data Structures:

RLRT_MCRT.

Action:

Use RC/V View 10.4 (MC ROUTE INDEX EXPANSION) to check the carr_id field in the RLRT_MCRT relation. The carr_id field should be null for this route index. If it is not, change it to null.

If the call still does not complete, contact your next level of support.

385. FCLNPFANI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A leased network (LN) call requiring a query to the LN network control point (NCP) was made on a private facility (PF) or PF flash repeating (PFLASH) trunk, but the trunk does not have a 10-digit automatic number identification (ANI). At the action point (ACP) for the LN application, the ANI for a LN query (QRY) call must be 10 digits. The affected call is sent to reorder. No LN QRY calls will complete for the indicated trunk group until this problem is corrected.

Data Structures:

RLPF_TKDN. Key fields: member, module.

The trunk group number of the trunk used in the call and the number of ANI digits used in the call are dumped.

Action:

Determine if the trunk is a valid LN QRY trunk. If the trunk is a valid LN QRY trunk, use RC/V View 5.1 (TRUNK GROUP) to modify the field "BILLING DN". This modification can also be done using ODBE to insert an rIPF_TKDN tuple for the trunk with a 10-digit ANI in the dn attribute or update the existing rIPF_TKDN tuple with a 10-digit ANI. (Refer to the population rules for the RLFC_TRUNK relation in the 5ESS® Switch Translations Data Manual for instructions on how to construct the ANI.)

If the trunk is not a valid LN QRY trunk, notify your next level of support.

386. FCLNSCMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SCMDB	Audit Mode: elev

Problem:

An attempt to link an rSCMDB tuple to the idle list failed. An audit has been scheduled to recover the list.

387. FCLNTCMDG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During collection of the dialed digits, two digits are collected for the traveling class mark (TCM). For leased network (LN) query calls, only one digit is allowed for the TCM. LN calls for the indicated port will not complete until this problem is corrected.

Data Structures:

RLARPORT.

Action:

Read the rLARPORT tuple keyed by the logical port and the lpt_type (OTHER). The value for the tcmin attribute should be 1 for the LN call. Correct the tcmin value using RC/V View 5.21 (AUTOMATIC ROUTE SELECTION TRUNK PARAMETERS).

388. FCLPCE9 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAIpce9() failed to link the given rIPCBLA tuple to the given enhanced 911 data block tuple rIE911DB. The process control block link area (PCBLA) audit is run. In the ROP output, field 1 provides the rIPCBLA tuple key (this is the process number where the error occurred) and field 2 provides the rIE911DB tuple key.

The call will not be torn down since the rIE911DB tuple is not critical for completing the call. If this assert occurred in an originating terminal process (OTP), the OTP will not be able to alternate route the call since the alternate routing data could not be stored. Also, the selective transfer data will not be available to send to the terminating terminal process (TTP).

If this assert occurred in a TTP, the selective transfer data was not stored and the enhanced 911 (E911) attendant will not be able to do a selective transfer. Manual or fixed transfers will still work.

389. FCLPTSPID (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error resulted in reading the virtual relation RLLPTSPID. Either the static rLPT_SPID tuple (the storage form for rLPTSPID) is missing or the keys used to access the tuple are invalid.

Data Structures:

RLLPTSPID. Key fields: lport, lpt_type .

The lport (logical port) and lpt_type (logical port type) keys are printed in decimal format on the ROP.

Action:

- (1) Verify that the keys are valid.
- (2) If the keys are valid, use ODBE with the batch read (BR) option to read the RLSPID relation into a *UNIX*[®] file.

- (3) Use a *UNIX*® editor or the grep command to find the rISPID tuple with the ckt_lport attribute value that matches the lport value on the ROP.
- (4) If the rISPID tuple exists, use ODBE to insert the rLPT_SPID tuple with the lport and lpt_type keys on the ROP. The values for the locdnn, npid, and natype attributes are taken from the rISPID tuple.
- (5) If the rLPT_SPID tuple was assigned through standard office data administration (ODA) or RC/V, file a trouble report.

390. FCLPTSPID (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPT_SPID tuple with the given keys could not be found in the static database. The rLPT_SPID tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLLPT_SPID. Key fields: lport, lpt_type.

The lport (logical port) and lpt_type (logical port type) keys are printed in decimal format on the ROP.

Action:

1. Verify that the keys are valid.
2. If the keys are valid, use ODBE with the batch read (BR) option to read the RLSPID relation into a *UNIX*® file.
3. Use a *UNIX*® editor or the grep command to find the rISPID tuple with the ckt_lport attribute value that matches the lport value on the ROP.
4. If the rISPID tuple exists, use ODBE to insert the rLPT_SPID tuple with the lport and lpt_type keys on the ROP. The values for the epdn, npid, and natype attributes are taken from the rISPID tuple.
5. If the rLPT_SPID tuple was assigned through standard office data administration (ODA) or RC/V, file a trouble report.

391. FCLSF_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSF_CF relation, a failure code of DBNO_MATCH was returned. An rLSF_CF tuple is missing or the key used to read this relation was not set properly. The key value feat_id will be printed on the ROP.

Data Structures:

RLLSF_CF. Key field: feat_id.

Action:

The port attempting to use a local area signaling services (LASS) selective feature (SCF, SCR, SDA, SCA, CAR) has a feature assigned (an rIDN_FEATS tuple exists for the ltm_idx and ltm_type), but no rLSF_CF tuple exists that is associated the LASS selective feature ID.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and CMP.

1. Use the feat_id provided in the ROP output to read the RLFD2NAME relation in the CMP where

RLfid2name.facid is the LASS selective feature (LSF) feature ID, RLfid2name.class is FACBRCS, and RLfid2name.subclass is SCL_NULL.

2. If an rLFID2NAME tuple does not exist for the LSF feature ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

3. If an rLFID2NAME tuple does exist for the LSF feature ID, insert the appropriate rLSF_CF tuple in the indicated SM. Since RLLSF_CF is an SM redundant relation, the values for RLLSF_CF can be found by reviewing the same tuple in another SM.

392. FCLSFHCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFHCA relation, a failure code of DBNO_MATCH was returned. An rLSFHCA tuple is missing or the key used to read this relation was not set properly. The key value grpnum will be printed on the ROP.

Data Structures:

RLLSFHCA. Key field: grpnum. This is a database inconsistency that can only be corrected by manual action.

393. FCLSFHCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFHCF relation, a failure code of DBNO_MATCH was returned. An rLSFHCF tuple is missing or the key used to read this relation was not set properly. The key value grpnum will be printed on the ROP.

Data Structures:

RLLSFHCF. Key field: grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

394. FCLSFHCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFHCR relation, a failure code of DBNO_MATCH was returned. An rLSFHCR tuple is missing or the key used to read this relation was not set properly. The key value grpnum will be printed on the ROP.

Data Structures:

RLLSFHCR. Key field: grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

395. FCLSFHDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFHDA relation, a failure code of DBNO_MATCH was returned. An rILSFHDA tuple is missing or the key used to read this relation was not set properly. The key value grpnum will be printed on the ROP.

Data Structures:

RLLSFHDA. Key field: grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

396. FCLSFSCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFSCA relation, a failure code of DBNO_MATCH was returned. An rILSFSCA tuple is missing or the keys used to read this relation were not set properly. The key values sca_idx and range, along with the ltm_index and ltm_type will be printed on the ROP.

Data Structures:

RLLSFSCA. Key fields: sca_idx, range.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call acceptance (SCA)/computer access restriction (CAR) feature, no action is required.

Otherwise, this is a database inconsistency that can only be corrected by manual action. Contact your next level of support.

397. FCLSFSCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFSCF relation, a failure code of DBNO_MATCH was returned. An rILSFSCF tuple is missing or the keys used to read this relation were not set properly. The key values scf_idx and range, along with the ltm_index and ltm_type will be printed on the ROP.

Data Structures:

RLLSFSCF. Key fields: scf_idx, range.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call forwarding (SCF) feature, no action is required.

Otherwise, this is a database inconsistency that can only be corrected by manual action. Contact your next level of support.

398. FCLSFSCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFSCR relation, a failure code of DBNO_MATCH was returned. An rILSFSCR

tuple is missing or the keys used to read this relation were not set properly. The key values scr_idx and range, along with the ltm_index and ltm_type will be printed on the ROP.

Data Structures:

RLLSFSCR. Key fields: scr_idx, range.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call rejection (SCR) feature, no action is required.

Otherwise, this is a database inconsistency that can only be corrected by manual action. Contact your next level of support.

399. FCLSFSDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFSDA relation, a failure code of DBNO_MATCH was returned. An rILSFSDA tuple is missing or the keys used to read this relation were not set properly. The key values sda_idx and range, along with the ltm_index and ltm_type will be printed on the ROP.

Data Structures:

RLLSFSDA. Key fields: sda_idx, range.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective distinctive alerting (SDA) feature, no action is required.

Otherwise, this is a database inconsistency that can only be corrected by manual action. Contact your next level of support.

400. FCLSNTWK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A local area signaling services (LASS) transaction capabilities application part (TCAP) failure occurred because of incorrect common channel signaling version 7 (CCS7) network data. Data in this office is inconsistent with data in a CCS signal transfer point (STP) or with data in another end office within the LASS network. Because of this failure, customer invocations of LASS features are routed to denial announcements.

Case 1: No table exists for this global title translation type. The node (typically an STP) that was instructed to perform a global title translation for LASS is not equipped with a translation table for LASS. Therefore, the STP and this office are using different values for the LASS translation type.

Case 2: The far end office [the one that owns the queried directory number (DN)] does not recognize the value of the LASS subsystem number assigned to it by the translating node (typically an STP).

Data Structures:

RLDS_APP. Key field: CCLASS.

Action:

Case 1: Use RC/V View 8.17 (DIRECT SIGNALING APPLICATION) with the key equal to LASS to update the value

of the LASS translation type. Set the translation type to the value used by the translating nodes. The data administrators for the translating nodes (STPs) should be able to provide this information.

Case 2: Verify the data given for Case 1. If that data is correct, this problem cannot be corrected in this office. Report the problem to the data administrators for the translating nodes (STPs). There are normally two translating nodes and either one could be causing the problem.

401. FCLTATPLER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLTSBDB	Audit Mode: elev

Problem:

Failed to add the rDLTSBDB tuple to the tail of the idle list. An audit has been scheduled on rDLTSBDB.

402. FCLTBRMSER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A line time slot bridging (LTSB) MGLTSBBARG message was received by a LTSB shared call system process (SCSP). The message status and module fields were inconsistent with the SM SCSP state where the message was received.

When the message status is DBYES, only an LTSB SCSP acting in a non-lead capacity can receive the message. If the message status is DBNO, only the lead SM SCSP can receive the message and only when a lead port barging non-lead attempt failed to find the non-lead SM LTSB terminating process (TP) for the non-lead port that was supposed to be on a call.

403. FCLTCOSER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line time slot bridging (LTSB) capability only supports FC_INDVDL, FC_TWOPTY, and FC_2PTY for class of service (COS).

Data Structures:
RLLTSBPORT.

Action:

Use RC/V (or ODBE, if necessary) to check the COS. If the COS is incorrect, change it to the appropriate COS.

404. FCLTEXTMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line time slot bridging model (LTSM) received an external message that is not expected. The LTSM does not know what to do with this message.

405. FCLTGTUPER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLTSBDB	Audit Mode: elev

Problem:

An attempt to get an rDLTSBDB tuple from the idle list failed.

406. FCLTINTMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line time slot bridging model (LTSBM) received an internal message from one of its sibling models that it does not recognize. The LTSBM does not know what to do with this message, as it did not expect it. The LTSBM model data block (MDB) will be dumped.

407. FCLTLINKER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLTSBDB	Audit Mode: elev

Problem:

An attempt to link the call link data block (CLDB) and an rDLTSBDB tuple failed. An audit on rDLTSBDB is scheduled.

408. FCLTM_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLTM_PORT relation, a failure code of DBNO_MATCH was returned. An rLTM_PORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLLTM_PORT. Key fields: LTM index.

Action:

This is a database inconsistency that can only be corrected by manual action.

409. FCLTREORER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to give a reorder tone failed.

410. FCLTSBPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to access an rLTSBPORT tuple in line time slot bridging (LTSB) failed. Possibly, no tuple exists for the lport key used. This key is supplied by a MGLTSBxxxx message which could be wrong. A third possible cause is a database error.

Data Structures:

RLLTSBPORT.

Action:

Verify that the rLTSBPORT tuple does not exist for the lport key printed. If it does not exist, verify that the lport key is valid. If lport is valid, add the missing rLTSBPORT tuple.

If the lport key is not valid, a message was corrupted or the code did not build the message properly (perhaps other data is also corrupted).

If the lport key is valid and an rLTSBPORT tuple exists for the key, use database system error procedures.

411. FCLTSCSPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed to send a line time slot bridging (LTSB) message from a LTSB shared call system process (SCSP) to a LTSM terminating process (TP) or to another LTSB SCSP.

In most cases, the calling function will be exited; but in a few cases, the function will try to deal with the error. A pointer to the message and the destination are printed. In all cases, the objective for which the message was sent will not be attained.

412. FCLTUNLKER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLTSBDB	Audit Mode: elev

Problem:

Failed to unlink an rDLTSBDB tuple from a call link data block (CLDB). An audit has been scheduled on rDLTSBDBS.

413. FCLTUXBRCS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected business and residential custom services (BRCS) message was received by a line time slot bridging (LTSB) process.

414. FCMDC_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following occurred:

1. An rIMDC_GRP tuple (keyed by MDC_GRP) is missing.
2. The rIMDC_GRP tuple (keyed by MDC_GRP) has an invalid application processor (AP) site ID.
3. An analog message service system (MSS) attendant with basic service is in the hunt group.

Data Structures:

RLMDC_GRP, RLRT_MHG.

Action:

For case 1, add the rIMDC_GRP tuple or reset the MDC flag in the rIRT_MHG tuple for the hunt group.

For case 2, correct the AP site ID in the rIMDC_GRP tuple.

For case 3, create the message desk center (MDC) group data by putting a valid non-zero AP site ID in the rIMDC_GRP tuple keyed by MDC_GRP. Delete the analog attendant from the hunt group or reset the MDC flag in the rIRT_MHG tuple keyed by MDC_GRP.

415. FCMDCINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid combination of the business customer ID (BCID) and message desk center (MDC) number was found in the RLMDC_GRP or RLMD5_GRP relation.

Data Structures:

RLMDC_GRP, RLMD5_GRP.

Action:

Modify the RLMDC_GRP or RLMD5GRP relation to assign the proper BCID to the user's message service center (MSC) for this particular user group.

416. FCMDRCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rICDR_CF tuple is missing. The port attempting to use the message detail recording (MDR) to customer location (CL) feature has an MDR to CL feature assigned, but no rIMDR_CF tuple exists that is associated with the MDR to CL feature ID. The MDR to CL feature ID exists in the RLTRMFATS relation for the dialing port.

Data Structures:

RLMDR_CF, RLFID2NAME.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the feature ID (FID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and AM. Use the MDR feature ID provided in the ROP output to read the RLFID2NAME relation in the AM where RLfid2name.facid is the MDR feature ID, RLfid2name.class is FACBRCS, and RLfid2name.subclass is SCL_NULL.

If an rLFID2NAME tuple does not exist for the MDR feature ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

If an rLFID2NAME tuple does exist for the MDR feature ID, insert the appropriate rIMDR_CF tuple in the indicated SM. Since RLMDR_CF is an SM redundant relation, the values for the rIMDR_CF tuple can be found by reviewing the same tuple in another SM.

417. FCMDRGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMDR_GP tuple is missing. The port attempting to use the message detail recording (MDR) to customer location (CL) feature has an MDR to CL feature assigned in the rIMDR_PORT tuple, but the MDR group ID is invalid or an rIMDR_GP tuple is missing. The MDR to CL feature ID exists in the RLTRMFATS relation for the dialing port.

Data Structures:

RLMDR_GP.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the MDR group ID (GROUP ID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and AM.

Use the MDR group ID provided in the ROP output to read the RLfid2NAME relation in the AM where RLfid2name.facid is the MDR group ID, RLfid2name.class is FACMDR, and RLfid2name.subclass is SCL_NULL.

If an rlfid2NAME tuple does not exist for the MDR group ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

If an rlfid2NAME tuple does exist for the MDR group ID, insert the appropriate rIMDR_GP tuple in the indicated SM where RLmdr_gp.grp_id is the MDR group ID.

Since the RLMDR_GP relation is a group partitioned relation, the RLDB_AMGPD, RLDB_IMGPD, and RLDB_GPDUS group partitioned control relations may also need to be updated.

418. FCMDRINVGPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message detail recording (MDR) group ID in an rIMDR_PORT tuple is zero. The logical port attempting to use the MDR feature was assigned to an MDR feature in the rIMDR_PORT tuple, but it was not assigned to a valid MDR group ID. The MDR feature ID exists in the RLTRMFETS relation for the dialing port.

Data Structures:

RLMDR_PORT.

The ROP output indicates the SM number (MOD), the source file and line number, the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use RC/V (or ODBE, if necessary) to find the entity for the logical port.

1. Use the lport and lpt_type provided in the ROP output to read the RLLPT_PT relation to find the port and party.
2. Use the OP:CONV master control center (MCC) command to find the entity for the port - telephone number (TN) or trunk.

OP:CONV,PORT="mod"-h"port"

where "mod" is the SM number and "port" is the port found in RLLPT_PT.

Use RC/V View 1.33 (MESSAGE DETAIL RECORDING LINE PARAMETERS) or View 5.33 (MESSAGE DETAIL RECORDING TRUNK GROUP PARAMETERS) to assign a valid MDR group ID to this entity.

419. FCMDRPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMDR_PORT tuple is missing.

Data Structures:

RLMDR_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - logical port (lport) and logical port type (lpt_type).

Action:

The message detail recording (MDR) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the MDR feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLMDR_PORT relation where RLmdr_port.lport=RLfc_line.lport and RLmdr_port.lpt_type=RLfc_line.lpt_type.

An attempt to read the RLMDR_PORT relation using the original (non-BFG) keys was made because the MDR feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). MDR is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should equal the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rIMDR_PORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rIMDR_PORT tuple.

420. FCMDS_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMDS_CF tuple is missing. The key to this relation is obtained from the RLDN_FEATS relation.

Data Structures:

RLMDS_CF, RLDN_FEATS.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLMDS_CF relation with the actual keys used to access the relation. Verify that the tuple in question exists, if not the tuple must be added.

421. FCMDS_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMDS_GRP tuple is missing. The key to this relation is obtained from the RLMDS_PORT relation.

Data Structures:

RLMDS_GRP, RLMDS_PORT.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLMDS_GRP relation with the actual keys used to access the relation. Verify that the tuple in question exists, if not it must be added.

422. FCMDS_IGR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message desk service (MDS) group ID (zero) exists in an rIMDS_PORT tuple. The key to this relation is obtained from the RLDN_FEATS relation.

Data Structures:

RLMDS_PORT, RLDN_FEATS.

Action:

Use RC/V (or ODBE, if necessary) to populate the rIMDS_PORT tuple with a valid, non-zero MDS group ID.

423. FCMDS_INVAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rIMDS_GRP tuple contains an invalid entry in the ap_id field or the FCMSS2AP() macro was misused.

Data Structures:

RLMDS_GRP.

Action:

Use RC/V (or ODBE, if necessary) to verify the correct population of the rIMDS_GRP tuple. Verify that the ap_id contains a valid entry.

424. FCMDS_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMDS_PORT tuple is missing. The key to this relation is obtained from the RLDN_FEATS relation.

Data Structures:

RLMDS_PORT, RLDN_FEATS.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLMDS_PORT relation with the actual keys to access the relation. Verify that the tuple in question exists, if not it must be added.

425. FCMHG_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rIMHG_CF tuple during call forwarding (CF) activation on a multi-line hunt group (MLHG). The rIMHG_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLMHG_CF. Key field: grpnum.

Action:

Verify that an rIMHG_CF tuple exists on the originating module. If not, redefine the associated MLHG then try CF activation again.

426. FCMHG_TGSR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLMHG_TGSR relation resulted in a DBNO_MATCH. An rIMHG_TGSR tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLMHG_TGSR. Key field: mlhgrp.

Action:

Use RC/V (or ODBE, if necessary) to add an rIMHG_TGSR tuple with the mlhgrp key on the ROP.

427. FCMQSET1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An MGTKQ_TERM message was not received.

428. FCMQSET2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid terminating port type was encountered.

429. FCMQWHN1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the priority delay treatment relation RLQU_PRI.

Data Structures:

RLQU_PRI.

Action:

Use RC/V (or ODBE, if necessary) to determine if the priority delay treatment is assigned to the offhook queuing.

430. FCMQWHN2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) primitive failed to access the trunk queue owner block from the queue member block. Possibly, invalid linkage was found between the two blocks. The program will clean up the problem.

431. FCMSFREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message service system (MSS)/electronic directory service (EDS) system process received an MGINTPCM message with an invalid feature verification request.

432. FCMSGFLRASP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote access system process (RASP) received a failure from the OSWGETMSG() primitive indicating that an invalid message was received.

433. FCMSINVACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action code was encountered for a message service system (MSS) feature. This problem causes the MSS feature to fail.

434. FCMSMWIDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MSMWIDA	Audit Mode: elev

Problem:

The DAathcmw() or DARshcmw() dynamic access (DA) primitive returned DBNO_OWNER, DBBAD_ADD, DBBAD_RM, or DBSYS_ERR. The RLMSMWIDA relation read by the key field invoke_id caused one of these error return values.

If DBNO_OWNER was returned, the owner tuple (DBMSMWIIDLE or DBMSMWIBUSY) does not exist with the invoke_id key that was given as a parameter. If DBBAD_ADD was returned, the invoke_id key given as a parameter is already owned in a set (DBMSMWIBUSY/IDLE). If DBBAD_RM was returned, the invoke_id key given as a parameter is invalid for the set (DBMSMWIBUSY/IDLE). If DBSYS_ERR was returned, the existing linkages between the RLDB_HEADC relation (DBMSMWIIDLE/BUSY) and the RLMSMWIDA relation are corrupted. An audit will be scheduled to do integrity checks on the key to the relation, quarantine fields, and linkage. Call processing is not affected.

435. FCMSPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the message service system (MSS)/electronic directory service (EDS) system process.

436. FCMSSAPBFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message service system (MSS) feature model failed to retrieve a pointer to an associated process block (APB) with the MCGETAPBPTR() macro. There may be a linkage problem with APBs associated with the process, the process ID passed to the macro may be invalid, or the requested model may not exist in the process.

437. FCMSSIPOD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When the message service system feature model (MSS_FM) is created for the print on demand (POD) feature, the user is only allowed to have a customer status of FCMC_DIAL. Any other customer status is handled by the feature terminating process (FTP).

A target process of 7 decides if the FTP or the originating terminal process (OTP) is called. When the target process

is incorrect, this assert fires.

438. FCMSSPIN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown initialization reason was passed to the message service system (MSS)/electronic directory service (EDS) system process.

439. FCMWCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the static data for a multiway constructed feature for a port, a failure code of DBNO_MATCH was returned. An rlmwcf tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLMWCF. Key fields: feature ID.

Action:

Using ODBE, use the feature ID (feat_id) in the ROP output to look at the AM relation RLFID2NAME to determine the feature name assigned to the feat_id.

Refer to the "Multiway Calling Preconstructed Feature Definition Table" in the 5ESS® Switch Business and Residence Custom Features User's Guide to find the attributes associated with the feature name and the correct values for the attributes. Use ODBE to insert an rlmwcf tuple for the feat_id according to the values found for the attributes provided in the User's Guide.

440. FCMWIBADHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBHEADC	Audit Mode: elev

Problem:

The DAghcmw() or DAathcmw() dynamic access (DA) primitive returned DBNO_OWNER or DBSYS_ERR. An attempt was made to get the head of the busy list with the invoke_id key from the RLMSMWIDA relation, or an attempt was made to add to the tail of the idle list with the invoke_id key.

If DBNO_OWNER is returned, the owner tuple (DBMSMWIBUSY) does not exist with the invoke_id key that was given as a parameter. If DBSYS_ERR is returned, the existing linkages between the RLDB_HEADC relation (DBMSMWIIDLE or DBMSMWIBUSY) and the RLMSMWIDA relation are corrupted. An audit will be scheduled to do integrity checks on the key to the relation, quarantine fields, and linkage. Call processing is not affected.

441. FCMWIBODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the RLMDS_PORT relation indicated that the port should have an audible message waiting indicator (MWI) applied, but a read of the RLIS_LINE relation indicated that this is not a primary directory number (DN).

Data Structures:

RLMDS_PORT, RLIS_LINE.

Action:

The ROP output provides the parameters that were used to read the RLMD5_PORT relation. The parameters used to read the RLIS_LINE relation are a subset of the RLMD5_PORT parameters.

442. FCMWISDNERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The multiway calling (MW) function MCnewnear() checked to see if the controller heard silence as part of the permanent signal partial dial (PSPD) option. This should never happen on an integrated services digital network (ISDN) call. The non-ISDN code was entered on an ISDN call. The associated process block (APB) is dumped on the ROP for analysis and the process is purged.

443. FCMWITP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message service system (MSS)/electronic directory service (EDS) system process could not create the message waiting indicator (MWI) terminal process (TP) due to an invalid program ID for the MWI TP.

444. FCMWNOCC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made in the ISmw_ckfrdc() function to get a pointer to the call coordination (CC) model associated process block (APB). The MCGETAPBPTR() macro returned a null pointer indicating that the macro could not find an APB for the CC. The terminal process is purged which causes the call to be torn down. The process control block link area (PCBLA) is dumped to the ROP for analysis.

445. FCMWOSSNDERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the multiway (MW) models failed to output an external message. The error code from the OSsendmsg() primitive, the requested destination process ID (PID), and the contents of the message buffer that was to have been sent are dumped. A multiway call will be torn down and the related billing data will be lost. Contact your next level of support.

446. FCMWPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rMWPORT tuple is missing that is keyed with the logical port (lport) and the logical port type (lpt_type).

Data Structures:

RLMWPORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - lport, lpt_type, and the feature ID (FID).

Action:

The multiway (MW) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the MW feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLMWPORT relation where RLMwport.lport is RLfc_line.lport, RLMwport.lpt_type is RLfc_line.lpt_type, and RLMwport.feaid is the MW feature ID.

An attempt to read the RLMWPORT relation using the original (non-BFG) keys was made because the MW feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). MW is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rlmwport tuple should exist for the original (non-BFG) keys. Insert the appropriate rlmwport tuple.

447. FCMWRFTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message service system (MSS)/electronic directory service (EDS) system process could not create the message waiting indicator refreshing (MWIRF) terminal process (TP) due to an invalid program ID for the MWIRF TP.

448. FCNCPDIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a leased network (LN) common channel signaling (CCS) LN_NOQRY trunk origination, the LN automatic route selection (ARS) ID associated with this LN office was not successfully stored in the calling record. The LN ARS ID had the wrong number of digits. The affected call was sent to reorder.

Data Structures:

RLGPID_NET. Key field: argp

Action:

Determine the validity of the ARS group ID indicated and the associated LN ARS ID. Use RC/V View 10.5 (AUTOMATIC ROUTE SELECTION GROUP PARAMETERS) to insert the missing rlgpid_net tuple.

449. FCNFTLDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-fatal office dependent data (ODD) read error occurred. The call can continue with assumptions made, depending on the error encountered.

Data Structures:

Several relations are reported by this assert, the function that calls the assert identifies the relation involved.

Function	Relation	Key Fields
FCe_appton()	RLTATYPE	tatype
ISqapptone()	RLTATYPE	tatype
FC9t_fs()	RLFC_911TRNK	port.member, port.module
FCdir_conn()	RLFC_DIRCON	port.member, port.module, party
FCr_idle()	RLFC_LINE	port.member, port.module, party
MCnapptone()	RLFC_LINE	port.member, port.module, party
FCdialerr()	RLFC_LINE	port.member, port.module, party
FCdig_coll()	RLFC_LINE	port.member, port.module, party
FCtdir_con()	RLFC_TDIRC	port.member, port.module
FCto_ans()	RLIMITGRPS	tgroup
FCto_fs()	RLIMITGRPS	tgroup
FCconn_ann()	RLFC_ANOUNCE	port.member, port.module
FCtone()	RLTONETIME	tonetype
FCtone_ann()	RLTATYPE	tatype
FCwatscar()	RLFC_LINE	port.member, port.module, party
FCwatscar()	RLFC_TRUNK	port.member, port.module
FCwatscar()	RLEDSDLTRKG	grpnum
MCdrng()	RLDR_LTM	ltm_type, lead_module, ltm_idx, feat_id
FCnullfid()	RLDN_FEATS	lead_mod, ltm_type, ltm_idx
FCdcfs()	RLFC_LINE	port.member, port.module, party
MCcn00()	RLFC_DIRCON	port.member, port.module, party
FCffs() RCFEATENT		

The data dump layouts to determine the key values can be found in the 5ESS® Switch Translations Data Manual.

Action:

The solution to the problem can be found by consulting the associated assert mnemonic.

Relation	Mnemonic
RLTATYPE	FPTATYPE
RLFC_911TRNK	FP_911TRNK
RLFC_DIRCON	FP_DIRCON
RLFC_LINE	FPFCLINE
RLFC_TDIRC	FPFC_TDIRC
RLIMITGRPS	FPIMTGRPS
RLFC_ANOUNCE	FP_ANOUNCE
RLTONETIME	FPTONETY
RLEDSDLTRKG	FPEDSLTRKG
RLFC_TRUNK	FP_TRUNK
RLDR_LTM	FPDR_LTM
RLDN_FEATS	FPDNFEAT

If FCwatscar() is the asserting function, the problem is in the RLFC_LINE, RLFC_TRUNK, or RLEDSDLTRKG relation. A switch is performed on the class of service found in the process control block link area (PCBLA). If the class of service is FC_PBX, then the relation is RLFC_LINE; otherwise, the class of service is FCEDSLHM. A call is placed to RLFC_TRUNK, then to RLEDSDLTRKG. The grpnum for the RLEDSDLTRKG relation is found in the FC_TRUNK relation.

If MCdrng() is the asserting function, the RLDR_LTM relation is missing or the dring is not valid.

If FCffs() is the asserting function, the role value is FCTERM and the selection criteria expected can be ABA_FLASH, FLASH_RP, FLASH_TERM, or FLASH_ANY; the selection criteria was not any of these. Contact your next level of support.

450. FCNLUPERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rIORTLA tuple for the indicated port is marked as a nail-up port, but a read of the rINAILUP tuple for the same port failed to find a match. This will occur if the rIORTLA tuple was erroneously marked as a nail-up, or the rINAILUP tuple was erroneously deleted (more likely).

Data Structures:

RLNAILUP. Key field: port

The port key is the local port name of the nailed-up port.

Action:

Determine if the port is actually a nailed-up port. If so, the rINAILUP tuple was erroneously deleted and needs to be re-inserted. A nail-up connection requires two tuples which cross reference each other. The existence of the matching tuples must be manually verified by the OP:NAILUP command or RC/V (or ODBE, if necessary).

If the port should not be nailed-up, running the PORTLA audit will clear up the problem.

451. FCNOCCODE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLNOCCODE tuple could not be identified or had an unexpected base numbering plan area (NPA) for the given NPA-NXX of a 10-digit directory number (DN).

Data Structures:

RLNOCCODE.

The RLNOCCODE tuple could not be found for the NPA-NXX or the NXX and NPA retrieved from the RLNOCCODE relation contained an unexpected base NPA. If found, the NPA-NXX of the 10-digit DN are dumped.

Action:

Use the NPA-NXX to inspect the rINOCCODE tuple. Verify that the office data is consistent with signal transfer point (STP) data for local area signaling services (LASS) global title routing. Correct the NPA in the rINOCCODE tuple, if appropriate. For NPA splits using SFID 36 (LASS NPA SPLIT), add old - new NPA association in RC/V View 8.25 (LASS NPA SPLIT RESOLUTION).

452. FCNOCFDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

MGTPCREDIR message was received by this process from the host computer for third party call control feature to redirect a ringing call for the position DN which does not have call forwarding don't answer (CFDA) feature(s) that apply to this call assigned to it. To prevent this from happening again, assign a CFDA feature [or equivalent feature(s) that allows forwarding of this call] to the DN (only if they have purchased the feature) and also notify ACD/BRCS customer about the problem.

Data Structures:

The logical port and port type will be printed out on the ROP.

Action:

Use the port information provided to find the directory number (DN), then use RC/V 1.11 [BRCS FEATURE ASSIGNMENT (LINE)] to assign a CFDA feature (or equivalent feature(s) that allows forwarding of this call) to the DN.

453. FCNOEONCOS (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The class of service for the originating port is not valid for a Nodal origination. This type of call is only supported by the following classes of service on the originating port: PF, PFITT, PFLASH for trunks, or any class of service for lines. Reorder will be given as the failure mechanism if the class of service for the port is not valid. The data printed is the originating port, the originating class of service associated with this port and the modular constructed route index (MCRI) associated with the call.

Data Structures:

RLRT_MCRT. Key Field: mcri.

Action:

The originator of this port can be a line or a trunk. Verify or correct the class of service for the indicated port using: RC/V View 4.1 (LINE CLASS CODE) if the port is a line, or RC/V View 5.1 (TRUNK GROUP) if the port is a trunk. If the class of service is correct, do the following: Use RC/V View 10.4 (BRCS - MC ROUTE INDEX EXPANSION) keyed by MCRI to get the SFG GP NUM. Use RC/V View 7.3 (SIMULATED FACILITY GROUP) keyed by SFG GP NUM to check the SFG TYPE. The SFG TYPE should not be EON for this class of service.

454. FCNO_FENPA (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The far-end numbering plan area (NPA) was not populated for this trunk group and it must be populated since the npasrc field indicates to use the far-end NPA.

Data Structures:

RLRT_TRKG, key = grpnum.

Action:

Use RC/V to populate the FAR END NPA field on RC/V View 5.1 (TRUNK GROUP).

455. FCNOHDALB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the dynamic access (DA) primitive DAghteda() that was called in the ISdmw() function. This primitive tried to get the head D-channel application linkage block (DALB) using a terminal equipment data block (TEDB). The terminal process is purged which tears down the call. The TEDB and the process control block link area (PCBLA) are dumped to the ROP for analysis.

456. FCNOISLN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed to read the RLIS_LINE relation which contains customer specific data for an integrated services digital network (ISDN) terminal.

Data Structures:

RLIS_LINE.

Action:

Populate the RLIS_LINE relation.

457. FCNOLNPTRIG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error associated with local number portability (LNP) has occurred. Specifically, a telephone number (TN) was dialed that is provisioned with the "NP - Non-Conditional 10-Digit Trigger for LRN" feature (99-CP-3888). For information on the "NP - Non-Conditional 10-Digit Trigger for LRN" feature, consult the "5ESS® Switch Number Portability User's Guide (235-190-127)."

The following example defines switch provisioning and a user scenario that would result in this assert. Note that the RC/V provisioned data may vary slightly and still result in this assert.

Example of RC/V provisioning that results in this assert:

```
RC/V View 9.3 (LOCAL DIGIT): (key) LDIT = 001
                             (key) INCOMING DIGITS = 996
                             RDIT = ____
                             LNP TRIG NBR = ____
                             PORTED IN = Y
RC/V 1.6 (ANALOG LINE ASSIGNMENT): (key) TN = 9961001
                                     NON COND TRIG = Y
```

Example of user scenario:

Party A calls 9961001. Because the NON COND TRIG field on RC/V View 1.6 is set to Y, execution of the "NP - Non-Conditional 10-Digit Trigger for LRN" feature is looking for, and expects, the LNP TRIG NBR field on RC/V View 9.3 to be populated with an active trigger number. Trigger numbers are defined and activated on RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).

Data Structures:

Not applicable.

Result:

The 5ESS® switch software prints the following message to the read only printer (ROP) when this assert is encountered.

```
NO LNP TRIG NBR DEFINED FOR: DAS = 1, DIALED_TN = 9961001
```

Because the required LNP TRIG NBR was not provided on RC/V View 9.3, an LNP query DOES NOT occur. The call will attempt to complete to the dialed TN.

Action:

This must be corrected by manual action.

Do one of the following:

- (a) Use the digit analysis selector (DAS) value as the key for RC/V View 9.1 (DIGIT ANALYSIS SELECTOR). This RC/V View gives the local digit interpreter table (LDIT) associated with the call. Use this LDIT and the DIALED_TN, as keys (LDIT and INCOMING DIGITS) for the appropriate RC/V View, 9.3 (LOCAL DIGIT) or 9.9 (REMAINING DIGIT). Change the LNP TRIG NBR field to a valid, active, trigger from RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION) for this LDIT and INCOMING DIGITS combination.
- (b) Remove the "NP - Non-Conditional 10-Digit Trigger for LRN" feature from the line by setting the NON COND TRIG field to N on the appropriate RC/V View:

1.6 (ANALOG LINE ASSIGNMENT)	1.8 (ANALOG LINE/BRCS ASSIGN)
23.2 (ISDN INDIVIDUAL DSL)	23.8 (DSL/BRCS ASSIGNMENT)
23.20 (PRIMARY/SECONDARY ONLY)	

Or the global recent change (GRC) Views:

28.2 (UPDATE VIEW FOR 1.6)	28.3 (UPDATE VIEW FOR 1.8)
28.4 (UPDATE VIEW FOR 23.2)	28.5 (UPDATE VIEW FOR 23.8)

458. FCNOMEMCLMD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid dynamic database read occurred during call processing. Feature execution (FEX) received a DBNO_MEMBER return code from dynamic access (DA). This error was probably caused by an invalid mdb_id passed to the DAatclmd() function.

459. FCNOMEMPCCCL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid dynamic database read occurred during call processing. Feature execution (FEX) received a DBNO_MEMBER return code from dynamic access (DA). This error was probably caused by an invalid cldb_id passed to the DAatpccl() function.

460. FCNOMUSRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The music source could not be found when a request was made to provide music to a party placed on hold. An attempt was made to obtain the music source port member number from the RLRT_TG relation which is keyed by the terminal group ID (tgid).

One of three problems may have occurred.

1. The moh_act attribute in the rITGLTM tuple is DBYES for the line requesting music, but the tgid is zero.
2. The rIRT_TG tuple is missing.
3. The rIRT_TG tuple read for the line's terminal group has a music port member number of zero.

Data Structures:

RLRT_TG. Key field: tgid.

RLTGLTM. Key fields: lead_mod, ltm_type, ltm_idx, bfgid.

RLDN_FEATS. Key fields: lead_mod, ltm_type, ltm_idx, bfgid.

The tgid key for the rIRT_TG tuple is dumped on the ROP. If the tgid is zero, the first error condition is true. The ROP output also provides the ltm_type, lead_mod, ltm_idx, and bfgid keys for the rIDN_FEATS and rITGLTM tuples. If the bfgid field is non-zero, the line requesting music has a business and residential services (BRCS) feature group (BFG) assigned and the terminal group/station restriction (TG/SR) feature may be assigned via the BFG. Otherwise, the line has no BFG so the TG/SR feature must be assigned as an individual directory number (DN) feature. In this case, the ltm_idx is used instead of the bfgid.

Action:

1. If the tgid output on the ROP is zero, inconsistent data was found in the database. Use the following steps to correct the data:
 - a. Verify that the line requesting music is allowed to provide music. Determine how the TG/SR feature was assigned to this line.
 - b. If the bfgid is non-zero, read RC/V View 12.9 (BRCS FEATURE GROUP UPDATE) with the name of the BFG found in RC/V View 1.11 (BRCS FEATURE ASSIGNMENT).
 - c. If the TG/SR feature is assigned via the BFG, use ODBE to verify that the moh_act field is set to DBYES in the rITGLTM tuple. For keys, use the bfgid printed on the ROP as the LTM_IDX, LTM_ISDN as the LTM_TYPE, and zero as the LEAD_MODULE.
 - d. If the feature is not assigned in the BFG, read RC/V View 1.11 to determine if the TG/SR feature is assigned as an individual DN feature. Use ODBE to read the rITGLTM tuple. Use the ltm_idx printed on the ROP as the LTM_IDX, the ltm_type printed on the ROP as the LTM_TYPE, and the lead_mod printed on the ROP as the LEAD_MODULE to verify that the moh_act field is set to DBYES.
 - e. If the moh_act field is set to DBYES in step 1c or step 1d, verify the tgid in the rIDN_FEATS tuple. Use ODBE to read the rIDN_FEATS tuple with the same keys used to read the rITGLTM tuple.
 - f. If the tgid field is non-zero, the dynamic data for this one call is corrupted. The static data is still valid and does not require any changes for future calls on this line that may request music again.
 - g. If the tgid field is zero, the static data is inconsistent and requires updating. If the TG/SR feature is assigned via the BFG, read RC/V View 12.9 to find the tgid that this line belongs to. Update the rIDN_FEATS tuple using the same keys as the first read to the rIDN_FEATS tuple with the tgid found in RC/V View 12.9.
- If the TG/SR feature is assigned as an individual DN feature, the default tgid field from RC/V 12.21 (TERMINAL GROUP FEATURE DEFINITION) can be used to update the rIDN_FEATS tuple or the line may be assigned to a terminal group by updating the rIDN_FEATS tuple with an existing tgid. In either case, update the rIDN_FEATS tuple with the same keys used to read the rIDN_FEATS tuple previously.
- h. If the line is currently being assigned to a terminal group, verify that a non-zero music source (moh_src) port member is assigned to the tgid by reading the rIRT_TG tuple with the tgid of the terminal group as the key.
- i. If the moh_act field is set to DBNO in the rITGLTM tuple, the dynamic data is corrupted for this one call. The static data is valid and does not require any changes for future calls involving this line.
2. Use ODBE to verify that an rIRT_TG tuple exists on the SM number dumped on the ROP for the tgid key output on the ROP. If the rIRT_TG tuple is not found, use RC/V to insert a tuple with the music source trunk group number and member number found on RC/V View 4.4 (TERMINAL GROUP ATTENDANT AND DATA).
3. If the rIRT_TG tuple is found, verify that the music port member number is non-zero. If the member number is zero, use RC/V to update View 4.4 (TERMINAL GROUP ATTENDANT AND DATA) with a valid music trunk group number and member number.

461. FCNOMWIREQ (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The message waiting indicator (MWI) terminal process (TP) was entered (it was just created), but the MWI TP timed out while waiting for an MWI request to process. The MWI TP was created incorrectly.

462. FCNONRST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A NEAR model state was not found while dropping back to a 2-way call from a multiway (MW) call via the MCdcomst() function. The call dropped back to a POTS feature model (PFM) state (MCPWSIG) that tears down the call. The MW model associated process block (APB), the call coordination (CC) model APB, and the CC state are dumped to the ROP for analysis.

463. FCNONSDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not insert rINSDB tuples when adding advanced services platform (ASP) service to this office. This problem results in blocked ASP calls.

Data Structures:

RLNSDB.

Action:

Use RC/V View 8.17 (DIRECT SIGNALING APPLICATION) to delete then re-insert the form keyed by "ASP" or "AINR0D1".

464. FCNOPAPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not get a parent's associated process block (APB) for the integrated services digital network (ISDN).

465. FCNOPRT2MWI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message waiting indicator (MWI) terminal process (TP) or the analog visual MWI refreshing (AVMWIR) TP could not couple the analog visual MWI port to the TP. Therefore, the TP could not activate or de-activate the AVMWI lamp.

466. FCNORRTI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An integrated services attendant (ISAT) remote busy verification error occurred. The remote route index (rti) read from the RLREMBV_RI relation does not have a corresponding rLRT_ROUTING tuple where RLrembv_ri.rti=RLrt_routing.route_x.

Data Structures:

RLRT_ROUTING. Key field: route_x (route index).

RLREMBV_RI. Key fields: isat_idx (ISAT code index), rti (route index).

Action:

This is a database inconsistency that will cause the call to be torn down and the ISAT will get reorder tone. This inconsistency can only be corrected through manual action. Use RC/V View 10.2 (ROUTE INDEX) to insert the

rIRT_ROUTING tuple for the rrti obtained from the RLREMBV_RI relation. If the data is populated correctly, contact your next level of support.

467. FCNOTATDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not insert rITATDB tuples while converting the office to advanced services platform (ASP) 0.1B service. This may result in blocked ASP terminating attempt trigger calls or ASP calls reporting BLNA events.

Data Structures:

RLTATDB.

Action:

Use RC/V View 8.17 (DIRECT SIGNALING APPLICATION) to delete then re-insert the form keyed by CCAINR01.

468. FCNOTGTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An integrated services digital network (ISDN) attendant (ISAT) remote busy verification error occurred. The trunk group number (grpnum) read from the RLRT_ROUTING relation that corresponds to the remote route index (rrti) read from the RLREMBV_RI relation, does not have an rITGOATT tuple.

Data Structures:

RLTGTOATT. Key field: grpnum.

RLREMBV_RI. Key fields: isat_idx, rti, rrti.

The key values grpnum, isat_idx (ISAT code index), rti (route index), and rrti (remote route index) will be printed on the ROP.

Action:

This is a database inconsistency that causes the call to be torn down and the ISAT will get the reorder tone. This inconsistency can only be corrected through manual action.

Use RC/V View 5.1 (TRUNK GROUP) to enter the ISAT multi-line hunt group (MLHG) value that will associate the busy verify trunk (grpnum) with the ISDN attendant corresponding to the isat_idx read from the RLREMBV_RI relation. If the data is populated correctly, contact your next level of support.

469. FCNPAMAPTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Local access and transport area (LATA) mapping was active and attempted on a customer dialed call, but the originating number (back number) NPA and NXX were not populated in the RLFCNPAMAP base relation.

Data Structures:

RLFCNPAMAP. Key fields: back number NPA, back number NXX.

Glatmap (global parameter)

Action:

The data printed on the ROP includes the back number NPA and the back number NXX for the rIFCNPAMAP tuple that is not populated. Use RC/V View 26.1 (OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS) to add the

missing tuple.

-OR-

If LATA mapping is not required on this switch, it can be turned off by using RC/V View 8.9 (OSPS OFFICE PARAMETERS). The LATA MAP field is Y (Yes) for performing LATA mapping and N (No) when no LATA mapping should be performed.

470. FCNPASRC (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The numbering plan area (NPA) SOURCE field was not populated for this primary rate interface (PRI) trunk and CALLING PARTY SCREENING is turned on for the trunk. In order to screen seven digit calling party numbers, an NPA must be prefixed. This field tells where to get the NPA, so it must be populated when screening is turned on.

Data Structures:

RLEDSLTRKG: key field: grpnum.

Action:

Use RC/V to populate this data in the NPA SOURCE field on View 5.1 (TRUNK GROUP).

471. FCNPTMOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The FCptmodel() function encountered an unknown parent model ID. The parent model ID will be dumped on the ROP for analysis.

472. FCNS_ALGT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A full global title value could not be determined by the service switching point (SSP) when formulating a query message. The alternate global title is missing in the RLNS_TRIG relation. The call will fail.

Data Structures:

RLNS_TRIG. Key field: trigger number.

Action:

The alternate global title information is missing; this must be corrected by manual action. The missing alternate global title may need to be inserted in the RLNS_TRIG relation with the given trigger number.

Insert an alternate global title via RC/V View 9.35 (NETWORK SERVICE TRIGGERS) using the trigger number as the key or change the trigger number associated with this call using the appropriate procedure below.

(A) If a DN is printed:

The digit analysis selector (DAS) and the digits are used to determine the trigger number associated with the call. The DAS is used as the key to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR). The information from this view and the digits are used to read the digit analysis RC/V views: View 9.2 (PREFIX/FEATURE DIGIT), View 9.3 (LOCAL DIGIT), View 9.5 (INCOMING TRUNK DIGITS), View 9.6 (IDDD COUNTRY ACCESS CODE), View 9.9 (REMAINING DIGIT), View 9.13 (IDP DIALED CODE ASSIGNMENT), or View 9.15 (MULTIPLE LOCAL DIGITS).

- (B) If the TRIGTYPE is OHD (Off Hook Delay):
The trigger number associated with the OHD feature can be changed. Use the trunk group and member as a key to RC/V View 5.11 (BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)) to obtain the feature. Using the feature and trunk group and member as a key to view 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) the OHD trigger number can be changed to one which has an alternate global title. Another option is to use the trunk group as a key to RC/V View 5.1 (TRUNK GROUP), and populate a BILLING DN for this private facility (PF) trunk.
- (C) If the TRIGTYPE is shared interoffice trunk (SIT):
The digit analysis selector (DAS) can be used to determine the incoming trunk digit (INC DIT) table. The INC DIT along with the OZZ code can be used to access RC/V View 9.5 (INCOMING TRUNK DIGITS) and change the trigger number. Another option is to change the outgoing trunk in the originating network access point (NAP) office so that a charge number or ANI is signalled.
- (D) If the TRIGTYPE is originating busy line (OBL) or originating no answer (ONA):
The trigger number associated with the OBL or ONA trigger does not have a valid alternate global title. If this is an office-wide OBL or ONA trigger, use RC/V View 8.49 (ASP PARAMETERS) to change the ORIG BL TRIG or ORIG NA TRIG to a trigger number which has an alternate global title. If this is a provisioned OBL or ONA trigger for the originating port, use RC/V View 1.64 to change the OBL or ONA to a trigger number which has an alternate global title.

473. FCNS_ALGT (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A full global title value could not be determined by the service switching point (SSP) when formulating a query message. The alternate global title is missing in the RLNS_TRIG relation. The call will fail.

Data Structures:

RLNS_TRIG. Key field: trigger number.

Action:

The alternate global title information is missing; this must be corrected by manual action. The missing alternate global title may need to be inserted in the RLNS_TRIG relation with the given trigger number.

Insert an alternate global title via RC/V View 9.35 (NETWORK SERVICE TRIGGERS) using the trigger number as the key or change the trigger number associated with this call via the appropriate procedure below.

- (A) If a DN is printed: The digit analysis selector (DAS) and the digits are used to determine the trigger number associated with the call. The DAS is used as the key to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR). The information from this view and the digits are used to read the digit analysis RC/V views: View 9.2 (PREFIX/FEATURE DIGIT), View 9.3 (LOCAL DIGIT), View 9.5 (INCOMING TRUNK DIGITS), View 9.6 (IDDD COUNTRY ACCESS CODE), View 9.13 (IDP DIALED CODE ASSIGNMENT), or View 9.15 (MULTIPLE LOCAL DIGITS).
- (B) If the TRIGTYPE is off hook delay (OHD): The trigger number associated with the OHD feature can be changed. Use the trunk group and member as a key to RC/V View 5.11 [BRCS FEATURE ASSIGNMENT (TRUNK MEMBER)] to obtain the feature. Using the feature and trunk group and member as a key to view 5.64 (ADVANCED SERVICES PLATFORM TRUNK PARAMETERS) the OHD trigger number can be changed to one which has an alternate global title. Another option is to use the trunk group as a key to RC/V View 5.1 (TRUNK GROUP), and populate a BILLING DN for this private facility (PF) trunk.
- (C) If the TRIGTYPE is shared interoffice trunk (SIT): The digit analysis selector (DAS) can be used to determine the incoming trunk digit (INC DIT) table. The INC DIT along with the OZZ code can be used to access RC/V

view 9.5 (INCOMING TRUNK DIGITS) and change the trigger number. Another option is to change the outgoing trunk in the originating network access point (NAP) office so that a charge number or ANI is signaled.

474. FCNSOFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update the Glnsdbavl global parameter to DBNO when removing private virtual network (PVN) service from this office. This problem results in wasted audit time in auditing a structure that is no longer used.

Action:

Use RC/V (or ODBE, if necessary) to update the Glnsdbavl global parameter to DBNO on the SM that originated this assert.

475. FCNSON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update the Glnsdbavl global parameter to DBYES when adding private virtual network (PVN) service to this office. This problem results in rINSDB tuples not being audited.

Action:

Use RC/V (or ODBE, if necessary) to update the Glnsdbavl global parameter to DBNO on the SM that originated this assert.

476. FCNS_SCR (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIRT_SCRNING tuple is missing. The code destination index (CDI) key is not populated or populated incorrectly. The CDI must be populated when the trigger number is greater than 0. In this case, the call's charge index can not be determined. The call is torn down.

Data Structures:

RLRT_SCRNING. Key fields: code destination index, screening index, prefix dialed.

Action:

This is a database inconsistency that must be corrected by manual action. An rIRT_SCRNING tuple may need to be updated or inserted with the given keys.

If the rIRT_SCRNING tuple is missing, insert a tuple using RC/V View 10.10 (SCREENING (CHARGING)) using the CDI, screening index and prefix dialed as keys or change the CDI associated with this call via the appropriate digit analysis view. The digit analysis selector (DAS) and the digits are used to determine the CDI associated with the call.

The DAS is used as the key to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR). The information from this view and the digits are used to read the digit analysis RC/V views: View 9.2 (PREFIX/FEATURE DIGIT), View 9.3 (LOCAL DIGIT), View 9.5 (INCOMING TRUNK DIGITS), View 9.6 (IDDD COUNTRY ACCESS CODE), View 9.9 (REMAINING DIGIT), or View 9.15 (MULTIPLE LOCAL DIGITS).

477. FCNS_SCR (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIRT_SCRNING tuple is missing. The code destination index (CDI) key is not populated or populated incorrectly. The CDI must be populated when the trigger number is greater than 0. In this case, the call's charge index can not be determined. The call is torn down.

Data Structures:

RLRT_SCRNING. Key fields: code destination index, screening index, prefix dialed

Action:

This is a database inconsistency that must be corrected by manual action. An rIRT_SCRNING tuple may need to be updated or inserted with the given keys.

If the rIRT_SCRNING tuple is missing, insert a tuple via RC/V View 10.10 (SCREENING [CHARGING]) using the CDI, screening index and prefix dialed as keys or change the CDI associated with this call via the appropriate digit analysis view. The digit analysis selector (DAS) and the digits are used to determine the CDI associated with the call.

The DAS is used as the key to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR). The information from this view and the digits are used to read the digit analysis RC/V views: View 9.2 (PREFIX/FEATURE DIGIT), View 9.3 (LOCAL DIGIT), View 9.5 (INCOMING TRUNK DIGITS), View 9.6 (IDDD COUNTRY ACCESS CODE), or View 9.15 (MULTIPLE LOCAL DIGITS).

478. FCNS_TRIG (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown application is in the RLNS_TRIG relation, an rINS_TRIG tuple is missing, or a mismatch exists between the application in the rINS_TRIG tuple and the advanced services platform (ASP) office type. In the case of an LNP trigger the rINS_TRIG tuple specifies an incorrect APPLICATION, AIN REL (i.e., protocol), or ASP TOLLFREE indicator or VPN trigger indicator.

The key for the rINS_TRIG tuple was obtained as a non-zero trigger number from the dialing plan associated with the digit analysis selector (DAS). In the first two cases, the call's application can not be determined. In all cases, the call is given standard switch error treatment.

Data Structures:

RLNS_TRIG. Key field: trigger number

Action:

This is a database inconsistency that must be corrected by manual action. An rINS_TRIG tuple may need to be updated or inserted with the given trigger number.

If the application is unknown, the application can be updated via RC/V View 9.35 (NETWORK SERVICE TRIGGERS) using the trigger number as the key.

If the rINS_TRIG tuple is missing, insert the tuple via RC/V View 9.35 using the trigger number as the key or change the trigger number associated with this call on the appropriate digit analysis view to an existing trigger number. The DAS and the digits are used to determine the trigger number associated with the call.

The DAS is used as the key to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR). The information from this view and the digits are used to read the digit analysis RC/V views: View 9.2 (PREFIX/FEATURE DIGIT), View 9.3 (LOCAL DIGIT), View 9.5 (INCOMING TRUNK DIGITS), View 9.6 (IDDD COUNTRY ACCESS CODE), View 9.9 (REMAINING DIGIT) or View 9.15 (MULTIPLE LOCAL DIGIT).

If a mismatch exists between the application and the ASP office type, change the application for the given trigger number via RC/V View 9.35 or correct the ASP office type via RC/V View 8.49 (ASP PARAMETERS).

In the case of an LNP trigger data error the APPLICATION is not ASP, or the AIN REL is not R0D1, or the ASP TOLLFREE indicator is Y, or VPN trigger indicator is Y. Use RC/V View 9.35 to correct these values.

479. FCNS_TRIG (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown application is in the RLNS_TRIG relation, an rINS_TRIG tuple is missing, or a mismatch exists between the application in the rINS_TRIG tuple and the advanced services platform (ASP) office type. In the case of an LNP trigger the rINS_TRIG tuple specifies an incorrect APPLICATION, AIN REL (i.e., protocol), or ASP TOLLFREE indicator.

The key for the rINS_TRIG tuple was obtained as a non-zero trigger number from the dialing plan associated with the digit analysis selector (DAS). In the first two cases, the call's application can not be determined. In all cases, the call is given standard switch error treatment.

Data Structures:

RLNS_TRIG. Key field: trigger number

Action:

This is a database inconsistency that must be corrected by manual action. An rINS_TRIG tuple may need to be updated or inserted with the given trigger number.

If the application is unknown, the application can be updated using RC/V View 9.35 (NETWORK SERVICE TRIGGERS) using the trigger number as the key.

If the rINS_TRIG tuple is missing, insert the tuple using RC/V View 9.35 using the trigger number as the key or change the trigger number associated with this call on the appropriate digit analysis view to an existing trigger number. The DAS and the digits are used to determine the trigger number associated with the call.

The DAS is used as the key to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR). The information from this view and the digits are used to read the digit analysis RC/V views: View 9.2 (PREFIX/FEATURE DIGIT), View 9.3 (LOCAL DIGIT), View 9.5 (INCOMING TRUNK DIGITS), View 9.6 (IDDD COUNTRY ACCESS CODE), or View 9.15 (MULTIPLE LOCAL DIGIT).

If a mismatch exists between the application and the ASP office type, change the application for the given trigger number using RC/V View 9.35 or correct the ASP office type via RC/V View 8.1 (OFFICE PARAMETERS).

In the case of an LNP trigger data error the APPLICATION is not ASP, or the AIN REL is not R0D1, or the ASP TOLLFREE indicator is not N. Use RC/V View 9.35 to correct these values.

480. FCNULPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A macro called to retrieve a portname has failed to to successfully read either RLFC_PORTTYP or RLCKT_PORT. The calling function or macro was returned a value of GLNULPORT. This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

481. FCOAEXMAPFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLOAEXMAP base relation in the intermediate switching point (ISP) feature.

482. FCOFFICECODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rOFFICECODE tuple is missing or an invalid key was used to read the relation. Incomplete information will be displayed on an integrated services digital network (ISDN) terminal that received a forwarded call.

Data Structures:

RLOFFICECODE. Key field: noc.

Items printed on the ROP are the NOC (key used to read the rOFFICECODE tuple), PORT [port where the call terminated (alerts) that caused the assert; SM where this port resides is printed with the assert number], CALLING DN [directory number (DN) that originated the call], ICI (ISDN call identifier indicating the type of call; a call forwarding ICI indicates the first reason for forwarding), LAST CF BASE LTM_IDX (logical termination index for the last DN performing the call forwarding), LAST CF BASE LTM_TYPE (logical termination type for the last DN performing the call forwarding), and LAST CF BASE SM (SM where the primary DN's port is located which performed the last call forwarding).

Action:

Determine if an rOFFICECODE tuple is missing.

1. The noc used to read the rOFFICECODE tuple is retrieved from the rINOCCODE tuple during digit analysis and routing. If the noc does not exist in the rINOCCODE tuple, then the noc printed on the ROP is an invalid key generated to read the rOFFICECODE tuple.

Determine if the noc printed on the ROP was retrieved from the rINOCCODE tuple. The key to rINOCCODE is the nxx (i.e., officecode) and is an unknown. The tuple that contains the noc printed on the ROP must be found indirectly by searching the content (i.e., noc attribute) of each rINOCCODE tuple.

Use ODBE to perform a batch read into temporary files for the RLNOCCODE relation in the CMP and all SMs. Search the temporary files for one tuple within each relation per processor (must only be one tuple per relation) that contains the noc printed on the ROP. If desired because of too many SMs, choose 1 or 2 processors to perform the batch read, but ideally all processors should be verified because RLNOCCODE is a redundant relation.

2. If an rINOCCODE tuple is not found on the CMP or SMs, then an invalid key was used to read the RLOFFICECODE relation. A trouble report should be filed.

3. If an rINOCCODE tuple is found on the CMP and SMs, the tuple should be identical on all processors. Verify that the attributes of the tuple are valid for the noc. Use the information associated with the noc in the rINOCCODE tuple to insert an rOFFICECODE tuple using ODBE.

4. Determine if other processors (i.e., AM, CMP, SMs) have a missing rOFFICECODE tuple. RLOFFICECODE is a redundant relation on the AM, CMP, and all SMs. Use ODBE to verify that the rOFFICECODE tuple of interest is identical on all processors for the noc printed on the ROP.

If the information for the noc could not be obtained as explained in these steps, file a trouble report.

483. FCOHICSD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The advanced services platform (ASP) off-hook immediate (OHI) trigger references a trigger that is only defined for circuit switch data (CSD). OHI must be provisioned with a trigger that allows circuit switch voice (CSV). The origination will ignore the OHI trigger attempt and the call will continue as a non-ASP call.

Data Structures:

RLASP_PORT.

RLNS_TRIG.

Action:

The assert will print the originating telephone number (TN), port (PORT and MODULE), and OHI trigger number (TRIGGER NUMBER) referenced in the ASP originating feature that is assigned to the originating terminal. Update RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION) keyed with TRIG NBR equal to the TRIGGER NUMBER value printed in the assert. Update SERVICE ALWD to be VOICE or BOTH. Alternatively, use the TN (telephone number) from the assert as a key to RC/V View 1.11 (BRCS FEATURE ASSIGNMENT) to find the assigned BRCS ASP originating feature (such as, /ASPORIG). Update RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) keyed by BRCS ASP originating feature from RC/V View 1.11 and the TN. Update the OHI trigger number (TRIG NBR) with a trigger that allows voice. RC/V View 9.35 defines the trigger number.

484. FCOPRTKFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLFC_OPRTK base relation in the intermediate switching point (ISP) feature.

485. FCOPRTKREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLFC_OPRTK relation could not be found in the database. An attempt was made to obtain information about an operator trunk.

Data Structures:

RLFC_OPRTK. Key field: tgroup.

The tgroup (trunk group) field is from the RLFC_TRUNK relation which is accessed by the port number.

Action:

Add the RLFC_OPRTK relation according to RC/V procedures.

486. FCOPRTKTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLFC_OPRTK tuple is missing. An attempt was made to obtain information about an operator trunk. The tuple for the specific operator trunk group could not be found.

Data Structures:

RLFC_OPRTK. Key field: tgroup.

The tgroup (trunk group) key is from the RLFC_TRUNK relation which is accessed by the port number.

Action:

Use RC/V (or ODBE, if necessary) to crosscheck the key set used to access the RLFC_OPRTK relation with the actual keys for the relation. Verify that this tuple does or does not exist. Add the tuple if it is missing.

487. FCOSLNGTH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The user supplied operating system for distributed switching (OSDS) message was too long.

488. FCOSWTFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The feature execution (FEX) message receiver received an unexpected error code from the OSWGETTYPE() macro while waiting for an FCWGETTYPE() macro specific message.

489. FCPAORAF (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A phrase overflow occurred while constructing the phrase array for announcements.

Data Structures:

The following data will be dumped: ann_id: the announcement ID.

Action:

The specified announcement ID causes the phrase array overflow. The combination of phrases and digit commands causes the total number of phrases to be greater than allowed. Redefine the announcement to get the total number of phrases down.

490. FCPCC_CC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

(PCC) (3 digits) or the country code (CC) (1-3 digits). The problem occurred in the second stage of the traditional 2-stage international outbound call. The PCC or the CC that was received is invalid, the relation is corrupt.

Data Structures:

The ROP output provides the dialed PCC or CC digits, one byte per digit (subtract hex 30 from each), and the incoming trunk-port.

Action:

Verify that the digits that were received include a valid PCC or CC. If the digits represent a valid PCC or CC and a corresponding rIFCCPCC_CC tuple does not exist, use RC/V View 9.18 (PAIRED COUNTRY CODE (PCC)/COUNTRY CODE [CC]) to add the tuple.

If the digits do not represent a valid PCC or CC, then the outpulsing office may be sending invalid digits.

then the relation must be corrupt. Check the relation and re-create it by using RC/V View 9.18 (or ODBE, if necessary).

491. FCPCLSP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid dynamic database read occurred during call processing. The feature control (FC) feature execution (FEX) environment received an error return code from a dynamic access (DA) primitive. The linkage in the process control block link area (PCBLA) to call leg data block (CLDB) set may be corrupted. FEX could not recover from this error.

492. FCPEDSGRP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rEDS_GRP tuple is missing. The calling name on PRI feature is assigned, but the defined EDS group is not found. The information displayed on the ROP includes the EDS_GRP tuple that was unmatched, the module, and the PRI group.

Data Structures:

RLEDSTRKG. Key field: grpnum.
 RLED_GRP. Key field: eds_grpid.

The first variable on the ROP output is the unmatched EDS group tuple. The other variable identifies the PRI group number ID that has the invalid EDS group ID. All variables are in decimal.

Action:

This is a database inconsistency that can only be corrected by manual action.

Use RC/V View 5.1 (TRUNK GROUP) and RC/V view 4.38 (ELECTRONIC DIRECTORY SERVICE) to verify correct data was entered. Check with ODBE that the correct rEDS_GRP tuple is on the affected SM. If not, insert the tuple. One can then examine the other SMs that use the given rEDS_GRP to confirm the data.

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

493. FCPEDSGRP (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rEDS_GRP tuple is missing. The Calling Name on PRI Feature is assigned, but the defined EDS group is not found. The information displayed on the ROP includes the EDS_GRP tuple that was unmatched, the Module, and the PRI group.

Data Structures:

RLEDSTRKG. Key field: grp_num.
 RLED_GRP. Key field: eds_grp.

The first variable on the ROP output is the unmatched EDS group tuple. The other variable identifies the PRI Group number ID that has the invalid EDS Group ID. All variables are in decimal.

Action:

This is a database inconsistency that can only be corrected by manual action.

Use RC/V View 5.1 (TRUNK GROUP) and RC/V view 4.38 (ELECTRONIC DIRECTORY SERVICE) to verify correct data was entered. Check with ODBE that the correct rIEDSL_GRP tuple is on the affected SM. If not, insert the tuple. One can then examine the other SMs that use the given rIEDS_GRP to confirm the data.

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

494. FCPFCPECOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trunk class of service (COS) was not set to private facility customer premises equipment trunks (PFCPE), although signal conversion is set to Yes and the signal conversion time is set to 0.

Data Structures:

RLFC_PORTTYP. Key fields: member, module, cos.

Action:

If signal conversion is needed, change the signal conversion time found in RC/V View 7.1 (PRIVATE FACILITIES GROUP) from 0 to a digit ranging from 4 to 12. Otherwise, change the signal conversion in View 7.1 from Yes to No.

If signal conversion with the signal conversion time set to 0 is desired, change the trunk class of service found in RC/V View 5.1 (TRUNK GROUP) to PFCPE. This configuration is reserved for the recorded telephone dictation feature only.

495. FCPF_CT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-senderized (cut-through) outpulsing was attempted without setting the cut-through bit.

Data Structures:

RLFCLTRUNK. Key field: port.

Action:

Use RC/V View 5.1 (TRUNK GROUP) to change the cut-through bit (CUTTHRU) from N to Y.

496. FCPF_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPF_GP relation, a failure code of DBNO_MATCH was returned. An rIPF_GP tuple is missing, the keys used to read this relation were not set properly, or an invalid access code was dialed.

Data Structures:

RLPF_GP. Key fields: group ID, dial code.

Action:

This is a database inconsistency that can only be corrected by manual action.

497. FCPFNONCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A private facilities access (PFA) senderized dial code was used to route to a non-senderized (cut-through) trunk. This call may result in one way transmission.

Data Structures:

RLFC_LINE. Key field: port.

RLPF_GROUP. Key fields: pf_gpid, dial_code.

Action:

If the intent is to make a non-senderized call, change the DIG COL field in RC/V View 7.1 (PRIVATE FACILITIES GROUP) to N.

If the intent is to make a senderized call, change the CUTTHRU field in RC/V View 5.1 (TRUNK GROUP) to N.

498. FCPF_PARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPF_PARM relation, a failure code of DBNO_MATCH was returned. An rLPF_PARM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPF_PARM. Key fields: parameter ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

499. FCPF_PCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-senderized (cut-through) outputting is not supported with primary rate interface (PRI) facilities [extended digital service line (EDSL) trunks].

Data Structures:

RLPF_GP. Key fields: pf_gpid, dial_code.

RLFC_PORTTYP. Key fields: member, module, cos.

Action:

If cut-through outputting is desired, the trunk class (TRK CLASS) field on RC/V View 5.1 (TRUNK GROUP) must be changed from EDSL to PF, PFITT, PFCPE, or PFLASH.

If a PRI facility is desired, then a private facilities access (PFA) cut-through access code can not be used.

500. FCPF_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPF_PORT tuple is missing that is keyed with the logical port (lport) and logical port type (lpt_type).

Data Structures:

RLPF_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this

relation - lport and lpt_type.

Action:

The private facility access (PFA) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the PFA feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLPF_PORT relation where RLpf_port.lport=RLfc_line.lport and RLpf_port.lpt_type=RLfc_line.lpt_type.

An attempt to read the RLPF_PORT relation using the original (non-BFG) keys was made because the PFA feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). PFA is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rlpf_port tuple should exist for the original (non-BFG) keys. Insert the appropriate rlpf_port tuple.

501. FCPF_POVL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal configuration was detected. Overlap outputpulsing was attempted over a primary rate interface (PRI) facility.

Data Structures:

RLPF_GP. Key fields: pf_gpid, dial_code.

RLPF_PARM. Key field: parm_id.

Action:

If a PRI facility [extended digital service line (EDSL) trunk] is required, change the overlap outputpulsing bit (OVLP OPLS) on RC/V View 7.1 (PRIVATE FACILITIES GROUP) from Y to N.

If overlap outputpulsing is required, change the trunk class (TRK CLASS) field on RC/V View 5.1 (TRUNK GROUP) from EDSL to PF, PFITT, or PFLASH.

502. FCPHDBER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not retrieve an rlpHDB tuple. The PHDB audit is scheduled and the code returns to the point of interrupt.

503. FCPNGRNG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to create the ISpnrng process failed. The process is created when attempting to "ping ring" an unbound terminal that has call forwarding assigned. This terminal will not ping ring, but the call will still forward.

504. FCPP_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line or trunk has the precedence and preemption (PP) feature assigned in the RLDN_FEATS relation and the data for the port is in the RLPP_LTM or RLPP_TRUNK relation, but there is no corresponding data in the RLPP_CF relation. When attempting to read the RLPP_CF relation, a failure code of DBNO_MATCH was returned. An rIPP_CF tuple is missing or the keys used to read the relation were not set properly.

Data Structures:

RLPP_CF. Key fields: port, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to examine the precedence and preemption feature assignment data on the indicated line or trunk. For lines, see RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) or the RLDN_FEATS relation. For trunks, see RC/V View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER) or the RLDN_FEATS relation.

Obtain the keys to the RLDN_FEATS relation from the RLFC_LINE or RLPORT_GROUP relation. The output data shows the port by module and member as well as the feat_id that is associated with the port in the RLPP_LTM or RLPP_TRUNK relation. For lines, see RC/V View 1.31 (PRECEDENCE AND PREEMPTION LINE PARAMETERS) or the RLPP_LTM relation. For trunks, see RC/V View 5.31 (PRECEDENCE AND PREEMPTION TRUNK PARAMETERS) or the RLPP_TRUNK relation.

Corresponding feature description data should exist in the RLPP_CF relation for the feature that the assert indicates does not exist. See RC/V View 12.31 (PRECEDENCE AND PREEMPTION FEATURE DEFINITION) or the RLPP_CF relation.

505. FCPP_COI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rICOI_GPID tuple is missing.

Data Structures:

RLCOI_GPID. Key field: destination index.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to verify the existence of an rICOI_GPID tuple for the destination index key from the ROP output. See RC/V View 10.32 (VERIFY PRECEDENCE AND PREEMPTION COMMUNITY OF INTEREST GROUP) or the RLCOI_GPID relation.

506. FCPP_COS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The port has the precedence and preemption feature assigned in the RLDN_FEATS relation, but the class of service from the RLFC_PORTTYP relation is invalid for the precedence and preemption feature.

Data Structures:

RLFC_PORTTYP. Key field: port.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to examine the class of service assigned to the specified port. The output data shows the port by module and member as populated in the RLDN_FEATS relation. For lines, see RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINES) or the RL_DNFEATS relation. For trunks, see RC/V View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER) or the RLDN_FEATS relation.

The corresponding class of service is not valid for the precedence and preemption feature. For lines, see RC/V View 4.1 (LINE CLASS CODE) or the RLFC_PORTTYP relation. For trunks, see RC/V View 5.1 (TRUNK GROUP) or the RLFC_PORTTYP relation.

507. FCPP_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the rIPP_LTM relation, a failure code of DBNO_MATCH was returned. An rIPP_LTM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPP_LTM. Key fields: lead module, ltm index, ltm type.

Action:

This is a database inconsistency that can only be corrected by manual action.

508. FCPPSI04 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The precedence and preemption (PP) feature was assigned to the trunk, but the PP trunk type was incorrect.

Data Structures:

RLPP_TRUNK. Key fields: port, feat_id.

Action:

Use RC/V (or ODBE, if necessary) to examine the PP trunk type. See RC/V View 5.31 (PRECEDENCE AND PREEMPTION TRUNK PARAMETERS) or the RLPP_TRUNK relation for the specified port and feat_id. The output data shows the port by module, and the member as populated in the RLPP_TRUNK relation.

509. FCPP_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trunk has the precedence and preemption feature assigned in the RLDN_FEATS relation, but there is no corresponding data in the RLPP_TRUNK relation.

When attempting to read the RLPP_TRUNK relation, a failure code of DBNO_MATCH was returned. An rIPP_TRUNK tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPP_TRUNK. Key fields: port, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to examine the precedence and preemption feature assignment data on the indicated trunk. See RC/V View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER) or the RLDN_FEATS relation.

The output data shows the port by module, member, and feat_id from the RLDN_FEATS relation. Corresponding trunk parameter data should exist for that port. See RC/V View 5.31 (PRECEDENCE AND PREEMPTION TRUNK PARAMETERS) or the RLPP_TRUNK relation.

510. FCPRISTAT (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

An error occurred while accessing an rIPRISTAT tuple.

Probable Cause:

Missing or corrupt data in rIPRISTAT or the PCBLA (prigrp).

Action:

Assert and schedule the PRISTAT audit.

511. FCPUENTRY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PUENTRY	Audit Mode: elev

Problem:

Failed to link a RLPU_ENTRY tuple to one of the RLPU_QUEUE head cell lists or failed to traverse through the RLPU_ENTRY tuples linked to the RLPU_QUEUE head cell.

Probable Cause:

Linkage field corruption.

Action:

The RLPU_ENTRY key (puentkey) will be printed on the ROP and the AUPUENTRY audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

512. FCPUG_SM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPUG_SM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPUG_SM. Key field: queue.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLPUG_SM relation with the actual keys used to access the relation. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify the next level of support.

This relation is updated by RC/V View 1.23 (CALL PICKUP LINE PARAMETERS).

513. FCPULTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPU_LTM relation, a failure code of DBNO_MATCH was returned. An rIPU_LTM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPU_LTM. Key fields: lead module, LTM index, LTM type, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

514. FCPUO_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPUO_CF relation, a failure code of DBNO_MATCH was returned. An rIPUO_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPUO_CF. Key field: feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

515. FCPUO_ROUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPUO_ROUT tuple is missing that is keyed with the logical port (lport), logical port type (lpt_type), and pickup action (pu_act).

Data Structures:

RLFC_LINE, RLLPT_PT, RLPUO_ROUT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - lport, lpt_type, and pu_act.

Action:

The RLPUO_ROUT relation is accessed when the call pickup (CPU) feature is used to pickup code calling or loudspeaker paging calls. Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). CPU is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rIPUO_ROUT tuple should exist for the keys

printed on the ROP where RLpuo_rout.lport is RLfc_line.lport, RLpuo_rout.lpt_type is RLfc_line.lpt_type, and RLpuo_rout.pu_act is ACN_LSP or ACN_CCL. ACN_LSP is used for loudspeaker paging and ACN_CCL is used for code calling. Insert the appropriate rIPUO_ROUT tuple.

516. FCPU_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPU_PORT tuple is missing that is keyed with the logical port (lport) and logical port type (lpt_type).

Data Structures:

RLPU_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - lport, lpt_type, and the feature ID (FID).

Action:

The call pickup (CPU) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the CPU feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLPU_PORT relation where RLpu_port.lport is RLfc_line.lport, RLpu_port.lpt_type is RLfc_line.lpt_type, and RLpu_port.feaut_id is the CPU feature ID.

An attempt to read the RLPU_PORT relation using the original (non-BFG) keys was made because the CPU feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). CPU is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rIPU_PORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rIPU_PORT tuple.

517. FCPUQUEUE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PUQUEUE	Audit Mode: elev

Problem:

Failed to access a RLPU_QUEUE tuple or access a RLPU_ENTRY tuple linked to a RLPU_QUEUE tuple.

Probable Cause:

Data corruption.

Action:

The RLPU_QUEUE key (queue) will be printed on the ROP and the APUQUEUE audit will be scheduled to run.

This is a returning assert and it is assumed that the software calling it can recover.

518. FCPUT_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPUT_CF relation, a failure code of DBNO_MATCH was returned. An rIPUT_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPUT_CF. Key field: feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

519. FCPZEDSGPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PRI Trunk has the EDS CND feature assigned with an EDS group ID of zero. This PRI trunk group should have been assigned a non-zero EDS group ID at EDS CND feature assignment time.

Data Structures:

RLEDSL_TRKG. Key field: grp_num.

The variable on the ROP output is the PRI Trunk number (in decimal format) that is assigned with a zero EDS group ID.

Action:

This is a database inconsistency that can be corrected only by manual action. Determine the valid EDS group to assign to this PRI Trunk. RC/V View 4.38 (ELECTRONIC DELIVERY SERVICE GROUP PARAMETERS) can be used to determine valid EDS Group IDs. Assign valid EDS Group ID to the PRI Trunk using RC/V View 5.1 (TRUNK GROUP).

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

520. FCQDATNAVL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MLHG	Audit Mode: elev

Problem:

The multi-line hunt group (MLHG) queue status feature button on a queue monitor console was pressed and MLHG queue status data is being collected. However, the MLHG queue status data in the dynamic relation RLQO_MLHG cannot be accessed. The key to the RLQO_MLHG relation is the MLHG number. A MGDISPFEAT message buffer is dumped; the group field contains the MLHG number.

The call processing affect is to display "Data unavailable for MLHG XXXX" on the queue monitor console customer premises equipment (CPE), where XXX is the MLHG number. The QO_MLHG audit is scheduled to run in the elevated mode. If the problem is in the RLQO_MLHG relation, this audit corrects the problem.

If this assert fires repeatedly, there is a static data inconsistency in the RLMONTOQ relation. The relation is keyed by the logical port (lport) of the MLHG queue monitor console and contains a list of MLHGs monitored by the MLHG queue monitor console and by the queuing SMs for these MLHGs. The MLHG number is invalid or the queuing SM

is incorrect.

If the MLHG number is invalid (no such MLHG), remove the MLHG from the RLMONTOQ relation. The MLHGs in this relation can be verified and/or removed via RC/V View 23.17 (DSL MONITOR FOR MLHG QUEUES). This view is keyed by the telephone number (TN) of the queue monitor console; or if the queue monitor console is a MLHG member, by the MLHG group and member number.

If the MLHG number is valid but the queuing SM is incorrect, correct the queuing SM. The correct queuing SM for a MLHG can be determined by examining the QUEUING SM field in RC/V View 3.40 (MODULAR QUEUING PARAMETERS) which is keyed by the MLHG number.

If the assert fires on an SM other than the queuing SM, then the queuing SM data in the RLMONTOQ relation is incorrect. Correct the queuing SM via RC/V View 23.17 (DSL MONITOR FOR MLHG QUEUES) by removing the MLHG from the queue monitor console list, updating the view, putting the MLHG back in the queue monitor console list, and updating the view again.

521. FCRASPIN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown initialization reason was passed to the remote access system process (RASP).

522. FCRBQBTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The distinctive ring type was invalid. The allowed types are A, B, C, or D.

Data Structures:

RLQU_RGBK. Key fields: portgrp.grpnum, portgrp.grptype.

The ring type field is rgbk.typ.

Action:

Check the ring type and make the necessary correction.

523. FCRCMULTIDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIRC_MULTIDN tuple is missing or an invalid key was used to read the relation. While a test set DN was assigned to a wireless handset a signal for message waiting indication was received. The message waiting indication data should be updated internally for both the test set and the wireless handset. This message indication may need to be relayed on to the wireless handset and the test set if its status has changed. If a problem occurs in attempting to read rIRC_MULTIDN then the wireless handset may not be properly updated with the correct status of its message waiting indicator.

Data Structures:

RLRC_MULTIDN. Key fields: locdn.

Action:

Determine if an rIRC_MULTIDN is missing. 1. Determine if a test set dn is still assigned to the wireless handset by running the op:testset command. If the test set is still assigned then follow step 2 otherwise follow step 3.

2. The noc and last 4 digits used to read rIRC_MULTIDN are retrieved initially from rIFC_LINE using the port and party value for the wireless handset/W port DN. Read the rIFC_LINE tuple corresponding to the wireless handset/W port DN and determine if the locdn is the same as shown for the locdn field of rIFC_LINE. If the values are different then data corruption occurred and an invalid key was used. If the values are the same then the rIRC_MULTIDN tuple is actually missing. The DB transaction for setting up the test set DN must have failed and not cleaned up.

3. If the test set dn was not assigned to the wireless handset then the tuple for rIFC_LINE should be read using the port and party value of the wireless handset/W port DN. Verify or set the multidn field to DBNO.

524. FCREDIRCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The redirect count in the isdn_data.history.redir_cnt field of the MGLN_TERM message is 0. When the call is forwarded, the redirection counter should be incremented before the IScfreminder() function is called. The IScfreminder() function is called when attempting to notify (reminder ring) a standard terminal that a call is being forwarded. This terminal will not be notified, but the call will still be forwarded.

525. FCRELAYMSGER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The POTS feature model failed to output an external message during a conference or transfer attempt. The requested destination process ID (PID) and the contents of the message buffer that should have been sent are printed on the ROP. The conference or transfer attempt will fail and the call will be preserved.

526. FCRERTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A code of GLFAIL was returned from the RTerte() function. The model data blocks (MDBs) and the process control block link area (PCBLA) associated with the process will be output to the ROP. Contact your next level of support.

527. FCRGLPRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was returned from an attempted read of a global parameter from within a transaction. No audit is available to correct the error.

528. FCRHHCE9 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DARhhce9() failed to remove an enhanced 911 (E911) data block tuple rIE911DB from the head of the idle list. The call will not be torn down since the rIE911DB tuple is not critical for completing the call.

If this assert occurred in an originating terminal process (OTP), the OTP will not be able to alternate route the call since the alternate routing data could not be stored. Also, the selective transfer data will not be available to send to the terminating terminal process (TTP).

If this assert occurred in a TTP, the selective transfer data was not stored and the E911 attendant will not be able to do a selective transfer. Manual or fixed transfers will still work.

529. FCRTDNMOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of DBNO_MATCH was returned when the RLRTDNMOD relation was read. An rLRTDNMOD tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRTDNMOD. Key fields: NOC, D4D3[0] (1000's digit), D4D3[1] (100's digit).

Action:

Verify that the keys printed on the ROP are valid. The normalized office code (NOC) must be in the range 0-250. If the keys are valid, use ODBE to verify that the rLRTDNMOD tuple does not exist, then insert the tuple. If the keys are not valid, file a trouble report.

530. FCRT_DNTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of DBNO_MATCH was returned when the RLRT_DNTRAN relation was read. An rLRT_DNTRAN tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_DNTRAN. Key fields: NOC, digits.

Action:

Verify that the keys printed on the ROP are valid. The normalized office code (NOC) must be in the range 0-250. The digits key consists of 4 digits.

If the keys are valid, use ODBE to verify that the rLRT_DNTRAN tuple does not exist on the SM indicated on the ROP, then insert the tuple. If the keys are not valid, file a trouble report.

531. FCRTROUTING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A "not found" condition was returned when attempting to access the tuple pointed to by the routing index.

Data Structures:

RLRT_ROUTING. Key field: route_x.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLRT_ROUTING relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support. This relation is updated by RC/V View 10.25 (ALTERNATE ROUTE INDEX) and View 10.2 (ROUTE INDEX).

532. FCRTSCRNFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLRT_SCRNING base relation in the intermediate switching point (ISP) feature.

533. FCRT_SCRNING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_SCRNING relation to get the charge index using the screen index, destination index, and prefix, a failure of DBNO_MATCH was returned. An rIRT_SCRNING tuple is missing for the screen index, destination index, and prefix specified. For a coin line, the call will be terminated gracefully and the coin will be returned to the customer.

Data Structures:

RLRT_SCRNING. Key fields: dest_x, screen_x, prefix.

Action:

The destination index and the prefix are the results of digit analysis. The screening index is from the rIFC_LINE tuple for the particular line. Use RC/V (or ODBE, if necessary) to cross-check the keys for correctness. If the rIRT_SCRNING tuple is missing, use RC/V View 10.11 (SCREENING) or ODBE for the RLRT_SCRNING relation to add the tuple.

534. FCRT_TG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_TG relation, a failure code of DBNO_MATCH was returned. The rIRT_TG tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_TG. Key field: tgid.

Action:

Use RC/V View 4.4 (TERMINAL GROUP ATTENDANT AND DATA) to insert the rIRT_TG tuple.

535. FCSASINV (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The service announcement system (SAS) announcement port is requested to activate a function which is not allowed. A SAS announcement port is capable to activate those functions which are in agreement with the service class of the announcement trunk.

Action:

Most likely the (alternate) route index used with the special route ID, is directing to the wrong announcement trunk.

536. FCSCALTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSCA_LTM relation, a failure code of DBNO_MATCH was returned. An rLSCA_LTM tuple is missing or the keys used to read this relation were not set properly. The key values ltm_type and ltm_index will be printed on the (ROP).

Data Structures:

RLSCA_LTM. Key fields: ltm_type, ltm_index.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call acceptance (SCA)/computer access restriction (CAR) feature, no action is required.

Otherwise, this is database inconsistency that can only be corrected by manual action. Contact your next level of support.

537. FCSC_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSC_CF relation, a failure code of DBNO_MATCH was returned. An rISC_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLSC_CF. Key field: feature ID.

Action:

Use ODBE in the CMP to find the corresponding tuple in the RLSC_OPTS relation. Use the feature ID from the ROP output as the key to this relation.

If the rISC_OPTS tuple exists, use the information from this tuple to populate the rISC_CF tuple keyed by the same feature ID. The RLSC_CF relation is on the SM indicated in the ROP output.

If the rISC_OPTS tuple does not exist, use RC/V View 12.51 (SPEED CALLING FEATURE DEFINITION) to define the speed calling feature. If there is a problem with this feature definition, contact the next level of support.

538. FCSCFLTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSCF_LTM relation, a failure code of DBNO_MATCH was returned. An rISCFLTM tuple is missing or the keys used to read this relation were not set properly. The key values ltm_type and ltm_index will be printed on the ROP.

Data Structures:

RLSCF_LTM. Key fields: ltm_type, ltm_index.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call forwarding (SCF) feature, no action is required.

Otherwise, this is database inconsistency that can only be corrected by manual action. Contact your next level of support.

539. FCSCM_NSCM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLSCM_NSCM tuple is missing or the keys used to read this relation are incorrect.

Data Structures:

RLSCM_NSCM. Key fields: ltm_idx, ltm_type.

RLIS_LINE. Key fields: lead_module, ltm_idx.

RLFC_LINE. Key fields: port, party.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data on the SM identified on the ROP output. Determine if the series completion (SC) feature is assigned on this line.

1. If the ltm_type key printed on the ROP is LTM_ISDN, read the RLIS_LINE relation using as keys the ltm_idx key from the ROP and the SM number printed on the ROP for the lead_module key. If the rLIS_LINE tuple's sercomp bit is set to DBYES, then SC is assigned.

2. If the ltm_type key from the ROP is LTM_OTHER, read the RLLTM_PORT relation using the ltm_idx key printed on the ROP. Use the RLltm_port.port and RLltm_port.party attributes as keys to read the RLFC_LINE relation. If the rLFC_LINE tuple's sercomp bit is set to DBYES, then the SC feature is assigned.

If the SC feature is assigned, then an rLSCM_NSCM tuple should exist. Insert the appropriate tuple.

If the SC feature is not assigned, contact the next level of support.

540. FCSCPDAS (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are two possible problems that this assert addresses:

- (1) An rIDA_DIGSTRT tuple is missing. An advanced services platform (ASP) or service switching point (SSP800) call was placed that resulted in a query to an external switching control point (SCP) database. The database returned routing digits to route the call. During translation of these digits, an rIDA_DIGSTRT tuple was discovered missing.

The global parameter Glscp_das is used as the digit analysis selector (DAS) to translate the routing digits that were returned from the SCP database for ASP. The global parameter GI800_das is used as the DAS to translate the routing digits that were returned from the SCP database for SSP800.

- (2) For an EON2 Call, one of the EON DAS fields is not populated on RC/V View 8.49 (ASP PARAMETERS). For APN calls, the EON APN DAS field (Gleonapn_das) must be populated. For local calls, the EON LOCAL DAS field (Gleonloc_das) must be populated. For toll calls, the EON TOLL DAS field (Gleontolldas) must be populated.

Data Structures:

RLDA_DIGSTRT.

Action:

Check the global parameter Glscp_das to verify that its value is not null for ASP. If it is null, call the office engineer and ask what the value for Glscp_das should be for your office. Add this value to RC/V View 8.49 (ASP PARAMETERS). This DAS value should correspond to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR).

Check the SSP800 global parameter GI800_das value. A null (zero) value indicates that no SSP800 translation DAS should be used. If it is not null, this DAS value should correspond to RC/V View 9.1. Add the DAS value to RC/V View 8.49.

For EON calls, check the values of EON APN DAS, EON LOCAL DAS and EON TOLL DAS on RC/V View 8.49. If these values are null, call the office engineer and ask what the values should be for these fields. Update these values on RC/V View 8.49 (ASP PARAMETERS).

541. FCSCP DAS (5E13 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIDA_DIGSTRT tuple is missing. An advanced services platform (ASP) or service switching point (SSP800) call was placed that resulted in a query to an external switching control point (SCP) database. The database returned routing digits to route the call. During translation of these digits, an rIDA_DIGSTRT tuple was discovered missing.

The global parameter Glscp_das is used as the digit analysis selector (DAS) to translate the routing digits that were returned from the SCP database for ASP. The global parameter Gl800_das is used as the DAS to translate the routing digits that were returned from the SCP database for SSP800.

Data Structures:
RLDA_DIGSTRT.

Action:

Check the global parameter Glscp_das to verify that its value is not null for ASP. If it is null, call the office engineer and ask what the value for Glscp_das should be for your office. Add this value to RC/V View 8.49 (ASP PARAMETERS). This DAS value should correspond to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR).

Check the SSP800 global parameter Gl800_das value. A null (zero) value indicates that no SSP800 translation DAS should be used. If it is not null, this DAS value should correspond to RC/V View 9.1. Add the DAS value to RC/V View 8.49.

542. FCSCP DAS (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIDA_DIGSTRT tuple is missing. An advanced services platform (ASP) or service switching point (SSP800) call was placed that resulted in a query to an external switching control point (SCP) database. The database returned routing digits to route the call. During translation of these digits, an rIDA_DIGSTRT tuple was discovered missing.

The global parameter Glscp_das is used as the digit analysis selector (DAS) to translate the routing digits that were returned from the SCP database for ASP. The global parameter Gl800_das is used as the DAS to translate the routing digits that were returned from the SCP database for SSP800.

Data Structures:
RLDA_DIGSTRT.

Action:

Check the global parameter Glscp_das to verify that its value is not null for ASP. If it is null, call the office engineer and ask what the value for Glscp_das should be for your office. Add this value to RC/V View 8.1 (GLOBAL PARAMETERS). This DAS value should correspond to RC/V View 9.1 (DIGIT ANALYSIS SELECTOR). Check the SSP800 global parameter Gl800_das value. A null (zero) value indicates that no SSP800 translation DAS should be used. If it is not null, this DAS value should correspond to RC/V View 9.1. Add the DAS value to RC/V View 8.1.

543. FCSC_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISC_PORT tuple is missing that is keyed with the logical port (lport), the logical port type (lpt_type), and the feature ID.

Data Structures:

RLSC_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - lport, lpt_type, and feature ID.

Action:

A one-digit or two-digit speed calling (SC) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the SC feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLSC_PORT relation where RLsc_port.lport is RLfc_line.lport and RLsc_port.lpt_type is RLfc_line.lpt_type.

The feature ID is also a key to the RLSC_PORT relation, regardless of whether the feature was assigned via a BFG.

An attempt to read the RLSC_PORT relation using the original (non-BFG) keys was made because the data indicates that the SC feature is assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the following data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). SC is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rISC_PORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rISC_PORT tuple.

544. FCSCRANG (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISC_RANGE tuple is missing or the keys (pbx_id and tuple_idx) used to read this relation are wrong. This problem does not affect the call.

Data Structures:

RLSC_RANGE. Key fields: pbx_id, tuple_idx.

RLFC_TRUNK. Key fields: port.module, port.member.

RLRT_TRKG. Key field: tgroup.

RLGROUP_PORT. Key fields: tgroup, member.

Action:

The following steps are a series of checks to determine if the problem was caused by a software error or a data error. If the problem was caused by a software error, contact your next level of support and give them the

information you have collected to that point.

If the problem was caused by a data error, consult the population rules to double check and/or correct the error. Use caution when dealing with the population rules as the relations mentioned above are networked, and changing one incorrectly can have a detrimental effect on others.

1. Use RC/V View 7.5 (CALLING PARTY NUMBER SCREENING RANGES) to review the RLSC_RANGE relation using the pbx_id and tuple_idx obtained from the ROP as keys.
2. Count the number of ranges in View 7.5 and, using the tuple_idx obtained from the ROP, verify that the following equation is true: $\text{number of ranges} \geq (5 * \text{tuple\_idx})$. If the equation is false, there is a software error; contact your next level of support. If the equation is true, go to the next step.
3. Using the tgroup value obtained from the ROP as they key, review RC/V View 5.1 (TRUNK GROUP) to see if the pbx_id found there matches the pbx_id used in View 7.5.
 - a. If the pbx_id values do not match, there is a data error.
 - b. If the pbx_id values match, use ODBE to read the RLGROUP_PORT relation (using the tgroup and port.member obtained from the ROP as keys) and see if the extended digital subscriber line (EDSL) trunk group member is in the SM that the assert fired from. If it isn't, there is a software error; contact your next level of support. If it is, there is a data error.

545. FCSCRLTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSCR_LTM relation, a failure code of DBNO_MATCH was returned. An rlSCR_LTM tuple is missing or the keys used to read this relation were not set properly. The key values ltm_type and ltm_index will be printed on the ROP.

Data Structures:

RLSCR_LTM. Key fields: ltm_type, ltm_index.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective call rejection (SCR) feature, no action is required.

Otherwise, this is database inconsistency that can only be corrected by manual action. Contact your next level of support.

546. FCSDALTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSDA_LTM relation, a failure code of DBNO_MATCH was returned. An rlSDA_LTM tuple is missing or the keys used to read this relation were not set properly. The key values ltm_type and ltm_index will be printed on the ROP.

Data Structures:

RLSDA_LTM. Key fields: ltm_type, ltm_index.

Action:

If this assert occurs when an end user is in a screen list editing (SLE) session and recent changes (RCs) are being performed to insert, update, or delete the end user's access to the selective distinctive alerting (SDA) feature, no action is required.

Otherwise, this is database inconsistency that can only be corrected by manual action. Contact your next level of support.

547. FCSDNBDBF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the RLBRCSDb relation failed to return the current processor ID (OSpdb.procno).

548. FCSDNBRET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An unexpected return code was received from the FCtrhdlr() function which is communicating with an external network control point (NCP) database. The transaction data buffer will be dumped.

549. FCSDNFFINTF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Call processing to transaction handler interface problems occurred. A transaction initialization was requested by call processing without passing route request and/or D-channel data block (DCDB) buffers. The process control block link area (PCBLA) is dumped.

550. FCSDNFINTF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The transaction handler received an invalid call status from call processing in the interface buffer. The interface buffer is dumped and the terminal process causing the call to be torn down is purged.

551. FCSENDMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the OSSENDMSG() macro failed because the message was too long or the destination process ID was invalid. The destination process ID and the message header are printed on the ROP.

552. FCSHRINCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found in the RLSHTERM relation. This relation contains the associated terminal information for a shared directory number (DN) plus the lead port information. The lead port is the primary terminal where the DN is located. Each rLSHTERM tuple holds up to four entries of shared terminal information.

The shtm_cnt attribute in the first rLSHTERM tuple (range 0) indicates the number of shared DNs that are associated

with the lead port DN (primary DN). The shared1 attribute of the first tuple (range 0) is associated with the lead port DN and the shared2 through shared4 attributes are associated with shared DNs. The shtm_cnt values should be from 1 to 7. If there are more than three shared DNs, a second tuple (range 1) should exist. The second tuple contains only shared DN information.

An attempt to read the second rLSHTERM tuple (range=1) failed. The shtm_cnt count was greater than three. The second rLSHTERM tuple is missing or the shtm_cnt value in the first tuple is incorrect.

If this problem occurs during a call, the call will be torn down.

Data Structures:

RLSHTERM. Key fields: lead_module, range, ltm_idx.

The ROP output provides the LEAD_MODULE (lead module of lead lport), the RANGE (a number from 0-1 used to distinguish the two tuples, should always be 1), and the LTM_IDX (logical termination index).

Action:

Execute the following static data audit command on the master control center (MCC):

EXC:SODD,ISDN,KY,SM=1&&192,OUTFILE=filename (where "filename" is the name of the log file typed in upper case).

If there are more than three shared DNs (shtm_cnt>3), use the output from the log file "filename" and ODBE to insert the second rLSHTERM tuple with the correct attributes.

If the log file "filename" indicates that there are no other DNs shared, use ODBE to update the shtm_cnt attribute of the range 0 rLSHTERM tuple on the SM which fired this assert.

If the data from the log file "filename" does not provide enough information to reconstruct the range 1 rLSHTERM tuple, contact your next level of support.

553. FCSHTERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSHTERM relation, a failure code of DBNO_MATCH was returned. The rLSHTERM tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLSHTERM. Key fields: lead module, LTM index, range.

Action:

This is a database inconsistency that can only be corrected by manual action.

554. FCSHTRMCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a shared directory number (DN) feature and this problem is service affecting. The call will be torn down. The shtm_cnt field (the total number of associated terminals sharing this DN) in an rLSHTERM tuple is invalid. This number should be greater than or equal to one.

Data Structures:

RLSHTERM. Key fields: lead_module, ltm_idx, range, shtm_cnt.

Action:

This is database inconsistency that can be corrected by manual action. Use RC/V View 23.20 (PRIMARY OR SECONDARY ONLY KEY SYSTEM) to delete all the shared DN members, then recreate the shared DN members.

This action is suggested because the RLSHTERM relation is group partitioned, and its validity is not certain in any of the SMs. The method suggested is the thorough way of insuring data integrity with minimal overhead.

555. FCSLEBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a local area signaling services (LASS) screen list editing (SLE) session, the originating terminal process (OTP) received an unexpected message from the terminating terminal process (TTP) associated with the announcement hardware. Contact your next level of support.

556. FCSLEDEFAULT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received after a function call during a screen list editing (SLE) session. The SM is in an unstable state.

557. FCSLEDSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSLE_DSP relation, a failure code of DBNO_MATCH was returned. An rSLE_DSP tuple is missing or the key used to read this relation was not set properly. The key value dsp_id will be printed on the ROP.

Data Structures:

RLSLE_DSP. Key field: dsp_id.

Action:

This is a database inconsistency that can only be corrected by manual action.

558. FCSLEINVLDREQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a local area signaling services (LASS) screen list editing (SLE) session, the originating terminal process (OTP) received an invalid request from the terminating terminal process (TTP) associated with the announcement hardware. Contact your next level of support.

559. FCSLELENGTHERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed during a screen list editing (SLE) session. An attempt was made to send a message with a length that is greater than permitted by OSSENDMSG().

560. FCSLEPROCERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed during a local area signaling services (LASS) screen list editing (SLE) session. This failure is the result of an invalid process ID; the process that was to receive this message does not exist.

561. FCSLETARG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a local area signaling services (LASS) screen list editing (SLE) session, an SLE function was called with an invalid argument. Contact your next level of support.

562. FCSLETFID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a local area signaling services (LASS) screen list editing (SLE) session, the terminating terminal process (TTP) encountered an invalid feature ID. Contact your next level of support.

563. FCSLETMRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a local area signaling services (LASS) screen list editing (SLE) session, the terminating terminal process (TTP) received an invalid return code from the originating terminal process (OTP) associated with the SLE session. Contact your next level of support.

564. FCSMSEQIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSMSEQIDX relation, a failure code of DBNO_MATCH was returned. An rISMSEQIDX tuple is missing or the keys used to read this relation were not set properly. The key values qid, appl_cls, and seq_key will be printed on the ROP.

Data Structures:

RLSMSEQIDX. Key fields: qid, appl_cls, seq_key.

Action:

This is a database inconsistency that can only be corrected by manual action.

565. FCSPABILLDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISPABILLDN tuple is missing that is keyed with a trunk group. When a special access (SPA) customer originated a WATS or MEGACOM® call, the RLSPABILLDN relation was read to retrieve the assigned billing number. The rISPABILLDN tuple has the trunk group number incorrectly populated or is corrupt.

Data Structures:

RLSPABILLDN. Key field: trunk group number.

The trunk group that originated the SPA WATS or *MEGACOM*® call is dumped.

Action:

Check the class of service for this trunk group using the trunk group form.

If the trunk group is a valid SPA WATS or *MEGACOM*® type and an rISPABILLDN tuple does not exist that corresponds to this trunk group, use RC/V to add the tuple. If the trunk group is a valid SPA WATS or *MEGACOM*® type and the rISPABILLDN tuple does exist, then the relation is corrupt. Use RC/V to check the relation and re-create the tuple if it is corrupt.

If the trunk group is not valid for SPA WATS or *MEGACOM*® service, use RC/V to change the class of service for this trunk group appropriately.

566. FCSPABNDSCRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISPABNDSCRN tuple is missing that is keyed with a calling numbering plan area (NPA) and a called NPA. When a special access (SPA) customer originated a WATS or *MEGACOM*® call, the RLSPABNDSCRN relation was read to retrieve the band number required to place the call.

The calling NPA was extracted from the dnbill field in the RLSPABILLDN relation and the called NPA was the dialed NPA. The calling NPA stored in the dnbill field of rISPABILLDN tuple is incorrectly populated, the dialed NPA is invalid, or the RLSPABNDSCRN relation is corrupt.

Data Structures:

RLSPABNDSCRN. Key fields: calling NPA, called NPA.

Action:

If the calling NPA and the called NPA are a valid NPAs in the North American numbering plan and the rISPABNDSCRN tuple does not exist, consult FCC tariff #2 to find the band number required. Use RC/V to add the rISPABNDSCRN tuple.

If the calling NPA is valid and the called NPA is not valid, then the SPA customer is dialing an invalid NPA.

If the calling NPA is not valid and the called NPA is valid, then the rISPABILLDN tuple's dnbill field is populated with an incorrect billing number. Use RC/V (via the trunk group form) to change the dnbill field to the correct billing number.

If the calling NPA and the called NPA are valid and the rISPABNDSCRN tuple does exist, then the relation is corrupt. Check the relation using RC/V to re-create the tuple if it is corrupt.

567. FCSPAENXX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLSPAENXX relation that is keyed with a calling numbering plan area (NPA) and a called office code (NXX) is corrupted. When a special access (SPA) customer originated a WATS or *MEGACOM*® call, the RLSPAENXX relation was read to determine if calls are allowed to the central office that is assigned to the called NXX.

Data Structures:

RLSPAENXX. Key fields: calling NPA, called NXX.

The ROP printout provides the calling NPA that was assigned in the RLSPABILLDN relation and the called NXX which is the dialed NXX.

Action:

Use RC/V to verify that the RLSPAENXX relation exists in the SM that originated the assert. Check with the network operations group (NOG) to determine if this relation should be populated with disallowed central office codes for SPA WATS or MEGACOM®. If the RLSPAENXX relation is not populated or is incorrectly populated, use RC/V to re-populate this relation.

568. FCSTRCARTONE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A send to resource play&collect returned from the service control point (SCP) requested 400 Hz carrier tone, but carrier tone is not provisioned as system tone.

TONE TYPE (in RC/V View 10.17 [NETWORK ANNOUNCEMENTS]) == CARRIER but the field CARRIER TONE (in RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]) == N

Data Structures:

- Global parameter, Glcartone.
- rISSP_ANN.tone_type. Key fields: annc code.
- rIFC_TRUNK.tgroup. Key fields: tgroup, member.
- rIFC_TRUNK.member. Key fields: tgroup, member.

Action:

There are two options,

- Set the value of "CARRIER TONE" in RC/V View 8.1 to "Y".
- Update RC/V View 10.17. The key field is annc code (provided in the assert message). Clear out the "TONE TYPE" field in RC/V View 10.17. The trunk group and trunk member are provided in the assert message for informational purposes only, they are not needed in order to resolve the problem.

569. FCTAT_LNTM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The advanced services platform terminal process (ASP_TP) did not receive an initial message from routing and terminal allocation (RTA) for a terminating attempt trigger or BLNA request, or an error was detected by the OSWGETMSG() macro with respect to the message. The call cannot proceed. The process is purged.

570. FCTATON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update the global parameter Glatdbavl to DBYES while adding advanced services platform (ASP) 0.1B service to this office. This will result in rTATDB tuples that are not audited.

Action:

Use ODBE to update the Gltatdbavl parameter to DBYES on the SM which originated this assert.

571. FCTATSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The advanced services platform terminal process (ASP_TP) encountered an invalid or unknown value for its internal state variable. Stack data was overwritten or an internal logic error occurred. The process is purged. This can result in lost ASP terminating attempt trigger calls or ASP calls being monitored for BLNA events.

572. FCTCMINVRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The traveling class mark (TCM) received from the far-end office is out of range. The incoming port over which the TCM was received has a tuple in the automatic route selection (ARS) logical port information relation RLARPORT. A discrepancy exists between the tcmmin value of the incoming port and the "outgoing number of TCM digits" indicator at the far-end office for the outgoing side of this port.

Data Structures:

RLARPORT, RLARTCM.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - ARS group ID (GROUP ID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

Use the data in the ROP output and RC/V to identify the outgoing end of this incoming port and notify the far-end office that it belongs to. There are two possible solutions to this problem.

- (1) The far-end office is a 5ESS[®] switch.

The number of TCM digits expected, specified by the tcmmin value on RC/V View 5.21 (AUTOMATIC ROUTE SELECTION TRUNK PARAMETERS), for the incoming port indicated in the dump is inconsistent with the number of TCM digits outpulsed, specified by the tcmout value on View 5.21 for the outgoing side of this port at the far-end office.

This office must be set up to receive the same number of TCM digits over the incoming port as the far-end office is outpulsing. Change tcmmin accordingly.

- (2) The far-end office is a 1/1A ESSTM switch or a PBX.

The tcmmin value on RC/V View 5.21 for the incoming logical port indicated in the ROP output must have a value of 1. If the tcmmin value is not 1, change it to 1.

Also, make sure that the far-end office is not outpulsing TCMs with a value less than 0 or greater than 7.

573. FCTCMRNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The traveling classmark (TCM) value read from the TCM conversion relation RLARTCM is out of range. The valid

range is 0-7. This error was found in the terminating terminal process (TTP) while attempting to convert the incoming facility restriction level (FRL) to a one-digit TCM.

The TCM information element (IE) field in the outgoing SETUP message was populated to an error condition (GLFAIL) since the value read from the relation is not valid. Action should be taken to populate this field to an acceptable value. If no action is performed, the call may not complete successfully.

Data Structures:

RLARTCM. Key field: ar_gpid.

Action:

Use the ODBE update option to modify the contents of the RLARTCM relation to correct the TCM value that is out of range. The key to access this data is the ar_gpid (group ID) value printed on the ROP. Check for the one-digit TCM values (tcmone) which should be numbers between 0 and 7; if they are not, correct them.

574. FCTCWPARMS (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An RLTCW_PARM tuple with the given keys could not be found in the static database. The keys are printed on the ROP. The RLTCW_PARM tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLTCW_PARM. Key fields: bool.

Action:

Verify that the keys printed on the ROP are valid. Use RC/V View 8.1 (OFFICE PARAMETERS (MISCELLANEOUS)) to assign talking call waiting parameters.

If the RLTCW_PARMS tuple was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

575. FCTD_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLTD_CF relation, a failure code of DBNO_MATCH was returned. An rITD_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLTD_CF. Key field: feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

576. FCTD_CODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLTD_CODE relation, a failure code of DBNO_MATCH was returned. An rITD_CODE tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLTD_CODE. Key fields: feature ID, action point index.

Action:

This is a database inconsistency that can only be corrected by manual action.

577. FCTD_SCHED (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLTD_SCHED relation, a failure code of DBNO_MATCH was returned. An rITD_SCHED tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLTD_SCHED. Key field: time of day (TOD) ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

578. FCTG_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rITG_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLTG_CF. Key field: feature ID.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLTG_CF relation with the actual keys used to access the relation. If the rITG_CF tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify the next level of support. This relation is updated by RC/V View 12.21 (TERMINAL GROUP FEATURE DEFINITION).

579. FCTGLTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rITGLTM tuple is missing for a member of a terminal group. As a result, it cannot be determined if the member is allowed to provision music to held calls.

Data Structures:

RLTGLTM. Key fields: ltm_type, lead_mod, ltm_idx, bfgid.

The ROP output provides the tgid that the line belongs to, and the ltm_type, lead_mod, ltm_idx, and bfgid keys. If the bfgid field is non-zero, the terminal group/station restriction (TG/SR) feature was assigned via a business and residential custom services (BRCS) feature group (BFG). Otherwise, the TG/SR feature was assigned as an individual directory number (DN) feature and the ltm_idx can be used.

Action:

Use the following steps to recover the rITGLTM tuple:

1. Determine the valid value for the moh_act field in the rITGLTM tuple for this line.
2. If the TG/SR feature is assigned through a BFG, read RC/V View 12.9 (BRCS FEATURE GROUP CONSTRUCTION AND UPDATE) with the name of the BFG found in RC/V 1.11 (BRCS FEATURE ASSIGNMENT).

Verify the moh_act field found in the BFG.

3. Use ODBE to insert an rITGLTM tuple using the bfgid on the ROP as the LTM_IDX, LTM_ISDN as the LTM_TYPE, and the lead_mod printed on the ROP as the LEAD_MODULE. The moh_act found in RC/V 12.9 is assigned to the MOH_ACT in this tuple.
4. If the TG/SR feature is assigned as an individual DN feature, the default moh_act field from RC/V 12.21 (TERMINAL GROUP FEATURE DEFINITION) can be used or the line may or may not be allowed to provide music.
5. In either case, insert an rITGLTM tuple using ODBE with the ltm_idx printed on the ROP as the LTM_IDX, the lead_mod printed on the ROP as the LEAD_MODULE, and the ltm_type printed on the ROP as the LTM_TYPE. For the MOH_ACT attribute, insert the moh_act found in RC/V View 12.21, or DBYES if music provisioning is allowed for held calls or DBNO if music provisioning is not allowed.
6. If the moh_act field was populated without the use of the default moh_act field from RC/V 12.21, verify that the tgid this line belongs to has a music source. The music source can be checked on RC/V View 4.4 (TERMINAL GROUP ATTENDANT AND DATA) using the tgid printed on the ROP as the key.
7. If a music source is not found for this terminal group, update RC/V 4.4 with a valid music trunk group number and member number.

580. FCTMRARCFail (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value was found in the FCarctimer[] array, the internal timer chain for local area signaling services (LASS) automatic callback/automatic recall (AC/AR), or in the FCarcheadtmr[] array, the internal timer chain control structure.

581. FCTPUNXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by a terminal process other than the originating or terminating terminal processes (OTP/TTP). The message, the far process ID from the process control block link area (PCBLA), and the terminal equipment data block (TEDB) information are dumped to the ROP. The port that received this unexpected message will also be dumped. This port information will start at the fifth byte after the far process ID.

This assert returns to the calling function without any affect on call processing. No audits are scheduled. The data printed on the ROP is used to determine which process sent the message. Contact your next level of support.

582. FCTRANSEXCEEDED (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following terminal processes in the FC subsystem running in the VFSM framework exceeded the maximum number of state transitions it defined for itself:

- The frame relay terminal process (fc/FCfr)
- The ISLP terminal process (fc/DCislp)

Probable Cause:

This should never happen.

Action:

Assert and purge the terminal process.

583. FCTRANSEXCEEDED (5E12 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The VFSM maximum transitions loop in the frame relay terminal process has been exceeded.

Probable Cause:

This should never happen.

Action:

Assert and purge the frame relay terminal process.

584. FCTREDLANI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

At the action point (ACP) for the software defined network (SDN) service, the billing number (ANI) for the call must be 10 digits. An rLEDLSTRKG tuple is missing or the tuple has an incorrect ANI.

Data Structures:

RLEDLSTRKG. Keys: trunk group number

Action:

Use RC/V View 5.1 (TRUNK GROUP) (or ODBE, if necessary) to correct the problem. If the trunk group should remain dedicated to SDN service, supply a 10-digit billing number to this trunk group. Otherwise, reset the sdnded attribute to 0 in the RLFC_TRUNK relation for all trunks members of this trunk group.

585. FCTRKLN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A leased network (LN) call requiring a query to the LN network control point (NCP) was attempted on a port, but the port does not have a valid class of service (COS) for LN. The affected call is sent to reorder. No LN calls will complete for the indicated port until this problem is corrected.

Data Structures:

RLFC_PORTTYP. Key fields: port.member, port.module.

Action:

Determine if the port is a line or a trunk and if the port is intended to be used for the leased network.

If the port should be used in the LN, update the COS and any other related data. (Refer to the population rules for the RLRCTGRPRK relation in the 5ESS[®] Switch Translations Data Manual for the valid LN COSs for trunks. See the population rules for the RLFC_LINE relation for the valid LN COS for lines.)

If the port should not be used in the LN, do one of the following actions. If the port is a line, use ODBE to update the ln_type attribute of the line's rLFC_LINE tuple to LN_NULL. If the port is a trunk, use ODBE to update the ln_type attribute of the trunk's rLFC_TRUNK tuple to LN_NULL. These updates cannot be done with RC/V.

586. FCTRKNOTA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An integrated services attendant (ISAT) remote busy verification error occurred. The trunk group number (grpnum) read from the RLRT_ROUTING relation that corresponds to the remote route index (rti) read from the RLREMBV_RI relation is not associated with the ISAT that originated the busy verification.

Data Structures:

RLTGTOATT. Key fields: grpnum, isat_idx (ISAT code index).

RLREMBV_RI. Key fields: isat_idx, rti (route index), rti.

Action:

This is a database inconsistency that will cause the call to be torn down and the ISAT will get the reorder tone. This inconsistency can only be corrected through manual action. Use RC/V View 5.1 (TRUNK GROUP) to enter the ISAT MLHG value that will associate the busy verify trunk's trunk group number (TGN) with the ISAT corresponding to the isat_idx read from the RLREMBV_RI relation. If the data is populated correctly, contact your next level of support.

587. FCTRKSDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid incoming trunk is dedicated to software defined network (SDN) service.

Data Structures:

RLFC_TRUNK. Key field: port.

Action:

Use RC/V View 5.1 (TRUNK GROUP) (or ODBE, if necessary) to make the trunk not dedicated to SDN service.

588. FCTRMBFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An RLTRMFEATS tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLFC_LINE, RLLPT_PT, RLTRMFEATS.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG), the keys used to read the relation (lport, lpt_type), the range (RANGE), the BFGID, and the original (non-BFG) keys for this relation.

Action:

BRCS features can be assigned directly to the line or assigned to the line via a BRCS feature group (BFG).

When a BRCS feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLTRMFEATS relation where RLtrmfeats.lport is RLfc_line.lport, RLtrmfeats.lpt_type is RLfc_line.lpt_type, and RLtrmfeats.range is 0 through 6.

When a BRCS feature is assigned to a line via a BFG, the BFG keys are used to read the RLTRMFEATS relation where RLtrmfeats.lport is RLfc_line.bfgid, RLtrmfeats.lpt_type is LPT_BFG, and RLtrmfeats.range is 0 through 6.

An attempt to read the RLTRMFEATS relation using the BRCS feature group (BFG) keys was made because the BRCS terminal feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the BFG ID (bfgid) and the BFG indicator for terminal features (trmbfg).
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, then the BFG ID from RLFC_LINE should equal the BFG ID given in the ROP output. If the BFG ID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFG ID values match, an rITRMFEATS tuple should exist for the BFG keys. Insert the appropriate rITRMFEATS tuple.

589. FCTRMFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rITRMFEATS tuple is missing.

Data Structures:

RLFC_LINE, RLLPT_PT, RLTRMFEATS.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - the logical port (lport), the logical port type (lpt_type), and the range.

Action:

Business and residential custom services (BRCS) features can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When a BRCS feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLTRMFEATS relation - RLtrmfeats.lport=RLfc_line.lport, RLtrmfeats.lpt_type=RLfc_line.lpt_type, and RLtrmfeats.range is 0 through 6.

An attempt to read the RLTRMFEATS relation using the original (non-BFG) keys was made because a BRCS feature was thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm).
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

5. If brc_trm is DBYES and the lport and lpt_type values match, an rITRMFEATS tuple should exist for the original (non-BFG) keys. Insert the appropriate rITRMFEATS tuple.

590. FCTRMINCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found in the RLTRMFEATS relation. This relation holds data for business and residential custom services (BRCS) features assigned to terminals (lines or trunks). Each tuple holds up to six feature entries. If more than six BRCS features are assigned to a terminal, multiple rITRMFEATS tuples are used to hold the feature entries.

The feat_cnt field in the first rITRMFEATS tuple (range 0) indicates the number of features that should exist for the terminal. For example, if 14 BRCS features are assigned to a terminal, three rITRMFEATS tuples are used to store the BRCS feature data. The first tuple (range 0) has feat_cnt=14 and contains the first six feature entries. The second tuple (range 1) contains the next six feature entries and the third tuple (range 2) contains the final two feature entries.

An attempt to read one of the additional rITRMFEATS tuples (range>0) failed. An rITRMFEATS tuple is missing or the feat_cnt in the first tuple is incorrect. The tuple keys as well as the actual number of feature entries found are printed on the ROP.

If this problem occurs during a call, the call will not be torn down and an attempt will be made to process the BRCS features that were successfully read.

Data Structures:

RLTRMFEATS. Key fields: range, lpt_type, lport.

The ROP output provides the RANGE (a number from 0-4 used to distinguish multiple tuples assigned to a terminal), the LPT_TYPE (the terminal's logical port type where 0 (LPT_OTHER) indicates an analog terminal, 1 (LPT_ISDN) indicates an ISDN terminal, and 2 (LPT_BFG) indicates that the BRCS features are part of a BRCS feature group (BFG) assigned to the terminal), the LPORT (the terminal's logical port or the BFG ID, if the LPT_TYPE is LPT_BFG), and the CNT (a count of the number of feature entries found).

Action:

If the LPT_TYPE is not LPT_BFG, use the LPORT and LPT_TYPE to read the RLLPT_PT relation using ODBE in order to determine the port and party. If the LPT_TYPE is LPT_BFG, the LPORT is the BFG ID.

Examine the first rITRMFEATS tuple. The RANGE for the first tuple is 0. The LPORT and LPT_TYPE keys are printed on the ROP. If the feat_cnt field in the first tuple is incorrect, use ODBE to update the tuple to the correct count. The correct count will be CNT.

If the feat_cnt field in the first tuple is correct, then one or more rITRMFEATS tuples are missing. Update the rITRMFEATS tuple (range=0) using ODBE. Set the feat_cnt attribute to the value of CNT. This update allows RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) to display the features that were found for this LPORT. This is a temporary fix until the missing features can be determined.

The missing feature entries must be added to the RLTRMFEATS relation based on the office records. The feat_cnt in tuple 0 must be updated using ODBE once the correct number of features is determined. The data for each missing feature depends on the feature. Contact your next level of support for assistance in restoring these rITRMFEATS tuples.

591. FCTRPFANI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

At the action point (ACP) for the software defined network (SDN) service, the billing number (ANI) for the call should be 10 digits. An rIPF_TKDN tuple is missing or the tuple has an incorrect ANI.

Data Structures:

RLPF_TKDN. Key field: port.

Action:

Use RC/V View 5.1 (TRUNK GROUP) (or ODBE, if necessary) to supply the 10-digit ANI to the port or make the trunk not dedicated to SDN service.

If ODBE is used, reset the sdnded attribute to 0 on the rIFC_TRUNK tuple to make the trunk not dedicated to SDN service; otherwise, assign a 10-digit ANI to the trunk on the rIPF_TKDN tuple.

592. FC_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIFC_TRUNK tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_TRUNK relation with the actual keys used to access the relation. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify the next level of support.

This relation is updated by the following RC/V views:

- 1.11 (BRCS FEATURE ASSIGNMENT LINE)
- 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER)
- 5.1 (TRUNK GROUP)

593. FCTR_UNKN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Transaction initialization was requested with an invalid routing domain. The process control block link area (PCBLA) and the D-channel data block (DCDB) buffer are dumped and the terminal process causing the call to be torn down is purged.

594. FCTSDBER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

Could not retrieve an rITSDB tuple. The time-slot data block (TSDB) audit is scheduled and the code returns to the point of interrupt.

595. FCUEXPRET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ATP received an unexpected return from OSWGETMSG.

596. FCUGLPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while updating a global parameter.

597. FCULNSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSDB	Audit Mode: elev

Problem:

An error indicating invalid linkages in the RLNSDB relation occurred when the advanced services platform (ASP) software tried to release an rLNSDB tuple. The AUNSDb audit will be scheduled to clean up the linkage problem.

598. FCUNCNFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNCNFLICT tuple was missing. Private digit analysis tried to resolve a conflict state previously determined by the RLUNDTRE relation, but could not find a tuple with the indicated keys.

Data Structures:

RLUNCNFLICT. Key fields: table index, number of digits to collect.

RLUNDTRE. Key fields: ARS group ID, previous index, dialed digits.

Action:

This problem indicates that the database was not properly populated. The first fields on the ROP are the key fields that were not found in the RLUNCNFLICT relation. Give this information to office data administration (ODA) support.

The next three reported values are the automatic route selection (ARS) customer group index, the dialing plan number, and the digits analyzed up to the point of the data inconsistency.

Use the base relation RLFACTNAME to recover the ARS group name associated with the reported ARS group index. Using office records form "Private Network Dialing Plan Conflict Table," the set of form entries that match the reported ARS group name, dialing plan number, and (partial) incoming digits should be verified using RC/V.

The RC/V view tuple that fails identifies the error being reported. Attempt to remove the conflict view tuple, and then re-insert the tuple.

A trouble report should be filed.

599. FCUNDPINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNDPINFO tuple was missing.

Data Structures:

RLUNDPINFO. Key fields: ARS group ID, dialing plan number.

Action:

The ROP output provides the automatic route selection (ARS) group ID and the ARS dialing plan number. Use base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. With the ARS group name and the dialing plan number, insert an rLUNDPINFO tuple using RC/V View 9.20 (PRIVATE NETWORK INFORMATION).

A trouble report should be filed.

600. FCUNFLGNSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This phone call was already passed through the network service code conversion. This should only occur once per call.

The rLUNNSC tuples were improperly populated to convert a network service code to another network service code. The original off-network number should only be translated to a valid phone number.

Data Structures:

RLUNNSC. Key fields: ARS group ID, conversion index.

The ROP output provides the automatic route selection (ARS) group ID, the conversion index, the number returned from the network service code, and the active dialing plan number.

Action:

Use base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. Use the ARS group name and the dialing plan number to locate the incorrectly populated tuple. A trouble report should be filed.

601. FCUNNSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNNSC tuple was not found for the associated keys.

Data Structures:

RLUNNSC. Key fields: ARS group ID, conversion index.

The ROP output provides the automatic route selection (ARS) group ID, the conversion index, and the dialed digits (network service code dialed).

Action:

Use base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. Use RC/V View 9.21 (PRIVATE NETWORK DIALING PLAN) to insert the rLUNNSC tuple. A trouble report should be filed.

602. FCUNOFFON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This phone call was already passed through the on-network to off-network conversion. This should only occur once per call.

The rLUNOFFON tuples were improperly populated to convert an off-network number to another off-network

number. The original off-network number should only be translated to an on-network number.

Data Structures:

RLUNOFFON. Key fields: ARS group ID, conversion index.

The ROP output provides the automatic route selection (ARS) group ID, the conversion index, the number returned from the off-network to on-network conversion, and the current dialing plan number.

Action:

Use base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. With the ARS group name and the conversion index, use RC/V View 9.22 (OFF NETWORK NUMBER CONVERSION) to locate the incorrectly populated rLUNOFFON tuple. Remove this tuple then correctly re-enter the information. A trouble report should be filed.

603. FCUNONDI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNON_DI tuple was not found for the associated keys.

Data Structures:

RLUNON_DI. Key fields: ARS group ID, previous digits.

The ROP output provides the automatic route selection (ARS) group ID, the previous digits, and the on-network number being translated.

Action:

Use base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. With the ARS group name, the on-network number, and the previous value, use RC/V View 9.21 (PRIVATE NETWORK DIALING PLAN) to insert the appropriate information in the rLUNON_DI tuple. A trouble report should be filed.

604. FCUNONOFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNONOFF tuple was not found for the associated keys.

Data Structures:

RLUNONOFF. Key fields: ARS group ID, on-network digits.

Action:

Use base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. Use RC/V View 9.23 (ON-NETWORK NUMBER CONVERSION) to insert the appropriate rLUNONOFF tuple. A trouble report should be filed.

605. FCUNRLOFFON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNOFFON tuple was not found for the associated keys.

Data Structures:

RLUNOFFON. Key fields: ARS group ID, conversion index.

The ROP output provides the automatic route selection (ARS) group ID, the conversion index, the off-network number, and the current dialing plan number.

Action:

Use base relation RLFACTNAME to recover the ARS group name associated with the reported ARS group index. Use RC/V View 9.22 (OFF NETWORK NUMBER CONVERSION) to insert the appropriate rUNOFFON tuple. A trouble report should be filed.

606. FCUNXDESTTYPE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid call type was populated for the local digit interpreter table (LDIT)/incoming digits (INC DIGITS) combination or the RDIT/previous digits/remaining digits combination.

Data Structures:

RLFC_TRUNK. Key field: port.

Action:

Use the digit analysis selector (DAS) value dumped as the key for RC/V View 9.1 (DIGIT ANALYSIS). This view gives the LDIT associated with the call. The LDIT and the INC DIGITS are the keys for RC/V View 9.3 (LOCAL DIGITS). The LDIT view may have an associated RDIT view. The RDIT, PREVIOUS DIGITS and the REMAINING DIGITS are the keys for RC/V View 9.9 (REMAINING DIGIT). Change the call type field on View 9.3 or View 9.9 to a valid value for this LDIT/INC DIGITS or RDIT/PREVIOUS DIGITS/REMAINING DIGITS combination. See the Translation Guide 5ESS® Switch TG-5 Vol. 1, Div. 3 (Translation Administration), Sec 3c (Routing and Charging Forms - Local Digit Interpreter Table (5300-3/5) - LDIT) for valid values.

607. FCUNXDESTTYPE (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid call type was populated for the local digit interpreter table (LDIT)/incoming digits (INC DIGITS) combination.

Data Structures:

RLFC_TRUNK. Key field: port.

Action:

Use the digit analysis selector (DAS) value dumped as the key for RC/V View 9.1 (DIGIT ANALYSIS). This view gives the LDIT associated with the call. The LDIT and the INC DIGITS are the keys for RC/V View 9.3 (LOCAL DIGITS). Change the call type field to a valid value for this LDIT/INC DIGITS combination. See the Translation Guide 5ESS® Switch TG-5 Vol. 1, Div. 3 (Translation Administration), Sec 3c (Routing and Charging Forms - Local Digit Interpreter Table (5300-3/5) - LDIT) for valid values.

608. FCUNXMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received from the far process.

609. FCUNXPECTEDRET (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function/macro in the FC subsystem called another function/macro (not necessarily in FC) that returned an unexpected value. This general assert will require a stack back trace to investigate.

Probable Cause:

The called function/macro encountered an unexpected problem.

Action:

Assert to support further investigation and return to caller.

610. FCUNXTYPCICALL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value for the type of carrier interconnect call (TYP CI CALL) was populated for the local digit interpreter table (LDIT)/incoming digits (INC DIGITS) combination or the RDIT/previous digits/remaining digits combination.

Data Structures:

RLFC_TRUNK. Key field: port.

Action:

Use the digit analysis selector (DAS) value dumped as the key for RC/V View 9.1 (DIGIT ANALYSIS). This view gives the LDIT associated with the call. The LDIT and the INC DIGITS are the keys for RC/V View 9.3 (LOCAL DIGITS). The LDIT view may have an associated RDIT view. The RDIT, PREVIOUS DIGITS and the REMAINING DIGITS are the keys for RC/V View 9.9 (REMAINING DIGIT). Change the TYP CI CALL field to a valid value for this LDIT/INC DIGITS or RDIT/PREVIOUS DIGITS/REMAINING DIGITS combination. See the Translation Guide 5ESS® Switch TG-5 Vol. 1, Div. 3 (Translation Administration), Sec. 3c (Routing and Charging Forms - Local Digit Interpreter Table (5300-3/5) - LDIT) for valid values.

611. FCUNXTYPCICALL (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value for the type of carrier interconnect call (TYP CI CALL) was populated for the local digit interpreter table (LDIT)/incoming digits (INC DIGITS) combination.

Data Structures:

RLFC_TRUNK. Key field: port.

Action:

Use the digit analysis selector (DAS) value dumped as the key for RC/V View 9.1 (DIGIT ANALYSIS). This view gives the LDIT associated with the call. The LDIT and the INC DIGITS are the keys for RC/V View 9.3 (LOCAL DIGITS). Change the TYP CI CALL field to a valid value for this LDIT/INC DIGITS combination. See the Translation Guide 5ESS® Switch TG-5 Vol. 1, Div. 3 (Translation Administration), Sec. 3c (Routing and Charging Forms - Local Digit Interpreter Table (5300-3/5) - LDIT) for valid values.

612. FCUPCCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

An attempt to unlink the call build up data block (CBDB) and the process control block link area (PCBLA) failed.

The CBDB could not be released. The call will not be affected.

613. FCVPNPRIOHD (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual private network (VPN) PRI OHD trigger defined on RC/V View 5.1 (TRUNK GROUP) does not specify R0D1 protocol on RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).

The trigger number associated with the OHD trigger should only be populated with R0D1 protocol. The call will be provided with standard switch error treatment.

Data Structures:

RLNS_TRIG.

Action:

Check the trigger defined on RC/V View 9.35 to ensure that the OHD trigger defined on RC/V View 5.1 for the VPN PRI trunk group specifies R0D1 protocol.

614. HIUNEXPMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The home intercom (HI) model received an unexpected internal message. The process control block link area (PCBLA), information from the associated process block (APB), and the message type are dumped. This assert occurs in STATE *. No calls are affected.

615. ICLIDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CNDATA	Audit Mode: elev

Problem:

A tuple in the RLCNDDATA dynamic relation could not be found with the given keys. Either the keys used to access the relation are invalid, or a user that is assigned the incoming call line identification (ICLID) calling name display (CND) feature has a tuple in static relation RLICLIDIDX with no corresponding rlcNDDATA tuple. The audit on the dynamic relation RLCNDDATA will be scheduled. The keys for the rlcNDDATA tuple, ltm_idx and ltm_type, will be printed on the ROP.

616. ICLIDDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBCND	Audit Mode: elev

Problem:

A tuple in the RLDBCND dynamic relation could not be obtained, or could not be linked to the process control block link area (PCBLA). The audit on the RLDBCND relation will be scheduled. The rldBCND tuple that was to be obtained or linked will be printed on the ROP.

617. ICLIDIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rliCLIDIDX tuple with the given keys cannot be found in the static database. The LTM_TYPE is one of two possible values. If the type is LTM_OTHER, a 0 will be printed on the ROP, if the type is LTM_ISDN a 1 will be printed. The tuple is missing or the keys used to access the tuple are not valid.

Data Structures:

RLICLIDIDX. Key fields: ltm_idx, ltm_type

RLDNFEATS. Key fields: lead_module, ltm_idx, ltm_type

Action:

1. Verify that the keys are valid. LTM_TYPE will be 0 or 1, LTM_IDX must be between 1 and 4095. If the keys are not valid, file a trouble report.
2. Use ODBE in the batch read (BR) mode to read the RLFC_LINE relation from the SM that the assert was fired from into a *UNIX*® file. Use a *UNIX*® editor to locate the tuple that has LTM_TYPE and LTM_IDX attributes that match the attributes printed on the ROP.
3. Verify that the rIFC_LINE tuple's port and party have the link inhibit denied message (LID) feature assigned. If so, reset the brc_dn bit in the tuple.
4. Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) to re-insert the features for that user.
5. If the rIFC_LINE tuple's port and party are not assigned to the LID feature, verify that the LID feature has been assigned as part of a business and residential custom services (BRCS) feature group (BFG). Here, bfg_dn will be 1 (DBYES). Set bfg_dn in the tuple to 0 (DBNO).
6. Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) to re-assign the user to the BFG.
7. If the error cannot be corrected by steps 2-6, file a trouble report.

618. ISACOFTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid read of the database relation RLACOFTRAN occurred.

Data Structures:

RLACOFTRAN. Key fields: config, cpe_comp, button.

Action:

Validate the keys for the RLACOFTRAN relation that were dumped on the ROP. If the keys are valid, insert the corresponding rIACOFTRAN tuple.

619. ISACSR_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACSR_GRP tuple is missing. The key to this tuple is the automatic customer station rearrangement (ACSR) group ID from the RLDSLEQUIP relation.

Data Structures:

RLDSLEQUIP. Key field: dsl.

RLACSR_GRP. Key field: acsr_gpid.

Action:

Use RC/V (or ODBE, if necessary) to validate the acsr_gpid key for this digital subscriber line (DSL) in the RLDSLEQUIP relation. Then verify that the RLACSR_GRP relation has a tuple for this acsr_gpid.

620. ISACSR_OPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACSR_OPT tuple is missing. The key to this relation is the feature ID from the RLTRMFEATS relation.

Data Structures:

RLACSR_OPT. Key fields: feat_id. RLTRMFEATS. Key fields: lport, lpt_type.

Action:

Use RC/V (or ODBE, if necessary) to validate the feat_id for this lport and lpt_type in the RLTRMFEATS relation. Then verify that the RLACSR_OPT relation has a tuple for this feat_id.

621. ISADBPID (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: ADB	Audit Mode: elev

Problem:

The process ID (PID) in the analog data block (ADB) did not match the PID of the analog terminal process that is linked to the ADB. The process associated with the ADB will be purged, and the ADB audit will be scheduled to check the RLADB relation.

622. ISAHBLTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to link an rIATTM_BLF tuple to the ordered set owned by an rIATTH_BLF tuple failed. The following data is printed on the ROP in this order: the key of the rIATTH_BLF tuple that the rIATTM_BLF tuple was to be linked to, the return value (ret_val) from the DAahbltm() function, and the rIATTM_BLF tuple.

623. ISAHDPDA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the dynamic access (DA) primitive DAahdpda() could not link an rIDALB tuple to an rIDPB tuple.

624. ISAHHCBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to link an rIATTH_BLF tuple to the ordered set owned by an rIDB_HEADC tuple failed. The following data is printed on the ROP in this order: the key of the rIDB_HEADC tuple that the rIATTH_BLF tuple was to be linked to, the return value (ret_val) from the DAahhcbl() function, and the rIATTH_BLF tuple.

625. ISAHHCBR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCSDB	Audit Mode: elev

Problem:

The DAahhcbr() dynamic access (DA) primitive failed to return an rIBRCSDB tuple to the head of the idle list. The rIBRCSDB tuple key is printed on the ROP.

626. ISAHHCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DAahhcda() function. The dalb key is printed.

627. ISAHHC DI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DISPDB	Audit Mode: elev

Problem:

An attempt to add an rIDISPDB tuple to the head of the idle list failed. The rIDISPDB tuple key is printed on ROP.

628. ISAHTEDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the DAahteda() primitive. The tedb_key and dalb_key values are printed on the ROP.

629. ISANALMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The shared directory number (SHDN) terminal array contains information about terminals in a SHDN. If an analog phone is part of the key system group, it must be the first entry in the array. An analog terminal was found in an array entry other than the first entry.

630. ISANFAILTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

If a process is linked to the analog data block (ADB) and is not a normal terminating process (has_tp1 and Has_tp2 both == DBNO), then the analog terminal process failed, giving busy to the terminal. An attempt to send an MGINTERRUPT message to this terminal process failed.

631. ISATCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLAT_CF tuple is missing.

Data Structures:

RLTRMFEATS, RLAT_CF.

Action:

The FID field in an rITRMFEATS tuple indicated that an rLAT_CF tuple should exist. Check the rITRMFEATS tuple then add the expected rLAT_CF tuple, or null the FID in the rITRMFEATS tuple.

632. ISATGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLAT_GRP tuple is missing.

Data Structures:
RLAT_GRP.

Action:

Check the RLAT_PORT relation to determine the expected group number then add it to the RLAT_GRP relation.

633. ISATHCDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ADB	Audit Mode: elev

Problem:

The DAATHCDB() macro failed to link an analog data block (ADB) to the busy list. The ADB audit will be scheduled.

634. ISATPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLAT_PORT tuple missing that is keyed with the logical port (lport) and logical port type (lpt_type).

Data Structures:
RLAT_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - lport and lpt_type.

Action:

The attendant control of voice terminals (ACVT) business and residential custom services (BRCS) feature is always assigned directly to a line.

For the keys used to read the RLAT_PORT relation, RLat_port.lport is RLfc_line.lport and RLat_port.lpt_type is RLfc_line.lpt_type.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to find the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). ACVT is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rLAT_PORT tuple should exist for the keys on the ROP. Insert the appropriate rLAT_PORT tuple.

635. ISAUPCDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DAupcdl() function. The process control block link area (PCBLA) key is dumped.

636. ISBADADB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The key of the analog data block (ADB) is not the ADB that was expected. The ADB may be incorrect or it may be incorrect with a valid reason for the inconsistency. This assert will not peg the escalation counts towards SPP or INIT.

637. ISBADARG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A feature control (FC) function was called with an invalid argument.

638. ISBADDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The D-channel process linkage block (DALB) key may be incorrect. The DALB audit is scheduled to check the RLDALB relation.

639. ISBAD_MEM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid member number information was encountered for a logical port and terminal number. The logical port and terminal number are output on the ROP.

640. ISBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received. An explicit message is considered invalid if the "other call reference value" is PSUNTRANS. The status flags for the cref and ocref fields are dumped to the ROP.

641. ISBADMWDYN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ISmwsst_cmp() or ISmwsrecal() function returned a value that was not valid for the situation when the function was called. The integrated services digital network (ISDN) state in the process control block link area (PCBLA) or the multiway (MW) data (ringing or talking) for the far end may be wrong.

For example, a far party answers on a MW call and the function returns the value ISNOTIFY_RINGING. Since a far party answered, the ISmwsst_cmp() or ISmwsrecal() function should not return information to notify ringing.

The PCBLA and selected data from up to five associated process blocks (APBs) are dumped to the ROP.

642. ISBADMWRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function that was called from the multiway (MW) model returned an invalid value. For example, if the ISmw_merge() function did not return ISFAIL_REC, ISFAIL_IRREC or GLSUCCESS, the return code would be invalid. The process control block link area (PCBLA) and selected data from up to five associated process blocks (APBs) are printed.

643. ISBADPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected parameter was received in a display function. This error should not affect call processing.

644. ISBKINSR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A terminal is in service, but the ISsh_srchca() function returned DBNO_MATCH when attempting to retrieve the D-channel application linkage block (DALB) for the terminal. The out of service (OOS) status of this terminal is not consistent in the data.

645. ISBR_FRDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCSDB	Audit Mode: elev

Problem:

An invalid return was received from the ISBRFRDA() macro. The BRCSDB audit will be scheduled to check the relation.

646. ISDAGTAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to access a tuple in the dynamic relation RLATTM_BLF failed. The rlIS_TERM tuple that supplied the latidx (the key to the rLATTM_BLF tuple) is printed on the ROP.

647. ISDBFDAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to delete a tuple in the dynamic relation RLATTM_BLF failed. The following data is printed on the ROP in this order: the return value (ret_val) from the DBfdltup() function, and the rLATTM_BLF tuple.

648. ISDBFIAH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to insert a tuple in the dynamic relation RLATTH_BLF failed. The following data is printed on the ROP in this order: the return value (ret_val) from the DBfintup() function, and the rLATTH_BLF tuple.

649. ISDBFIAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to insert a tuple in the dynamic relation RLATTM_BLF failed. The following data is printed on the ROP in this order: the return value (ret_val) from the DBfintup() function, and the rLATTM_BLF tuple.

650. ISDISPCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLDISP_CF tuple was missing. The terminal attempting to use a display terminal feature, had the feature assigned (that is, a display feature ID was in the RLTRMFEATS relation for the requesting terminal), but no rLDISP_CF tuple was associated with the feature ID.

Data Structures:

RLDISP_CF. Key field: feature ID.

RLTRMFEATS. Key fields: port, party.

In the ROP output, the first variable is the display constructed feature ID (hexadecimal) expected but not found, and the other data identifies the port (hex) and the party (decimal).

Action:

Use RC/V to find the display feature name for the display feature ID found in the data dump by looking at View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) or View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]) for the identified port and party.

Use the display feature name to define a new display feature in the RLDISP_CF relation via the ISDN BRCS DISPLAY FEATURE DEFINITION view.

If the display feature was assigned through standard office data administration (ODA) or recent change (RC), file a trouble report.

651. ISDLBKEY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The key of the D-channel process linkage block (DALB) was not the key that was expected. The RLDALB relation may be corrupted. The DALB audit will be scheduled.

652. ISDSL_EQUIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDSLEQUIP relation, a failure code of DBNO_MATCH was returned. An rLDSLEQUIP tuple is missing or the keys used to read the relation were not set properly.

Data Structures:

RLDSLEQUIP. Key fields: dsl.

Action:

This is a database inconsistency that can only be corrected by manual action.

653. ISDSP_ACN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The display terminal process received an unknown action in a feature activation information element.

654. ISDSP_REST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSRESTART() macro failed in the display terminal process.

655. ISDSP_RMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The display terminal process received an invalid operating system for distributed switching (OSDS) message.

656. ISDSP_SMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) message was not sent by the display terminal process.

657. ISDSP_SWTCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown case in a switch statement was encountered in the display terminal process.

658. ISEDS_APID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An application processor (AP) site ID in the RLEDS_GRP relation did not have a corresponding entry in the RLCMAPDATA relation. The logical termination port (ltm_idx) attempting to use an electronic directory service (EDS) feature is assigned to an EDS feature and a valid EDS group. The EDS feature ID is in the rIDN_FEATS tuple for the ltm_idx, and the ltm_idx has an rLEDS_PORT tuple. The EDS group has an rLEDS_GRP tuple, but the AP site ID in this tuple does not appear as an AP site ID entry in the RLCMAPDATA relation.

Data Structures:

RLEDS_GRP. Key field: EDS group ID.

RLCMAPDATA. Key field: AP site ID.

In the ROP output, the first variable is the EDS group ID (decimal) associated with the ltm_idx attempting to use an EDS feature, and the second variable is the AP site ID (decimal) that is associated with this EDS group ID.

Action:

This is a database inconsistency that can be corrected only by manual action. There are two possible solutions to this problem.

1. If the AP site ID is correct for this EDS group ID, define a new AP site ID entry using RC/V View 24.7 (DSL AP COMMUNICATIONS DATA).
2. If the AP site ID is not valid, use the EDS group ID and RC/V View 4.38 (ELECTRONIC DIRECTORY SERVICE GROUP PARAMETERS) to correct the invalid entry.

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

659. ISEDSCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLEDSCF tuple is missing. The logical termination port (ltm_idx) attempting to use the electronic directory service (EDS) feature has an EDS feature assigned, but no rLEDSCF tuple exists that is associated with the ltm_idx. The EDS feature ID is an rIDNFEATS tuple for the requesting ltm_idx.

Data Structures:

RLEDSCF. Key field: feature ID.

RIDNFEATS. Key fields: ltm_module, ltm_type, ltm_idx.

The first variable on the ROP output is the EDS constructed feature ID (hexadecimal) expected but not found. The other data identifies the ltm_module (decimal), ltm_type (decimal), and ltm_idx (decimal) of the requesting ltm_idx.

Action:

This is a database inconsistency that can only be corrected by manual action.

Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) or View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER) to find the EDS feature name for the EDS feature ID found in the data dump. Use this EDS feature name to define a new EDS feature in the RLEDSCF relation via RC/V View 12.38 (ELECTRONIC DIRECTORY SERVICE FEATURE DEFINITION).

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

660. ISEDGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLEDGRP tuple is missing. The logical termination port (ltm_idx) attempting to use an electronic directory service (EDS) feature has an EDS feature assigned and the ltm_idx is assigned to a valid EDS group ID, but the EDS group information has not yet been supplied.

The EDS feature ID is in an rIDNFEATS tuple, the ltm_idx is assigned to an EDS group ID in an rLEDPORT tuple, and an rLEDGRP tuple stores the EDS group information.

Data Structures:

RLEDGRP. Key field: EDS group ID.

RLEDPORT. Key fields: ltm_module, ltm_type, and ltm_idx.

The first variable on the ROP output is the module (ltm_module), the second variable is the logical termination type (ltm_type), and the third variable is the logical termination port (ltm_idx) that encountered the missing data. The fourth variable is the EDS group ID. All variables are printed in decimal.

Action:

This is a database inconsistency that can be corrected only by manual action.

With the ltm_module, ltm_type, ltm_idx printed on the ROP, use RC/V View 4.38 (ELECTRONIC DELIVERY SERVICE GROUP PARAMETERS) to determine the EDS group name. Define a new EDS group for this group name by using RC/V View 4.38.

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

661. ISEDSINVGPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Electronic directory service (EDS) group ID zero is assigned. A logical termination port (ltm_idx) attempting to use an EDS feature is assigned to EDS group ID zero. This ltm_idx should have been assigned a non-zero EDS group ID at line assignment time.

Data Structures:

RLEDS_PORT. Key fields: ltm_module, ltm_type, and ltm_idx.

The first variable on the ROP output is the module (ltm_module), the second variable is the logical termination type (ltm_type), and the third variable is the logical termination port (ltm_idx) that is assigned a zero EDS group ID.

Action:

This is a database inconsistency that can be corrected only by manual action. Determine the valid EDS group to assign to this port. Use RC/V View 4.38 (ELECTRONIC DELIVERY SERVICE GROUP PARAMETERS) to assign the port to the EDS group ID.

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

662. ISEDSPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLEDS_PORT tuple is missing. The logical termination port (ltm_idx) attempting to use an electronic directory service (EDS) feature is assigned an EDS feature, but is not assigned to an EDS group. The ltm_idx should have been placed in an EDS group at line assignment time. The EDS feature ID is in an rIDNFEATS tuple for the ltm_idx.

Data Structures:

RLEDS_PORT. Key field: ltm_module, ltm_type, ltm_idx.

The first variable printed on the ROP is the module in decimal (ltm_module), the second variable is the logical termination type in decimal (ltm_type), and the third variable is the logical termination port (ltm_idx) that attempted to access the EDS feature.

Action:

This is a database inconsistency that can be corrected only by manual action. There are two possible solutions to this problem.

1. If the ltm_idx indicated in the dump should not be assigned to an EDS feature, then the EDS feature should be removed from the ltm_idx via RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) or View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER).

2. If the ltm_idx indicated in the dump should be assigned to an EDS feature, then the ltm_idx should also be assigned to an EDS group and an rEDS_PORT tuple for the ltm_idx using the EDS feature should exist. Determine the EDS group to assign to this port. Assign the ltm_idx to the EDS group using RC/V View 4.38 (ELECTRONIC DIRECTORY SERVICE GROUP PARAMETERS).

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

663. ISEXTMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The shared call model (SCM) received an unrecognizable external message from one of its sibling models. The SCM does not know what to do with this message because it was not expected.

664. ISFBBRCSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No rIBRCSDB tuple was linked to the rIDALB tuple, or the rIBRCSDB pointer did not point to an rIBRCSDB tuple.

665. ISFBDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

No rIDALB tuple was associated with the process number in the rIPCBLA tuple.

666. ISFBDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

The rIDPB tuple pointer returned by the DAGETDPB() macro did not point to the rIDPB tuple. The dport key that was passed to DAGETDPB() was invalid.

667. ISFBIDLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The DAahhcda() primitive could not return an rIDALB tuple to the idle linked list.

668. ISFBINTER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an invalid return code from the ISfbinter() function; that is, a code other than GLSUCCESS or DBNO_MATCH. This function reads the RLFEATBTN relation.

669. ISFBLDAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

For each tuple in the static relation RLMONI_BLF, there is a corresponding tuple in the dynamic relation RLLDAT_BLF. The key to RLLDAT_BLF is the index, which is a unique value generated by evaluating of the global parameters Glmoni1x through Glmoni8x.

The DAGETLDAT() primitive returned an RLLDAT_BLF index which did not match the one requested, probably because the rLLDAT_BLF tuple does not exist. The tuple may have been deleted if there were two rLMONI_BLF tuples using the same index value to reference the same rLLDAT_BLF tuple (this would cause LDATBLF audit errors to occur.)

If one of the rLMONI_BLF tuples was deleted by changing the BUSY MONITOR attribute to N for every monitored directory number (DN) within the associated hundreds group, the corresponding rLLDAT_BLF tuple will also be deleted. Hence, an rLMONI_BLF tuple without a matching rLLDAT_BLF tuple would remain.

The LDATBLF audit is requested to create the required rLLDAT_BLF tuple. The problem does not impact call processing, but does impact the busy/idle status provided by the integrated services digital network (ISDN) attendant busy lamp field.

Repeated occurrences of this assert and/or the LDATBLF audit suggests that an error exists within static data. Use ODBE to check the index attribute in the rLMONI_BLF tuple to verify that it is unique. Also check the Glmoni1x through Glmoni8x parameters to ensure that the correct bit is set for each index being used in the RLMONI_BLF relation. If you find errors, use ODBE to correct them.

670. ISFBLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAahteda() primitive returned DBBAD_ADD. An rDALB tuple could not be added (linked) to the head of an rITEDB tuple.

671. ISFBLTMSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The pointer returned from the DAGTLMSTA() macro did not point to an rLTMSTAT tuple. The key passed to the DAGTLMSTA() macro is printed.

672. ISFBNOTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

No rITEDB tuple was found for the given rDALB tuple. The rDALB tuple did not have an owner rITEDB tuple.

673. ISFBRDI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCSDB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAfbrdi() failed to follow the linkage from the rBRCSDB tuple to the rDISPDB tuple. The BRCSDB audit is scheduled and the BRCSDB key is output on the ROP.

674. ISFBTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

The DAghdpte() primitive returned DBNULL_SET. No rITEDB tuple was found for the rIDPB tuple.

675. ISFBUNLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The DARhteda() primitive returned DBNULL_SET. The rIDALB tuple could not be removed (unlinked) from the owning rITEDB tuple.

676. ISFCLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_LINE relation or the rIFC_LINE tuple is missing.

Data Structures:

RLFC_LINE. Key fields: port.member(hex), port.module(dec), party(dec).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the keys in the RLFC_LINE relation with the actual keys used to access the relation. If the rIFC_LINE tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify the next level of support.

The RLFC_LINE relation is updated by the following views:

12.8 (BFG ADMINISTRATION)
 23.2 (DIGITAL SUBSCRIBER LINE)
 21.30 (OSPS - DSL PORT)
 1.12 (BRCS FEATURE ACTIVATION [LINE ASSIGNMENT])
 5.12 (BRCS FEATURE ACTIVATION [TRUNK MEMBER])
 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
 4.29 (ATTENDANT MLHG/BUSY LAMP FIELD RANGE DN ASSIGNMENT)
 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE)
 1.9 (MULTIPLE DIRECTORY NUMBER WITH DISTINCTIVE RINGING)
 3.5 (MULTILINE HUNT GROUP [LINE ASSIGNMENT])
 3.3 (MULTIPLE TN FOR MULTILINE HUNT GROUPS)
 1.32 (TWO TELEPHONE NUMBER SWAP)
 1.5 (PBX-DID LINE [LINE ASSIGNMENT])
 1.6 (COMPOSITE LINE [LINE ASSIGNMENT])

677. ISFCPORTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIFC_PORTTYP tuple with the given keys could not be found in the static database. The keys are printed on the ROP. The rIFC_PORTTYP tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLFC_PORTTYP. Key fields: port.module (SM number), port.member.

Action:

Verify that the keys printed on the ROP are valid. Use RC/V View 1.1 (LINE ASSIGNMENT INDIVIDUAL LINE) to assign this port.

If the rIFC_PORTTYP tuple was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

678. ISFDABR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAfdabr() failed to obtain the rIBRCSCDB tuple pointer by using the rIDALB tuple key. The rIDALB tuple key is printed on the ROP.

679. ISFDABR2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a shared directory number (DN) non-lead answer, an attempt to use the dynamic access (DA) primitive DAfdabr() to obtain the rIBRCSCDB tuple pointer by using the rIDALB tuple key failed. The rIDALB key is printed on the ROP.

680. ISFDAPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAfdapc() failed to obtain the rIPCBLA tuple pointer by using the rIDALB key. The rIDALB tuple key is printed on the ROP.

681. ISFNDDISP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

Given the information from the D-channel application linkage block (DALB), the ISfinddisp() function failed to get the associated display data block (DISPDB). The DISPDB was not retrieved. The DALB key will be dumped and the DALB audit will be scheduled.

682. ISFPCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAfpcda() failed to obtain the rIDALB tuple pointer by using the rIPCBLA tuple key. The rIPCBLA tuple key is printed on the ROP.

683. ISFPCDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DAfpcdl() function. The process control block link area (PCBLA) key is

dumped.

684. ISGETADB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ADB	Audit Mode: elev

Problem:

Given the associate key from the SHDN[] terminal array, the DAGETADB() macro failed to retrieve the analog data block (ADB). The associate key will be dumped and the ADB audit will be scheduled.

685. ISGETDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DAgetdalb() failed to obtain a pointer to an rIDALB tuple. The rIDALB tuple key that was passed to the primitive is printed on the ROP.

686. ISGETEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a shared directory number (DN) non-lead answer, an attempt to use the dynamic access (DA) primitive DAGoteda() to obtain the rITEDB tuple pointer by using the rIDALB tuple key was not successful. The rIDALB key is printed on the ROP.

687. ISGETPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DAgetpcbla() failed to obtain a pointer to an rIPCBLA tuple. The rIPCBLA tuple key that was passed to the primitive is printed on the ROP.

688. ISGETPTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Given the port name, the DAgetptla() function failed to retrieve a port linkage area (PORTLA). The port name from the PORTLA and the dport variable used to get the PORTLA will be dumped. The PORTLA audit will be scheduled to run.

689. ISGETTCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get a timing control block (TCB). The OSCTIMER() macro returned OSENOTCB. This process will be purged.

690. ISGETTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

Given the port name and the termno, the ISTEFRTRM() macro failed to retrieve the associated terminal equipment data block (TEDB). The port and termno are dumped and the TEDB audit will be scheduled.

691. ISGHTEDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAghteda() failed to obtain the head rIDALB tuple from the set owned by the rITEDB tuple. The rITEDB tuple key is printed on the ROP.

692. ISGODPDA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DAgodpda() function could not find an owning rIDPB tuple for the rIDALB tuple.

693. ISGODPTE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When calling the DAgodpte() function, failed to get a pointer to the rIDPB tuple that is associated with an rITEDB tuple. The TEDB audit is scheduled and the rITEDB key that was passed to the DAgodpte() function is printed on the ROP.

694. ISGOTEDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAgoteda() failed to obtain the rITEDB pointer by using the rIDALB tuple key. The rIDALB tuple key is printed on the ROP.

695. ISGRPPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIGROUP_PORT tuple was missing. While reading the RLGROUP_PORT relation for keys from the RLPORT_GROUP relation, a failure code of DBNO_MATCH was returned. A member number of the group was not found in the SM or AM. The global port relation with group and member numbers should have been placed in the SM or AM.

Data Structures:

RLGROUP_PORT. Key fields: grpnum, grptype, member.

In the ROP output, the first variable is the group number, the second variable is the group type (TM_LINE or TM_TRK), and the third variable is the member number.

Action:

Use the information on the ROP to determine the port relation with group and member numbers to be assigned to the SM or AM through standard recent change (RC).

696. ISGSTEDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAGsteda() failed to obtain the successor rIDALB tuple to the specified rIDALB tuple in the ordered set owned by the rITEDB tuple. The rIDALB tuple key is printed on the ROP.

697. ISGTOOSDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

The ISDAFRTE() macro failed to get a pointer to the first D-channel application linkage block (DALB) whose isdn_state is out of service from a terminal equipment data block (TEDB). The TEDB key is invalid or an invalid return was received from the macro. The TEDB key is dumped and the TEDB audit is scheduled to run.

698. ISHHCDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ADB	Audit Mode: elev

Problem:

The DAGhhcdb() function or DARhhcdb() function failed to get an analog data block (ADB) off the idle list. The ADB audit will be scheduled.

699. ISHHCDI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DAahhcdi() function. The disp key is printed.

700. ISICX_ICI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLICX_ICI static relation or the key used to read the relation is invalid.

Data Structures:

RLICX_ICI. Key field: isat_idx.

The isat_idx key is the index of the integrated services attendant (ISAT) hunt group. The key is printed in hex format.

Action:

An rLICX_ICI tuple with the key given on the ROP cannot be found in the static database. Verify that the key is a valid ISAT hunt group member. If it is valid, an rLICX_ICI tuple with that key should exist. If there is no tuple, use ODBE to insert one.

If the key is not valid, an initial modification request (IMR) should be written to document the problem.

701. ISINDISPTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to insert tuples into the RLDISPDB relation failed.

702. ISINTMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The shared call model (SCM) received an unrecognizable internal message from one of its sibling models. The SCM does not know what to do with this message because it was not expected.

703. ISINV_ENVAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected value was received for the enumerated data type. The enumerated value is output on the ROP.

704. ISINVICI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid integrated services digital network (ISDN) call identifier (ICI) was passed as a parameter to a function.

705. ISINVSTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid integrated services digital network (ISDN) display string type (ISDPTYPE) was received.

706. ISINVTERM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

An invalid terminal type (DMCPETYP) was found in an rTEDB tuple. The key to the rTEDB tuple and the invalid terminal type are dumped.

707. ISISAFIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid database read of the RLISAFIDX relation occurred.

Data Structures:

RLISAFIDX. Key field: config.

Action:

Validate the config key dumped on the ROP. If the key is valid, insert the missing rlISAFIDX tuple using RC/V.

708. ISISATGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was encountered when reading the RLISATGRP database relation.

Data Structures:
RLISATGRP. Key field: ISAT_IDX.

Action:
Verify that the key printed on ROP is valid. If so, use RC/V to insert the appropriate missing rllSATGRP tuple.

709. ISISATMBR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A tuple is missing from the RLISATMBR static relation or the key used to access the relation is invalid.

Data Structures:
RLISATMBR. Key field: isat_idx.

The isat_idx key is the index of the integrated services attendant (ISAT) hunt group. The key is printed in hex format.

Action:
An rllSATMBR tuple with the key given on the ROP cannot be found in the static database. Verify that the key is a valid ISAT index. If it is valid, an rllSATMBR tuple with this key should exist. Use ODBE to insert the tuple. Also use RC/V to verify the key.

If the key is not valid, an initial modification request (IMR) should be written to document the error.

710. ISISTGIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An invalid database read of the RLISTGIDX relation occurred.

Data Structures:
RLISTGIDX. Key field: config.

Action:
Validate the key dumped on the ROP. If the key is valid, add the missing rllSTGIDX tuple using RC/V.

711. ISKAMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An attempt to send a message to the keep alive process failed.

712. ISKATPCR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An attempt to create a keep alive terminal process (KATP) failed.

713. ISLBRDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCsDB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAIBrda() failed to link the rIBRCSDB tuple to the rIDALB tuple. The rIBRCSDB and rIDALB tuple keys are printed on the ROP.

714. ISLBRDI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: DISPDB	Audit Mode: elev

Problem:

The DAIBrdi() function failed to link the given rIBRCSDB tuple to the given rIDISPDB tuple. On the ROP printout, field 1 is the rIBRCSDB tuple key and field 2 is the rIDISPDB tuple key.

715. ISLIDCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLLID_CF tuple was missing. The logical termination port (ltm_idx) attempting to use a display line feature had one of the display line feature IDs assigned in the RLDNFEATS relation, but there was no rLLID_CF tuple associated with the feature ID.

Data Structures:

RLLID_CF. Key field: feature ID.

RLDNFEATS. Key fields: lead_module, ltm_type, ltm_idx

In the data dump, the first variable shows the display constructed feature ID (hexadecimal) that was expected but not found. The other data identifies the lead_module (decimal), the ltm_type (decimal), and the ltm_idx (decimal) of the requesting ltm_idx.

Action:

Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) or View 5.11 (BRCS FEATURE ASSINGMENT TRUNK MEMBER) to find the display line feature name for the display feature ID found in the data dump. Look at these views for the lead_module, ltm_type, and ltm_idx identified in the dump.

Use the display feature name to define a new display line feature in the RLLID_CF relation via the ISDN BRCS LINE IDENTIFICATION FEATURE DEFINITION view.

If the display feature was assigned through standard office data administration (ODA) or recent change (RC), file a trouble report.

716. ISLINECA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLIS_LINE static relation or the keys used to access the tuple are invalid.

Data Structures:

RLIS_LINE. Key fields: lead module, ltm_idx.

Action:

An rLIS_LINE tuple with the given keys cannot be found in the static database. The keys printed on the ROP are the lead module (SM number) and ltm_idx (logical terminal index); they are printed in decimal format.

Use ODBE to crosscheck the data set for the keys in the RLIS_LINE relation with the actual keys used to access the relation. If the tuple was assigned through standard office data administration (ODA) or recent change (RC), file a

trouble report.

717. ISLPCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered in the DALpcda() function. The process control block link area (PCBLA) pointer and the D-channel application linkage block (DALB2) pointer are printed.

718. ISLPCDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DALpcdl() function. The process control block link area (PCBLA) and the D-channel application linkage block (DALB2) keys are dumped.

719. ISLPMVPORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to move a B-channel from one process to another, the LPmvport() function failed to move the channel control block (CCB) linkage to a new process.

720. ISLPODB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

The DALPODB() macro failed to link an analog data block (ADB) to a port linkage area (PORTLA). The PORTLA key and the ADB key will be dumped. The PORTLA audit will be scheduled.

721. ISLPTPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPT_PT tuple with the given keys could not be found in the static database. The tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLLPT_PT, RLFC_LINE.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the logical port (LPORT) and logical port type (LPT_TYPE).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

- (1) Verify that the lport and lpt_type key values are valid. Use the ODBE batch read (BR) option to read the RLFC_LINE relation into a *UNIX*[®] file.
- (2) Use a *UNIX*[®] editor or the grep command on this file to find the rLFC_LINE tuple containing the lport and lpt_type that is in the ROP output.

- (3) If the rIFC_LINE tuple is found, use ODBE to insert the appropriate rLPT_PT tuple where:

```
RLlpt_pt.lport=RLfc_line.lport,
RLlpt_pt.lpt_type=RLfc_line.lpt_type,
RLlpt_pt.port=RLfc_line.port.member, and
RLlpt_pt.party=RLfc_line.party.
```

- (4) If the rIFC_LINE tuple is not found, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

722. ISMISCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the RLEDS_CF relation or the RLLID_CF relation. For the RLEDS_CF relation, the attributes nd_prim and nd_dn should not both be set to DBYES. For the RLLID_CF relation, the attributes cnd_prim and cnd_all should not both be set to DBYES.

Data Structures:

RLEDS_CF. Key field: feat_id.

RLLID_CF. Key field: feat_id.

Action:

Use the feat_id key printed on the ROP to access the RLEDS_CF or RLLID_CF relation. Use RC/V (or ODBE, if necessary) to crosscheck the keys in the relation with the actual key used to access the relation. Refer to the population rules for RLEDS_CF or RLLID_CF for correct population of these attributes.

If the tuple was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

723. ISMSGTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A feature control (FC) function received an invalid message type.

724. ISNO2LINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The second rIDALB tuple linkage off of the rIPCBLA tuple is expected to exist, but does not.

725. ISNOBNFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing from the RLBNFEAT static relation.

Data Structures:

RLBNFEAT. Key fields: config, cpe_comp, button.

The config field is the configuration group ID, cpe_comp is the customer premise equipment (CPE), and button is the feature button number.

Action:

The keys used to read the RLBNFEAT relation are printed in decimal format on the ROP.

Use ODBE to verify that the keys are valid. (A relation can be reviewed by reading it into a file using the batch read (BR) option, then using an editor to look through the file.) Review the RLIS_TERM relation to verify that config is a valid configuration group ID. The cpe_comp number ranges from 0 to 7, and the button number can range from 1 to 254.

Use ODBE to check for a compliment tuple in the RLFEATBN relation that contains this same data. If a tuple is found, the RLBNFEAT keys should match the data in this RLFEATBN tuple. The keys for RLFEATBN are configuration group ID (config), feature ID (FID), and action (action).

If the keys are valid, use RC/V View 12.5 (CONFIGURATION GROUP DEFINITION) to insert the RLBNFEAT tuple.

If the keys are not valid, a trouble report should be filed.

726. ISNOCCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid read of the RLNOCCODE relation occurred.

Data Structures:

RLNOCCODE. Key field: nxx.

Action:

Validate the keys printed on the ROP. If the keys are valid, insert data for the missing rINOCCODE tuple.

727. ISNODALB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

No process control block link area (PCBLA) to D-channel application linkage block (DALB) linkage exists for this terminal process. A PCBLA audit will be scheduled to dump the RLPCBLA relation to the ROP. A DALB audit will automatically be scheduled to dump the RLDALB relation.

728. ISNOFEATBN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rFEATBN tuple with the given keys could not be found in the static database. The tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLFEATBN.

The key fields are the configuration group ID (config), the BRCS feature ID (FID), and the action enumeration (action).

Action:

Use RC/V (or ODBE, if necessary) to verify that the keys printed on the ROP are valid.

1. Review the RLIS_TERM relation to verify that the config key is a valid configuration group ID.
2. Review the RLFACNAME relation to verify that the FID key matches a valid feature ID.
3. Verify that the action key is valid.

Use ODBE to check for a compliment tuple in the RLBNEFEAT relation that contains this same data (there should be one). The keys for RLBNEFEAT are config, customer premise equipment (CPE) module component (cpe_comp), and feature button number (button).

If the keys are valid and the compliment rLBNEFEAT tuple was found, use RC/V View 12.5 (CONFIGURATION GROUP DEFINITION) to insert the rFEATBN tuple.

If the keys are not valid, a trouble report should be filed, that is, write an initial modification request (IMR).

729. ISNOICM1LST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLICM_1LST tuple is missing or one of the keys used to read the RLICM_1LST relation is incorrect.

Data Structures:

RLICM_1LST. Key fields: icmgrp, tens.

Action:

Use RC/V View 4.24 (ISDN INTERCOM GROUP DIALING PLAN) to crosscheck the data in the RLICM_1LST relation with the actual keys that were used to access the relation. If the tuple was assigned through standard office data administration (ODA) or recent change (RC), file a trouble report.

730. ISNOICMTERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLICM_TERM tuple is missing or the keys used to read the tuple are invalid.

Data Structures:

RLICM_TERM. Key fields: lport, termno.

Action:

This is a database inconsistency that can only be corrected by manual action. The key fields used to access the relation are printed on the ROP. Use RC/V (or ODBE, if necessary) to crosscheck the data set for the keys in the relation with the actual keys used to access the relation. If the tuple was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

731. ISNRMODS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ISmw_nrsrch() function encountered a model other than MSS_FM, CND_FM, or ISNEAR on the NEAR leg prior to a merge. The model ID of the first invalid model will be dumped on to the ROP.

732. ISOFFICECODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLOFFICECODE relation or an rIOFFICECODE tuple is missing.

Data Structures:

RLOFFICECODE. Key field: noc.

Action:

The noc key printed on the ROP should be used to access the RLOFFICECODE relation. Use RC/V (or ODBE, if necessary) to crosscheck the keys in the relation with the actual keys used to access the relation.

If the noc was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

733. ISOSERNG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the OSCTIMER() macro returned the value OSERANGE. The amount of time to set the timer to was out of range. Could not get a timer. The process will be purged.

734. ISPACK_NLOADED (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Code requiring the software optioned ISDNBRCS package was executed, but the ISDNBRCS package was not loaded.

735. ISPORPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Failed to couple the port with the process with the DACppopc() function. The process control block link area (PCBLA) audit will be scheduled.

736. ISPORTGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPORT_GROUP tuple is missing.

Data Structures:

RLPORT_GROUP.

The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the port (MEMBER), module (MODULE), and party (PARTY).

Action:

Use the information on the ROP to determine the port (member, module, and party) to be assigned through recent change (RC).

737. ISPPGHTEDA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAghteda() failed to obtain the head rIDALB tuple from the set owned by the rITEDB tuple. The rITEDB tuple key is dumped and the process is purged.

738. ISPTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The display terminal process in the feature control (FC) subsystem received an error return code from the dynamic access (DA) primitive macro DAGETPTLA(). The rIORTLA tuple key is output on the ROP.

739. ISQ_ISAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ISAT	Audit Mode: elev

Problem:

An attempt to access a tuple in the dynamic relation RLQ_ISAT failed. The rIQ_ISAT tuple key is printed on the ROP.

740. ISQO_ICI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ICI	Audit Mode: elev

Problem:

An attempt to access a tuple in the dynamic relation RLQO_ICI failed. The rIQO_ICI tuple key is printed on the ROP.

741. ISRDATTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to access a tuple in the dynamic relation RLATTM_BLF failed. The rIATTM_BLF tuple key is printed on ROP.

742. ISRDSPLYPAR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the Gldisplay global parameter failed.

743. ISRHHCBR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DARhhcbr() failed to remove an rIBRCSDB tuple from the head of the idle list.

744. ISRHHCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DARhhcda() function.

745. ISRHHCDI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DARhhcdi() primitive failed to remove an rDISPDB tuple from the head of the idle list.

746. ISRSBLTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to unlink an rIATTM_BLF tuple from the ordered set owned by an rIATTH_BLF tuple failed. The following data is printed on the ROP in this order: the return value (ret_val) from the DArshbltm() function, the rIATTM_BLF tuple, and the rIATTH_BLF tuple.

747. ISRSHCBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

An attempt to unlink an rIATTH_BLF tuple from the ordered set owned by an rIDB_HEADC tuple failed. The following data is printed on the ROP in this order: the return value (ret_val) from the DArshcbl() function, and the rIATTH_BLF tuple.

748. ISRSTEDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while unlinking the D-channel application linkage block (DALB) from the terminal equipment data block (TEDB) in the DArsteda() primitive. The DALB and TEDB are printed on the ROP.

749. ISRTDNMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRTDN_MHG relation, a failure code of DBNO_MATCH was returned. The rIRTDN_MHG tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRTDN_MHG. Key fields: noc, digits.

Action:

This is a database inconsistency that can only be corrected by manual action.

750. ISRTMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIRT_MHG tuple is missing. While reading the RLRT_MHG relation for the key from the RLPORT_GROUP relation, a failure code of DBNO_MATCH was returned. The tuple was not found for the group.

Data Structures:
RLRT_MHG. Key field: grpnum.

Action:

This problem is a database inconsistency that can be corrected by manual action. The first variable on the ROP contains the group number. Using the information on the ROP, verify that the group number is assigned for the multi-line hunt group through RC/V.

751. ISSCMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SCMDB	Audit Mode: elev

Problem:

An inconsistency was detected in the RLSCMDB relation by the shared directory number (SHDN) code. The SCMDB audit will be scheduled.

752. ISSCMLPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The input array from the shared call model (SCM) contained a NULL lport value. It should not be NULL.

753. ISSCMMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to send a message to the shared call model (SCM) failed.

754. ISSDTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The soft_dalb value in the terminal equipment data block (TEDB) does not match the dalb2 key. The soft_dalb and dalb2 key values are printed on the ROP.

755. ISSENDEXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An external message could not be sent to another terminal process in multiway (MW). The process control block link area (PCBLA), a selected set of fields from up to five associated process blocks (APBs), and the in message from the call leg data block (CLDB) are dumped.

756. ISSHDACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unidentified return value was received from the ISsh_dack() function. This function searches for data blocks associated with the calls on this call appearance (CA), then releases the data blocks and the process (if it exists).

757. ISSHSCINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ISsh_scinit() function was called with an invalid reason.

758. ISSOFTSPP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This network interconnect (NI-1) problem occurs when the rIBRCSDB tuple's soft_reason field is not consistent with the rITEDB tuple's soft_dalb field. The soft_dalb field is set to a non-NULL value (call is on soft hold) yet the soft_reason field is set to SOFT_H_NONE, or the soft_dalb field is set to a NULL value yet the soft_reason field is not set to SOFT_H_NONE. The call is torn down. Contact your next level of support.

759. ISSOHHOLD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TEDB	Audit Mode: nonseg

Problem:

The soft_dalb field in the rITEDB tuple had been already populated. This means that there is a softheld call.

760. ISTERMARRAY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The lport or associate key was NULL in the shared terminal array. This is not a valid condition. The lport and associate key will be dumped.

761. ISTERMCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in the setting the keys used to read the RLIS_TERM relation, or the rIIS_TERM tuple is missing.

Data Structures:

RLIS_TERM. Key fields: lport, termno.

Action:

This is a database inconsistency that can only be corrected by manual action. The first variable on the ROP contains the logical port, and the second variable is the terminal number. Verify that the information on the ROP should be used to access the RLIS_TERM relation. Use RC/V (or ODBE, if necessary) to crosscheck the data in the relation with the actual keys used to access the relation.

762. ISUBRDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DAubrda() failed to unlink the rIDALB tuple from the rIBRCSDB tuple. The rIBRCSDB tuple key is printed on the ROP.

763. ISUBRDI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DAubrdi() failed to unlink the rIBRCSDB tuple from the rDISPDB tuple. The rIBRCSDB tuple key is printed on the ROP.

764. ISUDISPPAR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to update the Gldispdb global parameter failed.

765. ISUMICMGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The intercom (ICOM) group numbers of the originator and the terminator do not match. The rLICM_TERM tuples were improperly populated to give the unmatched ICOM group numbers.

Data Structures:

RLICM_TERM. Key fields: lport, termno.

The ROP output provides the logical sequential number of the ISDN BRCS digital subscriber line (DSL) or shared analog port (lport), the terminal number (termno), the originator's directory number (orig_dn), and the terminator's directory number (term_dn).

Action:

Given the originator's and terminator's directory numbers on the ROP, examine RC/V View 1.45 (ISDN INTERCOM LINE PARAMETERS) by using the directory number and the ICOM feature name as keys. This view displays all ICOM groups with the line as a member. By examining this view for both the originator and terminator, the information regarding the ICOM group can be re-entered correctly.

766. ISUPCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DAupcda() function. The process control block link area (PCBLA) key is dumped.

767. ISUPCDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered in the DAupcdl() function. The process control block link area (PCBLA) pointer is printed.

768. ISXLFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not translate a message into Q9.31 format to send to a terminal. The ISqbrcsend() function returned PSXLFAIL instead of GLSUCCESS.

769. MCRBQERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error code was received for the modular queuing phase-II - ringback queuing feature control. An error return was received from a DBfrdtup() function call to read the RLQU_RGBK relation to provide the originator with distinctive ring.

Data Structures:

RLQU_RGBK. Key fields: portgrp.grpnum, portgrp.grptype.

770. MTBADPFMSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognized POTS feature model (PFM) state was encountered in the multiway transition (MT) model during a conference or transfer call. The invalid data in the PFM state is dumped and the call is purged.

771. MTBAVALERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting a conference or transfer call, the Rlbavail() function returned a failure condition. The return code from Rlbavail(), the process ID of the controlling terminal process (TP) that the B-channel was being passed to, and the rIBRCSDB tuple pointer for the controlling TP are dumped.

772. MTCLOSERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered during a conference or transfer call attempt. The multiway transition (MT) model (ISmt.sd) could not close a path using the PHclos() function. The controlling terminal process did not return control of the B-channel to this terminal process before sending the MGMRG or MGJOIN ACK message with a status field set to preserve the calls. The the process is purged. The return code from the PHclos() function is printed.

773. MTDALBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred while attempting to transfer or conference a call. In the multiway transition (MT) model (ISmt.sd), the DAfpcda() primitive failed to determine the controller's D-channel application linkage block (DALB) pointer. The return code from the primitive, the process ID of the controlling terminal process, and the DALB pointer returned by the function are dumped.

774. MTOPENERRR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to conference or transfer call. In the multiway transition (MT) model (ISmt.sd), the PHopen() function failed. The return code from the PHopen() function and the process ID of the controlling terminal process are dumped.

775. MTOUTMSGER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The multiway transition (MT) model failed to output an external message during a conference or transfer attempt. The requested destination process ID (PID) and the contents of the message buffer to be sent are dumped. This problem indicates an SDL OUTPUT command or OSSENDMSG() macro error.

776. MTPASSMSGER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred in the multiway transition (MT) model while passing a message from a far process to the multiway calling (MW) controlling process during a conference or transfer call. An error return code was received from the OSLOCALDEL() macro. The destination process ID (PID) for the message and the message buffer are dumped.

777. MTUNEXPMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The multiway transition (MT) model received an unexpected internal message. The process control block link area (PCBLA), information from the associated process block (APB), and the message type are dumped. This assert will occur in STATE *, STATE ISMTWRESP, and STATE ISMTWFARPID call processing states. It reports and continues.

778. MTUNLCKER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return code was received from the PHunlock() function in the multiway transition (MT) model while attempting to unlock a path during a conference or transfer attempt. The terminal process is purged. The error code is dumped.

779. MTWGETER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The FCWGETTYPE() macro returned a failure code within the multiway transition (MT) model for an integrated services digital network (ISDN) multiway (MW) conference or transfer call.

780. NOANILHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

An rIAN_ILHB tuple is missing. The tuple will be inserted and the FCLINE audit will run to correct any other problems.

781. NOANOLHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

An rIAN_OLHB tuple is missing. The tuple will be inserted and the FCLINE audit will run to correct any other problems.

782. NOISILHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

An rIIS_ILHB tuple is missing. The tuple will be inserted and the FCLINE audit will run to correct any other problems.

783. NOISOLHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

An rIIS_OLHB tuple is missing. The tuple will be inserted and the FCLINE audit will run to correct any other problems.

Range: fcph**1. FCUNXMSG (5E14 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received.

Probable Cause:

This is most likely a software problem.

Action:

Contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

2. ISBADARG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected parameter was received.

Probable Cause:

This is most likely due to a software problem.

Action:

Contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

Range: fita**1. FCSDNBDBF (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the RLBRCSDb relation for the OSpdb.procno value failed.

2. FI0001 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line (indicated by the port) was marked as having the series completion feature, but it does not have an rIFC_SERCOMP tuple that specifies the directory number of the next line in the series completion group. Either this line should not have the series completion feature, or an rIFC_SERCOMP tuple is missing.

Data Structures:

RLFC_SERCOMP. Key fields: port.member, port.module, party.

In the first word of the data dump, the first two bytes contain port.member, the next byte is filler, and the next byte is port.module. The first five bits of the next word contain party.

Action:

Use RC/V (or ODBE, if necessary) to determine if the line indicated has the series completion feature. If it does, verify that an rIFC_SERCOMP tuple exists that designates the directory number to complete to.

3. FI0003 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading the RLFC_LINE relation, a failure code was returned. Either the rIFC_LINE tuple is missing, or an error occurred when setting the keys.

Data Structures:

RLFC_LINE. Key fields: port.member, port.module, party.

In the first word of the data dump, bytes 0-1 contain port.member, byte 2 is filler, and byte 3 contains port.module. In the next word, bits 0-4 of byte 0 contain party.

Action:

Use RC/V (or ODBE, if necessary) to verify that the keys are valid. If the rIFC_LINE tuple is missing, add it.

4. FI0004 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_TRUNK relation, or the rIFC_TRUNK tuple is missing.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

In the first word of the data dump, the first two bytes contain port.member, the next byte is filler, and the next byte is port.module.

Action:

Use RC/V (or ODBE, if necessary) to crosscheck the data set for the keys in the RLFC_TRUNK relation with the actual keys used to access the relation.

5. FI0034 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ownership relation was not the RLRTCONTROL or RLRTCAMPON relation for an announcement or busy verify termination.

6. FI0040 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGLN_TERM message was not present.

7. FI0042 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGANN_TERM message was not present.

8. FI0114 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received from a far process. Additional data is dumped from up to five associated process blocks (APBs). A single process purge is invoked. The layout of the data to be dumped from the APBs is found in the fc/hdr/MCmmsgtxt.L file in the typedef named MCASRT_APB.

9. FIACDENT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution system process (ACDSP) received an invalid operating system (OS) event.

10. FIACDIDS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A MGACDSMRST message was received with an invalid interprocessor data synchronization (IDS) reason for the automatic call distribution system process (ACDSP).

11. FIACDINF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDINFO	Audit Mode: elev

Problem:

A problem occurred while linking or unlinking an rIACDINFO tuple. Data corruption may be found in the RLACDINFO

relation.

12. FIACDINP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDINFO	Audit Mode: elev

Problem:

A failure occurred while linking an rIACDINFO tuple to an rIACDPOSDB tuple.

13. FIACDMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD)/business and residential custom services (BRCS) system process received an invalid message.

14. FIACDPOSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

No rIACDPOSDB tuple was found for the given rITEDB tuple. The rITEDB tuple key is printed on the ROP.

15. FIACDSPI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown initialization reason was passed to the automatic call distribution (ACD)/business and residential custom services (BRCS) system process.

16. FIACSR_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACSR_GRP tuple is missing. The key to this relation is the automatic customer station rearrangement (ACSR) group ID from the RLDSLEQUIP relation.

Data Structures:

RLDSLEQUIP. Key field: dsl.

RLACSR_GRP. Key field: acsr_gpid.

Action:

Use RC/V (or ODBE, if necessary) to validate the acsr_gpid value for this digital subscriber line (DSL) in the RLDSLEQUIP relation. Then verify that an rIACSR_GRP tuple exists for this acsr_gpid value.

17. FIACSR_OPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIACSR_OPT tuple is missing. The key to this relation is the feature ID from the RLTRMFEATS relation.

Data Structures:

RLACSR_OPT. Key field: feat_id.

RLTRMFEATS. Key fields: lport, lpt_type.

Action:

Use RC/V (or ODBE, if necessary) to validate the feat_id value for this lport and lpt_type in the RLTRMFEATS relation. Then verify that an rIACSR_OPT tuple exists for this feat_id.

18. FIAFICWA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD) feature integrity terminal process received an invalid return code from the RIPOSMGR() macro call while updating the call waiting lamps of the agents.

19. FIAFIGNE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGIN_TPGNE message was received by the automatic call distribution (ACD)/business and residential custom services (BRCS) system process, but the process purged by system integrity (SI) was not the ACD/BRCS feature integrity terminal process.

20. FIAFIMSGNR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD) feature integrity process woke up to receive a message, but the message was not there.

21. FIAFITPI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD)/business and residential custom services (BRCS) system process (ACDSP) could not create the ACD/BRCS feature integrity terminal process (AFITP) due to an invalid program ID for the AFITP.

22. FIAFIUNXTAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD) feature integrity terminal process received an invalid timer tag.

23. FIAFIUXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD) feature integrity terminal process received an invalid message.

24. FI_ANOUNCE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the keys used to read the RLFC_ANOUNCE relation, or the rIFC_ANOUNCE tuple is missing.

Data Structures:

RLFC_ANOUNCE. Key fields: port.module, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLFC_ANOUNCE relation with the actual keys used to access the relation. If the rIFC_ANOUNCE tuple is missing, use RC/V View 5.1 (TRUNK GROUP) and View 5.5 (TRUNK MEMBER) to insert the tuple. If the keys used to access the relation were not set correctly, notify your next level of support.

25. FIAPCCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to get the head link for the member channel control block communication region (CCBCOM) from its owner process control block link area (PCBLA) using the DAghpccc() and DAghpccc() primitives returned an unexpected failure indicating a possible invalid link from the owner PCBLA to the member CCBCOM.

26. FIAUACDINFO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDINFO	Audit Mode: elev

Problem:

Some attributes in an rIACDINFO tuple were corrupted.

Probable Cause:

The dynamic rIACDINFO tuple was overwritten.

Action:

The ACDINFO audit is scheduled to correct the invalid data.

27. FIAUACDPOSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem:

Some attributes in an rIACDPOSDB tuple were corrupted.

Probable Cause:

The dynamic rIACDPOSDB tuple was overwritten.

Action:

The ACDPOSDB audit is scheduled to correct the invalid data.

28. FIAUDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

An error occurred while accessing an rIDALB tuple.

29. FIAUDPb (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

An error occurred while accessing an rIDPB tuple.

30. FIAUTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

A failure occurred while accessing the RLTEDB relation. Could not get a correct pointer to the rITEDB tuple.

31. FIBADBRG (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: ACDPOSDB	Audit Mode: elev

Problem:

A monitoring bridge terminal process used for automatic call distribution (ACD)/business and residential custom services (BRCS) service observing, encountered a failure while trying to apply or lift a time slot interchange (TSI) bridge to or from a call. The call is purged, and the service observing session is terminated. The ACDPOSDB audit is requested.

Probable Cause:

Possibly, corrupted data was encountered.

Action:

The single process purge and associated audits will recover the relevant dynamic data structures.

The first data dump is the process control block link area (PCBLA) of the call that is being bridged, and the second data dump is the PCBLA of the monitoring bridge terminal process. These dumps provide information about the identity of the observed port and the service observing session in case further investigation is considered. The dumps with the single process purge provide additional information about the purged call.

32. FIBADMSG (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was encountered.

33. FIBADPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to a function.

34. FIBADVALUE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLTYPE relation contains an invalid tone value in the pctone field.

35. FIBFGPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation CKT_PORT was read with the intent of retrieving a global business and residential custom services (BRCS) feature group (BFG) port name (default service). This is a database inconsistency - contact your next level of support.

36. FIBFGPP_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPP_LTM tuple is missing for a business and residential custom services (BRCS) feature group (BFG). The lead_module key is 0, the ltm_idx key is the BFG ID, and the ltm_type key is LTM_ISDN.

The BFG ID is obtained from the RLFC_LINE relation for analog lines and primary directory number (DN) integrated services digital network (ISDN) basic rate interface (BRI) lines. If the ISDN DN is not primary, the BFG ID is obtained from the RLIS_LINE relation.

Data Structures:

RLPP_LTM. Key fields: lead_module, ltm_idx, ltm_type.

RLFC_LINE. Key fields: port.member(hex), port.module(dec), party(dec).

RLIS_LINE. Key fields: lead_module, ltm_idx.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the RLPP_LTM relation with the actual keys used to access the relation. The ltm_idx key should match the bfgid attribute in the rLFC_LINE tuple keyed with the port assigned the BFG ID or in the rLIS_LINE tuple keyed with the ltm_idx on the specified lead_module assigned the BFG ID. Determine if the rIPP_LTM tuple in question exists. If the tuple does not exist, it must be added if the rLFC_LINE tuple indicates that the port has a BFG assigned or if the rLIS_LINE tuple indicates that the DN has a BFG assigned.

37. FIBSTPOSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem:

The serving team identifier (servtm) retrieved from the RLACDPOSDB relation is not valid. This error was found while attempting to read the serving team information relation RLSTINFO during an automatic call distribution (ACD) service assist or ACD emergency call. The AUACDPOSDB audit will be run to correct the problem in the RLACDPOSDB relation.

38. FICLMDSP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in a dynamic database read during call processing. Feature control (FC) feature execution (FEX) received an error return code from a dynamic access (DA) primitive. This may be due to an invalid linkage in the call leg data block (CLDB)-model data block (MDB) set. FEX could not recover from this error.

39. FICLSUSPP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to link or unlink an rLSTPDB tuple from the call leg data block (CLDB). Failed to access the RLSTPDB relation through the linkage from the CLDB when the linkage exists. An audit will be scheduled to clean up the data block.

40. FICPNBNCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When reading the RLCPNBN_CF relation, the key (fid) was wrong or a tuple was missing.

Data Structures:

RLCPNBN_CF. Key fields: fid.

RLDN_FEATS. Key fields: lead_module, ltm_type, ltm_idx, range.

RLFID2NAME. Key fields: facid, class, subclass.

The ROP output provides the FID (feature ID used to read the RLCPNBN_CF relation), the LEAD MODULE (lead module of the directory number [DN] being called, or lead module activating or deactivating the calling party number/billing number [CPN/BN] feature), the LTM_IDX (ltm_idx of the DN), the LTM_TYPE (ltm_type of the DN), and the BFGID (business and residential custom services [BRCS] feature group ID of the DN that is being called or that is activating or deactivating the CPN/BN feature).

Action:

Use ODBE to fix the problem.

1. Determine if this is a valid feature ID for the CPN/BN feature. Use ODBE for processor 0 and the RLFID2NAME relation. The keys for the RLFID2NAME relation are facid, class, and subclass. Specify the FID value from the ROP for the facid key, FACBRCS for class, and SCL_FEAT for subclass.

If the rLFID2NAME tuple is found, the FID is valid; go to the next step. If a tuple is not found, go to step 3.

2. If the FID is found in the RLFID2NAME relation, use ODBE for the SM that generated the assert and the RLCPNBN_CF relation. The key to this relation is the FID value. If an rICPNBN_CF tuple does not exist, consult the office records to determine if a CPN/BN feature should exist for this FID. If a CPN/BN feature should exist, insert the tuple along with the appropriate options (consult the office records for the correct option information).

If an rICPNBN_CF tuple exists, contact the next level of support.

3. Determine if the invalid FID is in the RLDN_FEATS relation for the LEAD_MODULE, LTM_TYPE, and LTM_IDX keys. Use ODBE for the SM that generated the assert for the RLDN_FEATS relation. Use 0 for the range key. Check each fentX.fid attribute for the FID specified in the assert, where "X" can have the values 1 through 6. If there are more than 6 features for this LTM_IDX, other rLDN_FEATS tuples may need to be read using the next value for the range key. When a fentX.fid of 0 is found, there are no more features.

If the FID is not found, go to step 4. If the FID is found in the RLDN_FEATS relation, contact the next level of support.

4. If the FID is not found in step 3 and the BFGID is greater than 0, check the rLDN_FEATS tuple(s) associated with the BFGID. Specify 0 for the lead_module key and the BFGID value for the ltm_idx key. Repeat the same procedure as in step 3.

If the FID is found in the RLDN_FEATS relation, contact the next level of support.

41. FICVALCE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STATE	Audit Mode: elev

Problem:

A problem occurred while allocating or de-allocating an rQV_STATE tuple. This implies a problem with the SM free/idle list.

42. FICVBADS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected event occurred during vector processing that implies data corruption.

43. FICVCORD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected event occurred during vector processing that implies data corruption.

44. FICVDBRF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed.

45. FICVEBADS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected event occurred during vector processing that implies data corruption.

46. FICVLNKE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred while allocating or de-allocating an rIQV_STATE tuple, or when linking with the rIPCBLA tuple of a process.

47. FICVMPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call vectoring model FICVD received a MGTASUCCESS or MGTA_END message from an announcement terminal process (ATP) connected to a music port.

Data Structures:

RLFC_ANOUNCE. Key field: port.

Action:

Check the port type and the machine supplying the music for a match. This call should have been connected to music; however, a message was received indicating that the announcement had completed. If the machine is an announcement unit, use RC/V View 5.1 (TRUNK GROUP) to check the rIFC_ANNOUNCE tuple to verify that ANNC CYCLES is set to 0 and BARGE IN is set to YES.

48. FICVSDLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STATE	Audit Mode: elev

Problem:

A problem occurred while linking or unlinking an rIQV_STATE tuple to/from an rIPCBLA tuple. This implies possible data corruption in one or both tuples.

49. FICVUXEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected event occurred during vector processing.

50. FIDATIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the keys used to read the RLDA_TIMER relation, or the rIDA_TIMER tuple is missing.

Data Structures:

RLDA_TIMER. Key fields: servclass, signal, sigtype.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLDA_TIMER relation with the actual keys used to access the relation. If the rIDA_TIMER tuple is missing, use RC/V View 8.5 (TIMING [MISCELLANEOUS]) to insert the tuple. The signal attribute for lines is always FCSSNULL; the start signal attribute is not applicable.

If the keys used to access the relation were not set correctly, notify your next level of support.

51. FIDNFEATS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple with the given keys or the expected feature could not be found in the RLDN_FEATS relation. The tuple or feature is missing, or the keys used to access the tuple are not valid. The keys used to read the tuple and the expected feature (feature ID) are printed on the ROP.

Data Structures:

RLDN_FEATS. Key fields: lead_module, ltm_type, ltm_idx, range.

The lead_module key is the SM number, the ltm_type key is the logical termination index type, the ltm_idx key is the logical termination index, and the range key indicates the group of five tuples (0-4).

Action:

1. Verify that the keys are valid. The lead_module must be between 1 and 192, ltm_type will be 0 or 1, ltm_idx must be between 1 and 4095, and range should be from 0 to 4.
2. Verify that an rIFC_LINE tuple exists for the associated port with the brc_dn attribute set to DBYES.
3. Use ODBE in the batch read (BR) mode to read the RLFC_LINE relation into a *UNIX*® file. Use a *UNIX*® editor to locate the tuple that has the same ltm_type and ltm_idx attribute values as found on the ROP. If the located tuple has the brc_dn attribute marked DBNO, file a trouble report.
4. If the brc_dn attribute in the rIFC_LINE tuple is DBYES, perform the following steps:

- a) Zero the brc_dn bit (DBNO) in the rIFC_LINE tuple.
 - b) Check the rIDN_FEATS tuples that have the same keys with the five possible ranges (0 to 4).
 - c) Note the assigned features in any rIDN_FEATS tuples found.
 - d) Use RC/V View 1.8 (ANALOG LINE/BRCS ASSIGNMENT), View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]), or View 23.8 (DSL/BRCS ASSIGNMENT) to re-insert the features.
5. If the keys are valid but the expected feature is not found, perform the following steps:
- a) File a trouble report.
 - b) Use ODBE to read the RLFID2NAME relation with keys of the feature ID, FACBRCS, and SCL_FEAT. This may map to a specific feature (for example, /CFV) or a wild card feature (for example, /CF*).
 - c) If a wild card feature is found, map it to a corresponding preconstructed or constructed feature.
 - d) Use RC/V View 1.8, View 1.11, or View 23.8 to insert the feature.

52. FIDNLPT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the virtual relation RLDNLPT relation, a failure code of DBNO_MATCH was returned. Either the static relation tuple, RLDN_LPT (the storage form for RLDNLPT) is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLDNLPT. Key fields: dnlpt.locdn, dnlpt.lpt_type, dnlpt.lpt_stype.

The SM on which the relation was read may also be printed in decimal format on the ROP if a cross-processor read was used.

Action:

This is a database inconsistency that can only be corrected by manual action.

- (1) Verify the keys in rIDN_LPT as follows: using ODBE in Batch Read option, find a tuple in rILPT_SPID where `rILPT_SPID.lport == rIDN_LPT.lport` and `rILPT_SPID.lpt_type == rIDN_LPT.lpt_type`
- (2) If the keys are valid, then using ODBE, insert a tuple in rIDN_LPT with the keys LOCDN, LPT_TYPE, LPT_STYPE
- (3) If the rIDN_LPT tuple was assigned through standard office data administration (ODA) or RC/V, file a trouble report.

53. FIDNLPT (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDN_LPT relation, a failure code of DBNO_MATCH was returned. The rIDN_LPT tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLDN_LPT. Key fields: dn_lpt.epdn, dn_lpt.lpt_type, dn_lpt.lpt_styp.

The SM on which the relation was read may also be printed in decimal format on the ROP if a cross-processor read was used.

Action:

This is a database inconsistency that can only be corrected by manual action.

54. FIDSL_EQUIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDSLEQUIP relation, a failure code of DBNO_MATCH was returned. The rIDSLEQUIP tuple is missing, or the key used to read this relation was not set properly.

Data Structures:

RLDSLEQUIP. Key field: dsl.

Action:

This is a database inconsistency that can only be corrected by manual action.

55. FIDSP_ACN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The display terminal process received an unknown action in a feature activation information element.

56. FIDSP_RMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The display terminal process received an invalid operating system for distributed switching (OSDS) message.

57. FIDSP_SWTCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The display terminal process encountered an unknown case in a switch statement.

58. FIEDSLGPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or inconsistent data was found in the extended digital subscriber line (EDSL) relation RLEDGLPRT. This relation associates a simulated facilities group (SFG) via a modular communications route index (MCRI) to a trunk group for each call by call service provided to the trunk group. The RLEDGLPRT and RLNSFMAP relations provide data for the call by call service selection feature.

Data Structures:

RLEDGLPRT. Key fields: trunk group number, EDSL pre-routing index.

The trunk group number, pre-route index, NSF type, band, carrier ID, bearer capability, and selective class of call

screening (SCOCS) ID are printed on the ROP.

Action:

The trunk group and pre-route index were not associated with an MCRI in the RLEDGLPRT relation. An rLEDGLPRT tuple needs to be added for the offending trunk group and EDSL pre-route index combination. This relation is modified by using RC/V View 5.34 (EDSL CALL BY CALL FEATURES).

Each rLEDGLPRT tuple is associated with an EDSL B-channel trunk group tuple in the RLEDGLTRKG relation. It is not required that an rLEDGLPRT tuple exist for each rLEDGLTRKG tuple.

59. FIEDSLTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLEDGLTRKG relation, a failure code of DBNO_MATCH was returned. The rLEDGLTRKG tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLEDGLTRKG. Key field: trunk group number.

RLFC_TRUNK. Key fields: port.member, port.module.

RLPORT_GROUP. Key fields: port.member, port.module.

RLFC_PORTTYP. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to verify that the trunk group number is valid. The port member and port module dumped on the ROP are used to read the RLPORT_GROUP and RLFC_TRUNK relations. If both relations indicate that the port is a member of the trunk group dumped on the ROP, then the trunk group number is probably valid.

If the trunk group number is valid, and it has a service class of FCEDSL or FCEDSLHM and a logical port type of PCTBCHAN in the RLFC_PORTTYP relation, then determine if an rLEDGLTRKG tuple exists. If the rLEDGLTRKG tuple is not populated, insert the tuple (consult the office records).

If the trunk group assigned to the port in the RLFC_TRUNK relation is different than the one in the RLPORT_GROUP relation, consult the office records and correct trunk group assignment. After correction, manually restore the trunk back to service.

60. FIEODPSOP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when reading the static relation RLODPSOP. A user attempted to place an on-demand packet (ODP) call; however, a database error occurred when reading the corresponding rLODPSOP tuple. A database problem exists or the rLODPSOP tuple is missing.

61. FIFAPERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSfap() function returned OSNOTLOADED or OSNOTMATCHED when the CCospsmsg() function in the CCSCOMMN package was called from the automatic call distribution (ACD)/business and residential custom services (BRCS) QVTP code in the ACDBASE package.

This should not happen because the code invoking the OSfap() function should not have control unless the common

channel signaling (CCS) packages are loaded and the call is from a CCS trunk.

62. FIFBDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

The pointer returned by the DAGETDPB() macro does not point to the rIDPB tuple. The dport key passed to the DAGETDPB() macro is invalid.

63. FIFBNOTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

No rITEDB tuple was found for the given rIDALB tuple. The rIDALB tuple does not have an owner rITEDB tuple.

64. FIFBTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

The DAghdpte() primitive returned DBNULL_SET. An rITEDB tuple was not found for the rIDPB tuple.

65. FIFCLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the keys used to read the RLFC_LINE relation, or the rIFC_LINE tuple is missing.

Data Structures:

RLFC_LINE. Key fields: port.member(hex), port.module(dec), party(dec).

Action:

This is a database inconsistency that can only be corrected by manual action. The first variable port contains the member and module, the second variable defines the party. Use RC/V (or ODBE, if necessary) to crosscheck the data set for the keys in the RLFC_LINE relation with the actual keys used to access the relation. If the rIFC_LINE tuple was assigned through standard office data administration (ODA) or recent change (RC), file a trouble report.

66. FIFCPORTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of DBNO_MATCH was returned when an attempt was made to read the RLFC_PORTTYP relation. The rIFC_PORTTYP tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLFC_PORTTYP. Key fields: port.member, port.module.

Action:

Verify that the keys printed on the ROP are valid. If the keys are valid, use ODBE to verify that the rIFC_PORTTYP tuple does not exist, then insert the tuple. If the keys are not valid, file a trouble report.

67. FIFCTRNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIFC_TRUNK tuple failed. The ROP output contains the SM and port member number. On the SM, the given port was not assigned to a trunk group number (TGN) and member number (MEMB NBR). No equipment number (EN) entry was found for the port on RC/V View 5.5 (TRUNK MEMBER).

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use the OP:CONVERT input message to convert the port member number to an EN. Use RC/V View 5.5 to assign the EN to a TGN and MEMB NBR.

68. FIFC_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_TRUNK relation, a failure code of DBNO_MATCH was returned. The rIFC_TRUNK tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

RLFC_PORTTYP. Key fields: port.member, port.module.

Action:

Use ODBE to verify that the port is valid. The port number and port module dumped on the ROP are used as the keys to read the RLFC_PORTTYP relation. If the port is found in this relation, then it is a valid port.

If the port is valid, check the RLFC_TRUNK relation to determine if a tuple exists for the port. If an rIFC_TRUNK tuple is not populated, insert a tuple (consult the office records). If the port is not valid, the port value is corrupted.

69. FIFPCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAfpcda() failed to obtain the D-channel application linkage block (DALB) pointer by using the process control block link area (PCBLA) key. The PCBLA key is printed on the ROP.

70. FIGETDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DAgetdalb() failed to obtain a pointer to an rIDALB tuple. The rIDALB tuple key that was passed to the primitive is printed on the ROP.

71. FIGETPTLA (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Given the port name, the DAgetptla() function failed to retrieve a port linkage area (PORTLA). The port name from the PORTLA and the variable used to get the PORTLA (OSpdb->port) will be dumped.

Action:

The PORTLA audit will be scheduled to run.

72. FIGOTEDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAgoteda() failed to obtain the terminal equipment data block (TEDB) pointer by using the D-channel application linkage block (DALB) key. The DALB key is printed on the ROP.

73. FIINAFIR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD)/business and residential custom services (BRCS) system process received an invalid reason in the MGAFITERM message.

74. FIINVINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD) feature integrity terminal process received an invalid reason in the MGACDSMRST message.

75. FIINVREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An integrated services port administrator (ISPA) terminal process passed an invalid reason code to the FCdslinit() function during initialization of a digital subscriber line (DSL). The valid codes are found in the fc/ISfbdefs.h header file.

76. FIINVRSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD) feature integrity terminal process was created with an invalid reason.

77. FIINVTMR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD) feature integrity terminal process received an error while attempting to allocate a 1 second timer.

78. FIISLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLIS_LINE static relation, or the keys used to access the tuple are not valid.

Data Structures:

RLIS_LINE. Key fields: lead_module, ltm_idx.

Action:

The lead_module (SM number) and ltm_idx (logical termination index) keys used to read the RLIS_LINE relation are printed on the ROP in decimal format.

Use RC/V (or ODBE, if necessary) to crosscheck the data set for the keys in the RLIS_LINE relation with the actual keys used to access this relation. If the RLIS_LINE tuple was assigned through standard office data administration (ODA) or recent change (RC), file a trouble report.

79. FILPT_PT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPT_PT tuple with the given keys could not be found in the static database. The tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLPT_PT, RLFC_LINE. The ROP output indicates the SM number (MOD), the source file and line number, and the keys used to read the relation - the logical port (LPORT) and logical port type (LPT_TYPE).

Action:

Use ODBE to cross-check the data in the indicated SM.

- (1) Verify that the lport and lpt_type key values are valid. Use the ODBE batch read (BR) option to read the RLFC_LINE relation into a *UNIX*[®] file.
- (2) Use a *UNIX*[®] editor or the grep command on this file to find the rLFC_LINE tuple containing the lport and lpt_type that is in the ROP output.
- (3) If the rLFC_LINE tuple is found, use ODBE to insert the appropriate rLPT_PT tuple where:

```
RLlpt_pt.lport =RLfc_line.lport,
RLlpt_pt.lpt_type=RLfc_line.lpt_type,
RLlpt_pt.port=RLfc_line.port.member, and
RLlpt_pt.party=RLfc_line.party.
```

- (4) If the rLFC_LINE tuple is not found, further office dependent data (ODD) inconsistencies may exist. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

80. FILPTSPID (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual relation, rLPTSPID, was read with the given keys and a tuple could not be found in rLPT_SPID (the storage form for LPTSPID), in the static database. The tuple is missing, or the keys used to access the tuple are not valid.

Data Structures:

RLPT_SPID. Key fields: lport, lpt_type.

The lport (logical port) and lpt_type (logical port type) keys used to read the RLLPTSPID relation are printed in decimal format on the ROP. The SM on which the relation was read may also be printed in decimal format if a cross-processor read was used.

Action:

- (1) Verify that the keys are valid.
- (2) If the keys are valid, use ODBE with the batch read (BR) option to read the RLSPID relation and write it into a file.
- (3) Use a *UNIX*® editor or the grep command to find the rISPID tuple with the ckt_lport attribute value that matches the lport value printed on the ROP.
- (4) If the rISPID tuple exists, use ODBE to insert the rLPT_SPID tuple with the keys LPORT and LPT_TYPE. The values for the locdn, npid, and natype attributes are from the rISPID tuple that was found in step 3.
- (5) If the rLPT_SPID tuple was assigned through standard office data administration (ODA) or RC/V, file a trouble report.

81. FILPTSPID (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPT_SPID tuple with the given keys could not be found in the static database. The tuple is missing, or the keys used to access the tuple are not valid.

Data Structures:

RLLPT_SPID. Key fields: lport, lpt_type.

The lport (logical port) and lpt_type (logical port type) keys used to read the RLLPT_SPID relation are printed in decimal format on the ROP. The SM on which the relation was read may also be printed in decimal format if a cross-processor read was used.

Action:

1. Verify that the keys are valid.
2. If the keys are valid, use ODBE with the batch read (BR) option to read the RLSPID relation and write it into a file.
3. Use a *UNIX*® editor or the grep command to find the rISPID tuple with the ckt_lport attribute value that matches the lport value printed on the ROP.
4. If the rISPID tuple exists, use ODBE to insert the rLPT_SPID tuple with the keys LPORT and LPT_TYPE. The values for the epdn, npid, and natype attributes are from the rISPID tuple that was found in step 3.
5. If the rLPT_SPID tuple was assigned through standard office data administration (ODA) or RC/V, file a trouble report.

82. FILTM_PORT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLTM_PORT relation, a failure code of DBNO_MATCH was returned. An rLTM_PORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLLTM_PORT. Key fields: LTM index.

Action:

This is a database inconsistency that can only be corrected by manual action.

83. FILTSBPORT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to access an rILTSBPORT tuple in line time slot bridging (LTSB) failed. Possibly, no tuple exists for the lport key used. This key is supplied from the PCBLA which could be corrupted. A third possible cause is a database error.

Data Structures:

RLLTSBPORT(lport).

Action:

Verify that the rILTSBPORT tuple does not exist for the lport key printed. If it does not exist, verify that the lport key is valid. If lport is valid, add the missing rILTSBPORT tuple.

If the lport key is not valid, the PCBLA was corrupted or the key to the PCBLA was corrupted in the asserting function.

If the lport key is valid and an rILTSBPORT tuple exists for the key, use database system error procedures.

84. FIMBBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A monitoring bridge terminal process used for automatic call distribution (ACD)/business and residential custom services (BRCS) service observing, received a message with inconsistent data. The service observing session is terminated suddenly. The observer is disconnected from any call that was being observed.

Probable Cause:

Possibly, the message was corrupted.

Action:

The first data dump contains the process control block link area (PCBLA) of the process that received the message. The lport field identifies the party being observed. The second data dump contains the received message. The errcode variable on the asserting function's stack pinpoints the location of the problem. Analyze this data to determine the nature of the problem.

85. FIMBBADPAR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitoring bridge terminal process used for automatic call distribution (ACD)/business and residential custom services (BRCS) service observing, called a function that was passed a parameter with an invalid value. The service observing session is terminated suddenly, and the observer is disconnected from any call that was being observed.

Action:

The first data dump contains the process control block link area (PCBLA) of the process that received the message.

The lport field identifies the party being observed. Data on the asserting function's stack identifies the values of the parameters being passed. The stack trace identifies the calling function. Analyze this data to determine the nature of the problem.

86. FIMBBADRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A monitoring bridge terminal process used for automatic call distribution (ACD)/business and residential custom services (BRCS) service observing, encountered an unexpected return value from a function call. The service observing session is terminated suddenly, and the observer is disconnected from any call that was being observed.

Action:

The data dump contains the process control block link area (PCBLA) of the process that received the message. The lport field identifies the party being observed. Data on the asserting function's stack identifies the value of the invalid return code, as well as the location where the problem was encountered. Analyze this data to determine the nature of the problem.

87. FIMBBADSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

A monitoring bridge terminal process used for automatic call distribution (ACD)/business and residential custom services (BRCS) service observing, was in an invalid state. The service observing session is terminated suddenly, and the observer is disconnected from any call that was being observed. A process control block link area (PCBLA) audit is scheduled automatically.

Probable Cause:

Possibly, data in the process control block link area (PCBLA) was corrupted.

Action:

The first data dump contains the PCBLA of the process that received the message. The lport field identifies the party being observed. The second data dump contains data associated with the event that encountered the invalid state. Data on the asserting function's stack identifies the internal signal that was being handled, and the value of the invalid state. Analyze this data to determine the nature of the problem.

88. FIMBNOMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A monitoring bridge terminal process used for automatic call distribution (ACD)/business and residential custom services (BRCS) service observing, failed to retrieve a message from the operating system (OS) that was guaranteed to be available. The service observing session is terminated suddenly. The observer is disconnected from any call that was being observed.

Probable Cause:

Possibly, operating system for distributed switching (OSDS) data corruption occurred.

Action:

The process control block link area (PCBLA) of the process that could not retrieve the message is dumped. The lport field identifies the party being observed. The errcode variable on the asserting function's stack further pinpoints the location of the failure. Analyze this data and other data in the PCBLA to determine the cause of the problem.

89. FIMBUNEXP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A monitoring bridge terminal process used for automatic call distribution (ACD)/business and residential custom services (BRCS) service observing, received an unexpected event. The service observing session is terminated suddenly. The observer is disconnected from any call that was being observed.

Probable Cause:

Possibly, operating system for distributed switching (OSDS) data corruption occurred.

Action:

The process control block link area (PCBLA) of the process that received the unexpected event is dumped. The lport field identifies the party being observed; the farpid field identifies the OSDS process ID of the observer's process. The reason variable on the asserting function's stack identifies the nature of the unexpected event. This data should be analyzed to determine the cause of the problem.

90. FIMBUXMG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A monitoring bridge terminal process used for automatic call distribution (ACD)/business and residential custom services (BRCS) service observing, received an unexpected message from the observer's terminal process. The service observing session is terminated suddenly, an interrupt message is sent to the observer's process, and the observer is disconnected from any call that was being observed. A switch cut-off may be reported.

Probable Cause:

Possibly, data corruption or message corruption occurred.

Action:

The first data dump contains the process control block link area (PCBLA) of the process that received the message. The lport field identifies the party being observed. The second data dump contains the received message. The errcode variable on the asserting function's stack pinpoints the location of the problem. Analyze this data to determine the nature of the problem.

91. FIMPGPERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when reading the RLPSGP_PRT relation in the packet switching modem call processing (PSMCP) function FCmpbd(), which gets the billing directory number (DN), in module FCpsmp.

92. FIMPMSGERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSsendinj() function returned the PSERROR code in the packet switching modem call processing (PSMCP) function FCmpbd() in module FCpsmp. The PSERROR return code indicates that the message could not be sent due to a user input error, that is, the message length could be too long.

93. FINFTLDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-fatal DBfrdtup() primitive error occurred. Recovery is possible with assumptions made about the inaccessible tuple, processing may continue.

94. FINOBNFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLBNFEAT static relation, or the keys used to access this relation are not valid.

Data Structures:

RLBNFEAT. Key fields: config, cpe_comp, button.

The config key is the configuration group ID, cpe_comp is the customer premise equipment (CPE), and button is the feature button number.

Action:

The keys used read the RLBNFEAT relation are printed in decimal format on the ROP.

1. Use ODBE to verify that the keys are valid. Use the batch read (BR) option to read a relation into a file, then use a *UNIX*[®] editor to look through the file.

a. Review the RLIS_TERM relation and verify that the config key is a valid configuration group ID.

b. The cpe_comp number ranges from 0 to 7.

c. The button number can range from 1 to 254.

2. Use ODBE to check for a compliment rIFEATBN tuple that contains this same data, the tuple may or may not exist depending on the feature assigned to the button. If a tuple is found, the rIBNFEAT tuple keys should match the data in this rIFEATBN tuple. The keys for the RLFEATBN relation are configuration group ID (config), feature ID (fid), and action (action).

3. If the keys are valid, use RC/V View 12.5 (CONFIGURATION GROUP DEFINITION) to insert the rIBNFEAT tuple.

4. If the keys are not valid, file a trouble report; that is, write an initial modification request (IMR).

95. FINOCCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid read of the RLNOCCODE relation occurred.

Data Structures:

RLNOCCODE. Key field: nxx.

Action:

Validate the nxx key field printed on the ROP. If it is valid, insert data for the missing rINOCCODE tuple.

96. FINOCTINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the key used to read the RLCQPARM relation, or the rlcqparm tuple is missing.

Data Structures:

RLCQPARM. Key field: call_que (ACD call queue).

Action:

Verify that the call_que key printed on the ROP is valid; the range is from 1 through 999. If the key is valid, use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLCQPARM relation with the actual key used to access the relation. If the tuple is missing or if the key used to access the relation was not set correctly, notify your next level of support.

The RLCQPARM relation is updated by RC/V View 6.4 (ACD CALL QUEUE).

97. FINOE9ACD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The psap flag for this ACD_DN or DAA_DN is set to Y. Since ACD E911 special feature has not been purchased, this flag must be set to N.

Data Structures:

RLACD_DN, RLDAAC_DN key fields: noc, digits.

Action:

This database inconsistency needs to be corrected by manual action. The noc key printed on the ROP should be used to access the RLOFFICECODE relation. Use RC/V (or ODBE, if necessary) to crosscheck. Use Recent Change/Verify(RC/V) view 4.15 (ACD and DAA TN Assignment) to correct the PSAP field.

98. FINOFEATBN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of DBNO_MATCH was returned when an attempt was made to read the RLFEATBN relation. The rifeatbn tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLFEATBN. Key fields: fid, config, action.

Action:

Verify that the keys printed on the ROP are valid. If the keys are valid, use ODBE to verify that the rifeatbn tuple does not exist then insert the tuple. If the keys are not valid, file a trouble report.

99. FINO_FENPA (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The far-end NPA was not populated for this trunk group and it must be populated since the npasrc field indicates to use the far-end NPA.

Data Structures:

RLRT_TRKG, key = grpnum.

Action:

Use RC/V to populate the FAR END NPA field on RC/V View 5.1 (TRUNK GROUP).

100. FINOSTINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the key used to read the RLSTPARM relation, or the rLSTPARM tuple is missing.

Data Structures:

RLSTPARM. Key field: serv_tm (serving team).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLSTPARM relation with the actual key used to access the relation. If the rLSTPARM tuple is missing, use RC/V View 6.1 (SERVING TEAM) to insert the tuple.

If the keys used to access the relation were not set correctly, notify your next level of support.

101. FINPASRC (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The NPA SOURCE field was not populated for this PRI trunk and CALLING PARTY SCREENING is turned on for the trunk. In order to screen seven digit calling party numbers, an NPA must be prefixed. This field tells where to get the NPA, so it must be populated when screening is turned on.

Data Structures:

RLEDSDLTRKG: key field: grpnum.

Action:

Use RC/V to populate this data in the NPA SOURCE field on RC/V View 5.1 (TRUNK GROUP).

102. FINSFMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred for the RLNSFMAP relation. This relation along with the RLEDGLPRT relation is read when an extended digital subscriber line (EDSL) primary rate interface (PRI) origination requires a simulated facilities group (SFG).

Based on the originating trunk group and the pre-routing index (RLnsfmap.eptidx2) for a requested call-by-call feature, the RLEDGLPRT relation is read to determine the modular communications route index (MCRI). The MCRI is used to hunt for a SFG. An rLNSFMAP tuple is associated with one or more trunk groups and must have a corresponding rLEDGLPRT tuple. The rLNSFMAP tuple keys (NSF type, band, carrier ID, facility number, bearer capability, and selective class of call screening (SCOCS) ID) and the originating trunk group are printed on the ROP. The RLNSFMAP relation is updated via RC/V View 5.34 (EDSL CALL BY CALL FEATURES).

103. FINULPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A macro called to retrieve a portname has failed to successfully read either FC_PORTTYP or CKT_PORT. The calling function or macro was returned a value of GLNULPORT. This is a database inconsistency - contact your next

level of support.

104. FIODBBAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The on-demand packet (ODP) terminal process did not recognize its own internal state. The terminal process is purged. The state is a value set by the terminal process to control its actions. The value is stored in the process control block link area (PCBLA). The PCBLA was corrupted or an error caused an unknown value to be written into this field.

105. FIODBERRMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The on-demand packet (ODP) terminal process received an unexpected message from the system (that is, not a Q.931 message). This message is ignored. The system should not send this type of message to the terminal process, or the terminal process needs to be reworked to handle this message type.

This assert should not fire due to customer actions from the customer premises equipment (CPE). This assert should only react to normal operating system for distributed switching (OSDS) messages from other processes in the switch.

106. FIODBPHR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the on-demand B-channel (ODB) terminal process, an unrecognized task type was received in an MGL3X25R message from the protocol handler (PH). A PH sent a message to an on-demand packet (ODP) terminal process that it is not prepared to handle. This should not happen. The terminal process ignores the message.

107. FIODBSPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSSendin() function failed to send a message from the on-demand packet (ODP) terminal process to the protocol handler (PH). The SMP could not communicate with the PH assigned to this ODP user. The PH could be out of service and not spared, or there could be a system communication failure. This assert does not fire for the return code PSRESRCE, which indicates that the packet interface (PI) first-in first-out (FIFO) queue is full and the send did not occur.

108. FIODBUNR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The on-demand packet (ODP) terminal process was entered for an unknown reason. This should never happen and indicates an unstable system. The process is purged. The terminal process can be entered as a result of the OSMCREATE(), OSREPLACE(), OSMSG(), or OSTIMEOUT() macro. If there is another valid entry reason, it must be added to the process.

109. FIODBWGM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The on-demand B-channel (ODB) terminal process received an unexpected return value from the OSWGETMSG() macro. The error is ignored and the terminal process will continue. Recognized returns from the OSWGETMSG() macro in the terminal process are OSMSG and OSTMEOOUT. If there is another valid return, it should be added to the terminal process.

110. FIOFFICECODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the key used to read the RLOFFICECODE relation, or the rLOFFICECODE tuple is missing.

Data Structures:

RLOFFICECODE. Key field: noc.

Action:

This is a database inconsistency that can only be corrected by manual action. The first variable printed on the ROP is the noc (decimal) that was expected, but not found. Use the noc key to access the RLOFFICECODE relation.

Use RC/V (or ODBE, if necessary) to crosscheck the data set for the keys in the RLOFFICECODE relation with the actual keys used to access the relation.

If the noc was assigned through standard office data administration (ODA) or recent change (RC), file a trouble report.

111. FIOPSTLVL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected delay level was encountered in the MGACQUEUED message after an automatic call distribution (ACD)/business and residential custom services (BRCS) call was queued for standard delay treatment.

Probable Cause:

An error is in the provisioned data for standard delay.

Action:

Correct the specified delay levels for standard delay.

112. FIORNOCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rICQPARM tuple was not found for the call_que key. A database inconsistency exists between the RLSTPARM and RLCQPARM relations.

Data Structures:

RLCQPARM.

Action:

Search the RLCQPARM relation for a tuple with the call_que key. If none is found, use RC/V to insert an rICQPARM tuple. If an entry exists, contact the product engineering control center (PECC) and write an initial modification

request (IMR).

113. FIPACK_NLOADED (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Code requiring the software optioned ISDNBRCS package was executed, but the ISDNBRCS package was not loaded.

114. FIPCOPSPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

In the file fita/Flacdqv/Flcrtpcop.c, an error return was received from the DAgetpcbla() primitive when attempting to obtain a pointer to the newly created call forwarding (CF) terminating terminal process's process control block link area (PCBLA).

Action:

The new terminal process is purged. The first data dump contains the process ID of the newly created process. The second data dump contains the return value from the DAgetpcbla() primitive.

115. FIPEDSGRP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLEDs_GRP tuple is missing. The calling name on PRI feature is assigned, but the defined EDS group is not found. The information displayed on the ROP includes the EDS_GRP tuple that was unmatched, the module and the PRI group.

Data Structures:

RLEDsLTRKG. Key field: grpnum.
RLEDs_GRP. Key field: eds_grpid.

The first variable on the ROP output is the unmatched EDS group tuple. The other variable identifies the PRI group number ID that has the invalid EDS group ID. All variables are in decimal.

Action:

This is a database inconsistency that can be corrected only by manual action.

Use RC/V View 5.1 (TRUNK GROUP) and RC/V View 4.38 (ELECTRONIC DIRECTORY SERVICE) to verify correct data was entered. Check with ODBE that the correct rLEDs_GRP tuple is on the affected SM. If not, insert the tuple. One can then examine the other SMs that use the given rLEDs_GRP to confirm the data.

If the EDS feature was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

116. FIPORTGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When reading the RLPORT_GROUP relation for a key from the RLPCBLA relation, a failure code of

DBNO_MATCH was returned. The port was not found in the RLPORT_GROUP relation.

Data Structures:

RLPORT_GROUP. Key field: port.

Action:

This is a database inconsistency that can be corrected by manual action. The first variable contains the port (member and module) from the RLPCBLA relation. Using the information on the ROP, determine the port (member and module) to be assigned through recent change (RC).

117. FIPP_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line or trunk has the precedence and preemption (PP) feature assigned in the RLDN_FEATS relation and the data for the port is in the RLPP_LTM or RLPP_TRUNK relation, but there is no corresponding data in the RLPP_CF relation. When attempting to read the RLPP_CF relation, a failure code of DBNO_MATCH was returned. An rIPP_CF tuple is missing or the keys used to read the relation were not set properly.

Data Structures:

RLPP_CF. Key fields: port, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to examine the precedence and preemption feature assignment data on the indicated line or trunk. For lines, see RC/V View 1.11 (BRCS FEATURE ASSIGNMENT LINE) or the RLDN_FEATS relation. For trunks, see RC/V View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER) or the RLDN_FEATS relation. Obtain the keys to the RLDN_FEATS relation from the RLFC_LINE or RLPORT_GROUP relation. The output data shows the port by module and member as well as the feat_id that is associated with the port in the RLPP_LTM or RLPP_TRUNK relation. For lines, see RC/V View 1.31 (PRECEDENCE AND PREEMPTION LINE PARAMETERS) or the RLPP_LTM relation. For trunks, see RC/V View 5.31 (PRECEDENCE AND PREEMPTION TRUNK PARAMETERS) or the RLPP_TRUNK relation.

Corresponding feature description data should exist in the RLPP_CF relation for the feature that the assert indicates does not exist. See RC/V View 12.31 (PRECEDENCE AND PREEMPTION FEATURE DEFINITION) or the RLPP_CF relation.

118. FIPP_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of DBNO_MATCH was returned when an attempt was made to read the RLPP_LTM relation. The rIPP_LTM tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLPP_LTM. Key fields: lead_module, ltm_idx, ltm_type.

Action:

Verify that the keys printed on the ROP are valid. If the keys are valid, use ODBE to verify that the rIPP_LTM tuple does not exist then insert the tuple. If the keys are not valid, file a trouble report.

119. FIPP_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trunk has the precedence and preemption feature assigned in the RLDN_FEATS relation, but there is no corresponding data in the RLPP_TRUNK relation.

When attempting to read the RLPP_TRUNK relation, a failure code of DBNO_MATCH was returned. An rIPP_TRUNK tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPP_TRUNK. Key fields: port, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to examine the precedence and preemption feature assignment data on the indicated trunk. See RC/V View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER) or the RLDN_FEATS relation.

The output data shows the port by module, member, and feat_id. Corresponding trunk parameter data should exist for that port. See RC/V View 5.31 (PRECEDENCE AND PREEMPTION TRUNK PARAMETERS) or the RLPP_TRUNK relation.

120. FIPRIFEATS (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in the RLPRIFEATS relation, or the key used to read this relation was not set correctly.

Data Structures:

RLPRIFEATS. Key field: prigrp

Action:

Use RC/V View 5.2 (PRI GROUP ASSIGNMENT) (or ODBE, if necessary) to cross check the data for the key in the RLPRIFEATS relation with the actual key used. If the tuple is missing, add it. If the key used to access the relation was set incorrectly, notify the next level of support.

121. FIPRISTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

An error occurred while accessing an rIPRISTAT tuple.

122. FIPSSENDASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The PSBADDATA return code was received from the PSmsadt() or PSmsudt() function, which indicates invalid data in the D-channel application linkage block (DALB).

123. FIQVINVST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid routing state (rtg_state) was used in the Flacdrerte() or Flcvroute() function.

Action:

Check the routing states in the file fita/Flacdqv/Flacdrerte.h.

124. FIQVUXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by the QVTP in the automatic call distribution (ACD)/business and residential custom services (BRCS) rerouting code. In the Flacdrerte() function, the msghead, return value, and the routing state are dumped. In the Flcvroute() function, the msghead, routing status, and the routing state are dumped.

Action:

Determine if the Flacdrerte() and Flcvroute() functions should be explicitly checking for the message received and determine the action to be taken.

125. FIQVUXPROC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by QVTP in the automatic call distribution (ACD)/business and residential custom services (BRCS) code from a process that was not previously a far process of the QVTP in the Flqvrelay() function (i.e. before PHjoin and MGCHG_FPID). A dump of msghead.from indicates the process that sent the message.

Probable Cause:

The call was transferred or forwarded.

Action:

Determine where the call was from and if action should be taken in the code to account for this problem. Currently no action is taken.

126. FIQVUXSTATUS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected status was detected in the Flcvroute() function. The rtg_status value was set incorrectly. This value will be dumped.

Action:

Verify that the rtg_status used is defined in the file fita/Flacdqv/Flacdrerte.h

127. FIQVUXTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Flacdrerte() function received an unexpected acdtype value in the MGLN_TERM message. The valid acdtypes are FI_INTRFLW and FI_DAA.

Probable Cause:

The message data is corrupted, or Flacdrerte() was not the appropriate function to call.

Action:

Verify that Flacdrerte() is the correct function to call. This function is only called for automatic call distribution (ACD)/business and residential custom services (BRCS) rerouting of a direct agent access (DAA) or INTERFLOW

call.

If a DAA or INTERFLOW call is being rerouted, verify that the MGLN_TERM message was populated with the correct acctype before calling the Flacdrerte() function.

128. FIRTDNMOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of DBNO_MATCH was returned when the RLRTDNMOD relation was read. The rIRTDNMOD tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLRTDNMOD. Key fields: NOC, D4D3[0] (1000's digit), D4D3[1] (100's digit).

Action:

Verify that the keys printed on the ROP are valid. The normalized office code (NOC) must be in the range 0-250.

If the keys are valid, use ODBE to verify that the rIRTDNMOD tuple does not exist, then insert the tuple. If the keys are not valid, file a trouble report.

129. FIRT_DNTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of DBNO_MATCH was returned when the RLRT_DNTRAN relation was read. The rIRT_DNTRAN tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLRT_DNTRAN. Key fields: NOC, digits.

Action:

Verify that the keys printed on the ROP are valid. The normalized office code (NOC) must be in the range 0-250. Digits consists of four digits.

If the keys are valid, use ODBE to verify that the rIRT_DNTRAN tuple does not exist on the SM indicated, then insert the tuple. If the keys are not valid, file a trouble report.

130. FIRT_SCRNING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_SCRNING relation to get the charge index (charge_x) using the screen index, dest_x, and prefix keys, a failure code of DBNO_MATCH was returned. The rIRT_SCRNING tuple is missing for the specified keys.

Data Structures:

RLRT_SCRNING. Key fields: dest_x, screen_x, prefix.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the keys for correctness. If the rIRT_SCRNING tuple is missing, use RC/V View 10.11 (CHARGE INDEX EXPANSION [CHARGING]) (or ODBE, if necessary, for the RLRT_SCRNING relation) to add the missing tuple.

131. FIRT_TRKG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_TRKG relation, a failure code of DBNO_MATCH was returned. The rLRT_TRKG tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLRT_TRKG. Key fields: grpnum.

Action:

Use ODBE to verify that the trunk group is valid. Check the RLRT_TRKG relation to determine if a tuple exists for the trunk group. If the rLRT_TRKG tuple is not populated, insert a tuple (consult the office records).

132. FISCRANG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISC_RANGE tuple is missing or the keys (pbx_id and tuple_idx) used to read this relation are wrong. This problem does not affect the call.

Data Structures:

RLSC_RANGE. Key fields: pbx_id, tuple_idx.

RLFC_TRUNK. Key fields: port.module, port.member.

RLRT_TRKG. Key field: tgroup.

RLGROUP_PORT. Key fields: tgroup, member.

Action:

The following steps are a series of checks to determine if the problem was caused by a software error or a data error. If the problem was caused by a software error, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on how to contact your next level of support and give them the information you have collected to that point.

If the problem was caused by a data error, consult the population rules to double check and/or correct the error. Use caution when dealing with the population rules as the relations mentioned above are networked, and changing one incorrectly can have a detrimental effect on others.

- (1) Use RC/V View 7.5 (CALLING PARTY NUMBER SCREENING RANGES) to review the RLSC_RANGE relation using the pbx_id and tuple_idx obtained from the ROP as keys.
- (2) Count the number of ranges in View 7.5 and, using the tuple_idx obtained from the ROP, verify that the following equation is true: $\text{number of ranges} \geq (5 * \text{tuple\_idx})$. If the equation is false, there is a software error; contact your next level of support. If the equation is true, go to the next step.
- (3) Using the tgroup value obtained from the ROP as they key, review RC/V View 5.1 (TRUNK GROUP) to see if the pbx_id found there matches the pbx_id used in View 7.5.
 - (a) If the pbx_id values do not match, there is a data error.
 - (b) If the pbx_id values match, use ODBE to read the RLGROUUP_PORT relation (using the tgroup and port.member obtained from the ROP as keys) and see if the extended digital subscriber line (EDSL) trunk group member is in the SM that the assert fired from. If it isn't, there is a software error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual. If it is, there is a data error.

133. FISHTERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSHTERM relation, a failure code of DBNO_MATCH was returned. The rLSHTERM tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLSHTERM. Key fields: lead module, LTM index, range.

Action:

This is a database inconsistency that can only be corrected by manual action.

134. FISPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rSPID tuple is missing, but an rIACSR_USR tuple exists for the epdn field value specified.

Data Structures:

RLSPID. Key fields: natype, npid, epdn.

RLACSR_USR. Key field: epdn.

Action:

Use RC/V (or ODBE, if necessary) to determine if an rIACSR_USR tuple exists for this epdn value. If this tuple is found, populate an rSPID tuple with the same epdn or delete the rIACSR_USR tuple.

135. FI_TAG_MAP (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The call tag allocation algorithm for the ISDN PRI two B-channel transfer (TBCT) notification to controller (NTC) feature failed to allocate a call tag for a transferred call because all of the call tags in the bit map were marked as busy.

Probable Cause:

Call tags are not being released.

Action:

The process control block link area (PCBLA) audit is scheduled to free up any stuck call tags.

136. FITATYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the key used to read the RLTATYPE relation, or the rITATYPE tuple is missing.

Data Structures:

RLTATYPE. Key field: tatype.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLTYPE relation with the actual key used to read the relation. If the RLTYPE tuple is missing, use RC/V View 10.1 (FIXED ROUTE [ROUTING]) to insert the tuple. If the key used to access the relation was not set correctly, notify your next level of support.

137. FITERMCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the keys used to read the RLIS_TERM relation, or the RLIS_TERM tuple is missing.

Data Structures:

RLIS_TERM. Key fields: lport, termno.

Action:

This is a database inconsistency that can only be corrected by manual action. The first variable contains the logical port and the second variable contains the terminal number. Use the information on the ROP to determine if this data should be used to access the RLIS_TERM relation. Use RC/V (or ODBE, if necessary) to crosscheck the data in the relation with the actual keys used to access the relation.

138. FITPCBADPID (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in fita/Flacdc/core/Fitpc_crt.c. While creating either feature or display terminal process, an error was returned. This assert will also fire if Fitpc_crt() is unable to send a message using OSSENDMSG.

139. FITPCINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid third party call request message has been passed to the Flfindtpc() function to locate the terminal process.

140. FITPCIPG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to create a third party call control ring-back terminal process (GLPGTPC).

141. FITPCSP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in fita/Flacdc/core/Fitpcorig.c. During the creation of a ringback terminal process for third party call control, an error return was received from the DAggetpcbl(), DAcppopc(), or Rlupdat_b() function after the process was just created. The ringback terminal process is purged. The first data dump contains the process ID of the process to be purged or the gport. Study the stack frame dump to gain further insight into this assert.

142. FITPCSP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in fita/Flacdc core/Fitpcorig.c. During the creation of a ringback terminal process for third party call control, an error return was received from the DARhhcbr(), DALbrda(), or DAfpcda() primitive. The newly create terminal process is purged. The first data dump contains the error return. The second data dump contains the contents of the appropriate business and residential custom services data block (BRCSDB). Study the stack frame dump to gain further insight into this assert.

143. FITPCSP3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in fita/Flacdc core/Fitpcorig.c. During the creation of a ringback terminal process for third party call control, an error return was received from the RTbusysa(), Rlalloccre() or Rladdalb() primitive. The newly created terminal process is purged. The first data dump contains the error return from the primitives. The second data dump contains the port member on which the operation was to be performed. Study the stack frame dump to gain further insight into this assert.

144. FITPCSP1 (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in fita/Flacdc core/Fitpc_crt.c. An error return was received from the DAGETPCBL macro. The newly created terminal process is purged. The first data dump contains the process ID of the process to be purged. The second data dump contains the relevant rIPCBLA. Study the stack frame dump to gain further insight into this assert.

Probable Cause:

Process ID is bad.

Action:

Newly created process will be purged and cleaned up.

145. FITPCSP2 (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

An exception occurred in fita/Flacdc core/Fitpc_crt.c During the creation of a feature or display terminal process, an error return was received from the DARhhcda() primitive when attempting to access a D-channel application linkage block (DALB). The first data dump contains the D port that the DALB is associated with. The newly created terminal process is purged and the DALB audit is run. Study the stack frame dump to gain further insight into this assert.

Probable Cause:

Idle link list of DALBs is corrupted.

Action:

Purge newly created process and run DALB audit.

146. FITPCSP3 (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

An exception occurred in fita/Flacdc core/Fitpc_crt.c. An error return was received from the DAahteda() primitive

when attempting to link D-channel application linkage block (DALB) to the terminal equipment data block (TEDB).

The first data dump contains the relevant rITEDB tuple. The second data dump contains the relevant rIDALB tuple. The newly created terminal process is purged and the audit is called.

Probable Cause:

Corrupted dynamic data.

Action:

Purge newly created process and run TEDB audit.

147. FITPCSP4 (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

An exception occurred in fita/Flacdc/core/Fitpc_crt.c. During the creation of a feature or display terminal process, an error return was received from the DAahdpda() primitive when attempting to link a D-channel application linkage block (DALB) data block to the D-channel port block (DPB). The first data dump contains the relevant rITEDB tuple. The second data dump contains the relevant rIDALB tuple. The third data dump contains the D port that the DALB was to be linked to. The newly created terminal process is purged and the DPB audit is run. Study the stack frame dump to gain further insight into this assert.

Probable Cause:

Corrupted dynamic data.

Action:

Purge newly created process and run DPB audit.

148. FITPCSP5 (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in fita/Flacdc/core/Fitpc_crt.c. During the creation of a feature or display terminal process, an error return was received from the DALpcda() primitive when attempting to link the D-channel application linkage block (DALB) to the process control block link area (PCBLA) of the newly created terminal process. The first data dump contains the relevant rITEDB tuple. The second data dump contains the contents of the DALB that was to have been linked to the PCBLA. The third data dump contains the appropriate D port data block. The newly created terminal process is purged. Study the stack frame dump to gain further insight into this assert.

Probable Cause:

Dynamic data linkage is bad.

Action:

Purge the newly created process.

149. FITPUNXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by a terminal process other than the originating terminal process (OTP) or terminating terminal process (TTP). The message, the far process ID from the process control block link area (PCBLA), and the terminal equipment data block (TEDB) information are dumped to the ROP. The port that received the unexpected message is also dumped. The port information starts at the fifth byte after the far process

ID.

This assert returns to the calling function with no affect on call processing. No audits are scheduled. The data printed on the ROP is used to determine the process that sent the message. Contact your next level of support.

150. FITSM_BMAP (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLTSMBMAP relation, or the rITSMBMAP tuple is mssing.

Data Structures:

RLTSM_BMAP. Key fields: TSM monitored LPORT.

151. FITSM_BTN (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLTSMBTN relation, or the rITSMBTN tuple is missing.

Data Structures:

RLTSM_BTN. Key Fields: Monitoring LPORT, Monitoring Stored_parameter.

Action:

This is a database inconsistency that can only be corrected by manual action.

152. FITSMTRING (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading the RLTSMTTRING relation, a failure code was returned. Either the rITSMTTRING tuple is missing or an error occurred when population the keys.

Data Structures:

RLTSMTTRING.

Key Fields: Monitored SM, Monitored LTM_TYPE, Monitored LTM_IDX

Action:

Use ODBE to read RLLTM_PORT with the LTM_IDX from the ROP output and retrieve the port and party information. Read either RLFC_LINE with the port and party information or execute an "OP:CONV,PORT=x-y (where x = SM, y= port)" to determine the DN.

Once the DN has been determined, use RC/V Views 1.8 (ANALOG LINE/BRCS ASSIGNMENT) or 23.2 (DIGITAL SUBSCRIBER LINE) to verify that this is a monitored terminal and if so, populate RC/V View 23.24 with the monitoring DNs associated with this monitored DN.

153. FIUNXMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received from the far process. The NI feature terminal process (FTP) received an unexpected return value from the OSWGETMSG() macro. Recognized return values from the OSWGETMSG()

macro to the NI FTP are OSMSG or OSTIMEOUT.

154. FIUUICHK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The primary rate interface (PRI) user to user information (UUI) screening function Fluuichk() received a message that is not recognized. The message type is printed on the ROP.

155. FIWBTBLOCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLWBTBLOCK relation, a failure code of DBNO_MATCH was returned. The rLWBTBLOCK tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLWBTBLOCK. Key fields: trunk group number, trunk block.

RLFC_TRUNK. Key fields: port.member, port.module.

RLPORT_GROUP. Key fields: port.member, port.module.

The trunk block is calculated by dividing the trunk group member number by 24 and using the integer portion of the result. For example, if a member number is 0-23, the trunk block is 0 and if the member number is 24-47, the trunk group is 1.

Action:

Use ODBE to verify that the trunk group number is valid. The port member and port module dumped on the ROP are used to read the RLPORT_GROUP and RLFC_TRUNK relations. If both relations indicate that the port is a member of the trunk group dumped on the ROP, then the trunk group number is probably valid.

If the trunk group number is valid, and the wbrate field in the rLFC_TRUNK tuple contains a wide band data rate, check the RLWBTBLOCK relation to determine if a tuple exists. Use the member field from the rLPORT_GROUP tuple to compute the tblock key for the RLWBTBLOCK relation. If the rLWBTBLOCK tuple is not populated, insert the tuple (consult the office records).

If the trunk group assigned to the port in the rLFC_TRUNK tuple is different than the one in the rLPORT_GROUP tuple, consult the office records and correct the trunk group assignment.

After correction, manually restore the trunk back to service.

156. FTTSM_BTN (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLTSMBTN relation, or the rLTSMBTN tuple is missing.

Data Structures:

RLTSMBMAP. Key fields: TSM monitored LPORT and STR_PARAMETER.

Range: fp**1. FCBADVAL (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

*This assert should never be used in the real system - temporary only - use FPBADVALUE.

2. FCLTSBPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Use FPLTSBPORT.

An attempt to access a tuple in line time slot bridging (LTSB) relation RLLTSBPORT failed. Likely, no tuple exists for the key used (lport). This key is supplied by a MGLTSBxxxx message, and could also be incorrect. A third possible cause is a database error.

Data Structures:

RLLTSBPORT.

Action:

Verify that the rLTSBPORT tuple does NOT exist for the lport key displayed. If true, verify that the lport key is correct, and, if so, add the missing tuple in RLLTSBPORT. If the lport key is invalid, either a message was corrupted, or code did not build the message properly (perhaps other data are also bad). If the lport key is correct, and a rLTSBPORT tuple exists for it, use database system error procedures.

3. FCSDNBDBF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of struct rIBRCSDb for OSpdb.procno has failed.

4. FP0001 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A line, indicated by the port, has been marked as having the series completion feature, but does not have a tuple in the RLFC_SERCOMP relation that specifies the directory number to complete to. Either this line should not have this feature or a tuple with the directory number of the next line in the series completion group should be added.

Data Structures:

RLFC_SERCOMP. Key fields: port.member, port.module, and party.

In the data dump, the first two bytes of the first word are port.member, the next byte is filler, and the next byte is port.module. In the next word, the first five bits are party.

Action:

Use RC/V (or ODBE, if necessary) to see if the line indicated has the series completion feature and a designated number to complete to. This relation is updated by RC.V View 1.5 (PBX-DID LINE [LINE ASSIGNMENT]) and RC/V View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]).

5. FP0003 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_LINE relation or the rLFC_LINE tuple is missing.

Data Structures:

RLFC_LINE. Key fields: port.member, port.module, party.

In the data dump, the first two bytes of the first word are port.member, the next byte is filler, and the next byte is port.module. In the next word, first five bits are party.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_LINE relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V views:

- 12.8 (BFG ADMINISTRATION)
- 23.2 (DIGITAL SUBSCRIBER LINE)
- 21.30 (OSPS-DSL PORT)
- 1.12 (BRCS FEATURE ACTIVATION [LINE ASSIGNMENT])
- 5.12 (BRCS FEATURE ACTIVATION [TRUNK MEMBER])
- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
- 4.29 (ATTENDANT MLHG/BUSY LAMP FIELD DN ASSIGNMENT)
- 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE LIST)
- 1.9 (MULTIPLE DIRECTORY NUMBER WITH DISTINCTIVE RINGING)
- 3.5 (MULTILINE HUNT GROUP [LINE ASSIGNMENT])
- 3.3 (MULTIPLE TN FOR MULTILINE HUNT GROUPS)
- 1.32 (TWO TELEPHONE NUMBER SWAP)
- 1.5 (PBX-DID LINE [LINE ASSIGNMENT])
- 1.6 (COMPOSITE LINE [LINE ASSIGNMENT])

6. FP0004 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_TRUNK relation or the rLFC_TRUNK tuple is missing.

Data Structures:

RLFC_TRUNK. Key fields: port.member and port.module.

In the data dump, the first two bytes of the first word are port.member, the next byte is filler, and the next byte is port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_TRUNK relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V views:

- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
- 5.1 (TRUNK GROUP)
- 5.5 (TRUNK MEMBER)

7. FP0005 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLDA_TIMER relation or the rIDA_TIMER tuple is missing.

Data Structures:

RLDA_TIMER. Key fields: servclass, signal, sigtype.

In the data dump, the first word is critical, the second word is partial, the third word is permsig, the fourth word is ovlpart, and the fifth word is ovlperm. In the sixth word, the first byte is servclass, the next four bits are filler, the next two bits are sigtype, and the next two bits are startsig.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLDA_TIMER relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support. (The "signal" for lines is always FCSSNULL; start signal is not applicable.)

This relation is updated by RC/V View 8.5 (TIMING [MISCELLANEOUS]).

8. FP0010 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_PORTTYP relation or the the rIFC_PORTTYP tuple is missing.

Data Structures:

RLFC_PORTTYP. Key fields: port.member, port.module, servclass.

In the data dump, the first two bytes in the first word is port.member, the next byte is filler, and the next byte is port.module. In the next word, the first two bytes are sleeveid (no concern) and the next byte is servclass.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V views:

- View 8.11 (REMOTE ALARM ASSIGNMENT)
- View 8.13 (MSU/MMSU SCAN POINT ASSIGNMENT)
- View 21.34 (OSPS DSL PACKET SWITCHING ASSIGNMENT)
- View 8.10 (CARRIER GROUP ALARM)

 View 5.5 (TRUNK MEMBER)

9. FP0012 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When trying to read the RLSCRNING relation, an error was returned. Either the tuple was missing or an error occurred when setting the keys.

Data Structures:

RLSCRNING. Key fields: dest_x, screen_x, prefix.

The keys are in the ROP listing as follows: the first two bytes in the first word are dest_x, the next two bytes are screen_x, the next two bytes are charge_x, and the next two bytes are route_x. In the next word, the first eight bits are filler, the next two bits are cst, the next three bits are route_type, and the next three bits are prefix.

Action:

Use RC/V (or ODBE, if necessary) to cross check the keys used to access the RLSCRNING relation with the actual keys. Verify the existence of this tuple, add it if necessary. Use the RC/V screening view. The destination index and the prefix are the results of digit analysis. The screening index used is from the rIFC_LINE tuple for the line.

10. FP0028 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The FCorigcs() function encountered an invalid originating class of service. The probable cause for the error is a data population error in the RLFC_PORTTYP relation.

11. FP0029 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The FCtermcs() function encountered an invalid terminating class of service. The probable cause for the error is a data population error in the RLFC_PORTTYP relation.

12. FP0030 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid program ID was passed to a coin control program.

13. FP0031 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The timer tag was not recognized in the local coin overtime time-out.

14. FP0032 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid treatment type was encountered by the busy-verify function FCbv_orig().

15. FP0033 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received and the message header was dumped; or the FCbailout() function was called. The stack is dumped because it is lost after the FCreblout() function restart.

16. FP0034 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ownership relation was not RLRTCONTROL or RLRTCAMPON for an announcement or busy verify termination.

17. FP0039 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A value is out of range of the enumeration.

18. FP0040 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGLN_TERM message was not present.

19. FP0041 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGTK_TERM message was not present.

20. FP0042 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGANN_TERM message was not present.

21. FP0046 (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid TYPE_CI_CALL was received. One of the following situations has been detected:

- (1) an invalid combination of TYPE_CI_CALL (FCCI_NULL) and ROW TYPE, or
- (2) an undefined TYPE CI CALL.

Data Structures:

The following information is output (in hex) in the first data dump: the digit count (first half byte) and the dialed digits (one byte per digit, subtract hex 30 from each). The second data dump provides the digtree (bytes 0 and 1) and TYPE CI CALL (bytes 2 and 3).

Action:

Use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]), View 9.9 (REMAINING DIGIT [OFFICE DIALING]), View 9.2 (PREFIX/FEATURE DIGIT [OFFICE DIALING]), or View 9.5 (INCOMING TRUNK DIGITS [OFFICE DIALING]) to verify the TYPE CI CALL value and correct the error.

22. FP0046 (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid TYPE_CI_CALL was received. One of the following situations has been detected:

- 1) an invalid combination of TYPE_CI_CALL (FCCI_NULL) and ROW TYPE, or
- 2) an undefined TYPE CI CALL.

Data Structures:

The following information is output (in hex) in the first data dump: the digit count (first half byte) and the dialed digits (one byte per digit, subtract hex 30 from each). The second data dump provides the digtree (bytes 0 and 1) and TYPE CI CALL (bytes 2 and 3).

Action:

Use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]), View 9.2 (PREFIX/FEATURE DIGIT [OFFICE DIALING]), or View 9.5 (INCOMING TRUNK DIGITS [OFFICE DIALING]) to verify the TYPE CI CALL value and correct the error.

23. FP0047 (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rDI_COMP tuple is missing.

Data Structures:

RLDI_COMP.

The following data is output (in hex):

REPT DATA #1: digit count (first half byte), dialed digits (one byte per digit; subtract hex 30 from each).

REPT DATA #2: digtree (bytes 0 and 1), TYPE CI CALL (bytes 2 and 3).

REPT DATA #3: CODE INDEX (bytes 0 and 1), CARRID (bytes 4, 5, and 6; one byte per digit; subtract hex 30 from each).

Action:

Use the RC/V CDIM view to insert an rDI_COMP tuple. If necessary, use the LDIT, PDIT or INDIT views to verify the CODE INDEX and use the ICF view to verify the CARRID.

24. FP0048 (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rFC_WZ1 tuple is missing.

Data Structures:

RLFC_WZ1.

The first data dump provides (in hex) the numbering plan area (NPA) (bytes 0, 1, and 2; one byte per digit; subtract hex 30 from each).

Action:

Use RC/V (or ODBE, if necessary) to insert an rFC_WZ1 tuple (WZ1 REGION field). This relation is updated by RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]), View 9.9 (REMAINING DIGIT [OFFICE DIALING]) and View 9.15 (MULTIPLE LOCAL DIGIT [OFFICE DIALING]).

25. FP0048 (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rFC_WZ1 tuple is missing.

Data Structures:

RLFC_WZ1.

The first data dump provides (in hex) the numbering plan area (NPA) (bytes 0, 1, and 2; one byte per digit; subtract

hex 30 from each).

Action:

Use RC/V (or ODBE, if necessary) to insert an rFC_WZ1 tuple (WZ1 REGION field). This relation is updated by RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) and View 9.15 (MULTIPLE LOCAL DIGIT [OFFICE DIALING]).

26. FP0049 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range country access code length was detected. The country access code should be either 1, 2, or 3 digits.

Data Structures:

The following information is output (in hex): the first data dump contains the country access code length (first half byte), and the second data dump contains the digtree (bytes 0 and 1) and TYPE CI CALL (bytes 2 and 3) values.

Action:

Use RC/V View 9.6 (IDDD COUNTRY ACCESS CODE [OFFICE DIALING]) to verify the country access code.

27. FP4WDRNG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in the distinctive ringing type assigned to this port.

Data Structures:

RLDR_LTM. Key fields: port, feat_id, dring.

Action:

Use RC/V to change the distinctive ringing type to a valid value for this port. Types DR_A, DR_B, DR_C, and DR_D can not be assigned to ports with class of service FC_4WIRE_INDV. Types DR_E and DR_F can only be assigned to ports with class of service of FC_4WIRE_INDV.

The RLDR_LTM relation is updated RC/V View 1.25 (DISTINCTIVE RINGING LINE PARAMETERS).

28. FP_4WIRE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLFC_4WIRE relation.

Data Structures:

RLFC_4WIRE. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_4WIRE relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by RC/V View 1.5 (PBX-DID LINE [LINE ASSIGNMENT]), View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]), and View 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE LIST).

29. FP0062 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A line has an individualized dialing (ID) feature assigned in the RLBRCEATS relation, but there is no constructed feature data associated with this line in the RLIDP_CF relation.

Data Structures:

RLBRCEATS. Key fields: port_id (port.member and port.module), party.

RLIDP_CF. Key fields: individualized dialing constructed feature ID.

There are two raw data dumps, the first dump is the rLIDP_CF tuple where the key is in the first two bytes. The second dump is port information where the first two bytes are the member and the next two bytes are the module. For the party, see the Recent Change manual for valid party enumeration.

Action:

Use RC/V to verify that the individualized dialing constructed feature ID obtained from the first dump and the port obtained in the second dump are defined in the RLBRCEATS relation, and that the constructed feature ID obtained from the first dump is defined in the RLIDP_CF relation. If the constructed feature ID is not defined, it must be constructed. See the Audits Manual - Data Structure Field Layout section for the RLIDP_CF relation to identify the fields in the relation.

30. FP0074 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The translation of a customer premises equipment port to a scan point port seems to be in error.

Data Structures:

RLPF_CPSL. Key fields: cpe_port.module, cpe_port.member.

The RLPF_CPSL relation associates a customer premises equipment port with a scan point port. In the data dump, the first two bytes are the cpe_port.member and the fourth byte is the cpe_port.module.

Action:

Use RC/V (or ODBE, if necessary) to check for the rLPF_CPSL tuple that is associated with the key dumped on the ROP. This relation is updated by RC/V View 5.5 (TRUNK MEMBER).

31. FP0080 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The line has an automatic route selection (ARS) feature assigned, but there was no tuple in the RLARCF relation associated with this line.

Data Structures:

RLARCF. Key field: feat_id

The first raw data dump shows the rLARCF tuple expected but not found. The first two bytes comprise the ARS constructed feature ID. The first two bytes of the second raw data dump comprise the member of the port and the third byte is the module of this port.

Action:

Use RC/V to find the FEATURE NAME associated with this port by looking at View 1.11 (BRCS FEATURE

ASSIGNMENT [LINE]). Use this feature name to define a new ARS feature definition on View 12.11 (BRCS FEATURE ACTIVATION [LINE ASSIGNMENT]), if the feature is not there. Or use ODBE, if necessary, to directly insert a tuple into the RLARCF relation using feat_id as a key.

32. FP0081 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read error occurred when attempting to read the static data for a multiway constructed feature for a port.

Data Structures:

RLMWCF. Key Field: feat_id.

Action:

The first raw data dump shows the tuple for which the read error occurred. The first two bytes comprise the constructed feature ID. See the Audits Manual - Data Structure Field Layouts section for the RLMWCF relation to identify the fields in the relation. The first two bytes of the second raw data dump comprise the internal port name of the line on which the multiway constructed feature should be assigned.

33. FP0113 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dest_type FCOSOIWTS was not valid for an office set to Gl_oso=DBNO. Dest_type FCOSOIWTS implies that this office is an OSO/INWATS office. RC/V ensures that dest_type FCOSOIWTS is only populated for offices set to Gl_oso=DBYES. The dest_type FCOSOIWTS was set for a non-OSO office, that is, the population rules for the RLDAPRIMDGT relation may be in error or the Gl_oso parameter value was corrupted.

34. FP911TBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Glim2dummy office parameter that specifies delay timing on basic 911 and enhanced 911 calls is set to an invalid value. The call will proceed without any delay timing.

Action:

Using RC/V View 8.1 (OFFICE PARAMETERS [MISCELLANEOUS]), initialize the 911 DELAY field to a valid value.

Note that the value for Glim2dummy printed on the ROP is in milliseconds and the value entered on the RC/V screen is in seconds. Translation for valid values is as follows: 0 ms=0 second, 1000 ms=1 second, 2000 ms=2 seconds, and 3000 ms=3 seconds.

35. FP_911TRNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation or the tuple is missing from the RLFC_911TRNK relation.

Data Structures:

RLFC_911TRNK. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_911TRNK relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by RC/V View 1.5 (PBX-DID LINE [LINE ASSIGNMENT]) and View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]).

36. FPAMCMCID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAMCMCID relation, a failure code of DBNO_MATCH was returned. The 10 digit billing number for a cellular mobile carrier was not found in the RLAMCMCID relation or the keys used to read this relation were not set properly.

Data Structures:

RLAMCMCID. Key field: cmc_id.

Action:

Consult the office records to determine if the key field CMCID printed on the ROP is a valid value. If it is, add the rIAMCMCID tuple corresponding to this CMCID. Using the information provided in the office records, add the key tuple via RC/V View 10.16 (CELLULAR MOBILE CARRIER IDENTIFICATION [CHARGING]), the key field is CMCID (or use ODBE, if necessary, the key field is cmc_id). If the key used to access the relation was set incorrectly, or if the key field in the office records is incorrect, notify your next level of support.

37. FPAMTKGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAMTKGP relation, a failure code of DBNO_MATCH was returned. The trunk group billing information was not found in the RLAMTKGP relation or the key used to read this relation was not set properly.

Data Structures:

RLAMTKGP. Key field: grpnum

Action:

Consult the office records to determine if the trunk group number (TGN) key field printed on the ROP is a valid value. If it is, add the tuple corresponding to this TGN to the RLAMTKGP relation. Use the information provided in the office records to add the rIAMTKGP tuple via RC/V View 5.1 (TRUNK GROUP) (key field is TGN) or ODBE, if necessary (key field is grpnum).

If the key used to access the RLAMTKGP relation was set incorrectly or if the key field in the office records is incorrect, notify your next level of support.

38. FPANIDFLT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Missing long distance platform (LDP) ANI default tuple. This relation is read for LDP calls. This default tuple is required to be populated before the LDP feature is activated.

Action:

Using a key of 000-000-0000 as the NPA-NXX-XXXX and a carrier ID of 100000, insert a tuple on RC/V View 8.51.

39. FP_ANOUNCE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation or the tuple is missing from the RLFC_ANOUNCE relation.

Data Structures:

RLFC_ANOUNCE. Key fields: port.module, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_ANOUNCE relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V Views: 5.1 (TRUNK GROUP) and 5.5 (TRUNK MEMBER).

40. FPARCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLARCF relation, a failure return of DBNO_MATCH occurred. This indicates that the tuple is missing, or that the keys used were set improperly.

Data Structures:

RLARCF. Key fields: feature ID (first data item dumped).

Action:

This is a database inconsistency. Verify that the key is valid. Use RC/V View 12.11 (AUTOMATIC ROUTE SELECTION FEATURE DEFINITION) to assign the RLARCF tuple..

41. FPARGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the RLARGP relation.

Data Structures:

RLARGP, RLARPORT, RLDB_AMGPD, RLDB_IMGPD, RLDB_GPDUS, RLTRMFEATS.

The ROP output indicates the SM number (MOD), the source file and line number, the key used to read the relation - automatic route selection (ARS) group ID (GROUP ID), and the originating logical port (LPORT) and logical port type (LPT TYPE).

Action:

The logical port attempting to use the automatic route selection (ARS) feature has an ARS feature assigned (the ARS feature ID exists in the RLTRMFEATS relation for the originating port).

The logical port is assigned to a valid ARS group (a tuple exists in the RLARPORT relation), but the ARS group ID in RLARPORT is invalid or a tuple in RLARGP is missing.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and AM.

1) Using the ARS group ID provided in the ROP output, read the RLFID2NAME relation in the AM where RLfid2name.facid is "ARS group ID", RLfid2name.class is FACARS, and RLfid2name.subclass is SCL_NULL.

2) If a tuple does not exist in RLFID2NAME for the ARS group ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

3) If a tuple exists in RLFID2NAME for the ARS group ID, insert the appropriate rLARGP tuple in the indicated SM where RLargp.ar_gpuid is "ARS group ID". Since the RLARGP relation is a group partitioned relation, other group partition control relations may also need to be updated: RLDB_AMGPD, RLDB_IMGPD, and RLDB_GPDUS.

42. FPARPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in the relation RLARPORT keyed with logical port (LPORT) and logical port type (LPT_TYPE). The automatic route selection (ARS) business and residential custom services (BRCS) feature can be assigned to a line or trunk, or assigned via a BRCS feature group (BFG).

When the ARS feature is directly assigned to a line, the original (non-BFG) keys are used to read the RLARPORT relation where RLarport.lport is RLfc_line.lport and RLarport.lpt_type is RLfc_line.lpt_type. If ARS is assigned to a trunk, the keys are RLarport.lport=RLfc_trunk.lport and RLarport.lpt_type=LPT_OTHER=0.

An attempt to read the RLARPORT relation using the original (non-BFG) keys was made because the ARS feature is thought to be assigned directly to the line or trunk. In most cases, after receiving this assert, the call gets routed to reorder.

Data Structures:

RLARPORT, RLFC_LINE, RLFC_TRUNK, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, the keys used to read this relation (LPORT and LPT_TYPE), and the global PORT number.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport if not 0 and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.

2. Using the port and party, do the following: For lines, read the RLFC_LINE relation to get the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). For trunks, read the RLFC_TRUNK relation to get the logical port (lport) and the indicator for BRCS terminal features (brc_trm). The lpt_type is 0 for trunks. ARS is a terminal feature.

3. If the brc_trm value from RLFC_LINE (or RLFC_TRUNK) is DBNO, contact the next level of support.

4. If the brc_trm value from RLFC_LINE (or RLFC_TRUNK) is DBYES, then the lport and lpt_type from RLFC_LINE (or RLFC_TRUNK) should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

5. If brc_trm is DBYES and the lport and lpt_type values match, a tuple should exist in RLARPORT for the original (non-BFG) keys. Insert the appropriate rLARPORT tuple.

43. FPARSEGSIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing in the automatic route selection (ARS) segmented signaling relation RLARSEGSIG.

Data Structures:

RLARSEGSIG, RLRT_MCRT.

The ROP output indicates the SM number (MOD), the source file and line number, the keys used to read the relation - modular customization route index (MC RI) and ARS group ID (GROUP ID), and the originating logical port (LPORT) and logical port type (LPT TYPE).

Action:

The logical port attempting to use the segmented signaling has an rLRT_MCRT tuple with an MC route index of "xxxx", an ARS group ID of "xxxx", and the segsig bit of DBYES. An rLARSEGSIG tuple has not been populated with this MC route index and ARS group ID.

Using the dumped data, verify that the logical port does have the ability for segmented signaling by looking at RC/V View 10.4 (BRCS MC ROUTE INDEX EXPANSION). If segsig is YES, populate a tuple on RC/V View 10.7 (ARS SEGMENTED SIGNALING PAUSES) for this ARS group.

44. FPARTCM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In attempting to use the traveling class mark (TCM) feature, the automatic route selection (ARS) logical port information relation RLARPORT has a tuple with a valid ARS group ID (RLarport.argpid) and a tcm value of 1 (which means the TCM feature is allowed, active, and must be used). However, the TCM conversion relation information has not been fully supplied (that is, the tuple is missing or the tuple data is incorrect in the RLARTCM relation for the group used by this port).

Data Structures:

RLARTCM, RLARPORT.

The ROP output indicates the SM number (MOD), the source file and line number, the key used to read the relation - ARS group ID (GROUP ID), and the originating logical port (LPORT) and logical port type (LPT TYPE).

Action:

Using the data in the ROP output and RC/V, verify that the logical port does have the TCM feature allowed by looking at RC/V View 5.21 (AUTOMATIC ROUTE SELECTION TRUNK PARAMETERS). If the tcm value equals 1, then an rLARTCM tuple needs to be populated on RC/V View 10.9 (ARS TRAVELING CLASS MARKS [CONVERSION FROM 1-DIGIT]) for the ARS group specified. If a tuple already exists for the specified ARS group, then re-populate the data.

45. FPASI_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLASI_CF relation, a failure code of DBNO_MATCH was returned. The rLASI_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLASI_CF. Key field: feature ID

Action:

Use the feature ID from the ROP output as the key to the RLASI_CF relation. Use RC/V View 12.61 (ADVANCED

SERVICE INTERFACE FEATURE DEFINITION) to define the feature ID. If there is a problem with this feature definition, contact the next level of support.

46. FPASI_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLASI_GP relation, a failure code of DBNO_MATCH was returned. The rIASI_GP tuple is missing, the keys used to read this relation were not set properly, or an invalid access code was dialed.

Data Structures:

RLASI_GP. Key fields: GROUP_ID, DIAL_CODE.

Action:

This is a database inconsistency that can only be corrected by manual action. Use the GROUP_ID and DIAL_CODE from the ROP output as the key to the RLASI_GP relation. Use RC/V View 4.61 (ADVANCED SERVICE INTERFACE GROUP DEFINITION) to insert the correct keys for GROUP_ID and DIAL_CODE.

47. FPASI_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIASI_PORT tuple is missing that is keyed with the logical port (lport), logical port type (lpt_type), and feature ID (feat_id).

Data Structures:

RLASI_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read the RLASI_PORT relation (LPORT, LPT_TYPE, and FEAT_ID).

Action:

The advance service interface (ASI) business and residential custom services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ASI feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLASI_PORT relation where RLasi_port.lport is RLfc_line.lport and RLasi_port.lpt_type is RLfc_line.lpt_type.

An attempt to read the RLASI_PORT relation using the original (non-BFG) keys was made because the ASI feature is thought to be assigned directly to the line.

Use ODBE to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to get the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). ASI is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.

5. If brc_trm is DBYES and the lport and lpt_type values match, an rIASI_PORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rIASI_PORT tuple.

48. FPASP_DC (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid set-up of advanced services platform (ASP) occurred.

- 1) The office is not set up as ASP, but the private virtual network (PVN) bit is assigned to a direct connect line.
- 2) The class of service of this ASP direct connect line is invalid (FC_INDVDL is the only valid class of service).

Data Structures:

RLFC_LINE. Key field: port.

Action:

On RC/V View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]), change the PVN field from "Y" to "N" and assign a telephone number. Also, change the NODL field from "HOT" to "N".

49. FPATMPT_OVLP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Overlap outpulsing is not allowed when using the automatic number identification (ANI) over private facility special feature. The overlap indicator must be set to N (NO). Reorder will be given as the failure mechanism if the overlap indicator is set to Y (YES). The MGTK_TERM message is the trunk termination message.

Data Structures:

The data printed on the ROP is the port and the overlap outpulsing indicator (value must equal 0).

Action:

Set the OVLAP IND field to N (NO) with RC/V View 10.2 (ROUTE INDEX [ROUTING]).

50. FPBAD4WIRE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation or the tuple is missing from the RLFC_4WIRE relation.

Data Structures:

RLFC_4WIRE. Key fields: port.member and port.module.

In the data dump, the first two bytes of the first word represent port.member, the next byte is filler, and the next byte is port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_4WIRE relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by RC/V View 1.5 (PBX-DID LINE [LINE ASSIGNMENT]), View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]), and View 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE LIST).

51. FPBADBILLDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The billing directory number (DN) for this office must be 7 or 10 digits for the automatic number identification (ANI) over private facility (PF) special feature. Reorder will be given as the failure mechanism if the billing DN is not 7 or 10 digits. The MGTK_TERM message is the trunk termination message.

Data Structures:

The data printed on the ROP is the port and the number of digits in the billing DN.

Action:

The originator of this port can be a line or a trunk. For a line origination, review any of the RC/V line views. For a trunk origination, review RC/V View 5.1 (TRUNK GROUP). Verify that the billing DN assigned to the line or trunk is a 7- or 10-digit billing directory number. If the number is not 7 or 10 digits, correct it.

52. FPBADCUT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in provisioning an LDP tandem cutthru call. This call is only valid on the LDP platform for an incoming LATA_CONN trunk routing to an IC trunk. The signaling protocol in the outgoing route must be equal access (EA) and the outgoing class of service must be IC.

Action:

Use RC/V to cross-check the data for the call. Verify that the route selected on RC/V View 10.2 [ROUTE INDEX (ROUTING)] specifies EA signaling, and the outgoing trunk class on RC/V View 5.1 (TRUNK GROUP) is an IC trunk.

53. FPBADPARM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to the function.

54. FPBADPDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid item exists in the process data block (PDB).

55. FPBADQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queue value obtained from either the RLPU_PORT or RLPU_LTM relation is invalid, although a tuple was found that matched the keys that were populated in the tuple buffer.

Data Structures:

This assert can be called after reading either of the two relations mentioned above; the data dump will be different depending on the relation just read.

RLPU_LTM. Key fields: lead module, LTM index, LTM type, feature ID, queue value. RLPU_PORT. Key fields: port's module, port's member, 0 (place holder), feature ID, queue value.

Action:

This is a database consistency that can only be corrected by manual action.

56. FPBADRET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An undefined return value was received from the function call.

57. FPBADSIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trunk signaling protocol did not match the feature group B (FGB) carrier TYPE CI CALL. A call dialed 950-XXXX in an equal access end office (EAEO) uses an FGB carrier that provides interim plan or transition plan access.

One of two conditions caused this call to fail - (1) the call is TYPE CI CALL = FCINTERIM, and was routed to a trunk group using equal access (EA) signaling, or (2) the call is TYPE CI CALL = FCTRANSITION, and was routed to a trunk group using FGB signaling.

If possible, the call will be completed using the signaling protocol specified for this trunk group. If the call fails, machine detected interoffice irregularities (MDII) messages may print describing the particular failure mode.

Data Structures:

RLRT_ROUTING. Key field: fgb_ri

Action:

If RC/V View 10.2 (ROUTE INDEX [ROUTING]) indicates that EA signaling is intended for these calls, the FGB carrier should be provisioned as a transition plan carrier. Use RC/V View 10.3 (INTER-LATA CARRIER) to set the access type for the FGB carrier to TRANSITION. Enter the carrier ID code (CIC) for the FGD carrier that corresponds to the FGB carrier in the TRANS CARRIER field. If the interim plan should be used with traditional signaling, route these calls via a route index and trunk group that use FGB signaling protocol via RC/V View 10.2.

58. FPBADSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid program state exists.

59. FPBADTC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid transition plan feature group D (FGD) carrier was specified. A call was dialed 950-XXXX to a feature group B (FGB) carrier that is provisioned for transition access. A TRANS CARRIER was indicated in the RLFC_FGBCARR relation for this FGB carrier, but no corresponding FGD carrier was defined in the RLFC_CARR relation; or the TRANS CARRIER field was not filled in. The call cannot be routed, and reorder treatment is given.

Data Structures:

RLRCFGB_CARR. Key fields: fgb_carrid, feature group=B.

Action:

Insert an FGD carrier into the office dependent data (ODD) using RC/V View 10.3 (INTERLATA CARRIER FEATURE). The key value must match the carrier ID code (CIC) that is indicated in the TRANS CARRIER field of View 10.3 for the FGB carrier.

60. FPBADTCOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The class of service for the port is not valid for termination.

Data Structures:

RLFC_PORTTYP. Key fields: port.member and port.module.

Action:

Review the class of service for the indicated port, using RC/V (or ODBE, if necessary). If the port is a line, use RC/V View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]); for a trunk, use RC/V View 5.1 (TRUNK GROUP). If the tuple was assigned through standard office data administration (ODA) or recent change (RC) and is valid for terminations, a trouble report should be filed.

61. FPBADVALUE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLTATYPE relation contains an invalid tone value in the pctone field.

Data Structures:

RLTATYPE. Key field: tatype

Action:

Use RC/V (or ODBE, if necessary) to correct the pctone field with a valid value. The RLTATYPE relation is updated by RC/V View 10.1 (FIXED ROUTE [ROUTING]).

62. FPBDACTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect access type for an incoming feature group B (FGB) trunk call to a tandem switch was encountered. In an FGB tandem switch, a call originating on an incoming trunk is translated to a carrier that is provisioned for TRANSITION access type. If possible, the call is routed as a TYPE CI CALL = FCINTERIM; if this is not possible, reorder treatment is given.

Machine detected interoffice irregularities (MDII) messages may also print on the ROP to indicate the type of call failure on the outgoing trunk.

Data Structures:

RLRFRGB_CARR. Key field: fgb_carrid

Action:

FGB carriers are only allowed to handle incoming tandem trunk calls that are translated as TYPE CI CALL =

FCINTERIM. The FGB carrier access type must be INTERIM in the FGB tandem. Use RC/V View 10.3 (INTER-LATA CARRIER) to change the access type to INTERIM for this carrier.

If this carrier should be handling incoming FGB calls as transition plan calls, then the calls should be translated as TYPE CI CALL = FCAVT, and the incoming trunk should be using equal access (EA) signaling. Calls translated in this way will be handled by a feature group D (FGD) carrier, not by the FGB carrier.

63. FPBDCITP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Incorrect translation of a feature group B (FGB) call origination in an end office or tandem switch occurred. If the FGB carrier is provisioned with access type INTERIM in an end office, FGB calls routed via that carrier are translated as TYPE CI CALL = FCTRANSITION. If possible, this call will be routed as a TYPE CI CALL = FCINTERIM; if this is not possible, reorder treatment is given.

In an FGB tandem switch, a call originated on an incoming trunk is translated as TYPE CI CALL = FCTRANSITION (instead of FCINTERIM). If possible, the call is routed as a TYPE CI CALL = FCINTERIM; if this is not possible, reorder treatment is given.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use RC/V View 5.1 (TRUNK GROUP) to verify that the digit analysis selector (DAS) value for the trunk group is correct for FGB calls. Use the DAS value in RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) to determine the local digit interpreter table (LDIT) that is used. Correct the LDIT translation in RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) or RC/V View 9.9 (REMAINING DIGIT [OFFICE DIALING]) for this call. Verify that all LDIT or RDIT records for calls for this FGB carrier originating on a line or (tandem) trunk in this office are translated as TYPE CI CALL = FCINTERIM, not FCTRANSITION.

64. FPBDCITP (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Incorrect translation of a feature group B (FGB) call origination in an end office or tandem switch occurred. If the FGB carrier is provisioned with access type INTERIM in an end office, FGB calls routed via that carrier are translated as TYPE CI CALL = FCTRANSITION. If possible, this call will be routed as a TYPE CI CALL = FCINTERIM; if this is not possible, reorder treatment is given.

In an FGB tandem switch, a call originated on an incoming trunk is translated as TYPE CI CALL = FCTRANSITION (instead of FCINTERIM). If possible, the call is routed as a TYPE CI CALL = FCINTERIM; if this is not possible, reorder treatment is given.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use RC/V View 5.1 (TRUNK GROUP) to verify that the digit analysis selector (DAS) value for the trunk group is correct for FGB calls. Use the DAS value in RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) to determine the local digit interpreter table (LDIT) that is used. Correct the LDIT translation in RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) for this call. Verify that all LDIT records for calls for this FGB carrier originating on a line or (tandem) trunk in this office are translated as TYPE CI CALL = FCINTERIM, not FCTRANSITION.

65. FPBFGARPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in relation RLARPORT keyed with logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLARPORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG) keys used to read the relation (LPORT, LPT_TYPE), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The automatic route selection (ARS) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ARS feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLARPORT relation where RLarport.lport is RLfc_line.lport and RLarport.lpt_type is RLfc_line.lpt_type.

When the ARS feature is assigned to a line via a BFG, the BFG keys are used to read the RLARPORT relation where RLarport.lport is RLfc_line.bfgid and RLarport.lpt_type is LPT_BFG.

An attempt to read the RLARPORT relation using the BRCS feature group (BFG) keys was made because the ARS feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to get the BFGID (bfgid) and the BFG indicator for terminal features (trmbfg). ARS is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, the bfgid from RLFC_LINE should match the BFGID given in the ROP output. If the BFGID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFGID values match, a tuple should exist in RLARPORT for the BFG keys. Insert the appropriate rLARPORT tuple.

66. FPBFG_ASI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIASI_PORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLASI_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, the BRCS feature group (BFG) keys used to read the relation (LPORT, LPT_TYPE), the BFGID, and the original (non-BFG) keys for this relation.

Action:

The advance service interface (ASI) BRCS feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the ASI feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLASI_PORT; where RLasi_port.lport is RLfc_line.lport and RLasi_port.lpt_type is RLfc_line.lpt_type.

When the ASI feature is assigned to a line via a BFG, the BFG keys are used to read the RLASI_PORT relation; where RLasi_port.lport is RLfc_line.bfgid and RLasi_port.lpt_type is LPT_BFG.

An attempt to read the RLASI_PORT relation using the BFG keys was made because the ASI feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to get the BFGID (bfgid) and the BFG indicator for terminal features (trmbfg). ASI is a terminal feature.
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, the bfgid from RLFC_LINE should match the BFGID given in the ROP output. If the BFGID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFGID values match, an rIASI_PORT tuple should exist for the BFG keys. Insert the appropriate rIASI_PORT tuple.

67. FPBFGMDR_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMDR_PORT tuple is missing that is keyed with the logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLMDR_PORT, RLFC_LINE, RLLPT_PT.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG) keys used to read the relation, the BFGID, and the original (non-BFG) keys for this relation.

Action:

The message detail recording (MDR) BRCS feature can be assigned directly to a line or assigned to the line via a BFG.

When the MDR feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLMDR_PORT relation where RLmdr_port.lport is RLfc_line.lport and RLmdr_port.lpt_type is RLfc_line.lpt_type.

When the MDR feature is assigned to a line via a BFG, the BFG keys are used to read the RLMDR_PORT relation where RLmdr_port.lport is RLfc_line.bfgid and RLmdr_port.lpt_type is LPT_BFG.

An attempt to read the RLMDR_PORT relation using the BFG keys was made because the MDR feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to get the BFGID (bfgid) and the BFG indicator for terminal features (trm_bfg). MDR is a terminal feature.
3. If the trm_bfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trm_bfg value from RLFC_LINE is DBYES, the bfgid from RLFC_LINE should equal the BFGID given in the ROP output. If the BFGID values do not match, contact the next level of support.
5. If trm_bfg is DBYES and the BFGID values match, an rIMDR_PORT tuple should exist for the BFG keys. Insert the appropriate rIMDR_PORT tuple.

68. FPBFGPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation RLCKT_PORT was read with the intent of retrieving a global BFG port name (default service). This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

69. FPBFGTG_LTMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in relation RLTG_LTMER for a business and residential custom services (BRCS) feature group (BFG). The BFG ID (bfgid) is obtained from the RLFC_LINE relation for analog lines and primary directory number (DN) integrated services digital network (ISDN) basic rate interface (BRI) lines. If the ISDN DN is not primary, the bfgid is obtained from the RLIS_LINE relation.

Data Structures:

RLTG_LTMER, RLFC_LINE and/or RLIS_LINE.

The keys are lead module = 0, ltm_type = LTM_ISDN, and ltm_idx = bfgid.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the dumped keys with the actual keys in the RLTG_LTMER relation. The BFGID part of the key should match the bfgid attribute in the RLFC_LINE tuple, keyed with the port assigned the BFGID or in the RLIS_LINE tuple, keyed with the ltm_idx on the specified lead_module assigned the BFGID. If the tuple in question does not exist, add it. If the RLFC_LINE tuple indicates that the port has a BFG assigned, or if the RLIS_LINE tuple indicates that the DN has a BFG assigned.

70. FPBORIGCOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The class of service for the originating port is not valid for origination. The automatic number identification (ANI) over private facility (PF) special feature will allow only the following classes of service on the originating port: PF, PFITT (PF intertandem trunk), INDIV (individual line), ISDN (digital subscriber line associated with ISDN service), ATTENDANT (attendant line), and ISATND (ISDN attendant).

Reorder will be given as the failure mechanism if the class of service for the port is not valid. The MGTK_TERM

message is the trunk termination message.

Data Structures:

The data printed on the ROP is the originating port and the originating class of service associated with this port.

Action:

The originator of this port can be a line or a trunk. Correct the class of service for the indicated port via RC/V View 4.1 (LINE CLASS CODE) if the port is a line, or RC/V View 5.1 (TRUNK GROUP) if the port is a trunk.

71. FPBTERMCOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The class of service for the terminating port is not valid for termination, or the signaling type or address signal mode is incorrect.

The automatic number identification (ANI) over private facility special feature will allow only the following classes of service on the terminating port: PF (private facility) and PFITT (PF intertandem trunk).

The start signaling type must be multifrequency (MF). The outgoing address signal mode must be wink start (WINK). The trunk type must NOT be cut through.

Reorder will be given as the failure mechanism if the class of service for the port is not valid.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

The data printed on the ROP is the terminating port, the terminating class of service associated with this port, and the signaling type and signaling mode. Also, the value of CUT THROUGH (value must be 0) will be printed.

Action:

If the class of service is not valid, correct it with RC/V View 5.1 (TRUNK GROUP).

If the signaling type is incorrect, correct it with View 5.1 (TRUNK GROUP).

If the signaling mode is incorrect, correct it with View 5.5 (TRUNK MEMBER).

If trunk is defined as cut through, set the CUT THRU field to N (NO) with View 5.1 (TRUNK GROUP).

72. FP_CARR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLFC_CARR. When attempting to read this relation, a failure return code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

RLFC_CARR. Key field: carrier ID

Action:

This is a database inconsistency that can be corrected by manual action. First verify that the key is correct. Use RC/V View 10.3 (INTERLATA CARRIER) to add the tuple.

73. FPCARTONE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

400 Hz carrier tone requested but not provisioned as system tone for FGD cutthru on LATA trunks or for start signal on DAL trunks.

The "CT FOR DT" field in RC/V View 5.1 (TRUNK GROUP) is set to "Y" but the field "CARRIER TONE" in RC/V View 8.1 (OFFICE PARAMETERS (MISCELLANEOUS)) is set to "N".

The TRUNK GROUP and trunk group MEMBER NUMBER are printed in this assert. The TRUNK GROUP can be used as the key to RC/V View 5.1

Data Structures:

- Global parameter, Glcartone.
- rIFC_TRUNK.ct_for_dt.

Action:

There are two options,

- Set the value of "CARRIER TONE" in RC/V View 8.1 to "Y"
- Set value of "CT FOR DT" in RC/V View 5.1 to "N"

74. FPCHGTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLCHGTBL relation.

Data Structures:

RLCHGTBL. Key field: CHRGTABL_X.

Action:

There are two options:

1) Avoid firing an assert and let the call go through free by turning on feature ID 558 in RC/V View 8.22 (SECURED FEATURE UPGRADE), if it is off. In View 8.22, set the FEATURE ID field to 558, MODULE to the SM# for one SM or OFC for all SMs, and ACTIVE to Y.

2) Fire the assert and terminate the call by turning off feature ID 558 in RC/V View 8.22, if it is on.

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLCHGTBL relation with the actual keys used. If the tuple is missing, use View 10.14 (MESSAGE REGISTER) to add it. If the keys used to access the relation were set incorrectly, notify the next level of support.

75. FPCHRGIDXEXP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in the RLCHRGIDXEXP relation. When trying to get the call type and charge treatment data, a not found condition was returned. This indicates that a tuple is missing for the "charge_x" obtained from the

RLRT_SCRNING relation.

Data Structures:

RLCHRGIDXEXP. Key field: CHARGE_X. RLRT_SCRNING. Key fields: DEST_X, SCREEN_X, PREFIX.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the charge_x for correctness. If the rLCHRGIDXEXP tuple is missing, use View 10.11 [CHARGE INDEX EXPANSION (CHARGING)] to add it. Otherwise, the RLRT_SCRNING relation has an incorrect charge index.

76. FPCKT_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation RLCKT_PORT was read with invalid key values, (cktname, port_indx) or a tuple is missing from this relation. This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

77. FPCLMDSP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid dynamic database read occurred during call processing. The FPDiganl() function received an error return code from a dynamic access (DA) primitive, possibly due to a corrupted linkage in the call leg data block (CLDB)-model data block (MDB) set. The FPDiganl() function could not recover from this error.

78. FP_COINCHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLFC_COINCHG. When attempting to read this relation with keys from the RLCHRGIDXEXP relation, a failure code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

RLFC_COINCHG. Key fields: charge table index (first data item dumped).

Action:

This is a database inconsistency that can be corrected by manual action. Verify that the keys were used correctly. Use RC/V View 10.13 (COIN CHARGING [CHARGING]) to add the tuple.

79. FPCONF_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was introduced as part of the ICLATA special feature. This assert will not fire if the ICLATA special feature has not been purchased and activated in the office.

In this call scenario, digit analysis provided a type_ci_call of FCICCONTOLL or FCONFLICT, indicating that type_ci_call conflict resolution must be done. Therefore, the RLRT_SCRNING relation was read (with the destination index and prefix derived from digit analysis) to determine the type_ci_call. However, the conf_type attribute of the RLRT_SCRNING relation, which represents the type_ci_call was invalid. The valid values for the

conf_type attribute are: a) FCICTOL for intraLATA toll, b) FCINTER for interLATA or c) FCLEC indicating intraLATA local (if type_ci_call was FCICCONTOLL) or indicating that the normal FCONFLICT algorithm should decide if the call is intraLATA local or interLATA (if the type_ci_call was FCONFLICT).

Data Structures:

RLRT_SCRNING keys: SCREEN_X, DEST_X, PREFIX attribute: CONF_TYPE

Action:

Update RC/V 10.10 (SCREENING [CHARGING]) using the keys provided in the assert and update the conf_type field to the appropriate value (such as blank for FCLEC, "T" for FCICTOL or "I" for FCINTER).

80. FPDAPRL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in the relation RLDAPRLDGT. This indicates that the tuple is missing or the keys used to read the relation are set incorrectly.

Data Structures:

RLDAPRLDGT. Key fields: previous, digit.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLDAPRLDGT relation with the actual keys used to access this relation, add the specified previous and digit values to the relation RLDAPRLDGT using RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]).

The RLDAPRLDGT.previous key was retrieved from RLDA_DIGSTRT.preltable. The RLDAPRLDGT.digit key is the incoming digit being translated. RLDAPRLDGT.digit is printed out in hexadecimal form.

81. FPDAPRL1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in the relation RLDAPRLDGT. This indicates that the tuple is missing or the keys used to read the relation are set incorrectly.

Data Structures:

RLDAPRLDGT. Key fields: previous, digit.

RLDA_AMBIG. Key field: table.

The ROP output provides the keys for the missing rIDAPRLDGT tuple and the key for the related rIDA_AMBIG tuple. The RLDA_AMBIG.next value provides the RLDAPRLDGT.previous key. RLDAPRLDGT.digit is printed out in hexadecimal form.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLDAPRLDGT relation with the actual keys used to access this relation. If the actual keys are not populated in the relation, add the specified previous and digit values to the RLDAPRLDGT relation using RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]).

82. FPDAPRL2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in the relation RLDAPRLDGT. This indicates that the tuple is missing, or the keys used to read the relation are set incorrectly.

Data Structures:

RLDAPRLDGT. Key fields: previous, digit.

The ROP output provides the keys for the missing rLDAPRLDGT tuple and the keys for the preceding rLDAPRLDGT tuple read. The preceding RLDAPRLDGT.next value provides the RLDAPRLDGT.previous key for the incoming digit being translated. RLDAPRLDGT.digit is printed out in hexadecimal form.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLDAPRLDGT relation with the actual keys used to access this relation. If the actual keys are not populated in the relation, add the specified previous and digit values to the relation RLDAPRLDGT using RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]).

83. FPDATIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLDA_TIMER relation.

Data Structures:

RLDA_TIMER. Key fields: servclass, signal, sigtype.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLDA_TIMER relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support. The signal value for lines is always FCSSNULL; start signal is not applicable.

This relation is updated by RC/V View 8.5 (TIMING [MISCELLANEOUS]).

84. FPDCACTER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An analog line has an attendant control of voice terminals (ACVT) restriction level that provides direct connect service upon origination, but the error treatment specified for the line is not RERTE. This means that there is no ERROR TN specified to connect to when the line originates, so the direct connect capability cannot function.

Data Structures:

The port from the process control block link area (PCBLA) is printed in the assert message.

Action:

Use the OP:CONV input message with the port and SM number in the assert message to convert the port to a directory number. Find the ACVT feature assigned to the line from RC/V VIEW 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) Use the RC/V View 1.46 (ISDN ATTENDANT CONTROL OF VOICE TERMINALS LINE PARAMETERS) with the ACVT feature and DN to change the ACVT error treatment to ERROR TYPE = RERTE and specify an ERROR TN.

85. FPD_COMP (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the relation RLDI_COMP, a failure return code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

RLDI_COMP. Key fields: carrier ID, feature group = D, code index.

Action:

Use the RC/V CDIM view to insert an rLDI_COMP tuple. If necessary, use the LDIT, PDIT or INDIT views to verify the CODE INDEX and use the ICF view to verify the CARRID.

86. FPDIGDPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call failed in digit analysis because an rLDA_DIGSTRT tuple was not found. The tuple is missing or the key used to read the RLDA_DIGSTRT relation was set incorrectly.

The digtree and port number will be printed on the ROP to help determine the status of the digtree and where the incorrect information came from.

Data Structures:

RLDA_DIGSTRT. Key field: digtree

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the key in the RLDA_DIGSTRT relation with the actual key used to access this relation. The port number was printed to help determine the key. If the actual key is not populated in the RLDA_DIGSTRT relation, add the digtree value shown on the ROP to the relation using RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]).

87. FPDIGSTRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in the relation RLDA_DIGSTRT. This indicates that the tuple is missing, or the key used to read the relation is set incorrectly.

Data Structures:

RLDA_DIGSTRT. Key field: digtree.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the key in the RLDA_DIGSTRT relation with the actual key used to access this relation. If the actual key is not populated in the relation, add the specified digtree value to the relation RLDA_DIGSTRT using RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]).

88. FP_DIRCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLFC_DIRCON relation.

Data Structures:

RLFC_DIRCON. Key fields: port.member, port.module, party.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_DIRCON relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by RC/V View 1.5 (PBX-DID LINE [LINE ASSIGNMENT]) and View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]).

89. FPDNBFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read a rIDN_FEATS tuple has failed.

Data Structures:

RLDNFEATS. Key fields: lead module, ltm index, ltm type.

Action:

The ROP report will show the keys to the relation RLDN_FEATS and the business and residential custom services (BRCS) feature group (BFG) ID associated with the keys.

Verify the features on the line with RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]). If these are correct, use ODBE with the keys to verify the existence of an rIDN_FEATS tuple. If the tuple does not exist, make sure that, for the line, the rIFC_LINE tuple with the same ltm_index and ltm_type has the dnbfg field set to DBNO.

90. FPDNFEA2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIDN_FEATS tuple with the given keys cannot be found in the static database. The keys used to read the tuple are found in the assert printout on the ROP. The LTM_TYPE will have only one of two possible values. If the type is LTM_OTHER, a 0 will be printed; if the type is LTM_ISDN, a 1 will be printed. The tuple is either missing or the keys used to access the tuple are invalid.

Data Structures:

RLDN_FEATS. Key fields: lead_module, ltm_type, ltm_idx, range.

The lead_module is the SM number, ltm_type is the logical termination index type, ltm_idx is the logical termination index, and range indicates the group of 5 tuples (0-4).

Action:

1. Verify that the keys are valid. The LEAD_MODULE must be between 1 and 192, LTM_TYPE will be 0 or 1, LTM_IDX must be between 1 and 4095, and RANGE should be 0.

2. This assert should be called only when RANGE = 0. This is the only tuple that's required. When RANGE = 0, there must be an rIFC_LINE tuple for the associated port with the brc_dn attribute set to DBYES.

3. Use ODBE in the batch read (BR) mode to read the RLFC_LINE relation into a *UNIX*[®] file. Use the *UNIX*[®] editor to locate the tuple that has the same LTM_TYPE and LTM_IDX by checking the "ltm_type" and "ltm_idx" attributes for each rIFC_LINE tuple. If the located tuple has the brc_dn attribute marked DBNO, file a trouble report.

4. If the "brc_dn" attribute is DBYES, perform the following steps:
 - a. Zero the brc_dn bit (DBNO) in the rIFC_LINE tuple.
 - b. Check for any rIDN_FEATS tuples that have the same keys with the other 4 possible ranges (1,2,3,4).
 - c. Note the assigned features in any rIDN_FEATS tuples found.
 - d. Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) to re-insert the features.

91. FPDNFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIDN_FEATS tuple failed.

Data Structures:

RLDN_FEATS. Key fields: lead module, ltm index, ltm type.

The D channel portname will also be printed on the ROP. The D CHANNEL PORT will be printed as zero if this data was unavailable.

Action:

The ROP report will show the keys to RLDN_FEATS. Verify the features on the line with RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]). If these are correct, use RC/V, (or ODBE, if necessary) with the keys to verify the existence of an rIDN_FEATS tuple. If the tuple does not exist, make sure that for the line, the rIFC_LINE tuple with the same ltm_index and ltm_type has the brc_dn field set to DBNO.

92. FPDR_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLDR_LTM relation.

Data Structures:

RLDR_LTM. Key fields: lead module, LTM index, LTM type, feature ID.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLDR_LTM relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by RC/V View 1.25 (DISTINCTIVE RINGING LINE PARAMETERS).

93. FPDSU2NRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to activate or deactivate an analog visual message waiting indicator (AVMWI) failed, or an attempt to send display information to an analog individual calling line identification calling number display (ICLID CND) by sending a frequency shift key (FSK) signal to the analog customer premise equipment (CPE) port failed. The request was issued with the expectation that the digital service unit model 2 (DSU2) equipment/transceiver (XCVR) circuits were currently part of the SM.

The failure occurred due to one of the following reasons:

1. The SM on which the port resides does not have a DSU2 present. The message service system (MSS) feature with virtual message waiting indicator (VMWI) or line identification (LID) feature with ICLID should not be assigned to analog ports on this SM.
2. The SM on which the port resides does have a DSU2 present, but no transceiver circuits are assigned. The DSU2 needs to be reconfigured to include XCVR circuits.

Data Structures:

RLMDS_CF, RLMDS_GRP, RLMDS_PORT, RLMDS_PORT, RLDN_FEATS, RLCKTDATA, RLTDCE_CKT, RLCTB_ECCKT, RLXCVR_CKT, RLPICB, RLRC_EQLOC, RLICLIDIDX, and RLCNDDATA.

Action:

The ROP output provides the port number, the parameters used to read the RLMDS_PORT or RLICLIDIDX relation, and a message indicating that there is an invalid AVMWI or ICLID CND request and there is no DSU2 or there are no transceiver circuits.

94. FPE9TKESCO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The emergency service central office (ESCO) is not specified for a dedicated E911 trunk. The E911 call in progress will be routed based on the ESCO obtained from the rIDA_DIGSTRT tuple specified for the trunk.

Data Structures:

RLFC_TRUNK. Key fields: port.member port.module.

Action:

1. Consult the office records to determine the correct ESCO value to be assigned to the trunk group specified as GRPNUM on the ROP.
2. Update the ESCO field on screen 6 of RC/V View 5.1 (TRUNK GROUP) to the value determined in step 1, using the GRPNUM printed on the ROP as the key.

95. FPEAIDIGS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the RLFCEAINFO relation failed to find a match of the equal access signaling (EAS) information digits that came in the billing sequence of an EAS call. This relation specifies whether a certain call type should be allowed or blocked for domestic and international outbound calls. The RLFCEAINFO relation is fully populated between 0 and 99. Therefore, any two digits received will match a tuple in the relation.

Data Structures:

RLFCEAINFO. Key field: II digits. Dumped Data: II digits

Action:

The RLFCEAINFO relation is corrupt. Check the relation and re-create it using RC/V View 9.17 (EAS INFORMATION DIGITS) (or use ODBE, if necessary).

96. FPEDSLTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLEDSTRKG relation.

Data Structures:

RLEDSTRKG. Key fields: grpnum, member, module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLEDSTRKG relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V Views: 5.34 (EDSL CALL BY CALL FEATURES), 5.1 (TRUNK GROUP), and 5.5 (TRUNK MEMBER).

97. FPERR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected internal error occurred.

Probable cause:

Data not properly initialized or memory crashed or network problem occurred.

Action:

Use FPerr.h to map the first dumped data to the corresponding symbolic name then use the symbolic name to locate the function and line where the assert fired.

98. FPFCLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation or the tuple is missing from the RLFC_LINE relation.

Data Structures:

RLFC_LINE. Key fields: port.member (hex), port.module (dec), party (dec).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_LINE relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V views:

- 12.8 (BFG ADMINISTRATION)
- 23.2 (DIGITAL SUBSCRIBE LINE)
- 21.30 (OSPS-DSL PORT)
- 1.12 (BRCS FEATURE ACTIVATION [LINE ASSIGNMENT])
- 5.12 (BRCS FEATURE ACTIVATION [TRUNK MEMBER])
- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
- 4.29 (ATTENDANT MLHG/BUSY LAMP FIELD RANGE DN ASSIGNMENT)

- 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE LIST)
- 1.9 (MULTIPLE DIRECTORY NUMBER WITH DISTINCTIVE RINGING)
- 3.5 (MULTILINE HUNT GROUP [LINE ASSIGNMENT])
- 3.3 (MULTIPLE TN FOR MULTILINE HUNT GROUPS)
- 1.32 (TWO TELEPHONE NUMBER SWAP)
- 1.5 (PBX-DID LINE [LINE ASSIGNMENT])
- 1.6 (COMPOSITE LINE [LINE ASSIGNMENT])

99. FPFC_OPERTRK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLFC_OPERTRK relation.

Data Structures:

RLFC_OPERTRK. Key fields: port member, port module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_OPERTRK relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V Views: 5.1 (TRUNK GROUP) and 5.5 (TRUNK MEMBER).

100. FPFCPORTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIFC_PORTTYP tuple with the given keys cannot be found in the static database. The keys used are found in the assert printout on the ROP. The tuple is either missing or the keys used to access the tuple are invalid.

Data Structures:

RLFC_PORTTYP. Key fields: port.module (SM number), port.member.

Action:

1. Verify that the keys are valid.
2. Use View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]) to assign this port.
3. If the tuple was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

101. FPFC_TDIRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When trying to get direct connect directory numbers (DNs) for trunks, a not found condition was returned. This indicates that the rIFC_TDIRC tuple is missing or the keys used were incorrect.

Data Structures:

RLFC_TDIRC. Key fields: member, module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_TDIRC relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V Views: 5.1 (TRUNK GROUP) and 5.5 (TRUNK MEMBER).

102. FPFC_WZ1 (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the key used to read this relation, or the tuple is missing from the RLFC_WZ1 relation.

Data Structures:

RLFC_WZ1. Key field: npa (in hex).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_WZ1 relation with the actual key used. If the tuple is missing, add it. If the key used to access the relation was set incorrectly, notify your next level of support.

This relation is updated by the following RC/V Views: 9.3 [LOCAL DIGIT (OFFICE DIALING)], 9.9 [REMAINING DIGIT (OFFICE DIALING)] and 9.15 [MULTIPLE LOCAL DIGIT (OFFICE DIALING)].

103. FPFC_WZ1 (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the key used to read this relation, or the tuple is missing from the RLFC_WZ1 relation.

Data Structures:

RLFC_WZ1. Key field: npa (in hex).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_WZ1 relation with the actual key used. If the tuple is missing, add it. If the key used to access the relation was set incorrectly, notify your next level of support.

This relation is updated by the following RC/V Views: 9.3 (LOCAL DIGIT [OFFICE DIALING]) and 9.15 (MULTIPLE LOCAL DIGIT [OFFICE DIALING]).

104. FPGETCHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in relation RLGETCHT. When attempting to get the charge table name, a not found condition was returned. This indicates the tuple is missing in relation RLGETCHT or that the keys used were incorrect.

Data Structures:

RLGETCHT. Key fields: TIME_B, D_O_WEEK (in hex).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLGETCHT relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next

level of support.

This relation is updated by RC/V View 10.15 (RATE DAY AND TIME [CHARGING]).

105. FPGLRE3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A glare problem occurred and the releasing end did not back-down before glare timed-out.

Data Structures:

RLFC_TRUNK.

Action:

The releasing side may be engineered incorrectly. If the trunk is a digital two-way trunk, the carrier system could be looped. If the trunk is a one way trunk, the glare bit is erroneously set.

106. FPGLR_NC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates a problem where a glare yield situation has occurred. The originating office has the non-controlling end of a trunk and the trunk backs down. For ASI-Proxy IP trunks, the initial connection to the IP is not successful.

Data Structures:

RLFC_TRUNK.

Action:

If the trunk is a digital two-way trunk or an ASI-Proxy IP outgoing trunk, the carrier system could be looped back or engineered incorrectly. If the trunk is a one-way trunk, the glare bit on RC.V view 5.1 is erroneously set. For ASI-Proxy Trunks, the IP may be OOS. If an ASI-Proxy carrier is looped, it may cause dialing problems to the ASI user.

107. FPICLIDDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBCND	Audit Mode: elev

Problem:

A tuple in the RLDBCND dynamic relation cannot be obtained, or cannot be linked to the process control block link area (PCBLA). The audit on dynamic relation RLDBCND will be scheduled to run. The ROP will print out the rLDBCND tuple that was trying to be obtained, or was trying to be linked.

Data Structures:

RLDBCND.

Action:

An audit has been scheduled. No manual action required.

108. FPICLIDIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLICLIDIDX tuple with the given keys cannot be found in the static database. The LTM_TYPE will have only one of two possible values: If the type is LTM_OTHER a 0 will be printed; if the type is LTM_ISDN a 1 will be printed.

The tuple is either missing or the keys used to access the tuple are invalid.

Data Structures:

RLICLIDIDX. Key fields: ltm_idx, ltm_type.

RLDNFEATS. Key fields: lead_module, ltm_idx, ltm_type.

Action:

- 1) Verify that the keys are valid. LTM_TYPE will be 0 or 1, and LTM_IDX must be between 1 and 4095. If the keys are invalid, file a trouble report.
- 2) Use RC/V (or ODBE, if necessary) in the batch read (BR) mode to read the RLFC_LINE relation from the SM that the assert was fired from into a *UNIX*® file. Use the *UNIX*® editor to locate the tuple that has the same LTM_TYPE and LTM_IDX by checking the "ltm_type" and "ltm_idx" attributes for each rLFC_LINE tuple.
- 3) Check if the RLFC_LINE "port" and "party" has been assigned the link inhibit denied (LID) feature, and if so, reset the "brc_dn" bit in the tuple.
- 4) Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) to re-insert the features for that user.
- 5) If the RLFC_LINE "port" and "party" has not been assigned the LID feature, check if it has been assigned as part of a BRCS feature group (BFG). Here, "bfg_dn" will be a 1 (DBYES). Set "bfg_dn" in the tuple to 0 (DBNO).
- 6) Use RC/V View 1.11 to re-assign the user to the BFG.
- 7) If the error cannot be corrected by these steps, file a trouble report.

109. FPIMTGRPS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When looking for the interface module trunk group number, a failure code of DBNO_MATCH was returned. This indicates that the rLIMTGRPS tuple is missing, or the keys used were incorrect.

Data Structures:

RLIMTGRPS. Key fields: tgroup, port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLIMTGRPS relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V Views: 5.1 (TRUNK GROUP) and 5.5 T(RUNK MEMBER).

110. FPINVTNSC (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Terminating network selection code (TNSC) value is too large. The call will be killed.

Data Structures:

The ROP output indicates the TNSC value that was too large.

Probable Cause:

Value is larger than 999.

Action:

Check sources of the TNSC value and determine where the invalid value came from. The office default, RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] TERM NSC may be 1023 and should be set to a value that is less than 1000.

111. FPINVTNSC2DAS (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Missing terminating network selection code (TNSC) to DAS translation.

Data Structures:

Terminating network selection code (TNSC) value.

Action:

Insert TNSC value as a key on RC/V View 8.53.

112. FPLDPTNSC (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a bad return code from read of RLLDPTNSC We got a TNSC in signaling, completed the mapping specified in RC/V View 8.54 Then the results of this mapping were the key to RLLDPTNSC. A read error from DBfrdtup() indicates a problem with the database.

Data Structures:

The ROP output indicates the return code from DBfrdtup() primitive.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for assistance.

113. FPLINE_SCN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in the relation RLFC_LINE. Either the tuple is missing, or the keys used to read the RLFC_LINE relation are set incorrectly.

This problem involves POTS calls including 2-party, 4-party, 8-party line time slot bridging (LTSB), coin, INDIV, etc. In the case of a 2-party line where only one party is assigned (as in the case of LTSB) this condition can occur due to an incorrectly-wired phone or port. For example, this assert will fire if a tip ground phone is connected to a ring port, or a ring ground phone is connected to a tip port. This can also occur in the case of a 2-party configuration where party 2 is assigned, but party 1 is not.

Although the lines can have any business and residential custom services (BRCS) feature on them, most of the features would not be activated at the time of this RLFC_LINE read. The call will be torn down and the port will be put out of service.

The key field 'PARTY' does not print out with the assert. This is because RLFC_LINE can be read with several 'PARTY' values based on the class of service. The 'PARTY' value dumped at the time this assert fires may not be the actual value that should be used. The correct 'PARTY' value can be determined from the LEN value, which prints out instead.

The line equipment number (LEN) consists of the SM number, the line unit (LU) number, the GRID, BOARD, SWITCH and LEVEL numbers - the actual physical location of the port. From the LEN information, those who configured the office should be able to determine which 'PARTY' value is acceptable at the LEN specified.

(1) A 'PARTY' value of 0 must be used by lines with the following class of service: FC_INDVDL, FC_4WIRE_INDV, FC_ATTENDANT, FC_COIN, FC_PBX, FC_SATSTLN, or PBXHOTMOT.

(2) For MULTIPARTY lines, valid 'PARTY' values are as follows:

```
FC_TWOPTY      1 or 2
FC_2PTY (ringpty) 1, 2, 3, 4, 5
FC_2PTY (tippty) 6, 7, 8, 9, 0
FC_5PTY        1, 2, 3, 4, 5
FC_4PSS (ringpty) 1 or 3
FC_4PSS (tippty) 2 or 4
FC_4PFS        1, 2, 3, 4
FC_8PSS        1, 2, 3, 4, 5, 6, 7, 8
FC_10PTY       6, 7, 8, 9, 0
```

(3) Any service class NOT covered in cases 1 or 2, will default to a value of 0.

Data Structures:

RLFC_LINE. Key fields: global port (sm and port), party.

Domain values for 'PARTY' can also be found in the 5ESS® Domain Description Reference Manual.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the values for the global port key in RLFC_LINE with the global port value that was printed on the ROP. Also cross-check the value for the 'PARTY' key in RLFC_LINE with the 'PARTY' value determined from LEN. If the tuple is missing, insert it. If the keys used to access the relation were set incorrectly, notify your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

This relation is updated by the following RC/V Views:

- 1.5 (PBX-DID LINE [LINE ASSIGNMENT])
- 1.6 (COMPOSITE LINE [LINE ASSIGNMENT])
- 1.8 (ANALOG LINE/BRCS ASSIGNMENT)
- 1.9 (MULTIPLE DIRECTORY NUMBER WITH DISTINCTIVE RINGING)
- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 3.5 (MULTILINE HUNT GROUP [LINE ASSIGNMENT])

For the case of a 2-party configuration where party 2 is assigned, but party 1 is not, change the customer's line and equipment from "party 2" to "party 1".

114. FPLNBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the leased network (LN) transaction handler function FCIntrhdlr(), which was communicating with the network control point (NCP) to get routing information. The call affected was sent to reorder.

Action:

No action is required if this assert occurs singularly. If this assert starts to roll, contact your next level of support. Multiple occurrences indicate the load is suspect.

115. FPLNDAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A leased network (LN) call requiring a query to the LN network control point (NCP) database has been made on an LN trunk, but the LN digit analysis selector (which is the global office parameter, Gllndas) has not been set.

In the RLFC_TRUNK relation, the trunk is marked as an LN query trunk; that is, the RLFC_TRUNK attribute ln_type is set to LN_QRY. Such trunks are required to send queries to the NCP for routing information. Before a query can be sent to the NCP, 3-digit screening is required on the number dialed. The LN digit analysis selector (DAS) points to the DAS to be used for this screening. The affected call was sent to reorder. All LN QRY calls will not complete until this problem is corrected.

Data Structures:

RLFC_TRUNK. Key fields: member and module.

Action:

To correct the problem, first determine which is incorrect: the RLFC_TRUNK "ln_type" field or the LN DAS. If the trunk is a valid LN_QRY trunk, set the LN DAS using RC/V View 8.15 (CCS OFFICE PARAMETERS). If the trunk is NOT a valid LN QRY trunk, notify your next level of support.

116. FPLNDGST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in the relation RLDA_DIGSTRT for a particular line.

Data Structures:

RLDA_DIGSTRT, RLPSX25LN.

The digit analysis selector (digtree), normalized office code (NOC), and 4-digit station number of the line are printed.

Action:

Ensure that the digtree attribute in relation RLPSX25LN for the given line is correct using RC/V. If the digtree is valid, add a tuple for the corresponding digtree to RLDA_DIGSTRT using View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]).

117. FPLNPKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A leased network (LN) call has been attempted, but the leased network action point (LNACP) software package is not loaded. The "ln_type" field of the RLFC_TRUNK relation is set to LN_QRY, indicating a LN Query (QRY) trunk, but the LNACP package is not loaded.

Data Structures:

RLFC_TRUNK. Key fields: member and module.

Action:

To correct the problem, first determine if the trunk is a valid LN trunk. If the trunk is a valid LN trunk, the SM should have the standard or loaded configuration loaded. The LNACP package is part of both of these configurations. In this case and the one in which the trunk is NOT a valid LN trunk, notify your next level of support.

118. FPLNPTYPECI (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid TYPE CI CALL was detected in this LNP call due to one of the following situations:

- (1) An LNP query was launched and the SCP returned a location routing number (LRN), LRN SCREENING was set to Y, and the LRN was analyzed in digit analysis to pick up a new code index and TYP CI CALL.
- (2) A call came into an office on an incoming ISUP trunk group with an LRN (trunk group is given). The LRN was analyzed and an invalid TYP CI CALL was found.
- (3) call was terminated to a line which had an LRN IDX assigned. In digit analysis, an LNP trigger was found and/or PORTED IN was set to Y. The LRN associated with the LRN IDX, when analyzed, had LRN SCREENING set to Y, with an invalid TYP CI CALL.

Data Structures:

In addition to the used TYP CI CALL, the following information is output: The DAS, the LRN, the TG (case 2), and DN.

Action:

Use the DAS and the LRN output on the ROP to find the offending form on RC/V Views 9.3 (LOCAL DIGIT (OFFICE DIALING)), 9.9 (REMAINING DIGIT (OFFICE DIALING)), or 9.15 (MULTIPLE LOCAL DIGIT (OFFICE DIALING)). Change the TYP CI CALL to one of the following values supported by LNP for LRNs:

INTRA NONCI ICTOLL COMP PRIV CONFL ICCONTOLL *INTER

NOTE: INTER is only allowed for LNP on LDP calls. SFID 303 must be purchased.

If this change is too obtrusive (that is, the digit analysis form is shared by other calls), office personnel also have the option of:

For case 1), change the DAS being used (which could be the trigger's post-query DAS, SCP DAS, and so forth) so that digit analysis uses a form where the LRN is defined with a valid TYP CI CALL for an LRN. Or if the LRN TYP CI CALL and CDI does not need to be used, set LRN SCREENING=N on the form where the LRN is defined in digit analysis.

For case 2), change the DAS being used (which could be the LRN DAS assigned to the incoming trunk, trunk's DAS, and so forth) so that digit analysis uses a form where the LRN is defined with a valid TYP CI CALL. Of course, changing the trunk DAS will affect the routing on incoming calls that do not contain LRNs.

For case 3), change the DAS being used (which could be the trigger's post-query DAS, originator's DAS, and so forth) so that digit analysis uses a form where the LRN is defined with a valid TYP CI CALL. Or if the LRN TYP CI CALL and CDI does not need to be used, set LRN SCREENING=N on the form where the LRN is defined in digit analysis. Or using the DN output, update the LRNIDX on the line (RC/V Views 1.6 [COMPOSITE LINE (LINE ASSIGNMENT)], and 23.2 [DIGITAL SUBSCRIBER LINE]) which maps to an LRN with a valid TYP CI CALL value for LRNs.

119. FPLRN_RTTYPE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid provisioning of local number portability (LNP) data has occurred. When analyzing a local routing number (LRN) which is not on the switch (HOME LRN = N), a route index (RTI) needs to be specified.

Misprovisioning can be a result of one of the following scenarios:

- (1) An OFFCOD is correctly specified, but the HOME LRN is incorrectly set to N.
- (2) The HOME LRN is correctly set to N, but an RTI is not specified.

Use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]), View 9.9 (REMAINING [OFFICE DIALING]) or View 9.15 (MULTIPLE LOCAL DIGIT [OFFICE DIALING]) to inspect the HOME LRN, RTI, and OFFCOD values.

Data Structures:

RLDAPRMFNL

Action:

- (1) When the OFFCOD is correctly specified, but the HOME LRN is incorrectly set to N, change HOME LRN to Y to correct the problem.
- (2) When the HOME LRN is correctly set to N, and an RTI is not specified, specify an RTI to correct the problem.

120. FPLTSBPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to access a tuple in the line time slot bridging (LTSB) relation RLLTSBPORT failed. Possibly, no tuple exists for the lport key used. This key is supplied by a MGLTSBxxxx message which could also be incorrect. A third possible cause is a database error.

Data Structures:

RLLTSBPORT.

Action:

Verify that the rLTSBPORT tuple does not exist for the lport key displayed. If true, verify that the lport key is correct, and, if so, add the missing rLTSBPORT tuple.

If the lport key is invalid, either a message was corrupted or code did not build the message properly (perhaps other data is also corrupted). If the lport key is correct, and an rLTSBPORT tuple exists for the key, use database system error procedures.

121. FPMDRGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing in the RLMDR_GP relation.

Data Structures:

RLMDR_GP.

The ROP output indicates the SM number (MOD), the source file and line number, the key used to read the relation - MDR group ID (GROUP ID), the originating logical port (LPORT), and the logical port type (LPT TYPE).

Action:

The port attempting to use the message detail recording to customer location (MDR to CL) feature, has an MDR to CL feature assigned (the MDR to CL feature ID exists in the RLTRMFEATS relation for the dialing port).

The port is assigned to a valid MDR group (a tuple exists in the RLMDR_PORT relation), but the MDR group ID in RLMDR_PORT is invalid or a tuple in RLMDR_GP is missing.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and AM.

1) Using the MDR group ID provided in the ROP output, read the RLfid2NAME relation in the AM where RLfid2name.facid is "MDR group ID", RLfid2name.class is FACMDR, and RLfid2name.subclass is SCL_NULL.

2) If a tuple does not exist in RLfid2NAME for the MDR group ID, further office dependent data (ODD) consistencies may exist. Contact the next level of support.

3) If a tuple exists in RLfid2NAME for the MDR group ID, insert the appropriate rIMDR_GP tuple in the indicated SM where RLmdr_gp.grp_id is "MDR group ID".

Since the RLMDR_GP relation is a group partitioned relation, other group partitioned control relations may also need to be updated - RLDB_AMGPD, RLDB_IMGPD, and RLDB_GPDUS.

122. FPMDRINVGPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message detail recording (MDR) group ID in the RLMDR_PORT relation is zero.

Data Structures:

RLMDR_PORT.

The ROP output indicates the SM number (MOD), the source file and line number, the originating logical port (LPORT), and logical port type (LPT TYPE).

Action:

The logical port attempting to use the message detail recording to customer location (MDR to CL) feature, has an MDR to CL feature assigned (the MDR to CL feature ID exists in the RLTRMFEATS relation for the dialing port).

The logical port has been assigned a MDR feature (a tuple exists in the RLMDR_PORT relation), but the logical port has not been assigned to a valid MDR group (MDR group ID is zero).

Use ODBE to find the entity for the logical port.

1) Using the lport and lpt_type provided in the ROP output, read the RLLPT_PT relation to get the port and party.

2) Use the OP:CONV master control center (MCC) command to find the entity for the port - telephone number (TN) or trunk.

OP:CONV,PORT="mod"-h"port"

where "mod" is the SM number and "port" is the port found in the RLLPT_PT relation.

Use RC/V to assign a valid MDR group to this entity. Use the appropriate MDR parameter view to assign a valid MDR group name: View 1.33 (MESSAGE DETAIL RECORDING LINE PARAMETERS) or View 5.33 (MESSAGE

DETAIL RECORDING TRUNK GROUP PARAMETERS).

123. FPMDRPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing in the relation RLMDR_PORT keyed with logical port (lport) and logical port type (lpt_type).

Data Structures:

RLMDR_PORT, RLFC_LINE, RLLPT_PT.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - LPORT and LPT_TYPE.

Action:

The message detail recording (MDR) business and residential services (BRCS) feature can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When the MDR feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLMDR_PORT relation where RLmdr_port.lport is RLfc_line.lport and RLmdr_port.lpt_type is RLfc_line.lpt_type.

An attempt to read the RLMDR_PORT relation using the original (non-BFG) keys was made because the MDR feature is thought to be assigned directly to the line.

Use ODBE to cross-check the data in the indicated SM.

1. Use the original keys (lport and lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to get the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm). MDR is a terminal feature.
3. If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
4. If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
5. If brc_trm is DBYES and the lport and lpt_type values match, an rIMDR_PORT tuple should exist for the original (non-BFG) keys. Insert the appropriate rIMDR_PORT tuple.

124. FPMWCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the static data for a multiway constructed feature for a port, a failure return code of DBNO_MATCH was returned. This indicates the tuple is missing from the RLMWCF relation, or the keys used to read this relation were set improperly.

Data Structures:

RLMWCF. Key field: feature ID (first data item dumped).

Action:

Using ODBE, look at AM relation RLFID2NAME using the feat_id found in the data dump to determine the feature name assigned to the feat_id. Then refer to the multiway calling preconstructed feature definition table in the

5ESS® Switch Business and Residence Custom Features User's Guide to find the attributes associated with that feature name and what the attributes should be set to. Finally, using ODBE, insert a tuple in the RLMWCF relation for the feat_id according to the values found for the attributes provided in the User's Guide.

125. FPNFTLDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-fatal office dependent data (ODD) read error occurred. The call can continue with assumptions made. These assumptions depend on the error encountered.

Data Structures:

Several relations are reported by this assert. The function asserting identifies the relation involved.

Function	Relation	Keys
MCdrng()	RLDR_LTM	ltm_type, lead_module, ltm_idx, feat_id
FCdcls()	RLFC_LINE	port.member, port.module, party
FCffs()	RLRCFEATENT	

The data dump layouts to determine the key values can be found in the 5ESS® Switch Translations Data Manual.

Action:

The solutions to the problem can be found by consulting the FPFCLINE mnemonic for the RLFC_LINE relation.

If the asserting function is MCdrng(), the dring value is not valid. If the asserting function is FCffs(), the role is FCTERM and the selection criteria can be ABA_FLASH, FLASH_RP, FLASH_TERM, or FLASH_ANY; the selection criteria is not any of these. If this occurs, contact your next level of support.

126. FPNODEST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid destination index and/or route index was encountered after carrier selection. For carrier types other than PSEUDO, the carrier-specific route index and/or code index is zero. The call cannot be routed, reorder treatment is given.

Data Structures:

RLFCFGB_CARR. Key fields: fgb_carrid, feature group=B.

RLFC_CARR. Key fields: carrid, feature group=D.

Action:

The probable cause of this problem is that digit routing is set to YES, but the RLDI_COMP relation does not contain a tuple with the proper keys. To resolve this problem,

(a) enter the correct route index and destination index for routing the call on RC/V View 10.3 (INTER-LATA CARRIER), or

(b) set dig_route to DBYES on RC/V View 10.3, and insert at least one rLDI_COMP tuple using RC/V View 9.7 (CARRIER DESTINATION [OFFICE DIALING]) with keys that correspond to this carrier as translated in the office dependent data (ODD).

The destination index key to the RLDI_COMP relation is the regular destination index (determined by digit analysis), not the carrier-specific destination index (determined by carrier selection).

127. FPNOEAO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No feature group D (FGD) carrier was found that corresponds to a feature group B (FGB) carrier. A trunk-to-trunk call in an access tandem that originated in a non-equal access end office (EAEO) was translated as FCINTERIM in the tandem. The call was routed to an FGB carrier via a route index that has equal access (EA) signaling.

There is no FGD carrier defined in the office dependent data (ODD) that corresponds to the carrier ID code (CIC) that was inputted, or the carrier type is not valid for this type of call. Reorder treatment is given.

Data Structures:

RLFC_CARR. Key field: carrid, feature group=D

Action:

If an FGD carrier is present in the ODD, verify that the carrier type is set to TYPE_IEC or TYPE_CONSOL.

Verify that this call should be routed to a carrier that expects EA signaling. If this is not the case and the far office expects traditional signaling, change the signaling protocol to FGB in RC/V View 10.2 (ROUTE INDEX [ROUTING]). (CAUTION: This route index may be used by other calls. If in doubt, create an entirely new route index to implement traditional signaling on this route.)

If EA signaling is intended, insert an rIFC_CARR tuple using RC/V View 10.3 (INTER-LATA CARRIER) that corresponds to the FGB carrier indicated in the dialed digits for this call.

128. FPNS_TNLNK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

During a call, an attempt to access the RLNS_TN dynamic relation failed. This relation is linked to the RLPCBLA dynamic relation during calls that communicate with an external database for routing information, such as the network control point (NCP) for leased network (LN) or software defined network (SDN) calls.

The linkage from the RLPCBLA relation to the RLNS_TN relation is out-of-range (pc_cb.lnk is 0 or greater than DBQNNS_TN). This assert can occur for all kinds of calls. The linkage for RLPCBLA and RLNS_TN is used to determine if the call is a LN or SDN call. Since the linkage is broken, the type of call cannot be correctly determined. The affected call was purged and the FCPCBLA audit was scheduled to run in the elevated mode.

Action:

No action is required if this assert occurs singularly. If this assert starts to roll, contact your next level of support.

129. FPNULPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A macro called to retrieve a portname has failed to successfully read either RLFC_PORTTYP or RLCKT_PORT. The calling function or macro was returned a value of GLNULPORT. This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

130. FPNVLSCFID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of two problems may have occurred:

1. Either two one-digit speed calling features or two two-digit speed calling features were assigned to the same port. The call continued, using the speed call feature that is indicated by the first feature ID that was dumped.
2. There is invalid data in the rISC_CF tuple that is keyed by the feature ID that is dumped.

Data Structures:

RLTRMFEATS. Key fields: port, port type, range (not dumped).

RLSC_CF. Key field: fid.

Action:

If two fids were dumped, then the first problem has occurred. Take the following action:

1. Use RC/V (or ODBE, if necessary) in the CMP to access the rIFID2NAME tuple keyed by each of the feature IDs that appear on the ROP output. The other keys to this relation are: RLfid2name.class = FACBRCS and RLfid2name.subclass = SCL_FEAT. Remember the feature name (or facname) given in both of the tuples found.
2. Examine each of the two features using RC/V View 12.51 (SPEED CALLING FEATURE DEFINITION), which is keyed by the feature name found above. One (or both) of these features should not be assigned to this port, and must be removed. If the feature that should be removed is not apparent, contact the next level of support.
3. If the feature that should be removed is apparent, follow these steps to remove it:
 - a) At the master control center (MCC), enter the following command: op:conv,lport=x-y-z where: x is the SM indicated on the ROP output, y is the lport number from the ROP output, and z is either ISDN or OTHER, depending on whether or not this is an ISDN port.
 - b) Determine the RC/V view to use. If the op:conv command gave a TN, OE, or MLHG number, use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]). If the op:conv command gave a TG or EN number, use RC/V View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]).
 - c) Use the RC/V view determined above to delete the feature. If there is any problem with deleting this feature, contact the next level of support.

If only one fid was dumped, then the second problem has occurred. Take the following action:

1. Use RC/V (or ODBE, if necessary) in the CMP to access the rIFID2NAME tuple keyed by the feature ID that appears on the ROP output. The other keys to this relation are: RLfid2name.class = FACBRCS and RLfid2name.subclass = SCL_FEAT. Remember the feature name (or facname) given in the tuple that is found.
2. Examine the feature using RC/V View 12.51, which is keyed by the feature name found above. Determine whether this feature is one-digit speed calling or two-digit speed calling.
3. Use RC/V (or ODBE, if necessary) in the SM to access the rISC_CF tuple keyed by the feature ID that appears on the ROP output. Change the sc attribute of this tuple according to the following rules:
 - a) If RC/V View 12.51 indicated that this is a one-digit speed calling feature, assign the value SC1_DIG to the sc attribute.
 - b) If RC/V View 12.51 indicated that this is a two-digit speed calling feature, assign the value SC2_DIG to the sc attribute.
4. If any problems are encountered during this procedure, contact the next level of support.

131. FPOFFICECODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLOFFICECODE relation or the rlofficecoe tuple is missing.

Data Structures:

RLOFFICECODE. Key field: noc.

Action:

This is a database inconsistency that can only be corrected by manual action. The noc variable (decimal) was expected, but not found. Use the key NOC as printed on the ROP to access the RLOFFICECODE relation. Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the relation with the actual keys used to access the relation. If the noc was assigned through standard office data administration (ODA) or recent change (RC), a trouble report should be filed.

132. FPOW_BADCICALL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

For OUTWATTS calls, if the carrier type is LEC or if the carrier type is PSEUDO and the scp route is SCP_PRIV, then the type_ci_call (type of carrier interconnect call) can only be PRIV, INTRA, COMP, or SAC, or INTER for dest_type (destination type) OPER. An inconsistency was found in the type_ci_call attribute.

Data Structures:

RLDAPRMFNL. Key field: previous.

The table number is from the RLDAPRMDGT or RLDA_AMBIG relation.

Action:

Change the TYPE_CI_CALL field in RC/V View 9.3 [LOCAL DIGIT (OFFICE DIALING)] or RC/V View 9.9 [REMAINING DIGIT (OFFICE DIALING)] to PRIV, INTRA, COMP, SAC, or INTER with 0 as the PREFIX.

133. FPOW_BADCICALL (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

For OUTWATTS calls, if the carrier type is LEC or if the carrier type is PSEUDO and the scp route is SCP_PRIV, then the type_ci_call (type of carrier interconnect call) can only be PRIV, INTRA, COMP, or SAC, or INTER for dest_type (destination type) OPER. An inconsistency was found in the type_ci_call attribute.

Data Structures:

RLDAPRMFNL. Key field: previous

The table number is from the RLDAPRMDGT or RLDA_AMBIG relation.

Action:

Change the TYPE_CI_CALL field in RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) to PRIV, INTRA, COMP, SAC, or INTER with 0 as the PREFIX.

134. FPPCCLSP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid dynamic database read occurred during call processing. The FPDiganl() function received an error return code from a dynamic access (DA) primitive, possibly due to a corrupted linkage in the process control block link area (PCBLA)-call leg data block (CLDB) set. The FPDiganl() function could not recover from this error.

135. FPPCONF1 (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in the relation RLDA_CONFLCT.

Data Structures:

RLDA_CONFLCT, RLDAPRIMDGT.

The ROP output provides the keys used to access the missing rIDA_CONFLCT tuple (table and digits) and the keys for the corresponding rIDAPRIMDGT tuple (previous and digit).

Action:

Verify that the next attribute in the rIDAPRIMDGT tuple points to a valid rIDA_CONFLCT table. Also, verify that the digits field printed on the ROP is the correct number of additional digits (after primary translation in RLDAPRIMDGT) for this conflict. If the value is incorrect, update the conflict resolution entries on RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) or RC/V View 9.9 (REMAINING DIGIT [OFFICE DIALING]).

136. FPPCONF1 (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in the relation RLDA_CONFLCT.

Data Structures:

RLDA_CONFLCT, RLDAPRIMDGT.

The ROP output provides the keys used to access the missing rIDA_CONFLCT tuple (table and digits) and the keys for the corresponding rIDAPRIMDGT tuple (previous and digit).

Action:

Verify that the next attribute in the rIDAPRIMDGT tuple points to a valid rIDA_CONFLCT table. Also, verify that the digits field printed on the ROP is the correct number of additional digits (after primary translation in RLDAPRIMDGT) for this conflict. If the value is incorrect, update the conflict resolution entries on RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]).

137. FPPCONF2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIDA_CONFLCT tuple has an invalid attribute (row) value for packet switching.

Data Structures:

RLDA_CONFLCT. Key fields: table, digits.

Action:

Modify the row attribute in accordance with the population rules for the RLDA_CONFLCT relation.

138. FPPF_CPSL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When trying to get a customer premises equipment port to a scan port point relation, a failure code of DBNO_MATCH was returned. This indicates that the RLPF_CPSL tuple is missing or the keys used were incorrect.

Data Structures:

RLPF_CPSL. Key fields: cpe_port.member, cpe_port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLPF_CPSL relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by RC/V View 5.5 (TRUNK MEMBER).

139. FPPF_TKDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLFP_TKDN relation.

Data Structures:

RLPF_TKDN. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFP_TKDN relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V Views: 5.1 (TRUNK GROUP) and 5.5 (TRUNK MEMBER).

140. FPPORTGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLPORT_GROUP relation. When reading the RLPORT_GROUP relation with the key from the RLPCBLA relation, a failure code of DBNO_MATCH was returned. The port was not found in the RLPORT_GROUP relation.

Data Structures:

RLPORT_GROUP. Key fields: port.member, port.module, party.

Action:

This is a database inconsistency that can be corrected by manual action. The first two variables contain the port member and module from RLPCBLA. Using the information on the ROP, determine what port (member and module) should be assigned through recent change (RC).

141. FPPORTTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation RLFC_PORTTYP was read with an invalid key, (port), or a tuple is missing from this relation. This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the

INTRODUCTION section of the Asserts manual.

142. FPPP_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLPP_CF relation.

Data Structures:

RLPP_CF. Key field: feat_id.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLPP_CF relation with the actual keys used. If the tuple is missing, add it using RC/V View 12.31 (PRECEDENCE AND PREEMPTION [FEATURE DEFINITION]). If the keys used to access the relation were set incorrectly, notify your next level of support.

143. FPPUG_SM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLPUG_SM relation.

Data Structures:

RLPUG_SM. Key field: queue (first data item dumped).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the relation with the actual key used. If the tuple is missing, add it. If the key used to access the relation was set incorrectly, notify your next level of support.

This relation is updated by RC/V View 1.23 (CALL PICKUP LINE PARAMETERS).

144. FPPU_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLPU_LTM. When attempting to read this relation, a failure return code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

RLPU_LTM. Key fields: lead module, LTM index, LTM type, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

145. FPRDANITB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure of RLANIMOD, RLANITBL, or RLANIDFLT has occurred. These relations are read for toll digital exchange (TDX) calls. If the assert failing address indicates a problem with RLANIMOD, look at the full North American Numbering Plan (NANP DN) entry for that automatic number identification (ANI) on RC/V View 8.50 (AUTOMATIC NUMBER IDENTIFICATION SWITCHING MODULE).

If the failing address points to the RLANITBL relation, check the contents of the full NANP DN entry on RC/V View 8.51 (AUTOMATIC NUMBER IDENTIFICATION TABLE).

If the failing address indicates the RLANIDFLT relation has failed, then using a key of 000-000-0000 as the full NANP DN, check the contents of RC/V View 8.51.

The first raw data dump contains the ANI calling number.

The second raw data dump message contains the return code from the database read request.

146. FPRDIITB (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure of RLIIDIGITS has occurred. This relation is read for long distance platform (LDP) calls.

Data Structures:

RLTDXCARTB. Keys: ii_digits, trk_grp.

Action:

The first raw data dump contains the II digits of the call and the trunk group associated with the call. Use these values as a key to check the contents of RC/V View 8.57.

NOTE: the II digits value 100 indicates the wildcard information digits and the trunk group number 0 indicates the wildcard trunkgroup.

The second raw data dump contains the return code from the database read request.

147. FPRDLPCTB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure of RLTDXCARTB has occurred. This relation is read for long distance platform (LDP) calls.

Data Structures:

RLTDXCARTB. keys: tdx_carr, presub.

Action:

Using the first two raw data dumps (the ID of the carrier associated with the call and the presubscription status of the caller with respect to this carrier) as a key, check the contents of RC/V View 8.52 (LONG DISTANCE PLATFORM CARRIER TABLE). Note: a carrier ID of 10000 indicates the default LDP carrier table entry, which is a required entry. The third raw data dump contains the return code from the database read request.

148. FPRDLPCTBDFLT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Missing long distance platform (LDP) carrier table default tuples. This relation is read for LDP calls. These default tuples are required to be populated before the LDP feature is activated.

Action:

Using RC/V View 8.52 (LONG DISTANCE PLATFORM CARRIER TABLE), insert two default LDP carrier table tuples, using a carrier ID of 10000 and a presubscription value of Y in the first tuple, then a carrier ID of 10000 with a

presubscription value of N in the second tuple.

149. FPRDLDPIDX (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There is no tuple found in relation RLLDPINDEX with a given index(key). Relation RLLDPINDEX is read to get the ANI related data for LDP calls. If the given index is 0 the Default ANI Table is not defined.

Action:

Check RC/V View 8.59 [LONG DISTANCE PLATFORM (LDP) INDEX TABLE] to make sure that there is a tuple with the given index. Check RC/V View 8.58 (AUTOMATIC NUMBER IDENTIFICATION INDEX TABLE) to make sure that the same index is defined for the NPA-NXX-XXXX. If the given index is 0 use RC/V View 8.58 and RC/V View 8.59 to insert the default ANI tuple with the NPA-NXX-XXXX=000-000-0000 and CARRIER ID=10000.

150. FPRTMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When reading the RLRT_MHG relation with the key from the RLPORT_GROUP relation, a failure code of DBNO_MATCH was returned. The rIRT_MHG tuple is missing.

Data Structures:

RLRT_MHG. Key field: grpnum.

RLPORT_GROUP. Key fields: port.member, port.module, party.

Action:

The first variable contains the group number. The next three show the keys of the rIORT_GROUP tuple. Using the information on the ROP, verify that the group number is assigned for the multiline hunt group through standard RC/V.

The RLRT_MGH relation is updated by the following RC/V Views:

- 21.34 (OSPS DSL PACKET SWITCHING ASSIGNMENT)
- 1.22 (CALL FORWARDING LINE PARAMETERS)
- 23.2 (DIGITAL SUBSCRIBER LINE)
- 3.5 (MULTILINE HUNT GROUP [LINE ASSIGNMENT])
- 3.40 (MODULAR QUEUING [QUEUING PARAMETERS])
- 7.12 (MODULAR QUEUING [QUEUING PARAMETERS])
- 1.5 (PBX-DID LINE [LINE ASSIGNMENT])
- 1.6 (COMPOSITE LINE [LINE ASSIGNMENT])

The RLPORT_GROUP relation is also updated by RC/V Views 21.34, 23.2, 3.5, 1.5, and 1.6 as well as the following RC/V views:

- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
- 3.3 (MULTIPLE TN FOR MULTILINE HUNT GROUPS)
- 5.5 (TRUNK MEMBER)

151. FPRTRROUTING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A not found condition was returned when trying to get the rLRT_ROUTING tuple pointed to by the RLSCRNING relation whose keys are also dumped.

Data Structures:

RLRT_ROUTING. Key field: route_x.

RLSCRNING. Key field: screen_x, dest_x, prefix.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLRT_ROUTING relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V views: 10.25 (ALTERNATE ROUTE INDICES [ROUTING]) and 10.2 (ROUTE INDEX [ROUTING]).

152. FPRT_SCRNING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLRT_SCRNING relation.

Data Structures:

RLRT_SCRNING. Key fields: DEST_X, SCREEN_X, PREFIX.

Action:

This destination index and the prefix are the results of digit analysis. The screening index used is from the RLFC_LINE relation for the particular line. Use RC/V (or ODBE, if necessary) to cross-check the keys used to access the RLRT_SCRNING relation with the actual keys for the relation. Verify that this tuple exists; if it does not, add it.

This relation is updated by RC/V View 10.10 (SCREENING [CHARGING]).

153. FPRT_TRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLRT_TRKG relation.

Data Structures:

RLRT_TRKG. Key field: grpnum.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLRT_TRKG relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V views:

24.4 (TRAFFIC DATA, ACA, MDR AND FM PARAMETERS)
 12.5 (CONFIGURATION GROUP DEFINITION)
 12.7 (DIRECT TRUNK GROUP SELECT [DTGS] ASSIGNMENT)
 3.5 (MULTILINE HUNT GROUP [LINE ASSIGNMENT])
 3.40 (MODULAR QUEUING [QUEUING PARAMETERS])
 7.12 (MODULAR QUEUING [QUEUING PARAMETERS])
 7.3 (PFA SIMULATED FACILITY GROUP)
 1.29 (TERMINAL GROUP LINE PARAMETERS)
 5.29 (TERMINAL GROUP TRUNK PARAMETERS)
 5.1 (TRUNK GROUP)
 5.5 (TRUNK MEMBER)

154. FPSC_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in the relation RLSC_CF. When attempting to read this relation, a failure return code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

RLSC_CF. Key fields: feature ID (first data item dumped).

Action:

Use ODBE in the AM to find the corresponding tuple in the RLSC_OPTS relation. Use the feature ID from the ROP output as the key to this relation.

If the tuple exists in this relation, use the information from this tuple to populate the rISC_CF tuple keyed by the same feature ID. This relation is on the SM indicated in the ROP output.

If the tuple does not exist in the RLSC_OPTS relation, use RC/V View 12.51 (SPEED CALLING FEATURE DEFINITION) to define the speed calling feature. If there is some problem with this feature definition, contact the next level of support.

155. FPSCDSCRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The scd_scrn attribute in the rIFC_LINE tuple was incorrectly set to DBYES, or the corresponding rISCD_SCRN tuple is missing.

Data Structures:

RLFC_LINE. Key fields: port.member, port.module, party-must be FC_INDI.

RLSCD_SCRN. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross check the status of the RLfc_line.scd_scrn attribute and the existence of an rISCD_SCRN tuple. For each rIFC_LINE tuple with the scd_scrn attribute set to DBYES, there must be a corresponding rISCD_SCRN tuple. If the scd_scrn attribute was incorrectly set to DBYES, use ODBE to set it to DBNO. If the scd_scrn attribute should be DBYES, create an rISCD_SCRN tuple using RC/V View 1.60 (CARRIER LINE SCREENING).

156. FPSCM_NSCM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLSCM_NSCM tuple is missing or the keys used to read this relation are incorrect.

Data Structures:

RLSCM_NSCM. Key fields: ltm_idx, ltm_type.

RLIS_LINE. Key fields: lead_module, ltm_idx.

RLFC_LINE. Key fields: port, party.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data on the SM identified on the ROP output as follow:

1) Check to see if the series completion feature is assigned on this line as follows:

a) If the ltm_type of the original key printed on the ROP was LTM_ISDN, read the RLIS_LINE relation using the ltm_idx of the original key from the ROP and the lead_module key as the SM number printed on the ROP as keys. If the sercomp bit is set to DBYES, then series completion is assigned.

b) If the ltm_type of the original key is LTM_OTHER, read the RLLTM_PORT relation using the ltm_idx of the original key printed on the ROP as the key. Use the port and party attributes as keys to read the RLFC_LINE relation. If the sercomp bit is set to DBYES, then the series completion feature is assigned.

2) If the series completion feature is assigned, a tuple should exist in the RLSCM_NSCM relation. Insert the appropriate tuple.

3) If the series completion feature is not assigned, the switch software should not have attempted to read RLSCM_NSCM with these keys. Contact the next level of support.

157. FPSDNBRET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An unexpected return code was received from the FCtrhdlr() function, which is communicating with an external network control point (NCP) data base. The transaction data block will be dumped.

158. FPSDNPKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A software defined network (SDN) call was attempted, but the SDN action point (ACPSDN) software package is not loaded. The sdnded field in the rIFC_TRUNK tuple is set to DBYES, indicating an SDN-dedicated trunk.

Data Structures:

RLFC_TRUNK. Key fields: member, module.

Action:

Determine if the trunk is a valid SDN trunk. If it is a valid SDN trunk, the ACPSDN package is missing; call your next level of support.

If the trunk is not a valid SDN trunk, change the sdnded field in the rIFC_TRUNK tuple to DBNO by changing the SDN DEDIC field to NO in RC/V View 5.1 (TRUNK GROUP).

159. FP_SERCOMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation or the tuple is missing from the RLFC_SERCOMP relation.

Data Structures:

RLFC_SERCOMP. Key fields: port.member, port.module, party.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_SERCOMP relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

This relation is updated by RC/V View 1.5 (PBX-DID LINE [LINE ASSIGNMENT]) and RC/V View 1.6 (COMPOSITE LINE [LINE ASSIGNMENT]).

160. FPSF18 (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure of RLANIMOD, RLANITBL, or RLANIDFLT has occurred. These relations are read for toll digital exchange (TDX) calls. If the assert failing address indicates a problem with RLANIMOD, look at the NPA-NXX entry for that ANI on RC/V View 8.50 (AUTOMATIC NUMBER IDENTIFICATION SWITCHING MODULE).

If the failing address points to the RLANITBL relation, check the contents of the NPA-NXX-XXXX entry on RC/V View 8.51 (AUTOMATIC NUMBER IDENTIFICATION TABLE).

If the failing address indicates the RLANIDFLT relation has failed, then using a key of 000-000-0000 as the NPA-NXX-XXXX, check the contents of RC/V View 8.51.

The first raw data dump contains the ANI (calling number).

The second raw dump message contains the return code from the database read request.

161. FPSPABILLDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in the RLSPABILLDN relation that is keyed with a trunk group. The problem occurred when a special access (SPA) customer originated a WATS or MEGACOM[®] call and RLSPABILLDN was read to retrieve their assigned billing number. Therefore, the RLSPABILLDN relation has the trunk group number incorrectly populated or it is corrupt.

Data Structures:

RLSPABILLDN. Key field: trunk group number.

The trunk group that originated the SPA WATS or MEGACOM[®] call is dumped.

Action:

Check the class of service of this trunk group using RC/V View 5.1 (TRUNK GROUP).

If the trunk group is a valid SPA WATS or *MEGACOM*® type and an rSPABILLDN tuple does not exist that corresponds to this trunk group, use RC/V to add the tuple. If the trunk group is a valid SPA WATS or *MEGACOM*® type and the rSPABILLDN tuple does exist, the relation is corrupt. Check the relation and re-create it using RC/V.

If the trunk group is not valid for SPA WATS or *MEGACOM*® service, use RC/V to change the class of service for this trunk group appropriately.

162. FPTATYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either a tuple is missing from the RLTYPE relation, or the key used to read this relation is not in the domain (which is the set of values the key can have).

Data Structures:

RLTYPE. Key field: tatype.

Values for DMTREAT (domain for tatype) can be found in the *5ESS*® Switch Translations and Dynamic Data Domain Description Manual and the *5ESS*® Switch Translations Guide.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the value for the tatype keys in the RLTYPE relation with the tatype value that was printed on the ROP. If the tuple is missing, insert it (especially if it is required in all offices). If the key used to access the relation is incorrect (that is, not in the domain), notify your next level of support. The RLTYPE relation is updated by RC/V View 10.1 (FIXED ROUTE).

Although RT_REGICPT, RT_DENIED, and RT_OOS are in the domain, they are intercepts and should not be populated in the RLTYPE relation. This is normally true for RT_BLANK, also; however, RT_BLANK can be set up for use on incoming CCS7 trunks that send a "REL" message of 'unallocated number.'

163. FPTCMOBF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates that there was not enough space for the traveling class mark (TCM) digits in the outpulsing buffer. The digits were outpulsed without the TCM. This could be an indication of errors in the prefixing and deleting data.

Data Structures:

RLARPORT.

The first data dumped (hexadecimal) is the logical trunk port (lport) on which the error occurred. The second data dump (hexadecimal) contains the digits outpulsed. This is the string, in ASCII, after prefixing and deleting has already been done. To convert, subtract 30 from each digit. The third data dump (hexadecimal) is the TCM that could not be appended.

Action:

This assert may indicate an error in the prefixing and deleting data. Use RC/V to look up the port in the RLARPORT_GROUP relation to find the trunk group it is in. Now, search through the AM relation RLRT_MCRT for tuples that may route to the trunk group, check that the prefixing and deleting could not result in a digit string longer than 14 for 1 digit TCM or 13 for 2 digit TCM. If the resulting digit string is too long, correct the prefixing and deleting attributes using the RC/V view for ARS MC Route Index expansion.

164. FPTG_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation or the tuple is missing from the RL TG_CF relation.

Data Structures:

RLTG_CF. Key fields: feature ID (first data item dumped).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RL TG_CF relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by RC/V View 12.21 (TERMINAL GROUP [FEATURE DEFINITION]).

165. FPTGLTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TGLTM tuple is missing for a member of a terminal group. As a result, it cannot be determined if the member is allowed to have a customer defined restriction displayed when the member is part of a call involving the ISDN attendant console for the centrex network feature.

Data Structures:

RLTGLTM. Key fields: lead_mod, ltm_idx, ltm_type.

The first three items on the ROP output are the keys used to access the TGLTM relation. Item 1 - LEAD_MOD. The lead module is the SM number associated with the port or is zero if the terminal group station restriction (TGS R) feature was assigned via a Business and Residential Custom Services (BRCS) Business Feature Group (BFG). Item 2 - LTM_TYPE. This is the ltm type of the originating port. Item 3 - LTM_IDX. This is the ltm idx of the originating port. The next two items on the ROP output are useful data for finding out more information about the port with the problem. Item 4 - MEMBER. This is the port that a was originating a call. Item 5 - MODULE. This is the originating SM of the port.

Action:

Use the following steps to recover the TGLTM tuple and to determine a value for the disp_rstrct field. Step 1. Use odbe to insert a TGLTM on the SM indicated by the MODULE item of the ROP output. Use the LEAD_MOD, LTM_TYPE, and LTM_IDX as the keys. Leave all the other fields with their default values. Step 2. If you are satisfied with the default value in the disp_rst field you are done, otherwise do the rest of these steps. Step 3. Do an op:conv,port=MODULE-h'MEMBER substituting the MODULE and MEMBER with the values from the ROP output. This will provide the DN to use for the rest of the steps. Step 4. If the LEAD_MOD field from the ROP output is zero, the TGS R feature was assigned through a BFG. Use RC view 1.11 to find the BFGN and the TGS R feature. Use RC view 12.9 with the BFGN to find the value of DISP RESTRICT. Use RC view 1.29 to set the value of DISP RESTRICT to the value found on the 12.9 view. Step 5. If the LEAD_MOD field from the ROP output is not zero there is no BFG involved. The TGS R feature was assigned as an individual DN feature. Use RC view 1.11 to find the TGS R feature. Use RC view 12.21 to get the default DISP RESTRICT value. Use RC view 1.29 to set the value of DISP RESTRICT to the value found on the 12.21 view.

166. FPTG_LTMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLTG_LTMER relation.

Data Structures:

RLTG_LTMER. Key fields: lead module, LTM type, LTM index.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLTG_LTMER relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by RC/V View 1.29 (TERMINAL GROUP LINE PARAMETERS) and RC/V View 5.29 (TERMINAL GROUP TRUNK PARAMETERS).

167. FPTGNTNSC (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received bad return code from read RLTGNTNSC Got a TNSC value, tried to read RLTGNTNSC using this as the key. No tuple was found. Then attempted to read RLTGNTNSC using 10004 as the key. Got a read error that indicates a problem with the database mechanism.

Data Structures:

The ROP output indicates the return code from DBfrdtup() primitive

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

168. FPTKDGST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found in RLDA_DIGSTRT for a given trunk.

Data Structures:

RLDA_DIGSTRT, RLFC_TRUNK.

The digit analysis selector (digtree) and the trunk group number (tgroup) are printed.

Action:

Ensure that the digtree specified in RLFC_TRUNK for the given trunk is valid using RC/V. If the digtree is valid, add a tuple for the specified digtree to RLDA_DIGSTRT using RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]).

169. FPTONETY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When trying to get a tuple in the RLTONETYPE relation, a not found condition was returned.

Data Structures:

RLTONETIME. Key field: tonetype

Action:

This is a database inconsistency that can be corrected only by manual action. Use RC/V (or ODBE, if necessary) to cross check and correct the problem.

170. FPTRMBFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in relation RLTRMFEATS keyed with logical port (lport) equal to the business and residential custom services (BRCS) feature group ID (BFGID) and the logical port type (lpt_type) equal to LPT_BFG (2).

Data Structures:

RLFC_LINE, RLLPT_PT, RLTRMFEATS.

The ROP output indicates the SM number (MOD), the source file and line number, the BRCS feature group (BFG) keys used to read the relation (LPORT, LPT_TYPE), the range (RANGE), the BFGID, and the original (non-BFG) keys for this relation.

Action:

BRCS features can be assigned directly to the line or assigned to the line via a BFG.

When a BRCS feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLTRMFEATS relation where RLtrmfeats.lport is RLfc_line.lport, RLtrmfeats.lpt_type is RLfc_line.lpt_type, and RLtrmfeats.range is 0 through 6.

When a BRCS feature is assigned to a line via a BFG, the BFG keys are used to read the RLTRMFEATS relation where RLtrmfeats.lport is RLfc_line.bfgid, RLtrmfeats.lpt_type is LPT_BFG, and RLtrmfeats.range is 0 through 6.

An attempt to read the RLTRMFEATS relation using the BRCS feature group (BFG) keys was made because the a BRCS terminal feature is thought to exist in a BFG assigned to this line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

1. Use the original keys (lport, lpt_type) from the ROP output to read the RLLPT_PT relation to find the port and party of the line in question.
2. Use the port and party to read the RLFC_LINE relation to get the BFGID (bfgid) and the BFG indicator for terminal features (trmbfg).
3. If the trmbfg value from RLFC_LINE is DBNO, contact the next level of support.
4. If the trmbfg value from RLFC_LINE is DBYES, the bfgid from RLFC_LINE should match the BFGID given in the ROP output. If the BFGID values do not match, contact the next level of support.
5. If trmbfg is DBYES and the BFGID values match, a tuple should exist in RLTRMFEATS for the BFG keys. Insert the appropriate rITRMFEATS tuple.

171. FPTRMFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing in relation RLTRMFEATS keyed with logical port (lport) and logical port type (lpt_type).

Data Structures:

RLFC_LINE, RLLPT_PT, RLTRMFEATS.

The ROP output provides the SM number (MOD), the source file and line number, and the keys used to read this relation - LPORT, LPT_TYPE, and RANGE.

Action:

Business and residential custom services (BRCS) features can be assigned directly to a line or assigned to the line via a BRCS feature group (BFG).

When a BRCS feature is assigned directly to a line, the original (non-BFG) keys are used to read the RLTRMFEATS relation where RLtrmfeats.lport is RLfc_line.lport, RLtrmfeats.lpt_type is RLfc_line.lpt_type, and RLtrmfeats.range is 0 through 6

An attempt to read the RLTRMFEATS relation using the original (non-BFG) keys was made because a BRCS feature is thought to be assigned directly to the line.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

- 1) Find the port and party of the line in question. Using the original keys (lport and lpt_type) from the ROP output, read the RLLPT_PT relation to get the port and party.
- 2) Using the port and party, read the RLFC_LINE relation to get the logical port (lport), logical port type (lpt_type), and the indicator for BRCS terminal features (brc_trm).
- 3) If the brc_trm value from RLFC_LINE is DBNO, contact the next level of support.
- 4) If the brc_trm value from RLFC_LINE is DBYES, then the lport and lpt_type from RLFC_LINE should match the lport and lpt_type in the ROP output. If the values do not match, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
- 5) If brc_trm is DBYES and the lport and lpt_type values match, a tuple should exist in RLTRMFEATS for the original (non-BFG) keys. Insert the appropriate RLTRMFEATS tuple.

172. FP_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read this relation, or the tuple is missing from the RLFC_TRUNK relation.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_TRUNK relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

This relation is updated by the following RC/V views:

- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
- 5.1 (TRUNK GROUP)
- 5.5 (TRUNK MEMBER)

173. FPUNXEISMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to connect a caller to an external audio response unit (ARU). During the attempt, the FPextsetup() function received an unexpected message from the originating terminal process (OTP). The caller will be connected to an operator. Contact your next level of support.

174. FPUNXMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message is received from the far process.

175. FPUTTRK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in the relation RLUTTRK, which is used in processing a utility telemetry service call.

Data Structures:

RLUTTRK Key Field: grpnum = trunk group number.

Action:

Use RC/V View 5.16 (UTILITY TELEMETRY TRUNK GROUP PARAMETERS) (or ODBE, if necessary) and insert the trunk group number of the UTS trunk, call type information (CTI) digits, value of receiving a ST, value of receiving a STP, value of receiving a ST2P, and the maximum call duration.

176. ISFCLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_LINE relation, or the rLFC_LINE tuple is missing.

Data Structures:

RLFC_LINE. Key fields: port.member(hex), port.module(dec), party(dec).

Action:

Use RC/V (or ODBE, if necessary) to cross-check the keys in the RLFC_LINE relation with the actual keys used to access the relation. If the rLFC_LINE tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify the next level of support.

The RLFC_LINE relation is updated by the following RC/V views:

- 12.8 (BFG ADMINISTRATION)
- 23.2 (DIGITAL SUBSCRIBER LINE)
- 21.30 (OSPS-DSL PORT)
- 1.12 (BRCS FEATURE ACTIVATION [LINE ASSIGNMENT])
- 5.12 (BRCS FEATURE ACTIVATION [TRUNK MEMBER])
- 1.11 (BRCS FEATURE ASSIGNMENT [LINE])
- 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER])
- 4.29 (ATTENDANT MLHG/BUSY LAMP FIELD RANGE DN ASSIGNMENT)
- 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE)

- 1.9 (MULTIPLE DIRECTORY NUMBER WITH DISTINCTIVE RINGING)
- 3.5 (MULTILINE HUNT GROUP [LINE ASSIGNMENT])
- 3.3 (MULTIPLE TN FOR MULTILINE HUNT GROUPS)
- 1.32 (TWO TELEPHONE NUMBER SWAP)
- 1.5 (PBX-DID LINE [LINE ASSIGNMENT])
- 1.6 (COMPOSITE LINE [LINE ASSIGNMENT])

Range: hm**1. HMMAP0 (5E11 and later)**

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A function return value error occurred, or invalid data was found in the variable init (all functions).

2. HMMAP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module alarms process (MAP) received a message of type MGTIMER and a tag that indicates it is for a repeating fan alarm. However, this timer cannot be associated with any particular fan alarm scan point. No repeating fan alarm output message will be generated.

3. HMMAP2 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmaest() function encountered invalid data in SMmccustat (the external status table).

4. HMMAP3 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmaest() function encountered data in SMmccustat (the external status table) indicating that both module controllers (MCs) are in the same state.

5. HMMAP4 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmafnanl() function encountered an HMoutmsg() failure return value during a remote fan reset.

6. HMMAP5 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMromreq() function encountered an OSSENDMSG() failure return value while executing the OP:ALM command.

7. HMMAP6 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmasend() function encountered a DBfrdtup() failure when reading relation RLRC_LOCEQ to obtain aisle location information for a fan or fuse alarm output message. No aisle information will be provided in the output message.

8. HMMAP7 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmafnanl() function encountered an HMack() failure return value.

9. HMMAP8 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The module alarms process (MAP) received a failure return value from OSTIMER(), OSCTIMER(), or OSDETIMER() while handling timer functions for fan alarms.

10. HMMAP9 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmrasdnd() function or HMdmamsnd() function encountered invalid data in the unit field.

11. HMMAP10 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was encountered in the message text field mess by function HMmasend(), HMmrasdnd(), or HMdmamsnd().

12. HMMAP11 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmasend() function encountered invalid data in the mes_to field.

13. HMMAP12 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmaanldt() function encountered invalid force active data.

14. HMMAP13 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmasend() function encountered a DBfrdtup() failure when reading relation RLNO_PICB to obtain aisle location information for a fan or fuse alarm output message. No aisle information will be provided in the output message.

15. HMMAP14 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmasvanl() function encountered invalid old_state data [module controllers (MCs) or dual link interfaces (DLIs)].

16. HMMAP15 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmafnanl() function encountered invalid old_state data (fans).

17. HMMAP16 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmasvanl() function encountered invalid new_state data [module controllers (MCs) or dual link interfaces (DLIs)].

18. HMMAP17 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmafsanl() function encountered invalid new_state data (fuses), or the HMmafnanl() function encountered invalid new_state data (fans).

19. HMMAP18 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmagtmsg() function found an invalid msghead.type in a message from OSWGETMSG().

20. HMMAP19 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmafnanl() function encountered an invalid type.

21. HMMAP20 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmasend() function was attempting to obtain aisle location information for a fan or fuse alarm output message, but encountered a DBfrdtup() failure when reading relation RLPLI_LNK. No aisle information will be provided in the output message.

22. HMMAP21 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmaroffnorm() function has been called with an invalid scan point type.

23. HMMAP22 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DBfrdtup() failure was encountered when reading relation RLPLI_LNK in the module alarms process (MAP). If this occurs during a remote fan reset operation, no attempt will be made to reset the fan unit if there is one associated with the time slot interchange (TSI) link being investigated. If a remote reset is not in progress, this failure occurred during routine scanning for remote fan and fuse scan point status. No status will be taken from the TSI link during this scan by MAP.

24. HMMAP23 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmaanldt() function encountered invalid data in the chg_f field (force active data).

25. HMMAP24 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmagtdt() function encountered invalid data in the chg field.

26. HMMAP25 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmagtdt() function encountered invalid data in the chg_flag field.

27. HMMAP26 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmagtdt() function encountered invalid data in the sc_flag field.

28. HMMAP27 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmascrd() function encountered invalid data in the state field.

29. HMMAP28 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmascrd() function encountered invalid data in the sc_data[] array.

30. HMMAP29 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HMmaadmn() function encountered an OSWGETMSG() failure return value.

31. HMOMTBDTMR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) was unable to create a cyclic timer for the output message control process (SOCO).

32. HMOMTBLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MSQ	Audit Mode: elev

Problem:

A database (DB) dynamic relation access primitive returned a failure code indicating invalid linkages between the tuples of the RLIMMSQ (SM) or RLCPPMSQ (AM) dynamic relations. The assert fired from the HMmqasrt() [Slmqasrt()] function, and the stack backtrace will indicate a function in the HMmsgctl.c (Slmsgctl.c) or HMsoco.c (Slsooco.c) files in the hm/HMamsmsoc node. The DB return value and the pointer(s) to the invalid linkages are on the function stack, and in the stack frame output message. The linkage problem will be corrected by the demand MSQ audit.

33. HMOMTBPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The human/machine interface (HM) subsystem output message throttling code passed an invalid parameter internally, which resulted in a nonsense return from a database (DB), HM [system integrity (SI)], or operating system (OS) primitive. The return value from the failing function, and some of the data passed to the function, which detected the failure are on the function stack and included in the stack frame output message.

34. HMOMTDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) primitive returned an error code that was not severe enough to warrant the demand audit of the dynamic relations for the output message queues, but must be recorded. The return value and the pointer(s) to the buffers involved are included on the function stack space and in the stack frame output message.

35. HMOMTDDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DDWRITE() macro or DDREAD() macro returned a failure or invalid parameter indication, or DDREAD() returned a value that was not expected. The returned value is included on the function stack and in the stack frame output message.

36. HMOMTINVRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) passed an invalid reason to the output message control process (SOCO). The function HMsocoit() [Slsoocoit()] in the file hm/HMamsmsoc/HMsoco.c (si/Slamsmsoc/Slsooco.c) requested the assert. The invalid reason is the parameter to the HMsocoit() function and is

included in the stack frame output message.

37. HMOMTOSRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operating system for distributed switching (OSDS) primitive returned a value that was not expected. The return value is included on the function stack and in the stack frame output message.

38. HMOMTRELCK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MSQ	Audit Mode: elev

Problem:

The external data used to avoid re-entrancy problems was found in an unexpected (illegal) state. This indicates a problem in the dynamic relation of output message buffers (RLIMMSQ or RLCPPMSQ), which is audited in the demand mode.

39. HMOMTUNEXP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

HM OUTPUT MESSAGE THROTTLING - UNEXPECTED MESSAGE This assert signifies that the function HMwakewt() [Slwakewt()] in the file hm/HMamsmsoc/HMsoco.c [si/Slamsmsoc/Slsoco.c] was notified by the operating system for distributed switching (OSDS) that an interprocessor message was received but the message type, the timer tag for MGTIMER, or the verb for MGDISCARD is illegal. The message types other than MGTIMER and MGDISCARD are invalid. The MGTIMER timer tags other than HMBCTIMER and HMCLRTIMER are invalid. The MGDISCARD message verbs other than HM_OP and HM_CLR are invalid for the SOCO process. The message buffer received has been read onto the function's stack and is included in the STACK FRAME output message. The SENDER of this message is in error in sending this message to output message control process (SOCO).

40. HMRAS01 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLRIIBM_SC relation was read to find the alarm level of a scan point. The read was successful, but the alarm level is not recognized. The alarm level will default to MINOR.

41. HMRAS02 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During initialization of the remote alarm section (RAS) terminal process, a message is sent to the remote integrated services line unit (RISLU) alarm process (RISA) telling RISA that the RAS terminal process is alive. The message was not sent. Recovery is automatic, but the next level of support should be informed.

42. HMRAS03 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During initialization, the remote alarm section (RAS) terminal process sends a message to the remote integrated

services line unit (RISLU) alarm process (RISA) telling RISA that the RAS terminal process is alive. RISA should return initialization data. The return message did not arrive. Recovery is automatic, but the next level of support should be notified.

43. HMRAS04 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote integrated services line unit (RISLU) alarm process (RISA) can send commands to the remote alarm section (RAS) terminal process. The terminal process did not recognize one of those commands.

44. HMRAS05 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When the remote integrated services line unit (RISLU) alarm process (RISA) is ready to send a message to a remote alarm section (RAS) terminal process, it is only sent if RISA's internal tables indicate that the terminal process is in a state to receive. The RAS terminal process is ready to receive messages, but the sending of the message failed.

45. HMRAS06 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote integrated services line unit (RISLU) alarm process (RISA) received a message with a subtype that was not recognized.

46. HMRAS07 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLRIBM_SC relation failed.

Action:

Check the RLRIBM_SC relation using RC/V.

47. HMRAS08 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLPCBLA relation failed.

Action:

Check the RLPCBLA relation using RC/V.

48. HMRAS09 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLDLDSL relation failed.

Action:

Check the RLDLDSL relation using RC/V.

49. HMRAS10 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote integrated services line unit (RISLU) site for which information is required, does not have an entry in the internal table used by the RISLU alarm process (RISA). Either the site number is incorrect or the table was corrupted.

50. HMRAS11 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLRISLUDFI relation failed.

Action:

Check the RLRISLUDFI relation using RC/V.

51. HMRAS12 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid data value was found in a message.

52. HMRAS13 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral interface control bus (PICB) number for remote integrated services line unit (RISLU) alarms out of range.

53. HMRAS14 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Remote integrated services line unit (RISLU) number out of range for digital subscriber lines (DSL) alarms.

54. HMRAS15 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Line unit (LU) number out of range for remote integrated services line unit (RISLU) alarms.

55. HMRISA00 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid process entry reason was received from system integrity (SI) on restart of the remote integrated services line unit (RISLU) alarm process (RISA).

56. HMRISA01 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote integrated services line unit (RISLU) alarm process (RISA) received an invalid message type. The contents of the input message buffer was dumped.

57. HMRISA02 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote integrated services line unit (RISLU) alarm process (RISA) received an MGTIMER message type with an invalid timer tag.

58. HMRISA03 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote integrated services line unit (RISLU) alarm process (RISA) received a state change message, MGALMRISLU, from peripheral control (PC) signifying that a RISLU alarm (fan, fuse, power, or battery) changed state. The database read that determines the RISLU site number failed. There are two possible causes for this error.

1. The line unit number sent by PC in the message is incorrect.
2. The key for the RLRISLUDFI relation was incorrectly calculated or is invalid.

The RLRISLUDFI relation describes the RISLU digital facility interfaces (DFIs) and their relationship to other components in the RISLU.

Data Structures:

RLRISLUDFI. Key field: dfi_picb.

Action:

Verify via RC/V (or ODBE, if necessary) that the site number in the RLRISLUDFI relation is correctly populated.

59. HMRISA04 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple could not be read from the RLRISITE relation within the remote integrated services line unit (RISLU) alarm process (RISA). The RLRISITE relation contains configuration information for each RISLU site.

Action:

If this SM is hosting a RISLU, verify via RC/V (or ODBE, if necessary) that the RLRISITE relation is populated with a tuple for this RISLU site.

60. HMRISA07 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter value was found within the remote integrated services line unit (RISLU) alarm process (RISA).

Use the stack backtrace information to analyze the problem.

61. HMRMAP00 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid process entry reason was received from system integrity (SI) on restart of the remote module alarms process (RMAP).

62. HMRMAP01 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote module alarms process (RMAP) received an invalid message type. The contents of the input message buffer is dumped.

63. HMRMAP02 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote module alarms process (RMAP) received an MGTIMER message type with an invalid timer tag.

64. HMRMAP03 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote module alarm process (RMAP) received an MGONHOOK or an MGOFFHOOK message type that signifies that a master scanner unit (MSU) scan point changed state; but RMAP does not recognize the scan point. The local port name for the scan point in question is dumped. There are two possible causes for this error:

1. The RLFC_PORTTYP relation incorrectly shows the servclass for this scan point to be set to HM_REM_ALM, when the scan point does not belong in the remote alarms group.
2. The office parameters GLRSC0 and/or GLRSC1 are incorrectly set. These parameters correspond to point zero on each of the two MSU scan boards in service group zero that have remote alarm scan points.

Data Structures:

RLFC_PORTTYP. Key field: port.

Action:

For case 1, verify that the local port name dumped corresponds to a scan point associated with remote alarms. If not, verify via RC/V (or ODBE, if necessary) that the corresponding rLFC_PORTTYP tuple does not have the servclass attribute set to HM_REM_ALM.

For case 2, verify via RC/V (or ODBE, if necessary) that the GLRSC0 and GLRSC1 office parameters are correctly set. The scan point corresponding to the local port name dumped should exist on one of the two boards specified by the office parameters.

65. HMRMAP04 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple could not be read from the RLRBP_SC relation within the remote module alarms process (RMAP).

Data Structures:

RLRBP_SC. Key field: ptnum.

Action:

The ptnum field is the internal name for the scan point; 0-31 for scan points on the first remote alarm scan board, 32-63 for points on the second board. If this SM has remote alarm handling, verify via RC/V (or ODBE, if necessary) that the RLRBP_SC relation is properly populated. If this SM does not have remote alarm handling, verify via RC/V (or ODBE, if necessary) that the office parameter Glrbpsc is set to DBNO.

66. HMRMAP05 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The tuple for the remote alarm unit (RAU) or the alarm and status circuit (ASC) could not be read from the RLSMEST relation within the remote module alarms process (RMAP).

Data Structures:

RLSMEST. Key field: unit_id.

Action:

If this SM has remote alarm handling, verify via RC/V (or ODBE, if necessary) that the RLSMEST relation is properly populated with a tuple for the RAU. If this SM does not have remote alarm handling, verify via RC/V (or ODBE, if necessary) that the office parameter Glralmmod is set to DBNO.

67. HMRMAP06 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter of type DMHMPOINT (scan point internal name) was passed to a function within the remote module alarms process (RMAP). Use the stack backtrace information to analyze the problem.

68. HMRMAP07 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter value was found within the remote module alarms process (RMAP). Use the stack backtrace information to analyze the problem.

69. HMRMAP08 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote module alarms process (RMAP) detected a software failure of the master scanner unit (MSU) scan point masks. The problem could be in the peripheral control (PC) subsystem that implements the scan point masking, or in the client process (RMAP).

70. HMRMAP09 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote module alarms process (RMAP) detected a possible hardware or software failure with scan point masks. The problem could be in the peripheral control (PC) subsystem that implements scan point masking, in the client process (RMAP), or in the mask register on the hardware itself.

71. HMRMP10 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The duplexed mate circuit name is out of range.

72. HMRMP11 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read for duplex portname for an metallic service unit (MSU) scan point returned an error, indicating a database system error.

73. HMRMP12 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read on RLFC_PORTTYP failed.

74. HMRMP13 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote module alarms process (RMAP) received an MGHMALMTORMAP message requesting that an operation be performed at the SM alarm status unit (ASU), but the request is invalid.

75. HMRMP14 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed database read of relation RLCKTDATA by the remote module alarms process (RMAP).

76. HMRMP15 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed database read of relation RLRC_LOCEQ by the remote module alarms process (RMAP).

Range: nm**1. NMAD_DOCDA (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: DOC	Audit Mode: elev

Problem:

An unexpected dynamic access (DA) return code was encountered in referencing dynamic overload control (DOC) or invalid data was found in DOC.

2. NMAD_EXRDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EXRR	Audit Mode: elev

Problem:

An unexpected dynamic access (DA) return code was encountered when referencing the RLEXRR relation.

3. NMAD_GTGDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GRPTGC	Audit Mode: elev

Problem:

An unexpected dynamic access (DA) return code was encountered when referencing the RLGRP_TGC relation, or invalid data was found in the RLGRP_TGC relation.

4. NMAD_IVAR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value was detected for a local network management (NM) variable.

5. NMAD_KEYTGC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Routing and terminal allocation (RTA) passed an invalid RLGRP_TGC relation key value.

6. NMAD_RTKGDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected database (DB) return code was encountered when referencing data in the RLRT_TRKG relation.

7. NMAD_TGCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TGC	Audit Mode: elev

Problem:

An unexpected dynamic access (DA) return code was encountered when referencing the RLTGC relation, or invalid data was found in the RLTGC relation.

8. NMAD_TRDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NMTR	Audit Mode: elev

Problem:

An unexpected dynamic access (DA) return code was encountered in referencing a trunk reservation (TR) tuple, or invalid data was found in a TR tuple.

9. NMA SPERROR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the advanced services platform (ASP) R0.1 automatic call gapping (ACG) data structures used to implement the list and tree structures. The possibilities include indices out of range, invalid duration or gap interval times, invalid digit information, stack corruption, invalid code control identifiers, or unable to locate the requested control.

10. NMBADARG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid argument was passed to a base level or interject level function. The argument is dumped.

11. NMBADCNTL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Corrupt data was found in a network management (NM) code control. This results in the code control being removed.

12. NMBADDDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid network management (NM) data was detected. The invalid data is dumped.

13. NMBADDDSA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid direct signaling application (DSA) type was passed to application software related to features that involve interactions with external databases via common channel signaling (CCS) "direct signaling". A single occurrence of this assert can be ignored. If more than one appears, something is wrong with the load.

14. NMBADLEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to install a leased network (LN) return query control that is not six digits. The current call will be allowed. If this occurs more than once, it is probably the result of a programming error and should be looked into more thoroughly.

15. NMBADRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid network management (NM) return code was encountered.

16. NMCC_BADDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NMCC	Audit Mode: elev

Problem:

The network management (NM) code control search tree or list contains erroneous data. Possibilities are out of range gap indices, out of range dispositions, or out of range control identifiers. Another possibility is an out of range pointer in the tree structure.

17. NMCCBADPOLL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of network management (NM) code controls in an SM does not match the number of manual code controls in the master list in the CMP.

18. NMCC_NONODES (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NMCC	Audit Mode: elev

Problem:

While attempting to install a code control, no nodes were available to install the new control into the code control search tree. This should never happen since enough nodes are allocated for the maximum number of code controls. The code control audit will be scheduled to clean up the tree.

19. NMCCSMDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in an SM's network management (NM) manual code control list.

20. NMCCTIMEOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A network management (NM) SM system process timed out while waiting for initialization messages from the CMP for the manual code controls list. Possible causes could be SM isolation, resource shortages, overload, or errors in the CMP code control list.

21. NMCD_ARC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NMDSNARC	Audit Mode: elev

Problem:

A tuple was retrieved from the dynamic relation RLNMDSNARC, but the alternate route cancellation (ARC) control data in the tuple is in error. This tuple may be corrupted due to problems in ARC processing functions or other feature functions that have access to the RLNMDSNARC relation.

22. NMCNAMERROR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the analog calling name delivery (CNAM) automatic call gapping (ACG) data structures used to implement the list and tree structures. The possibilities include indices out of range, invalid duration or gap interval times, invalid digit information, stack corruption, invalid code control identifiers, or unable to locate the requested control.

23. NMDDRFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has been encountered while reading the DD key "DDOOPIMS" to determine the equipped SM.

Probable Cause:**Action:**

None.

24. NMDSCCBADATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the direct signaling code controls data structures used to implement the list and tree structures. The possibilities include indices out of range, invalid duration or gap interval times, invalid digit information, stack corruption, invalid code control identifiers, or unable to locate the requested control.

25. NMERRCTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A wrong parameter was passed to obtain a cyclic timer.

26. NMFC_LINE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An attempt to read the RLFC_LINE relation returned the failure code DBNO_MATCH. The keys were obtained from the RLPCBLA relation. The process control block link area (PCBLA) audit will be scheduled since it is likely that the dynamic data was in error.

27. NMFCTRSMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was encountered while reading the RLFC_TRUNK relation. The RLFC_TRUNK relation may be corrupted.

28. NMILL_CMD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal command request was entered.

29. NMIMPDIGITS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rNMIMPDGTS tuple was read successfully, but at least one of its fields is in error.

Possibly, the nxx field of the found tuple contains nulls, AND the call for which this tuple was looked up had under seven digits (an abbreviated signaling call). For abbreviated signaling calls, the nxx field MUST be filled in with the office code of the final destination; nulls ("") are not acceptable.

Data Structures:

RLNMIMPDGTS. Key fields: trntbl, steering, prefix

The fields from the tuple in error are dumped in this order: trntbl (type DMTRNTBL), steering (an array of length 3 of type DMNXX, padded on the right with nulls), npa (an array of length 3 of type DMNPA), nxx (an array of length 3 of type DMNXX), 5 bits of padding, and prefix (type DMPREFIX, 3 bits).

Action:

RC/V View 9.5 (INCOMING TRUNK DIGITS [OFFICE DIALING]) should be examined for correctness, specifically the implied nxx field.

30. NMINSANE_PROC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A network management (NM) process was corrupted. The process was purged.

31. NMIVAL_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Network management administration (NMA) is considered a "traffic controller" for all messages received from the engineering and administrative data acquisition system for NMA (EADAS/NM) or the NM on-site capability. A field within a message received by a system process or terminal process was unexpected; the assert fired and returned to the caller, where several small actions take place before the recovery action is complete.

32. NMIVNM_SCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network management (NM)-schedule is a list of trunk groups for which the network managers want to see trunk group reference data and 5-minute report associated data. Trunk group data on this list was destroyed; the assert fired and returned to the calling function for further recovery steps.

33. NMIWCCARG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid argument was passed to the base level inward wide area telecommunications service (INWATS) code control installation functions NMiwcc6() or NMiwcc10().

34. NMIWCHKARG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid argument was passed to the interject level inward wide area telecommunications service (INWATS) code control application function NMiwcc_chk().

35. NMIWCHKLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid 10-digit code control linkage was found in the interject level inward wide area telecommunications service (INWATS) code control application function NMiwcc_chk().

36. NMIWDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inward wide area telecommunications service (INWATS) code control data was corrupted in the interject level code control application function NMiwcc_chk().

37. NMIWLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid 10-digit code control linkage was found in the base level inward wide area telecommunications service (INWATS) code control installation function NMiwcc10().

38. NMKY_ARC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an attempt to read the dynamic relation RLNMDSNARC, the key in the returned tuple was not in legal range (1 to the size of the relation), or the office name in the returned tuple is not described in the static relation RLNMDCOFC. This office name serves as a link from the RLNMDSNARC relation to the RLNMDCOFC relation.

The RLNMDSNARC relation may have been corrupted due to problems in alternate route cancellation (ARC) functions or RC/V functions that resulted in changes to the relation. Another possibility is that the relation was overwritten by processes.

39. NMLDLSTOVFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An automatic call gapping (ACG) control was not installed because the numbering plan area (NPA) or revenue accounting office (RAO) that it is to control already has too many controls in place. The limit on the number of controls for the NPA or RAO was implemented for real-time performance reasons.

40. NMLIDBOVFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to install one or more network management (NM) controls for a NPA-NXX or RAO-0/1XX that is controlled by the line information database. The controls were not installed because the maximum number of controls is already in place. The #defined value LDLISTSZ defines this maximum value.

Action:

Fixing this problem involves a software change. If this event occurs often (several times a year), contact your next level of technical support to change the maximum number of controls from 64 to 100. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

41. NMLNDSCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the direct signaling code controls leased network (LN) data structures used to implement the list and tree structures. The possibilities include indices out of range, invalid duration or gap interval times, invalid digit information, stack corruption, invalid code control identifiers, unable to locate the requested control, or no more free nodes. This problem is self-correcting. An audit or initialization is done to control the problem.

42. NMMCLRSMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code was encountered while reading the data delivery (DD) key DDSLCLVL to determine the current overload level. This prohibits selective incoming load control (SILC) processing on this trunk.

43. NMMSGRSMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received from the NMamsilc terminal process with an erroneous data field. This situation should never occur. Work on this message is halted for this SM.

44. NMMSG_UNX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected network management (NM) message was encountered. The message is dumped.

45. NMNCDCCARG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid argument was passed to the base level function NMncdctl().

46. NMNCDCCDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The NMncdctl() function found corrupted data in the code control structure.

47. NMNCDCHKARG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid argument was passed to the interject level function NMncdchk().

48. NMNOCTIMER (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

A cyclic timer was requested during an initialization, but one could not be found.

49. NMNOPTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A valid rPORTLA tuple could not be accessed via the DAGETPTLA() primitive. The elevated audit requested should reconstruct the rPORTLA tuple from static data, and schedule the appropriate recovery.

Repeated asserts associated with the same port (the portname will usually be available in the assert stack trace, either as a parameter or a local variable associated with the function calling the assert) indicate that the recovery was not successful. It is possible that the corresponding rRFC_PORTTYP tuple is missing or corrupt. This static data relation should be interrogated with ODBE.

50. NMOFC_CODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLOFFICECODE relation failed with a DBNO_MATCH failure. The key used to read the relation was the normalized office code (NOC) from an rRFC_LINE tuple that was just read. An inconsistency exists between the RLFC_LINE relation and the RLOFFICE_CODE relation.

Data Structures:

RLOFFICECODE. Key field: noc.

RLFC_LINE. Key fields: port, party.

The keys used to access both relations are dumped in a single structure in the following order: port (type DMGPORT), party (type DMPARTY, 5 bits), and noc (type DMNOC, 8 bits).

Action:

With the port number from the dump as the key, use ODBE for the specified SM to read the rRFC_LINE tuple. Get the telephone number associated with the line from the bill_dn field and the noc from the locdn.noc field. Use RC/V View 8.2 (NOC CODES MISCELLANEOUS) to verify that the NXX from the telephone number maps into the noc. If they do not match, correct the noc in the rRFC_LINE tuple using ODBE or correct the noc using RC/V.

51. NMOPCCERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) network management (NM) code controls binary tree contains a

linkage error. The NM code controls are initialized for that OSPS application. If this assert occurs often, there is probably a software error in the tree manipulation primitives.

52. NMOPCCOVFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to install an operator services position system (OSPS) network management (NM) code control. The control was not installed because the maximum number of controls for that OSPS application is already in place. The maximum value for the different OSPS applications is #defined in the NMopcc.G header file.

Action:

Fixing this problem involves a software change. If this event occurs often (several times a year), contact AT&T Bell Laboratories to change the maximum number of controls for that OSPS application.

53. NM_OSAUBU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network management administration (NMA) audit buffer (nmar_blk) had an invalid message type in the msg_type field or an invalid control type in the cntltyp field.

54. NM_OSILMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal message was entered. Invalid data was found in the system process or terminal process message buffer.

55. NM_OSINVFLD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the system process message buffer action field or control type field.

56. NM_OSRETCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The NMrd1frm() function received an invalid return code from the NMcreatetp() function when creating the NMsitetp terminal process (TP).

57. NMPVNEROR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the private virtual network (PVN) automatic call gapping (ACG) data structures used to implement the list and tree structures. The possibilities include indices out of range, invalid duration or gap interval times, invalid digit information, stack corruption, invalid code control identifiers, or unable to locate the requested control.

58. NMQRYCHK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid argument was passed to a base level or interject level function.

59. NMQRYCNTL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Corrupt data was found in the code control structure.

60. NMQRYOVTBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An overloaded table was encountered. Could not add control for a numbering plan area (NPA).

61. NMRD_DCOFC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the static relation RLNMDCOFC failed with a reason other than GLSUCCESS or DBNO_MATCH, or the alternate route cancellation (ARC) ID in the returned rLNMDCOFC tuple was not in the valid range.

Data Structures:

RLNMDCOFC, RLNMDSNARC.

For case 1, the failure return code is dumped in decimal. For case 2, the invalid ARC ID value is dumped in decimal.

Action:

If the failure return code is DBOEMP_REL (= DB_FAIL-25), the RLNMDCOFC relation is empty. This is legal only if this office does not require ARC control capability. Otherwise, use the OP:DCOFC command, RC/V View 10.36 (DEFENSE SWITCHED NETWORK CONNECTED OFFICES), or ODBE (if necessary) to review the RLNMDCOFC relation. If the failure return code is not DBOEMP_REL, the system is encountering problems with database read. Observe the system activity for other trouble reports regarding the database.

If the problem resulted from an invalid ARC ID, this might be caused by office data administration (ODA) or previous recent change (RC) actions which planted an invalid ARC ID. Use RC/V View 10.36 (or ODBE, if necessary) to correct the invalid ARC ID. In all cases, use OP:ARC to list all active ARC controls and report the error to the network control managers.

62. NMSACT_DD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to write the data delivery (DD) key DDSLCACT failed. The selective incoming load control (SILC) activity status may be in error.

63. NMSBAD_TG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SILCTG	Audit Mode: elev

Problem:

While reading the RLSILCTG relation, a trunk group read failed that should have succeeded. An audit is called to remove the trunk group and update the associated SM trunk lists.

64. NMSDNDSCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the direct signaling code controls switched digital network (SDN) data structures used to implement the list and tree structures. The possibilities include indices out of range, invalid duration or gap interval times, invalid digit information, stack corruption, invalid code control identifiers, unable to locate the requested control, or no more free nodes. This problem is self-correcting. An audit or initialization is done to control the problem.

65. NMSP_ENTRY (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason code from the operating system for distributed switching (OSDS) was received in a network management (NM) system process.

66. NMSRTKG_DB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIRT_TRKG tuple failed.

67. NMSTG_DB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to insert, delete, clear, or read an rSILCTG tuple failed.

68. NMTKGDSMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKGSILC	Audit Mode: elev

Problem:

A failure return code was received while trying to delete an rTKGSILC tuple. This relation may be corrupted.

69. NMTKGISMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKGSILC	Audit Mode: elev

Problem:

A failure return code was received while trying to insert an rTKGSILC tuple. This relation may be corrupted.

70. NMTKGRSMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKGSILC	Audit Mode: elev

Problem:

A failure return code was received while trying to read an rTKGSILC tuple. The relation may be corrupted. The read

failure may have occurred in or out of a transaction.

71. NMTP_ENTRY (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A network management (NM) terminal process was created with an invalid reason from the operating system for distributed switching (OSDS). The terminal process will be terminated.

72. NMTP_STUCK (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A network management (NM) terminal process was executing too long and must be purged to free the resources associated with it.

73. NMUNEXMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by a network management (NM) function in the AM or SM.

Range: oa**1. INVALID_LPSTAT (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The loop status field in the MGPOSTRMRQ message contained an invalid loop status.

2. OA0000 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed.

3. OA0004 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when setting the keys used to read the RLFC_TRUNK relation, or the rIFC_TRUNK tuple is missing.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

In the first word of the data dump, the first two bytes are port.member, the next byte is filler, and the next byte is port.module.

Action:

Use RC/V (or ODBE, if necessary) to crosscheck the data set for the keys in the RLFC_TRUNK relation with the actual keys used to access the relation.

4. OA1_ACDRTFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distributor (ACD) request type included within an external information system (EIS) operating system for distributed switching (OSDS) message (internal format) was not expected when calling the message set 1 (OAMSET1) outgoing message translator function OASET1tout(). The unexpected ACD request type is dumped along with the OSDS message ID (message type) that the unexpected value was read from.

5. OA1_APPCDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) application code passed to the message set 1 (OAMSET1) outgoing translator function OASET1tout() was out of range. The EIS application code indicates the type of application (service) to be provided for the 5ESS[®] switch. The application code range for OAMSET1 is 1 to 999, inclusive; the internal message format supports values from 0 to 1023, inclusive. The unexpected application code is dumped along with the operating system for distributed switching (OSDS) message ID (message type) that the unexpected value was read from.

6. OA1CIDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) message set 1 incoming translator function OAsel1tin() detected an EIS call ID that is out of range; that is, greater than 0x1ffff. The EIS call ID, internal message type, and the EIS ID of the sending EIS are dumped.

7. OA1_MSGTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) operating system for distributed switching (OSDS) internal message type passed to the outgoing message translator function OAsel1tout() for message set 1 was not expected. That is, the OSDS message type passed is not included in the OAMSET1 message protocol. The unexpected OSDS message ID (internal message type) is dumped.

8. OA1_POSNMOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) position number passed to the external information system (EIS) outgoing message set 1 (OAMSET1) translator function OAsel1tout() was out of range. The range specified for the position number under the OAMSET1 interface specification is 1 through 9999, inclusive. Currently, OSPS only supports position numbers in the range of 1 to 4095, that is, twelve binary bits. This error code supports future expansion of the OSPS position number range. The out-of-range position number and the internal OSPS message ID (message type) from which the position number was read are dumped.

9. OA1SDNNRA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A software defined network (SDN) network remote access (NRA) call attempted to route to a non-CCS7 trunk. Since an SDN NRA call can not be routed via a non-CCS7 trunk, this call will not be completed.

Data Structures:

RLDA_DIGSTRT. Key field: digtree.

RLDAPRLDGT. Key fields: previous, digit.

RLDAPRLFNL. Key field: previous.

RLDAPRMDGT. Key fields: previous, digit.

RLDAPRMFNL. Key field: previous.

RLRT_SCRNING. Key fields: dest_x, screen_x, prefix.

RLRT_ROUTING. Key field: route_x.

The Glstdnds global parameter is also involved.

Action:

SDN NRA calls can only route to CCS7 trunks; a non-CCS7 trunk will be blocked. An SDN NRA call passed digit analysis and routing, but routed to a non-CCS7 trunk. The ROP output includes the dialed digits along with the screen index and digit analysis selector (DAS) used for this call. This should be enough information to trace through the digit analysis and routing office records to determine at what step the problem was introduced.

10. OA1VMS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Voice messaging service interface (VMSI) transfer was routed to the enhanced services provider (ESP) over a non-CCS7 trunk, but the ESPINFO table in office record 5472 and RC/V View 27.65 (VOICE MESSAGING SERVICE INTERFACE) has the CCS7SIG field set to DBYES, this is an inconsistency.

The CCS7SIG field is an indicator that specifies how the VMS call data will be transmitted to the ESP. If CCS7SIG is set to DBYES, the call data will be sent via common channel signaling system 7 (CCS7) signaling during the call setup. If CCS7SIG is set to DBNO, the call data will be sent to the VMS via dual tone multifrequency (DTMF) signaling once the call is completed.

The call cannot be transferred to the VMS, so the call is idled.

Action:

Modify the routing data so that only CCS7 trunks are used, or change the value of the CCS7SIG field to DBNO if the traditional DTMF signaling should be used to transfer the call data to the ESP. The ROP output includes the dialed digits and other routing data to help analysis the routing of this call.

11. OA1XATINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin(), received an MGOA1TRNS_REQ message with an announcement type that is not consistent with the route type specified in the RLSRV_DEST relation. Route types operator (OPER) and route index external announcement should indicate the null announcement type of 255; and route types route index internal announcement and fixed index internal announcement should indicate an announcement type between 1 and 254, inclusive. The announcement type, EIS ID, and service destination ID are dumped; the last two parameters are the keys for RC/V View 21.53 (OSPS DESTINATION DATA FOR LISTING SERVICES CALLS).

12. OA1XBMOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin(), exceeded the capacity of the internal operating system for distributed switching (OSDS) message billing module array due to the receipt of more billing data than expected. The internal OSPS message ID (message type) associated with the external message is dumped.

13. OA1XBTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin(), received an external message containing an unexpected billing module type. The unexpected billing module type is dumped along with the internal operating system for distributed switching (OSDS) message ID (message type) associated with the external message.

14. OA1XCOCBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin(), received an external message with an unexpected class of charge code. The unexpected class of charge value is dumped along with the internal operating system for distributed switching (OSDS) message ID (message type) associated with the external message.

15. OA1XDTINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin(), received an unexpected data type in the listing number data fields of the MGOA1TRNS_REQ external message. The unexpected data type value is dumped.

16. OA1XFDVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin(), upon receipt of the MGOA1TRNS_REQ message, exceeded the size of the internal operating system for distributed switching (OSDS) message field_data[] array. The EIS sent more field data than the 5ESS[®] switch expected, or the external message data was corrupted, which may imply more data than was really sent.

17. OA1XICOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin() received an external message containing incorrect billing information for an intercept call. The billing option selected in the COMPLETE CALL message is incorrect, or the class of charge in the LISTING ACCESS COMPLETE message is incorrect. The external message ID is dumped along with the incorrect value received.

18. OA1XMTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin(), received an unexpected external message type. The unexpected message ID is dumped.

19. OA1XPNBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 1 translator function oa/OAeis/OAset1tin(), received an incoming message that contains a position number that cannot be converted to a binary value. The most significant byte, least significant byte, and associated internal operating

system for distributed switching (OSDS) message ID (message type) are dumped.

20. OA1XPNOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) incoming message set 1 (OAMSET1) translator function oa/OAeis/OAset1tin(), received an external message with a position number that is out of range. The unexpected position number and the corresponding internal operator services position system (OSPS) message ID (message type) are dumped.

21. OA2_ACDRTFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distributor (ACD) request type included in an external information system (EIS) operating system for distributed switching (OSDS) message (internal format) was unexpected when calling the message set 2 (OAMSET2) outgoing message translator function OAset2tout(). The unexpected ACD request type is dumped along with the OSDS message ID (message type).

22. OA2ACoor (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 2 (OAMSET2) translator function OAset2tin() received an invalid auto collect option from an external message. The unexpected auto collect option is dumped.

23. OA2_ARUIDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) audible response unit (ARU) trunk group member number passed to the external information system (EIS) outgoing message set 2 (OAMSET2) translator function OAset2tout() was greater than the range specified for the trunk group given.

Action:

Check RC/V View 21.58 (OSPS PORT RANGES FOR IBM DA SYSTEM) to verify that the range of member numbers for a given trunk group does not exceed the range dumped. If it does, the trunk group must be changed to the limit defined by the range given.

24. OA2_MSGTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) operating system for distributed switching (OSDS) internal message type passed to the outgoing message translator function OAset2tout() for message set 2 was unexpected; that is, the OSDS message type passed is not included in the OAMSET2 message protocol. The unexpected OSDS message ID (internal message type) is dumped.

25. OA2POSID_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 2 (OAMSET2) translator function OASET2tin() received an invalid position ID. The invalid position ID is dumped.

26. OA2_POSIDOOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) position number (defined in RC/V View 21.32 [POSITION TO PORT MAPPING]) passed to the external information system (EIS) outgoing message set 2 (OAMSET2) translator function OASET2tout() was out of range.

The range specified for the position number is global parameter Glposmn through (Glposmn + Glposrn - 1), inclusive. The out-of-range position number and the internal OSPS message ID (message type) corresponding to the position number, are dumped.

Action:

Check RC/V View 21.58 (OSPS PORT RANGES FOR IBM DA SYSTEM) to verify that all OSPS position numbers associated with an IBM digit analysis selector (DAS) are bounded (inclusive) between the minimum and maximum position numbers defined on RC/V View 21.58.

27. OA2XMTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 2 (OAMSET2) translator function OASET2tin() received an unexpected external message type. The unexpected message ID is dumped.

28. OA0033 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was encountered in the operator services code. The message header is dumped.

29. OA3_APPCDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) application code passed to the message set 3 (OAMSET3) outgoing translator function OASET3tout() was out of range. The EIS application code indicates to the EIS the type of application (service) to be provided for the 5ESS[®] switch.

The application code range for OAMSET3 is 1 to 999, inclusive; the internal message format supports values from 0 to 1023, inclusive. The unexpected application code is dumped along with the operating system for distributed switching (OSDS) message ID (message type) from which the unexpected value was read.

30. OA3BADBNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function `oa/OAeis/OAset3tin()` received an external message containing an invalid billing number module (module code 0x076c). The billing module is dumped and an action denied message is sent to the EIS.

31. OA3BADVER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only when the operator services position system (OSPS) external information system (EIS) global variable `OAeisim` is set to `DBYES`. The EIS sent a message over a link that resulted in a link takeover scenario. The version ID in the message was within the range supported by the switch, but was of a greater value than the version assigned to the link. This is an error because the link decides the version level.

The incoming message, `rEIS_LNK` tuple, and version ID from the message are dumped. This assert is reported for message set 3 (Computer Generation Incorporated) only.

Probable Cause:

The EIS system might have transferred the call from a processor that was running a higher level version to a processor running a lower level version.

Action:

Contact field support personnel.

32. OA3BBOPTINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints when the external information system (EIS) global flag `OAeisim` is set to `DBYES`. The EIS incoming message translator for message set 3 (OAMSET3) detected an invalid billing option in the `BEGIN BILLING` message. The value is in the first byte of the data dump.

33. OA3BDEISVER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the operator services position system (OSPS) external information system (EIS) interface, this assert only prints when the global variable `OAeisim` is set to `DBYES` (1). The external vendor system sent a version ID in a heartbeat message that was not in the range of values supported by the OSPS. The external vendor system is associated with message set 3 (CGI).

The heartbeat message, the OSPS software version for message set 3, and the `rEIS_LNK` tuple associated with the data link the message arrived over are dumped.

Probable Cause:

The external vendor system and the OSPS are running incompatible versions of the interface software.

Action:

Report the problem immediately to field support personnel.

34. OA3BDVER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only when the operator services position system (OSPS) external information system global variable OAeisim is set to DBYES (1). The external vendor system (Computer Generation Incorporated message set 3) sent OSPS a message that resulted in a link takeover scenario. The version ID sent in the message was out of the range supported by OSPS. The incoming message, the version level currently supported by OSPS, and the rEIS_LNK tuple associated with the data link that the call arrived over are dumped.

Probable Cause:

OSPS or EIS is operating with an invalid version of the interface.

Action:

Alert field support personnel.

35. OA3BLFVER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only when the operator services position system (OSPS) external information system (EIS) global variable OAeisim is set to DBYES. The EIS sent a message over a link that resulted in a link following scenario. The version ID in the message was within the range supported by the switch, but was of greater value than the version assigned to the link. This is an error because the link decides the version level.

The rEIS_LNK tuple associated with the link the message was received on, the rEIS_LNK tuple associated with the link the call was originally assigned to, and the rEISCALL tuple assigned to the call are dumped. This assert is reported for message set 3 (Computer Generation Incorporated) only.

Probable Cause:

The EIS system might have transferred the call from a processor that was running a higher level version to a processor running a lower level version.

Action:

Contact field support.

36. OA3BOPTINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) incoming message translator for message set 3 (OAMSET3) detected an invalid billing option selected field. The value is in the first byte of the data dump.

37. OA3CIDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) message set 3 incoming translator function OASet3tin() detected an EIS call ID that is out of range (greater than 0x1ffff). The EIS call ID, the internal message type being translated at the time the error was found, and the EIS ID of the sending EIS are dumped.

38. OA3EISVOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) version ID specified in the dynamic relation RLEIS_LNK was out of range. The rLEIS_LNK tuple and the version currently supported on the switch are dumped.

Probable Cause:

A wild process write or an error in software logic regarding the initialization or update of the version ID may have occurred.

Action:

Report the problem to field support personnel.

39. OA3MSGTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) operating system for distributed switching (OSDS) internal message type passed to the outgoing message translator for message set 3 function OAs3tout() was unexpected; that is, the message type is not included in the OAMSET3 message protocol. The unexpected message ID (internal message type) is dumped on the ROP.

40. OA3OTRANFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert only prints when the operator services position system (OSPS) external information system (EIS) integrity monitor flag OAeisim is set to DBYES (1). A message set 3 translator could not be assigned to an outgoing EIS message. The outgoing message, version ID assigned to the call, and rLEISCALL tuple are dumped. The outgoing message is dropped.

Probable Cause:

Most likely, the switch was upgraded to a new version ID for the message set and no longer supports the version being used by the external vendor. This is a coordination problem between the switch and the external vendor.

Action:

The external vendor needs to upgrade their version, or the switch needs to go back to an older version.

41. OA3RTNMFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only when the external information system (EIS) global variable OAeisim is set to DBYES. The EIS incoming message translator for message set 3 (OAMSET3) failed to convert a routing number (supplied in the routing number module) from compact binary coded decimal (BCD) to domain directory number (DMDN) format. The incoming message buffer, incoming message type, and billing module type are dumped.

Probable Cause:

The EIS sent an invalid routing number, or operator services position system (OSPS) incorrectly translated the number supplied.

Action:

Contact OSPS field support personnel.

42. OA3TRANFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert only prints when the operator services position system (OSPS) external information system (EIS) integrity monitor flag OAeisim is set to DBYES (1). A message set 3 translator could not be assigned to an incoming EIS message. The incoming message and the version ID sent in the message are dumped. The incoming message is dropped.

Probable Cause:

Most likely, the switch was upgraded to a new version ID for the message set and no longer supports the version being used by the external vendor. This is a coordination problem between the switch and the external vendor.

Action:

The external vendor needs to upgrade their version, or the switch needs to go back to an older version.

43. OA3XBCF1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing more than one data module (module code 0x707c or 0x709c). The billing modules are dumped.

44. OA3XBCF2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 1 data module (0x707c) with a release 2 feature module (0x70ac). The billing modules are dumped.

45. OA3XBCF3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 2 data module (0x709c) when the feature was not activated. The billing modules are dumped.

46. OA3XBCF4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 2 data module (0x709c) with another data module (0x707c or 0x709c). The billing modules are dumped.

47. OA3XBCF5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 2 feature module (0x70ac) when the feature has not been activated. The billing modules are dumped.

48. OA3XBCF6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing multiple release 2 feature modules (0x70ac). The billing modules are dumped.

49. OA3XBCF7 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 2 feature module (0x70ac) with a release 1 data module (0x707c). The billing modules are dumped.

50. OA3XBCF8 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing more billing modules than will fit in the internal message buffer. The billing modules are dumped.

51. OA3XBCF9 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 2 feature module (0x70ac) with an invalid feature flag. The billing modules are dumped.

52. OA3XBCFA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 2 feature module (0x70ac) with a forced return timer value that was out of range. The billing modules are dumped.

53. OA3XBCFB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 2 feature

module (0x70ac) with a busy/no answer timer value that was out of range. The billing modules are dumped.

54. OA3XBCFC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received a routing number module (module code 0x705c) in an external message that is not a complete call message.

55. OA3XBCFD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing a release 2 feature module (0x70ac) with a platform billing indicator that is set improperly. This indicator must be set to 1 for a begin billing message.

56. OA3XBMOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() exceeded the capacity of the internal operating system for distributed switching (OSDS) message billing module array due to receipt of more billing data than expected. The internal OSDS message ID (message type) associated with the external message is dumped.

57. OA3XBTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an external message containing an unexpected billing module type. The unexpected billing module type and the internal operating system for distributed switching (OSDS) message ID (message type) associated with the external message are dumped.

58. OA3XMTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 3 (OAMSET3) translator function oa/OAeis/OAset3tin() received an unexpected external message type. The unexpected message ID is dumped.

59. OA0046 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid TYPE_CI_CALL value was encountered. One of the following situations was detected:

- 1) an invalid combination of TYPE_CI_CALL (FCCI_NULL) and ROW_TYPE
- 2) an undefined TYPE_CI_CALL value
- 3) the TYPE_CI_CALL is AD1 with no carrier prefix (10XXX) dialed

Data Structures:

The following information is dumped to the ROP (in hex):

The first data dump contains the digit count (first half byte) and dialed digits (one byte per digit; subtract hex 30 from each).

The second data dump contains the digtree value (bytes 0 and 1) and the TYPE_CI_CALL value (bytes 2 and 3).

Action:

Use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]), View 9.2 (PREFIX/FEATURE DIGIT [OFFICE DIALING]), or View 9.5 (INCOMING TRUNK DIGITS [OFFICE DIALING]) to verify the TYPE_CI_CALL value and correct the error.

60. OA0048 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rRFC_WZ1 tuple is missing.

Data Structures:

RLFC_WZ1.

The first data dump contains the numbering plan area (NPA) in hex (bytes 0, 1, and 2; one byte per digit; subtract hex 30 from each).

Action:

Use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) (or ODBE, if necessary) to insert an rRFC_WZ1 tuple (WZ1 REGION field).

61. OA4_ACDRTFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distributor (ACD) request type in an external information system (EIS) operating system for distributed switching (OSDS) message (internal format) was unexpected when the message set 4 (OAMSET4) outgoing message translator function OASET4tout() was called. The unexpected ACD request type is dumped along with the OSDS message ID (message type).

62. OA4_APPCDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) application code passed to the message set 4 (OAMSET4) outgoing translator function OASET4tout() was out of range. The EIS application code indicates to the EIS the type of application (service) to be provided for the 5ESS[®] switch.

The application code range for OAMSET4 is 1 to 999, inclusive; the internal message format supports values from 0 to 1023, inclusive. The unexpected application code is dumped along with the operating system for distributed

switching (OSDS) message ID (message type).

63. OA4CIDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) message set 4 incoming translator function OAset4tin() detected an EIS call ID that is out of range, that is, greater than 0x1ffff. The EIS call ID, internal message type, and the EIS ID for the sending EIS are dumped.

64. OA4_MSGTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) operating system for distributed switching (OSDS) internal message type passed to the outgoing message translator function for message set 4 OAset4tout() was unexpected; that is, the OSDS message type is not included in the OAMSET4 message protocol. The unexpected OSDS message ID (internal message type) is dumped.

65. OA4_POSNMOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) position number passed to the external information system (EIS) outgoing message set 4 (OAMSET4) translator function OAset4tout() was out of range. The range specified for the position number under the OAMSET4 interface specification is 1 through 9999, inclusive.

Currently, OSPS only supports position numbers in the range of 1 to 4095, that is, twelve binary bits. This error code supports future expansion of the OSPS position number range. The out-of-range position number and the internal OSPS message ID (message type) for the message that the unexpected value was read from are dumped.

66. OA4XATINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) incoming message set 4 (OAMSET4) translator function oa/OAeis/OAset4tin() received an OA4TRNS_REQ message with an announcement type that is not consistent with the route type specified in the RLSRV_DEST relation in RC/V View 21.53 (OSPS DESTINATION DATA FOR LISTING SERVICES CALLS).

Route types operator (OPER) and route index external announcement should indicate the null announcement type of 255; route types route index internal announcement and fixed index internal announcement should indicate an announcement type between 1 and 254, inclusive. The announcement type, EIS ID, and service destination ID are dumped; the latter two parameters are the keys for View 21.53.

67. OA4XBMOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 4 (OAMSET4) translator function oa/OAeis/OAset4tin() exceeded the capacity of the internal operating system for

distributed switching (OSDS) message billing module array due to receipt of more billing data than expected. The internal OSPS message ID (message type) associated with the external message is dumped.

68. OA4XBTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 4 (OAMSET4) translator function oa/OAeis/OAset4tin() received an external message containing an unexpected billing module type. The unexpected billing module type is dumped along with the internal OSDS message ID (message type) associated with the external message.

69. OA4XDTINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 4 (OAMSET4) translator function oa/OAeis/OAset4tin() received an unexpected data type in the listing number data fields of the OA4TRNS_REQ external message. The unexpected data type value is dumped.

70. OA4XFDOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When the operator services position system (OSPS) external information system (EIS) incoming message set 4 (OAMSET4) translator function oa/OAeis/OAset4tin() received the OA4TRNS_REQ message, it exceeded the size of the internal operating system for distributed switching (OSDS) message field_data array. The EIS sent more field data than the 5ESS[®] switch expected, or the external message data was corrupted, which may imply more data than was really sent.

71. OA4XICOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 4 (OAMSET4) translator function oa/OAeis/OAset4tin() received an external message containing incorrect billing information for an intercept call. The billing option selected in the COMPLETE CALL message is incorrect, or the class of charge in the LISTING ACCESS COMPLETE message is incorrect. The external message ID is dumped along with the incorrect value received.

72. OA4XMTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 4 (OAMSET4) translator function oa/OAeis/OAset4tin() received an unexpected external message type. The unexpected message ID is dumped.

73. OA4XPNBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 4 translator function oa/OAeis/OAset4tin() received an incoming message with a position number that could not be converted to a binary value. The most significant byte, least significant byte, and associated internal OSDS message ID (message type) are dumped.

74. OA4XPNOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) incoming message set 4 (OAMSET4) translator function oa/OAeis/OAset4tin() received an external message with a position number that was out of range. The invalid position number and the corresponding internal operator services position system (OSPS) message ID (message type) are dumped.

75. OA0050 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Modular feature construction (MFC)/feature execution (FEX) received an error return code from a dynamic access (DA) primitive. The error may be an invalid linkage in the process control block link area (PCBLA)-associated process block (APB) set. FEX could not recover from this error.

76. OA0052 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAatpcap() primitive failed to return the associated process block (APB) to the APB idle list during a subprocess suicide.

77. OA0054 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator actions (OA) feature execution (FEX) had an invalid digit analysis request flag. It could not invoke digit analysis or parameter collection.

78. OA0057 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A subprocess had an invalid state and caused a single process purge. The process control block link area (PCBLA) and related associated process blocks (APBs) are dumped on the ROP. The layout of the APB data dumped is found in the file fc/hdr/MCcmmsgtxt.L in the typedef named MCASRT_APB.

79. OA0058 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A subprocess received an invalid message and caused a single process purge. The process control block link area (PCBLA) and related associated process blocks (APBs) are dumped on the ROP.

80. OA0059 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Too many JOINSTATE in a master control center (MCC) terminal process. There may be an infinite loop of "JOIN".

81. OA5_APPCDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application code range for OAMSET5 is 1 to 999, inclusive; the internal message format supports values from 0 to 1025, inclusive. The unexpected application code is dumped along with the operating system for distributed switching (OSDS) message ID (message type) from which the unexpected value was read.

Probable Cause:

The application code used by the process sending this message has become corrupted.

Action:

Report the problem immediately to field support personnel.

82. OA5BADBNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 5 (OAMSET5) translator function OAs5tin. received an external message containing an invalid billing number (module code 0x106c). The billing module and the message ID received from the EIS vendor are dumped.

Probable Cause:

The Tele-Matic Inmate Calling System has sent invalid data to OSPS.

Action:

Contact Tele-Matic Inc. field support.

83. OA5BBOPTINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 5 (OAMSET5) detected an invalid billing option in the BEGIN BILLING message. The value is in the first byte of the data dump.

Probable Cause:

The Tele-Matic Inmate Calling Services system sent invalid data to OSPS.

Action:

Contact Tele-Matic Inc. field support.

84. OA5BDEISVER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only if the external information system (EIS) global flag OAeisim is set to DBYES. The external vendor system sent a version ID in a heartbeat message that was not in the range of values supported by the OSPS. The external vendor system is associated with message set 5 (Tele-Matic Inc).

The heartbeat message, the OSPS software version for message set 5, and the rIEIS_LNK tuple associated with the data link the message arrived over are dumped.

Probable Cause:

The external vendor system and the OSPS are running incompatible versions of the interface software.

Action:

Report the problem immediately to field support personnel.

85. OA5BDN_DCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS vendor for an Inmate Calling Services call has sent a FORWARD NUMBER CHECK AND DATABASE QUERY REQUEST message to OSPS with a pre-paid class of charge, but has not included a valid billing number in the billing number module (module code 0x106c). The number of digits received in the module is printed.

Probable Cause:

The external vendor system has sent an invalid billing number module.

Action:

Report the problem immediately to field support personnel.

86. OA5BDN_MISS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints when the external information system (EIS) global flag OAeisim is set to DBYES. The EIS vendor for an Inmate Calling Services call has sent a BEGIN BILLING message to OSPS with a pre-paid class of charge, but has not included a valid number in the billing number module (module code 0x106c). This request is rejected by the OSPS.

Probable Cause:

The external vendor system has sent an invalid billing number module.

Action:

Report the problem immediately to field support personnel.

87. OA5BINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert fires when an invalid initial action is found for an Inmate Calling Services call.

Data Structures:

RLSERVDATA, key = serv_id.

Action:

The 5ESS® switch data has the initial action for this call, with the printed SERV_ID, as sending the call to an operator. This action is not valid for an Inmate Calling Services call. Use RC/V View 21.54 (OSPS SERVICE DATA FOR LISTING SERVICES CALLS) to change the initial action for this service.

88. OA5B_NMATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The billing number for an Inmate Calling Services call does not agree with 5ESS® switch data.

Data Structures:

RLSERVDATA, key=serv_id.

Action:

This assert fires when the billing number sent to the operator services position system (OSPS) by the external information system (EIS) vendor does not match the one provisioned in the 5ESS® switch data. The number sent to OSPS in a FORWARD NUMBER CHECK AND DATABASE QUERY REQUEST message from Tele-Matic Inc for an Inmate Calling Services call is compared against 5ESS® switch data. Since these two numbers do not match, one system must be updated. Determine which of the two printed billing numbers is incorrect. If the 5ESS® switch billing number is wrong, use RC/V View 21.54 (OSPS SERVICE DATA FOR LISTING SERVICES CALLS), keyed with the printed SRV ID, to update the billing number in the 5ESS® switch data. If the EIS billing number is wrong, the Tele-Matic Inc system must be updated to use the correct number.

89. OA5BNUM_CHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The billing number received from the EIS vendor (Tele-Matic Inc) for an Inmate Calling Services call has changed. The original billing number received in the FORWARD NUMBER CHECK AND DATABASE QUERY REQUEST message and stored in a DMDN in the call record is dumped and the changed number received in the BEGIN BILLING message is dumped.

Probable Cause:

The EIS software has improperly changed the billing number.

Action:

Contact Tele-Matic customer support.

90. OA5BOPTINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 5 (OAMSET5) detected an invalid billing option in the FORWARD NUMBER CHECK AND DATABASE QUERY REQUEST message. The value is in the first byte of the data dump.

Probable Cause:

The EIS database software has sent an invalid billing option to OSPS.

Action:

Contact customer support for Tele-Matic Inc.

91. OA5CIDDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) message set 5 incoming translator function OAs5tin or message set 6 incoming translator function OAs6tin detected an EIS call ID that is out of range (greater than 0x1ffff). The EIS call ID, the text of the message being translated at the time the error was found, and the EIS ID of the sending EIS are dumped. The message ID is the first byte of the message text.

Probable Cause:

An invalid EIS call ID was received from the EIS vendor.

Action:

Contact Tele-Matic customer support if message set 5 or OSPS field support if message set 6.

92. OA5COC_CHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The class of charge received from the EIS vendor (Tele-Matic) for an Inmate Calling Services call has changed. The first byte in the first dump is the class of charge received in the FORWARD NUMBER CHECK AND DATABASE QUERY REQUEST message and the first byte in the second dump is the changed class of charge from the BEGIN BILLING message. A value of 06 means pre-paid, while 02 is collect.

Probable Cause:

The external vendor system has changed the class of charge for the cause.

Action:

Report the problem immediately to field support personnel.

93. OA5DIOR_ICS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A international originating number is identified as an inmate line.

Data Structures:

RLFCNPAMAP, key=bnpa,bnxx RLFCSCRLNE, key=lnoc,lnum RLFCSCRRNG, key=tupnum,lnoc RLOLSR, key=scrncode

Action:

This assert fires when an international number is defined in 5ESS[®] switch data as an inmate line. When found, this provisioning error is reported and the USA Direct call is sent to an operator for proper handling. Determine the originating line screening code associated with the printed originating line number from RC/V View 26.2 (LINE SCREENING). There is then an entry in RC/V View 26.3 (OSPS BACK SCREEN CODE TABLE) with the ICS TREAT field marked Y. Either the originating line has the wrong screening code assigned to it or the ICS TREAT field for the screening code should be set to N.

94. OA5MSGTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) operating system for distributed switching (OSDS) internal message type passed to the outgoing message translator for message set 5 function OAs5tout was unexpected; that is, the message type is not included in the OAMSET5 message protocol. The unexpected message ID (internal message type) is dumped on the ROP.

Probable Cause:

Internal 5ESS® switch call processing error - sending an unexpected message for an Inmate Call.

Action:

Report the problem immediately to field support personnel.

95. OA5NO_SRV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call from a line marked for Inmate Calling Services is not being served.

Data Structures:

RLFCNPAMAP, key=bnpa,bnxx RLFCSCLNE, key=lnoc,lnum RLFCSCLRRNG, key=tupnum,lnoc RLOLSR, key=scrncode

Action:

This assert is fired when an Inmate Calling Services call arrives and is not going to receive service. The reason for denying service is one of the following: the call arrived over an 800 access trunk, the originating line is identified as a coin line, the originating line is identified as receiving telephone relay service (TRS) or the call is received from a wireless provider. The originating line number and trunk group number are printed. If the line is improperly identified as an inmate call, use the LINE SCREENING view (RC/V View 26.2) to determine the Originating Line Screening code associated with the originating line number. Then, use the OSPS BACK SCREEN CODE TABLE view (RC/V26.3), keyed by the screening code, to set the ICS TREAT field to N.

96. OA5SRV_BDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid billing number for an Inmate Call is found in the 5ESS® switch data.

Data Structures:

RLSERVDATA, key=serv_id.

Action:

The assert fires when an invalid billing number is found in the 5ESS® switch data. The SVC ID associated with the Inmate Calling Services call is printed. This value is used as the key to the OSPS SERVICE DATA FOR LISTING SERVICES CALLS view (RC/V View 21.54). The billing number for the Inmate Calling Services call must be specified on this view.

97. OA5XBMOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 5 (OAMSET5) has exceeded the capacity of the internal operating system for distributed switching (OSDS) message billing module array due to receipt of more billing data than expected. The

internal OSDS message ID (message type) associated with the external message is dumped.

Probable Cause:

The billing modules received from the EIS vendor (Tele-Matic) was greater than what OSPS expects or handles.

Action:

Report the problem immediately to field support personnel.

98. OA5XBTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 5 (OAMSET5) received an external message containing an unexpected billing module type. The unexpected billing module type and the internal operating system for distributed switching message ID (message type) associated with the external message are dumped.

Probable Cause:

The EIS vendor (Tele-Matic) has sent a billing module with an unknown module ID.

Action:

Report the problem immediately to field support personnel.

99. OA5XMTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 5 (OAMSET5) received an unexpected external message type. The text of the unexpected message is dumped. The first byte is the message ID.

Probable Cause:

The EIS vendor (Tele-Matic) has sent a message to the 5ESS[®] switch that is not in the agreed upon message set.

Action:

Report the problem immediately to field support personnel.

100. OA6_AAPCDOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) operating system for distributed switching (OSDS) internal message type passed to the outgoing message translator for message set 6 function OAs6tout was unexpected; that is, the message type is not included in the OAMSET6 message protocol. The unexpected message ID (internal message type) is dumped on the ROP.

Probable Cause:

Internal 5ESS[®] switch call processing error - sending an unexpected message for a Customer Services Data Unit (CDSU) call.

Action:

Contact OSPS field support personnel.

101. OA6BCALL_TR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 6 (OAMSET6) detected an invalid call treatment option in the COMPLETE CALL message. The value received from the Customer Services Data Unit (CDSU) is in the first byte of the data dump.

Probable Cause:

The CDSU software has sent an invalid call treatment option to OSPS.

Action:

Contact OSPS field support personnel.

102. OA6BDEISVER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only if the external information system (EIS) global flag OAeisim is set to DBYES. The external vendor system sent a version ID in a heartbeat message that was not in the range of values supported by the OSPS. The external vendor system is associated with message set 6 (CDSU)

The heartbeat message, the OSPS software version for message set 6, and the rEIS_LNK tuple associated with the data link the message arrived over are dumped.

Probable Cause:

The EIS and the OSPS are running incompatible versions of the interface software.

Action:

Report the problem immediately to field support personnel.

103. OA6BDTMF_OPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 6 (OAMSET6) detected an invalid dtmf/speech indicator in the COMPLETE CALL MESSAGE received from the Customer Services Data Unit (CDSU). The value is in the first byte of the data dump.

Probable Cause:

The CDSU software sent invalid data to OSPS.

Action:

Contact OSPS field support personnel.

104. OA6BNMF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming

message translator for message set 6 (OAMSET6) found invalid compact binary coded decimal (BCD) data in the billing number supplied by the CDSU in the CDSU Billing number module. The incoming message buffer, incoming message type, and billing module type are dumped.

Probable Cause:

The Customer Services Data Unit (CDSU) software sent an invalid billing number or OSPS incorrectly translated the number supplied.

Action:

Contact OSPS field support personnel.

105. OA6CNMFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 6 (OAMSET6) failed to convert a called number (supplied in the CDSU Called number module) from compact binary coded decimal (BCD) to domain directory number (DMDN) format. The incoming message buffer, incoming message type, and called module type are dumped.

Probable Cause:

The Customer Services Data Unit (CDSU) software sent an invalid called number or OSPS incorrectly translated the number supplied.

Action:

Contact OSPS field support personnel.

106. OA6LKTKO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Customer Services Data Unit (CDSU) returned at least one message to OSPS over a Call Processing Data Link (CPDL) that terminates on an SM that is different from the one initially used to communicate with the CDSU. All CPDLs from one CDSU must all terminate on a single SM. The eis_id and the number of the SM originally used are dumped.

Probable Cause:

CPDLs from one CDSU terminate on different SMs.

Action:

For each CDSU, verify that all of its CPDLs terminate to a single SM. For each SM with CDSU CPDLs, verify that all CPDLs originate from a single CDSU.

107. OA6MOD_MISS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 6 (OAMSET6) received a COMPLETE CALL message from the Customer Services Data Unit (CDSU) with a call treatment type of external transfer, but the message did not contain the required routing number module (0x105c).

Probable Cause:

The CDSU software sent OSPS a message with a required field missing.

Action:

Contact OSPS field support personnel.

108. OA6MSGTYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) operating system for distributed switching (OSDS) internal message type passed to the outgoing message translator for message set 6 function OAs6tout was unexpected; that is, the message type is not included in the OAMSET6 message protocol. The unexpected message ID (internal message type) is dumped on the ROP.

Probable Cause:

Internal 5ESS[®] switch call processing error - sending an unexpected message for a Customer Services Data Unit (CDSU) call.

Action:

Contact OSPS field support personnel.

109. OA6RTE_FL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. OSPS has been instructed by the Customer Services Data Unit (CDSU) to transfer a call to an external number, but cannot do so. The transfer failed because either the number sent by the CDSU is not provisioned in the 5ESS[®] switch digit analysis data or the number is invalid or the number is not an 800/888 or 129 format number.

Data Structures:

RLDA_DIGSTRT. Key field: digtree. RLDAPRLDGT. Key fields: previous, digit. RLDAPRLFNL. Key field: previous. RLDAPRMDGT. Key fields: previous, digit. RLDAPRMFNL. Key field: previous.

Action:

If the number sent by the CDSU is valid, use Recent Change to provision it on the 5ESS[®] switch. If the number sent by the CDSU is not valid, provisioned data on the CDSU must be changed.

110. OA6RTNFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 6 (OAMSET6) failed to convert a routing number (supplied in the routing number module) from compact binary coded decimal (BCD) to domain directory number (DMDN) format. The incoming message buffer, incoming message type, and billing module type are dumped.

Probable Cause:

The Customer Services Data Unit (CDSU) sent an invalid routing number, or OSPS incorrectly translated the number supplied.

Action:

Contact OSPS field support personnel.

111. OA6XBMOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 6 (OAMSET6) has exceeded the capacity of the internal operating system for distributed switching (OSDS) message billing module array due to receipt of more billing data than expected. The internal OSDS message ID (message type) associated with the external message is dumped.

Probable Cause:

The billing modules received from the Customer Services Data Unit (CDSU) is greater than what OSPS expects or handles.

Action:

Contact OSPS field support personnel.

112. OA6XBTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 6 (OAMSET6) received an external message containing an unexpected billing module type. The unexpected billing module type and the internal operating system for distributed switching message ID (message type) associated with the external message are dumped.

Probable Cause:

The Customer Services Data Unit (CDSU) has sent a billing module with an unknown module ID.

Action:

Contact OSPS field support personnel.

113. OA6XMYPEFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints if the external information system (EIS) global flag OAeisim is set to DBYES. The EIS incoming message translator for message set 6 (OAMSET6) received an unexpected external message type from the Customer Services Data Unit (CDSU) or the length of the message did not match what is defined in the interface specification. The text of the message is dumped. The first byte of the dump is the message ID.

Probable Cause:

The CDSU software has sent a message to the 5ESS[®] switch that is not in the agreed upon message set.

Action:

Contact OSPS field support personnel.

114. OA7BADHIL (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) message set 7 incoming translation function OAetp7emsg() detected a Harris host interface link (HIL) circuit ID that can not be mapped to an

internal 5ESS® switch call ID. The mapping from HIL circuit ID to call ID is done with the dynamic relation RLHAR_CODE. The external message type and HIL circuit ID are dumped.

Probable Cause:

Harris operator system has routed call control messages to incorrect location.

Action:

Contact OSPS field support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

115. OA7INVEMSG (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) incoming message set 7 translator function OASET7tin() received an unexpected external message type. The unexpected message ID is dumped.

Probable Cause:

Harris operator system has sent a message not supported by OSPS.

Action:

Contact OSPS field support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

116. OA7INVIMSG (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) translator function for 5ESS® switch OSDS messages OASET7tou() received an unexpected message type. The message type is dumped.

Probable Cause:

An attempt to send an un-supported message was made.

Action:

Contact OSPS field support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

117. OA7LKTKO (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Harris External System returned at least one message to OSPS over a call processing data link (CPDL) that terminates on a SM that is different from the one initially used to communicate with the Harris System. All CPDLs from one Harris System must terminate on a single SM. The eis_id and the number of the SM originally used are dumped.

Probable Cause:

CPDLs from one Harris System terminate on different SMs.

Action:

For each Harris System verify that all of its CPDLs terminate to a single SM. For each SM with Harris CPDLs verify that all CPDLs originate from a single Harris System.

118. OA0120 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BUFMSG	Audit Mode: elev

Problem:

A BUFMSG audit was called when an rIBUFMSG tuple could not be inserted into the busy list.

119. OA0121 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A single process purge was called when rIBUFMSG tuples could not be obtained from the idle list. This indicates a resource failure because the IMfex_rsc() function has already searched for BUFMSG hogs.

120. OA0123 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BUFMSG	Audit Mode: elev

Problem:

An audit was scheduled in elevated mode when an rIBUFMSG tuple could not be returned to the idle list.

121. OA0127 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No message buffers were queued and the OAbuf_end() function was called.

122. OA0128 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown apb_tag value was encountered.

123. OA0129 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A model with the given apb_tag value could not be found.

124. OA0130 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BUFMSG	Audit Mode: elev

Problem:

The BUFMSG audit was called when an rIBUFMSG tuple could not be obtained from the idle list.

125. OA0150 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digit count value (dial_data.dial_dig.digcnt) in the route request message was too small or too big. This error occurred in the OAop_id() function when determining if the call is an operator services position system (OSPS) call.

126. OA700C7ER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A specialized 700 call that required routing over a common channel signaling system 7 (CCS7) trunk was routed over a non-CCS7 trunk group. Specialized 700 calls cannot be completed until the routing data is corrected.

Action:

One of the following may have occurred:

1. Digit analysis selected a code index that is associated with a non-CCS7 trunk group.
2. Overflow routing occurred and the overflow trunk group is non-CCS7.
3. The external information system (EIS) that requested the call to be completed over a CCS7 trunk sent the switch a number that was not agreed upon as requiring routing on CCS7 trunks only.

For all possibilities, the starting point is digit analysis. The incoming trunk group number, routing (forward) number, and outgoing trunk group number are dumped. Use these values with the office data records to determine where the problem lies.

127. OA900C7ER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) 900 call attempted to route to a non-CCS7 trunk. Since OSPS 900 calls cannot be routed using a non-CCS7 trunk, this call will not be completed.

Data Structures:

RLFC_TRUNK. Key field: port.
 RLDA_DIGSTRT. Key field: digtree.
 RLDAPRLDGT. Key fields: previous, digit.
 RLDAPRLFNL. Key field: previous.
 RLDAPRMDGT. Key fields: previous, digit.
 RLDAPRMFNL. Key field: previous.
 RLRT_SCRNING. Key fields: dest_x, screen_x, prefix.
 RLRT_ROUTING Key field: route_x.

Action:

OSPS 900 calls only route to common channel signaling system 7 (CCS7) trunks; routing to non-CCS7 trunks is blocked. An OSPS 900 call passed digit analysis and routing, but routed to a non-CCS7 trunk. The ROP output includes incoming and outgoing trunk numbers and the 900 forward number. This should be enough information to trace through the digit analysis and routing office records to determine at what step the problem was introduced.

128. OAABUSYF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

A failure occurred while linking the toll and assistance LOOP data base (TALOOPDB) to the DB_HEADC busy list. The assert will schedule an elevated TALOOPDB audit, and return to the caller.

129. OAACCSFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAGTACCSDb() macro returned an invalid pointer.

130. OAACC_TIMO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The timer timed out while waiting for the automated calling card service terminal process (ACCS-TP). The ACCS-TP is assumed corrupted and the call is idled.

131. OAACC_TYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the automated calling card service (ACCS) call type is invalid.

132. OAACCUPTTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACCSDB	Audit Mode: elev

Problem:

Failed to unlink the automated calling card service data block (ACCSDB) from its owning pointer data block (PTRDB).

Probable Cause:

A bad parameter was passed to the DA primitive and it was not able to locate either the PTRDB tuple of the ACCSDB tuple.

Action:

Schedule the ACCSDB audit.

133. OAACNBFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:

The OAcndatsz() function encountered a failure when adding an rICOINOT tuple to the headcell busy list. An elevated COINOT audit is scheduled and processing returns to the calling function.

134. OAACNIFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:

The OAcndatrls() function encountered a failure when adding an rICOINOT tuple to the headcell idle list. An elevated AUICOINOT audit is scheduled and processing returns to the calling function.

135. OAACOPUN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ACop_req() function returned an unknown value.

136. OAACTOWN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The account owner received in the originating line number screening (OLNS) reply could not be found in the account owner table.

Data Structures:

RLACCTOWN. Key fields: account owner.

Action:

Add a new tuple in RC/V View 26.48 (OSPS OLNS ACCOUNT OWNER) with the account owner received in the OLNS reply.

137. OAAGRTRK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

RLFC_OPRTK indicates that a trunk group carries calls from a directory assistance aggregator, but no RLDA_ENH tuple exists for the trunk group. The trunk group number is printed with the assert.

Data Structures:

RLFC_OPRTK (View 26.26), RLDA_ENH (View 26.27).

Action:

Remove the trunk group from service. Delete, then re-insert the tuples for this trunk group on RC/V Views 26.27 and 26.26. Restore the trunk group.

138. OAAHHCSL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SDAPSDL	Audit Mode: elev

Problem:

An attempt to add an SDAP_SDL tuple to the head of the idle list failed. An elevated SDAP_SDL audit is scheduled and processing returns to the calling function.

139. OAAHPCSL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SDAPSDL	Audit Mode: elev

Problem:

An attempt to attach an SDAP_SDL tuple to the head of the PCBLA owner tuple failed. An elevated SDAP_SDL audit is scheduled and processing returns to the calling function.

140. OAAIDLEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

An error occurred while adding the toll and assistance LOOP database (TALOOPDB) to the DB_HEADC idle list. The assert will schedule an elevated TALOOPDB audit, and return to the caller.

141. OAILSERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is used for all the AILS errors.

Action:

On the ROP output, the first parameter is the error type. The following error types are given as part of the message:

1. An AILS BEGIN message was sent to the wrong operator services position system (OSPS). This assert will print out in both the call serving OSPS and the normal serving site OSPS. The parameters printed are the calling number and the point code of the offending OSPS. The data in the AILS Destination Table (RC/V View 26.7) is correct for the calling number printed in the message.

An AILS BEGIN message was received with an out-of-range OSPS Service Specifier value. The only parameter printed is the point code of the offending OSPS.

3. An AILS BEGIN message was received in an OSPS where the AILS feature was not activated. This assert will print out in both the call serving OSPS and the normal serving site OSPS. The parameters printed are the calling number and the point code of the offending OSPS. The AILS feature should be turned on in the offending site.

4. The parsing of an AILS BEGIN/END/ERROR message failed. The only parameter printed is the point code of the offending OSPS.

5. There is an inconsistency in the AILS software version number between OSPSs. The only parameter printed is the point code of the offending OSPS. Make sure that the AILS software version number is consistent among all OSPSs.

6. An NPA-NXX was not found in the NPA-NXX SM Assignment & LATA Exceptions Table (RC/V View 26.1) and/or not found in the AILS Destination Table (RV/V View 26.7). The parameters printed are the calling number and the TGN-MEM. The NPA-NXX should be added to either table, if applicable.

142. OAA_INCRSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect reason for the creation of the automatic charge quotation service terminal process (ACQS-TP) was encountered. The reason should only be OSRREPLACE. The reason field is dumped.

143. OAAISDIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected digit analysis data was defined for an incoming intercept to operator services position system (OSPS) call.

Data Structures:

RLDA_DIGSTRT. Key field: digtree.
 RLDAPRLDGT. Key fields: previous, digit.
 RLDAPRLFNL. Key field: previous.
 RLDAPRMDGT. Key fields: previous, digit.
 RLDAPRMFNL. Key field: previous.
 RLDA_CONFLCT. Key fields: table, digits.

RLDA_AMBIG. Key field: table.

Action:

An incoming intercept to OSPS call arriving over a multi-frequency trunk encountered a problem with digit analysis data. The digit analysis selector (DAS), the dialed digits received over the incoming intercept trunk, and the trunk group number are printed on the ROP.

Use RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) to verify that the DAS is valid. If this DAS is not found, either insert the DAS on RC/V View 9.1 or change the DAS specified on RC/V View 8.9 (OSPS OFFICE PARAMETERS) to a valid DAS.

If the DAS is valid, use the dialed digits and the PDIT/INDIT and LDIT values to trace through the digit analysis data. Only three types of calls can arrive over an intercept trunk: test calls, toll fraud follow-up calls (also called no voice calls or NOVA), and intercept calls.

For a test call, the CALL TYPE on the RC/V LDIT View must be a valid value for a test call and the CI TYPE field must be NONCI. For a toll fraud follow-up call, the CALL TYPE on the LDIT View must be LOCDA and the CI TYPE must be NONCI; the CODE INDEX specified can be used in RC/V View 26.10 (OSPS ACD CALL TYPE POOL).

For a valid intercept call, the first digit received is the intercept class. The following table summarizes the relationship that should exist between the INC DIGITS (class) field and the NBR DIG (valid number of digits to collect) field on the LDIT View:

INC DIG	NBR DIG
0	1, 8 or 11
1	1, 8 or 11
2	1
3	1, 8 or 11
5	1
6	1
7	1
8	1

For a valid intercept call, the CALL TYPE on the LDIT View must be NORMAL and the CI TYPE must be NONCI.

For a vacant code, the CALL TYPE on LDIT must be VACANT and the CI TYPE must be NONCI.

144. OAALOPTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAalo_ptrdb() function returned GLFAIL. This function is called whenever a change is made to the counts for RAFs, VDTs, interflow positions, or requests for more PTRDBs. OAalo_ptrdb() controls the creation of new tuples and also updates Glptrdb, which holds the count of PTRDBs on the SM. Glptrdb must be the sum of Glnraf + Glnvdt + Glint + Gliptrdb. Whenever one of these globals changes, then OAalo_ptrdb() is called to perform any adjustments to the number of PTRDBs.

Probable Cause:

1. the wrong parameter ID was passed as an argument 2. could not obtain the new tuple count from OAresizerel() 3. the attempt to update the global Glptrdb failed (which should cause an additional assert to fire 4. failed to insert a tuple using DBfintup() 5. failed to attach a tuple to the idle list using DBathcpr()

Action:

None. If this problem was temporary, then the next time OAalo_ptrdb() is called, it will re-adjust everything to make up any differences.

145. OAALOQRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAalo_qrydb() function returned GLFAIL. This function is called whenever a change is made to the counts for RAFs, VDTs, Interflow Positions, or requests for more QRYDBs. OAalo_qrydb() controls the creation of new tuples and also updates Glqrydb, which holds the count of QRYDBs on the SM. Glqrydb must be the sum of Glnraf + Glnvdt + Glint + Gliqrydb. Whenever one of these globals changes, then OAalo_qrydb() is called to perform any adjustments to the number of QRYDBs.

Probable Cause:

1. the wrong parameter ID was passed as an argument 2. could not obtain the new tuple count from OAresizerel() 3. the attempt to update the global Glqrydb failed (which should cause an additional assert to fire 4. failed to insert a tuple using DBfintup() 5. failed to attach a tuple to the idle list using DBathcqr()

Action:

None. If this problem was temporary, then the next time OAalo_qrydb() is called, it will re-adjust everything to make up any differences.

146. OAANI2_UNK (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A coin call came in which an automatic number identification (ANI) II/originating line information (OLI) digits are not recognized by operator services position system (OSPS) office data. The call will be treated as if ANI II/OLI digits of 07 are received.

Action:

The source office for this call should be checked to see if they are sending the correct ANI II/OLI digits for this type of call. Determine whether the receiving ANI II/OLI digits should be included in the RC/V View 26.45 (OSPS ANI II DIGITS FOR AMA RECORDING). The data printed on the ROP are trunk group, trunk member, ANI information digits, NPA, NXX, and line number. If the LRN of the back number exists, the LRN is also printed.

147. OAANI_DB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call came in with an automatic number identification (ANI) code that was defined in the database to be treated as if it had a normal ANI code by allowing it to be routed to an operator services position system (OSPS) operator for further identification of necessary information for processing.

Action:

The source office for this call should be checked to see if they are sending the correct ANI digits for this type of call. Start by looking at the associated relations printed on the ROP. Also check to see if the tuple in the database for this ANI value is correct.

148. OAANIGRP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ANI group ID from the incoming trunk group could not be found in the ANI group table.

Data Structures:

RLFC_OPRTK. Key field: trunk group number

RLANIIGRP. Key field: ANI group ID

Action:

Get the ANI group ID from the incoming trunk group using RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS) and add a new tuple in RC/V View 26.47 (OLNS ANI GROUP DIGIT LIST) with it.

149. OAANRIREAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason parameter in the OAannri() function was unexpected; it does not correspond to enum values in the file OAannreas.h. The reason is dumped.

150. OAANYCOC_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OArplyqry() function was called when the OARPLY_QRY message was received in the "wait for query/connection state". A class of charge that does not generate queries did in fact generate a query.

Action:

The OArplyqry() function continues by returning NXTSTATE and going to the next state. The APB_ptr->int_msg.text[0] and loop_ptr->coc values are dumped. No manual intervention is required.

151. OAAOCEXTENT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While preparing to terminate, the announcement only channel terminal process (AOC-TP) could not determine the extent of the resources that need to be cleaned up.

152. OAAPBBUFF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An APB/BUFMSG linkage was invalid, causing a dynamic access (DA) primitive to return failure. A single process purge is called.

153. OAAPBFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAgetapb() primitive returned a failure code.

154. OAAPBPOSF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The associated process block (APB) to position data block (POSDB) linkage was invalid.

155. OAAPBTAPF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This returning assert is called by operator actions (OA) feature execution (FEX) when the associated process block (APB) to toll and assistance operator position data block (TAPOSDB) linkage is invalid.

156. OAAPB_TMRFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) feature execution (FEX) model's attempt to start an associated process block (APB) timer failed. The OAASSERT() macro is used with this error code; therefore, the following information is dumped: APB key, model ID, state of the model, type of input message, where the message is from, far process ID, APB tag, the value switched on, and the external message header.

157. OAAPCCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to get the head link for the member channel control block communication region (CCBCOM) from its owner process control block link area (PCBLA) using the DAghpccc() primitive returned an unexpected failure. There may be an invalid link from the owner PCBLA to the member CCBCOM.

158. OAAPTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Glaptyp global parameter for AP automation call selection protocol was set to an unexpected value (OAAP_NULL).

Action:

Use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to update the AP PROTOCOL field with a valid entry, or use RC/V View 21.33 (OSPS SWITCHING MODULE GROWTH) to add the SM to group partition 2 by setting the OPRT 2 field to Y.

159. OA_AQONHK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The autoquote originating terminal process (AQ-OTP) received an MGONHOOK message during the path set up.

160. OA_AQSENDFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The autoquote originating terminal process (AQ-OTP) failed to send an operating system for distributed switching (OSDS) message to the autoquote terminal process (AQTP).

161. OA_AQTGFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAclr_seqn() or OArst_seqn() function failed; could not reset the hotel sequence number to the RLHTL_SEQN dynamic relation.

162. OA_AQUNMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The autoquote originating terminal process (AQ-OTP) received a return value from the FCsetup() function that was not FCDISC or the expected return of GLSUCCESS.

163. OA_AQZODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_LINE relation, or the rLFC_LINE tuple is missing for an autoquote mate analog line Z-card port on a (remote) integrated services line unit [(R)ISLU]. When this port is out of service (OOS), the associated autoquote digital subscriber line (AQ-DSL) is also removed from service due to a family of equipment relationship. See the RLAQTE_ADP relation for the port relationship.

Data Structures:

RLFC_LINE Key fields: port.member, port.module, party.

In the first word of the data dump layout, the first two bytes are port.member, the next byte is filler, and the next byte is port.module. In the next word, the first five bits are party.

Action:

Use RC/V (or ODBE, if necessary) to crosscheck the data set for the keys in the RLFC_LINE relation with the actual keys used to access the relation.

164. OAASGNDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Inks_asgnd field in the rLEIS_SM relation contains 16 bits where each bit position (0-15) represents the SM relative link (sm_rel_lnk) number of an external information system (EIS) call processing data link (CPDL). A bit set to 1 in the Inks_asgnd field implies that the CPDL with the corresponding SM relative link number was assigned to the EIS represented by the eis_id key in the rLEIS_SM tuple.

The rLEISDSL tuple is keyed by sm_rel_lnk and contains the external system name (x_name, equivalent to the eis_id) that is assigned to this CPDL.

One of the following occurred:

1. An extra bit was set to 1 in the Inks_asgnd field of the rLEIS_SM tuple.
2. The eis_id value in the rLEISDSL tuple (x_name) was incorrectly modified.
3. The rLEISDSL tuple does not exist; that is, the x_name, x_link, and port attributes are all 0.

The value of Inks_on_sm should equal the number of bits set to one (1) in the Inks_asgnd field.

Data Structures:
RLEIS_SM, RLEISDSL.

Action:

Use ODBE on the SM firing this assert to modify the corrupted databased on your particular office data configuration.

165. OAASOTPRIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) originating terminal process (OTP) called the OAcruPd() function with a MGOACRUPD message that had an invalid primitive type. Most likely, the position terminal process (PTP) did not load a proper value in the primitive field of the MGOACRUPD message. This is an internal OSPS call processing problem. Save the ROP output and contact your next level of support.

166. OAATAPF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

The DAattptl() primitive failed while linking the toll and assistance (T/A) LOOP database (TALOOPDB) to the T/A operator position data block (TAPOSDB) owner. This assert schedules an elevated TALOOPDB audit, and returns to the caller.

167. OAATCMSGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid common channel signaling (CCS) direct signaling message was received by the OAatcset() function for an ALLIANCE teleconferencing (add-on or meet-me) call. The message could not be understood. The message head and contents will be dumped.

168. OAATCSSD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A second start dial was received on an ALLIANCE teleconferencing call. The call will be idled. The second start dial could be the result of one of the following:

- (1) Network routing problems - the call routed non-CCS ISDN7 direct egress.
- (2) The 4ESSTM switch that serves as the host to the NSC is not running a 4E13 or later software release.
- (3) The 4ESSTM switch that serves as the host to the NSC had problems completing to the NSC.

169. OAATHCSL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SDAPSDL	Audit Mode: elev

Problem:

An attempt to attach an SDAP_SDL tuple to the tail of the idle list failed. An elevated SDAP_SDL audit is scheduled and processing returns to the calling function.

170. OAATPDBINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization for the RLATPDB relation busy/idle tuple lists failed. This may temporarily or permanently prevent any or all operator service position system (OSPS) directory assistance (DA) digital services unit 2 - recorded announcement facility (DSU2-RAF) or DSU2-service announcement system (DSU2-SAS) automated announcement units on the indicated SM from providing announcements. The output message indicates the number of tuples that were successfully initialized and added to the idle list. If this number is 32 or greater, a limited number of announcements can be provided on this SM.

The total number of DA announcement channels available is the sum of the number of channels that are available on each OSPS DA SM. This can be determined by examining the trunk group associated with the OSPSDA route type (assuming all tuples have successfully initialized and all OSPS DA DSU2-RAF or DSU2-SAS units are in service). The number of available channels on the indicated SM will be equal to the lesser of the number of OSPS DA DSU2-RAF or DSU2-SAS channels on the SM and the number of tuples that were successfully initialized rounded down to the next smallest multiple of 32. For example, if the number of tuples is 45, and there are 64 OSPS DA DSU2-RAF or DSU2-SAS channels on this SM (two units), the number of available channels is 32 since 45 rounded down is 32 and 32 is smaller than the number of channels (64).

Operators on this SM will be able to transfer DA calls to any of the announcement channels in this trunk group (that is, they are not confined to announcement channels on this SM only). However, since the number of channels available is lower than the number that should be available, an increased number of calls will require verbal announcements and the overall OSPS announcement transfer performance will be degraded. The duration of this problem depends on whether the busy/idle lists can be repaired by the ATPDB audit which runs on a routine basis.

Data Structures:
RLATPDB.

Action:

The problem may be corrected automatically by a routine ATPDB audit. If the audit does not correct the problem, asserts will continue to fire and several options are available.

If a sufficient number of announcement channels are available across the entire OSPS DA system, recovery action may not be necessary. In this case, a number of OSPS DA DSU2-RAF or DSU2-SAS units on this SM should be taken out of service so that the number of units left in service, times 32, does not exceed the number of tuples successfully initialized. (This may mean that all OSPS DA DSU2-RAF or DSU2-SAS units on this SM must be taken out of service). Units are taken out of service using the RAF or SAS page on the master control center (MCC) (SM pages menu). These units should be left out of service until the problem can be corrected.

If this problem will degrade performance to an unacceptable level, a full initialization of this SM with pump must be re-attempted. This is done from the SM INH & RCVRY CNTL page on the MCC. If the problem occurs again, a memory or database problem is indicated.

171. OAATPDBLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ATPDB	Audit Mode: elev

Problem:

An attempt to play an operator services position system (OSPS) directory assistance (DA) announcement failed due to errors in retrieving an idle rLATPDB tuple. The operator to gave the announcement verbally. The ATPDB audit will be scheduled and should fix this problem.

172. OAATPUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by the OAatp_init() function of the announcement terminal process. This prevented an automated operator services position system (OSPS) directory assistance (DA) announcement from being played.

173. OA_AUNEXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic charge quotation service terminal process (ACQS-TP) received an unexpected operating system for distributed switching (OSDS) message from the OSWEGETMSG() macro. The message is dumped.

174. OABABADACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAeetkbact() function found an invalid action in the MGBEGINACT message that it was processing. The action is out of range or simply not supported at this point in the call. The MGBEGINACT message is dumped.

Probable Cause:

The external information system (EIS) interface may have translated the external vendor message incorrectly, the OAeetkbact() function may not be supporting valid actions, or SMs may be out of synch while a software update is loaded that affects the structure layout of the MGBEGINACT message.

Action:

Contact field support personnel.

175. OABABADST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function OAeetkbact() received an invalid MGBEGINACT message with action OABEG_BILLING. The message was received on a call with an associated service that does not support this action. The MGBEGINACT message is dumped.

Probable Cause:

The external information system (EIS) interface may have initialized the message incorrectly, or the OAeetkbact() function may not be allowing this action on services that support it. Another possibility is that SMs may not be in synch while a software update is being applied that changes the values assigned to actions in the MGBEGINACT message.

Action:

Contact field support personnel.

176. OABACTCOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external vendor for message set 3 sent a begin action message containing an invalid class of charge. This assert only prints when the global variable OAeisim is on.

Probable Cause:
Vendor error.

Action:
Contact field support personnel.

177. OABAD_2TK_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAdef_npa() function that prepends a default numbering plan area (NPA) onto an operator-entered 7 digit directory number, encountered a return of DBNO_MATCH from the read of the RLFC_OPRTK relation. An rLFC_OPRTK tuple must exist for a valid trunk group; either loop_ptr->ta_data.trk_grp is not valid or the relation was corrupted. The data dumped is the trunk group number in the toll & assistance LOOP database (TALOOPDB).

178. OABADACTION (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected action code was found in the function OAevent(). The function OAevent() is defined in the file oa/OAa_ot/OAevent.c. The unexpected action code is dumped.

179. OABADARG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An OA trigger function was called with an invalid parameter.

Probable Cause:
Unknown.

Action:
None.

180. OABADBIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An external information system (EIS) vendor provided billing modules when they should not have been provided. Billing should only be done on 5E6(2) software release and later type calls, it should not be done on a call using the dynamic access (DA) call type determination. To correct this problem, the vendor should not provide billing information. This assert only fires when the global variable OAeisim is turned on using ODBE or in ITS.

181. OABADBLOPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid billing option was returned by the external information system (EIS) associated with a request action for a X00 number forward check. The fwd_chk variable from the rLSRVOT tuple and the invalid billing option are dumped.

Probable Cause:

The vendor returned invalid information.

Action:

Determine the invalid billing option from the ROP output and talk to the EIS vendor.

182. OABADCALLCLASS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call coordinator - originating treatment (CCOT) or position terminal process (PTP) model found an invalid call class in the RLTALOOPDB relation. taloopdb_ptr->ta_data.call_class is not valid. The following information is dumped: the associated process block (APB) key, model ID, model state, type of input message, where message is from, far process ID, APB tag, the value switched on, and the external message header.

183. OABADCCIND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid call completion indicator was detected. The loop_ptr->cc_ind value is dumped.

184. OABADCCRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received from the OAlscchk() function and passed as a parameter to the OAchkccret() function. This return is in error and cannot be corrected without code change. The unexpected return is dumped.

185. OABADCGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A carrier group ID value has been found that does not have any carriers associated with it.

Data Structures:

RLTCCID. Key field: issiddgt.

RLLECCRD. Key fields: npa, nxx.

RLLECRNG. Key fields: npa, tupnum.

RLTMP3OSPS. Key fields: key3_a, key3_b, key3_c.

Action:

A carrier group value used in static data does not have any carrier codes belonging to it. The carrier group value assigned to a calling card number and the card issuer ID are printed. No entry for this carrier group was found in RC/V View 27.69 (CARRIER CARD GRP). The carrier group value printed is determined from RC/V View 27.55 (TCR IDENTIFICATION) or RC/V View 27.68 (LEC CARD). Determine the carriers that should be allowed with this card and enter the data using the CARRIER CARD GRP view. The effect of this data inconsistency is that calling card billed calls are blocked when they might have been allowed.

186. OABAD_CLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

4 and 9 are not valid intercept class digits. The operator services position system (OSPS) originating terminal process (OTP) call processing should have detected these digits and given them appropriate error treatment. However, a function discovered them later in call processing.

187. OABADCSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Listing services calls are not allowed to have carrier selection enforcement (CSE) on.

Data Structures:

RLFC_OPRTK. Key field: tgroup.

Action:

Check RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS) to verify that the CSE field has a proper value (NO) based on the trunk group number that is dumped on the ROP. If the CSE field is YES, set it to NO.

188. OABAD_DA_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from the OAtadiganl() function. The first variable in the dump specifies what digit analysis was being performed on (that is, bk#, fwd#, etc). The values are defined in the header file hdr/db/DMoadigkey.h. The second variable is the unexpected return code. The return codes are defined in oa/hdr/OAtadigrtn.h.

189. OABADDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data was out of range.

190. OABADDBFRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The current operator could not log in on an operator services position system (OSPS) operator position automated multi-leaf bulletin (AMLB) external database because an attempt to read the static database relation RLOPEXTDB failed. The user defined keys to the relation were invalid, or there are not enough database resources left to complete this transaction.

Data Structures:

RLOPEXTDB. Key fields: OSC #, serving team #, database #.

The serving team # is the number of the serving team serving this call type. The database # is the number of the database that is used for login information.

Action:

This assert is only a warning, no further action will be taken. Manual login procedures will continue if the operator cannot access the AMLB external database.

If the external database is required, take one of the following actions:

1. Check the key values in the office dependent data (ODD) for the relation RLOPEXTDB against the valid values in RC/V View 26.31 (OSPS OPERATOR EXTERNAL DATABASE ACCESS). If these values and number.
2. If there are not enough resources are available to complete the transaction, re-initialize the system (type in 52 on the master control center [MCC]). This should retrieve any available system resources.

191. OABADDCR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an invalid value for dcc_pend in OACOMplete case.

192. OABADDEST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The transfer request message from the directory assistance system/computer (DAS/C) contains an unknown destination ID.

193. OABADEBARET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAetkbact() function received an unexpected return from the external information system (EIS) call event point function OAbgactfl(). The unexpected return value and the MGBEGINACT message are dumped.

Probable Cause:

The OAbgactfl() function returned an invalid code, or the OAetkbact() function is not handling all valid returns.

Action:

Contact field support personnel.

194. OABADEISRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A return code from the external information system (EIS) interface primitives indicated that an unexpected return was encountered. These returns should be clearly defined between the application calling the primitive and the primitive itself. The return received will be dumped.

195. OABADERRTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) model verifies the reason found in the OAMPRNO message. The two allowable values are OAOPKEY_ERR (an operator made an incorrect keypress) and OATNKEY_ERR (an operator's keypress is currently rejected, but a subsequent keypress will probably be accepted). The OAeiserrch() function detected a reason other than the allowed values.

196. OABAD_ESC_DARET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return has been received from the OAtadiganl() function. In the data dump, the first variable specifies the digit analysis that was being performed on (for example, bk#, fwd#). The values are defined in the header file hdr/db/DMoadigkey.h.

The second variable specifies the return code that was received. The return codes are defined in oa/hdr/OAtadigrtn.h. The third variable specifies the directory number that was undergoing digit analysis. The rLESPINFO tuple is dumped for the requested voice messaging service (VMS), from hdr/db/RLespinfo.h.

197. OABADEVENT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected event code was passed to the OAevent() function. OAevent() is in the file oa/OAa_ot/OAevent.c. The event code should be in the range defined in the file hdr/oa/OAevents.h. The unexpected event code is dumped.

198. OABAD_EXT_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid external message text was encountered. An operator services position system (OSPS) process received a message with a correct msgtype, but the text of the message is corrupted.

Data dump interpretation:

Byte-Name	Description
0,1-procno	Process number
2-pcrid	Processor ID
3-uniq	Uniqueness
4,5-type	Type of message
6-priority	Priority
7-length	Length of message text
8 ->	Message text

199. OABADHDR_ID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an operator services position system (OSPS) announcement using a digital service unit model 2 recorded announcement facility (DSU2-RAF) or DSU2-service announcement system (SAS) failed when an invalid header ID was detected. No rLANNC_HDR tuple was found for the hdr_id value passed in through the OAhdr_lang() or OAannc_lang() function.

Data Structures:

RLANNC_HDR. Key fields: application, announcement header ID.

RLLANG_TBL. Key field: lang_val.

The application type is FCL2_OSPSTA, FCL3_OSPSTA, etc. for non-English languages. The RLLANG_TBL relation maps the language value for the calling card to the application type.

Action:

The ROP output provides the `hdr_id` and the `lang_val` keys. The `lang_val` key is the language value associated with the caller's calling card. A value of 1 indicates English. A value greater than 1 indicates that a non-English language was specified for the announcement. Use RC/V View 8.61 (ANNOUNCEMENT HEADER PHRASE LIST) to determine if an `rlANNC_HDR` tuple exists for the `hdr_id` and application type keys. If `lang_val` is 1, the application type is `FCOSPS_TA`. If `lang_val` is other than 1, obtain the application type from RC/V View 8.66 (NON-ENGLISH LANGUAGE ANNOUNCEMENT APPLICATION TYPES) using `lang_val` as the key. Insert the missing phrases via RC/V View 8.61.

200. OABADHEADER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an operator services position system (OSPS) announcement using a DSU2-DTA-RAF or a DSU2-DTA-SAS failed when an invalid header ID was detected. No `rlANNC_HDR` tuple was found for the `hdr_id` value passed in through the `OAreq_annc()` function.

Data Structures:

`RLANNC_HDR`. Key fields: application type, announcement header ID.

`RLLANG_TBL`. Key field: `lang_val`.

`RLOLSR`. Key field: `scrncode`.

In the `RLANNC_HDR` relation, the application type is `FCL2_OSPSTA`, `FCL3_OSPSTA`, etc., for non-English languages. In the `RLLANG_TBL` relation, the `lang_val` key maps the language value for the calling card to the application type.

Action:

The ROP output provides the `hdr_id` value and the `lang_val`, the language value associated with the caller's calling card. If `lang_val` is 1, the announcement language is English and the application type is `FCOSPS_TA`. If `lang_val` is not 1, find the application type via RC/V View 8.66 (NON-ENGLISH LANGUAGE ANNOUNCEMENT APPLICATION TYPES) using `lang_val` as the key.

Use RC/V View 8.61 (ANNOUNCEMENT HEADER PHRASE LIST) to determine if an entry exists for the `hdr_id` and application type keys. If the current feature is an independent telephone company (ICO) special feature, the `hdr_id` should be 65 (with phrase #79 "Bong" tone) or 66 (with phrase #155 "Thank you for using").

If the feature is OLS-CMA, use the numbering pla area (NPA) and office code (NXX) of the back number to access RC/V View 26.2 (OSPS BACK NUMBER SCREENING) to retrieve the screen code. Use the screen code as the key to access RC/V View 26.3 (OSPS BACK SCREEN CODE TABLE) to verify that the `hdr_id` is populated. If it is, each phrase of that header should be populated in RC/V View 8.63 (ANNOUNCEMENT PHRASE LIST). Then, the header ID and all of its phrase IDs should be populated in the `RLANNC_HDR` relation via RC/V View 8.61.

201. OABAD_IMF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The intercept class digit received over an incoming intercept trunk using multi-frequency signaling was not valid for intercept.

Data Structures:

`RLDA_DIGSTRT`. Key field: `digtree`.

`RLDAPRLDGT`. Key fields: previous, digit.

`RLDAPRLFNL`. Key field: previous.

`RLDAPRMDGT`. Key fields: previous, digit.

RLDAPRMFNL. Key field: previous.
 RLDA_CONFLC. Key fields: table, digits.
 RLDA_AMBIG. Key field: table.

Action:

When an intercept call arrives over an incoming intercept trunk that uses multi-frequency signaling, the first digit received is the intercept class. 4 and 9 are not valid intercept class digits, but either 4 or 9 was received and accepted by digit analysis. The trunk group number that the call arrived over is dumped.

Use the digit analysis selector (DAS) printed as the key to access RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) to determine the incoming trunk digits (INDIT) and local digits (LDIT) associated with the call. Use the INDIT and dialed digits as keys to RC/V View 9.5 (INCOMING TRUNK DIGITS [OFFICE DIALING]) and the LDIT and dialed digits as keys to RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) to update one of these forms so that the number is identified correctly as a vacant code.

If the DAS printed is not the correct one to use for incoming intercept calls, use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to update the DAS under the INTERCEPT section.

202. OABAD_INT_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) feature execution (FEX) model received an internal message that was corrupted. The OAASSERT() macro is used with this error code; therefore, the following information is dumped: associated process block (APB) key, model ID, state of the model, type of input message, where the message is from, far process ID, APB tag, the value switched on, and the external message header.

203. OABAD_LNP_HEAD (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid stat_field data found for a location routing number.

Data Structures:

RLOLNP_HEAD, Key field: npa.

Action:

RC/V View 27.34 (OSPS LOCAL NUMBER PORTABILITY DATABASE QUERY INSERT AND DELETE) defines the status of an NPA-NXX as portable or not. The stat_field in the relation is set to an unused value. Use Recent Change to check and correct the status of the NPA-N printed.

204. OABADMORE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad value for the ospsdata tag the sending or receiving function for the MGMOREDATA message. There are two brethren functions: OAsmdata.c and OAgmdata.c.

Probable Cause:

Someone filled it in incorrectly or forgot to write code to handle the case or the ospsdata field is no good.

Action:

If the problem consistently happens, fix the function where the assert fired or fix the sending function. If the problem happens infrequently, ignore it.

205. OABADNPA (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The numbering plan area (NPA) ASCII digits were corrupted and could not be converted to binary. The first three bytes of the dump contain the NPA digits.

206. OABADNPA (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The numbering plan area (NPA) ASCII digits were corrupted and could not be converted to binary in the OAtmzone() function. The first three bytes of the dump contain the NPA digits.

207. OABADNXX (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office code (NXX) ASCII digits were corrupted and could not be converted to binary. The first three bytes in the dump are the NXX digits.

208. OABADNXX (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office code (NXX) ASCII digits were corrupted and could not be converted to binary in the OAtmzone() function. The first three bytes in the dump are the NXX digits.

209. OABADOCS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid ocs_state value was encountered in the OAopsetup() function.

210. OABADOLOGINID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAtalogin() function encountered an unusual condition that prevented it from logging in any OA VDT. OAtalogin() could not read the RLOLOGINID relation. The database (DB) return code is dumped along with the RLOLOGINID buffer and a part of the position data block (POSDB).

211. OABADOPCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to route to a dynamic access (DA) recorded announcement function (RAF) announcement, an

error code was returned in the opcode field of the MGPCRAF message. The opcode field is dumped. This error code is located in the global header file under pc PCdsu2ops.h. These enumerations can be mapped to the reason for error.

212. OABADOPTRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid transfer type was found in the MGOPTRAN message (msg.text.opt.tran_typ). The MGOPTRAN message and the invalid transfer type are dumped.

213. OABADPARM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to a function.

214. OABADPATH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAeisintrt() or OAeisextrt() function received an invalid path number to define. The path number is dumped.

215. OABADPHRASE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an operator services position system (OSPS) directory assistance (DA) announcement using a digital services unit 2-recorded announcement facility (DSU2-RAF) or a DSU2-service announcement system (DSU2-SAS) on the indicated position switching module (PSM) failed when software detected an invalid phrase ID. The phrase ID is used by the DSU2-RAF or DSU2-SAS to play the announcement.

Run a diagnostic on the DSU2-RAF or DSU2-SAS firmware to determine if there is a problem on the firmware. If so, failed tests and segment number are dumped on the ROP. Phase 7 (RAF or SAS related messages) pinpoints the firmware or hardware problem.

Data Structures:

RLANNC_HDR. Key fields: application, announcement header ID.

RLANNC_TRL. Key fields: application, announcement trailer ID.

RLANNC_DIG. Key fields: application, inflection ID.

RLPHRASES. Key fields: application, phrase ID.

Action:

Examine each rLANNC_HDR (announcement header) tuple. List all possible announcement header IDs. Access RC/V View 8.61 (ANNOUNCEMENT HEADER PHRASE LIST) in review mode. Perform steps 1-3 for each announcement header. Perform steps 2 and 3, repeatedly, for each phrase ID found in the header. (16385 and 16386 are not phrase IDs.) The recognized phrase ID values are found in the 5ESS® Switch Translations and Dynamic Data Manual.

1. For the given announcement header, list each phrase ID that is in the header.

2. Access RC/V View 8.63 (ANNOUNCEMENT PHRASE LIST) in review mode.

3. Each phrase ID should be found and displayed correctly. If a phrase ID is invalid, make the appropriate update. Verify updates at the trunk line work station (TLWS). (See below for details.)

Examine each rIANNNC_TRL (announcement trailer) tuple. List all possible announcement trailer IDs. Access RC/V View 8.62 (ANNOUNCEMENT TRAILER PHRASE LIST) in review mode. Perform steps 1-3 for each announcement trailer. Perform steps 2 and 3, repeatedly, for each phrase ID found in the trailer.

1. For the given announcement trailer, list each phrase ID that is in the trailer.

2. Access RC/V View 8.63 in review mode.

3. Each phrase ID should be found and displayed correctly. If a phrase ID is invalid, make the appropriate update. Verify updates at the TLWS. (See below for details.)

Examine each rIANNNC_DIG (announcement digit) tuple. List all possible inflection IDs. Access RC/V View 8.60 (ANNOUNCEMENT DIGIT INFLECTION SCHEME) in review mode. Perform steps 1-3 for each inflection. Perform steps 2 and 3, repeatedly, for each phrase ID found in the inflection.

1. For the given inflection ID, list each phrase ID that is in the inflection ID.

2. Access RC/V View 8.63 in review mode.

3. Each phrase ID should be found and displayed correctly. If a phrase ID is invalid, make the appropriate update. Verify updates at the TLWS. (See below for details.)

To verify updates at the TLWS, plug a headset into the talk and monitor (T&M) phone jack and do the following:

1. Enter page 160 to display the test positions.

2. Enter 161 to select test position 1.

3. Enter 416, x, 0, 0 (where x is the PSM number) to seize a line/trunk.

4. Enter 527, x (where x is a phrase ID) to play the specific announcement. For example, phrase ID 30 plays the announcement "The number is".

5. When the announcement has completed, enter 499 to release the line/trunk, then enter 160 and 201 to release the test position.

216. OABADPOSNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position number value in the message received (transfer request or position release) by the external information system (EIS) model does not match with the value stored in the RLTALOOPDB relation. Both position numbers are printed.

217. OABADPREFDIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call coordinator - originating treatment (CCOT) or position terminal process (PTP) model found an unexpected prefix digit in the RLTALOOPDB relation; the loop_ptr->ta_data.pref_dig value is not valid.

218. OABADPROG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSRESTART() macro encountered an invalid program ID parameter.

219. OABADQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISTINFO tuple has the conf_q or sa_q attribute set to a non-zero value that is not a key into the RLCTINFO relation. Any non-zero number in these attributes must correspond to a call queue key in an rICTINFO tuple.

Data Structures:

RLSTINFO. Key field: serv_tm (serving team number).

RLCTINFO. Key field: call_type (call queue).

The ROP output provides the serving team key to the rISTINFO tuple, and the queue number from the conf_q or sa_q attribute that does not correspond to an rICTINFO tuple.

Action:

One of the following changes should be made:

- 1) Use RC/V View 21.2 (SERVING TEAM) to change the conf_q or sa_q attribute in the affected rISTINFO tuple to the value of a valid key in the RLCTINFO relation.
- 2) In the affected rISTINFO tuple, the conf_q or sa_q attribute should be set to 0. If conf_q is set to 0, verify that the emerg_conf attribute is set to DBNO.
- 3) Use RC/V View 21.22 (CALL TYPE) to add an rICTINFO tuple with the key from the conf_q or sa_q attribute.

220. OABADRANGE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid time parameter was passed to the OSTIMER(), OSWAIT(), or OSRESTART() macro. The autoquote terminal process (AQTP) cleans up some data and releases the processor.

221. OABADREQTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid request type was found in the MGOPTTRAN message (msg.text.acd_data.req_type). The message will be dumped along with the invalid request type.

222. OABAD_REQ_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function OAconn_init() that initializes data associated with operator connections at position seizure, has encountered an invalid value for loop_ptr->acd_data.req_type.

223. OABADREST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason for restarting the OAeistalk() function was received. This is an error in interfacing with this function. The reason is dumped and the call is terminated.

224. OABADRET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An undefined return value was received from a function call.

225. OA_BADRETN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic charge quotation service system process (ACQS-SP) received an unexpected return from the OSWAIT() or OSWGETMSG() macro. The message is ignored.

226. OABADR NATM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAsrvres() function (defined in the file oa/OAeisot/OAsrvres.c) found zero time specified in the busy no answer field in the rISRVOT tuple. This field must be non-zero. The rISRVOT tuple is dumped.

227. OABADR TENUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call coordinator - originating treatment (CCOT) or position terminal process (PTP) model found an invalid route number type in the RLTALOOPDB relation. taloopdb_ptr->rte_numtype is not an allowed value.

The following information is dumped: the associated process block (APB) key, model ID, model state, type of input message, where message is from, far process ID, APB tag, the value switched on, and the external message header.

228. OABADR TYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid routing type was found in the MGTRNS_REQ message (field rte_type). This field was initialized by the external information system (EIS) terminal process before being sent to this process. Either the EIS terminal process incorrectly populated this field or it was corrupted in transit.

229. OABADSDAPPOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is an SDAP call and we expected an AP to do provisioning but routed instead to an operator. Processing cannot continue so the call must be terminated.

Data Structures:

RLAC_CQDET - RC/V View 26.9 (OSPS ACD CALL TYPE)
 RLAC_DESTX - RC/V View 26.10 (OSPS ACD CALL TYPE POOL)
 RLCTINFO - RC/V View 21.22 (OSPS RSM/CARRIER DATA).

Action:

- (1) The wrong call type was selected in RC/V View 26.9 or 26.10 or,
- (2) the wrong serving team was assigned to the call type in RC/V View 21.22.

Check to ensure that in RC/V View 26.9 for the call_orig OATO_AP, that the fields are correctly populated. The values in RC/V View 26.10 are derived from RC/V View 26.9. Check to ensure that in RC/V View 21.22, the appropriate serving team has been assigned to the selected call type.

230. OABADSML (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The key in the rLSMPTRDB tuple (obtained from the DAGETSMPTR() macro) does not match the process number in the rIPCBLA tuple. This is an unrecoverable error; the currently running process is purged.

231. OABADSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid program state was encountered.

232. OABADSTINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAtalogin() function encountered an unusual condition that prevented it from logging in any OA VDT. OAtalogin() could not read the RLSTINFO relation. The database (DB) return code is dumped along with the RLSTINFO buffer and a part of the position data block (POSDB).

233. OABAD_TA_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function OAconn_init() that initializes data associated with operator connections at position seizure, has encountered an invalid value for loop_ptr->ta_data.ta_type.

234. OABADTC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid transition plan feature group D (FGD) carrier was specified. A call was dialed 950-XXXX to a feature group B (FGB) carrier that is provisioned for transition access. A transition carrier was indicated in the

rIFC_FGBCARR tuple for this FGB carrier, but no corresponding FGD carrier is defined in the RLFC_CARR relation; or the TRANS CARRIER field was not filled in. The call cannot be routed, and reorder treatment is given.

Data Structures:

RLRCFGB_CARR. Key fields: fgb_carrid, feature group=B.

Action:

Insert an FGD carrier into the office dependent data (ODD) using RC/V View 10.3 (INTER-LATA CARRIER). The key value must be the same carrier identification code (CIC) indicated in the TRANS CARRIER field of the View 10.3 page for the FGB carrier.

235. OABADTRANS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual network (VN) model had a switched on invalid transfer type in the OAMTRNS message from the NEAR process. Since the VN model stores this message and sends it to the call coordinator-originating treatment (CCOT), it may also switch on it when processing error messages after CCOT receives the OAMTRNS message. These two error messages are OAMERR and MCGTIMEOUT.

The VN model could timeout while waiting for an MGPATH_REL message from OT and switch on this to send the OAMCCA or OAMCCF message to the NEAR process. Default action is to send the OAMCCA message to the NEAR process and suicide.

The following information is dumped: associated process block (APB) key, model ID, state of the model, type of input message, where the message is from, far process ID, APB tag, value switched on, and the external message header.

236. OABAD_TRK_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIVALOFFC tuple is missing in the operator SM specified. For operator services position system (OSPS) automatic number identification failure (ANIF)/office number identification (ONI) calls, the incoming FIOPR trunk group must have a corresponding entry in the RLVALOFFC relation.

Data Structures:

RLVALOFFC. Key field: tgroup.

Action:

Use RC/V View 26.24 (OSPS NXX LIST FOR BILLING NUMBER ON ONI/ANIF CALLS) to determine if an entry exists for the corresponding trunk group. If an entry is not found, add one. This entry defines the valid office codes (that is, NXXs) for a given incoming FIOPR or DIOR trunk group for ANIF/ONI calls.

If an entry is found in View 26.24, use RC/V View 21.33 (OSPS SWITCHING MODULE GROWTH) to verify that the SM that the assert fired in is in OSPS GROUP 1 (field 6).

237. OABADTRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid transfer type was specified for an operator transfer.

238. OABADVAPHR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to play an operator services position system (OSPS) announcement using a DSU2-DTA-RAF or DSU2-DTA-SAS failed when an invalid phrase ID was detected. No rIPHRASES tuple was found with the variable phrase ID that was passed in through the OAreq_annc() function.

Data Structures:

RLPHRASES. Key fields: application, phrase ID.

RLFCNPAMAP. Key fields: NPA, NXX.

RLOLSR. Key field: scrncode.

Action:

The variable phrase ID is used in the independent telephone company (ICO) or OLS-CMA special feature. The phrase ID is not a part of the phrase list that constructs the header.

For ICO, access RC/V View 26.1 (OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS) with the numbering plan area (NPA) and office code (NXX) of the back number to verify that the phrase ID is populated. If it is, the phrase should be populated in RC/V View 8.63 (ANNOUNCEMENT PHRASE LIST).

For OLS-CMA, access RC/V View 26.2 (OSPS BACK NUMBER SCREENING) with the NPA and NXX of the back number to retrieve the screen code. Use the screen code to access RC/V View 26.3 (OSPS BACK SCREEN CODE TABLE) to verify that the phrase field is populated. If it is, the phrase should be properly populated in RC/V View 8.63.

239. OABADZNNEXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAZnnext() function encountered the default case of a switch. Look at the OAZnnext() function to determine which case statement is missing.

240. OABANSTIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to transfer to a recorded announcement facility (RAF) for an automated operator services position system (OSPS) directory assistance (DA) announcement failed when the announcement status indicator contained an unknown value. This will force the operator to respond verbally.

241. OABCKNUMERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not route to an operator service position system (OSPS) operator entered back number using the digit analysis selector (DAS) and trunk group indicated.

Data Structures:

RLFCNPAMAP. Key fields: bnxx, bnpacvt.

Action:

An OSPS operator tried to route to a back number that does not pass digit analysis; however, the data in RC/V View

26.1 (OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS) indicates that the dialed numbering plan area (NPA)-office code (NXX) can be routed to. The ROP output includes the dialed digits, the trunk group number from RC/V View 26.1, and the DAS for the trunk group.

- If this phone number should not be used for originations, use RC/V View 26.1 to set TERM ONLY to yes for this NPA-NXX.
- If this back number is for originations and terminations and the trunk group printed is not correct, use RC/V View 26.1 to correct the trunk group.
- If the trunk group is correct, review the office records using the DAS and the dialed digits to determine why it failed; then use RC/V to update the appropriate digit analysis view.

242. OABCKQZ_CRD_COC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The BACK_CARD class of charge was restricted (screened against), but not the BACK_QZ class of charge. This occurs in the class of charge modules (notably OAncoc/OAncbct). The transition strings call the OAcocck() function to check screening on the back number and in turn OAcocck() may call the OAcocrstck() function, which determines if the screening is wrong.

Action:

The call continues. No manual intervention is required. Normally an error is generated, then processing goes to the next state (normally waiting for operator action).

243. OABDBLOPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the billing option field of the MGTRNS_REQ message (MGTRNSREQ.cc_bill_opt). A complete call transfer request message was generated by the external information system (EIS) or by the unified position terminal process (UPTP) (COMPLETE SAME or DIFFERENT SOFT keys) with no class of charge specified, but the billing option field is populated with don't care.

This is invalid because a specific class of charge or a valid billing option is expected. The route type is dumped. If the route type is OACCOPER (see hdr/db/DMrtetyp.h), then the UPTP is responsible; otherwise, the EIS interface is responsible.

244. OABDBLSAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) listing services call completion capability identified an external vendor problem. This assert prints only when the global variable OAeisim is turned on. The vendor specified a billing option of "bill same" in the complete call message with a class of charge or rate class that was not valid with "bill same". The class of charge and rate class are dumped.

245. OABDCC_CR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While processing a listing services call, the external information system (EIS) provided an invalid carrier to be used for call completion. An rIFC_CARR tuple was not found for the carrier ID specified by the EIS.

Data Structures:

RLFC_CARR. Key field: carrid (FGD carrier identification code [CIC]).

Action:

There are two possible causes for this problem:

- (1) The EIS has an invalid carrier in its database. Changes must be made in that database to correct the problem. The listed number is printed on the ROP to help identify the incorrect database entry.
- (2) The EIS provided a valid feature group D (FGD) carrier to the 5ESS[®] switch, but it was not found in the 5ESS[®] switch database. Enter the FGD carrier data by accessing RC/V View 10.3 (INTER-LATA CARRIER).

246. OABDCCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Listing services call completion is activated for a trunk that does not support answer supervision.

Data Structures:

RLFC_OPRTK. Key field: tgroup.

Action:

Listing services call completion can only be activated on a trunk group that supports answer supervision. For the trunk group number printed on the ROP, call completion is activated, but data indicates that the trunk group does not support answer supervision.

Update RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS), keyed by the trunk group number, as follows:

1. If the specified trunk group does not support answer supervision, set the ANSWER SUP field to N and the CALL COMPL field to N.
2. If the specified trunk group supports answer supervision, but call completion should not be done, set ANSWER SUP to Y and CALL COMPL to N.
3. If the specified trunk group supports answer supervision and call completion should be done, set ANSWER SUP to Y and CALL COMPL to Y.

247. OABDCITP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Incorrect translation of a feature group B (FGB) call origination occurred. A call that originated on an incoming trunk was translated as TYPE CI CALL = FCTransition (instead of FCINTERIM). The call is routed as FCINTERIM, if possible; otherwise, reorder treatment is given.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use RC/V View 5.1 (TRUNK GROUP) to verify that the digit analysis selector (DAS) value for the trunk group is

correct for FGB calls. From the DAS value, use RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) to determine the local digit interpreter table (LDIT).

Use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) to correct the LDIT translation for this call. Make sure that all LDIT records for calls for this FGB carrier that originate on a line or (tandem) trunk in this office, are translated as TYPE CI CALL = FCINTERIM, not FCTRANSITION.

248. OABDDBNO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLOPEXTDB relation failed. An operator tried to log in to an external information system (EIS) database, but no rLOPEXTDB tuple existed.

Data Structures:

RLOPEXTDB. Key fields: db_key, ofc_num, serv_tm.

Action:

Use RC/V View 27.31 (OSPS OPERATOR EXTERNAL DATABASE ACCESS) to add an rLOPEXTDB tuple for this database, using the information from the ROP message. If this is a new database type, a new rLOPDBPARM tuple must be added to specify parameters for the database via RC/V View 27.30 (OSPS OPERATOR DATABASE PARAMETERS).

249. OABDDBNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch received an invalid database number from an operator position, caused by an operator logging into a position, or hitting a database key (MAIN DB or a softkey). The error could result from data corruption across the digital subscriber line (DSL), or a hardware (or firmware) problem in the terminal.

Action:

Diagnose the terminal and DSL. If a firmware upgrade was done to the terminal, check compatibility with switch.

250. OABDDBPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLOPDBPARM relation failed. An operator tried to log in to an external information system (EIS) database, but no rLOPDBPARM tuple existed for the database type.

Data Structures:

RLOPDBPARM. Key field: db_type.

Action:

Use RC/V View 27.30 (OSPS OPERATOR DATABASE PARAMETERS) to add an rLOPDBPARM tuple for this database type, using the information from the ROP message.

251. OABDEAINFO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAea_ani() function found an unexpected value in the ea_info (equal access [EA] signaling information) field of

the route request message. The ea_info value and the back number saved in the call record are dumped.

252. OABDEISCOC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) listing services call completion capability detected external vendor problems when the global parameter OAeisim was turned on. The vendor sent an invalid class of charge in the complete call message. The class of charge is dumped.

253. OABDELANS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OAopto_tlk() function, the unified position terminal process (UPTP) sent the originating terminal process (OTP) an MGANS_CHG message when delay answer supervision was not to be applied. Delayed answer supervision is specified by the customer on a per trunk group basis, and when selected, results in answer supervision being delayed until a vendor generated billing message is received.

The billing message was received by the UPTP, which forwarded an MGANS_CHG message to the OTP because the delay answer supervision option was selected. The OTP received the MGANS_CHG message, but did not find the del_ans bit set in the RLSRVOT relation. The UPTP should forward only one MGANS_CHG message per call. If the UPTP is not correctly updating the del_ans bit in the RLTALOOPDB relation, then subsequent billing messages will result in extra MGANS_CHG messages being sent to the OTP. Another possibility is that the del_ans field in the RLSRVOT relation was not updated or initialized correctly.

254. OABDERFC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAcall_arr() function returned an unexpected value when it was called by the OAFwdck() function. The unexpected return value is dumped.

Probable Cause:

The OAcall_arr() function returned an invalid return code, or the OAFwdck() function is not accepting valid return codes.

Action:

Contact field support personnel.

255. OABDFCONN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAotrsnd() function found an invalid forward connection type in the dynamic data. This field should indicate the last forward connection type made by the operator, and is used to properly populate fields of the operator trouble report (OTR). Valid values include: forward number, conference number, and route number.

The type of connection is defaulted to forward number and the OTR is printed. The first byte of the first data dump is the invalid forward number type. The second data dump is the rITALOOPDB tuple.

256. OABDFWCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAsrv_id() function identified a service that does not support a forward number check. A forward number check occurs when the operator enters a forward number that has an associated service (e.g., Quantum) and the external vendor that provides the service is queried to determine the next action (e.g., complete the call to a translated POTS number, route the call to an external audio response unit (ARU), etc.). Only certain services support this functionality. This assert is called from the function OAfwdck().

Probable Cause:

The position terminal process (PTP) initiated a forward number check on a call whose associated service does not support that functionality.

Action:

Contact field support personnel.

257. OABDISPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAais_dp() function encountered an unexpected return code when calling the FCispdigit() function. The return code is dumped.

258. OABDISRVID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incoming intercept to operator services position system (OSPS) call that requires listing services treatment was mapped to a call type in the RLCTINFO relation with a zero service ID. This is not allowed.

Data Structures:

RLAC_CQDET. Key fields: ta_type, prefix, coin, ospsid, carrier.
 RLAC_TGRP. Key fields: ta_pcid, tgroup.
 RLAC_DESTX. Key fields: ta_pcid, destx.
 RLAIISCLS. Key field: aiscls (intercept class).
 RLCTINFO. Key field: call_type.

A description of the key fields follows:

- ta_type is the toll and assistance (T&A) type of the OSPS call
- prefix is the prefix of the OSPS call
- coin indicates a coin or non-coin call
- ospsid is the OSPS number where the call originated
- carrier is the type of carrier used on the call
- tgroup is the trunk group number
- destx is the destination index from digit analysis

Action:

A call arriving over a trunk with a trunk class of INAISTRK, had a zero service ID associated with it, based on the call type printed on the ROP. This call type should be assigned a service ID, or this was call mapped to the wrong call type.

Call type determination for intercept is defined on RC/V View 26.10 (OSPS ACD CALL TYPE POOL) and uses the following information:

CALL ORIGIN: AIS
 PREFIX: NULLP
 CARRIER: UNKWN
 COIN: N
 OSPS ID: printed on ROP
 TGN: printed on ROP
 CDI: printed on ROP

If a service ID should be assigned to this call type, access RC/V View 21.22 (CALL TYPE) to change the SVC ID field to the correct value.

If the call type is not correct, use RC/V View 26.10 to update the call type determination so that this call has a call type with a non-zero service ID associated with it.

If the CDI for this intercept class is not correct, use RC/V View 21.57 (OSPS INTERCEPT DESTINATION INDICES) to assign the correct DI. Based on the dialed digits, determine the INCPT CL, which is used as the key to RC/V View 21.57.

If no dialed digits are printed, then there was a signaling problem with the call and the CDI value was obtained from the DEST IDX field on RC/V View 8.9 (OSPS OFFICE PARAMETERS). If calls with signaling problems should be sent to reorder, change the DEST IDX to zero; otherwise, change it to a value that will be correct for call type determination use.

259. OABDLATAACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The serv_data.lata_check value in the rLOOPDB tuple was out of range; that is, it was not OALCNULL, OALCFAIL, or OALCSUCC. The unexpected lata_check value is dumped.

260. OABDLSTRAF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-intermediate switching point (non-ISP) trunk group carrying operator services position system (OSPS) listing services traffic, had an rLFC_OPRTK tuple with the ls_traf attribute set to DBNO. This is a violation of the RLFC_OPRTK relation population rules.

Data Structures:

RLFC_OPRTK. Key field: tgroup (originating trunk group).

Action:

The trunk group number is dumped on the ROP. If this trunk group was intended to carry OSPS listing services traffic, enter RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS) using the trunk group number as

the key to change the LSTG SVC TRAF field to Y.

If this trunk group is not intended to be used for OSPS listing services traffic, use RC/V View 26.26 to delete the entry for this trunk group.

261. OABDOLSR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIOLSR tuple was missing. This relation is populated from RC/V View 26.3 (OSPS BACK SCREEN CODE TABLE). The decimal value of the screening code key (SCRN CODE field in RC/V View 26.3) is dumped. Most likely, the key is valid and is in the range defined in the domain DMSCRCDE.

Data Structures:

RLOLSR. Key field: screening code.

Action:

Verify that the key printed on the ROP is a valid screening code. If the key is valid, determine the back number(s) in RC/V View 26.2 (OSPS BACK NUMBER SCREENING) that reference this screening code before entering fields in RC/V View 26.3. Insert the rIOLSR tuple using View 26.3.

If the key is not valid, write an initial modification report (IMR).

262. OABDOSREAS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAccann() function was dispatched by the operating system for distributed switching (OSDS) with a reason other than OSRREPLACE. This is an unrecoverable error and results in a single process purge of the process. The reason parameter is dumped.

263. OABDPTPCOC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid class of charge was sent from the unified position terminal process (UPTP) to the originating terminal process (OTP) in a complete call transfer request message. The transfer request message is formatted by the UPTP in response to the operator selecting the COMPLETE SAME or COMPLETE DIFFERENT listing services call completion soft key. The invalid class of charge is dumped.

264. OABDRETFC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAsrv_id() function returned failure when it was called from the OAfwdck() function. The failure code is dumped.

Action:

Contact field support personnel.

265. OABDRQEIS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OArequesteis() returned an invalid code when it was called by the OEvent() function. The invalid return code is dumped.

Probable Cause:

The OArequesteis() function returned an invalid code, or the OEvent() function is not accepting valid return codes.

Action:

Contact field support personnel.

266. OABDRTETYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position terminal process (PTP) external information system (EIS) model received a MGTRNS_REQ message from the EIS interface with an invalid routing type (rte_type). The message is dropped. The invalid route type and the MGTRNS_REQ message are dumped. This assert only prints when the EIS debugging global parameter OAeisim is set to DBYES on the asserting SM.

267. OABDSDAST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected digit analysis state was found in the function OAsrvdanl(). The function OAsrvdanl() is found in the file oa/OAeisot/OAsrvdanl.c. The unexpected digit analysis state, stimulus message buffer, and associated rISRVOT tuple are dumped.

268. OABDSRVID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call identified as requiring listing services treatment was mapped to a call type in the RLCTINFO relation with a zero service ID. This is not allowed.

The call was identified as requiring listing services treatment based on static trunk group data in the RLFC_OPRTK relation and digit analysis (that is, assigned a destination type of DA or LOCDA). Call type determination is based on the RLAC_CQDET, RLAC_TGRP, and RLAC_DESTX relations.

Data Structures:

RLAC_CQDET. Key fields: ta_type, prefix, coin, ospsid, carrier.

RLAC_TGRP. Key fields: ta_pcid, tgroup.

RLAC_DESTX. Key fields: ta_pcid, destx.

The ta_type attribute is the toll and assistance (T&A) type of the operator services position system (OSPS) call, prefix is the prefix of the OSPS call, coin indicates a coin or non-coin call, ospsid is the OSPS number where the call originated, carrier is the type of carrier used on the call, tgroup is the trunk group number, and destx is the destination index from digit analysis.

Action:

The call type should be assigned a service ID, or call type determination mapped this call to the wrong call type.

If the call type should be assigned a service ID, access RC/V View 21.22 (CALL TYPE) to change the SVC ID field to the correct value.

If call type determination mapped this call to the wrong call type, access RC/V View 26.10 (OSPS ACD CALL TYPE POOL). Specify LSTA in the CALL ORIGIN field. Map the prefix dumped on the ROP (in decimal form) to the PREFIX field, the station type dumped on the ROP to the COIN field, the carrier type dumped on the ROP to the CARRIER field, and the OSPS ID dumped on the ROP to the OSPS ID field. Examine View 26.10 to determine where the call type dumped on the ROP was assigned. Correct the call type mapping.

269. OABDTARET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned from the OAa_init() function. The return code is dumped.

270. OABDVERSION (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This error only prints when the operator services position system (OSPS) external information system (EIS) global variable OAeisim is set to DBYES (1). An incoming message had a different version ID than the version ID assigned in the rIEISCALL tuple.

The OAETPMHDR structure that contains the version ID sent in the message, the rIEISCALL tuple assigned to the incoming message, and the rIEIS_LNK tuple associated with the link that the message arrived over are dumped. The incoming message is dropped by OSPS.

Probable Cause:

The external vendor system or OSPS changed the version ID at some point in the call.

Action:

Report the problem to field support personnel.

271. OABILL_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid billing center (revenue accounting office [RAO] or regional processing center [RPC]) was found in the rao_num attribute of an rIACCSDB tuple. The OAASSERT() macro is used with this assert. The following information is dumped: associated process block (APB) key, model ID, model state, type of input message, where the message is from, far process ID, APB tag, the value switched on, and the external message header.

272. OABINTOASC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid conversion from binary to ASCII occurred.

273. OABKCN_NOT_ACQS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A back number entered by the operator on an automatic number identification failure (ANIF)/operator number identification (ONI) call resulted in conflicting information about the type of station that is found at that back number.

Some information indicates that the call is an automatic charge quotation service (ACQS) call, but other information indicates that it is a coin call. Possibly, the operator services position system (OSPS) data is incorrect or internally inconsistent, the originating office forwarded the call on an incorrect type of trunk, the operator incorrectly indicated the call was hotel when it was not, or the caller gave an incorrect back number to the operator.

Data Structures:
RLTALLOOPDB.

The oa_data.backnum.dn value is the back number entered by the operator and the ta_data.trk_grp value is the incoming trunk group number.

Action:

Determine the kind of station that is actually at this back number by calling the originating office and providing the line number in question. To determine the originating office, look at the group card in the operator services position system (OSPS) office that is the same as the trunk group number (TGN) provided by the ROP output. If the trunk is a tandem access trunk, the tandem office must determine the local office from the numbering plan area (NPA) and office code (NXX). If the trunk is a direct trunk (directly connected to a local office), the local office is specified on the trunk card. If the station at the back number is actually coin, determine if the ACQS data incorrectly includes the station. If it does, use RC/V View 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE) to remove the entry from the ACQS data.

If the station at the back number is actually ACQS, determine if the originating line screening (OLS) data incorrectly indicates the station is coin. If it does, use RC/V View 26.2 (OSPS BACK NUMBER SCREENING) to correct the entry in the OLS data.

If the station type indications in the OLS and ACQS data are correct, no further action is required.

274. OABK_IS_CNACQS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A back number entered by the operator on an automatic number identification failure (ANIF)/operator number identification (ONI) call resulted in conflicting information about the type of station that is found at that back number.

Possibly, the operator services position system (OSPS) data is incorrect or internally inconsistent, the originating office forwarded the call on an incorrect type of trunk, the operator incorrectly indicated the call was hotel when it was not, or the caller gave an incorrect back number to the operator.

Data Structures:
RLTALLOOPDB.

The oa_data.backnum.dn value is the back number entered by the operator, the ta_data.trk_grp value is the incoming trunk group number, the ta_data.statn_typ value is the kind of station that OSPS thinks it should be, and the oa_data.service value is the service class that the originating line screening (OLS) data indicated.

Action:

In the ROP output, the station is COIN or automatic charge quotation service (ACQS) and the service class is "Noncoin Public" or "NonACQS Hotel".

Determine the kind of station that is at this back number by calling the originating office and providing the line number in question. To determine the originating office, look at the group card in the OSPS office that is the same as the trunk group number (TGN) provided by the ROP output. If the trunk is a tandem access trunk, the tandem office must determine the local office from the numbering plan area (NPA) and office code (NXX). If the trunk is a direct trunk (directly connected to a local office), the local office is specified on the trunk card.

If the station type printed in the ROP output is correct, the incompatible service class in OLS data must be corrected by using RC/V View 26.2 (OSPS BACK NUMBER SCREENING).

If the service class is correct and the station type incorrectly indicates COIN, determine if the OLS data indicates that the station is coin. If it does, use RC/V View 26.2 to mark the station not coin.

If the service class is correct and the station type incorrectly indicates ACQS, determine if the ACQS data incorrectly includes the station. If it does, use RC/V View 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE) to remove the entry in the ACQS data.

If the service class in the OLS data and the station type indications in the OLS and ACQS data are correct, no further action is required.

275. OABK_NOT_ACQS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An automatic number identification failure (ANIF)/operator number identification (ONI) call arrived on a trunk that is dedicated to automated charge quotation service (ACQS) traffic. The operator then entered a back number that was not in the ACQS database.

The originating office may have inadvertently determined this call to be an ACQS call, the ACQS database for that operator services position system (OSPS) office could be out-of-date, or the back party may have supplied an incorrect number to the operator.

Data Structures:

RLTALOOPDB. Key fields: oa_data.backnum.dn (back number entered by the operator), ta_data.trk_grp (incoming trunk group number).

Action:

The ROP output provides the numbering plan area (NPA), office code (NXX), line number (LINENO), and trunk group number (TGN).

Determine if this back number is an ACQS establishment by calling the originating office and providing the line number in question. To determine the originating office, look at the trunk group card (in the OSPS office) that is the same as the TGN provided by the ROP output.

If the trunk is a tandem access trunk, then the tandem office will need to determine the local office from the NPA and NXX. If the trunk is a direct trunk (directly connected to a local office), the load office will be specified on the trunk card. If the back number is an ACQS establishment, use RC/V View 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SYSTEM) to insert an rIFC_HOTEL tuple. The key to this view is the ACQS telephone number. The information in the tuple must be provided by the local office. If the back number is not an ACQS establishment, no action is required.

276. OABLVEXCL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLBLVEXCL relation has one of the following problems:

1. No tuple exists for the specified keys.
2. Not enough tuples are available based on the entries attribute in this relation.

Data Structures:

RLBLVEXCL. Key fields: NXX of the forward number, tuple number (00-15), exclusion key.

The exclusion key is obtained from the RLBLVSCRN relation and based on the numbering plan area (NPA) of the forward number.

Action:

The order of the keys listed on the ROP will be the office code (NXX), exclusion key, then tuple number. These keys indicate the rLBLVEXCL tuple that was expected when the relation was read.

If the tuple number was 0, then no tuples for these keys were found. The RLBLVSCRN relation indicated that there are exclusions for the NXX, but none were specified in the RLBLVEXCL relation. This inconsistency must be fixed.

If the tuple number is greater than 0, rLBLVEXCL tuples are missing based on the entries attribute for this NXX. The number of tuples for this NXX is equal to entries divided by 6 plus 1. This problem must be fixed by making the entries attribute equal to the number of exclusion ranges for the NXX in question.

When this error occurs, the program will deny verification to the NXX.

277. OABLVSCRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The status of an office code (NXX) in the RLBLVSCRN relation contained an invalid value. The status must be verifiable, non-verifiable, or verifiable with exclusions.

Data Structures:

RLBLVSCRN. Key field: NPA of the forward number.

Action:

The ROP lists the numbering plan area (NPA) and NXX containing the invalid value. The value specified must be changed to a legal value. The program, in this case, will allow the verify attempt to proceed.

278. OABN_MONITRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bn_monitored attribute in the RLLOOPDB relation was corrupted. The attribute is dumped.

279. OABNSCOC_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OArplyqry() function, an inappropriate class of charge (COC) generated a BNS query. The OArplyqry() function is called when the OARPLY_QRY message is received in the "wait for query/connection" state.

The COCs that generate a BNS query are COLLECT, BACK_THIRD_NUMBER, and FORWARD_THIRD_NUMBER. No other COCs start BNS queries.

Action:

The OArplyqry() function continues and moves to the next state. The APB_ptr->int_msg.text[0] and loop_ptr->coc values are dumped to help determine where the error occurred in the OArplyqry() function. No manual intervention is required.

280. OABOOL_ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DMBOL attribute in the RLLOOPDB relation was not DBYES or DBNO. The attribute is dumped.

281. OABRCHKTRQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the attempt to play an automated operator services position system (OSPS) directory assistance (DA) announcement, the OAchk_treq() function of the position terminal process (PTP) returned an unexpected return code. This will cause the operator to give the announcement verbally.

282. OABRDG_FAL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Problem occurred when trying to bridge onto the requested terminal process port. MCGTIMEOUT or MGr_t_fail was received.

283. OABRSN_AQTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OA_aqtp() entry function was entered with a reason other than OSRREPLACE.

284. OABRT_RPRL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the OAchk_rpri() function after validation was performed on the request position release message. It is assumed that message validation was unsuccessful; ignore the message.

285. OABUSYPOSEIZ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) model was in the BUSY state when it received a position seizure message. This is invalid. The state of the model is changed to IDLE and the message is acted upon.

286. OACALLDUMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There may be errors in the rEISCALL tuple. The rEISCALL tuple is printed.

287. OACALLINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLEIS_CALL dynamic relation, which is associated with the operator services position system (OSPS) external information system (EIS) call processing data links (CPDLs), did not initialize properly.

288. OACALL_LIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The list of rLEISCALL tuple keys associated with a specified rLEIS_LNK tuple are dumped in the three data fields on the ROP. Each data field contains 80 keys providing a maximum indication of 240 rLEISCALL tuples linked to an operator services position system (OSPS) external information system (EIS) call processing data link (CPDL). After the keys of all rLEISCALL tuples have been displayed, the remaining key entries are populated with 0xffff.

289. OACAOVLP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) operator express trunk (private facility [PF] service class) selected a carrier that has OVERLAP set to Y. For operator express trunks in an OSPS office, the OVERLAP for the carrier must be set to N. The feature group D (FGD) carrier and the translated digits are dumped.

Data Structures:

RLFC_CARR. Key field: carrid.

Action:

Use the carrier ID dumped on the ROP and FGD to access RC/V View 10.3 (INTER-LATA CARRIER) to set the OVERLAP field to N. If the dumped digits are a SAC code, set the SAC OVERLAP field to N. If the OVERLAP and SAC OVERLAP fields are already N, contact your next level of support.

290. OACARD_4FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When the OAfcardf() function called the OAcrdanl() function, the return code was FOUR_DIGS_FAILED. (FOUR_DIGS_FAILED has a #defined value of 3.)

Card analysis found four digits, but there is not a valid forward number. This should never occur at this point in forward card processing; by this time forward number should be valid because the forward connection exists and is in the talking state.

Action:

The OAfcardf() function returns NXTSTATE (#defined value of 1) to go to the next state. No further action is required.

291. OACARDAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Office data associated with a feature group D (FGD) or feature group B (FGB) carrier is missing. This can affect entry of carrier data by an operator services position system (OSPS) operator and routing of operator assisted calls by a carrier.

Data Structures:

RLFC_CARR. Key field: carrid.

RLFC_FGBCARR. Key field: fgb_carrid.

RLCRI_CRN. Key fields: carr_id, featgrp.

Action:

The ROP output provides the carrier ID and its feature group. Use RC/V View 10.3 (INTER-LATA CARRIER) to verify that an entry exists for the carrier ID printed and that a CARRIER NAME is associated with it. If this data is missing, it must be inserted.

292. OACBADPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

OApasngen has received an optional ISUP parameter that its not set up to receive.

Probable Cause:

Incorrect switch statement in the function OAcopiamp or missing code in OApasngen.

Action:

Fix the code in either function or stop sending this ISUP parameter

293. OACBCOM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to access the channel control block (CCB) failed.

Probable Cause:

The link between the process control block link area (PCBLA) and the CCB communication region (CCBCOM) was corrupted.

294. OACDCOC_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An ineligible class of charge (COC) generated a CCD query. The CCD query result was received by the OArplyqry() function, but the wrong COC generated the query. The OArplyqry() function is called when the OARPLY_QRY message is received in the "wait for query/connection" state.

The COCs that can generate a CCD query are BACK_CARD_NUMBER, DDD_BACK_CARD_NUMBER, and FORWARD_CARD_NUMBER. No other COCs generate CCD queries.

Action:

The APB_ptr->int_msg.text[0] and loop_ptr->coc values are dumped to help determine where the error was encountered in the OArplyqry() function. The function continues and moves to the next state by returning the NXTSTATE return code.

295. OACCMODF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAaccs_init() function called the FCcreate() function to create the associated process block (APB) for the call

coordinator (CC) subprocess. The FCcreate() function returned failure.

296. OACCPCTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLCC_PCC relation which is used for international calls. An attempt was made to obtain a paired country code (PCC), but the RLCC_PCC tuple for the specific country code (CC) could not be found.

Data Structures:

RLCC_PCC. Key field: country code (CC).

The CC is in the dialed_dig field of the trunk termination (MGTK_TERM) message. The CC is converted to binary before accessing the RLCC_PCC relation; however, the CC is displayed in decimal on the ROP.

Action:

Use RC/V View 27.3 (OSPS TERMINATING CODE SCREENING & PCC FOR COUNTRY CODE) The message "ERROR: DBfrdtup() can not find tuple in RLCC_PCC relation - key = aaa", where aaa is the CC in decimal, will

297. OACCTP_PATH_ERR (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call control terminal process (CCTP) found inconsistent data used in tracking call connections.

Probable Cause:

Check data dumped to determine the problem.

Action:

Contact OSPS field support.

298. OACCTPRUNC (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call control terminal process (CCTP) run controller found an error that caused the CCTP to terminate.

Probable Cause:

Check data dumped to determine the problem. Either the 5ESS[®] switch software or adjunct software needs to be updated to fix this problem.

Action:

Contact OSPS field support.

299. OACEO_TO_NCEO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call came in on a conforming trunk, but the trunk group is marked as non-conforming.

Data Structures:

RLFC_TRUNK, RLFC_OPRTK.

Action:

The error is due to a mismatch in the signaling types indicated by the RLFC_TRUNK and RLFC_OPRTK relations. In the RLFC_OPRTK relation, the mfj_sig value is checked against the number of digits received in the back number (which includes automatic number identification [ANI] information). If the signaling is not compatible, the trunk group and member attributes from the RLFC_TRUNK relation are dumped along with whatever is known about the back number.

300. OACFCRERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global conference number carrier for an operator services position system (OSPS) conference number is not valid or can not handle a call.

Data Structures:

RLFC_CARR. Key field: carrid.

RLDNNTWK. Key fields: oanpa, oaindex.

RLFCRSMCAR. Key fields: carrier, rsm_num, featgrp.

Action:

The global conference carrier from the Glcf_carr global parameter is printed in decimal. The feature group of a global conference carrier is always D. Use the carrier ID and feature group D as keys for RC/V View 10.3 (INTERLATA CARRIER) to verify that the carrier is valid and that it is an interexchange or consolidated carrier.

If the carrier is not valid, the global parameter is not set properly. Determine the correct carrier and use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to update the conference carrier.

If the carrier is valid and the SM number printed is a remote SM (RSM), use RC/V View 26.22 (OSPS RSM/CARRIER DATA) to check that there is an entry for this carrier, feature group D, and SM number. If an entry is not present, the appropriate RSM dependent routing data must be inserted for this carrier to be used.

If the carrier is valid, it cannot handle an operator entered conference number. The digits dialed by the operator are printed. If another carrier handles this number, use RC/V View 26.20 (OSPS CARRIER FOR OPERATOR DIALED DNS) to insert an rIDNNTWK tuple for that carrier and this NPA-NXX.

301. OACHCON_NOS (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function OAch_conn() was called to change the status of a connection, but detected an error. The errors included are an unsupported change, invalid parameters passed to the function and corrupted dynamic data.

Probable Cause:

Invalid parameters were passed to OAch_conn(), an unsupported change was tried or corrupted data was found.

Action:

Contact field support with the ROP output to determine the problem and what action should be taken. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

302. OACHDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to access the channel control block (CCB) failed.

Probable Cause:

The link between the CCB communication region (CCBCOM) and the channel data block (CHDB) was corrupted.

303. OACHK_FAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The transfer check failed and returned an invalid value. This should not happen since all cases are accounted for in the OAnprls() function and the OAtrncheck() function has a default value. Recovery is handled in the code, the call continues.

304. OACIABBK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

ASCII to binary conversion (CCascbin) of the originating numbering plan area (NPA)-office code (NXX) failed during exception area determination and/or local access and transport area (LATA) mapping. The originating party's directory number from the call record calling number (billing number) or toll & assistance (T/A) loopdb.oe_data.backnum is dumped.

305. OACIABFW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

ASCII to binary conversion (CCascbin) of the terminating numbering plan area (NPA)-office code (NXX) failed during exception area determination and/or local access and transport area (LATA) mapping. The terminating party's directory number from the digit analysis data block (DADB) or toll & assistance (T/A) loopdb.fwd_rt_db for operator entered operator special dialed codes (OSDC) calls is dumped.

306. OACIBBCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Local access and transport area (LATA) mapping and/or exception area determination was requested from OT with other than 10 digits provided in the back number. The back number is retrieved from the call record billing number.

307. OACIDTGN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred while reading the RLTGNLEC relation.

Data Structures:

RLTGNLEC. Key field: tgn (incoming trunk group number [TGN]).

Action:

Use RC/V View 27.21 (OSPS TGN TO LEC INDEX) (or ODBE, if necessary) to verify that the RLTGNLEC relation exists. If necessary, add the relation.

308. OACIDTXT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred while reading the RLLECTEXT relation. There may be an office dependent data (ODD) inconsistency between the RLGTNLEC relation and the RLLECTEXT relation.

For every rLTGNLEC tuple with lec-index, an rLLECTEXT tuple must exist. For each rLTGNLEC tuple containing a tgn-index attribute value, a corresponding rLLECTEXT tuple may not have been found. Either the tgn-index attribute value is incorrect in the RLGTNLEC relation, or the rLLECTEXT tuple is missing.

Data Structures:

RLLECTEXT. Key field: lecidx (lec index).

Action:

Use RC/V View 27.20 (OSPS LOCAL EXCHANGE CARRIER TEXT) (or ODBE, if necessary) to check the key used for accessing the RLLECTEXT relation as output on ROP with the actual keys for this relation. Verify that the relation or the tuple exists; if necessary, add the relation or the tuple.

309. OACIEXMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure of the RLOAEXMAP relation occurred.

310. OACILATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Local access and transport area (LATA) mapping was turned on (the Glatmap global parameter was DBYES) and a customer dialed or an operator entered a forward number. The RLFCNPAMAP relation had invalid data stored for the LATA number associated with the originator's (back party) number.

Data Structures:

RLFCNPAMAP. Key fields: NPA, NXX.

Action:

Turn off LATA mapping or correct the rLFCNPAMAP tuple. The ROP output consists of the back number and local digit interpreter table (LDIT) associated with the call. Use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to turn LATA mapping on or off.

Or, use the numbering plan area (NPA) and office code (NXX) to read the RLFCNPAMAP relation via RC/V View 26.1 (OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS). To execute with LATA mapping on, every NPA-NXX in the operator services position system (OSPS) serving area must have the latanum field populated in RC/V View 26.1 with the same value that is populated in the RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) terminating LATA field (term_lata) for this NPA-NXX and LDIT ID.

311. OACILMIS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While local access and transport area (LATA) mapping was performed, a consistency check was made between the terminating LATA defined by the local digit interpreter tables (LDITs) in RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]), and the numbering plan area (NPA)-office code (NXX) mapping table in RC/V View 26.1 (OSPS

NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS).

Data Structures:

RLDAPRMDGT. Key field: LDIT ID.

RLDAONFLICT. Key field: LDIT ID.

RLFCNPAMAP. Key fields: NPA, NXX.

Action:

The ROP output provides the LDIT ID (which is the start index for the local digit interpreter) and the associated terminating LATA (term_lata) retrieved from the LDIT for analyzing the forward (called) number. The output also includes the dialed digits for the forward number and the LATA number (latanum) retrieved from the NPA map.

Use RC/V View 9.3 to verify the terminating LATA number for the given LDIT and dialed digits. Verify the LATA number stored within the NPA map. One or both of these values are wrong. Since network call denial (NCD) also uses the term_lata information from the LDIT, check if NCD works. If so, the NPA map value is wrong and must be changed.

Another alternative is to re-examine the entire office for LATA number values defined by both views. A LATA number is assigned for every NPA-NXX served by the operator services position system (OSPS) and represents the LATA in which the office resides. Valid LATAs are in the range 2-15 for directory numbers (DNs) served by this OSPS and should be the same in both views for all DN's in the serving area.

312. OACINMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Local access and transport area (LATA) mapping was active and was attempted for an operator entered number or for a customer dialed 0+ call, but the originating (back) number's numbering plan area (NPA) and office code (NXX) are not populated in the RLFCNPAMAP relation.

Data Structures:

RLFCNPAMAP. Key fields: NPA, NXX.

Action:

The ROP output provides the back number's NPA and NXX, and the local digit interpreter table (LDIT) ID of the digit analysis translator. Use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) for the LDIT and back number NPA and NXX given to retrieve the term_lata value. Insert an rIFCNPAMAP tuple via RC/V View 26.1 (OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS) and populate the latanum attribute with the term_lata value.

Or, if LATA mapping is not needed on this switch, turn it off via RC/V View 8.9 (OSPS OFFICE PARAMETERS). LATA mapping is not needed on a switch.

313. OACINPAF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLFCNPAMAP relation failed.

314. OACINVBK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Local access and transport area (LATA) mapping and/or exception area determination was requested with an invalid

back number. This should never happen since OA guarantees that a valid back number is available before calling digit analysis with LATA mapping and/or exception area determination turned on.

315. OACINVEA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Exception area determination was attempted on a customer entered 0+ call or on an operator entered forward number. The call was an inter-local access and transport area (LATA) call and the exception area indexes populated in the RLFCNPAMAP relation were the same. This is not allowed, exception area indexes must be different.

Data Structures:

RLFCNPAMAP. Key fields: NPA, NXX.

Action:

The ROP output provides the forward number and the back number. Use the numbering plan area (NPA) and office code (NXX) for each of these directory numbers (DNs) to access the RLFCNPAMAP relation.

Use RC/V View 26.1 (OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS) to correct the exception area index and define unique indexes for each LATA. The same index may not be used in two different LATAs. Exception area characteristics are defined in RC/V View 26.4 (OSPS/ISP EXCEPTION AREAS) for each exception index defined in the RLFCNPAMAP relation.

316. OACINVF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Exception area determination and/or local access and transport area (LATA) mapping was done for a floatable route number, but the forward number was invalid. This should never happen since OA should screen the number to ensure its validity.

317. OACIOATG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Exception area determination and/or local access and transport area (LATA) mapping was performed on this trunk group. The RLFCOPR_TK relation is not populated for this trunk group.

Data Structures:

RLFCOPR_TK.

The digit analysis data block (DADB) and toll & assistance (T/A) loop data block (LOOPDB) are also involved. The trunk group from LOOPDB.ta_data.trk_grp is dumped.

Action:

Most likely the trunk group is invalid. If the trunk group is valid, it must be added to the RLFCOPR_TK relation.

318. OACIOTTG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Exception area determination and/or local access and transport area (LATA) mapping was performed on this trunk group. The RLFCOPR_TK relation is not populated for this trunk group.

Data Structures:
RLFCOPR_TK.

The digit analysis data block (DADB) is also involved. The trunk group from DADB.tgroup is dumped.

Action:

Most likely the trunk group is invalid. If the trunk group is valid, it must be added to the RLFCOPR_TK relation.

319. OACKTFYL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to obtain a circuit index from RLCKTDATA, a failure occurred.

Probable Cause:

No cktdata.name was found to match the cktname from rIFC_PORTTYP

Action:

Refer to RC/V View 19.4 and 20.4

320. OACLG_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid calling number was found in the RLACCSDB relation. The OAASSERT() macro is used with this assert. The following information is dumped: associated process block (APB) key, model ID, model state, type of input message, where the message is from, far process ID, APB tag, the value switched on, and the external message header.

321. OACL_UNXMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by the OAcI_wann() function while attempting to set up to an announcement only channel (AOC) to play the purchase limits disconnect warning announcement. Call processing will proceed. The CL data structure (which contains the CL supervision state [cl_supv], confpath, and aoc_setup) and the message will be dumped on the ROP.

322. OACMPCRD_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLCMP_CRD relation associated with the operator services position system (OSPS) differentiation of card service charges feature was not initialized properly.

323. OACNFATI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:

The OAalo_coinot() function encountered a failure when adding an rICOINOT tuple to the headcell idle list.

Probable Cause:
Unknown.

Action:
An elevated AUCOINOT audit is scheduled and processing returns to the calling function.

324. OACNINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The COINOT initialization function, called during SM initialization, failed to insert a tuple or link a tuple to the idle list.

Probable Cause:
Unknown.

Action:
None.

325. OACNLKFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:
The OAcndatsz() function encountered a failure when linking an rICOINOT tuple to the process control block link area (PCBLA). An elevated AUCOINOT audit is scheduled and processing returns to the calling function.

326. OACNNLKD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:
The OAcndatrls() function encountered a failure when unlinking an rICOINOT tuple from the process control block link area (PCBLA). An elevated AUCOINOT audit is scheduled and processing returns to the calling function.

327. OACOCENUM_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An unknown or unexpected class of charge enumeration value was encountered. This assert is used mainly in the class of charge modules OAncoc and OAncbct.

Action:
The class of charge value that is in the LOOP data block (LOOPDB) is dumped. No manual intervention is required.

328. OACONF_OP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The MGCONFOP message contains corrupted data.

329. OACONQFWD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The conn_pending, qry_pending, and fwd_chk attributes in an rITALOOPDB tuple were all DBYES when the OAZNNEXT() macro was called from SDL code. These three bits should never be DBYES at the same time. The OAZNNEXT() macro called the OAZnnext() function, which called this assert.

Action:

Examine the stack back trace to determine the function that called the OAZnnext() function and why these bits are set to DBYES. Contact field support personnel.

330. OACONV_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Conversion from one type of notation to another failed (general). The structure containing the value being converted is dumped.

331. OACPSDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The entries attribute of an rLDIORCPS tuple indicated that more tuples in the RLDIORCPS relation needed to be read. However, the DBfrdtup() primitive returned DBNO_MATCH when attempting to read one of these additional tuples. The data may have been populated incorrectly for the originating country code and carrier.

332. OACPTGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAcarpic() function attempted to select the international carrier from the RLFCOPR_TK relation using the trunk group stored in taloopdb->ta_data.trk_grp as the key; the read failed.

333. OACRDAGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

The base call record DAGETCREC macro returned an invalid pointer to the base call record tuple.

Probable Cause:

A bad call ID was passed as a parameter.

Action:

The base call record audit is scheduled.

334. OACRD_NMTCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No tuple was found when attempting to read the RLCRD_ATTR relation using the card attribute ID printed on the ROP. This is an unexpected condition; a tuple matching this key should exist.

Data Structures:

RLCRD_ATTR. Key field: crd_attr (card attribute ID).

Action:

A data provisioning error has likely occurred. Access RC/V View 27.56 (OSPS TELEPHONE CREDIT CARD [TCR] ATTRIBUTES) using the card attribute ID listed on the ROP as the key. If the rICRD_ATTR tuple exists, an internal error has occurred; contact your local support organization.

If the rICRD_ATTR tuple does not exist, insert the tuple via RC/V View 27.56. If this is undesirable, update the corresponding tuple in View 27.55 (OSPS TELEPHONE CREDIT CARD ISSUER IDENTIFICATION) with a card attribute ID that has a matching tuple in View 27.56.

335. OACRDPRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to read the Product Type Table, but the DBfrdtup() primitive returned DBRELNAMEBAD when it attempted to read the RLCRDPRD relation.

Probable Cause:

Unknown.

Action:

None.

336. OACREXCPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is an operator services position system (OSPS) external information system (EIS) conditional removal exception report. An EIS may return a call processing interface message on an EIS call processing data link (CPDL) that is different from the one currently assigned by the 5ESS[®] switch. The switch normally changes the internal CPDL assignment when this event occurs.

Depending on the EIS interface specification, some EIS's are advised when a CPDL is marked internally for conditional removal and are not to move calls to CPDL's so marked. An EIS moved a call to a CPDL marked for conditional removal and the EIS integrity monitor flag (OAeisim) was on for the SM. The switch still honors the CPDL re-assignment. The rEIS_LNK tuple associated with the CPDL receiving the message is dumped along with a event value of 1 for link following and 2 for link takeover.

337. OACRMTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call record macro CRMTR() failed.

338. OACSCCLN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An international number was dialed and the local digit interpreter table (LDIT) indicated that the country code (CC) has an invalid length. The valid size is 1 to 3 digits.

Data Structures:

The digit analysis data block (DADB) contains the carrier information structure and directory number (DN) structure.

Action:

The ROP output provides the LDIT (digit analysis start ID), the CC length, and the dialed digits of the forward number. Review the IDDD Country access code RC/V View 9.6 (IDDD COUNTRY ACCESS CODE [OFFICE DIALING]) for the given LDIT and 011 prefix, then correct the CC defined.

339. OACSEISDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup(RLEIS_DATA,&eis_data) primitive call returned DBNO_MATCH. The decimal value of the eis_id key used to access the rEIS_DATA relation is dumped.

Data Structures:

RLEIS_DATA, RLOPEISDB.

Action:

Check the validity of the key. The eis_id key is based on the eis_id field value of the retrieved rLOPEISDB tuple. Use RC/V View 21.55 (OSPS OPERATOR TO EIS AND DATABASE MAPPING) and RC/V View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM [EIS] DATA) to check for a possible discrepancy. Remove the data link tuple and re-insert the tuple with the correct information, if any.

340. OACSEISID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A previously assigned eis_id value does not match the value in the RLOPEISDB relation; could not assign listing services calls to the proper vendor. This may occur on recall because the recall queue is set up incorrectly; or the eis_id assigned to the serv_tm is incorrect. The decimal value of the eis_id in the rLOPEISDB tuple and the eis_id in the MGPOSTMRQ message are dumped.

Data Structures:

RLOPEISDB.

Action:

Check the range of eis_id values. If the eis_id value in the MGPOSTMRQ message is out of range, this is a coding error in OT.

If the eis_id values are in range, use RC/V View 21.55 (OSPS OPERATOR TO EIS AND DATABASE MAPPING) to check for a possible discrepancy. Remove the data link tuple and re-insert the tuple with the correct information, if any.

341. OACSOPEISDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup(RLOPEISDB,&opeisdb) primitive call returned DBNO_MATCH. The decimal value of the serv_id and serv_tm keys used to access the RLOPEISDB relation are dumped.

Data Structures:

RLOPEISDB, RLSERVDATA.

Action:

Check the validity of the keys. The serv_id key is based on the serv_data.serv_id field value of the MGPOSTMRQ

message, and the serv_tm key is based on the serv_tm field value of the MGPOSTRMRQ message from the ACD.

Check for possible database discrepancies. Use RC/V View 21.55 (OSPS OPERATOR EIS AND DATABASE MAPPING) and RC/V View 21.54 (OSPS SERVICE DATA FOR LISTING SERVICES CALLS) to check the validity of the rLOPEISDB and rLSERVDATA tuples, respectively. Remove the invalid data link tuple and re-insert the tuple with the correct information, if any.

342. OACSREQTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OAissetup() function, the acd_data.req_type field in the MGPOSTRMRQ message was invalid or had an unexpected value. The expected req_type values are AC_NORMCONF, AC_EMERCONF, AC_NORMTRANS, AC_OPERCONF, AC_POSCONF, AC_OPERTRANS, AC_POSTRANS, AC_NORMAL, and AC_RECALL. The decimal value of req_type is dumped. This assert indicates a coding error.

343. OACSR_NMTCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No tuple was found when attempting to read the RLCSR_ATTR relation using the card attribute ID printed on the ROP. This is an unexpected condition; the tuple matching this key should exist.

Data Structures:

RLCSR_ATTR. Key field: csr_attr_id (CSR attribute ID).

Action:

A data provisioning error has likely occurred. Access RC/V View 27.58 (OSPS CARRIER SPECIFIC ROUTING (CSR) INTL CREDIT CARD ATTRIBUTES) using the CSR attribute ID listed on the ROP. If an rICSR_ATTR tuple exists, an internal error occurred; contact your local support organization.

If the tuple does not exist, insert a tuple via RC/V View 27.58. If this is undesirable, update the corresponding tuple in RC/V View 27.55 (OSPS TELEPHONE CREDIT CARD ISSUER IDENTIFICATION) with a CSR attribute ID that has a matching tuple in View 27.58.

344. OACTIN_READ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system error occurred while reading the RLCTINFO relation. The error was not DB_RESOURCE.

345. OACVALCE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STATE	Audit Mode: elev

Problem:

The rICV_STATE tuple could not be allocated or de-allocated. This implies a problem with the SM free list or idle list.

346. OACVCORD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected event occurred during vector processing that implied data corruption.

347. OACVLNKE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred when allocating or de-allocating the rICV_STATE tuple, or when linking with the rIPCBLA tuple of a process.

348. OACVMPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call vectoring model OACVD received an MGTASUCCESS message. This call should have been connected to music; however, a message was received indicating that an announcement just completed.

Data Structures:

RLFC_ANOUNCE. Key field: port.

Action:

Check the port type and the machine supplying the music for a match. If the machine is an announcement unit, check the RLFC_ANOUNCE relation in RC/V View 5.1 (TRUNK GROUP) to verify that the ANNC CYCLES field is set to 0 and the BARGE IN field is set to YES.

349. OACVSDLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STATE	Audit Mode: elev

Problem:

A problem linking/unlinking an rICV_STATE tuple to/from an rIPCBLA tuple occurred. Data may be corrupted in one or both tuples.

350. OACVUXEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected event occurred during vector processing.

351. OADANGLECONF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) position terminal process (PTP) left an N-port conference circuit dangling. The call for which the conference circuit was allocated is no longer at the position. The conference circuit is returned to the idle list.

The data dump provides the port (2 bytes), the process number (2 bytes), the process number uniqueness (1 byte), and the SM where the conference circuit resides (1 byte).

352. OADASCVENDOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global parameter Gldasc_vendor specifies the vendor supplying directory assistance system/computer (DAS/C) service to operator service position system (OSPS) operators. Gldasc_vendor was set to an unrecognized value.

The recognized values associated with Gldasc_vendor are enumerated in the 5ESS® Switch Translations and Dynamic Data Manual. The value FCDAS_NONE indicates the absence of a vendor supplying directory assistance service. However, the value FCDAS_NONE should not be encountered since a DAS/C is apparently being used.

Action:

Use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to reset the value of the Gldasc_vendor global parameter to reflect the DAS/C vendor supplying directory assistance service to OSPS operators.

353. OAD_BADESTID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The destination ID found in an immediate transfer message is invalid; the destination ID is dumped.

354. OAD_BADFLAG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data used by the autoquote terminal process (AQTP) was corrupted.

355. OAD_BADPOSID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position ID found in the IBM message is out of range; the position ID is dumped.

356. OAD_BCTME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The 30 second cyclic timer for the autoquote terminal process (AQTP) could not be set.

357. OAD_BDRSTRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSRESTART() macro returned an error code to the autoquote terminal process (AQTP).

358. OADBRBD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAcntvalid() function used the DBfrdtup() primitive to read a relation, but invalid data was found in the tuple read. The relation name and the entry containing the invalid data are dumped.

Data Structures:

RLCNH_CAS, RLICNH_CAS, RLICRH_CAS.

Action:

Verify the data in the tuple for the given relation name. Use RC/V View 27.53 (OSPS CAS CONTRACT STATUS) for the RLCNH_CAS relation, and RC/V View 27.54 (OSPS CAS INVERSE CONTRACT STATUS) for the RLICNH_CAS and RLICRH_CAS relations.

359. OADBRLCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive returned failure while reading the RLCTINFO relation.

360. OADBRNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OActnvalid() function used the DBfrdtup() primitive to read a relation, but no match was found. The relation name is dumped.

Data Structures:

RLCNH_CAS, RLCNB_CAS, RLICNH_CAS, RLICNB_CAS, RLICRH_CAS.

Action:

Determine why the relation does not exist. Use RC/V View 27.53 (OSPS CAS CONTRACT STATUS) or RC/V View 27.54 (OSPS CAS INVERSE CONTRACT STATUS).

361. OAD_BSTME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSTIMER() macro returned an error code to the autoquote terminal process (AQTP).

362. OADCPSSS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to determine country pair screening (CPS) - special screening (SS) for a direct international originations (DIOR) call, to read the RLDCPSSS relation.

363. OAD_DASCFULL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DASC	Audit Mode: elev

Problem:

The RLDASC relation is full; a call ID tuple could not be inserted. The AUDASC audit is called to remove inactive process IDs in the RLDASC relation.

364. OAD_DSLFRDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed to read an rLDLDSL tuple. The return value is dumped.

365. OAD_DSLNOMAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed. The global port does not exist in the RLDLDSL relation. The global port is dumped.

366. OADEACCS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete an rIACCSDB tuple. The rIACCSDB tuple key is dumped.

367. OADEAC_TMRO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitoring process timed out while waiting for a response to determine whether or not the position was de-activated as a monitor. Possibly, the position is still assigned monitoring privileges. The switch value contains the position number.

368. OAD_EMTPOSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OApst_init() function failed; the RLPOSDB relation is empty.

369. OAD_FDLFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfdltup() primitive failed to delete an rIDASC tuple. The return value is dumped.

370. OAD_FINFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfintup() primitive failed to insert an rIDASC tuple; the return value is dumped.

371. OAD_FRDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Dbfrdtup() primitive failed to read an rIDASC tuple; the return value is dumped.

372. OADFSRVRES (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognized resource was requested for either release or acquisition in the function OASrvres(). The function OASrvres() is defined in the file oa/OAeisot/OASrvres.c. The list of resources requested, the associated rISRVOT tuple, and the boolean indicator of whether the resource list is for acquisition or release are dumped.

373. OAD_FUPFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfuptup() primitive failed to update an rIDASC tuple. The return value is dumped.

374. OADGT_ANA_BAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAct_diganal() function returned a value that is not in the associated header file. This may indicate a memory problem since there is a default return value to cover the case of dropping through the function.

375. OADIGCOSERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAtacar_sel() function is entered if the class of service is a value found in a feature activation table (FAT). However, the OAtacar_sel() function had a class of service with an unexpected value that is not listed in the FAT.

376. OADIGKEYERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAtadignl() function prepares for digit analysis for an operator services position system (OSPS) call. The key used to start digit analysis was not recognized.

377. OAD_INCRSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect reason field was passed to the OA_dtp() function. The reason field is dumped.

378. OADINGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed initialize the Glnbst global parameter using the DBrfgparm() primitive when it was called from the OAdat_init() function in oa/OAfex/OAdatinit.c.

379. OADINGP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glnbst global parameter using the DBrfgparm() primitive when it was called from the OAdat_init() function in oa/OAfex/OAdatinit.c.

380. OADINGP3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the Gloop global parameter using the DBrfgparm() primitive when it was called from the OAinloopdb() function in oa/OAfex/OAdatainit.c.

381. OADINGP4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gloop global parameter using the DBrfgparm() primitive when it was called from the OAinloopdb() function in oa/OAfex/OAdatainit.c.

382. OADINGP5 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gloop global parameter using the DBrfgparm() primitive when it was called from the OAinloopdb() function in oa/OAfex/OAdatainit.c.

383. OADINGP6 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gloop global parameter using the DBrfgparm() primitive when it was called from the OAinloopdb() function in oa/OAfex/OAdatainit.c.

384. OAD_INITFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OApst_init() function failed due to a DBstfst() or DBstnxt() primitive failure. The return value is dumped.

385. OAD_INVMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received from the directory assistance system/computer (DAS/C). The message type is dumped.

386. OAD_INVPRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid process number (dalbkey) was found in the data link entry.

387. OAD_INVST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The state flag was set to an invalid state. The state flag is dumped.

388. OADIORCPS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to determine country pair screening (CPS) for a direct international originations (DIOR) call, but the DBfrdtup() primitive returned DBRELNAMEBAD when it attempted to read the RLDIORCPS relation.

389. OADIRCERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct connect directory number (DN) associated with an incoming intercept direct connect trunk is not valid.

Data Structures:

RLFC_TDIRC. Key field: port.

Action:

If this trunk only has initial intercept calls on it, then the direct connect DN must be one of the following values:

- 6 for operator number identification (ONI) regular
- 7 for ONI blank
- 8 for ONI trouble

The data printed on the ROP consists of the intercept trunk group number, the intercept trunk group port number and module, and the digits associated with the trunk. Check the direct connect DN specified on RC/V View 5.1 (TRUNK GROUP). Update this direct connect DN from its current, incorrect value to the single digit 6, 7, or 8. RC/V View 5.1 is keyed by trunk group number.

If the data on RC/V View 5.1 is correct, then the RLFC_TDIRC relation, keyed by the trunk group member port and module numbers, is not correct.

390. OAD_LSNOMAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAldsh() function failed; the global port does not exist in the RLDLDSL relation.

391. OA_DNMSGTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The autoquote originating terminal process (AQ-OTP) timed out waiting for the MGAQDN message. This message contains the directory number for the automatic charge quotation service (ACQS) establishment from the autoquote terminal process (AQTP).

392. OADNNERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The carrier identified in the RLDNNTWK relation could not handle an operator entered conference number.

Data Structures:

RLFC_CARR. Key field: carrid.

RLFCRSMCAR. Key fields: carrid, rsm_num, featgrp.

RLDNNTWK. Key fields: oanpa, oaindex.

Action:

The carrier ID from the RLDNNTWK relation is printed in decimal. Use the carrier ID and feature group D as keys to RC/V View 10.3 (INTERLATA CARRIER) to verify that the carrier is valid and is not an international carrier. If the data in this view is not correct, update it. If the data is valid, the carrier can not handle the call to the dialed digits printed.

If the SM number printed is a remote SM (RSM), use RC/V View 26.22 (OSPS RSM/CARRIER DATA) to verify that an rFCRSMCAR tuple exists for this carrier, feature group D, and RSM number. If the carrier is valid and should handle this call, but does not have an entry in View 26.22, determine the routing data needed and insert an rFCRSMCAR tuple.

If the carrier is not valid or if it should not handle calls to this NPA-NXX, use RC/V View 26.20 (OSPS CARRIER FOR OPERATOR DIALED DNS) to update the RLDNNTWK relation with the correct carrier, or remove the tuple specifying this carrier so that the global default conference carrier will be used.

393. OAD_NPAFLD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed to read an rINPA_HEAD tuple. The numbering plan area (NPA) number is dumped.

394. OAD_NPANXFLD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed to read an rINPA_NXX tuple. The first four digits of the npa_nxx value is dumped.

395. OADNRA_C7ER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) DIOR NRA call attempted to route to a non-CCS7 trunk. Since DIOR NRA calls cannot be routed via a non-CCS7 trunk, this call will not be completed.

Data Structures:

RLDNRARTE - Key fields: INWATS NPA, office code, line number.

Gldnrade - destination index

Gldnrarte - route index

Action:

DIOR NRA calls must route only to common channel signaling system 7 (CCS7) trunks; routing to non-CCS7 trunks is blocked. An OSPS DIOR NRA call passed digit analysis and routing, but routed to a non-CCS7 trunk. The ROP output includes incoming and outgoing trunk numbers, the forward number, the DIOR NRA translated routing number, the destination index, and the route index.

396. OADNSTART (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The starting point (position of the first digit that will be displayed) of the number the operator dialed is greater than the number of digits left over from digit analysis. Therefore, no digits will be displayed at the operator's position. These values are specified in the RLOAODISP relation.

Data Structures:

RLOAODISP. Key field: display index. The ROP output provides the display index key, the starting point of the digits to be displayed, the digit count (the number of digits left over from digit analysis), and the trunk group number.

Action:

Use RC/V View 21.1 (OSPS ADMINISTRATIVE OFFICE PARAMETERS) and View 21.26 (SEIZURE) to change the rLOAODISP tuple for the display index specified in the ROP output.

Change the starting point to allow the desired number of digits to be displayed. Decrease the starting point so that the digit count minus the starting point equals the number of digits to be seen by the operator.

397. OAD_OSENOTCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cyclic timer failed; could not allocate a timer control block (TCB).

398. OAD_OSERANGE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cyclic timer failed; the timer was out of range.

399. OAD_OSSENDFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed; could not send an operating system for distributed switching (OSDS) message.

400. OAD_OSTMOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETMSG() macro timed out; the cyclic timer was not running.

401. OAD_OSWGETFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETMSG() macro failed.

402. OAD_POSFRDFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed to read an rIPOS_LPRT tuple. The position ID is dumped.

403. OAD_POSIDNTSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position ID in the rIPOSDB tuple does not match the position ID in the rIPOS_LPRT tuple. The position ID is dumped.

404. OADPTF_C7ER (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An Operator Services Position System (OSPS) DIOR PTF call attempted to route to a non-CCS7 trunk. Since DIOR PTF calls cannot be routed using a non-CCS7 trunk, this call will not be completed.

Data Structures:

RLDPTFRTE - Key fields: INWATS NPA, Office Code, Line Number

Gldptfdest - destination index

Gldptfrte - route index

Action:

DIOR PTF calls must route only to common channel signaling system 7 (CCS7) trunks; routing to non-CCS7 trunks is blocked. An OSPS DIOR PTF call passed digit analysis and routing, but routed to a non-CCS7 trunk. The ROP output includes incoming and outgoing trunk numbers, the forward number, the destination index, and the route index.

405. OAD_REINTLNK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The directory assistance system/computer (DAS/C) terminal process (DTP) initialization or message handling could not continue. DTP calls this purging assert to allow re-initialization of the data link to occur.

406. OAD_RTNMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The directory assistance system/computer (DAS/C) terminal process (DTP) received a returned message from the DAS/C; the message type is dumped.

407. OAD_SRSPFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAsys_rsp() function failed due to accessing a global port, or the PSol3send() function failed; the return value is dumped.

408. OAD_STATFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAstat_mon() function failed because a directory assistance system/computer (DAS/C) digital subscriber line (DSL) global port was accessed or the PSol3send() function failed. The return value is dumped.

409. OAD_UNACMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unaccepted IBM messages; dump the message type.

410. OAD_UNEXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The directory assistance system/computer (DAS/C) terminal process (DTP) received an unexpected operating system for distributed switching (OSDS) message from the OSWGETMSG() macro. The message is dumped.

411. OAE_ACTIONFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While translating an external information system (EIS) operating system for distributed switching (OSDS) internally-formatted message into the specified external message set format, the action field value in the internal message structure was unexpected for the particular message type to be sent. The unexpected action value is dumped along with the OSDS message ID (message type) and the external message set number. The valid enumerations for the action field are found in oa/hdr/OAeis_act.L.

412. OAEATRETBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown return value was returned from the dynamic access (DA) "Add EIS call to the EIS link" function. This occurred while trying to add an external information system (EIS) call tuple to the tail of an EIS link tuple. The return value will be dumped.

413. OAEBADDBREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The "DB fast read tuple" primitive returned an unexpected value in the "EIS get SM" function. The return value is dumped.

414. OAEBADMSGTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAcomsend() function received a request to send a message with a message type that it can not understand.

Valid message types are MGDISCNTL, MGREQ_ACT, MGPORT_SEL, MGDENY_ACT, MGPOS_RLS and MGPOS_SEIZ. The invalid message type is printed.

415. OAEBADPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was detected on entry to one of the operator actions (OA) external information system (EIS) functions. The parameter is printed.

416. OAEBPRONO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

The external information system terminal process (EIS-TP) process number found in an EIS link tuple was out of range (<1||=>DBQNPCBLA). The process number is dumped and the EIS link audit is initiated.

417. OAE_BSCSUX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAtedisdata() or OAtedisdsl() external information system (EIS) trigger functions associated with the RLEIS_DATA and RLEISDSL static relations, respectively, found an rIORTLA tuple with an unexpected basic state (bsc_state) value. Each trigger function returns a failure code that causes the database (DB) subsystem to issue the DBTRIGFAIL assert that specifies the relation name and the trigger's return code value. This assert dumps the key (port) and the unexpected bsc_state value of the offending rIORTLA tuple.

418. OAECALTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EISCALL	Audit Mode: elev

Problem:

An error occurred while adding an external information system (EIS) call tuple to the tail of a set associated with the EIS. The dynamic access (DA) "add EIS call to tail of EIS link" function returned a value of "bad address" meaning that the tuple is already a member of a list. Before adding the tuple to the list, it should have been removed from its current list. The tuple will be dumped.

419. OAE_CIDMM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) call ID indicated within the local EIS data block (LEDB) does not match the EIS call ID specified in the rIEISCALL tuple. This may occur when an earlier call allocated an rIEISCALL tuple, returned the tuple to the RLEISCALL resource idle list, and a new call accessed the tuple once again; but the EIS or the 5ESS[®] switch attempted to use this rIEISCALL tuple for the "old" call.

This error may also happen if the key to the rIEISCALL tuple was corrupted. The key is the SM relative call ID; that is, the call ID relative to the SM where the EIS call processing data link (CPDL) was allocated. The EIS call ID from the LEDB and the rIEISCALL tuple are dumped.

420. OAEDBRETINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system terminal process (EIS-TP) called the "DB set cardinality" function during conditional removal and received an error return value. The return is either "DB set name bad" or an unknown return code. The return value is dumped.

421. OAEDIEJOBBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while scheduling an integrated services port administrator (ISPA) job in the "EIS terminal process terminate" function. The terminal maintenance (TM) ISPA job handler function returned failure or an unknown return value signifying that the call processing data links (CPDL) removal job was not scheduled. The return value, the ISPA input buffer, and the job ID will be dumped.

422. OAEDPBBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An inconsistency occurred in retrieving the rIDPB tuple associated with an external information system (EIS) call processing data link (CPDL). The port used as a parameter to the "DA get DPB" macro does not match the port in the retrieved rIDPB tuple. The port from the rIDPB tuple and the port used as a parameter to the macro, which is from the feature data block (FDB) of the EIS terminal process (EIS-TP), are dumped.

423. OAE_EISIDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system identification number (EIS ID) was outside of its defined range (0 to 16, inclusive). The unexpected EIS ID is dumped.

424. OAEFDBMSINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The external information system (EIS) found an invalid message set ID in the feature data block (FDB) of the process that called this function. The message set ID is dumped.

425. OAEFLAGSBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The flags used by the external information system terminal process (EIS-TP) to determine the conditional removal state of its call processing data link (CPDL) are invalid. The conditional remove active and ignore conditional remove flags from the feature data block (FDB) are both set. These flags should not both be set at the same time. The conditional remove state, which is calculated from the settings of these flags, is dumped.

426. OAEGKBADID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: EISLKSEL	Audit Mode: elev

Problem:

In the `OAeis_glnk()` function, a link to an external information system (EIS) was selected for the next call. When the link tuple was retrieved, the `eis_id` field did not match the value passed to this function. Both `eis_id` values will be printed. An EIS link select audit will be scheduled.

427. OAEGLPIDBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

An inconsistency was found while comparing the process ID of an external information system terminal process (EIS-TP) with the EIS link's process ID in the "get EIS link pointer" function. The EIS-TP's process ID, which was determined by calling the OS "get PID" macro, was not equal to the EIS link's process ID. Both process IDs will be dumped.

428. OAEGLPTRBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

An inconsistency was found while trying to access a pointer to the external information system (EIS) link tuple associated with an EIS terminal process (TP) in the "get EIS link pointer" function. The EIS link's SM relative link does not agree with the feature data block's (FDB's) SM relative link. Both SM relative link values are dumped.

429. OAEHBTMROOR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The external information system (EIS) heartbeat function requested an operating system for distributed switching (OSDS) timer while attempting to send an EIS request heartbeat message to the EIS. The EIS message delay field in the feature data block (FDB) of the process that called this function was used as an element of the calculated time parameter.

The OSDS timer function returned a value of error range, meaning that the time parameter calculated using EIS message delay was out of range. The EIS message delay field is dumped.

430. OAEHBTYPEINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the common "EIS message set X heartbeat message" functions was passed an invalid heartbeat message type parameter. The heartbeat message type is dumped.

431. OAEHUNGTOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A hung external information system (EIS) call tuple was found by the EIS system process (EIS-SP). The controlling terminal process associated with the EIS call tuple is no longer controlling this call. This assert only occurs if the EIS integrity monitor is on. The EIS call tuple is dumped.

432. OAEIDOOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) ID passed to one of the common EIS functions was out of range. The EIS ID is dumped.

433. OAEIETPR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

An inconsistency was detected in the external information system terminal process (EIS-TP) process ID (PID) value found in the EIS link tuple and the EIS call tuple. The inconsistent values will be printed and an audit will be scheduled.

434. OAEIKECT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EISCALL	Audit Mode: elev

Problem:

The DAGETCALL() macro returned a tuple that had an inconsistent key value. The key that was used to obtain the tuple and the key in the tuple are printed. An EISCALL audit is scheduled.

435. OAEIKELN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

The DAGETLNK() macro returned an external information system (EIS) link tuple that had an inconsistent key value. The key that was used to obtain the tuple and the key in the tuple are printed. An EIS_LNK audit is scheduled.

436. OAEIKELS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EISLKSEL	Audit Mode: elev

Problem:

The DAGETLKSEL() macro returned an external information system (EIS) link select tuple that had an inconsistent key value. The key that was used to obtain the tuple and the key in the tuple are printed. An audit is scheduled.

437. OAEINTINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) failed to establish an interface with an EIS for a new call. The assert is only called when the EIS integrity monitor global variable is on. The incoming message associated with this new call is dumped.

438. OAEIPRNO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

The external information system terminal process (EIS-TP) process number was not consistent between the rIPCBLA tuple and the EIS link tuple. The two values are printed and an EIS link audit is scheduled.

439. OAEIRHCAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive called to obtain an EIS call tuple from the head of the list returned DBNULL_SET. No audit was scheduled.

440. OAEISERCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert only prints when the global external information system (EIS) flag OAeisim is set to DBYES (1). The number of errors encountered during a call processing session with an EIS exceeded the threshold. The call is terminated to prevent looping errors that may occur if communication with the vendor continues. The message set ID is dumped.

441. OAEISINVPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The "OS send message" macro returned a value indicating the supplied receiver's process ID is invalid for the calling external information system (EIS) process. The return value and process ID of the receiving process are dumped.

442. OAEISLNGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The "OS send message" macro returned a value indicating that the calling external information system (EIS) process tried to send a message that is too long for the operating system for distributed switching (OSDS) or for the receiving process. The return value, process ID of the receiving process, and OSDS message length are dumped.

443. OAEISLPCNTBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) model detected that the eis_loopdb_ct value in the RLTAPOSDB relation is out of range (<0 or >1). The actual value will be printed.

444. OAEISMCID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected in the SM relative call ID value. The value will be printed.

445. OAEISMVCL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) system interface function OAmov_call() was passed a pointer to the rEIS_LNK tuple representing the call processing data link (CPDL) from which the call is being moved, and a pointer to the rEIS_CALL tuple that was assigned to the call.

The rIEISCALL tuple should be a member of the set currently owned by the rIEIS_LNK tuple from which the call is being moved, but this is not the case.

446. OAEISNOLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert only prints when the global external information system (EIS) debug flag OAeisim is set to DBYES (1). A vendor incoming message could not be associated with an internal EIS call processing link. When an incoming message is received, two 5ESS[®] switch internal data structures are accessed - the data associated with the call and the data associated with the call processing link assigned to the call.

The call related data was accessed successfully, but the call processing link data was not found. The message was late (that is, the switch cleared its data before the message was processed), or the vendor did not correctly specify the switch area data in the incoming message. The incoming message and the rIEISCALL tuple associated with the call are dumped. If the error was encountered in the EIS terminal process OAetpnrmmsg(), the rIEIS_LNK tuple is also dumped; otherwise, the message set ID is dumped.

447. OAEISNORES (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The "OS send message" macro returned a value indicating a resource failure to the calling external information system (EIS) process. This assert is only called when the EIS integrity monitor global variable is on. The return value and process ID of the receiving process are dumped.

448. OAEISRETUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The "OS send message" macro returned an unknown return value to the calling external information system (EIS) process. The return value is dumped.

449. OAEISRLNO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

An inconsistency was detected in the SM relative link number of the rIPCBLA tuple and the external information system (EIS) link tuple. The two values are printed and an EIS link audit is started.

450. OAEISUNXMSG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in the operator actions software interacting with an external information system (EIS). Data dumped about the call is the message or the dynamic data about the call. The action that is taken depends on the code that is executing at the time the message is received. If the message is from the far process or a far process does not exist, the call is terminated. If the message is from an unknown process, the message is ignored and processing continues.

451. OAEISUNXMSG (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in the operator actions software interacting with an external information system (EIS). The message is dumped. The action that is taken depends on the code that is executing at the time the message is received. If the message is from the far process or a far process does not exist, the call is terminated. If the message is from an unknown process, the message is ignored and processing continues.

452. OAEL3SEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An external information system (EIS) function received an error return code from the packet services (PS) sending function while attempting to send a message. The return value was unknown or indicated that one of the parameters passed to the PS sending function was invalid. The return value, rIDALB tuple key, and message size are dumped.

453. OAELMSINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

An external information system (EIS) function found an invalid message set ID in the EIS link tuple associated with its call processing data link (CPDL). The message set ID is dumped.

454. OAELPRETBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while attempting to traverse a "TA loop db" linked list in search of an external information system (EIS) call's SM relative call ID during EIS system process (EIS-SP) hung tuple processing. A dynamic access (DA) function returned an unknown return value. The return value is dumped.

455. OAELSINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EISLKSEL	Audit Mode: elev

Problem:

An inconsistency occurred when retrieving an external information system (EIS) link select dynamic tuple. The EIS ID used as a parameter to the "DA get EIS link select" macro does not match the EIS ID in the retrieved EIS link select tuple. The EIS ID used as a parameter to the macro and the EIS ID from the tuple are dumped.

456. OAEMIECI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected by the OAMsgck() primitive between the data in the received message's local external information system (EIS) data block (LEDB) and the EIS call tuple data. The EIS call ID value is not consistent. Both EIS call ID values are printed.

457. OAEMIEID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected by the OAMsgck() primitive between the data in the received message's local external information system (EIS) data block (LEDB) and the EIS link tuple data. The EIS ID is not consistent. Both EIS IDs are printed.

458. OAEMIESM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected by the OAMsgck() primitive between the SM value in the received message's local external information system (EIS) data block (LEDB) and in the GI_pcrd global parameter. The LEDB SM value and the contents of the GI_pcrd parameter are printed.

459. OAEMIMSID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected by the OAMsgck() primitive between the data in the received message's local external information system (EIS) data block (LEDB) and the EIS link tuple data. The message set ID is not consistent. Both message set IDs are printed.

460. OAEMISID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected by the OAMsgck() primitive between the data in the received message's local external information system (EIS) data block (LEDB) and the EIS link tuple data. The switch ID value is not consistent. Both switch ID values are printed.

461. OAEMISRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected by the OAMsgck() primitive between the data in the received message's local external information system (EIS) data block (LEDB) and the EIS call tuple data. The SM relative call ID is not consistent. Both SM relative call ID values are printed.

462. OAEMIVEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected by the OAMsgck() primitive between the data in the received message's local external information system (EIS) data block (LEDB) and the EIS link tuple data. The vendor information is not consistent. Both vendor IDs are printed.

463. OAEMLCOOR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

The maximum link capacity field of an external information system (EIS) link tuple was zero. This is invalid since this field is used as a divisor during the calculation of the approximate usage of an EIS call processing data link (CPDL).

464. OAE_MSGSETIDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface detected an invalid external message set ID. The message set ID is used to determine how to convert the internal EIS operating system for distributed switching (OSDS) message structure into the external format used by the particular EIS assigned to the call. The invalid message set ID value is dumped.

465. OAEMSGVIOL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the external information system (EIS) for service code OASRV5 (specialized handling for 700 numbers), for service code OASRV7 (inmate calling services) or for service code OASRV8 (AATLSOS automated access prompting with CDSU), the number of errors detected by the switch in communicating with the external vendor on this call exceeded the threshold of one.

466. OAEMSGVIOL (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the external information system (EIS) for service code OASRV5 (specialized handling for 700 numbers), for service code OASRV7 (inmate calling services) or for service code OASRV8 (AATLSOS automated access prompting with CDSU), the number of errors detected by the switch in communicating with the external vendor on this call exceeded the threshold of one. For service code OASRV9 (OSPS interface to Harris Operator System), this identifies a message received by the switch in the wrong state.

467. OAEMSGVIOL (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the external information system (EIS) for service code OASRV5 (specialized handling for 700 numbers), for service code OASRV7 (inmate calling services) or for service code OASRV8 (AATLSOS Automated Access Prompting with CDSU), the number of errors detected by the switch in communicating with the external vendor on this call exceeded the threshold of one.

468. OAENODALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The "EIS get DALB" function tried to access an rIDALB tuple associated with the process number passed as a parameter. The rIDALB tuple was not found. The return value from the "DA follow PCBLA to DALB" function will be dumped along with the process number.

469. OAENOEISDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rEIS_DATA tuple is missing. Most likely the key is valid, but the tuple is missing from the database. The decimal

value of the external information system (EIS) ID (eis_id) key used to access the RLEIS_DATA relation is dumped.

Data Structures:

RLEIS_DATA. Key field: eis_id.

Action:

Verify that the eis_id key printed on the ROP is a valid EIS ID. If the key is valid, access RC/V View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM [EIS] DATA) to insert the rLEIS_DATA tuple with this key. If the key is not valid, write an initial modification request (IMR).

470. OAENOESM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No bit was set in the preoper portion of an rLEIS_DATA tuple. The preoper portion is a bit map representing whether or not an SM is available for pre-operator external information system (EIS) functionality.

EIS pre-operator functionality was attempted, but no EIS SMs were assigned to provide this functionality. The decimal value of the eis_id key used to access the RLEIS_DATA relation is dumped.

Data Structures:

RLEIS_DATA. Key field: eis_id.

Action:

Use RC/V View 21.52 (OSPS SM SPECIFIC DATA FOR EIS) to verify that at least one EIS SM is available to handle pre-operator functionality for the associated EIS and asserting SM. If none are available, update the view so that at least one EIS SM is available for pre-operator functionality.

471. OAEQPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Feature control (FC) has this bad habit of forwarding MGINTERRUPT messages to the far process. When the position terminal process (PTP) has a connection with a FC process that receives an interrupt. Luckily, we can catch these cases by examining the gport field in the message and compare it to the PTP port. The comparison is performed in OAEqport() by reading RLFC_PORTYPE to obtain a portindex. The portindex specifies whether the port was a D or B port. A failure occurred while reading RLFC_PORTTYP.

Probable Cause:

Tuple does not exist for the port used as key to read FC_PORTTYP.

Action:

Populate RC/V View 21.30 with the appropriate digital subscriber line (DSL) port.

472. OAER0CCNAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to determine the country name for a country code, but database read did not recognize the RLCC_NAME relation.

473. OAER1AATOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to make a 1+800 alternate access to operator services/software defined network (AATOS/SDN) network remote access (NRA) call, but the feature is turned off or the feature activation parameter is set to a trunk group and member number that are not the same as the trunk group and member number over which the call originated. The call will be sent to reorder.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

RLFC_OPRTK. Key field: tgroup.

Action:

Use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to determine if the AS FEATURE WORD field equals N. If it does, set this field to Y in the AATOS/SDN NRA section of the view.

If the AS FEATURE WORD field equals "T aaaa bbbb" where T indicates test mode, aaaa is the trunk group number, and bbbb is the trunk group member number:

1. Obtain the trunk group number and trunk group member number from RC/V View 5.5 (TRUNK MEMBER).
2. Change the "aaaa" and "bbbb" in RC/V View 8.9 to match the trunk group number and trunk group member number in RC/V View 5.5.

474. OAER1CCNAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to determine the country name for a country code, but no entry was found for the country code.

Data Structures:

RLCC_NAME. Key field: country code.

Action:

Determine if this is a valid country code, according to the rules associated with RC/V View 27.7 (OSPS COUNTRY NUMBER TO COUNTRY NAME MAPPING) for specifying country codes. If the code is valid, add this country code and the name of the country using RC/V View 27.7.

475. OAER2AATOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to read an rLSERVDES tuple, but the tuple was not found or the key used to read the relation was incorrect. The call will be sent to reorder. This rLSERVDES relation is used by the alternate access to operator services/software defined network (AATOS/SDN) network remote access (NRA) feature.

Data Structures:

RLSERVDES. Key field: SSCWXY.

The SSCWXY key is the first six digits of the signaled forward number. servind is a required field.

Action:

If the SSCWXY key is a valid value, add this SSCWXY and the servind in RC/V View 27.70 (OSPS SERVICE DESIGNATION FOR 1+800 AATOS/SDN NRA OR AATLSOS CALLS).

476. OAER2CCNAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to determine the country name for a country code, but the name retrieved was blank.

Data Structures:

RLCC_NAME. Key field: country code.

Action:

Determine the name of the country associated with the printed country code. Use RC/V View 27.7 (OSPS COUNTRY NUMBER TO COUNTRY NAME MAPPING) to provide a name that can be displayed to the operator.

477. OAER3CCNAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAcountry() function was called with an invalid parameter; a request was made to display the country name for an unsupported or invalid directory number type.

478. OAER4CCNAME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to determine whether direct international originations (DIOR) automated sequence calls are allowed for a specified country code, but the database read did not recognize the RLCC_NAME relation.

479. OAERANNC_HDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to obtain phrases for a header ID from the RLANNC_HDR relation, but the DBfrdtup() primitive returned DBRELNAME_BAD.

480. OAE_REASONFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While translating an external information system (EIS) operating system for distributed switching (OSDS) internally-formatted message into the specified external message set format, the reason field value within the internal message structure was unexpected for the particular message type to be sent.

The unexpected reason value is dumped along with the OSDS message ID (message type) and the external message set number. The valid enumerations for the reason field are found in uhdr/db/DMeis_reas.G.

481. OAERHRETBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while attempting to remove an external information system (EIS) call tuple from a list. The dynamic access (DA) "remove EIS call from head of EIS link" function returned an unknown return value. The return

value will be dumped.

482. OAERLANG_TBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive returned failure when trying to read the RLLANG_TBL relation. The return value, the value of the key, and the language value (indicating the language to be used for the announcement) are dumped.

The language table is in RC/V View 8.66 (NON-ENGLISH LANGUAGE ANNOUNCEMENT APPLICATION TYPES) and the valid range for the language value is 1 through Gllop_max (see the MAX LOP field in RC/V View 8.9 [OSPS OFFICE PARAMETERS]).

Probable Cause:

The data read error occurred due to an invalid relation name or other invalid data.

483. OAE_RLSFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) position release call event function OAeisprls() was called with an invalid release reason; valid values are defined in uhdr/db/DMrls_reas.G. The invalid release reason is dumped.

484. OAERPHR_LANG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to obtain a non-English phrase ID from the RLPHR_LANG relation, but the DBfrdtup() primitive returned DBRELNAME_BAD.

485. OAERRDSL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was fired when the macro RTGETD() was invoked to obtain the D-port for a database session. The utility function Rlgetd() failed due to a SYSERROR, or some other error besides DBNO_MATCH, while an attempt was being made to obtain a UNIT_CKT or CKT_PORT tuple. This assert could fire under the following circumstances:

- 1) When a database session is being established for a strike login.
- 2) When a database session is being established for a non-strike login.
- 3) When the Main DB key or a database soft key has been hit in to access an external database.

486. OAERRFTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to make a 1+800 federal telecommunication system network remote access (FTS NRA) call, but the FTS NRA feature is not active. The call will be sent to reorder.

Action:

If the FTS NRA feature is not active, follow the standard procedures to activate the FTS NRA feature on RC/V Views

8.22 (SECURED FEATURE UPGRADE) and 8.31 (OPTIONED FEATURES).

487. OAERRSDAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to make a 1+800 Speed Dial Autoprovisioning (SDAP) call, but the SDAP feature is not active. The call will be sent to reorder.

Data Structures:

Action:

If the SDAP feature is not active, follow the standard procedures to activate the SDAP feature on RC/V Views 8.9 (OSPS OFFICE PARAMETERS) and 8.22 (SECURED FEATURE UPGRADE).

488. OAERTPRCC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to determine the terminating restrictions for a call, but the DBfrdtup() primitive returned DBRELNAMEBAD when it attempted to read the RLTPRINTL relation.

489. OAERTPRNPA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to determine the terminating restrictions for a call, but the DBfrdtup() primitive returned DBRELNAMEBAD when it attempted to read the RLTPR_NPA relation.

490. OAE_SCRCDE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) outgoing translator found an out-of-range originating line screening (OLS) screening code while translating a message. The OLS screening code must be a number from 0 to 9999, inclusive.

The message type being translated when the error was found, the message set identifier (indicating the outgoing translator that discovered the error), and the out-of-range OLS screening code are dumped.

491. OAE_SEIZFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) position seizure call event function OAeispsez() was called with an invalid seizure reason; valid values are defined in oa/hdr/OAseizreas.L. The invalid seizure reason is dumped.

492. OAESLLSINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) set link function was passed an invalid link setting parameter. The link setting

parameter will be dumped.

493. OAESMATLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

An error occurred while attempting to add an external information system (EIS) call tuple to the tail of an EIS link tuple. The dynamic access (DA) "add EIS call to tail of EIS link" function returned a value of "no owner". The SM relative link parameter supplied to the DA function was not a valid key for an EIS link tuple. The SM relative link parameter is dumped.

494. OAESMCLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EISCALL	Audit Mode: elev

Problem:

The dynamic access (DA) "get the owner rEIS_LNK tuple of the specific rEIS_CALL tuple" primitive failed and returned DBNO_OWNER or an invalid return code. The return code and the SM relative call ID used as the key are printed and an EIS_CALL audit is scheduled.

495. OAESMGHLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

An error occurred while obtaining an EIS call tuple from a list that it is a member of. The "DA get EIS call from head of EIS link" function returned a value of "no owner". The SM relative link parameter supplied to the dynamic access (DA) function is not a valid key for an EIS link tuple. The SM relative link parameter is dumped.

496. OAESMRHLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

An error occurred while attempting to remove an external information system (EIS) call tuple from a list. The dynamic access (DA) "remove EIS call from head of EIS link" function returned a value of "no owner" meaning that the SM relative link parameter supplied to the DA function was not a valid key for an EIS link tuple. The SM relative link parameter will be dumped.

497. OAESMRLKBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

The SM relative link key of an external information system (EIS) link tuple used as a parameter to the "DB set cardinality" function caused an error return of "DB no owner"; the key is invalid. The EIS terminal process (EIS-TP) called the "DB set cardinality" function during conditional removal. The EIS link tuple is dumped.

498. OAESMRLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EISCALL	Audit Mode: elev

Problem:

The DA primitive "remove EIS_CALL tuple from set owned by EIS_LINK tuple" has failed by returning DBNO_OWNER or an invalid return code. The SM relative call ID that was used by the primitive to access the tuple and the return code will be printed. An EIS call tuple audit will be scheduled.

499. OAE_SNDMSGFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An external information system (EIS) call event function could not send a message directly to the EIS using packet services (PS) subsystem primitives, or indirectly to the EIS system process using the operating system for distributed switching (OSDS) send message primitive.

The failing return code of the function used to send the message is dumped along with the OSDS message ID (message type) that could not be sent. This assert only fires when the OAeisim global parameter was set to DBYES on the SM being examined.

500. OAESPBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) received a message destined to the EIS without a call processing data link (CPDL) assigned. The type of message received should have already been assigned to a CPDL. The message is dumped.

501. OAESPCTIMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) could not allocate a cyclic timer. The operating system (OS) cyclic timer macro returned failure. The return value is dumped.

502. OAESPDEC (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Operator Services Position System (OSPS) enhanced services platform (ESP) encountered a problem when decoding a message according to recommendation X.209, Specification of Basic Encoding Rules for Abstract Syntax Notation One (ASN.1).

Probable Cause:

Check data dumped to determine the problem.

Action:

Contact OSPS field support.

503. OAESPENC (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Operator Services Position System (OSPS) Enhanced Services Platform (ESP) encountered a problem when encoding a message according to recommendation X.209, Specification of Basic Encoding Rules for Abstract Syntax Notation One (ASN.1).

Probable Cause:

Check data dumped to determine the problem.

Action:
Contact OSPS field support.

504. OAESPLNGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) received an operating system for distributed switching (OSDS) message that is too long for the buffer supplied in the "EIS-SP get message" function. The message is dumped.

505. OAESPMCBPROB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) received a failure return value from the "OS MCB count" macro while attempting to determine the number of message control blocks (MCBs) currently queued. The return value is dumped and the EIS-SP is purged.

506. OAESPMMSGUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) received an unknown operating system for distributed switching (OSDS) message in the "EIS-SP get message" function. The message is dumped.

507. OAESPNOCPLD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) received an internal message destined for the EIS vendor, but no call processing data links (CPDLs) are populated on the associated SM. Outgoing internal messages should only be routed to SMs with CPDLs. The internal message is dumped.

508. OAESPReason (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected initialization reason was passed to the external information system system process (EIS-SP) when it was created. The reason is dumped and the EIS-SP is purged.

509. OAESPRETUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) received an unexpected return value from either the "OS wait" or "OS wait get message" macros. The return value is dumped.

510. OAESPSTUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The state of the external information system system process (EIS-SP) is unknown. The state is dumped.

511. OAESP THROW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system system process (EIS-SP) was dispatched and found more than its threshold of message control blocks (MCBs) queued. The first "X" number of MCBs will be discarded until the number of MCBs queued is equal to the threshold that the EIS-SP is allowed to process in one real-time segment. This assert only fires when the EIS integrity monitor flag is set. The MCB count of queued messages when the EIS-SP was dispatched is dumped.

512. OAESPWTIMBAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The wait time parameter supplied by the external information system system process (EIS-SP) to the "OS wait get message" macro in the "EIS-SP get message" function was corrupted. The EIS-SP is purged.

513. OAESRLOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM relative link parameter passed to one of the common external information system (EIS) functions was out of range. The SM relative link is dumped.

514. OAE_SRVCFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An external information system (EIS) call event function detected an invalid service code. The service code is used to indicate the actions to be taken by the specific EIS call event function; the call event function implemented a default action due to this error. The invalid service code is dumped.

515. OAE_TGROUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The audible response unit (ARU) trunk group passed to the external information system (EIS) outgoing message translator was out-of-range. The ARU trunk group must be in the range 0 through 2001, inclusive. The message type being translated at the time the error occurred, the EIS message set identifier (identifies the outgoing translator that found the error), and the out-of-range trunk group number are dumped.

516. OAETKOCID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) interface function OAltco_chk()

(link takeover check) or OArace_chk() (race condition check) of the EIS system process detected a mismatch between the EIS call ID contained in the message received from the EIS and the value contained in the rEISCALL tuple currently assigned to the call. The contents of the incoming message and the rEISCALL tuple are dumped.

517. OAETKOMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) interface function OAltco_chk() (link takeover check) or OArace_chk() (race condition check) of the EIS system process received an unexpected message type. The message contents are dumped.

518. OAETKOPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following occurred:

1. The operator services position system (OSPS) external information system (EIS) interface function OAltco_chk() (link takeover check) of the EIS system process detected a mismatch between the controlling process ID in the message received from the EIS and the value contained in the rEISCALL tuple currently assigned to the call. The contents of the incoming message and the rEISCALL tuple are dumped.

2. The OSPS EIS interface function OArace_chk() (race condition check) of the EIS system process determined that the controlling process ID in the message received from the EIS and the value contained in the rEISCALL tuple are the same. This implies that the controlling process ID in the rEISCALL tuple was not updated; therefore, this message can not be sent to the correct process.

519. OAE_TMEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The audible response unit (ARU) trunk group member number passed to the external information system (EIS) outgoing message translator was out of range. The member number must be in the range 0 through 4095, inclusive. The message type being translated at the time the error occurred, the EIS message set identifier (identifies the outgoing translator that found the error), and the out-of-range trunk group member are dumped.

520. OAETPCALLID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found between the external information system (EIS) call ID in an EIS vendor's message and the EIS call ID in the associated EIS call tuple. This assert is only called when the EIS integrity monitor global variable is on. Both EIS call IDs are dumped.

521. OAETPCONPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found between the controlling process ID (PID) in an external information system (EIS) vendor's message and the controlling PID associated with the call. This assert is only called when the EIS integrity

monitor is turned on. The vendor's controlling PID and the controlling PID associated with the call will be dumped.

522. OAETPCTIMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system terminal process (EIS-TP) could not allocate a cyclic timer. The operating system (OS) cyclic timer macro returned failure. The return value will be dumped.

523. OAETPDESTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system terminal process (EIS-TP) could not destroy a previously allocated timer. This may be the cyclic timer or a heartbeat response timer. The "OS destroy timer" macro returned failure. The return value and the timer tag will be dumped.

524. OAETPLNGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system terminal process (EIS-TP) received an operating system for distributed switching (OSDS) message that is too long for the buffer supplied in the "EIS-TP get message" function. The message is dumped.

525. OAETPMSETID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found between the message set ID in an external information system (EIS) vendor's heartbeat message and the message set ID in the feature database (FDB) of an EIS terminal process (EIS-TP). This assert is only called when the EIS integrity monitor global variable is turned on. The vendor's message set ID and the message set ID in the FDB are dumped.

526. OAETPMMSGUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system terminal process (EIS-TP) received an unknown operating system for distributed switching (OSDS) message in the "EIS-TP get message" function. The OSDS message is dumped.

527. OAETPOORMSID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM ID received in an external information system (EIS) vendor's message by the EIS terminal process (EIS-TP) was out of range. This assert is only called when the EIS integrity monitor global variable is turned on. The vendor's SM ID is dumped.

528. OAETPREASON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason field in the external information system terminal process (EIS-TP) initialization function did not equal REPLACE, which should be the value passed from the OSREPLACE() macro. The reason field will be dumped.

529. OAETPRESET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An external information system terminal process (EIS-TP) received a Level 3 error message indicating that an X.25 reset occurred on its associated call processing data link (CPDL). EIS messages may be lost. This assert only fires when the EIS integrity monitor flag is set. The SM relative link of the EIS-TP is dumped.

530. OAETPRETUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system terminal process (EIS-TP) received an unknown return value from the "OS wait get message" macro in the "EIS-TP get message" function. The return value is dumped.

531. OAETPSIDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found between the switch ID in an external information system (EIS) vendor's message and the switch ID in the EIS link tuple associated with an EIS terminal process (EIS-TP). The inconsistency occurred in the EIS-TP message handler function OAetpmsg(). This assert is only called when the EIS integrity monitor global variable is turned on. Both switch ID values and the EIS message set ID are dumped.

532. OAETPSMRCID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found in the SM relative call ID of an external information system (EIS) vendor's message. This assert is only called when the EIS integrity monitor global variable is turned on. The vendor's SM relative call ID is dumped.

533. OAETPSTUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The state of an external information system terminal process (EIS-TP) is unknown. The state is dumped.

534. OAETPSWAREA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) terminal process received a SYSTEM ID REQUEST message from the external vendor that did not have the switch area of the message populated with all 1s (ones). This violates the call processing data link (CPDL) interface specification. This assert will only print when the global debugging variable

OAeisim is set to DBYES.

535. OAETPSWIDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found between the switch ID in an external information system (EIS) vendor's message and the switch ID in the EIS link tuple associated with an EIS terminal process (EIS-TP). The inconsistency occurred in the "EIS-TP message set 1 EIS message handler" function. This assert is only called when the EIS integrity monitor global variable is turned on. The vendor's switch ID and the EIS link's switch ID are dumped.

536. OAETPSWMODID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found between the switch module ID in an external information system (EIS) vendor's message and the switch module ID in the feature database (FDB) of an EIS terminal process (EIS-TP). This assert is only called when the EIS integrity monitor global variable is turned on. The vendor's switch module ID and the switch module ID in the FDB are dumped.

537. OAETPTMRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system terminal process (EIS-TP) received a timer operating system for distributed switching (OSDS) message in the "EIS-TP get message" function for an unknown timer tag. The timer tag from the message is dumped.

538. OAETPWTIMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system terminal process (EIS-TP) supplied a wait time to the "OS wait get message" macro in the "EIS-TP get message" function that is out of range. The wait time parameter is dumped.

539. OAETVRETBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while attempting to traverse an EIS call tuple linked list. A dynamic access (DA) function returned an unknown return value. The return value is dumped.

540. OAE_UNXLEDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An external information system (EIS) call event function detected an invalid local EIS data block (LEDB). The LEDB is used within all internal EIS operating system for distributed switching (OSDS) messages and is stored by the processes that use the EIS software interface. The unexpected LEDB structure in the RLSRVOT relation is dumped.

541. OAEXTDL_PER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

RLologinid.extdl_per is corrupted.

542. OAFAIL_BLVDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Office data identified a valid forward number as verifiable, but busy line verification (BLV) routing data to the forward number does not exist.

Action:

Determine if this numbering plan area-office code (NPA-NXX) is verifiable from this operator services position system (OSPS). Use RC/V View 27.10 (OSPS BUSY LINE VERIFICATION NPA FORM) to verify that the office data agrees. Note the route code in this view. It should be 3 digits; if not, pad zeroes in front so that it becomes 3 digits. For example, if 35 is shown, treat it as 035.

If RC/V View 27.10 indicates that the NPA-NXX is verifiable, use the following procedure to make sure that routing data is available.

1. Use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to find the DAS field of the BLV options.
2. Use RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) with the key DAS from View 8.9 to find the INC DIT and LDIT values.
3. Use RC/V View 9.5 (INCOMING TRUNK DIGITS [OFFICE DIALING]) with the keys INC DIT from View 9.1 and INC DIGS (described below) to verify the routing data for this forward number. The INC DIGS value is the forward number printed on the ROP, with the route code from View 27.10 substituted for the NPA. Not all of the forward number digits may be used.
4. If the LDIT field in View 9.5 is Y, use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) with the keys LDIT from View 9.1 and incoming digits (same as INC DIGS in step 3) to verify the routing data for this forward number.

543. OAFAILCNFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHconfig() primitive failed. A conference circuit could not be set up. Possible reasons include: 1) our SM or the SM with the conference circuit controller is isolated or 2) one of the paths being configured is in an invalid state.

544. OAFAILDROP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHdrop_conn() primitive failed. A reasonable call state could not be recovered since the multiway connector could not be released.

545. OAFAILISSET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process either a PTP or an OTP has failed to send the MGISSETUP message for an OSPA call.

Probable Cause:

We have probably exceeded the size of the MGISSETUP optional parameters or have populated the message incorrectly.

Action:

Contact craft to determine what actions should be taken.

546. OAFailJoin (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHjoin() primitive failed. Two paths on a conference circuit could not be joined. Possible reasons include: 1) our SM or the SM with the conference circuit controller is isolated or 2) one of the paths being joined is in an invalid state.

547. OAFailName (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHrename() primitive failed.

548. OAFail_NPAMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Office data identified an error in numbering plan area (NPA) mapping to a trunk group number on an operator initiated call.

Data Structures:

RLFCNPAMAP, RLFC_OPRTK, RLRCGTGRPRK.

Action:

Determine if the trunk group number in RC/V View 26.1 (OSPA NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS) is defined in RC/V View 5.1 (TRUNK GROUP) and/or in RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS). Probably, the trunk group number used in RC/V View 26.1 (field 5) is missing in RC/V View 5.1 and/or RC/V View 26.26.

549. OAFailRSV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHrsv_conn() primitive failed. A conference circuit could not be allocated for some reason, possibly:

- 1) all conference circuits are in use,
- 2) no SM is linked that has conference circuits, or
- 3) our SM is isolated from the rest of the switch.

550. OAFAPERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSfap() function returned OSNOTLOADED or OSNOTMATCHED when the CCospsmsg() function (in the CCSCOMMN package) was called from the operator services position system (OSPS) OT code (in the OPSMOT package). This should not happen. The code invoking the OSfap() function should not have had control unless the common channel signaling (CCS) packages were loaded and the call was from a CCS trunk.

551. OAFCFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Feature control (FC) has this bad habit of forwarding MGINTERRUPT messages to the far process. When the position terminal process (PTP) has a connection with a FC process that receives an interrupt, luckily we can catch these cases by examining the gport field in the message and compare it to the PTP port. OAeqport was called to perform this comparison and failed.

Probable Cause:

MGINTERRUPT message was from a different SM or a different port was contained in the message.

Action:

The Process will be purged.

552. OAFCHKBERET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value from the external information call event point function OAeisccl() was found by the OAcc_cmp() function. A forward number check was in progress at the time. The return value is dumped.

Action:

Contact field support personnel.

553. OAF COPNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rLFC_OPRTK tuple failed. The ROP output contains the key value trunk group number (TGN). There is no entry for this TGN in RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS), or OPRT 2 is set to N for this SM in RC/V View 21.33 (OSPS SWITCHING MODULE GROWTH).

Data Structures:

RLFC_OPRTK. Key field: tgroup (trunk group).

Action:

Use RC/V View 21.33 to verify that OPRT 2 is set to Y for this SM. If not, set OPRT 2 to Y. If it is Y, use View 26.26 to insert this trunk group number.

554. OAF COPNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLFC_OPRTK relation failed because the relation was not found in the database.

Data Structures:

RLFC_OPRTK. Key field: tgroup (trunk group).

Action:

Add the RLFC_OPRTK relation to the database according to RC/V procedures.

555. OAFCTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_PORTTYP relation, or the rRFC_PORTTYP tuple is missing.

Data Structures:

RLFC_PORTTYP. Key fields: port.module, port.member.

Action:

Use RC/V View 21.30 (OSPS - DSL PORT) (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_PORTTYP relation with the actual keys used to access the relation. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

556. OAFCTRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rRFC_TRUNK tuple failed. The ROP output contains the SM and port member number. On the SM, the given port was not assigned to a trunk group number (TGN) and member number (MEMB NBR). No equipment number (EN) entry was found for the port in RC/V View 5.5 (TRUNK MEMBER).

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use OP:CONVERT to convert the port member number to an EN. Use RC/V View 5.5 to assign the EN to a TGN and MEMB NBR.

557. OAFCTRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLFC_TRUNK relation failed because the relation was not found in the database.

Data Structures:

RLFC_TRUNK. Key field: tgroup (trunk group).

Action:

Add the RLFC_TRUNK relation to the database according to RC/V procedures.

558. OAFCTRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_TRUNK relation, or the rRFC_TRUNK tuple is missing.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_TRUNK relation with the actual keys used to read the relation. If the tuple is missing, add it. This relation is updated by RC/V View 5.1 (TRUNK GROUP) and View 5.5 (TRUNK MEMBER).

If the keys used to access the relation were set incorrectly, notify your next level of support.

559. OAFDBADD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBaddset() primitive returned failure while adding a tuple to the idle list for the set DBHCATPDB.

560. OAFDBRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBrmset() primitive returned failure while removing a tuple from the active list for the set DBHCATPDB.

561. OAFLHCSR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SRVOT	Audit Mode: elev

Problem:

Failed to link the rISRVOT tuple to one of the DB_HEADC lists - either idle or busy. The SRVOT audit is scheduled in elevated mode. This problem is most likely caused by the dynamic access (DA) primitive DAathcsr() finding a non-NULL owner linkage in the rISRVOT tuple.

562. OAFLSRSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SRVOT	Audit Mode: elev

Problem:

Failed to link the rISRVOT tuple to the rISMPTRDB tuple one-to-one. The SRVOT audit is scheduled in elevated mode to correct the problem. Most likely, a non-NULL linkage was found in the rISRVOT or rISMPTRDB tuple.

563. OAF_NPANXX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database read of the RLNPA_NXX relation failed. The error was DBNO_MATCH, a missing tuple. This can be corrected by updating the office dependent data (ODD) to contain a tuple with the appropriate tuple key.

Data Structures:

RLNPA_NXX. Key field: npa_n.

Action:

Use ODBE to add the rINPA_NXX tuple. RC/V Views 27.32 (OSPS LINE INFORMATION DATABASE QUERY INSERT AND DELETE) and 27.33 (OSPS LINE INFORMATION DATABASE QUERY REVIEW AND UPDATE) will NOT work until the tuple is in the RLNPA_NXX relation.

564. OAFNSIBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has occurred while attempting to populate the forward network specific information parameter into the MGISSETUP message for operator services position system (OSPS) calls. The following data is dumped. The feature indicators that show what type of call was populating the data, the feature information that includes the data to populate the message, and the forward network specific information data that has failed.

565. OAFPCCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to follow the linkage from the process control block link area (PCBLA) to the call build up data block (CBDB). Since the CBDB cannot be found, it cannot be unlinked and released. Failure to release the CBDB does not affect the current call.

566. OAFSPLIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the path split/unsplit primitives (PHopen(), PHclos(), PHopenc(), or PHclos()) failed unexpectedly.

567. OAFUBLSR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SRVOT	Audit Mode: elev

Problem:

Failed to unlink the rISRVOT tuple from the DB_HEADC busy list. The SRVOT audit will be scheduled to run in the elevated mode. This error is most likely caused by the dynamic access (DA) primitive DARshcsr() finding a NULL owner link in the rISRVOT tuple.

568. OAFUILSR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to unlink an rISRVOT tuple from the DB_HEADC idle list. Most likely, no idle rISRVOT tuples were available.

569. OAFWD_A_ERR (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services call has found invalid data dealing with the forward number answer. It appears as if the forward party answered more than once.

Probable Cause:

Dynamic data is probably corrupted.

Action:

Contact field support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

570. OAGBLTMZN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data received from reading the Gla1zone or Gla2zone global parameter to determine the time difference between the alternate 1 or alternate 2 time zone area, and the operator service position system (OSPS) base system clock was invalid.

Action:

Use RC/V to check the value of the Gla1zone and Gla2zone parameters. Verify that they are equal to one of the values allowed.

- N2: 2 hours from the OSPS base system clock
- N1: 1 hour from the OSPS base system clock
- 0: same time as the OSPS base system clock
- 1: +1 hour from the OSPS base system clock
- 2: +2 hours from the OSPS base system clock

Use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to update the parameter to one of the above values.

571. OAGENDIGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has occurred while attempting to populate the generic digits parameter into the MGISSETUP message for operator services position system (OSPS) calls. The following data is dumped. The feature indicators that show what type of call was populating the data, the feature information that includes the data to populate the message, and the generic digit data that has failed.

572. OAGENERAL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general OA assert code. Each ROP message that could appear should be specified below with its associated message, data structure and action.

572.1 Initial or overtime interval too short for Pre Paid Overtime Coin - Calling No NPANXXXXXX Called No NPANXXXXXX

The interval returned in the the initial or interim coin rating reply was too short to handle the possible processing time needed. The interval must be large than the sum of 2 times the query timeout parameter plus the warning period plus 2 seconds. This is for the Prepaid Overtime for Coin Calls feature.

Data Structures:

Calling and Called Numbers

Action:

The call is given post paid treatment and allowed to continue. The RTRS should be notified to correct this situation.

**572.2 Tuple not found in relation ANNC_HDR for key values: Application - FCOSPS_TA
Announcement Header ID - x**

The announcement header ID (x) specified was not found in relation RLANNH_HDR. This header ID should be added using recent change view 8.61.

Data Structures:
Announcement Header ID

Action:
Add this announcement header ID using RC/V View 8.61 (ANNOUNCEMENT HEADER PHRASE LIST) with an application type of FCOSPS_TA

572.3 An 800 UIN call was received but no entry was found in IDDD table for 800 CAC.

An invalid country access code was found in the IDDD table (RC/V View 9.6 [IDDD COUNTRY ACCESS CODE (OFFICE DIALING)]). For 800 universal international numbering (UIN) calls, the country access code must be 800 and not 8 or 80.

Data Structures:
DAS, Country Code length and the dialed digits

Action:
Update the country access code on RC/V View 9.6 to be 800.

572.4 LEC Operator Transfer call was received on trunk group with Special Access Service Identifier value of 1.

LEC operator transfer call was received on trunk group having an associated special access service identifier value of 1. On LEC operator transfer calls having 0+, 1+, 01+ or 011+ prefix, this assert will be printed with the trunk group, trunk member, back number, forward number and the dialed prefix information.

Data Structures:
Trunk group, trunk member, back number, forward number and dialed prefix

Action:
Contact the sending LEC office to resolve this issue.

572.5 Invalid header command in relation ALT_HDR

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility/service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software encountered an invalid command entry in the phrase/command list of an rIALT_HDR tuple.

The entry was interpreted as a command since it had a value greater than 16383, but was not recognized as a valid command or specified to repeat a digit string when no digit string expansion had been previously specified (in the announcement header).

Data Structures:
RLALT_HDR. Key fields: application, announcement header id, announcement set.

Action:
Use RC/V View 8.71 (ALTERNATE ANNOUNCEMENT TRAILER PHRASE LIST) to correct the rIALT_HDR tuple associated with the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements including the indicated announcement header.

572.6 Missing tuple in relation ALT_HDR

An attempt to play an announcement using a DSU2-RAF/SAS unit on the indicated SM failed when software could not retrieve the rIALT_HDR tuple associated with the key values indicated.

Data Structures:

RLALT_HDR. Key fields: application, announcement header id, announcement set.

Action:

Use RC/V View 8.71 to insert an rIALT_HDR tuple using the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements which include the indicated announcement header.

572.7 Invalid trailer command in relation ALT_TRL

An attempt to play an announcement using a DSU2-RAF/SAS unit on the indicated SM failed when software encountered an invalid command entry in the phrase/command list of an rIALT_TRL tuple.

The entry was interpreted as a command since it had a value greater than 16383, but was not recognized as a valid command or specified to repeat a digit string when no digit string expansion had been previously specified (in the announcement trailer).

Data Structures:

RLALT_TRL. Key fields: application, announcement trailer id, announcement set.

Action:

Use RC/V View 8.72 (ALTERNATE PHRASE ID MAPPING) to correct the rIALT_TRL tuple associated with the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements including the indicated announcement trailer.

572.8 Missing tuple in relation ALT_TRL

An attempt to play an announcement using a DSU2-RAF/SAS unit on the indicated SM failed when software could not retrieve the rIALT_TRL tuple associated with the key values indicated.

Data Structures:

RLALT_TRL. Key fields: application, announcement trailer id, announcement set.

Action:

Use RC/V View 8.72 to insert an rIALT_TRL tuple using the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements which include the indicated announcement trailer.

573. OAGENERAL (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general OA assert code. Each ROP message that could appear should be specified below with its associated message, data structure and action.

573.1 Initial or overtime interval too short for pre-paid overtime coin - calling number NPANXXXXX; called number NPANXXXXXX

The interval returned in the initial or interim coin rating reply was too short to handle the possible processing time

needed. The interval must be large than the sum of 2 times the query timeout parameter plus the warning period plus 2 seconds. This is for the pre-paid overtime for coin calls feature.

Data Structures:
Calling and called numbers.

Action:
The call is given post paid treatment and allowed to continue. The RTRS should be notified to correct this situation.

573.2 Tuple not found in relation ANNC_HDR for key values: application - FCOSPS_TA, announcement header ID - x

The announcement header ID (x) specified was not found in relation RLANNC_HDR. This header ID should be added using RC/V View 8.61 (ANNOUNCEMENT HEADER PHRASE LIST).

Data Structures:
Announcement header ID.

Action:
Add this announcement header ID using RC/V View 8.61 with an application type of FCOSPS_TA

573.3 An 800 UIN call was received but no entry was found in IDDD table for 800 CAC

An invalid country access code was found in the IDDD table (RC/V View 9.6 [IDDD COUNTRY ACCESS CODE (OFFICE DIALING)]). For 800 universal international numbering (UIN) calls, the country access code must be 800 and not 8 or 80.

Data Structures:
DAS, country code length and the dialed digits.

Action:
Update the country access code on RC/V View 9.6. to be 800.

573.4 LEC operator transfer call was received on trunk group with special access service identifier value of 1

LEC operator transfer call was received on trunk group having an associated special access service identifier value of 1. On LEC operator transfer calls having 0+, 1+, 01+ or 011+ prefix, this assert will be printed with the trunk group, trunk member, back number, forward number and the dialed prefix information.

Data Structures:
Trunk group, trunk member, back number, forward number and dialed prefix.

Action:
Contact the sending LEC office to resolve this issue.

573.5 Invalid header command in relation RLALT_HDR

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility/service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software encountered an invalid command entry in the phrase/command list of an RLALT_HDR tuple.

The entry was interpreted as a command since it had a value greater than 16383, but was not recognized as a valid command or specified to repeat a digit string when no digit string expansion had been previously specified (in the announcement header).

Data Structures:

RLALT_HDR. Key fields: application, announcement header ID, announcement set.

Action:

Use RC/V View 8.71 (ALTERNATE ANNOUNCEMENT TRAILER PHRASE LIST) to correct the rIALT_HDR tuple associated with the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements including the indicated announcement header.

573.6 Missing tuple in relation RLALT_HDR

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility/service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software could not retrieve the rIALT_HDR tuple associated with the key values indicated.

Data Structures:

RLALT_HDR. Key fields: application, announcement header ID, announcement set.

Action:

Use RC/V View 8.71 (ALTERNATE ANNOUNCEMENT TRAILER PHRASE LIST) to insert an rIALT_HDR tuple using the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements which include the indicated announcement header.

573.7 Invalid trailer command in relation RLALT_TRL

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility/service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software encountered an invalid command entry in the phrase/command list of an rIALT_TRL tuple.

The entry was interpreted as a command since it had a value greater than 16383, but was not recognized as a valid command or specified to repeat a digit string when no digit string expansion had been previously specified (in the announcement trailer).

Data Structures:

RLALT_TRL. Key fields: application, announcement trailer ID, announcement set.

Action:

Use RC/V View 8.72 (ALTERNATE PHRASE ID MAPPING) to correct the rIALT_TRL tuple associated with the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements including the indicated announcement trailer.

573.8 Missing tuple in relation RLALT_TRL

An attempt to play an announcement using a digital services unit 2 - recorded announcement facility/service announcement system (DSU2-RAF/SAS) unit on the indicated SM failed when software could not retrieve the rIALT_TRL tuple associated with the key values indicated.

Data Structures:

RLALT_TRL. Key fields: application, announcement trailer ID, announcement set.

Action:

Use RC/V View 8.72 (ALTERNATE PHRASE ID MAPPING) to insert an rIALT_TRL tuple using the SM and key values given in the ROP output message. This tuple should specify the phrase list to be given in announcements which include the indicated announcement trailer.

574. OAGENERAL (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general OA assert code. Each ROP message that could appear should be specified below with its associated message, data structure and action.

Initial or overtime interval too short for pre paid overtime coin - calling no NPANXXXXXX called no NPANXXXXXX

The interval returned in the initial or interim coin rating reply was too short to handle the possible processing time needed. The interval must be large than the sum of 2 times the query timeout parameter plus the warning period plus 2 seconds. This is for the prepaid overtime for coin calls feature.

Data Structures:

Calling and called numbers.

Action:

The call is given post paid treatment and allowed to continue. The RTRS should be notified to correct this situation.

Tuple not found in relation ANNC_HDR for key values: Application - FCOSPS_TA Announcement Header ID - x.

The announcement header ID (x) specified was not found in relation RLANN_C_HDR. This header ID should be added using RC/V View 8.61 (ANNOUNCEMENT HEADER PHRASE LIST).

Data Structures:

Announcement header ID.

Action:

Add this announcement header ID using RC/V View 8.61 with an application type of FCOSPS_TA.

575. OAGENOPBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has occurred while attempting to populate the generic operations parameter into the MGISSETUP message for operator services position system (OSPS) calls. The following data is dumped. The feature indicators that show what type of call was populating the data, the feature information that includes the data to populate the message, and the generic operations data that has failed.

576. OAGETAPB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DAgetapb() returned an invalid pointer.

577. OAGETCBDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to remove an rICBDB tuple from the idle list. The call cannot continue because the rICBDB tuple is needed to store the FCsemiglob data.

578. OAGOPCSL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SDAPSDL	Audit Mode: elev

Problem:

Either an attempt to get the owner of a given SDAP_SDL tuple failed or the owner was not associated with the current process. An elevated SDAP_SDL audit is scheduled and processing returns to the calling function.

579. OA_GST_MAN_PBX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call came to the position with good automatic number identification (ANI) on a trunk that does not carry automatic charge quotation service (ACQS) traffic, and the back party indicated that this was a manual PBX from a guest. Or, the call was an ANI failure (ANIF)/office number identification (ONI) call, and the back number entered was valid. The BLG CODE key was pressed, and the operator entered "gst" or "guest" into the billing code field.

The back number was in the ACQS database, but the ACQS establishment was not a manual PBX. The ACQS database for that operator services position system (OSPS) may need to be updated.

Data Structures:

RLTALLOOPDB.

The oa_data.backnum.dn value is the back number entered by the operator, and the ta_data.trk_grp value is the incoming trunk group number.

Action:

Determine if this back number is an ACQS establishment and a manual PBX by calling the originating office and providing the line number in question. To determine the originating office, look at the trunk group card in the OSPS office that is the same as the trunk group number (TGN) provided by the ROP output. If the trunk is a tandem access trunk, the tandem office must determine the local office from the numbering plan area (NPA) and office code (NXX). If the trunk is a direct trunk (directly connected to a local office), the load office is specified on the trunk card. If the back number is an ACQS establishment and a manual PBX, update the rIFC_HOTEL tuple to reflect this fact via RC/V View 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE). The key to this view is the ACQS telephone number. The information in the tuple must be provided by the local office.

If the back number is not an ACQS establishment, the number should be removed from the ACQS database.

580. OA_GST_NOTINDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call that is being changed to an automatic charge quotation service (ACQS) call arrived on a trunk that does not carry ACQS traffic, and the number is not in the ACQS database.

The call is on a trunk that does not carry ACQS traffic, but "gst" was entered. The back number must be looked up in the ACQS database to see if it is from an ACQS manual PBX establishment. If it is in the tables, information is gathered about that establishment. In this case, the back number is not in the ACQS database. This is an automatic number identification (ANI) or ANI failure (ANIF)/office number identification (ONI) call.

The ACQS database for that operator services position system (OSPS) office may be out of date.

In the case of an ANIF call, it is possible that the back party supplied an incorrect number to the operator.

Data Structures:

RLTALLOOPDB.

The oa_data.backnum.dn value is the back number entered by the operator, and the ta_data.trk_grp value is the

incoming trunk group number.

Action:

Determine if this back number is an ACQS establishment by calling the originating office and providing the line number in question. To determine the originating office, look at the trunk group card in the OSPS office that is the same as the trunk group number (TGN) provided by the ROP output. If the trunk is a tandem access trunk, the tandem office must determine the local office from the numbering plan area (NPA) and office code (NXX). If the trunk is a direct trunk (directly connected to a local office), the local office is specified on the trunk card.

If the back number is an ACQS establishment, an rRFC_HOTEL tuple must be inserted via RC/V View 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE). The key to this view is the ACQS telephone number. The information in the tuple must be provided by the local office.

If the back number is not an ACQS establishment, no action is required.

581. OAHAR_STAT (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Call processing software found data for an OSPS interface to Harris operator system call inconsistent.

Probable Cause:

An fault in call processing logic.

Action:

Contact OSPS field support personnel. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

582. OAHOMECALLERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLHOMECALL tuple is missing. The ROP output provides the issuer ID digits that were used to access the RLHOMECALL relation.

Data Structures:

RLHOMECALL. Key field: issiddgt.

Action:

Use RC/V View 27.55 (OSPS CREDIT CARD ISSUER IDENTIFICATION) to determine if an rLHOMECALL tuple exists for the key printed on the ROP. If the tuple does not exist, add the tuple. Also, if the home call allow field is no, an associated country direct number entry must exist.

583. OAHTLREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLFC_HOTEL relation could not be found in the database. An attempt was made to obtain data about an automated central quotation system (ACQS) establishment to verify that the back number was or was not from an ACQS establishment.

Data Structures:

RLFC_HOTEL. Key field: telno (number of the calling customer with first two digits reversed).

Action:

Add the RLFC_HOTEL relation according to RC/V procedures using View 26.11 (OSPS AUTOMATIC CHARGE QUOTATION SERVICE LIST).

584. OAIFATPDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: ATPDB	Audit Mode: elev

Problem:

Linkage errors are suspected for the failure to successfully move an rIATPDB tuple from the busy list to idle list. The ATPDB audit will be scheduled to fix linkage problems.

585. OAIF_BADDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the interflow feature, invalid data was accessed in the RLTALOOPDB relation, such as, corrupted data in loopdb_ptr->looptype that is used in the DECISION statement. This assert is called by NEAR, CC, and VN of OA models.

586. OAIFMH_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interflow message handler (IFMH) model failed to be created by FM-z.

587. OAIFTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by the originating terminal process (OTP) from the interflow position terminal process (IPTP) while an internal transfer between two operators on OSPS-z was in progress during an interflow call. The contents of the unexpected message are printed on the ROP.

588. OAIFUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown message was received in the operator actions (OA) interflow message handler (IFMH).

589. OAIFWDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator actions (OA) interflow message handler (IFMH) detected a wrong destination in the interflow message header.

590. OAIF_WRONGMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is called by operator actions (OA) basic main NEAR in the interflow feature. There are two operator services position system (OSPS) switches involved in the interflow feature: the sending OSPS and the receiving OSPS. A message was received by the wrong switch. The data loopdb_ptr->looptype and &stype will be dumped.

591. OAIFWSH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is called by the operator actions (OA) interflow message handler (IFMH) when a message is received in the wrong switch.

592. OAIFWSZ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator actions (OA) inter-flow message handler (IFMH) detected a wrong data size.

593. OAINACCS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rIACCSDB tuple. The rIACCSDB tuple is dumped.

594. OA_INCAQFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The autoquote failure message received from the autoquote terminal process (AQTP) contained an invalid failure reason. The automatic charge quotation service (ACQS) system process restored the quote message into the queue.

595. OAINC_CAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) stored carrier data conflict occurred. Data in RC/V View 26.25 (ACCESS TANDEM ROUTE INFO. FOR PRIMARY & ALTERNATE TOLL & ASSIST. O.S.) indicates that a feature group D (FGD) carrier is served by the OSPS, but other RC/V data says the carrier is not served.

Data Structures:

RCFC_OPRTK. Key field: tgroup.

RLFC_CARR. Key field: carrid.

RLFC_DIOPR. Key fields: carrid, bcarrier.

RLFCRSMCAR. Key fields: carrid, featgrp, rsm_num.

Action:

The ROP output contains the trunk group number and the carrier identifier. If calls for the printed carrier should be tandemmed to the FGD carrier without providing operator services, use RC/V View 26.25 to define a PRIM CDI value that will cause calls to be routed to this FGD carrier.

If the OSPS should provide service to the printed carrier and the SM is not a remote SM (RSM), set the LEC SERVICE field for the printed FGD carrier to Y using RC/V View 10.3 (INTER-LATA CARRIER). If the SM is an

RSM, set the OSPS SERVES field to Y for the printed FGD carrier using RC/V View 26.22 (OSPS RSM/CARRIER DATA).

If calls arriving on the printed trunk group should be handled by a different carrier, change the carrier assigned to the trunk group via RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUP).

596. OA_INCPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic charge quotation service (ACQS) system process detected an invalid range of pointers to the MGACQS message queue. Credit records are made for quote messages lost due to invalid pointers and the pointers are initialized.

597. OA_INCRESN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic charge quotation service (ACQS) system process initialization function OAasp_init() detected an incorrect reason. The system process terminates.

598. OA_INCTRGID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAclr_seqn() trigger function detected an invalid hotel relation identification or an invalid reason. The function returns without assigning a hotel sequence number to a dynamic relation.

599. OAINFNAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or unexpected values were assigned to function arguments.

600. OAINFRV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function returned an invalid or unexpected return value.

601. OAINITNRAF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the Glnraf global parameter using the DBrfgparm() primitive when it was called from the OAinaccsdb() function.

Probable Cause:

Unknown.

Action:

None.

602. OAINITPTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The pointer data block (PTRDB) initialization function, called during SM initialization, failed to insert a tuple or link a tuple to the idle list.

Probable Cause:

Unknown.

Action:

None.

603. OAINITQRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The QRYDB initialization function, called during SM initialization, failed to insert a tuple or link a tuple to the idle list.

Probable Cause:

Unknown.

Action:

None.

604. OAINSDYN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfintup has returned failure to insert a tuple in a dynamic relation.

Probable Cause:

Unknown.

Action:

None.

605. OAINITFLP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) interflow position terminal process (IPTP) on the OSPS-a switch detected that the OSPS-a switch is looped on itself.

Action:

The OSPS extended digital service line (EDSL) must be manually removed from service. The OSPS-z switch will have the interflow D-channel in a facility failure state. Once the interflow link is properly reconnected, the interflow link must be manually restored to service by telephone company administration (TCA) personnel via the RST:TRK input message.

606. OAINIT_MSG_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAMRTFAL, OAMPRNO, OAMINNO, or OAMEXRDN code was received by the operator services position system (OSPS) virtual terminal (VT) model, but the message contains corrupted data. These feature execution (FEX) internal messages have data associated with them, but the data is out of range.

607. OAINVACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid initial action was found in the RLSERVDATA relation.

Data Structures:

RLSERVDATA. Key field: serv_id (service identifier).

Action:

The key serv_id and the attribute init_action (initial action) are printed on the ROP. Access RC/V View 21.54 (OSPS SERVICE DATA FOR LISTING SERVICES CALLS) using this key to update the INITIAL_ACTION field with a valid value (TOOPER, TODEST, or ASKEIS).

608. OAINVBLOPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid billing option was populated in a call completion transfer request message. The MGTRNS_REQ message and the rISRVOT tuple are dumped.

609. OAINVCC_CR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) provided an invalid carrier ID. The carrier ID is dumped.

610. OAINV_CT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid conference type was received. In the rITALOOPDB tuple, the cnfrn_type attribute is corrupted. The conference transfer type is dumped.

611. OAINVDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator actions (OA) function detected some bad data. Either the data was corrupted or it is inconsistent with the running leg of code or some other data.

612. OAINVEISCOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the operator services position system (OSPS) call completion for service calls capability, the vendor sent the switch a class of charge that is not allowed by OSPS. The restriction is based on the service provided, station type, and originating line screening information. The class of charge, station type, and service type are dumped.

613. OA_INVLDTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message format was detected in the OAhobmsg() function.

614. OAINV_LSCOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid class of charge was received from an external information system (EIS) vendor. The class of charge received indicates that the vendor provided a carrier, but the class of charge for the switch to use is not one that the vendor should provide a carrier for. The EIS associated with the call and the invalid class of charge will be dumped.

615. OA_INVLSCOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An external information system (EIS) for listing services call completion returned an invalid class of charge for use in call completion. The vendor should only send a class of charge of autocollect when the carrier is provided by the EIS. The invalid class of charge and the carrier provided are dumped.

616. OAINV_QRY_DATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external database message handler (EDBMH) software encountered invalid data while trying to format a query or determine the destination. A directory number could not be successfully converted from ASCII to binary. The dump will contain the directory number (DMDN structures) associated with the query attempt.

617. OAINV_RAT_DATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external database message handler (EDBMH) software encountered invalid data while trying to gather data for a rating query for centralized flexible rating (CFR) or the real time rating system (RTRS). This problem may be caused by an invalid country code length or a failure return from the OA_rattime() function.

618. OAINVRES (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function was restarted for an invalid reason.

619. OAINVRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid route type was found in the RLSRV_DEST relation.

Data Structures:

RLSRV_DEST. Key fields: serv_dest, eis_id.

Action:

The serv_dest (service destination) and eis_id (external information system [EIS] ID) keys along with the rte_type (route type) attribute are printed on the ROP. Access RC/V View 21.53 (OSPS DESTINATION DATA FOR LISTING SERVICES CALLS) to update the RTE_TYPE field with a valid route type.

620. OAINVTRFLRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return from the external information system (EIS) call event point function OAeistrfl() was detected. Specifically, the return was inconsistent with the state of call processing. The return code will be dumped.

621. OAIOTPMMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by the interflow originating terminal process (IOTP) while processing a call. The contents of the message will be printed on the ROP.

622. OAIPTPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TAPOSDB	Audit Mode: elev

Problem:

Invalid data was discovered in the RLTAPOSDB relation for an interflow position terminal process (IPTP). An elevated TAPOSDB audit is scheduled.

623. OAIRTCAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global default carrier for emergency calls could not handle this call. The carrier ID is an invalid value, or it is not populated in the RLFC_CARR relation.

Data Structures:

RLFC_CARR. Key field: carrier ID.

The Glircar global parameter is also involved.

Action:

The ROP output includes the global emergency default carrier. Check the office parameters in RC/V View 8.9 (OSPS OFFICE PARAMETERS) to verify that the emergency default carrier is a proper value. Check RC/V View 10.3 (INTER-LATA CARRIER) for an entry for the carrier ID with a feature group of D.

If the carrier is not found, use RC/V View 10.3 to insert the carrier. Otherwise, use RC/V View 8.9 to define a new carrier and populate it using RC/V View 10.3.

624. OAISDN_RC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGISDNDATA message contains corrupted or unexpected data. This message is sent from the basic services terminal (BST) to the operator services position system (OSPS) virtual terminal (VT) model. This problem may result from

- 1) a blocking state for keys that is not what is expected by the VT model in a certain state
- 2) an unknown message or key type in the message
- 3) the VT model is in the wrong state
- 4) the BST sent something other than plugin while VT is in the "waiting for plugin" state

625. OAISPLSF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A listing services call originated on a ISP trunk group and was assigned to a call queue that had a zero service ID associated with it. Listing services calls originating on ISP trunk groups MUST have a non-zero service ID assigned in the RLCTINFO relation.

A non-unique screening index may have been assigned to this trunk group. That is, a screening index used by trunks carrying listing services traffic may also be assigned to this group.

Data Structures:

RLCTINFO. Key field: call_type.
 RLAC_TKCT. Key fields: oppcid, tgroup.
 RLFC_TRUNK. Key field: global port name.

Action:

The automatic call distributor (ACD) call type (CALL_TYPE), trunk group (TGROUP), operator pre-call ID (OPPCID), and screening index (SCREEN_X) are printed on the ROP. There are several corrective actions that can be taken:

- If this trunk group was not assigned to carry listing services traffic, use RC/V View 5.1 (TRUNK GROUP) with the key trunk group to change the trunk group screening index to a new value - one that is not assigned to other listing services trunk groups.
- If this trunk group was assigned to carry listing services traffic, then it was assigned to an incorrect queue, or the queue itself was not set up correctly. To modify the queue assignment, access RC/V View 21.23 (OSPS CALL TYPE & DISPLAY INDEX FOR TRUNK) with the keys trunk group and pre-call ID to change the call queue assignment to a new value. If the call queue itself must be modified, access RC/V View 21.22 (CALL TYPE) with the key call type to assign a non-zero service ID.

626. OAITLGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the Gltloop global parameter using the DBrfgparm() primitive when it was called from the OAintaloop() function in oa/OAfex/OAintaloop.c.

627. OAITLGP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gltloop global parameter using the DBrfgparm() primitive when it was called from the OAintaloop() function in oa/OAfex/OAintaloop.c.

628. OAITLGP3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gltloop global parameter using the DBrfgparm() primitive when it was called from the OAintaloop() function in oa/OAfex/OAintaloop.c.

629. OAITLGP4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gltloop global parameter using the DBrfgparm() primitive when it was called from the OAintaloop() function in oa/OAfex/OAintaloop.c.

630. OAKILLPROC (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The newly created process is terminated.

631. OALANGOLS (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Language code not found in RC/V View 27.95 (OSPS LANGUAGE TO DESTINATION CODE INDEX). An attempt to read RC/V View 27.95 failed with the language code indicated in the message.

Data Structures:

RLLANGDEST. Key field: lang_code.

Action:

Use RC/V View 27.95 to insert a tuple using the language code given in the ROP output message.

632. OALEC7CRERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The carrier in the carrier identification parameter (CIP) of the incoming IAM is not served by the OSPS.

Data Structures:

RLSS7CARR. Key field: carrid.

Action:

Use the carrier ID as key to view RC/V 26.51 to verify that the carrier is served by the OSPS. If the tuple exists, make sure the field "OSPS SERVICE" is marked "Y". If the carrier ID is valid and should be handled by the OSPS, but does not have an entry in RC/V View 26.51, insert a tuple and mark the field "OSPS SERVICE" to "Y".

633. OALF_OVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) interface received an incoming message from the EIS on a call processing data link (CPDL) different from the one currently assigned, but terminating on the same SM; this is called link following.

The CPDL on which the message was received is handling the maximum number of calls permitted. The OSPS will continue to communicate with the EIS via the currently assigned CPDL, thereby preventing data link overload and random message loss. The SM relative link numbers of the currently assigned CPDL and the CPDL to which the EIS attempted to move the call, and the EIS ID of the EIS are dumped.

634. OALINEDATA_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch data contains inconsistencies on the characteristics of a line.

ACQS--Automatic Charge Quotation Service

OLS--Originating Line Screening

1) OPERATOR_ON_DDD conflict: ACQS information specifying that an operator is *not* to be used to handle a direct distance dialed (DDD) call conflicts with OLS information that all calls from this line should be routed to an operator, or that calls billed to the originating line (which happens with DDD) are not allowed.

Data Structures:

RLFC_HOTEL contains ACQS data. RLFCSCRLNE, RLFCSCRCDE, and RLOLSR contain OLS data.

RC views [office record numbers]:

OSPS BACK NUMBER SCREENING ("line screening") [5416]

OSPS BACK SCREEN CODE TABLE ("screen code table") [5415]

OSPS AUTOMATIC CHARGE QUOTATION SERVICE ("auto charge quote") [5425]

Action:

1) OPERATOR_ON_DDD conflict: Determine whether the originating line really should use an operator to handle DDD calls. If so, use "auto charge quote" view to set the OPERATOR ON DDD field to Y. If it should not, and the OLS information is incorrect, use "line screening" view to set the TO OPER POS field to N, or change the SCREEN CODE field to an appropriate screen code that has (on "screen code table" view) PAID OR DDD set to Y, or change the PAID OR DDD field for the specified SCREEN CODE to Y. (Be aware that this last possible change will affect every line that uses the specified screen code.)

If necessary, use the printed trunk group number (TGN) to determine the originating office for the line, to find what the characteristics of the originating line should be.

635. OALINETERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) handled call attempted to route to a line termination. Since only trunk terminations are allowed, this call will not be completed.

Data Structures:

RLDA_DIGSTRT. Key field: digtree.
 RLDAPRLDGT. Key fields: previous, digit.
 RLDAPRLFNL. Key field: previous.
 RLDAPRMDGT. Key fields: previous, digit.
 RLDAPRMFNL. Key field: previous.
 RLRT_SCRNING. Key fields: dest_x, screen_x, prefix.
 RLRT_ROUTING. Key field: route_x.

Action:

OSPS calls only route to trunks; line terminations are blocked. An OSPS call passed digit analysis and routing, but routed to a line. The ROP output includes the dialed digits along with the screen index and digit analysis selector used for this call. Trace through the digit analysis and routing office records to determine at what step the problem was introduced.

636. OALKSELDUMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There may be errors in the rLEISLKSEL tuple.

Data Structures:

RLEISLKSEL.

Action:

Display the fields of the rLEISLKSEL tuple.

637. OALKSELINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLEISLKSEL dynamic relation, which is associated with the operator services position system (OSPS) external information system (EIS) call processing data links (CPDLs), did not initialize properly.

638. OALKTKOFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An IBM directory assistance system (DAS) returned at least one message on an operator services position system (OSPS) external information system (EIS) call processing data link (CPDL) that terminates on an OSPS SM that is not the SM that initially handled a call associated with the IBM DAS. An alternate data link assigned by the IBM DAS must terminate on the same OSPS SM as the original data link.

Action:

The EIS ID and the original SM handling the call are specified on the ROP along with the alternate link ID and the SM on which the message was received. Data must be changed in the IBM DAS using an IBM DAS utility to assure that the alternate link ID for any CPDL terminates on the same SM as the original data link.

639. OALNCBDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to insert an rCBDB tuple to the idle list. An audit was scheduled to clean up the problem.

640. OALNCBPC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to link the call build up data block (CBDB) and the process control block link area (PCBLA); therefore, the FCsemiglob data that is stored in the CBDB cannot be accessed. This prevents the call from being completed, a single process purge is called.

641. OALNKDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rLEISDSL tuple specified contained an external name identifier (x_name) that is inconsistent with the current database. A corresponding rLEIS_DATA tuple with the external information system (EIS) ID (eis_id key) equivalent to x_name should exist in the database, but no match occurred. The rLEISDSL tuple's x_name parameter was incorrectly altered, or the expected rLEIS_DATA tuple was removed.

Data Structures:

RLEISDSL. Key field: sm_rel_lnk (SM relative link number).

RLEIS_DATA. Key field: eis_id.

Action:

Use RC/V View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM [EIS] DATA) to verify that an rLEIS_DATA tuple exists. If not, enter the required information.

Use RC/V View 21.30 (OSPS - DSL PORT) to verify that the DATA LINK GRP field matches the expected eis_id (x_name). If not, remove the rLEISDSL tuple then re-insert the tuple with the correct information.

642. OALNKDUMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There may be errors in the specified rLEIS_LNK tuple.

Data Structures:

RLEIS_LNK.

Action:

Display the fields of the rLEIS_LNK tuple.

643. OALNKINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLEIS_LNK dynamic relation, which is associated with the operator services position system (OSPS) external information system (EIS) call processing data links (CPDLs), did not initialize properly.

644. OALNPBLDA (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

Busy line verify information about a location routing number is missing.

Data Structures:

RLBLVSCRN. Key field: NPA of the location routing number.

Action:

OSPS was not able to complete a busy line verify to a location routing number. An entry was missing in RC/V View 27.10 (OSPS BUSY LINE VERIFICATION NPA FORM) for the NPA-NXX of the location routing number printed. Without this entry, the routing code used for digit analysis is not known.

645. OALNP_DAFL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

OSPS attempted to route to a location routing number (LRN), but the number did not pass digit analysis.

Data Structures:

RLBLVSCRN, Key field: blvnpa.

RLDA_DIGSTRT. Key field: digtree.

RLDAPRLDGT. Key fields: previous, digit.

RLDAPRLFNL. Key field: previous.

RLDAPRMDGT. Key fields: previous, digit.

RLDAPRMFNL. Key field: previous.

RLDA_CONFLCT. Key fields: table, digits.

RLDA_AMBIG. Key field: table.

Action:

OSPS attempted to route to a LRN, but the number failed digit analysis. The LRN and the digit analysis selector are printed.

If a busy line verification is being done, check RC/V View 27.10 (BUSY LINE VERIFY NPA NXX) to determine the routing code associated with the LRN prior to checking digit analysis data.

Use RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) to determine the PDIT/INDIT and LDIT values associated with the DAS. Then trace through the digit analysis data using the LRN to determine what is missing. It is most likely that either an entry does not exist for it or the number is defined as a vacant code.

646. OALNP_DAFL (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

OSPS attempted to route to a location routing number (LRN), but the number did not pass digit analysis.

Data Structures:

RLDA_DIGSTRT. Key field: digtree.

RLDAPRLDGT. Key fields: previous, digit.

RLDAPRLFNL. Key field: previous.

RLDAPRMDGT. Key fields: previous, digit.

RLDAPRMFNL. Key field: previous.

RLDA_CONFLCT. Key fields: table, digits.

RLDA_AMBIG. Key field: table.

Action:

OSPS attempted to route to a LRN, but the number failed digit analysis. The LRN and the digit analysis selector are printed.

Use RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) to determine the PDIT/INDIT and LDIT values associated with the DAS. Then trace through the digit analysis data using the LRN to determine what is missing. It is most likely that either an entry does not exist for it or the number is defined as a vacant code.

647. OALNPDBBAD (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database value passed to an OSPS function is bad.

Probable Cause:

OAlrn_srck() is passed a parameter that says where to find local number portability data. This parameter should indicate RLTALOOPDB, RLACCSDB or RLOCRECORD. An invalid value was found.

Action:

Contact OSPS field support personnel.

648. OALNPOPRKTFL (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistent trunk group related local number portability data.

Data Structures:

RLFC_OPRTK, Key: tgroup.

Action:

Local number portability data for an incoming OSPS trunk group is not correct. The problem is that data says to associate the location routing number (LRN) assigned to the trunk group with an incoming call, but the LRN is missing. Use the trunk group number printed to update the data on RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS), either adding an LRN or changing the status so a query is made or the back number is treated as not ported.

649. OALNPPARBD (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad local number portability request was made.

Probable Cause:

A function called OAlrn_srck, asking that a number be checked to see if it is portable. However, the request was not valid.

Action:

Contact OSPS field support personnel.

650. OALOGSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

MGoalogack.logstat is corrupted.

651. OALPRTACCSF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database read of the RLLPRTACCS relation failed. The rLPRTACCS tuple may be missing. The key that was sent as an input parameter may not be valid, but it is more likely that the office dependent data (ODD) needs to be updated to contain an rLPRTACCS tuple with the appropriate key.

Another possibility is that the relation name that was sent to the primitive was not valid, or a system error occurred.

Data Structures:

RLLPRTACCS. Key field: lport (local port number).

Action:

Use RC/V View 20.22 (EQUIPMENT SUBUNIT -- RAF SERVICES) to update the static ODD database to contain an rLPRTACCS tuple for the port that is being used by the process. This port is printed on the ROP.

652. OALPRTPOSF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database read of the RLLPRT_POS relation failed. The rLPRT_POS tuple may be missing. The key that was sent as an input parameter may not be valid, but it is more likely that the office dependent data (ODD) needs to be updated to contain an rLPRT_POS tuple with the appropriate key.

Another possibility is that the relation name that was sent to the primitive was not valid, or a system error occurred.

Data Structures:

RLLPRT_POS. Key field: lbport (local B-channel port number and module).

Action:

Use RC/V View 21.32 (POSITION TO PORT MAPPING) to update the static ODD database to contain an rLPRT_POS tuple for the port that is being used by the process. This port (local B-channel number) is printed on the ROP. The output lists the port number and the module number, which together make up the key.

653. OALPSGFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The LPsig() function failed when accessing DSU2-LDSUF for a coin call.

654. OALSFCOSBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A listing services call received a MGSETUP_CMP message with a class of service that was unexpected for this type of call. The only classes expected are OA_TAOPER and FC_ANNCMNT. The class of service will be dumped.

655. OALT_OVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) interface received an incoming message from the EIS on a call processing data link (CPDL) different from the one currently assigned to the call and terminating on a different SM; this is called link takeover.

The CPDL on which the message was received is handling the maximum number of calls permitted. The OSPS will continue to communicate with the EIS via the currently assigned CDPL, thereby preventing data link overload and random message loss. The SM on which the currently assigned CPDL terminates, the SM relative link number of the CPDL to which the EIS attempted to move the call, and the EIS ID of the EIS involved are dumped.

656. OAMAKE_BUSY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OACHECKLED() macro returned something other than OALITLED or OADARKLED. This macro is called by operator services position system (OSPS) operator actions models. This macro has only two possible return values.

657. OAMC_ADIGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAMCAGDIG() macro found too many digits in the digit collection field for this macro.

658. OAMC_ARGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bcnt argument passed to the OAmiscitoa() function was too small for the number being converted. The length of the number to be converted in ASCII was larger than expected.

659. OAMC_BADTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The .5 second timer allocated in the MTP in the OA_mtp() or OAmischdlr() function was out of range.

660. OAMC_CTINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position terminal process's (PTP's) call type was invalid. The call type is checked in the OAMCCLTP() macro.

661. OAMC_CTUNUSED (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position terminal process's (PTP's) call type was not used for a commercial automatic call distributor (ACD) call. The OAMCCLTP() macro is used to check this field.

662. OAMC_INCRSN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason argument passed to the OA_mtp() function was not OSRREPLACE. The reason argument will be dumped.

663. OAMC_INVMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAmiscsend() function was called with an invalid event code. The valid event codes are found in oa/hdr/OAmiscev.L. The invalid event code will be dumped.

664. OAMC_NOTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitor terminal process (MTP) in the OA_mtp() or OAmischdlr() function could not allocate a .5 second cyclic timer.

665. OAMC_ODIGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAMCDIALDIG() macro found too many digits in the digit collection area for this macro.

666. OAMC_SDIGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAMCSPDIG() macro found too many digits in the digit collection area for this macro.

667. OAMC_SZERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number being converted to ASCII by the OAmiscitoa() function was larger than the maximum available for this function.

668. OAMC_TIMEOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MTP's .5 second cyclic timer in the OAmischdlr() function was not running.

669. OAMC_UNEXMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitor terminal process (MTP) received an unexpected operating system for distributed switching (OSDS) message from the OSWGETMSG() macro. The unexpected message is dumped. The MTP is in the OA_mtp() and OAmischdlr() functions.

670. OAMISS_LNP_NXX (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Missing local number portability data.

Data Structures:

RLOLNP_HEAD, Key: npa.

RLOLNP_NXX, Key: npa_grp.

Action:

RC/V View 27.34 (OSPS LOCAL NUMBER PORTABILITY DATABASE QUERY INSERT AND DELETE) is used to define if an NPA-NXX is portable or not. Data in RLOLNP_HEAD indicated that some NXXs in an NPA are portable, but the data in RLOLNP_NXX is missing. Use RC/V View 27.34 and correct the portability status of the NPA-NXX impacted.

671. OAMNTD_IMTXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal message text was corrupted. The state of the sending model is not known. The monitored position terminal process is released.

672. OAMNTDTMRF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position terminal process (PTP) being monitored could not set up a timer for waiting for "I'm alive" messages. A system error reply is sent to the monitoring PTP.

673. OAMNTD_TMRO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position terminal process (PTP) being monitored did not receive an "I'm alive" message from the monitoring PTP within the allotted time.

674. OAMNTG_PHF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the protocol handler (PH) path control primitives [PHdef1(), PHset(), PHclos(), or PHopen()] failed. The monitored position is released.

675. OAMNTGTMRF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitoring terminal process could not set up a timer to be used in sending "I'm alive" messages to the monitored terminal process. The monitored position is released.

676. OAMNUNXCLR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitoring process received an unexpected MGCLR_BACK message from the bridging process. The monitored position is released.

677. OAMON_PERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The mon_perm attribute in the RLOLOGINID relation was corrupted. The attribute is dumped.

678. OAMSGINFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The FCmsg_init() function returned failure. The msgid parameter was not recognized by the FCmsg_init() function.

679. OAMTBENUM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid enumeration value was sent to one of the operator actions (OA) message transport interface primitives in the OAbstvt() function.

680. OAMTI_CMPLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the message transport interface (MTI), a failure was received from the PSol3send() or OSsendmsg() function, or errors were detected that would produce failures from these two functions as a result of an attempted send.

The first two bytes of the third word in the ROP output contains the (possibly simulated) return from the PSol3send() or OSsendmsg() function as tabulated below.

DISPLAY (VALUE)	RETURN	REASON
PSol3send()		
0x0000xxxx (0000)	GLSUCCESS	no assert
0xfc0bxxxx (-1013)	PSL3DOWN	DALB or SPB linkage breakage
0xfc0cxxxx (-1012)	PSL3BADPARM	message too long, owner dead
0xfc08xxxx (-1016)	PSL3BFFULL	too many PKB's attached to owning process (usually, this causes a

0xfc18xxxx (-1000)	PS_FAIL	purge - see assert codes OAMTI_KILL and OAMTI_SUICIDE)
0xfc09xxxx (-1015)	PSUNAVLC	PKB buffer exhaustion
		level 3 not available because logical channel not available - no
		response from receiver OSsendmsg()
0x0000xxxx (00)	OSSUCCESS	no assert
0xffcaxxxx (-22)	OSenomCB	MCB buffer exhaustion
0xffff5xxxx (-11)	OSEPROC	dead receiving process
0xffff1xxxx (-15)	OSELENGTH	invalid message length

681. OAMTI_KILL (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The PSL3BFFULL error code was returned in the final step of the message transport interface (MTI) error recovery, and the data owner was not the current running process. The process that owns the data in the multimessage buffers is purged.

In general, the data owner will not be the calling process because a process will actually send its own data only during seizures, recover call, or slow-business periods. The companion OAMTI_SUICIDE assert is used when the currently running process is the offender.

682. OAMTI_SUICIDE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSL3BFFULL error code was returned in the final step of the message transport interface (MTI) error recovery, and the data owner is the current running process. The process that owns the data in the multimessage buffers is purged.

In general, the data owner will be the calling process during seizures, recover call, or slow-business periods. The companion OAMTI_KILL assert is used when the currently running process is not the offender.

683. OAMTPBSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAmtpstat() function received a message requesting the update of the management information system (MIS) computer data link terminal process global status data block. The SM number specified for the data link was out of the range of valid SM numbers for the switch. The text of the message is given in the stack for this function.

684. OANCDCOC_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OArplyqry() function encountered an error. For a given network call denial (NCD) query result, this particular class of charge does not generate NCD queries. An NCD query was sent and the reply was deny.

The classes that can generate NCD queries are PAID, DDD, COLLECT, AUTO_COLLECT, BACK_CARD_NUMBER, DDD_BACK_CARD_NUMBER, BACK_THIRD_NUMBER, FORWARD_CARD_NUMBER, FORWARD_THIRD_NUMBER, and HOTEL_ROOM_NUMBER. All other classes do not start NCD queries.

The APB_ptr->int_msg.text[0] and loop_ptr->coc values are dumped to show where the assert was fired in the OArplyqry() function. The function generates an error and continues to the next state. No manual intervention should be required.

685. OANCEO_TO_CEO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call came in on a non-conforming trunk, but the trunk group is marked as conforming.

Data Structures:

RLFC_TRUNK, RLFC_OPRTK.

Action:

This error is due to a mismatch in the signaling types indicated by the RLFC_TRUNK and RLFC_OPRTK relations. In the RLFC_OPRTK relation, the mfj_sig value is checked against the number of digits received in the back number (which includes automatic number identification [ANI] information). If the signaling is not compatible, the trunk group and member attributes from the RLFC_TRUNK relation are dumped along with whatever is known about the back number.

686. OANDSLPR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert resulted because an attempt was made to obtain an invalid D-port using the RTGETD() macro. The value GLNULPORT was returned from the invocation because an invalid port was passed as a parameter to RTGETD(). This assert will dump the port that was used to read the RTGETD() macro, when an attempt was made to obtain a D channel to bringup a database page.

687. OANFTLDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-fatal DBfrdtup() primitive error occurred. Recovery is possible with assumptions made about the inaccessible tuple, processing may continue.

688. OANFWDNUM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) sent the operator services position system (OSPS) a transfer request for which call completion checks are to be performed, but no listed number was included. That is, the referral directory number had a digit count of 0.

689. OANGENERAL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates an error has occurred while processing an OSPS call. The first argument dumped in the assert indicates what type of error occurred.

Error Type 1:

LEC operator transfer call was received on trunk group having an associated special access service identifier value of 1. On LEC operator transfer calls having 0+, 1+, 01+ or 011+ prefix, this assert will be printed with the trunk

group, trunk member, back number, forward number and the dialed prefix information.

Data Structures:

Trunk group, trunk member, back number, forward number and dialed prefix.

Action:

Contact the sending LEC office to resolve this issue.

690. OANG_TADATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OAtacall_typ() function, an invalid data value was discovered in the ta_data attribute of the RLTALOOPDB relation. This function sets up an operator services position system (OSPS) call type in the CROPDATA structure.

691. OANITOOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the display attribute was incorrect. The allowable range for the display attribute in the RLOAODISP relation is 1-276. The display value was out of range.

Data Structures:

RLOAODISP.

Action:

Use RC/V to check the RLOAODISP relation, and make the necessary corrections to the data.

692. OANMIFLW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading the RLINTERFLW relation to determine if re-route is active for a particular serving team, a DBNO_MATCH occurred. For every serving team (serv_tm) listed in the RLSTINFO relation, there must be an rINTERFLW tuple with the same serving team number.

Data Structures:

RLSTINFO, RLINTERFLW.

Action:

Check the RLSTINFO and RLINTERFLW relations and coordinate the data contained there.

693. OANMRRDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Re-routing is in effect, but a DBNO_MATCH occurred while trying to get the new re-route destination index in the RLRR_DN relation.

Data Structures:

RLRR_DN. Key fields: dest_x, tgroup, int_destid.

dest_x is the incoming destination index that is a product of digit analysis, tgroup is the incoming trunk group

number (or a wildcard number of 9999), and int_destid is the internal destination ID for re-routing the calls.

Action:

Use RC/V to insert an rIRR_DN tuple.

694. OANOCRUPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

For a listing services call, the originating terminal process (OTP) expected an MGOACRUPD message from the position terminal process (PTP), but did not receive one; or the OTP received an MGOACRUPD message from the PTP, but did not expect one.

Probable Cause:

An MGOACRUPD message was lost, or it was sent for listing services calls when it should not be.

695. OANOCTIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rICTINFO tuple is missing. A process on a different SM successfully read this relation with this same key. Either the key was corrupted, or the tuple is missing on this SM.

Data Structures:

RLCTINFO. Key field: call_type (ACD call type).

Action:

The call_type key is printed on the ROP. Verify that the key is valid (range is 0-128).

If the key is valid, then an rICTINFO tuple is missing from this SM, but is populated correctly on other SMs. This implies that ODBE may have been used to insert a tuple for this call type on other SMs but not this one, or to delete this tuple on this SM. RC/V may not be used to correct this problem since abnormal procedures were used to get into this situation. Use ODBE to insert the rICTINFO tuple with this key on this SM.

696. OANODALB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

Failed to access the D-channel application linkage block (DALB) associated with an active process. With no DALB, the process is isolated from its port. The process is purged and the DALB audit is scheduled.

697. OANODEST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The carrier-specific code index and/or route index were incorrectly set to zero after carrier selection. The call cannot be routed; reorder treatment is given.

Data Structures:

RLFC_FGBCARR. Key fields: carrier ID, feature group = B.

RLFC_CARR. Key fields: carrier ID, feature group = D.

RLFCRSMCAR. Key fields: carrier ID, feature group, RSM.

Action:

Most likely, digit routing is set to YES, but the RLDI_COMP relation does not contain a tuple with the proper keys. Take one of the following actions:

1. Provide the correct route index and code index for routing the call on RC/V View 10.3 (INTER-LATA CARRIER).
2. If this is a remote SM (RSM), insert an rFCRSMCAR tuple on RC/V View 26.22 (OSPS RSM/CARRIER DATA) with the carrier ID, feature group, and RSM number as keys. The appropriate route index/code index pair(s) must be filled in.
3. Set the dig_route field to DBYES on RC/V View 10.3. Insert at least one rLDI_COMP tuple via RC/V View 9.7 (CARRIER DESTINATION [OFFICE DIALING]) with the carrier ID, feature group, and code index (CDI) as keys. The CDI key is the regular code index determined by digit analysis, not the carrier-specific code index determined by carrier selection.

698. OANOFOPRTK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There is no RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS) entry for the given trunk group. All trunk groups carrying inward traffic must have a OPRTK entry on RC/V View 26.26.

Data Structures:

RLFC_OPRTK - RC/V View 26.26

Action:

Go to RC/V View 26.26 for the given trunk group and insert the view for the given trunk group.

699. OANO_FCTRNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLFC_TRUNK relation, or the rLFC_TRUNK tuple is missing.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_LINE relation with the actual keys used to access the relation. If the tuple is missing, add it. This relation is updated by RC/V View 5.1 (TRUNK GROUP) and View 5.5 (TRUNK MEMBER).

If the keys used to access the relation were set incorrectly, notify your next level of support.

700. OANOFIXEDRI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_FIXEDRI relation, a failure return of DBNO_MATCH was received. The rIRT_FIXEDRI tuple is missing, or the keys used to read the relation were in error. The keys used are dumped.

Data Structures:

RLRT_FIXEDRI. Key fields: noc, ritype.

Action:

This is a database inconsistency that must be corrected by manual action within the office.

701. OA_NOHOBSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic charge quotation service (ACQS) system process received an unexpected global office parameter Glhobisc of OAH_NULL. Quotations (either autoquote or voice quote) are ignored.

702. OANOKEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAMRTFAL, OAMINNO, OAMCCUAV, OAMTRANS, or OAMDIAL code was received by the operator services position system (OSPS) basic services terminal (BST) virtual terminal (VT) model, but no key or led is lit. A DIAL, TRANS, or SA key is expected to be lit in these cases.

703. OANOLANG_TBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive returned DBNO_MATCH when attempting to read the RLLANG_TBL relation. The language value, the key used to access the RLLANG_TBL relation, is dumped.

Data Structures:

RLLANG_TBL.

Action:

Check the validity of the language value key; the valid range is 1 to Glop_max. The Glop_max global parameter (maximum range of the language value) is defined in the MAX LOP field in RC/V View 8.9 (OSPS OFFICE PARAMETERS).

The rLANG_TBL tuple for the language value key was not found. Verify the language table in RC/V View 8.66 (NON-ENGLISH LANGUAGE ANNOUNCEMENT APPLICATION TYPES) and update the entry as necessary.

704. OANONUSA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When trying to read an rINON_USA tuple, a code other than GLSUCCESS or DBNO_MATCH was returned.

705. OANO_OTDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process thinks it should have an OAOTDB linked to the process control block link area (PCBLA), yet it cannot follow the linkage to obtain one.

Probable Cause:

A process did not link an OAOTDB to the PCBLA and it needed to for operator services position system (OSPS) processing, a linkage is corrupt, or a process has prematurely released its OAOTDB.

Action:

Since further OSPS originating treatment call processing cannot be done, the position is purged and the OAOTDB audit is scheduled in elevated mode.

706. OANO_OTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The autoquote originating terminal process (AQ-OTP) was purged without the autoquote terminal process (AQTP) being notified.

707. OANOPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A key used to access the rIORTLA tuple via the DAGETPTLA() macro did not match the key contained in the tuple referenced. The elevated audit requested should reconstruct the rIORTLA tuple from static data and schedule the appropriate recovery.

The corresponding rIFC_PORTTYP tuple may be missing or corrupt for the identified port. If this assert repeats, use RC/V (or ODBE, if necessary) to interrogate this static data. The key used to access the rIORTLA tuple and the key contained in the tuple are dumped.

708. OANOPHTH_REL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) virtual network (VN) model timed out while waiting for the MGPATH_REL message from an originating terminal process (OTP) or another position terminal process (PTP). This usually occurs on early position release when there is a problem in the OTP; or this could occur on conference handoff when the assistant operator (OP2) does not drop the first operator (OP1) properly.

The following information is dumped: associated process block (APB) key, model ID, state of the model, type of input message, where the message is from, far process ID, APB tag, value switched on, and external message header.

709. OANORCLTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the RLEIS_RCL relation failed. For the each eis_id and serv_id value, a recall tuple should exist for recalling an operator associated with this external information system (EIS).

Data Structures:

RLEIS_RCL. Key fields: eis_id, serv_id.
RLCTINFO. RLSERVDATA.

Action:

Use RC/V View 21.22 (CALL TYPE) and View 21.54 (OSPS SERVICE DATA FOR LISTING SERVICES CALLS) to verify that the eis_id and serv_id values are in the valid range. The range is 1-16 for eis_id and 1-512 for serv_id. If the values are out of range, a coding problem occurred and no further action can be taken. If the values are in range, refer to the serving team growth procedures.

710. OANORECV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

In the operator services position system, the default model for receiving a feature execution (FEX) message was lost, or the dynamic access (DA) primitive used to get the default receiver failed. The terminal process was purged.

711. OANORTGEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automated calling card service terminal process (ACCS-TP) did not receive the expected MGRT_GEN message. Possibly, a timeout occurred, or errors occurred while receiving the message.

712. OANOSERV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISERVDATA tuple is missing. Most likely the key is valid, but the tuple is missing from the database.

Data Structures:

RLSERVDATA. Key field: serv_id (service identifier).

Action:

The key serv_id (service ID) is printed on the ROP. Determine if the key is valid (domain DMUNS10; valid range from 1-1023). If the key is valid, use RC/V View 21.54 (OSPS SERVICE DATA FOR LISTING SERVICES CALLS) to insert the rISERVDATA tuple with this key. If the key is not valid, write an initial modification request (IMR).

713. OANOSRVOT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The OAGETSRVOT() macro was called to get a pointer to a rISRVOT tuple and no linkage of a rISRVOT tuple to the rIPCBLA tuple was found. In this case, the DA primitive does not set a value to the passed in address buffer.

This is an unrecoverable error; the callers of the OAGETSRVOT() macro expect an rISRVOT tuple to exist and to be linked to an rIPCBLA tuple.

The running process is purged. The PCBLA audit is scheduled to run in the elevated mode.

714. OANOSTINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rLSTINFO tuple failed. The ROP output contains the serving team key value. There is no entry in RC/V View 21.2 (SERVING TEAM) for this serving team, or the OSPS 2 field is set to N for this SM in RC/V View 21.33 (OSPS SWITCHING MODULE GROWTH).

Data Structures:

RLSTINFO. Key field: serv_tm (serving team).

Action:

Use RC/V View 21.33 to verify that the OSPS 2 field is set to Y for this SM. If not, set OSPS 2 to Y. If it is Y, use RC/V View 21.2 to insert this serving team.

715. OANOSVDT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLSRV_DEST tuple is missing. Most likely the keys are valid, but the tuple is missing from the database.

Data Structures:

RLSRV_DEST. Key fields: serv_dest, eis_id.

Action:

Determine if the serv_dest (service destination) and eis_id (external information system [EIS] ID) keys printed on the ROP are valid. The valid range for serv_dest is 1-65535, and the valid range for eis_id is 1-16.

If the keys are valid, access RC/V View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM [EIS] DATA) to determine the EIS name for the EIS ID. Access RC/V View 21.53 (OSPS DESTINATION DATA FOR LISTING SERVICES CALLS) to insert the rLSRV_DEST tuple with these keys. If either key is not valid the external information system associated with this EIS should be contacted to determine if they are sending invalid keys. If the keys that they are sending can be proven to be correct a logic problem in the switch is most likely to be at fault and an IMR should be written. In most cases it will be found that the external EIS is sending incorrect information and this must be corrected on their system.

716. OANOSVDT (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLSRV_DEST tuple is missing. Most likely the keys are valid, but the tuple is missing from the database.

Data Structures:

RLSRV_DEST. Key fields: serv_dest, eis_id.

Action:

Determine if the serv_dest (service destination) and eis_id (external information system [EIS] ID) keys printed on the ROP are valid. The valid range for serv_dest is 1-65535, and the valid range for eis_id is 1-16.

If the keys are valid, access RC/V View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM [EIS] DATA) to determine the EIS name for the EIS ID. Access RC/V View 21.53 (OSPS DESTINATION DATA FOR LISTING SERVICES CALLS) to insert the rLSRV_DEST tuple with these keys. If either key is not valid the external information system associated with this EIS should be contacted to determine if they are sending invalid keys. If the keys that they are sending can be proven to be correct a logic problem in the 5ESS[®] switch is most likely to be at fault and an IMR should be written. In most cases it will be found that the external EIS is sending incorrect information and this must be corrected on their system.

717. OANO_TCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No timer control block (TCB) space was available when an attempt was made to set a timer from the OSTIMER(), OSWAIT(), or OSRESTART() macro.

718. OANOTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function failed to seize a timer. One variable is dumped that can be helpful in pointing to the cause.

719. OANPORTPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) toll and assistance (T&A) position terminal process (PTP) received an invalid N-port conference circuit process ID (PID) on a recall seizure. Possible recall seizures with more than a back party connection are: 1+coin charge due, large charge 0+coin flash, charge due, large charge 0+non-coin flash, more efficient call handling (MECH) seizure, and time and charges (T&C) seizure.

The originating terminal process (OTP) sent an invalid PID. This is the result of a source code fault in one of the functions that performs recall seizures with conference circuits in the OSPS OTP.

The following information is dumped in hex: the signal received bytes, the APBTAG that the message is from, the from processor (0), the switch value (0), associated process block (APB) data, APB data of the sending model, rITAPOSDB tuple data, and rITALOOPDB tuple data. These hex dumps can be interpreted by field support personnel.

720. OANRAINCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There exists an inconsistency in the DIOR NRA in RC/V View 27.81. The 800 number entered was identified as a DIOR NRA call but the country code was not able to be translated in view 27.81. The DIOR incoming country code and the forward number will be dumped.

Probable Cause:

The data has not been correctly populated.

Action:

Correct the data.

721. OANRIFLW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read error occurred while reading the RLINTERFLW relation. It was not a DBNO_MATCH error.

722. OANRRRDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read error occurred while reading the RLRR_DN relation. It was not a DBNO_MATCH error.

723. OANRTGEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGRT_GEN message expected after the creation of the announcement terminal process (ATP) was never received by the ATP. The attempt to play an automated operator services position system (OSPS) directory assistance (DA) announcement fails, forcing the operator to respond verbally.

724. OANSUBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A toll and assistance NEAR submodel received a signal that it did not expect, and reported the error to the NEAR main model. Possibly, the NEAR main model misdelivered the signal to the submodel, another submodel sent the unexpected signal, or the submodel made an error in sending a signal to itself.

The signal received by the NEAR main model is dumped; this signal identifies the submodel that detected the error. The NEAR main model will notify the virtual network (VN) model of the error condition and suicide. The VN model should clean up, report availability of the loop to the feature model (FM), and suicide.

725. OANTINDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIFC_HOTEL tuple failed. The number was not in the database, or a database error occurred.

Data Structures:

The oa_data.backnum.dn value is the back number entered by the operator in the format of NPA NXX XXXX. The tgroup value is the incoming trunk group number in the rIFC_TRUNK tuple. The tmember value is the incoming trunk group member in the rIFC_TRUNK tuple.

Action:

Determine if this back number is an automatic charge quotation service (ACQS) establishment. This should be determined by the originating office. To determine the originating office, look at the RLRCTRGPRK relation using the trunk group number as a key; the vdata.orig_npa and vdata.offcode values provide the numbering plan area (NPA) and office code (NXX) combinations for the office in question.

If the back number is an ACQS establishment, insert an rIFC_HOTEL tuple for the back number. If the back number is not an ACQS establishment, no action is required.

726. OANULEMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLSTINFO tuple has the emerg_conf attribute set to DBYES, which indicates that a conference should be attempted when the EMERG key is pressed by an operator on this serving team. However, the conf_q attribute, which indicates the call queue to be used for the conference is set to 0; 0 is not a valid call type.

Data Structures:

RLSTINFO. Key field: serv_tm (serving team number).

Action:

In the affected rLSTINFO tuple, either change the conf_q attribute to the value of a valid key of the RLCTINFO relation, or set the emerg_conf attribute to DBNO. Use RC/V View 21.2 (SERVING TEAM) to make the changes.

727. OANUM_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

RLloopdb.num_type is corrupted.

728. OANXXREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLFC_NXXZN relation could not be found when an attempt was made to determine if a tuple was present. This relation contains data about the time zone for each numbering plan area (NPA)-office code (NXX) combination not covered in the RLFC_TMZN relation.

Data Structures:

RLFC_NXXZN. Key fields: npa, nxx.

Action:

Add the RLFC_NXXZN relation using RC/V View 26.12 (OSPS NXX OUTSIDE OF MAJORITY TIME ZONE) according to the Translation Data Manual. Actual data may be obtained from the operator services position system (OSPS) switch data engineer.

729. OAOCNERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The carrier identified in the RLOCNTWK relation could not handle an operator entered route number.

Data Structures:

RLFC_CARR. Key field: carrid.

RLFCRSMCAR. Key field: carrid, rsm_num, featgrp.

RLOCNTWK. Key fields: oanpa, oattc, oaosdc.

Action:

The carrier ID from the RLOCNTWK relation is printed in decimal. Use the carrier ID and feature group D as keys to RC/V View 10.3 (INTERLATA CARRIER) to verify that the carrier is valid and is not an international carrier. If the data in this view is not correct, update it. If the data is valid, then the carrier can not handle the call to the printed number dialed (Note: The number is in the form NPA-TTC-OSDC where TTC is the terminating toll center and OSDC is an operator special dial code). If the SM number printed is a remote SM (RSM), use RC/V View 26.22 (OSPS RSM/CARRIER DATA) to verify that an rIFCRSMCAR tuple exists for this carrier, feature group D, and RSM number. If the carrier is valid and should handle this call, but does not have an entry in View 26.22, determine the routing data needed and insert an rIFCRSMCAR tuple.

If the carrier is not valid or if it should not handle calls to this NPA-TTC-OSDC, use RC/V View 26.21 (OSPS CARRIER FOR OPERATOR SPECIAL DIALED CODES) to update the RLOCNTWK relation with the correct carrier, or remove the tuple specifying this carrier so that the global default route number carrier will be used.

730. OAODISP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system or database error occurred while reading the RLOAODISP relation.

731. OAOFRRERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator assisted call routing using the operator services position system (OSPS) office carrier failed because the carrier's size is invalid.

Data Structures:

RLFC_CARR. Key field: carrier.

Action:

The global office carrier is output to the ROP. Set the OSPS global office carrier parameter Glofcar via RC/V View 8.9 (OSPS OFFICE PARAMETERS). The valid range is 0-9999. Set the value to zero if this is a local exchange carrier (LEC) or Bell operating company (BOC) owned OSPS. Set the value to represent the inter-exchange carrier (IC) that owns this OSPS; for example, "288" for AT&T or "222" for MCI.

If the value is non-zero, a feature group D (FGD) entry must be populated on RC/V View 10.3 (INTER-LATA CARRIER) for this office carrier.

732. OAOLIBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has occurred while attempting to populate the originating line information parameter into the MGISSETUP message for operator services position system (OSPS) calls. The following data is dumped. The feature indicators that show what type of call was populating the data, the feature information that includes the data to populate the message, and the originating line information that has failed.

733. OAOLNSCN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Trunk signaling characteristics and trunk data in the RLFC_OPRTK relation are inconsistent with the service or equipment indicator (SEI) in the originating line number screening (OLNS) reply.

Data Structures:

RLFC_OPRTK. Key field: trunk group number.

Action:

Check the SEI value in the OLNS reply and use RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS) for the RLFC_OPRTK relation to verify the coin line indicator.

734. OAOLNSHT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch-based hotel data in the RLFC_HOTEL relation is inconsistent with the service or equipment indicator (SEI) in the originating line number screening (OLNS) reply.

Data Structures:

RLFC_HOTEL. Key field: line number.

Action:

Check the SEI value in the OLNS reply and the switch-based hotel data in View 26.11 (OSPS AUTOMATIC

CHARGE QUOTATION SERVICE).

735. OAOLOG_READ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system error occurred while reading the RLOLOGINID relation. The error was not DB_RESOURCE.

736. OAOLOG_TUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLOLOGINID tuple is missing.

737. OAOLSERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are inconsistencies between the originating line screening relations (RC/V Views 26.1 [OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS], 26.2 [OSPS BACK NUMBER SCREENING], and 26.3 [OSPS BACK SCREEN CODE TABLE]) and the operator trunk relation (RC/V View 26.26 [ACCESS TANDEM INCOMING TRUNK GROUPS]).

Data Structures:

RLFCNPAMAP. Key fields: NPA, NXX.
 RLFCSCRLNE. Key fields: Inoc, line number.
 RLFCSCRRNG. Key field: Inoc.
 RLFCBTNTBL. Key fields: Inoc, line number.
 RLOLSR. Key field: scrncode.

Action:

On the ROP output, the first parameter is the error type. The following error types are given as part of the message:

- (1) No rLFCNPAMAP tuple exists for the NPA-NXX of the back number. The parameters printed are the numbering plan area (NPA), office code (NXX), line number, trunk group, and member number for the back number. Enter this NPA-NXX on RC/V View 26.1.
- (2) The call is a local-office-identified screened call (that is, signaled with an ANI-7 code), but no rLFCSCRLNE or rLFCSCRRNG tuple exists. The parameters printed are the NPA, NXX, line number, trunk group, and member number for the back number. Enter this line number or range on RC/V View 26.2 if it should be screened.
- (3) The trunk type is dedicated screened, but no rLFCSCRLNE or rLFCSCRRNG tuple exists. The parameters printed are the NPA, NXX, line number, trunk group, and member number for the back number. If the back number was entered at an operator position, the operator ID is also printed. Enter this line number or range on RC/V View 26.2 if it should be screened.
- (4) The tbn flag is set in the rLFCSCRLNE or rLFCSCRRNG tuple, but no rLFCBTNTBL tuple exists for the back number. The parameters printed are the Inoc and line number for the back number. The Inoc is an internal translation of the NPA-NXX. This is an internal error. Use ODBE to correct the problem.

Type 4 errors may never appear as office data administration (ODA) does not allow the tbn flag to be set if no

true billing number (TBN) is entered.

- (5) The trunk type is ANI-search, but an ANI-7 was signaled with the call. Enter the line number or range on RC/V View 26.2 if it should be screened.
- (6) The screen code retrieved from RC/V View 26.2 was not populated in View 26.3. Enter the screen code on RC/V View 26.3.

738. OAOLSPRB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Trunk signaling characteristics and trunk data in the RLFC_OPRTK relation are inconsistent with the originating line screening (OLS) relations RLFCNPAMAP, RLFCSCRLNE, and RLFCSCRRNG.

Data Structures:

RLFCNPAMAP. Key fields: NPA, NXX.

RLFCSCRLNE. Key fields: Inoc, line number.

RLFCSCRRNG. Key field: Inoc.

RLFC_OPRTK. Key field: trunk group number.

Action:

In the ROP output, the first parameter is the error type.

Error type 1: The back number was a coin line based on trunk signaling and truck data, but the OLS data indicates that it is a non-coin line.

Error type 2: The back number was a non-coin line based on trunk signaling and truck data, but the OLS data indicates that it is a coin line.

The parameters displayed are the back number (numbering plan area [NPA], office code [NXX], and line number), trunk group, and trunk member. Use RC/V View 26.2 (OSPS BACK NUMBER SCREENING) for the RLFCSCRLNE, and RLFCSCRRNG relations, and View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS) for the RLFC_OPRTK relation to verify the coin line indicator.

739. OAOLSTRKCN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

After an operator services position system (OSPS) origination occurred on a non-intermediate switching point (ISP) trunk group, an inconsistency was found between originating line screening (OLS) and trunk group data while attempting to identify the originating station type. OLS data identified the originating station as coin, but the trunk group was marked as non-coin (the cn_ind and pp_ind attributes are both set to DBNO in the RLFC_OPRTK tuple).

Data Structures:

The relations for OLS data are:

RLFCNPAMAP. Key fields: NPA, NXX.

RLFCSCRLNE. Key fields: Inoc, line number.

RLFCSCRRNG. Key field: trunk group number.

The relation for trunk group data is:

RLFC_OPRTK. Key field: trunk group number.

Action:

There are three possible explanations:

- (1) A coin call was misrouted over the trunk group from the originating office. The originating number (NPA-NXX-LINENO) is dumped on the ROP. Trace back to the originating office and inform them of the misrouting.
- (2) Coin traffic should be allowed on the trunk group. Access RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS) using the trunk group dumped on the ROP as the key to change the coin fields to indicate that coin traffic is allowed on the group.
- (3) OLS incorrectly identified the call as coin. Access RC/V View 26.2 (OSPS BACK NUMBER SCREENING) with the keys from the NPA-NXX-LINENO dumped on the ROP to correct the COIN LINE value.

740. OAOPBADREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid request arrived at the operator services position system (OSPS) administrative processor (OAP) terminal process.

741. OAOPBADVAL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) administrative processor (OAP) terminal process detected an invalid case in a switch or an invalid communications path.

742. OAOPBPOOL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The bpool entry for the operator services position system (OSPS) administrative processor (OAP) terminal process was invalid. The process will terminate.

743. OAOPDBFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database access failed in the operator services position system (OSPS) administrative processor (OAP) terminal process.

744. OAOPERINDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has occurred while attempting to populate the operator indicators parameter into the MGISSETUP message for operator services position system (OSPS) calls. The following data is dumped. The feature indicators

that show what type of call was populating the data, the feature information that includes the data to populate the message, and the operator indicators data that has failed.

745. OAOPHBSTOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) administrative processor (OAP) terminal process detected a failure in the OAP or in the data link that goes to the OAP. The terminal process will exit.

746. OAOPLINETERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) operator initiated call attempted to route to a line termination. Since only trunk terminations are allowed, this call will not be completed.

Data Structures:

RLSTINFO. Key field: serv_tm.
 RLDA_DIGSTRT. Key field: digtree.
 RLDAPRLDGT. Key fields: previous, digit.
 RLDAPRLFNL. Key field: previous.
 RLDAPRMDGT. Key fields: previous, digit.
 RLDAPRMFNL. Key field: previous.
 RLRT_SCRNING. Key fields: dest_x, screen_x, prefix.
 RLRT_ROUTING. Key field: route_x.

Action:

OSPS calls only route to trunks; line terminations are blocked. An OSPS call passed digit analysis and routing, but routed to a line. The ROP output includes the dialed digits along with a serving team number. The OSPS serving team information record can be reviewed to find the screen index and digit analysis selector (DAS) for this serving team. This should be enough information to trace through the digit analysis and routing office records to determine at what step the problem was introduced.

747. OAOPNOBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) administrative processor (OAP) terminal process ran out of data buffers. Data was lost.

748. OAOPPRFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) administrative processor (OAP) terminal process called a primitive that failed.

749. OAOPRCCERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call completion transfer request message was received, but the local access and transport area (LATA) checks did not complete successfully. A call cannot be completed if LATA checks do not complete successfully.

The route type in the transfer request was OACCOPER, indicating that this request was generated by the operator keying the COMPLETE SAME or COMPLETE DIFFERENT keys on the operator services position system (OSPS) terminal. The unified position terminal process (UPTP) should not generate a complete call request if LATA checks failed.

The UPTP may be improperly or incompletely performing LATA checks, or an inconsistency may exist between the UPTP and originating terminal process (OTP) in the LATA check determination process. The MGTRNS_REQ message and the rISRVOT tuple are dumped on the ROP.

750. OAOPSMOTNL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A listing services call originated on a SM that is not loaded with the software necessary to provide the indicated service. The call was identified as requiring listing services treatment by the non-zero service ID assigned to the call queue associated with the origination.

That is, at least one trunk group member on this SM is assigned to a call queue that has a listing services service ID (serv_id attribute) in the RLCTINFO relation, but the appropriate software to handle this listing services call does not exist on this SM.

Data Structures:

RLCTINFO. Key field: call_type (ACD call type).

RLAC_TKCT. Key fields: oppcid (operator pre-call ID), tgroup (trunk group).

Action:

The call type (CALL_TYPE), service ID (SERV_ID), operator pre-call ID (OPPCID), trunk group (TGROUP), and trunk group member (TMEM) are printed on the ROP. Access RC/V View 21.23 (OSPS CALL TYPE & DISPLAY INDEX FOR TRUNK) using the TGROUP and OPPCID keys (TK_GROUP and CALL_TYPE_ID fields, respectively). There are two cases that can exist:

- (1) The entry for these keys is not found. In this case, the "wild trunk group" 9999 was used to assign the call type. The wild trunk group is used when an entry for the actual trunk group was not specified in RC/V View 21.23. If the intention of the office data design was to use the wild trunk group to assign a call type, then this type of traffic should not be originating on trunks on this SM.

If different types of traffic with the same operator pre-call ID, but different call types based on trunk groups was the intention, then entries for this trunk group must be made in RC/V View 21.23.

- (2) The entry for these keys is found. In this case, a member of the trunk group (TMEM) exists on this SM. This member must be dis-associated from the group, assigned to a different group, or the entire trunk group must be assigned to a call type in RC/V View 21.23 that does not have a listing service service ID assigned to it in RC/V View 21.22 (CALL TYPE).

751. OAOPSTLVL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAopsetup() function received an unexpected value in the level field of the MGACQUEUED message. The level field is dumped.

752. OAOPTKTRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator service position system (OSPS) operator initiated call attempted to route to an intermediate switching point (ISP) outgoing operator trunk. Since trunk terminations other than ISP outgoing operator trunks are allowed, this call will not be completed.

Data Structures:

RLDA_DIGSTRT. Key field: digtree.
 RLDA_PRLDGT. Key fields: previous, digit.
 RLDA_PRLFNL. Key field: previous.
 RLDA_PRMDGT. Key fields: previous, digit.
 RLDA_PRMFNL. Key field: previous.
 RLRT_SCRNING. Key fields: dest_x, screen_x, prefix.
 RLRT_ROUTING. Key field: route_x.

Action:

OSPS calls only route to trunks that are not outgoing operator trunks; terminations to these trunks are blocked. An OSPS call passed digit analysis and routing, but routed to a trunk that is an ISP outgoing operator trunk. The ROP output includes the dialed digits, incoming and outgoing trunk group numbers, and carrier.

If the carrier number on the ROP is 10000, the carrier is a local exchange carrier (LEC). Use RC/V View 5.1 (TRUNK GROUP) to find the digit analysis selector (DAS) for this trunk group. This information should be enough to trace through the digit analysis and routing office records to determine at what step the problem was introduced.

753. OAOQANTKUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in OT OAorigue function, FCANNTALK state. If the message is from the announcement terminal process, the announcement is idled and OAorigue is restarted in the FCWSEIZURE state; otherwise it is ignored. Dump msg.msghead.

754. OAOQWACKUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in OT OAorigue function, FCWACK state. The message is ignored. Dump msg.msghead.

755. OAOQWANUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in OT OAorigue function, FCWANNSETUP state. The message is ignored.

Dump msg.msghead.

756. OAOQWSZUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in OT OAorigue function, FCWSEIZURE state. The message is ignored.
Dump msg.msghead.type.

757. OAORANCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read error occurred when reading the RLCTINFO relation using the call_type key. It was not a DBNO_MATCH error.

758. OAORNOCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No rICTINFO tuple exists for the call_type key. A database inconsistency exists between the RLSTINFO and RLCTINFO relations, or between the RLCTINFO and RLAC_TKCT relations.

Data Structures:

RLCTINFO.

Action:

Search the RLCTINFO relation for a tuple with the call_type key. If none is found, use RC/V to insert the tuple. If an entry exists, contact the product engineering control center (PECC) and write an initial modification request (IMR).

759. OA_OSCNM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A mismatch of the originating station class was found while performing a terminating code screening (TCS) check.

760. OA_OSENMOCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed; could not allocate a message control block.

761. OAOSPDAGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OCRECORD	Audit Mode: elev

Problem:

The operator services position system (OSPS) call record DAGETOCREC macro returned an invalid pointer to

Probable Cause:

A bad call ID was passed as a parameter.

Action:

The OSPS call record audit is scheduled.

762. OAOTDBIDLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OAOTDB	Audit Mode: elev

Problem:

Failed to add the OAOTDB to the head of the DB_HEADC idle list.

Probable Cause:

The OAOTDB has a non-zero linkage to the idle head cell.

Action:

An OAOTDB audit is scheduled in elevated mode.

763. OAOTDBINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLOAOTDB initialization function OAinitotdb failed to insert a tuple or link a tuple to the idle list.

Probable Cause:

Unknown.

Action:

None.

764. OAOT_P_ERR (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to update the state of the talking path for an operator services call.

Probable Cause:

Dynamic data in the coinot dynamic relation is probably wrong.

Action:

Data dumped can be used to determine the failing area.

765. OAOTP_IFLOW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received at the originating terminal process (OTP) during the setup of an interflow call. This message was received after the interflow position terminal process (IPTP) was seized, but before the position terminal process (PTP) on OSPS-z was seized. The message contents are printed on the ROP.

766. OAOTR_VLDL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed because it received an invalid relation name. The relation could be missing from the

office dependent data (ODD), or the relation name could be incorrect in the ODD. The valid relation name is RLOTR_VLD.

767. OAOUT_CALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

RLloopdb.outcall is corrupted.

768. OAPARM_RDF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database error occurred at the position terminal process (PTP) being monitored, or the PTP requested to be monitored. This PTP was trying to read the RLOSPSPARM relation. A system error reply was sent to the monitoring PTP. The switch value contains the office number.

769. OAPCBLAOTDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OAOTDB	Audit Mode: elev

Problem:

Failed to link the process control block link area (PCBLA) to the OAOTDB.

Probable Cause:

There is an existing linkage in the OAOTDB or PCBLA.

Action:

An OAOTDB audit is schedule in elevated mode.

770. OAPCBLAPBF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A single process purge was called when the associated process block (APB) to process control block link area (PCBLA) linkage was invalid and the dynamic access (DA) primitive failed.

771. OAPI2PTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PCPT2PICB macro was called to obtain a peripheral interface control bus (PICB) for a port and failed. This assert will dump the port that was used to access a peripheral interface data bus (PIDB).

Probable Cause:

No PICB exists for the passed in port

Action:

Check recent change view 5.5 to determine if the passed in port is valid.

772. OAPICBNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rPICB tuple failed. The ROP output contains the picb_no key value (the peripheral interface control bus [PICB] number).

Data Structures:

RLPICB. Key field: picb_no.

Action:

Use RC/V (or ODBE, if necessary) to cross check the key value used to access the RLPICB relation with the actual keys for the relation. Determine if the rPICB tuple exists, and possibly add a tuple to this relation.

773. OAPICBNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLPICB relation failed because the relation was not found in the database.

Data Structures:

RLPICB. Key field: picb_no (peripheral interface control bus [PICB] number).

Action:

Add the RLPICB relation to the database according to RC/V procedures.

774. OAPOLSERR (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are inconsistencies between the originating line screening relations (RC/V Views 26.1 [OSPS NPA-NXX SM ASSIGNMENT & LATA EXCEPTIONS], 26.2 [OSPS BACK NUMBER SCREENING], and 26.3 [OSPS BACK SCREEN CODE TABLE]) and the operator trunk relation (RC/V View 26.26 [ACCESS TANDEM INCOMING TRUNK GROUPS]).

Data Structures:

RLFCNPAMAP. Key fields: NPA, NXX.

RLFCSCRLNE. Key fields: Inoc, line number.

RLFCSCRRNG. Key field: Inoc.

RLFCTBNTBL. Key fields: Inoc, line number.

RLOLSR. Key field: scrncode.

Action:

On the ROP output, the first parameter is the error type. The following error types are given as part of the message:

- (1) The trunk type is dedicated screened from payphone, but no rIFCSCRLNE or rIFCSCRRNG tuple exists. The parameters printed are the NPA, NXX, line number, trunk group, trunk member, and ANI information digits for the back number. If the location routing number (LRN) of the back number exists, the LRN is also printed. Enter this line number or range on RC/V View 26.2 if it should be screened.
- (2) The trunk type is ANI-search from payphone, but no rIFCSCRLNE or rIFCSCRRNG tuple exists. The parameters printed are the NPA, NXX, line number, trunk group, trunk member, and ANI information digits for the back number. If the LRN of the back number exists, the LRN is also printed. Enter the line number or range on RC/V View 26.2 if it should be screened.

- (3) The call is a local-office-identified screened call from payphone, but no rIFCSCRLNE or rIFCSCRRNG tuple exists. The parameters printed are the NPA, NXX, line number, trunk group, trunk member, and ANI information digits for the back number. If the LRN of the back number exists, the LRN is also printed. Enter this line number or range on RC/V View 26.2 if it should be screened.

775. OAPOSAPBF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The associated process block (APB) to position data block (POSDB) linkage was invalid and the dynamic access (DA) primitive failed. A single process purge was called.

776. OAPOS_INIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAMPINIT code was received by an operator services position system (OSPS) feature model. The position init control key was depressed on the basic services terminal (BST), causing the process to be purged.

777. OAPOSLOOPF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The position data block (POSDB) to loop data block (LOOPDB) linkage was invalid and the dynamic access (DA) primitive failed. A single process purge was called.

778. OAPOS_LPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system error occurred when reading the RLPOS_LPRT relation. The error was not DB_RESOURCE.

779. OAPOS_LPRTF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database read of the RLPOS_LPORT relation failed. An rIPOS_LPORT tuple may be missing. This can be corrected by updating the office dependent data (ODD) to contain a tuple with the appropriate tuple key.

The key that was passed to the read function may have been invalid. Another possibility is that the relation name passed to the read function was invalid; this would be due to a system error.

Data Structures:

RLPOS_LPRT. Key field: posnum (position number).

Action:

Use RC/V View 21.32 (POSITION TO PORT MAPPING) to update the ODD to contain an rIPOS_LPRT tuple for the position number that is used by the process. The position number is printed on the ROP output.

780. OAPOS_READ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system error occurred while reading the RLPOS_LPRT relation. The error was not DB_RESOURCE.

781. OAPOS_STILMON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitor position was not deactivated as a monitor position. One of the DBx... primitives failed. The switch value contains the position number.

782. OAPRL_ERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

OAnrls.sd received an invalid return from the OAprlcheck() function. This return was not one of the return values defined for this function, which would include the default return value for cases (rare) in which the OAprlcheck() function would fall through. This could be caused by a memory fault in the SM that would corrupt the return value.

783. OAPRTFYL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to obtain a circuit name from rIFC_PORTTYP, a failure occurred.

Probable Cause:

There was no port matching the posdb_ptr->lbport.

Action:

Refer to RC/V 5.1 (TRUNK GROUP) to get information about the port.

784. OAPSLPRTRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system error occurred while reading the RLPOS_LPTR relation. The error was not DB_RESOURCE.

785. OAPTRDBADD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not save the address of the rIPTRDB tuple in the semi-global data area.

786. OAPTREXRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pointer data block (PTRDB) resources have been exhausted from the idle list.

Probable Cause:

Call load has exceeded the expected amount for this resource.

Action:

If this is an SM-2000, overload control should report the condition and the office personnel will have to request more of this resource per administrative/engineering guidelines.

787. OAPTRFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

The DAfpcpr() function failed to populate a pointer to the pointer data block (PTRDB). This function follows the linkage of the process control block link area (PCBLA) to the PTRDB and populates a pointer to the PTRDB.

The probable cause may be that a PTRDB tuple is not linked to the PCBLA tuple.

Recovery action is to schedule the PTRDB audit.

788. OAPTRFARI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

Failed to retrieve a pointer data block (PTRDB) from the idle list while trying to create a process that requires a PTRDB tuple.

Probable Cause:

The DA primitive received a bad parameter and could not find the idle list.

Action:

Schedule the PTRDB audit.

789. OAPTRFATI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

Failed to attach a pointer data block (PTRDB) tuple to the idle list either during initialization of the PTRDB idle list, a request for more resources to be allocated by the craft, the addition of more resources due to the insertion of hardware related static tuples, or the deallocation procedure after a process is completed.

Probable Cause:

The DA primitive received a bad parameter and was not able to link the PTRDB tuple to the idle list, or the tuple was already on the idle list.

Action:

An elevated AUPTRDB audit is scheduled and processing returns to the calling function.

790. OAPTRLNKF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following dynamic access (DA) link primitives failed:

- The DAprac() primitive failed to link the pointer data block (PTRDB) and the automated calling card service data block (ACCSDB).

- The DAIPrqr() primitive failed to link the PTRDB and the query data block (QRYDB).
- The DAIPrtp() primitive failed to link the PTRDB and the toll and assistance operator position data block (TAPOSDB).

791. OAPTRLPCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

Failed to link the pointer data block (PTRDB) to its owning process control block link area (PCBLA).

Probable Cause:

A bad parameter was passed to the DA primitive and it was not able to find either the PCBLA tuple or the PTRDB tuple.

Action:

Schedule the PTRDB audit.

792. OAPTRUPCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

Failed to unlink the pointer data block (PTRDB) from its owning process control blocklink area (PCBLA).

Probable Cause:

A bad parameter was passed to the DA primitive and it was not able to locate either the PCBLA or the PTRDB tuples. Action:

Schedule the PTRDB audit.

793. OAPUR_PROC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When the MGOAKP_PS message is received from an operator, the virtual terminal (VT) model calls this assert to purge the receiving position terminal process (PTP). This message is related to a keying action on the operator terminal.

Note: No audits are specifically scheduled by this assert, but the single process purge uses audits to clean up the less important dynamic data. There will typically be a fair number of audit errors associated with this assert.

794. OAQBDBACOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert prints only when the external information system (EIS) global variable OAeisim is set to DBYES. The OAetkbact() function found an invalid class of charge specified in the MGBEGINACT message. The message specified that quantum platform access billing commence with the given class of charge. The invalid class of charge and the MGBEGINACT message are dumped.

Probable Cause:

The external vendor providing the quantum service specified an invalid class of charge, or operator services position system (OSPS) is not accepting all of the allowed class of charges.

Action:

Contact field support personnel.

795. OAQRYEXRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Query data block (QRYDB) resources have been exhausted from the idle list.

Probable Cause:

Call load has exceeded the expected amount for this resource.

Action:

If this is an SM-2000, overload control should report the condition and the office personnel will have to request more of this resource per administrative/engineering guidelines.

796. OAQRYFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAFPRQR() function failed to populate a pointer to the query data block (QRYDB). This function follows the linkage of the pointer data block (PTRDB) to the QRYDB and populates a pointer to the QRYDB.

Probable cause may be that a QRYDB tuple is not linked to the PTRDB tuple.

797. OAQRYFARI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QRYDB	Audit Mode: elev

Problem:

Failed to retrieve a query data block (QRYDB) tuple from the idle list while trying to create a process that requires a QRYDB tuple.

Probable Cause:

The DA primitive received a bad parameter and could not find the idle list.

Action:

Schedule the QRYDB audit.

798. OAQRYFATI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QRYDB	Audit Mode: elev

Problem:

Failed to attach a pointer data block (PTRDB) tuple to the idle list either during initialization of the QRYDB idle list, a request for more resources to be allocated by the craft, the addition of more resources due to the insertion of hardware related static tuples, or the deallocation procedure after a process is completed.

Probable Cause:

The DA primitive received a bad parameter and was not able to link the QRYDB tuple to the idle list, or the tuple was already on the idle list.

Action:

An elevated AUQRYDB audit is scheduled and processing returns to the calling function.

799. OAQRYFWD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The qry_pending and fwd_chk attributes in an rITALOOPDB tuple were both DBYES when the OAZNNEXT() macro was called from SDL code. These two bits should never be DBYES at the same time. The OAZNNEXT() macro called the OAZnnext() function, which called this assert.

Action:

Examine the stack back trace to determine the function that called the OAZnnext() function and why both bits are set to DBYES. Contact field support personnel.

800. OAQRYLPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QRYDB	Audit Mode: elev

Problem:

Failed to link the pointer data block (PTRDB) to its owning process control block link area (PCBLA).

Probable Cause:

A bad parameter was passed to the DA primitive and it was not able to find either the PTRDB tuple or the QRYDB tuple.

Action:

Schedule the QRYDB audit.

801. OAQRYMODF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAaccs_init() function called the FCcreate() function to create the associated process block (APB) for QUERY. The FCcreate() function returned a failure code.

802. OAQRY_NOLOOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The query model no longer had an rITALOOPDB tuple. If this occurred on the reply side of the query model, it is most likely that during call processing, the loop was torn down while waiting for a query to be returned; but the outstanding query was not canceled (it should have been canceled).

803. OAQRYUPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QRYDB	Audit Mode: elev

Problem:

Failed to unlink the query data block (QRYDB) from its owning pointer data block (PTRDB).

Probable Cause:

A bad parameter was passed to the DA primitive and it was not able to locate either the PTRDB tuple or the QRYDB tuple.

Action:

Schedule the QRYDB audit.

804. OAQUERY_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remaining query results are not valid for the "wait for query/connection state". The OArplyqry() function is called when the OARPLY_QRY message is received in the "wait for query/connection state". The OArplyqry() function resides in the oa/OAncoc module.

Action:

The OArplyqry() function continues by returning NXTSTATE and going to the next state. The APB_ptr->int_msg.text[0] valued is dumped. No manual intervention is required.

805. OARASTUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in the OArasetup() function of the originating terminal process (OTP). This prevents an automated operator services position system (OSPS) directory assistance (DA) announcement from being played and forces the operator to give the announcement verbally.

806. OARATCFWD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rate_quote, conn_pending, and fwd_chk attribute in an rITALOOPDB tuple were all DBYES when the OAZNNEXT() macro was called from SDL code. These three bits should never be DBYES at the same time. The OAZNNEXT() macro called the OAznnext() function, which called this assert.

Action:
