Notice

Every effort was made to ensure that the information in this IP was complete and accurate at the time of publication. However, information is subject to change.

This IP describes certain hardware, software, features, and capabilities of Lucent Technologies products. This IP is for information purposes; therefore, caution is advised that this IP may differ from any configuration currently installed.

Lucent Technologies is the successor to the business and assets of AT&T Network Systems business unit.

Mandatory Customer Information

Interference Information: Part 15 of FCC Rules - Refer to the *5ESS*® Switch Product Specification IP.

Trademarks

4ESS is a trademark of Lucent Technologies.
5ESS is a registered trademark of Lucent Technologies.
Air Extension is a servicemark of Lucent Technologies.
AUTOPLEX is a registered trademark of Lucent Technologies.
BILLDATS is a registered trademark of Lucent Technologies.
ESS is a trademark of Lucent Technologies.
SLC is a registered trademark of Lucent Technologies.
True Choice is a registered trademark in the United States and other countries, licensed exclusively through AT&T
UNIX is a registered trademark in the United States and other countries, licensed exclusively through X-Open Company Ltd.

Warranty

Warranty information applicable to the *5ESS*® switch may be obtained from the Lucent Technologies Account Management organization. Customer-modified hardware and/or software is not covered by this warranty.

Ordering Information

This IP is distributed by the Lucent Technologies Customer Information Center in Indianapolis, Indiana.

The order number for this IP is 235-600-700. To order, call:

1-888-LUCENT8 (1-888-582-3688) or fax to 1-800-566-9568 (From inside the continental United States)

1-317-322-6847 or fax to 1-317-322-6699 (From outside the continental United States).

Support Telephone Numbers

Information Product Support Telephone Number: To report errors or ask nontechnical questions about this or other IPs produced by Lucent Technologies, call 1-800-645-6759.

Technical Support Telephone Numbers: For initial technical assistance, call the North American Regional Technical Assistance Center (NARTAC) at 1-800-225-RTAC (1-800-225-7822). For further assistance, call the Customer Technical Assistance Management (CTAM) Center:

1-800-225-4672 (From inside the continental United States)

1-630-224-4672 (From outside the continental United States).

The CTAM center is staffed 24 hours a day, 7 days a week.

Acknowledgment

1. INTRODUCTION

1.1 PURPOSE

The *5ESS*®-2000 Switch Input Messages document describes the input messages (IMs) available for use on the *5ESS*®-2000 switch input channels. This document is a reference guide for *5ESS*®-2000 switch support personnel. This document is available on paper and electronic media.

The messages in this document and its updates represent complete documentation for the 5E11 and later software releases.

The *5ESS*®-2000 switch IMs are used to control, maintain, and monitor the switching system, including the processors, peripherals, and other software. For example, the messages can direct the system to:

- Execute diagnostic and exercise programs and report the results.
- Perform tests and report the results.
- Report the status of various subsystems.
- Report traffic information.
- Enter translation information into memory.
- Restore units to service or remove units from service.

Because of the many available options, some IMs are complex. Before using these particular messages, become familiar with conventions used in this document to describe them (see the User Guidelines section).

Some messages may adversely affect service. These messages show a **WARNING** appearing opposite the key block. Use these messages only during periods of light traffic. Before using one of these messages, read thoroughly the manual page containing the message description.

1.1.1 UPDATE INFORMATION

This document is being updated and may include documentation for the 5E14 software release of the *5ESS*®-2000 switch. It also includes numerous enhancements and responses to customer requests for more information.

The following messages are included in this update.

COPY:TAPE-TOP
EXC:PM-E
INIT:AM-FPI-B
OP:CCS-GSM-C
OP:CONV-EXT-C
OP:LOG-A
OP:LOG-B
OP:ST-GSMNET
OP:ST-NGSMNET
RMV:PSU
VFY:OFC-C

1.1.1.1 SUPPORTED SOFTWARE RELEASES

Copyright © 1999

In accordance with the *5ESS*®-2000 Switch Software Support Plan, the 5E11 software release will be rated Discontinued Availability (DA) as of November 13, 1998. The information supporting 5E11 is being removed over time, instead of concurrently, from all documentation.

If you are supporting offices that use a software release prior to 5E12 and you have a need for the information that is being removed, retain the associated pages as they are removed from the paper documents, or retain the earlier copy of the CD-ROM.

1.1.1.2 TERMINOLOGY

As of March 18, 1999, Bellcore officially changed its name to Telcordia Technologies. Not all pages of this document are being reissued to reflect this change; instead, the pages will be reissued over time, as technical and other changes are required. Customers on standing order for this document may see that, on previous-issue pages, the Bellcore name is still exclusively used.

Customers receiving new orders for this document will see the Telcordia Technologies name used as appropriate throughout the document, and the Bellcore name used only to identify items that were produced under the Bellcore name. Exceptions may exist in software-influenced elements such as input/output messages, master control center screens, and recent change/verify screens. These elements will not be changed in this document until such time as they are changed in the software code. Document updates will not be made specifically to remove historical references to Bellcore.

National ISDN is an evolving platform in which new features will continue to be introduced for new revenue opportunities, improved operational efficiencies, and for support of specific applications. NI 1, NI 2, and NI 3 represent specific features as documented in Bellcore SRs 1937, 2120, and 2457. The industry is migrating to an additional terminology to more specifically denote the availability of National ISDN features: NI 95, NI 96, etc. A feature is included in a specific version (such as, NI 96) if it is available by the switch vendors by the first quarter of the year.

As a result of the World Telecommunications Standardization Conference held March 1-12, 1993, the International Telegraph and Telephone Consultative Committee (CCITT), no longer exists as an organization under the International Telecommunication Union (ITU). According to the ITU, the CCITT is now referred to as the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS).

For new and revised Recommendations issued by the ITU-TS, the term "CCITT Recommendation X.xxx" will be replaced by the "ITU-T Recommendation X.xxx" designation. For a transition period from 1993 to 1997, if the Recommendation had a previous CCITT designation, the new name will include "(formerly CCITT Recommendation X.xxx)". Names of existing CCITT Recommendations will not change unless revised.

1.1.1.3 HANDLE DATE AND TIME TRANSITION TO YEAR 2000

For any time-stamp data that occurs in *5ESS*®-2000 switch operations after the time is transitioned to the year 2000 and beyond, the year 00 shall be interpreted as 2000 after 12/31/1999. The data (billing, log files, and etc.) shall continue to work even right after transition to the year 2000 from midnight 12/31 1999.

1.1.2 ORGANIZATION

The IM manual includes the:

Introduction - explains the purpose of the document and the organization of the material presented.

User Guidelines - contains information about the conventions used in documenting IMs. The structure and layout of IMs, as well as their naming and usage conventions, are discussed. This section also explains the on-line help feature, the input message edit and history function, the format notation used in this document, and the organization and content of the message descriptions contained in this

document.

Acronym List - defines acronyms and abbreviations used in the IM manual.

Indexes - contains helpful indexes. These indexes may be used as guides for locating and selecting specific message descriptions in the IM manual.

- The Alphabetical Index (paper only) lists, in alphabetical order by message ID, all IM descriptions found in the entire manual. A subset of this index is placed at the beginning of every volume of the manual. The subset lists the IM descriptions that are found in that particular volume.
- The Functional Index summarizes the purpose of each IM, categorizing the IM according to unit or function.
- The Page Inventory Index (paper only) itemizes every page in the IM manual. This includes volume breaks and placement of tabs.
- The Topical Index shows the relation of IMs divided into topics (categories).
- The Command Group Index (paper only) is a set of tables showing each command group code and the IMs that were assigned to that group at the time the software was released to service providers.
- The Command Group/Alpha Index (paper only) is an alphabetical listing of all IMs in the manual with each associated command group as assigned when the software was released to service providers.

Appendixes - contains information that is referred to by two or more IM descriptions, such as listings of audits and traffic (TRFC) sections.

The rest of the IM manual contains message descriptions presented in alphabetical order by message ID.

1.1.3 USER FEEDBACK

The producers of this manual are constantly striving to improve its quality and usability. Please use the enclosed user feedback form for your comments and to advise us of any errors (available in paper documents only). Or, you can write to us at the following address:

Lucent Technologies
Documentation Services
2400 Reynolda Road
Winston-Salem, NC 27106

Please include the issue number and/or date of the document, your complete mailing address, and telephone number. We will answer all correspondence within 30 days, informing you of the disposition of your comments.

You may also call our Documentation HOTLINE if you need an immediate answer to a documentation question. This HOTLINE is not intended to eliminate the use of the comment cards, but rather to enhance the comment process. The HOTLINE number is 1-800-645-6759, and is available from 7:30 a.m. to 6:00 p.m. Eastern Standard time. Outside of those hours, the line is served by an answering machine. You can leave a message on the answering machine and someone will return your call the following business day.

Document users who have access to electronic mail facilities may send comments via electronic mail. The electronic address is hotline5@wrddo.lucent.com. When sending comments via electronic mail please make sure

that the document title, document number, document issue number and/or document date are included in the mail along with the sender's name, phone number, and address.

1.1.4 DISTRIBUTION

This document is distributed by the Customer Information Center in Indianapolis, Indiana. Most service providers should place orders through their documentation coordinator. Some service providers may allow customers to order directly from the Customer Information Center; however, the majority do not. Service providers that use documentation coordinators to manage their orders receive a significant discount. If you do not know the name/number of your documentation coordinator, you may call 1-888-582-3688.

Customers not represented by a documentation coordinator and Lucent Technologies employees can order the documentation for the *5ESS*®-2000 switch directly from the Customer Information Center. Proper billing information must be provided. These orders may be mailed to:

Lucent Technologies
Customer Information Center
Order Entry
2855 N. Franklin Road
Indianapolis, IN 46219

Orders may also be called in on 1-888-LUCENT-8 (1-888-582-3688) within the continental United States and +1-317-322-6416 from outside the continental United States. Orders may be faxed in on 1-317-322-6484.

1.1.5 TECHNICAL ASSISTANCE

Technical assistance for the *5ESS*®-2000 switch can be obtained by calling the North American Regional Technical Assistance Center (NARTAC) at 1-800-225-RTAC (1-800-225-7822). This telephone number is monitored 24 hours a day, 7 days a week. During regular business hours, your call will be answered by your local NARTAC. Outside of normal business hours, all calls will be answered at a centralized technical assistance center where service-affecting problems will be dispatched immediately to your local NARTAC. All other problems will be referred to your local NARTAC on the next regular business day.

1.1.6 SECURED FEATURES

For all secured features, a right to use (RTU) fee must be paid before enabling information is provided. Contact your Account Team Representative for additional information about the specified secured feature.

For a complete list of secured feature identifiers (SFID), refer to the TG-5 manual (235-080-100).

1.1.7 REFERENCES

The *5ESS*®-2000 Switch Input Reference Guide is a companion document to the *5ESS*®-2000 Switch Input Messages manual. Designed as a "mind jogger" for users familiar with the Master Control Center (MCC) procedures and IMs, this guide summarizes MCC index display pages, function keys, system responses, and the construct of IM formats.

Additional references are given as needed, within individual message descriptions. An "x" or "x"s in the last three positions of a release specific document number indicate the digits that change from release to release. Refer to 235-001-001, Documentation Description and Ordering Guide for the document number associated with each software release.

This document contains information concerning the Compact Digital Exchange (CDX) and the Very Compact Digital Exchange (VCDX), which are switching systems based on the *5ESS*®-2000 switch. This document is a standard *5ESS*®-2000 switch document that is also applicable to the CDX and VCDX switching systems. Information

applicable only to CDX or VCDX may be found in the following manuals:

235-120-010 Compact Digital Exchange (CDX) Reference Guide

235-120-020 Compact Digital Exchange (CDX) User's Guide

235-120-110 Very Compact Digital Exchange (VCDX) Reference Guide

235-120-120 Very Compact Digital Exchange (VCDX) User's Guide

Copyright © 1999

2. USER GUIDELINES

2.1 INTRODUCTION

This section explains the rules to which *5ESS*®-2000 switch input messages (IMs) must conform, and the conventions that are used in this manual to show how messages are constructed.

The term messages refers to the commands that are used to control and monitor the *5ESS*®-2000 switch system (IMs).

Each *5ESS*®-2000 switch system is set to accept only one message language, human-machine language (MML). MML is the human interface language developed by the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT).

2.2 MESSAGE DESCRIPTIONS

The message descriptions form the bulk of the IM manual. Message descriptions are documented on manual pages.

The term "manual page" refers to the description of an IM without regard to how many physical sheets of paper or screens are used to complete the description.

Each IM manual page consists of several elements that form the message description.

2.3 MANUAL PAGE - GENERAL PARTS

This section gives a general description of each part of a manual page.

2.3.1 Page Headers (Paper Only)

The header consists of two lines across the top of each manual page. The header on the inside of the manual page identifies the document number and the issue date. The header on the outside of the manual page shows the name of the document (for example, *5ESS*®-2000 Switch Input Messages), and the message name.

2.3.2 Message Name

The message name is made up of the command code and parameter names from the message format omitting any variables and optional values and has a maximum length of 20 characters. This is used like a dictionary heading to give a general idea of placement in the manual.

2.3.3 Page Footers (Paper Only)

The footer on the inside of the page contains the issue number. The outside footer shows the message ID and page number. The message ID is explained with the key block items.

2.3.4 The Key Block

The key block is the block of text in the upper right corner of the manual page. The key block includes:

- ID
- RELEASE
- COMMAND GROUP

Copyright © 1999

- APPLICATION

2.3.4.1 ID

The ID is the unique identifier of the IM. Every message ID is composed of two parts separated by a colon. The part to the left of the colon is the command code of the message. One or more parameter names from the format usually make up the remaining portion of the ID. If there is more than one parameter name to the right of the colon, these parameter names are separated by a hyphen. For example: EXC:SODD-RED-OP.

2.3.4.2 RELEASE

This was formerly labeled GENERIC. The *5ESS*®-2000 switch software release or range of releases to which the message description applies. Here are some examples of possible software release entries:

5E12 only	The message description applies only to release 12.
5E12 and later	The message description applies to release 12 and to all later releases.
5E12 - 5E13	The message description applies to release 12 through release 13.

If changes from one release to another have affected a format, two or more separate manual pages are provided. Such a split is indicated by the last character of the message ID. If separate manual pages exist for the same message, the ID for the first manual page is followed by "-A", the second by "-B", and so forth.

Please note that this "dash-letter" suffix is dynamic depending on the number of software releases being supported and the number of versions of a message.

2.3.4.3 COMMAND GROUP

The command group identifies the message as a member of a group of input messages having a certain authority/priority level on the switch. This code can sometimes be changed by the service provider. What is documented on the manual page is the command group originally assigned by AT&T in the initial software release.

2.3.4.4 APPLICATION

This specifies the application to which the message pertains.

Application Code	Explanation
5	USA *5ESS*®-2000 switch. May also apply to CDX, VCDX, or WNC. Refer to the help facility to verify applicability for these systems.
3B	administrative module (AM) software.
CNI	Common Network Interface.
CDX	Compact Digital Exchange only.
VCDX	Very Compact Digital Exchange. May also apply to the AEWNC. Refer to the help facility to verify applicability for this system.
AEWNC	*Air Extension*® Wireless Network Controller only.

This implies that a listing such as "5,3B" means that this message applies to both USA *5ESS*®-2000 switch and the administrative module software.

2.3.5 WARNING

Input messages that may adversely affect service are flagged with a warning message at the left side of the key block. An explanation of the warning is given in the PURPOSE section.

Copyright © 1999

2.3.6 PURPOSE

This section of the manual page contains a brief explanation of the purpose of the message and includes the explanation of any associated warnings.

2.3.7 FORMAT

Message formats are a kind of notation that is used in this document to show the possible ways in which IMs can be constructed. Formats are described in greater detail in the **MANUAL PAGE-SECTION DETAILS** section of the User Guidelines.

2.3.8 EXPLANATION OF MESSAGE

This section of the manual page explains the meaning of the various parameter names, parameter values, and variables in the format.

2.3.9 SYSTEM RESPONSE

The system responds to IMs with an acknowledgment that appears one space after the terminating character of the IM on the TTY device. This will normally happen about five seconds after the message is entered.

These acknowledgments give information about the status of the message (for example, accepted, rejected, in progress, and so forth). Standard system responses are listed in the APP:RESPONSES appendix in the Appendixes section of the Input Messages manual. Standard *5ESS*®-2000 switch craftshell responses are listed in Table 1 at the end of the User Guidelines. If a message has a response that is not standard, the response is explained in this section of the manual page.

2.3.10 REFERENCES

This section lists all related input and output messages, documentation references, Master Control Center (MCC) display pages and recent change views.

2.4 MANUAL PAGE - SECTION DETAILS

2.4.1 FORMAT Section

The format is the most important part of every manual page. The FORMAT shows the syntax of the message (that is, the way the message must be constructed so that the system will understand it correctly).

2.4.1.1 Example

Here is an example of how the FORMAT section of a typical manual page might look:

```
[1]     OP:PMCR,TYPE=STAT[,HOURLY|,DAILY=a|,NOHOURLY|,NODAILY];

[2]     OP:PMCR,TYPE=RET,INTVL=b,FORM=c;

[3]     OP:PMCR,TYPE=DEM,FORM=c;
```

Many IMs can be input in more than one format. When appropriate, distinct formats are shown separately and given a number (in square brackets). In the example, there are three formats. (The OP:PMCR message requests various plant measurements detailing system performance statistics.)

Format 1 is a status report request. It reports hourly and/or daily data.

Format 2 is a retained report request. It reports hourly and/or daily data that was retained from a previous status report.

Format 3 is a demand report request. It reports up-to-the-hour data collected for the next daily report.

2.4.1.2 Format Notation

The message formats shown in this document may include one or more types of format notation that are not part of the message itself. The purpose of this notation is to show the choices the user has in entering the message.

[]	Brackets enclose optional entries. Optional entries may be included in the message or may be omitted.
{}	Braces enclose two or more entries where one entry, but only one, must be included in the message.
|	OR bars separate a selection of entries enclosed by braces or brackets. One of the entries separated by OR bars, but only one, may be selected.
. . .	Vertical ellipsis marks (three vertical dots) following a format means that there may be more than one line when an OM is printed. These additional lines will conform to the same format, but may contain different data.
...	Horizontal ellipsis marks used within a format depict variable repetition.
. . .	Three ellipsis marks with embedded spaces, either at the beginning of a line or at the end of a line, indicate that a format string is divided into multiple lines in the manual page. This is for documentation purposes only.

Remember that brackets, braces, OR bars, and ellipsis marks are never used when you are actually entering a message. They are only used in message formats to show you how a message must be constructed.

2.4.1.3 Notation Examples

The following examples illustrate the use of brackets, braces, OR bars, and ellipsis.

ENTRY1 ENTRY2	Both ENTRY1 and ENTRY2 must be used.
[ENTRY1][ENTRY2]	Both entries are optional. Both, either, or neither may be used.
{ENTRY1|ENTRY2}	Either ENTRY1 or ENTRY2 must be used. Using both is not permitted.
[ENTRY1|ENTRY2]	Either ENTRY1 or ENTRY2, but not both, may be used. Both entries may be omitted.
[ENTRY1{ENTRY2|ENTRY3}]	All three entries may be omitted; however, if any of these entries is used, your options are: ENTRY1 and ENTRY2 or ENTRY1 and ENTRY3. It is not permissible to use both ENTRY2 and ENTRY3.
{ENTRY1|ENTRY2|ENTRY3}	One of these three entries must be used, but it is not permissible to use more than one.
[ENTRY1]...[ENTRY1]	Signifies repetition of ENTRY1.
a b c	Signifies that there may be more than one line when an OM is printed.

2.4.1.4 Special Conventions

A special format convention governs cases where a colon is followed by a series of consecutive optional entries separated by commas. In these cases, the colon replaces the comma for the first optional entry that is actually used. For example, DGN:MTC is documented with the following format:

```
DGN:MTC=a[:[RPT=b][,RAW][,UCL][,REX|,DEX]][,[PH=c[&&d]][,TLP]
```

```
[,CONT][,MT=e]];
```

The following examples show the punctuation of this message when some (but not all) of the optional entries are chosen.

```
DGN:MTC=a:RPT=b,RAW,UCL,REX,PH=c,TLP;
DGN:MTC=a:RAW,UCL,REX,PH=c,TLP;
DGN:MTC=a:UCL,REX,TLP;
DGN:MTC=a;
```

2.4.2 Message Syntax

The structure of messages consists of a series of fields that must be entered in a prescribed order. Fields and the entries that can be made in them are summarized in Table 2 of the User Guidelines.

This is the general syntax of a message:

```
command code:parameter block(s):...:[data parameters block(s)];
```

IMs consist of two or more fields. The first field of an IM always contains a command code that identifies the action that the message is being used to accomplish. This command code is always followed by a colon.

The colon is followed by one or more parameter blocks. A parameter block consists of parameter names with associated parameter values. Parameter blocks are separated by colons. Parameter blocks identify units, functions, or data that the command code is acting upon.

A parameter name may appear by itself, or it may be followed by a single parameter value, a list of values, or a range of values. Parameter names are alphanumeric and must begin with a letter.

A parameter value is separated from a parameter name by an equal sign (=). Parameter values may be numeric or alphanumeric. When parameter values are shown in the FORMAT section of the manual page as lowercase letters, they represent variables that are replaced by specific data when the message is entered. If the value of the variable contains lowercase letters, the value must be enclosed in double quotes to retain the integrity of the lowercase letters.

Values in a list are separated by hyphens. Any two values that indicate the limits of a range are separated by two ampersands (&&), instead of a hyphen.

2.4.2.1 Syntax Examples

The following examples illustrate command codes and parameter blocks in various IMs.

`CLR:UMEM;`	Two fields: the command code (CLR), and one parameter block (UMEM).
`ABT:TASK:TLWS=a;`	Three fields: the command code (ABT), and two parameter blocks (TASK and TLWS=a)
`UPD:GEN:BACKOUT:UCL;`	Four fields: the command code (UPD), and three parameter blocks (GEN, BACKOUT, and UCL).
`OP:STATUS,PROCESS,ALL;`	Three fields: the command code (OP) and two parameter blocks (STATUS and PROCESS,ALL). NOTE: A comma is used here instead of the colon separating STATUS and PROCESS,ALL.

2.4.2.2 Parameter Name and Parameter Value Examples

The following examples show instances of parameter names and parameter values. `OP:STATUS,DN=a;`

The purpose of this message is to output the current status history for a specified line. The IM has the command

code of OP (for "output"), and the parameter names STATUS and DN in the next field. The parameter name DN has the parameter value 'a'. This value stands for the directory number of the line for which the status history is to be printed. If you were to type in this message, you would substitute an actual directory number for the value 'a'.
`SET:CLK,DATE=a-b-c,TIME=d-e-f;`

This message sets the system clock to the date and time that you specify. There are three names in the second field (CLK, DATE, and TIME). If you were to type in the command, you would enter the month for '`a`', the day of the month for '`b`', and the year for '`c`'. Similarly, you would enter the hour, minute, and second for values '`d`', '`e`', and '`f`'.
`CLR:ISOL,SM=a[&&b];`

This message takes one or more switching modules (SMs) out of isolation. The parameter name SM has one or two values ('`a`' and '`b`'). You must enter at least one. If you choose to enter only '`a`', then you will enter only one SM number. If you choose the option, then you will enter a range of SM numbers. In this case, '`a`' will stand for the lower limit of the range, and '`b`' stands for the upper limit of the range. (Note the two ampersands that precede the '`b`'. These ampersands indicate that a range is being specified.)

2.4.2.3 Comparison of Format Syntax and Actual Input Messages

The following examples show message format syntax as they might appear in manual pages and some examples of actual IMs that correspond to these formats. The FORMAT section of a manual page uses uppercase to indicate command codes and parameter names. Lowercase letters are used to indicate variables. In actual use at the user input terminal, all command codes and parameter names may be typed in lowercase.

Syntax:
 	
Example:
or
	`OP:STATUS,DN=a;`
	`OP:STATUS,DN=19;`
	`op:status,dn=19`

Syntax:
 	
Example:
or
	`SET:CLK,DATE=a-b-c,TIME=d-e-f;`
	`SET:CLK,DATE=12-22-94,TIME=2-30-15;`
	`set:clk,date=12-22-94,time=2-30-15;`

Syntax:
 	
Examples:
or
 	
or
	`CLR:ISOL,SM=a[&&b];`
	`CLR:ISOL,SM=5&&12;`
	`clr:isol,sm=5&&12;`
	
	`CLR:ISOL,SM=9;`
	`clr:isol,SM=9;`

Syntax:
 	
Examples:
or
 	
or
 	
or
	`OP:STATUS,PROCESS,{ALLTERMS|ALLKERNS|ALL}[,OPL=a];`
	`OP:STATUS,PROCESS,ALLTERMS,OPL=10;`
	`op:status,process,allterms,opl=10;`
	
	`OP:STATUS,PROCESS,ALL,OPL=10;`
	`op:status,process,all,opl=10;`
	
	`OP:STATUS,PROCESS,ALL;`
	`op:status,process,all;`

Syntax:
 	
Examples:
or
 	
or
 	
or
	`IN:REMOTE,START[,BSDIR="a"][,BLOCKS=b];`
	`IN:REMOTE,START,BSDIR="/etc/bwm",BLOCKS=100;`
	`in:remote,start,bsdir="/etc/bwm",blocks=100;`
	
	`IN:REMOTE,START,BSDIR="/etc/bwm";`
	`in:remote,start,bsdir="/etc/bwm";`
	
	`IN:REMOTE,START,BLOCKS=100;`

or	`in:remote,start,blocks=100;`
	`IN:REMOTE,START;`
or	`in:remote,start;`

2.4.2.4 Entering an IM

The craftshell accepts simplified IM syntax. Commas rather than colons may be used to separate the parameter blocks after the command code and first colon. All options may be specified as a single, comma-separated parameter block.

Parameter names may be typed in any order within a parameter block, but the parameter blocks must appear in the order specified in the manual page.

2.4.2.5 Syntax Combination Example

This example may be entered in a variety of format syntax combinations:
`DGN:IOP=1:RPT=1,RAW,UCL:DATA,CONT,TLP;`

Valid examples:

`DGN:IOP=1,RPT=1,RAW,UCL:DATA,CONT,TLP;`	(Colon between IOP and RPT has been changed to a comma.)
`DGN:IOP=1,RAW,UCL,RPT=1:DATA,CONT,TLP;`	(Order of keywords in the third block is rearranged.)
`DGN:IOP=1,RAW,UCL,RPT=1:DATA,TLP,CONT;`	(Order of keywords in the fourth block is rearranged.)
`DGN:IOP=1,RAW,UCL,RPT=1,TLP,CONT;`	(The ":" has been changed to a comma and the "`DATA,`" has been deleted.)

Invalid examples:

`DGN,IOP=1,RAW,UCL,RPT=1,CONT,TLP;`	(First colon has been changed to a comma.)
`DGN:IOP=1,CONT,TLP,RAW,UCL,RPT=1;`	(Order of blocks 3 and 4 reversed.)
`DGN:IOP=1,RAW,UCL,CONT,TLP,RPT=1;`	(Parameters of blocks 3 and 4 are intermixed.)

Because of the way that IMs are translated internally by the system, the message that is echoed to an output device may look different from the message originally entered at the console.

For example, the actual message: `DGN:IOP=1:RPT=1,RAW,UCL:DATA,CONT,TLP;` may be echoed to an output device from any of the following IM formats:

```
DGN:IOP=1,RPT=1,RAW,UCL,CONT,TLP;

DGN:IOP=1,RPT=1,UCL,RAW,CONT,TLP;

DGN:IOP=1,UCL,RAW,RPT=1,CONT,TLP;

DGN:IOP=1,UCL,RAW,RPT=1,TLP,CONT;
```

2.4.2.6 A Summary of Syntax Rules

A summary of rules for constructing IMs follows:

1 Block separators (:) may be typed as commas (,) except for the colon immediately following the command code.

2 Parameter names may be unordered within a parameter block, but the blocks themselves must remain ordered.

3 All numbers in IMs are assumed to be decimal unless you indicate otherwise by entering the appropriate code before the number. Valid codes are:

```
B' (binary)

O' (octal)

H' or X' (hexadecimal)

D' (decimal)
```

4 An entered message may consist of up to 255 spaces and characters that may extend over several lines of input.

5 The last character in a format line must be either an exclamation point, a semicolon, or a question mark.

- The semicolon (provided automatically by the return key) causes the message to be executed immediately as entered.
- The exclamation point is a continuation character.
- The question mark requests craftshell help.

6 Within a message, the equal sign (=) is used as a separator between the parameter name and the parameter value. Spaces are not allowed between parameters.

7 Double quotation marks (" ") around a parameter value are required when specifying a pathname to a file or file name or to maintain the integrity of lowercase letters.

8 Typing a non-printable character in a string results in ?(BEL) (a question mark and a bell sound). The non-printable character remains in the string.

2.5 ROUTING INPUT MESSAGE RESPONSES TO THE RECEIVE-ONLY PRINTER (ROP)

An output message response to an IM request is always printed on the originating TTY. The output message may also print on the receive-only printer (ROP) and/or other I/O devices, depending on the message class associated with the output message. There may be message classes that have an "RSP" or "_RSP" suffix (shown in the key block section of an output message description). These types of messages print at the originating TTY terminal only, in "response" to the input request.

Output messages with an "RSP" or "_RSP" message class can be forced to print at the ROP by appending ",PRTROP" to the end of the IM request. The ",PRTROP" option is valid on any IM and does not adversely affect the routing of the output message, except to route it to the ROP.

2.6 HELP FEATURE

The *5ESS*®-2000 switch has an IM HELP feature. This feature:

- Improves the understanding of error messages in cases where syntax or semantic errors are found in entered messages.

- Helps with IM syntax, including parameter value type and range.
- Prompts for entering IMs.

NOTE: Do not use HELP while the emergency action interface (EAI) page is displayed. Instead, press the NORM/DISP key to display a non-EAI page, then use HELP. If HELP is used while the EAI page is displayed, only the bottom few lines of the HELP message are displayed. The EAI page may also be left partially blank, but can be restored manually by pressing the EA/DISP key.

2.6.1 The Different Kinds of Help

There are two different ways to get help. One way is to type a portion of an IM, followed by a question mark. Another way is to type a question mark after an error message. Either of these will get you help.

There are two different types of help. The first type of help provides information about the syntax of IMs. The second type of help assists you in composing IMs by prompting choices between the possible entries.

2.6.2 Getting Help If You Know One or More Parameter Name

If you know one or more of the parameter names in a message, you can find out how many messages share that parameter, and what the syntax of these messages is.

To get information about the parameter names in an IM, enter part of the message (one or more parameter names). Type a question mark after the last parameter name.

EXAMPLE 1

If you enter: The system responds:	`op:pmcr?` The input matches 3 messages. Further errors may be revealed after a single message has been selected. 1 OP:PMCR:TYPE=a,FORM=b; 2 OP:PMCR:TYPE=a,INTVL=b,FORM=c; 3 OP:PMCR:TYPE=a[,b][,FORM=c]; b is HOURLY, DAILY[=d], NOHOURLY or NODAILY; choose one or omit. append text, hit ? for more info., hit (CR) to execute, or hit (DEL) to reject op:pmcr_

These are the only messages that begin with "OP:PMCR". Up to 128 messages can be displayed. The underline character in the last line of the example represents the position of your cursor after the system has displayed its response on your terminal. The system will wait about forty seconds for your response. If you do not respond within that time, then you are exited from the help facility, and you get the system prompt.

You may do one of the following:

- Enter a carriage return to execute "
  `OP:PMCR`
  ", which results in a missing parameter name error message.

- Type the rest of a message [for example, "
  `:type=dem,form=1`
  " (for format 1)] and a carriage return to execute the message.
- Type a question mark to go to the second help level. You are then taken through the message a step at a time, and you are prompted for each entry.
- Press the "Delete" key. You leave the help facility and the message is not sent.

NOTE: If you type a question mark immediately after a parameter name (as in the example), you get information only about the parameter names in the message. You do not get information about parameter values.

You may also get help for parameter values in a message. To get help for parameter values in a message, type an equal sign (=) followed by a question mark after the parameter name.

EXAMPLE 2

If you enter:	`op:conv,len=?`

The system responds:	`LEN=a-b-c-d-e-f`
	`  a is an SM number between 1 and 192`
	`  b is a number between 0 and 7`
	`  c is a number between 0 and 9`
	`  d is 0 or 1`
	`  e is a number between 0 and 7`
	`  f is a number between 0 and 3`
	
	`append text, hit ? for more info.,`
	`hit (CR) to execute, or hit (DEL) to reject`
	`OP:CONV,LEN=`

The system lists the possible entries for the values ('`a`' through '`f`') of parameter LEN of this message. The underline character represents the position of the cursor on the screen.

2.6.3 Getting Help for an Error Message

If you make a mistake when you enter an IM, the system responds with an error message. You can invoke the help facility after receiving such a message and get more information about how the message should be composed.

Here is an example of getting help after the system sends an error message:

EXAMPLE 3

If you enter:	`op:hdwchk,clink;`

The system responds:	`?D - unexpected keyword CLINK enter`
	`a new command OR ? for`
	`more information`
	
	If you now type a question mark, you will obtain the following system response:
	`unexpected keyword CLINK`
	`The input matches 3 messages.`
	
	`(Further errors maybe revealed after`

```
 a single message has been selected.)

1)  OP:HDWCHK,a;
      a is MMP=b-c, CMP=b-d, FPC=b, PPC=b,
      ONTC=b, MSCU=b, or CLNK=e-f-g-h;
      must choose one

2)  OP:HDWCHK,CM;

3)  OP:HDWCHK,NCREF,a;
      a is PRIM=b, SEC=b, XC=b; REF1=b, REF2=b,
      REF3=b, REF4=b, REF5=b, REF6=b, REF7=b,
      REF8=b; must choose one

enter a new command OR ? for more information
```

Typing the question mark after an error message has the same effect as typing a message fragment followed by a question mark. The same kind of help is provided. In this case, three messages begin with OP:HDWCHK. The unexpected keyword error is ignored.

2.6.4 The Second Level of Help: Prompting

Once you have gotten help as described in the previous section, you can get an additional kind of help: prompting. If you type a question mark again after receiving the help described in Examples 1, 2, and 3, you are prompted for each entry in the message until it is complete.

If you type a question mark in response to Example 2, you are prompted for each parameter value (a through f) for parameter LEN. In Examples 1 and 3, you are asked to choose one message from the list that is displayed. Then you are prompted to complete the chosen message.

2.6.5 Ending the Help Session

You may exit the help facility at any time by pressing the "Delete" key. If you are being prompted, then you must press the "Delete" key once to end the prompting, and press it a second time to end the help session.

2.7 INPUT MESSAGE EDIT AND HISTORY

The input message edit and history function is designed to assist the user in retrieving and editing input messages already entered on a given terminal. It provides the following capabilities to the user:

- A record of input messages entered during a session.
- Retrieval by history buffer line number, by string, or by last input message entered.
- Edit of retrieved input messages.

2.7.1 Availability

The input message edit and history function is provided on the following terminal types:

- Maintenance Control Center (MCC)
- Supplementary Trunk and Line Workstation (STLWS)

- Switching Control Center (SCC)
- Recent Change and Verify (RC/V)

2.7.2 Related Input/Output Messages

The input message edit and history function includes four input messages and an output message. The input messages apply only to the terminal upon which they are entered. See the appropriate manual pages for more information.

IM Message ID	Purpose
ALW:HIST	allow history recording
INH:HIST	inhibit history recording
CLR:HIST	clear history buffer
OP:HIST	displays entries from the history buffer

OM Message ID	Purpose
OP:HIST	response to the OP:HIST input message

2.7.3 History

Each terminal keeps a separate history buffer containing only the input messages entered at that terminal. Input messages are saved only when history recording is allowed. By default, history recording is allowed when a terminal comes into service.

If history recording is allowed and the input message is not a help input message, then the submitted input message is saved in the history buffer.

Function associated input messages that access help information and retrieve or edit input messages are not stored, regardless of the status of history recording.

2.7.3.1 Service Affecting or Sensitive Input Messages

It is recommended that the user inhibit history recording before entering any input messages that are sensitive or may cause interruptions or degradations of service. This prevents the service affecting input message from being accidentally retrieved and re-executed. After the sensitive or service affecting input message is executed, history recording can be allowed.

2.7.3.2 History Buffer Line Numbers

The history buffer can have a maximum of 200 entries at any given time. The buffer line numbers, however, begin at 1 and have a maximum range of 999.

Numbering of the buffer lines continues to 1000 even though only the last 200 input messages are in the buffer at any given time. The input message assigned to buffer line number 1000 triggers the following sequence:

- It is reassigned to line number 200.
- The last 199 entries already in the buffer are renumbered 1 through 199.
- The incrementation of buffer line numbers resumes with 201.

2.7.3.3 Clearing the History Buffer

It is recommended that the user clear out the history buffer at the end of each terminal session. This helps keep users from accessing input messages and corrupting the switch database by accident or intent. The buffer is always empty when a terminal comes into service.

2.7.4 Special Characters

The characters '#' and '^' are used for line editing control. The '#' character indicates that a retrieval process is to commence. The '^' indicates that a string follows. The string may be null.

2.7.5 Input Message Retrieval Procedure

A input message can be retrieved by one of the following methods:

Code	Explanation
#n>	Retrieve by history buffer line number. This retrieves line number 'n' from the history buffer.
##	Retrieve last input message. This is a shorthand method to retrieve the most recently stored input message from the history buffer.
#^a	Retrieve by string. This retrieves the most recently stored input message that contains the string 'a' from the history buffer.

2.7.6 Command Modes

The modes associated with the input message edit and history function are:

- command entry mode
- edit mode

2.7.6.1 Command Entry mode

Command entry mode is the default mode. Input messages entered in command entry mode are stored in the history buffer, if history recording is allowed. The prompt for command entry mode is '<'.

Enter '?' to request help information.

2.7.6.2 Edit Mode

From command entry mode, edit mode is accessed by entering one of the special character sequences that indicate history buffer retrieval is being requested.

If the indicated buffer line number or string is found in the history buffer, the retrieved input message becomes the "pending" input message and the craftshell switches to edit mode. If an available input message is not identified, a "Command Unavailable" error message is output and the craftshell remains in command entry mode.

The user stays in edit mode until he/she either submits the pending input message for execution or cancels the edit session. After each edit, the latest version of the pending input message is displayed, along with the edit mode prompt (<<). At the edit mode prompt, the user can perform any of the following actions:

- enter '?' to request input message edit help information.
- enter (cr) (carriage return) to execute the pending input message.
- enter (del) (delete) to return to command entry mode, without executing the pending input message.
- retrieve another saved input message by any of the available methods.

- continue editing the pending input message.
- enter an input message.

To stay in edit mode, a pending input message must always be available. If, after an edit cycle is complete, a pending input message is not available, the craftshell returns to command entry mode.

If a carriage return or semi-colon (;) is entered at the edit prompt (<<), the pending input message is submitted to the craftshell for execution and:

- the edit session is terminated
- the craftshell returns to command entry mode
- the command entry mode prompt (<) is displayed.

If the input message entered is incorrect, an appropriate error message is displayed by the craftshell.

2.7.7 Help

If a lone question mark (?) is entered at the edit prompt (<<), a brief input message edit help message is displayed, followed by the latest version of the pending input message and the edit mode prompt (<<).

If the user enters an edited input message with invalid syntax, the input message edit help information is displayed after the "Command Not Recognized" error message.

2.7.8 Line Editing

Input message editing provides the capability to retrieve saved input messages and re-execute them. Retrieved input messages may be edited using substitutions, appends, or a combination of both before re-execution.

2.7.8.1 Editing Definitions

Append = A string is added to the end of the pending message.

Substitute = A substitution is performed only at the right-most occurrence of the specified *oldstring* within the pending input message. This permits the user to easily update just the last characters(s) of an input string.

Nuances = A null *oldstring* causes the replacement string to be appended to the end of the pending input message. A null *newstring* causes the *oldstring* to be deleted from the pending input message.

2.7.8.2 Retrieval/Editing Options

Code	Explanation
^*newstring*	The `newstring` text is appended to the end of the pending input message or the last input message entered.
^*oldstring*^*newstring*	Substitute the new string for the old string to the pending input message or the last input message entered.
#*n*^*newstring*	Retrieve line number from the history buffer (#*n*) and append the *newstring* to it.
##^*newstring*	Retrieve the most recently stored input message from the history buffer (##) and append the *newstring* to it.

#^*searchstring*^*newstring*	Retrieve the most recently stored input message containing the *searchstring* from the history buffer (#^*searchstring*) and append the *newstring* to it.
#n^*oldstring*^*newstring*	Retrieve line number from the history buffer (#*n*) and substitutes the last occurrence of the *oldstring* with the *newstring*.
##^*oldstring*^n*ewstring*	Retrieve the most recently stored input message from the history buffer (##) and substitute the last occurrence of the *oldstring* with the *newstring*.
#^*searchstring*^*oldstring*^*newstring*	Retrieve the most recently stored input message containing the *searchstring* from the history buffer (#^*searchstring*) and substitute the last occurrence of the *oldstring* with *newstring*.

2.7.9 Error Cases

The input message edit and history function provides specific error messages to assist the user when problems are encountered when retrieving or editing an input message and when invalid conditions for an OP:HIST input message exist.

For error conditions that occur during the retrieve or edit procedures, the following results are possible:

Result	Explanation
Remain in command entry mode.	If an attempt to retrieve a input message (and go into edit mode) from command entry mode fails, there is no pending input message available. An error message is output, followed by the command entry mode prompt (<).
Remain in edit mode.	If there is a pending input message available, subsequent error conditions generates an error message followed by the pending input message and the edit mode prompt (<<). The pending input message is the result of the last successful retrieve or edit.
Go to edit mode.	If a combined retrieve and edit input message is entered at the command entry mode prompt (<), it may succeed for the retrieve and fail for the edit. An error message is output (for the failed edit), followed by the pending input message (the successful retrieve), and the edit mode prompt (<<).
Go to command entry mode.	If a successful edit results in a null pending input message, the command entry mode prompt (<) is output. No error message is output, since the edit was successful.

2.8 MCC DISPLAY PAGES

Master Control Center (MCC) display pages are used to perform maintenance and administrative functions for the *5ESS*®-2000 switch.

See document 235-105-110 System Maintenance Requirements and Tools for a further explanation of MCC display pages.

2.9 *5ESS*®-2000 SWITCH DIRECTORY STRUCTURE AND PATHNAMES

A *5ESS*®-2000 switch file system is a set of directories, ordinary files, and special device files.

- A directory is a collection of names of files and other directories.
- An ordinary file (also called a `flat file') is a collection of ASCII text. It may consist of ASCII characters, divided into lines demarcated by the new-line character, or it may consist of binary code that will be copied into main memory when a program is executed.
- A special device file supports input/output activity on a physical device, such as a terminal, magnetic tape, or disk partition. A request to read or write a special device file results in activation of the associated device. However, there is not necessarily a one-to-one correspondence between physical devices in the system and special device files. A single device may have more than one special device file. For example, four different special device files are used to read the same magnetic tape with high or low density and with or without rewind. Most special device files are

located in a directory named /dev.

The set of directories and files that comprise a file system is organized into a hierarchical tree structure. In this example:

- the database, dev, etc, lib, tmp, and cft directories all descend from the "root" directory
- the database directory contains a number of ordinary files, including the ecd and appecd databases
- the dev directory contains a number of special device files
- the cft directory contains various subdirectories, which in turn contain ordinary files and additional subdirectories

In the *5ESS*®-2000 switch system, the database, etc, and tmp directories are themselves the "root" directories of separate file systems that are mounted on the root file system during a system bootstrap. These four file systems (root, database, etc, and tmp) constitute the minimum set of file systems that are required for the *5ESS*®-2000 switch system to function. Backup copies of these file systems may also be provided, in case one of the primary file systems becomes damaged in a way that would prevent the system from operating successfully. If the system is bootstrapped on the backup file systems, the names of the directories where they are mounted remains the same. Other file systems may also be mounted automatically during a bootstrap, or they may be mounted manually by using ALW:FSYS-MOUNT.

Every file and directory in the system is identified by a unique pathname that indicates its location in the hierarchical file system structure. Many *5ESS*®-2000 switch IMs require the specification of a pathname. There are two types of pathnames that may be specified:

- Full pathnames begin with a slash (/). This is the name of the "root" directory of the root file system, and is followed by the name of the directory that is immediately beneath the "root" directory, followed by another slash, then the next directory name, and so forth, until the name of the specified file or directory is reached.

  For example: `FN="/user/a*/smo/test"`

- Relative pathnames begin with the name of a directory or file at an arbitrary point in the hierarchy, with no preceding slash. Their specification is relative to the immediately preceding directory. This is sometimes referred to as the base directory.

Because they contain lower-case alphabetic characters and slashes, pathnames must always be surrounded by quotation marks ("") when entered in an IM.

2.10 BINARY-DECIMAL-HEXADECIMAL CONVERSIONS

Both input and output messages use values in hexadecimal (base 16), decimal (base 10), octal (base 8), and binary (base 2). To convert binary numbers to hexadecimal, do the following:

- Separate the binary number into groups of four, starting with the rightmost number.
- Convert each group of four into its hexadecimal equivalent. (See Table 5 of the User Guidelines.)
- Example:

  ```
  001000011110    Binary number
  ```

```
0010 0001 1110  Binary number in groups of four
2    1    E     Hexadecimal equivalent
```

To convert hexadecimal numbers to binary, perform the above procedure in reverse order.

To convert numbers from hexadecimal to decimal or vice-versa, refer to Table 4 of the User Guidelines. The left column contains hexadecimal numbers without the units digits. The units digits are shown in the first row.

Table 1: *5ESS*®-2000 switch Craft Shell Responses

Response	Meaning
?D - incorrect value 'r' - arg #s of t	The craftshell encountered an IM with an incorrect parameter value. r = The incorrect parameter value. s = The index number of the parameter value. t = The corresponding parameter name.
?D - keyword a typed out of order	The craftshell encountered an IM with the order of parameter names from two parameter blocks reversed. a = The first out-of-order parameter name that the craftshell encountered.
?D - missing keyword	The craftshell encountered an IM with a missing parameter name.
?D - unexpected keyword b	The craftshell encountered an IM with a parameter name that it does not recognize. b = The parameter name that the craftshell does not recognize.
?E BAD IM CATALOG	The craftshell detected a problem with the IM catalog. The input request may or may not succeed. The catalog may be missing or corrupted, or UPD:IMCAT may not have been entered after a new catalog was installed. Refer to REPT:CFTSHL output message and UPD:IMCAT IM for further information.
?E CFTSHL HANGUP RECEIVED	The craftshell terminated because it received a hang-up signal.
?E CFTSHL TERMINAL READING ERROR, ERRNO=c	The craftshell encountered an error while reading input from a terminal. c = System error code (refer to the System Error Codes Appendix, APP:SYSERR, in the Output Messages manual).
?E CFTSHL UNABLE TO FORK PROCESS d	The craftshell can not fork a new process to execute a command. d = Full pathname of the process that was not executed because of the fork failure.
?E COMMAND NOT RECOGNIZED	(5E9(1) and later) This Line Edit and History error can occur when a string (recall, append or substitute string) was not prepended with a caret (^), a recall command was entered that did not properly specify which stored command was being recalled or there were too many 'caret' characters in an edit command.
?E - input matches multiple messages	(5E9(2) and later) The typed input request matches more than one input message in the IM catalog and the craftshell can not determine which message to execute. To obtain further information enter the help facility by terminating the input request with a question mark ('?'). If the desired input request can not be satisfied after accessing the help facility, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

?E NO COMMANDS ARE STORED	(5E9(1) and later) A Line Edit and History recall command was entered when there are no commands in the history buffer to recall. The No Commands Are Stored error takes precedence over the other Line Edit error messages.
?E STRING NOT FOUND	(5E9(1) and later) This Line Edit and History error can occur for two reasons: A substitute command was entered where the 'OLD' string is not present in the pending command. A recall by string command was entered where the recall string is not present in any of the commands stored in the command history buffer.
?E STRING TOO LONG	(5E9(1) and later) This Line Edit and History error occurs when an append or substitute command is entered that would result in a command longer than the legal limit of 256 characters. The append or substitute is rejected.
?E - syntax error; invalid e	The craftshell encountered an IM syntax error. e = The part of the IM that the craftshell identified as invalid.
?E - syntax error; unexpected 'f' after g	The craftshell encountered an IM syntax error. f = First invalid part of the IM. g = Last valid part of the IM.
?E - terminator must be 'q'	The craftshell encountered an improper IM terminator. q = Proper IM terminator character.
?E UNABLE TO INITIATE COMMAND h	The craftshell is unable to execute an input request because it encountered a zero-length file. h = Full pathname of the command that cannot be initiated.
?E UNABLE TO MATCH COMMAND i	An input command was entered that does not exist in the craftshell search directories. i = Full pathname of the non-existent command code
?E UNAVAILABLE COMMAND, CMD = j TO k	(5E9(1) and later) A Line Edit and History recall command was entered that identified a command that is out of the available range. To assist the user, the available range is printed as part of the error message. j = Lowest command number of available range k = Highest command number of available range
?E INVALID COMMAND	The craftshell is unable to execute an input request because it encountered a non-executable file or because it located a command directory but no executable file.
?V - invalid command code l	The craftshell encountered an IM with an invalid command code. l = The command code that the craftshell identified as invalid.
NG - FEATURE NOT AVAILABLE	(5E9(2) and later) The requested action failed because the feature required to process the request is not present in the switch or the given module.
NG - FILE OPEN FAILURE	(5E9(1) and later) An OP:HIST input command was entered but the output file could not be opened to print the information.
NG - NO COMMANDS ARE STORED	(5E9(1) and later) An OP:HIST input command was entered when there are no commands in the history buffer to output.
NG - RANGE UNAVAILABLE, CMD = m TO	(5E9(1) and later) An OP:HIST input command was entered that specified a

n	range (either explicitly or implicitly) that does not match any available stored command. To assist the user, the available range is printed as part of the error message. m = Lowest command number of available range n = Highest command number of available range
NG - SM o is isolated	The craftshell encountered an input request targeted for a switching module (SM) that is in the isolated state. o = Processor number of the isolated SM.
NG - SM p is not equipped	The craftshell encountered an input request targeted for an SM that is not equipped. p = Processor number of the unequipped SM.
NG - SYNTAX ERROR IN PREVIOUS MESSAGE	The EXC:PREV command was entered to execute a command that has a syntax error.
RL - UNABLE TO EXECUTE COMMAND	The craftshell is unable to communicate with another process to execute an input request. Retry request later.
RL - UNABLE TO SERVICE REQUEST	The craftshell is unable to execute an input request due to unavailable system resources such as system overload, excessive queue lengths, or a busy process. Retry request later.

Table 2: Summary of Parts of a Message Format

Term or Item	Definition
Block of Parameters	Any field but first field of message. Contains parameter names and parameter values.
Braces { }	Enclose two or more entries, separated by OR bars, of which the user must input one, but only one. Not input as part of the message.
Brackets [ ]	Enclose optional entries. Not input as part of the message.
Command Code	First field of message. Contains command code.
Data Field	Optional blocks of parameters in messages.
Equal Sign =	Separates parameter name and parameter value.
Exclamation Point !	Message terminating character that does one of the following: - In certain messages, causes the command to be executed at an appropriate break point. - Causes the system to expect more data field parameters to follow on the next line of input. - Causes the entered portion of the command to be executed as an immediate action (any ordinary message). Also causes a special colon (:) prompt to be issued. The terminal will not print output messages until the normal semicolon (;) terminating character is entered.
Field	Basic structural unit of message. Variable length. Separated by colons. There are at least two fields per message: command code and parameter block(s), in that order.
Keyword	The term keyword is often used in error messages to refer to a parameter name.
Message Length	Number of characters including spaces within the message (up to 255 characters). This may exceed one line.
Number Base	Default is decimal. Otherwise, numbers input must be preceded by B' (binary), O' (octal), or H' (hexadecimal).
OR bar |	Separates entries within braces or brackets. One entry, but only one, must be selected. If selections are enclosed by braces, one entry must be input; if enclosed by brackets, the entry

Copyright © 1999

	is optional. Not input as part of the message.
Parameter	Parameter name and its associated parameter values, if any. Two or more parameters within a block of parameters are separated by commas.
Parameter Name	Mnemonic identifier of a unit, function, or condition. May have parameter values associated with it. Error messages often refer to parameter names as keywords. Input as shown.
Parameter Value	Separated from parameter name by equal sign (=). Often represented by a variable in message format. Can be input as a single entry, as multiple entries in the form a-b-c, or as a range in the form x&&y.
Pathname	Starts with a slash (/), with every file and directory name separated by a slash. When entered, must be immediately preceded and followed by quotation marks (").
Question Mark ?	Help request character. A question mark may follow a partial message or previously entered message that was erroneous. Typing ? after a help guidance message will cause it to enter prompting mode.
Quotation Marks ""	Enclose pathname of file, directory, or device. Also enclose any text strings entered. Input as shown.
Semicolon ;	Message terminating character that causes the command to be executed as an immediate action.
&&	Indicates a range in messages.
Variable	Shown as a lowercase letter in manual pages. Replace with user-supplied information.
Verb	Known as the command code. Shows what type of action is to be taken. May be an abbreviation of the command code.

Table 3: Summary of Pathnames

Pathname	Meaning
/	Full pathname of the "root" directory of the *root* file system.
/data base	Full pathname of the *data base* directory which is located directly under /.
/cft/shl/cmds	Full pathname of the *cmds* directory, which is located under the *shl* directory, which is located under the *cft* directory, which is located directly under /.
/cft/shl/cmds/INH/AUD	Full pathname of the *AUD* program which is executed by the INH:AUD message.
INH/AUD	Relative pathname of the same *AUD* program, relative to the */cft/shl/cmds* base directory.
OP/AUD	Relative pathname of the *AUD* program which is executed by the OP:AUD message, relative to the */cft/shl/cmds* base directory.
/dev/root	Full pathname of the special device file for the disk partition that contains the *root* file system (mounted as /).
/dev/broot	Full pathname of the special device file for the disk partition that contains the backup copy of the *root* file system (also mounted as /).
/dev/db	Full pathname of the special device file for the disk partition that contains the *db* file system (mounted as */data base*).
/dev/bdb	Full pathname of the special device file for the disk partition that contains the backup copy of the *db* file system (also mounted as */data base*).
/dev/mt00	Full pathname of the high density magnetic tape device that is attached to input/output processor (IOP) number 0 with an option 0 (rewinds a tape after reading from it or writing to it).
/dev/mt04	Full pathname of the high density magnetic tape device that is attached to IOP number 0 with an option 4 (does not rewind a tape after reading from it or writing to it).
/dev/mt08	Full pathname of the low density magnetic tape device that is attached to IOP number 0 with an option 8 (rewinds a tape after reading from it or writing to it).
/dev/mt0c	Full pathname of the low density magnetic tape device that is attached to IOP number 0 with an option c (does not rewind a tape after reading from it or writing to it).
/dev/mt10	Full pathname of the high density magnetic tape device that is attached to IOP number 1 with an option 0 (rewinds a tape after reading from it or writing to it).
/dev/mt14	Full pathname of the high density magnetic tape device that is attached to IOP number 1 with an option 4 (does not rewind a tape after reading from it or writing to it).
/dev/mt18	Full pathname of the low density magnetic tape device that is attached to IOP number 1 with an option 9 (rewinds a tape after reading from it or writing to it).
/dev/mt1c	Full pathname of the low density magnetic tape device that is attached to IOP number 1 with an option c (does not rewind a tape after reading from it or writing to it).

Table 4: Binary-Octal-Decimal-Hexadecimal Conversions

Binary	Octal	Decimal	Hexadecimal
0000	00	00	0

0001	01	01	1
0010	02	02	2
0011	03	03	3
0100	04	04	4
0101	05	05	5
0110	06	06	6
0111	07	07	7
1000	10	08	8
1001	11	09	9
1010	12	10	A
1011	13	11	B
1100	14	12	C
1101	15	13	D
1110	16	14	E
1111	17	15	F

Table 5: Hexadecimal-Decimal Conversion

-	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
00	000	001	002	003	004	005	006	007	008	009	010	011	012	013	014	015

ACRONYM

Software Release: 5E10 and later

1. ACRONYM LIST

ACRONYM	DEFINITION
AATLSOS	alternate access to language specific operator service
AATOS	alternate access to operator service
ABT	abort
AC	alternating current
AC	automatic callback
ACC	automatic congestion control
ACCDICT	access dictionary
ACCS	automatic calling card service
ACCSDB	ACCS data block
ACD	automatic call distributor
ACG	automatic call gap
ACH	attempts per circuit per hour
ACKDB	acknowledgement database
ACL	audit control library
ACM	address complete message
ACP	action control point
ACQS	automatic charge quotation system
ACS	alert control status
ACSR	automatic customer station rearrangement
ACT	active
ACT	alternate code treatment
ACTS	automated coin toll service
ACTSR	active circuit status register
ADC	address complete
ADDR	address
ADP	automatic diagnostic process
ADPTR	address pointer register
AEOC	alternate embedded operations channel
AERM	alignment error rate monitor
AIBNS	automated inward billed number screening
AILS	automated inward line screening
AIM	application integrity monitor
AIOD	automatic identified outward dialing
AIOD	automatic input/output dialing
AIS	alarm indication signal
AIS-L	AIS for line
AIS-P	AIS for path
AIU	access interface unit
AIU	application interface unit
AIUEN	access interface unit equipment number
AIULC	access interface unit line circuit
ALCB	access line control block
ALE	automatic line evaluation
ALINK	A-link
ALIT	automatic line insulation test
ALMMDE	alarm retire mode
ALT	automatic link transfer
ALW	allow
AM	administrative module
AMA	automatic message accounting
AMAIRR	AMA irregularity
AMAT	AMA teleprocessing
AMEX	asynchronous transfer mode media transfer
AMI	administrative module intervention
AMI	alternate mark inversion
AML	automatic maintenance limit
AMLOOS	automatic maintenance limit out-of-service
ANCB	analog channel bank
ANI	automatic number identification
ANN	announcement
ANS	answer
ANSI	American National Standards Institute
AOC	announcement only channel
AP	application processor

Copyright © 1999

AP	automated position
APB	associated process block
APC	adjacent point code
APC	application specific controller
APDL	application processor data link
APDU	application processor data unit
APESM	application processor control error source mask
APID	applications processor identifier
APPLHOOK	application hook
APPRC	application recent change
APS	automated position system
APS	automatic protection switch
APT	automatic progression testing
AQ	associated autoquote
AQEST	autoquote establishment
AQM	autoquote mate analog
AR	automatic recall
ARC	alternate route cancellation
ARR	automatic ring recovery
ARS	automatic route selection
ARU	audio response unit
ASC	alarm and status circuit
ASCII	American standard code for information interchange
ASP	advanced services platform
ASPLG	advanced service platform large
ASPTF	advanced services platform toll free
ASU	alarm and status unit
ATA	automatic task administrator
ATCO	automation of TCS/CPS override
ATF	ASCII translation file
ATF	Announcement test function
ATM	asynchronous transfer mode
ATP	all test pass
ATS	automatic terminal setup
ATTG	attendant group
ATTS	automatic trunk test scheduler
AUD	audit
AUTISS	automatic time slot switching
AUTOVON	automatic voice network
AVL	available
AWS	administrative work station
BCI	blocked call indication
BCLID	bulk calling line identification
BCST	broadcast pump
BE	block errors
BER	bit error rate
BERR	buss error
BES	bursty errored seconds
BG	background
BGD	bi-directional gating bus direction
BGE	business group element
BISO	beginning of isolation
BIST	built in self test
BITS	building integrated timing supply
BLCTR	B data link parity counter register
BLK	block
BLKD	blocked
BLO	blocking
BNP	basic number portability
BNS	billed number screening
BOLO	back-out-last-official
BPUMP	backup pump
BPV	bi-polar violations
BRCF	business residential customer feature
BRCS	business and residential customer service
BRI	basic rate interface
BRITE	basic rate interface transmission extension
BSN	backward sequence number
BST	basic services terminal
BST	bitmap salvage technique
BTSR	bootstrapper
BUD	backup update database

Copyright © 1999

BUSCR	bus control register
BVA	billing validation application
BWM	broadcast warning message
CA	call appearance
CA	community address
CACTL	cache control register
CADN	circuit administration
CAMA	centralized automated message accounting
CAMPON	camp-on
CANC	cancel
CAR	computer access restriction
CAS	customer account services
CATL	code answer test line
CATP	conditional all tests passed
CAXEM	core auxiliary error source mask
CAXES	core auxiliary error source
CC	common control
CC	common controller
CCB	channel control block
CCB	communication control buffer
CCB	control communication buffer
CCC	commercial credit card
CCID	carrier issuer identification
CCIS	common channel interoffice signaling
CCP	common control processor
CCQS	centralized charge quotation system
CCR	continuity check request
CCRD	calling card
CCS	common channel signaling
CCS	hundred-call-seconds
CCS7	common channel signaling number 7
CCSLK	CCS links
CD	common data
CDAL	control and diagnostic access link
CDAL	control diagnostic access link
CDB	circuit data blocks
CDBCOM	circuit data block common
CDBS	customer defined billing segmentation
CDC	call duration and charge
CDFI	cluster digital facility interface
CDFI	communication link digital facility interface
CDI	control data interface
CDM	call disposition messages
CDMA	code division multiple access
CDN	customer directory number
CE	critical event
CF	call forwarding
CF	control fanout
CFAC	cluster facility
CFT	craft
CGA	carrier group alarm
CGAP	call gapping
CGC	circuit group carrier
CH	channel
CHG	charge
CHNG	channel group
CI	carrier interconnect
CI	control interface
CI	critical information
CIB	control interconnect bus
CIC	circuit identification code
CICADA	completion of interLATA calls accessing directory assistance
CICEXP	carrier identification code expansion
CIF	corruption indication flag
CKT	circuit
CKTLIM	circuit limit
CL	card limit
CLCT	collect
CLD	called
CLF	communications line fault
CLI	change level indicator
CLID	calling line identification

Copyright © 1999

CLLI	common language location identifier
CLNK	communication link
CLNORM	communication link normalization
CLR	clear
CLS	combined linkset
CM	communication module
CMCU	communication module control unit
CMISE	common management information service element
CMP	communication module processor
CMPMSG	communication module processor message handler
CNAM	calling name
CNC	central node control
CND	calling number delivery
CND	calling number display
CNI	common network interface
CNR	critical node restoration
CNTL	control
CO	cutover
COCTL	core control
COFA	change-of-frame alignments
COFF	common object file format
COINOT	coin service terminal process
COM	common controller
COMDAC	common data and control
COMGR	command group
COND	conditional
CONFIG	configuration
CONT	continuity
CORC	customer originated recent change
CORES	core error source
COT	central office terminal
COT	customer originated trace
CP	Central processor
CPDL	call processing data link
CPE	customer premises equipment
CPI	central processor intervention
CPISR	CPI status register
CPN	calling party number
CPS	country pair screening
CPU	call pick up
CPU	central processing unit
CPUT	call pickup group
CQ	circuit query
CQDB	call queue data blocks
CR	call record
CRA	circuit reservation acknowledgment
CRAM	control random access memory
CRC	cyclical redundancy checks
CRM	circuit reservation message
CRS	circuit reset signaling
CS	circuit-switched
CSC	clock synchronization circuit
CSCANS	Customer Service Computer Access Network System
CSD	circuit-switched data
CSI	Carrier selection information
CSOP	coordinator of spooler output process
CSS	controlled slip seconds
CSU	cache store unit's
CSV	circuit-switched voice
CTC	country-to-country
CTS	clear to send
CTS	common time slot
CTS	control time slot
CTTU	centralized trunk test units
CU	channel unit
CU	control unit
CUD	central update database
CUD	current update database
CUMEM	control unit memory
CURR	current
CVR	circuit validation response
CVT	circuit validation test

Copyright © 1999

CV_STATE	call vectoring state
DA	digit analysis
DA	directory assistance
DACC	directory assistance call completion
DACT	deactivating
DAM	dual access memory
DAOPER	directory assistance operator
DAP	Display administration process
DARAM	dual access random access memory
DAS	digit analysis selector
DAS/C	directory assistance services/computer
DASC	directory assistance system computer
DAT	digital audio tape
DBM	Database manager
DC	Direct current
DCBU	D-channel backup
DCC	destination code cancellation
DCCB	D-channel control block
DCHN	D-channel node
DCHOOS	D-channel out-of-service
DCI	dual channel/computer interconnect
DCLU	digital carrier line unit
DCR	device control register
DCTU	directly connected test unit
DCTUCOM	directly connected test unit common
DCTUPORT	directly connected test unit port
DD	data delivery
DDD	direct distance dialed
DDL	derived data link
DDMA	diagnostic direct memory access
DEN	digital equipment number
DESTSM	destination switching module
DF	data fanout
DF	distribution frame
DFC	device file controller's
DFC	disk file controller
DFI	digital facility interface
DFIH	host digital facilities interface
DFIH	host/remote digital facility interface
DFIMP	digital facility interface module processor
DFSA	data file system access
DFTAC	distributing frame test access circuit
DG	Data group
DGN	diagnostic
DGR	degraded
DI	data interface
DIAG	diagnostic
DIAMON	diagnostic monitor
DID	direct inward dialing
DIDNC	DI diagnostic control
DIEMR	DI error mask register
DIESR	DI error source register
DIOP	disk independent operation
DIOR	direct international origination
DIP	dual in-line package
DIS	disassembly
DIST	distribute
DKDRV	disk driver
DL	duration limit
DLEMR	DLI-MP interface error mask register
DLESR	DLI-MP interface error source register
DLGSHL	dialogue shell
DLI	dual link interface
DLI-MP	dual link interface-module processor/module controller ^
DLIT	demand LIT
DLN	direct link node
DLP	data link processor
DLT	data link terminal
DLTU	digital line and trunk unit
DLTURH	digital line and trunk unit host
DMA	direct memory access
DMAC	direct memory access controller

Copyright © 1999

DMCH	direct memory access channel
DMI	dual message interface
DMQ	deferred maintenance queue
DN	directory number
DNS	directory numbers
DNU-S	digital networking unit - SONET
DNU-S	digital networking unit - synchronous optical network
DNUSCC	DNU-S common controller
DNUSCD	DNU-S common data
DOC	dynamic overload control
DOTTO	direct international origination offered transfer to operator
DPA	dump all
DPC	destination point code
DPIDB	direct PIDB
DPIDB	directly-connected peripheral interface data bus
DPT	diagnostic phase table
DRHR	Division of revenue hourly report
DS1	digital signal level one
DS1SFAC	digital signal level 1 facility
DSC	DSU subtending circuit
DSC	digital service circuit
DSC	double seizing control
DSCH	dual serial channel
DSE	direct signaling event
DSL	digital service line
DSL	digital subscriber line
DSLG	digital subscriber line group
DSLGM	digital subscriber line group and member
DSN	defense switched network
DSP	digital signal processing
DSU	digital service unit
DSU2-RAF	digital service unit 2 - recorded announcement function
DTA	dial through announcement
DTCB	Digital channel bank
DTF	dial tone first
DTLU	Digital line trunk unit
DTMF	dual tone multi-frequency
DTR	data terminal ready
DUFR	Dynamic update function replacer
DUI	direct user interface
DUIC	direct user interface controller
DUR	duration
EA	equal access
EADAS	engineering and administrative data acquisition system
EAI	emergency action interface
EAIU	expansion access interface unit
EAN	equipment access network
EBD	enhanced buffer dump
EBU	E bus unit
ECD	equipment configuration database
ECDMAN	equipment configuration database manager
ECDN	expanded customer directory number
ECMA	European computer manufacturers
ECP	executive cellular processor
EDP-R	event detection point request
EDSC	electronic directory service customers
EDSL	extended digital subscriber line
EI	emergency interrupt
EIB	Ethernet interface board
EIH	by the error interrupt handler
EIR	enhanced information report
EIS	external information system
EISO	end of isolation
EL	enhanced limit
ELI	electrical line interface
ELI	electrical loop interface
ELS	electronic loop segregation
EMA	extended memory addressing
EN	equipment number
ENAC	Engineering Network Administration Center
EO	end office
EOC	embedded operations channel

Copyright © 1999

EOC	extended operations channel
EOF	end-of-file
EOT	end-of-transmission
EPCS	expanded personal communications services
EQCU	equipped CUs
EQL	equipment location
EQUIP	Equipment
ERAM	early RAM
ERR	Error
ES	errored seconds
ESA	enhanced 911 service adjunct
ESN	emergency service number
ESP	enhanced service provider
ESP	essential service protection
ESR	error source register
ET	elapsed time
ETE	end-to-end
EVRC	enhanced variable rate coding
EXT	external
FAC	facility
FACIL	facility
FACR	feature activation counting and reconciliation
FCG	false cross or ground
FE	family of equipment
FE	far end
FELP	far end loop
FG	foreground
FGD	feature group D
FI	facility interface
FI	full initialization
FIB	forward indicator bit
FID	feature identification
FIDB	facility interface data bus
FIFO	first in, first out
FIP	fully initializing protocol
FIW	frame information word
FMC	forced management center
FMGR	file manager
FMS	flat and measured services
FN	file name
FNC	forward number check
FP1	feature package one
FPC	foundation peripheral controller
FPCR	full point code routing
FPI	full process init
FR	fault recovery
FRC	forced
FRL	facility restriction level
FRPH	frame relay protocol handler
FS	failed seconds
FS	forced switch
FSCMPT	file system compaction
FSLINK	file system link
FTON	far to near
FTS	Field test set
FTS	federal telecommunication system
FUNCL	function code latch
FX	foreign exchange
GAC	group alerting circuit
GDG	guard data guard
GDSF	global digital services function
GDSUCOM	global digital service unit common
GDX	gated diode crosspoint
GDXACC	gated diode crosspoint access
GDXC	gated diode crosspoint compensator
GDXCON	gated diode crosspoint control
GDXCON	gated diode crosspoint controller
GDXCTRL	gated diode crosspoint control
GKCCR	generated key collection and compression routine
GRASP	generic access package
GRC	global recent change
GRID	gated diode crosspoint grid

Copyright © 1999

GRIDBD	GRID board
GROW	growth
GRS	group reset
GSM	global switching module
GTT	global title translation
GVAR	global variable
HA	host adapter
HDFI	host digital facilities interface
HDR	header
HDSU	hardware digital service unit
HDWCHK	hardware check
HFAC	host facility
HISRC	high interrupt source
HIST	history
HLR	home location register
HLSC	high level service circuit
HOBIC	hotel billing information center
HOBIS	hotel billing information system
HOC	host collector
HPQ	high priority queue
HRSMR	hardware reset source mask register
HRSRC	hardware reset source
HSD	high-speed synchronous datalink
HSDC	high-speed synchronous datalink controller
HSM	host switching module
HSR	hardware status register
HV	hardware version
HW	high-and-wet
IAM	initial address message
IBNS	international billed number screening
IC	interLATA carrier
IC	interexchange carrier
ICCV	international credit card validation
ICL	inter-RSM communication link
ICL	inter-cluster link
ICL	intra-cluster link
ICS	inmate calling services
ICVC	international card verification center
ID	identifier
IDCU	integrated digital carrier unit
IDENT	identity
IDLC	integrated digital loop carrier
IDP	individual dialing plan
IE	information element
IECSST	inter-exchange carrier start signal timeout
IFAC	Integrated digital carrier unit facility
IFAC	IDCU facility
IFB	interframe buffer
ILA	Idle link assurance
ILEN	IDCU line equipment number
ILEN	integrated digital carrier unit line equipment number
ILHB	incoming line history block
IM	input message
IM	interface module
IMS	interface module system
IMS	Interprocess message switch
IMSRMVRST	interprocess message switch remove/restore
IMT	intermodule trunk
IMTTASK	inter-module trunk task
INCBLK	INC block
INCR	Incremental
INDN	incoming directory number
INEN	IDLC network equipment number
INH	inhibit
INH	inhibited
INIT	initialization
INT	interval
INWATS	inward wide area telecommunications service
IO	input-output
IODRV	input/output driver
IOMI	input and output message interface
IOP	input/output processor

Copyright © 1999

IP	interface processor
IP	internal protocol
IPCT	in-progress call trace
IPM	interruptions per minute
IREX	installation routine exercise
IRN	integrated ring node
IS	in-service
ISAT	ISDN attendant
ISC	intelligent serial controller
ISDN	integrated services digital network
ISDNPCKT	Integrated services digital network packet
ISGEN	Incremental system generation
ISLC	integrated subscriber loop carrier
ISLU	integrated services line unit
ISLU	integrated switching line unit
ISLUCC	integrated services line unit common controller
ISLUCD	integrated services line unit common data
ISLUHLSC	integrated services line unit high level service circuit
ISLULC	integrated services line unit line card
ISLULCKT	integrated services line unit line circuit
ISLULGC	integrated services line unit line group controller
ISLUMAN	integrated services line unit metallic access network
ISLUPIDB	integrated services line unit peripheral interface data bus
ISLURG	integrated services line unit ringing generators
ISM	inter-switching module
ISMNAIL	inter-SM nailup
ISMQLNK	inter-switching module communication link
ISP	Intermediate switching point
ISTF	integrated services test function
ISTF	integrated services transmission function
ITAP	incoming test access port
ITNA	improved third number acceptance
ITU-TS	International Telecommunication Union - Telecommunication Standardization Sector
IUN	IMS user node
IUN	interprocessor message switch user node
JIP	jurisdiction information parameter
KP	kernel process
KP	key pulse
LAC	line applications for consumers
LALT	LIDB alternate
LASS	local area signaling services
LASS	local area switching services
LATA	local access and transport area
LATA	local access transport area
LAU	link adapter unit
LB	line board
LB	little boot
LC	line card
LC	line circuit
LCA	local alarm
LCCB	logical channel control block
LCEN	line card equipment number
LCKEN	line circuit equipment number
LCN	logical channel number
LDFT	load disk from tape
LDSCUCOM	local digital service circuit unit common
LDSF	local digital services function
LDSU2	local digital service unit - model 2 common
LDSUCOM	local digital service unit common
LE	link establishment
LEC	local exchange carrier
LEN	line equipment number
LG	line group
LGC	line group controller
LI	link interface
LIA	link inhibit acknowledgement
LIDB	line information database
LIT	line insulation testing
LLCB	logical link control block
LN	leased network
LN	link node
LNP	local number portability

Copyright © 1999

LOFA	loss of frame alignment
LOP	language override parameter
LP	line pack
LP	local processor
LP	lock out protection
LPA	loop-back acknowledgement
LPBK	loop-back
LPS	log/print status
LRAM	late RAM
LRN	location routing number
LRT	Local RT
LS	linkset
LSF	LASS selective features
LSI	loop side interface
LSM	local switching modules
LT	line termination
LTD	local test desk
LTD	long term denial
LTE	line terminating equipment
LTP	logical test ports
LTSB	line time slot bridging
LTSBDB	LTSB data block
LTTYPE	LT hardware type
LU	line unit
LU2	line unit - model two
LU3	line unit - model three
LUA	link uninhibit acknowledgement
LUCHAN	line unit channel
LUCHBD	line unit channel board
LUCOMC	line unit common control
LUCOMC	line unit common data and control
LUHLSC	line unit high level service circuit
LUPEX	line unit path exerciser
MA	metallic access
MAB	metallic access bus
MAC	memory administration center
MACTL	memory auxiliary control
MAN	metallic access network
MASC	main store controller
MBD	message buffer dump
MBESM0	memory board 0 error source mask
MBESM1	memory board 1 error source mask
MBESM2	memory board 2 error source mask
MBESM3	memory board 3 error source mask
MBTP	monitoring bridge terminal process
MC	microcode
MC	modular constructed
MCA	multiple call appearance
MCC	Master Control Center
MCH	Maintenance channel
MCRT	maintenance terminal
MCTRL	memory control
MCTSI	module control time slot interchange
MCTSI	module control/time slot interchange
MCTSI	module controller time slot interchange
MCTSI	module controller/time slot interchange
MCTSI	slot interchange
MCTU2	module controller and time slot interchanger unit
MCU	module controller unit
MD	message delivery
MDCT	major device chain table
MDCT	minor device chain table
MDCT	minor device configuration table
MDCT	monitor device chain table
MDCT-RID	Minor device chain table record ID
MDII	machine-detected interoffice irregularity
MECH	more efficient call handling
MELNK	MCTSI-based ethernet links
MEMES	memory error source
MESMR	memory error source mask register
MF	multi-frequency
MGDSC	message discard

MRVT	MTP routing verification test
MS	manual switch
MSCU	message switch control unit
MSGH	message handler
MSGS	message switch
MSGS	messages
MSKP	message switch kernel process
MSMTCH	mismatch
MSPU	message switch peripheral unit
MSS	Message Service System
MSU	metallic service unit
MSUCOM	MSU common
MSUCOM	metallic service unit common
MT	magnetic tape
MTB	metallic test bus
MTC	magnetic tape controller
MTCE	maintenance
MTIB	metallic test interconnect bus
MTIBAX	metallic test interconnect bus access
MTP	message transfer part
MTTY	maintenance teletypewriter
MTTYC	maintenance teletypewriter controller
MUPH	multiple position hunt
MWI	message waiting indicator
NA	not applicable
NAI	network access interrupt
NAI	number of address indication
NANP	North American numbering plan
NAP	name privacy
NC	network clock
NCAS	non-call associated services
NCD	network call denial
NCLK	network clock
NCOSC	network clock oscillator
NCP	network control point
NCREF	network clock reference
NCT	network control and timing
NE	near-end
NEN	network equipment number
NESS	network element services signaling

Software Release: 5E10 and later

1. FUNCTIONAL INDEX

Table 1 ACCESS INTERFACE UNIT

Topic/Purpose	Message ID/ Message Release
Requests that actions be aborted on an access interface unit common data and control controller (COMDAC).	ABT:AIUCOM 5E11 and later
Requests that actions be aborted on an access interface unit (AIU) line circuit (LC).	ABT:AIULC 5E11 and later
Requests that actions be aborted on an access interface unit (AIU) line pack (LP).	ABT:AIULP 5E11 and later
Requests that actions be aborted on an access interface unit (AIU) timeslot group (TSGRP).	ABT:AIUPIDB 5E11 and later
Requests that actions be aborted on an access interface unit (AIU) ring generator (RG).	ABT:AIURG 5E11 and later
Allows hardware checks on an access interface unit (AIU).	ALW:HDW-AIU 5E11 and later
Requests that diagnostics be executed on an access interface unit common data and control controller (COMDAC).	DGN:AIUCOM 5E11 and later
Requests that diagnostics be executed on an access interface unit (AIU) line circuit (LC).	DGN:AIULC 5E11 and later
Requests that diagnostics be executed on an access interface unit (AIU) line pack (LP).	DGN:AIULP 5E11 and later
Requests that diagnostics be executed on an access interface unit (AIU) timeslot group (TSGRP).	DGN:AIUPIDB 5E11 and later
Requests that diagnostics be executed on an access interface unit (AIU) ring generator (RG).	DGN:AIURG 5E11 and later
Inhibits hardware checks on an access interface unit (AIU).	INH:HDW-AIU 5E11 and later
Requests that an access interface unit common data and control controller (COMDAC) be removed from service.	RMV:AIUCOM 5E11 and later
Requests that an access interface unit (AIU) line circuit (LC) be removed from service.	RMV:AIULC 5E11 and later
Requests that an access interface unit (AIU) line pack (LP) be removed from service.	RMV:AIULP 5E11 and later
Requests that an access interface unit (AIU) timeslot group (TSGRP) be removed from service.	RMV:AIUPIDB 5E11 and later
Requests that an access interface unit (AIU) ring generator (RG) be removed from service.	RMV:AIURG 5E11 and later
Requests that an access interface unit common data and control controller (COMDAC) be restored to service.	RST:AIUCOM 5E11 and later
Requests that an access interface unit (AIU) line circuit (LC) be restored to service.	RST:AIULC 5E11 and later
Requests that an access interface unit (AIU) line pack (LP) be restored to service.	RST:AIULP 5E11 and later
Requests that an access interface unit (AIU) timeslot group (TSGRP) be restored to service.	RST:AIUPIDB 5E11 and later
Requests that an access interface unit (AIU) ring generator (RG) be restored to service.	RST:AIURG 5E11 and later
Requests the actions be stopped on an access interface unit common data and control controller (COMDAC).	STP:AIUCOM 5E11 and later
Requests the actions be stopped on an access interface unit (AIU) line circuit (LC).	STP:AIULC 5E11 and later
Requests the actions be stopped on an access interface unit (AIU) line pack (LP).	STP:AIULP 5E11 and later
Requests the actions be stopped on an access interface unit (AIU) timeslot group (TSGRP).	STP:AIUPIDB 5E11 and later
Requests the actions be stopped on an access interface unit (AIU) ring generator (RG).	STP:AIURG

Copyright © 1999

	5E11 and later
Requests that the active major/active minor states of the access interface unit common data and control controller be switched (interchanged).	SW:AIUCOM 5E11 and later

Table 2 ADMINISTRATIVE MODULE

Topic/Purpose	Message ID/ Message Release
Allows the logging and processing of all administrative module (AM) computer error sources.	ALW:ERRCHK 5E10 and later
Requests that the logging and processing of administrative module (AM) error interrupts attached to the unit specified in the identification field be allowed.	ALW:ERRINT 5E10 and later
Requests that the logging and processing of errors specific to the pseudo-nodes representing the administrative module (AM) control unit (CU) communities be allowed.	ALW:ERRSRC 5E10 and later
Initiates the off-line boot procedure.	EXC:OFLBOOT 5E10 and later
Inhibits the logging and processing of all administrative module (AM) error sources.	INH:ERRCHK 5E10 and later
Request that the logging and processing of error interrupts attached to the administrative module (AM) unit specified in the identification field be inhibited.	INH:ERRINT 5E10 and later
Inhibits the logging and processing of errors specific to the pseudo-nodes representing the administrative module (AM) control unit (CU) communities.	INH:ERRSRC 5E10 and later
Requests a list of all currently unavailable administrative module (AM) hardware units.	OP:UNAV 5E10 and later
Requests a list of all currently unequipped administrative module (AM) hardware units.	OP:UNEQIP 5E10 and later
To stop the offline boot (OFLBOOT) procedure.	STOP:OFLBOOT 5E10 and later
To perform a call processing side switch.	SW:OFLBOOT 5E10 and later

Table 3 ADVANCED SERVICES PLATFORM

Topic/Purpose	Message ID/ Message Release
Clears an advanced services platform (ASP) 0.1 test query parameter (or set of parameters) that has been set.	CLR:ASPTQ-A 5E10 only
Clears an advanced services platform (ASP) 0.1 test query parameter (or set of parameters) that has been set.	CLR:ASPTQ-B 5E11 only
Clears an advanced services platform (ASP) 0.1 test query parameter (or set of parameters) that has been set.	CLR:ASPTQ-C 5E12 and later
Provides a list of all currently active administrative module (AM) hardware units.	OP:ACT 5E10 and later
Requests displaying the advanced services platform (ASP) 0.1 test query parameters associated with a specified message type.	OP:ASPTQ-A 5E10 only
Requests displaying the advanced services platform (ASP) 0.1 test query parameters associated with a specified message type.	OP:ASPTQ-B 5E11 only
Requests displaying the advanced services platform (ASP) 0.1 test query parameters associated with a specified message type.	OP:ASPTQ-C 5E12 and later
Provides a list of all administrative module (AM) hardware units currently in the growth maintenance state.	OP:GROW 5E10 and later
Provides a list of all currently initializing administrative module (AM) hardware units.	OP:INIT 5E10 and later
Requests a list of all currently off-line administrative module (AM) hardware units.	OP:OFL 5E10 and later
Requests a list of all standby administrative module (AM) hardware units.	OP:STBY 5E10 and later
Set the value of a parameter for an advanced services platform (ASP) 0.1 test query message.	SET:ASPTQ-A 5E10 - 5E11
Set the value of a parameter for an advanced services platform (ASP) 0.1 test query message.	SET:ASPTQ-B 5E12 and later
Requests sending an advanced services platform (ASP) 0.1 test message to the service control point (SCP).	TST:ASPTQ-A 5E10 only

Copyright © 1999

Requests sending an advanced services platform (ASP) 0.1 test message to the service control point (SCP).	TST:ASPTQ-B 5E11 only
Requests sending an advanced services platform (ASP) 0.1 test message to the service control point (SCP).	TST:ASPTQ-C 5E12 and later
Requests that the contents of files that are essential to the booting of the administrative module (AM) be verified.	VFY:FILE 5E10 and later

Table 4 AIR EXTENSION

Topic/Purpose	Message ID/ Message Release
Requests that maintenance information be collected for an *Air Extension*® wireless phone.	OP:WCPE 5E10 and later
Requests that the shared secret data (SSD) associated with an *Air Extension*® wireless subscriber be updated.	UPD:SSD 5E10 and later

Table 5 ALARMS

Topic/Purpose	Message ID/ Message Release
Requests that alarm reporting on a scan point be allowed, according to type.	ALW:ALM-A 5E10 - 5E11
Requests that alarm reporting on a scan point be allowed, according to type.	ALW:ALM-B 5E12 and later
Requests a change to or adds alarm labels, levels, and repeatability status for office assignable building/power or miscellaneous alarms.	CHG:ALM 5E10 and later
Requests that the alarm indicators on the display terminals be cleared (retired), the exit pilot light alarm units and the audible alarms.	CLR:ALARMS 5E10 and later
Requests that the data delivery bits for the OP:ALM-ALL input message feature be cleared, unconditionally.	CLR:OP-ALM-ALL 5E10 and later
Requests that alarm reporting on a scan point be inhibited, according to type.	INH:ALM-A 5E10 - 5E11
Requests that alarm reporting on a scan point be inhibited, according to type.	INH:ALM-B 5E12 and later
Requests alarm summary of either off-normal or all alarm scan points.	OP:ALM-A 5E10 - 5E11
Requests alarm summary of either off-normal or all alarm scan points.	OP:ALM-B 5E12 and later
Requests the output of the virtual path(s) (VPATHs), starting from a given near end community address (CA), that are in the asynchronous transfer mode (ATM) alarm state.	OP:ATMALM 5E11 and later
Requests that the alarm retire mode (ALMMDE) be set to either automatic or manual.	SET:ALMMDE-A 5E10 - 5E11
Requests that the alarm retire mode (ALMMDE) be set to either automatic or manual.	SET:ALMMDE-B 5E12 and later
Requests that the reporting of all active alarms in the office in response to the OP:ALM-ALL input message be stopped.	STP:OP-ALM-ALL 5E10 and later
Requests that the audible and visual alarm reporting mechanism be tested.	TST:ALM 5E10 and later

Table 6 Fan Alarm Scan Points

Topic/Purpose	Message ID/ Message Release
Requests that a fan alarm be cleared.	CLR:FANALM 5E10 and later
Requests that a remote reset of the administrative module (AM) fan alarm (FANALM) distribute point be performed.	CLR:FANALM-3B 5E10 and later
Requests that exit pilot lamps (alarms) be extinguished.	CLR:LAMPS 5E10 and later

Table 7 Alarm and Status Circuit

Topic/Purpose	Message ID/ Message Release
Requests that maintenance actions on the remote switching module (RSM), optical remote	ABT:ASC

Copyright © 1999

switching module (ORM), or the two-mile remote switching module (TRM) alarm and status circuit (ASC) be aborted.	5E10 and later
Requests that a multimodule remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC) be diagnosed to determine if it is in working order.	DGN:ASC 5E10 and later
Requests that maintenance exercises be performed on the remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC).	EX:ASC 5E10 and later
Requests that a remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC) be removed from service.	RMV:ASC 5E10 and later
Requests that a remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC) be restored to service.	RST:ASC 5E10 and later
Requests that maintenance actions on the remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC) be stopped.	STP:ASC 5E10 and later

Table 8 ALTERNATE ROUTE CANCELLATION CONTROL

Topic/Purpose	Message ID/ Message Release
Clears one or all alternate route cancellation (ARC) controls of a given control type.	CLR:ARC 5E10 and later
Lists all alternate route cancellation (ARC) controls in the office.	OP:ARC 5E10 and later
Requests that an alternate route cancellation (ARC) control at an office be set or modified.	SET:ARC 5E10 and later

Table 9 APPLICATION PROCESSES

Topic/Purpose	Message ID/ Message Release
Requests an administrative module (AM) initialization of an application process at the specified level.	INIT:AM-FPI 5E10 and later
Requests an administrative module (AM) single process purge (SPP) initialization of a named application process running under either operational kernel process (OKP) or switch maintenance kernel process (SMKP).	INIT:AM-SPP 5E10 and later
Requests that switching modules (SM) be reconfigured or forced by sending administrative module intervention (AMI) messages (CMD) to either a single SM, to a range of SMs, or broadcast to all SMs.	ORD:CPI 5E10 and later

Table 10 AUDIT PROGRAMS

Topic/Purpose	Message ID/ Message Release
Requests that the routine execution of one or more audits controlled by the system integrity monitor (SIM) that were previously inhibited be allowed.	ALW:AUD 5E10 and later
Requests that a communication module processor (CMP) audit be allowed to execute automatically or an audit cycle to execute routinely on one CMP.	ALW:AUD-CMP 5E10 and later
Allows a kernel process environment (OKP or SMKP) audit to execute automatically or allows an audit cycle in the administrative module (AM) to execute routinely.	ALW:AUD-ENV 5E10 and later
Requests that either the full or incremental static office-dependent data (SODD) audit, which is to execute automatically, be allowed.	ALW:AUD-SODD 5E10 and later
Requests that the central node control (CNC) audit be initiated.	AUD:CNC 5E10 and later
Requests that the equipment configuration database (ECD) be audited.	AUD:ECD 5E10 and later
Requests that the equipment configuration database manager (ECDMAN) audit of record ownership be run.	AUD:ECDOWN 5E10 and later
Requests that a simple existence audit of files on the disks be run.	AUD:FILES 5E10 and later
Requests that the resources of the file manager (FMGR) be audited.	AUD:FMGR

Copyright © 1999

	5E10 and later
Requests that the file system block audit be run.	AUD:FSBLK 5E10 and later
Requests that the file system compaction audit be run.	AUD:FSCMPT 5E10 and later
Requests that the file system link audit be run.	AUD:FSLINK 5E10 and later
To initiate the link status and band status audit.	AUD:LKBDST 5E10 and later
Requests that the memory manager audits be run.	AUD:MMGR 5E10 and later
Requests that the message buffer (MSGBUF) resources be audited.	AUD:MSGBUF 5E10 and later
Requests that the internal data audits be run on the recent changeable tables.	AUD:NIDATA 5E10 and later
NMDATA is the audit family name for the group of audits concerned with the integrity of network management dynamic data.	AUD:NMDATA 5E10 and later
Requests that ring node (RN) state audits be initiated.	AUD:NODEST 5E10 and later
Requests that the plant measurements system (PMS) database audit be run.	AUD:PMS 5E10 and later
Audits the directly connected trunks (DCT) extended (DCTEXT), searching for suspended process creations (including forks) and terminations.	AUD:PROAD 5E10 and later
Format 1 requests the clearing of the full static office-dependent data (SODD) audit's schedule.	CLR:AUD 5E10 and later
Format 1 restarts a full or incremental static office-dependent data (SODD) audit that was previously executing but was stopped for some reason, provided that the conditions permit it to be restarted.	EXC:AUD-SODD-A 5E10 only
Format 1 restarts a full or incremental static office-dependent data (SODD) audit that was previously executing but was stopped for some reason, provided that the conditions permit it to be restarted.	EXC:AUD-SODD-B 5E11 and later
Requests that control operations be performed on the remote access subsystem (REMACS) data audit, or requests the status of that subsystem.	EXC:REMACS 5E10 and later
Requests that the routine execution of one or more audits that are controlled by the system integrity monitor (SIM) be inhibited.	INH:AUD 5E10 and later
Inhibits the automatic execution of a kernel process environment (OKP or SMKP) audit or the routine execution of the cycle in the administrative module (AM).	INH:AUD-ENV 5E10 and later
Inhibits the automatic execution of an audit or the routine execution of the audit cycle in the switching module (SM) or range of SMs.	INH:AUD-SM 5E10 and later
Requests that the execution of either the full or incremental static office-dependent data (SODD) audit be inhibited.	INH:AUD-SODD 5E10 and later
Reports the status of one or more audits controlled by the system integrity monitor (SIM).	OP:AUD 5E10 and later
Requests either the generation of a detailed error report of the errors found by a previously-executed full, incremental or entity static office-dependent data (SODD) audit, a detailed summary report of errors detected by one of the forementioned audits, or just a summary of the number of errors found by one of the forementioned audits.	OP:AUD-ERRLOG-A 5E10 only
Requests either the generation of a detailed error report of the errors found by a previously-executed full, incremental or entity static office-dependent data (SODD) audit, a detailed summary report of errors detected by one of the forementioned audits, or just a summary of the number of errors found by one of the forementioned audits.	OP:AUD-ERRLOG-B 5E11 and later
Requests that either the execution status of the static office-dependent data (SODD) audits be printed or that the full SODD audit's schedule be printed.	OP:AUD-SODD 5E10 and later
Reports the error counts of one or more audits controlled by the system integrity monitor (SIM).	OP:AUDERR 5E10 and later
Requests a report of the status of a specified audit, all audits, or all inhibited audits for a particular communication module processor (CMP) or range of CMPs.	OP:ST-AUD-CMP 5E10 and later
Requests the status of a specific audit, all audits or all inhibited audits for a particular kernel process environment.	OP:ST-AUD-ENV 5E10 and later
Requests a report of the status of a specific audit, all audits, or all inhibited audits for a particular switching module (SM) or range of SMs.	OP:ST-AUD-SM 5E10 and later

Copyright © 1999

Requests the status of the full or incremental static office-dependent data (SODD) audit.	OP:ST-AUD-SODD 5E10 and later
Schedules the day, time, and duration for the full static office-dependent data (SODD) audit.	SCHED:AUD-SODD 5E10 and later
Requests that a currently active audit that is controlled by the administrative module (AM) system integrity monitor (SIM) stops.	STOP:AUD 5E10 and later
Requests that a currently active audit that is controlled by the administrative module (AM) system integrity monitor (SIM) be stopped.	STP:AUD 5E10 and later
Stops the currently executing audit in a communication module processor (CMP).	STP:AUD-CMP 5E10 and later
Requests that the currently executing kernel process environment (OKP or SMKP) audit in the administrative module (AM) be stopped.	STP:AUD-ENV 5E10 and later
Requests that the currently executing audit be stopped in a switching module (SM) or range of SMs.	STP:AUD-SM 5E10 and later
Requests the termination of an executing static office-dependent data (SODD) audit as indicated with the parameter list.	STP:AUD-SODD-A 5E10 only
Requests the termination of an executing static office-dependent data (SODD) audit as indicated with the parameter list.	STP:AUD-SODD-B 5E11 and later

Table 11 AUTHORITY MANAGEMENT

Topic/Purpose	Message ID/ Message Release
Adds a new person identity (IDENT) with its related password (PSSWD) to the person authority (PAUTH) database.	ADD:PAUTH 5E10 and later
This input message adds a command group or profile to the person-command group (PCGRP) relation for the given person identity (IDENT).	ADD:PCGRP 5E10 and later
Adds a new profile identity (IDENT) to the profile authority database (PROFL).	ADD:PROFL 5E10 and later
Adds a terminal identity (TERM) to the terminal authority (TAUTH) database.	ADD:TAUTH 5E10 and later
This command adds a command group or profile to the terminal-command group (TCGRP) relation for a given terminal identity (TERM).	ADD:TCGRP 5E10 and later
Changes the password for a given person identity (IDENT) in the person authority database (PAUTH).	CHG:PAUTH 5E10 and later
Adds or removes a command group (COMGR) from a profile identity (IDENT) in the profile authority database (PROFL).	CHG:PROFL 5E10 and later
Changes a user's password (PSSWD) from its current value (OLD) to a new value (NEW).	CHG:PSSWD 5E10 and later
Deletes a person identity (IDENT) from the person authority database (PAUTH).	DEL:PAUTH 5E10 and later
This input message deletes a command group or profile from the person-command group (PCGRP) relation for a given person identity (IDENT).	DEL:PCGRP 5E10 and later
Deletes a profile identity (IDENT) from the profile authority database (PROFL).	DEL:PROFL 5E10 and later
Deletes a terminal identity (TERM) from the terminal authority (TAUTH) database.	DEL:TAUTH 5E10 and later
This command deletes a command group of profile from the terminal-command group (TCGRP) relation for a given terminal (TERM) identity.	DEL:TCGRP 5E10 and later
Verifies authority settings for the originating terminal.	VFY:AUTH 5E10 and later
Format 1 verifies a person identity and the person's last login date and time.	VFY:PAUTH 5E10 and later
Verifies the person-command group (PCGRP) relation for a given person identity (IDENT).	VFY:PCGRP 5E10 and later
Verifies all profile names in the profile authority database (PROFL), or verifies the command groups associated with a given profile identity (IDENT) if the optional IDENT parameter is specified.	VFY:PROFL 5E10 and later
Verifies all terminal identities in the terminal authority (TAUTH) database.	VFY:TAUTH 5E10 and later
Verifies terminal-command group (TCGRP) relation for a given terminal (TERM) identity.	VFY:TCGRP 5E10 and later

Copyright © 1999

Table 12 AUTOMATIC CALL GAPPING CONTROL

Topic/Purpose	Message ID/ Message Release
Requests a list of all automatic call gapping (ACG) controls for the specified application and control cause.	OP:ACG-A 5E10 only
Requests a list of up to 64 active automatic call gapping (ACG) controls for the specified application, starting at the given control identifier.	OP:ACG-B 5E11 only
Requests a list of up to 64 automatic call gapping (ACG) controls for the specified application, starting at the given control identifier.	OP:ACG-C 5E12 and later
Requests that automatic customer station rearrangement (ACSR) requests be added or deleted from the ACSR queue.	ALW:ACSR 5E10 and later

Table 13 AUTOMATIC CUSTOMER STATION REARRANGEMENT

Topic/Purpose	Message ID/ Message Release
Requests that one or all automatic customer station rearrangement (ACSR) requests be deleted from the ACSR queue.	DEL:ACSR 5E10 and later
Requests that automatic customer station rearrangement (ACSR) recent change log and error data files be printed.	DUMP:ACSR 5E10 and later
Requests that automatic customer station rearrangement (ACSR) requests not be added nor deleted from the ACSR queue.	INH:ACSR 5E10 and later
Requests that the status of one or all automatic customer station rearrangement (ACSR) requests in the ACSR queue be printed.	OP:ACSR 5E10 and later
Requests that the status of automatic customer station rearrangement (ACSR) enqueuing and dequeueing be printed.	OP:STAT 5E10 and later

Table 14 AUTOMATIC LINE EVALUATION

Topic/Purpose	Message ID/ Message Release
Requests that the operation of automatic line evaluation (ALE) be allowed for the specified option.	ALW:ALE-A 5E10 - 5E11
Requests that the operation of automatic line evaluation (ALE) be allowed for the specified option.	ALW:ALE-B 5E12 only
Requests that the operation of automatic line evaluation (ALE) be allowed for the specified option.	ALW:ALE-C 5E13 and later
Requests that automatic line evaluation (ALE) provide performance monitoring error count information and protocol error histories on integrated services digital network (ISDN) protocol channels.	EXC:ALE-A 5E10 - 5E11
Requests that automatic line evaluation (ALE) provide performance monitoring error count information and protocol error histories on integrated services digital network (ISDN) protocol channels.	EXC:ALE-B 5E12 only
Requests that automatic line evaluation (ALE) provide performance monitoring error count information and protocol error histories on integrated services digital network (ISDN) protocol channels.	EXC:ALE-C 5E13 and later
Requests that a routine exercise (REX) and/or automatic line insulation test (ALIT) schedule be generated based on the equipment present.	EXC:SCHED 5E10 and later
Requests inhibition of the options utilized for the operation of the automatic line evaluation (ALE) system and protocol error record (PER) reporting and generation.	INH:ALE-A 5E10 - 5E11
Requests inhibition of the options utilized for the operation of the automatic line evaluation (ALE) system and protocol error record (PER) reporting and generation.	INH:ALE-B 5E12 only
Requests inhibition of the options utilized for the operation of the automatic line evaluation (ALE) system and protocol error record (PER) reporting and generation.	INH:ALE-C 5E13 and later
Requests the status of automatic line evaluation (ALE) system control parameters and resource usage.	OP:ALE-A 5E10 - 5E11
Requests the status of automatic line evaluation (ALE) system control parameters and resource usage.	OP:ALE-B 5E12 only
Requests the status of automatic line evaluation (ALE) system control parameters and resource usage.	OP:ALE-C 5E13 and later
Requests that the current automatic line evaluation (ALE) session be stopped.	STP:ALE 5E10 and later

Copyright © 1999

Table 15 AUTOMATIC LINE INSULATION TEST

Topic/Purpose	Message ID/ Message Release
Requests that actions on the automatic line insulation test (ALIT) circuit at the specified location be aborted.	ABT:ALIT 5E10 and later
Requests that an automatic line insulation test (ALIT) be diagnosed to determine whether it is in satisfactory working order.	DGN:ALIT 5E10 and later
Requests interactive diagnostics (exercises) of the automatic line insulation test (ALIT) unit.	EX:ALIT 5E10 and later
Requests that an automatic line insulation test (ALIT) circuit in a metallic service unit (MSU) be removed from service.	RMV:ALIT 5E10 and later
Requests that an automatic line insulation test (ALIT) board in a metallic service unit (MSU) be conditionally or unconditionally restored restored to service.	RST:ALIT 5E10 and later
Requests that actions on the automatic line insulation test (ALIT) circuit at the specified location be stopped.	STP:ALIT 5E10 and later

Table 16 AUTOMATIC MAINTENANCE LIMIT

Topic/Purpose	Message ID/ Message Release
Requests that the number of out-of-service (OOS) trunks be printed in relation to the automatic maintenance limit (AML) for a specified trunk group or a list of all trunk groups whose outages have reached their AML.	OP:AML 5E10 and later

Table 17 AUTOMATIC MESSAGE ACCOUNTING

Topic/Purpose	Message ID/ Message Release
Requests that the tape writing process be aborted.	ABT:AMATAPE 5E10 and later
Requests that automatic message accounting (AMA) automatic tape writing be allowed.	ALW:AMA-AUTOST 5E10 and later
Requests that automatic message accounting (AMA) teleprocessing sessions or tape writing sessions be allowed.	ALW:AMA-SESSION 5E10 and later
Requests that the printing of data related to an automatic message accounting irregularity (AMAIRR) be allowed when and if such an irregularity occurs.	ALW:AMAIRR 5E10 and later
Requests that the printing of data related to a lost automatic message accounting (AMALOST) record be allowed when and if such a loss occurs.	ALW:AMALOST 5E10 and later
Format 1 requests that the printing of an automatic message accounting (AMA) record be allowed on the receive-only printer (ROP) for a specific originating and/or terminating directory number (DN).	ALW:AMATRC-A 5E10 - 5E11
Format 1 requests that the printing of an automatic message accounting (AMA) record be allowed on the receive-only printer (ROP) for a specific originating and/or terminating directory number (DN).	ALW:AMATRC-B 5E12 and later
Requests that the automatic message accounting (AMA) partitions on the offline moving head disk (MHD) be cleared during retrofits, disk growths, and updates, to ensure that all billing data recorded on the offline MHD is current.	CLR:AMA-MAPS 5E10 and later
Requests that the automatic message accounting (AMA) configuration files be converted from the previous software release to the new software release during retrofits, disk growths, or updates, to accommodate the new disk layouts.	CNVT:AMA-CONFIG 5E10 and later
Requests that primary or secondary automatic message accounting (AMA) data records be copied onto tape.	CPY:AMATAPE 5E10 and later
Requests that automatic message accounting (AMA) automatic tape writing sessions be inhibited.	INH:AMA-AUTOST 5E10 and later
Requests that all automatic message accounting (AMA) sessions be inhibited or the writing of AMA tapes be prevented.	INH:AMA-SESSION 5E10 and later
Inhibits the printing of data related to an automatic message accounting irregularity (AMAIRR).	INH:AMAIRR 5E10 and later
Requests that the printing of data related to lost automatic message accounting (AMALOST) records be stopped.	INH:AMALOST 5E10 and later
Format 1 requests that the printing of automatic message accounting (AMA) records be inhibited for a matching active trace directory number (DN) (that is, DN and PS option are	INH:AMATRC 5E10 and later

Copyright © 1999

equal).	
Requests the current status of the automatic message accounting (AMA) configuration files.	OP:AMA-CONFIG 5E10 and later
Requests that the current state of the automatic message accounting (AMA) control file be obtained.	OP:AMA-CONTROLF 5E10 and later
Requests current automatic message accounting (AMA) disk space occupancy data.	OP:AMA-DISK 5E10 and later
Requests that the automatic message accounting (AMA) maintenance file be obtained.	OP:AMA-MAINT 5E10 and later
Requests the contents of the disk maps for all partitions and the contents of the global maps for each stream.	OP:AMA-MAPS 5E10 and later
Indicate which disk blocks correspond to a given block sequence number, and the automatic message accounting (AMA) partitions on which they are located.	OP:AMA-SEQ 5E10 and later
Requests a report of the current or most recent automatic message accounting (AMA) tape or teleprocessing session.	OP:AMA-SESSION 5E10 and later
Requests the printing of the automatic message accounting (AMA) record status in the administrative module (AM) buffer.	OP:AMA-STATUS 5E10 and later
Requests output of the automatic message accounting (AMA) office stream configuration.	OP:AMA-STREAM 5E10 and later
Requests automatic message accounting (AMA) teleprocessing and tape summary data.	OP:AMA-SUMMARY 5E10 and later
Requests automatic message accounting (AMA) teleprocessing summary data that has been accumulated today.	OP:AMA-TELE 5E10 and later
Requests the current status of the automatic message accounting irregularity (AMAIRR) record reporting feature.	OP:AMAIRR 5E10 and later
Requests the current status of the automatic message accounting lost (AMALOST) record reporting feature.	OP:AMALOST 5E10 and later
Requests the current status of the automatic message accounting (AMA) record reporting feature AMATRC.	OP:AMATRC 5E10 and later
Requests that an automatic message accounting (AMA) partition be equipped or unequipped for either the ST1 or ST2 data stream.	SET:AMA-CONFIG 5E10 and later
Requests that one or two of the automatic message accounting (AMA) control file parameters be set.	SET:AMA-CONTROL 5E10 and later
Requests that the automatic message accounting (AMA) office stream configuration be set.	SET:AMA-STREAM 5E10 and later
Requests that the printing of data related to lost automatic message accounting (AMALOST) records be stopped.	STP:AMALOST 5E10 and later
Requests that the tape writing process be stopped.	STP:AMATAPE 5E10 and later
Requests that a particular tape drive be set to the automatic message accounting (AMA) function and that the tape on that tape drive be verified.	VFY:AMATAPE 5E10 and later
Requests that billing data be collected from the switching modules (SMs) and the billing data in the administrative module be written to disk prior to generic retrofit.	WRT:AMADATA 5E10 and later

Table 18 Centralized Automatic Message Accounting Operator Number Identification

Topic/Purpose	Message ID/ Message Release
Requests that centralized automatic message accounting (CAMA) operator number identification (ONI) processing be allowed.	ALW:CAMAONI 5E10 and later
Inhibits centralized automatic message accounting (CAMA) operator number identification (ONI) processing.	INH:CAMAONI 5E10 and later

Table 19 AUTOMATIC PROGRESSION TESTING

Topic/Purpose	Message ID/ Message Release
Displays the status of an automatic (Trunk) progression test (APT) session.	OP:APT 5E10 and later
Schedules the time in which trunk automatic progression testing (APT) is to be run for a given 24-hour period.	SCHED:APT 5E10 and later
Requests that a manually or automatically scheduled automatic progression testing (APT) session that is currently executing be stopped.	STP:APT 5E10 and later

Copyright © 1999

Table 20 AUTOMATIC TRUNK TEST SCHEDULER

Topic/Purpose	Message ID/ Message Release
Dumps the entries in the automatic trunk test scheduler (ATTS) schedule database which relate to a specified ATTS test schedule.	DUMP:ATDTA 5E10 and later
Retrieves scheduled trunk test data from automatic trunk test scheduler (ATTS) log files.	DUMP:ATLOG 5E10 and later
Dumps the entries in the automatic trunk test scheduler (ATTS) parameters database which relate to a specified ATTS test schedule.	DUMP:ATPRM 5E10 and later
Requests a report of the status of the specified automatic trunk test scheduler (ATTS) test schedule.	OP:ATTS 5E10 and later
Requests that records of the last successful office backup activities using GENBKUP (the automated office backup procedure) be printed.	OP:GENBKUP-LAST 5E10 and later
Requests that the automatic generic backup process be started.	RCV:M-GENBKUP 5E10 and later
Places a specified ATTS (Automatic Trunk Test Scheduler) test schedule in an operational state to enable the automatic execution of test sessions defined in that schedule.	ST:ATTS 5E10 and later
Disables the automatic execution of test sessions defined in a specified ATTS (Automatic Trunk Test Scheduler) test schedule.	STP:ATTS 5E10 and later
Requests that a billed number screening (BNS) query be sent to the billing validation application (BVA), the line information database (LIDB), or the LIDB alternate destination (LALT) to verify its operation.	TST:BNS 5E10 and later
Requests that a calling card (CCRD) query be sent using the billing validation application (BVA) interface, the line information database (LIDB) transaction capability application part (TCAP) interface, or to the LIDB alternate destination (LALT) using the LIDB TCAP interface to verify its operation.	TST:CCRD 5E10 and later

Table 21 AUTOMATED PACK RETURN TAG

Topic/Purpose	Message ID/ Message Release
Requests that the automated pack return tag (RTAG) tool be run.	RCV:M-RTAG 5E10 and later

Table 22 BILLING

Topic/Purpose	Message ID/ Message Release
Stops the reporting, begun with an ALW:BCI input message, of line unit concentrator blockages in A- and B-links for originating (ORIG) or terminating (TERM) calls.	STP:BCI 5E10 and later

Table 23 BOOTSTRAP

Topic/Purpose	Message ID/ Message Release
Aborts actions on the bootstrapper board (BTSR) at the specified location.	ABT:BTSR 5E10 and later
Requests that the bootstrapper board (BTSR) be diagnosed to determine whether it is in satisfactory working order.	DGN:BTSR 5E10 and later
Performs various exercises on the bootstrapper board (BTSR).	EX:BTSR 5E10 and later
Requests that the bootstrapper board (BTSR) be removed from service.	RMV:BTSR 5E10 and later
Requests that the bootstrapper boards (BTSR) be restored to the active state.	RST:BTSR 5E10 and later
Requests that the actions on the bootstrapper board (BTSR) at the specified location be stopped.	STP:BTSR 5E10 and later
Invokes the bootstrapper board (BTSR) resident diagnostic.	TST:BTSR 5E10 and later

Table 24 BREAKPOINTS

Topic/Purpose	Message ID/ Message Release
Requests that all currently defined administrative module (AM) generic access package	ALW:UTIL

(GRASP) breakpoints be enabled so that the associated actions are executed when the breakpoint conditions occur.	5E10 and later
Requests that a specific administrative module (AM) generic access package (GRASP) breakpoint be enabled so that the associated actions are executed when the breakpoint condition occurs.	ALW:UTILFLAG 5E10 and later
Removes all currently defined administrative module (AM) generic access package (GRASP) breakpoints; clears definitions.	CLR:UTIL 5E10 and later
Removes the specified administrative module (AM) generic access package (GRASP) breakpoint and clears the definition.	CLR:UTILFLAG 5E10 and later
Disables (but leaves defined) all administrative module (AM) generic access package (GRASP) breakpoints.	INH:UTIL 5E10 and later
Disables (but leaves defined) a specific central processor (CP) generic access package (GRASP) breakpoint.	INH:UTILFLAG 5E10 and later
Requests lists of currently defined central processor (CP) or administrative module (AM) AM) generic access package (GRASP) breakpoints, their status and trace status.	OP:UTIL 5E10 and later

Table 25 BREVITY CONTROL

Topic/Purpose	Message ID/ Message Release
Allows originating (ORIG) or terminating (TERM) blocked call indication (BCI) reporting when a path is not available through both the A- and B-links of a line unit concentrator.	ALW:BCI 5E10 and later
Requests to clear all brevity control message discard (MGDSC) counts and throttling message discard counts for administrative module (AM) operational kernel process, a communication module processor (CMP), or a switching module (SM).	CLR:MGDSC 5E10 and later
Requests the output of the current output message brevity control (BREVC) status of one or all message class(es) (MSGCLS).	OP:BREVC 5E10 and later
Requests total number of messages that have been discarded (MGDSC) due to brevity control and/or message queue overflow from administrative module (AM) operational kernel process, communication module processor (CMP), or a switching module (SM).	OP:MGDSC 5E10 and later

Table 26 BROADCAST WARNING MESSAGE

Topic/Purpose	Message ID/ Message Release
Requests that the segment name of acknowledgement database (ACKDB) be invalidated so that the next invocation of either the shell or display administration process (DAP) reinitializes the segment name using the ACKDB installed in /cft/she/ackdb.	CLR:ACKDB 5E10 and later
Requests the generic text version and software update level by file system partition.	OP:VERSION 5E10 and later
Requests that an official software update be blocked or inhibited from being backed out.	UPD:BLOCK 5E10 and later
Requests that a software update that has already been installed and made official be cleared from the /etc/bwm directory.	UPD:CLRBWM 5E10 and later
Requests update of the text version and/or software update level of the file system partitions.	UPD:VERSION 5E10 and later
Requests verification of the content of a software update, the name of which has been entered using the UPD:UPNAME input message.	UPD:VFYBWM 5E10 and later

Table 27 Program Update Page

Topic/Purpose	Message ID/ Message Release
Requests that the software update installation page (BWM Installation) or program update (PU) maintenance page be cleared.	CLR:PUPAGE 5E10 and later
Requests that the software update installation page (BWM installation) or program update maintenance page be entered.	SET:PUPAGE 5E10 and later

Table 28 CALL

Topic/Purpose	Message ID/ Message Release
Requests the status of the blocked call indication (BCI) reporting feature.	OP:BCI 5E10 and later

Copyright © 1999

Table 29 Call Monitor

Topic/Purpose	Message ID/ Message Release
Requests that the call monitor be allowed to start the cycle of making test calls and performing call completion analysis.	ALW:CALLMON 5E10 and later
Requests that the verbose mode of the call monitor be turned off.	CLR:CALLMON 5E10 and later
Requests that the call monitor be inhibited from making test calls and performing call completion analysis.	INH:CALLMON 5E10 and later
Requests that the OP:CALLMON output message be generated.	OP:CALLMON 5E10 and later
Requests that the call monitor alarm indicator be retired.	RTR:CALLMON 5E10 and later
Requests that the verbose mode of the call monitor be turned on.	SET:CALLMON 5E10 and later

Table 30 Call Pick Up

Topic/Purpose	Message ID/ Message Release
Requests that all lines assigned to a specific call pickup group (CPUG) number or lines having a form of directed call pickup be queried and reported.	VFY:CPU 5E10 and later

Table 31 Call Trace

Topic/Purpose	Message ID/ Message Release
Requests that tracing be allowed to take place according to the previously input trace parameter settings.	ALW:TRACE 5E10 and later
Requests that the tracing mechanism be inhibited.	INH:TRACE 5E10 and later
Requests a listing of the status of tracing and the settings of the trace detail flags for the various subsystems.	OP:TRACE 5E10 and later
Requests the printing of all data collected for a traced call.	OP:TRC-A 5E10 - 5E11
Requests the printing of all data collected for a traced call.	OP:TRC-B 5E12 and later
Requests that the user be allowed to change the contents of the system trace control block, and therefore to change the operational characteristics of trace.	SET:TRACE 5E10 and later
Requests that a directory number (DN) be added to or deleted from the calling line identification (CLID) list.	TRC:CLID-A 5E10 - 5E11
Requests that a directory number (DN) be added to or deleted from the calling line identification (CLID) list.	TRC:CLID-B 5E12 and later
Requests an in-progress call trace (IPCT) by using either the directory number (DN), the multiline hunt group and member number (MLHG), the trunk group and member number (TKGMN), or the process ID (PID) of the party to be traced.	TRC:IPCT 5E10 and later
Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.	TRC:UTIL-A 5E10 - 5E11
Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.	TRC:UTIL-B 5E12 only
Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.	TRC:UTIL-C 5E13 and later
Requests electronic loop segregation (ELS) to be run on the specified line or hardware group of lines.	TST:LINE-ELS-A 5E10 only
Requests electronic loop segregation (ELS) to be run on the specified line or hardware group of lines.	TST:LINE-ELS-B 5E11 only
Requests electronic loop segregation (ELS) to be run on the specified line or hardware group of lines.	TST:LINE-ELS-C 5E12 and later

Table 32 Reorder

Topic/Purpose	Message ID/ Message Release
Requests that additional information on calls that are routed to reorder be collected for a	ALW:REORD-SM

switching module (SM) or a range of SMs, and the information be reported on the receive-only printer (ROP) after 15 minutes have elapsed or information for the first 30 reorder events has been collected, whichever occurs first.	5E10 and later
Requests that the collection of additional information for calls routed to reorder be terminated.	INH:REORD 5E10 and later

Table 33 Switch Cutoff

Topic/Purpose	Message ID/ Message Release
Requests that information related to switch cutoff calls be allowed, either with or without an accompanying hardware call trace.	ALW:SCORPT 5E10 and later
Requests that the reporting of information related to switch cutoff calls be inhibited.	INH:SCORPT 5E10 and later

Table 34 Transient Calls Lost

Topic/Purpose	Message ID/ Message Release
Requests that the reporting of information be allowed related to transient calls lost either with or without an accompanying hardware call trace.	ALW:TCLRPT 5E10 and later
Inhibits the reporting of information related to transient calls lost.	INH:TCLRPT 5E10 and later

Table 35 CAMPED-ON UNITS

Topic/Purpose	Message ID/ Message Release
Requests a list of the trunks, lines, data links, and Operator Services Position System Ports (OSPSPORTs) that are currently camped on due to a manual request to remove or restore that trunk, line, data link, or OSPSPORT (RMV:TRK, RST:TRK, RMV:LINE, RST:LINE, RMV:DATALINK, RST:DATALINK, RMV:OSPSPORT, RST:OSPSPORT).	OP:CAMPON 5E10 and later
Requests that all camp-on activity on a trunk, line, data link, or Operator Services Position System port (OSPSPORT) caused by a RMV:TRK, RMV:LINE, RMV:DATALINK, RMV:OSPSPORT, RST:TRK, RST:LINE, RST:DATALINK, or RST:OSPSPORT input message be stopped.	STP:CAMPON-A 5E10 only
Requests that all camp-on activity on a trunk, line, data link, or Operator Services Position System port (OSPSPORT) caused by a RMV:TRK, RMV:LINE, RMV:DATALINK, RMV:OSPSPORT, RST:TRK, RST:LINE, RST:DATALINK, or RST:OSPSPORT input message be stopped.	STP:CAMPON-B 5E11 - 5E12
Requests that all camp-on activity on a trunk, line, data link, or Operator Services Position System port (OSPSPORT) caused by a RMV:TRK, RMV:LINE, RMV:DATALINK, RMV:OSPSPORT, RST:TRK, RST:LINE, RST:DATALINK, or RST:OSPSPORT input message be stopped.	STP:CAMPON-C 5E13 and later

Table 36 CARRIER GROUP ALARM

Topic/Purpose	Message ID/ Message Release
Requests clearance of a network management (NM) call gapping (CGAP) code control restricting traffic by issuing a destination code, an access prefix, or both.	CLR:CGAP 5E10 and later
Requests that the active carrier group alarms from integrated carrier facilities terminating on digital facility interfaces (DFIs), integrated digital carrier units (IDCUs), remote integrated services line units (RISLUs), non-integrated carrier facilities monitored by metallic service unit (MSU) scan points, and digital network unit-synchronous optical network (SONET)(DNU-S) be printed.	OP:CGA-A 5E10 - 5E11
Requests that the active carrier group alarms from integrated carrier facilities terminating on digital facility interfaces (DFIs), integrated digital carrier units (IDCUs), remote integrated services line units (RISLUs), non-integrated carrier facilities monitored by metallic service unit (MSU) scan points, and digital network unit-synchronous optical network (SONET)(DNU-S) be printed.	OP:CGA-B 5E12 only
Requests that the active carrier group alarms from integrated carrier facilities terminating on digital facility interfaces (DFIs), integrated digital carrier units (IDCUs), remote integrated	OP:CGA-C 5E13 and later

Copyright © 1999

services line units (RISLUs), non-integrated carrier facilities monitored by metallic service unit (MSU) scan points, and digital networking unit-synchronous optical network (SONET)(DNU-S) be printed.	
Requests that all call gapping (CGAP) code controls in the office be listed.	OP:CGAP 5E10 and later
Requests that a call gapping (CGAP) code control be set to restrict traffic.	SET:CGAP 5E10 and later

Table 37 CENTRALIZED TRUNK TESTING UNIT

Topic/Purpose	Message ID/ Message Release
Requests that the position busy (PB) indicator be cleared at certain trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) assigned to receive incoming 101 test line calls.	CLR:PB 5E10 and later
Requests the display of the position busy (PB) and not position busy (NPB) status of each of the trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test calls.	OP:PB 5E10 and later
Requests that the position busy (PB) indicator of certain trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test line calls be set.	SET:PB 5E10 and later

Table 38 CHECKSUM

Topic/Purpose	Message ID/ Message Release
Requests a 16-bit checksum for a specified file, and prints the number of blocks in the file.	OP:ST-SUM 5E10 and later

Table 39 CLOCKS

Topic/Purpose	Message ID/ Message Release
Reports the current date and time.	OP:CLK 5E10 and later
Requests that the system clock be set to the specified date and time, or that the system time be adjusted by a small amount.	SET:CLK-5 5E10 and later

Table 40 COMMAND HISTORY

Topic/Purpose	Message ID/ Message Release
Allows history recording for the terminal upon which it is entered.	ALW:HIST 5E10 and later
Clears out the command history buffer.	CLR:HIST 5E10 and later
Requests that the previous input message entered at this terminal be re-executed.	EXC:PREV 5E10 and later
Inhibits history recording for the terminal upon which it is entered.	INH:HIST 5E10 and later

Table 41 COMMON LINK NORMALIZATION

Topic/Purpose	Message ID/ Message Release
Requests that the communication link normalization (CLNORM) process be allowed.	ALW:CLNORM 5E10 and later
Request that the communication link normalization (CLNORM) process be inhibited.	INH:CLNORM 5E10 and later

Table 42 COMMON NETWORK INTERFACE

Topic/Purpose	Message ID/ Message Release
Requests an allow of all break points in the specified common network interface (CNI) node.	ALW:RUTIL 5E10 and later
Requests an allow of the specified break point in the specified common network interface	ALW:RUTILFLAG

Copyright © 1999

(CNI) ring node.	5E10 and later
Requests that the common network interface (CNI) ring be configured to include or exclude ring node(s) from the active ring segment, or if the ring is down, to initialize it.	CFR:RING 5E10 and later
Requests a change in the common network interface (CNI) incore view of the CNI generic identification (ID).	CHG:GEN 5E10 and later
Requests that the SCCP routing verification test (SRVT) delay parameter, which is used in the calculation of the T2 timer, be changed or displayed.	CHG:SRVT 5E10 and later
Removes (clears) the common network interface (CNI) system from min-mode.	CLR:MINMODE-CNI 5E10 and later
Clears all breakpoints in the specified common network interface (CNI) ring node.	CLR:RUTIL 5E10 and later
Clears a specific breakpoint in the specified common network interface (CNI) ring node.	CLR:RUTILFLAG 5E10 and later
Requests that the specified link nodes (LN) be diagnosed.	DGN:LN-A 5E10 - 5E11
Requests that the specified link nodes (LN) be diagnosed.	DGN:LN-B 5E12 and later
Requests a dump of the memory contents of the specified address at the given common network interface (CNI) ring node.	DUMP:RUTIL 5E10 and later
Requests the exercise of a link node (LN) in an interactive diagnostic mode.	EX:LN 5E10 and later
Requests that control operations be performed on the remote access subsystem (REMACS) data audit, or requests the status of that subsystem.	EXC:REMACS 5E10 and later
Requests that the signaling connection control port (SCCP) routing verification test (SRVT) be initiated.	EXC:SRVT 5E10 and later
Requests forced removal of the specified node from service, regardless of the state of the link, mate, or other nodes.	FRMV:LN 5E10 and later
Requests the status or changes the value of the report inhibit flag.	INH:REPORT 5E10 and later
Requests that the link removal inhibit flag be administered and displayed.	INH:RMV 5E10 and later
Requests an inhibit of all the break points in the specified common network interface (CNI) node.	INH:RUTIL 5E10 and later
Requests an inhibit of the specified break point in the specified common network interface (CNI) ring node.	INH:RUTILFLAG 5E10 and later
Requests a common network interface (CNI) initialization at a specified level.	INIT:CNI 5E10 and later
Requests forced removal from service and restart of the specified node, regardless of the state of the link and other nodes.	INIT:LN 5E10 and later
Initiates the updating of the software of all or a single SS7 node.	LNUPD:LN 5E12 and later
Requests a load of the contents of the specified address at the given common network interface (CNI) ring node with the given data.	LOAD:RUTIL 5E10 and later
Requests the output of the current usage of an Operator Position System (OSPS) External Information System (EIS) data link or data link group.	OP:DATALINK 5E10 and later
Requests that a snapshot of certain key link node (link interface and node processor) status and data information be output.	OP:LNSTAT 5E10 and later
Generates a printout of the status for the last LNUPD:LN input message request.	OP:LNUPD 5E12 and later
Requests status information (Format 1) or generic information (Format 2) about a particular node, a group of nodes, or all nodes on a particular group.	OP:RING 5E10 and later
Requests an output of the status of all the break points in the specified node.	OP:RUTIL 5E10 and later
Requests an output of the status of the specified break point in the specified common network interface (CNI) ring node.	OP:RUTILFLAG 5E10 and later
Requests that the common network interface data base consolidator (CNIDBOC) be run.	RCV:M-CNIDBOC 5E10 and later
Requests that the common network interface (CNI) growth script be executed.	RCV:M-CNIGROWTH 5E10 and later
Requests that the specified link node (LN) be removed from service.	RMV:LN 5E10 and later
Requests that the specified link node (LN) be restored to service either conditionally or	RST:LN

unconditionally.	5E10 and later
Terminates or interrupts the updating of the software of all SS7 nodes before the update procedure has been completed.	STOP:LNUPD 5E12 and later
Requests the Operating System for Distributed Switching (OSDS) resource monitoring utility to stop collecting and reporting usage of OSDS message, process, stack, and timer control blocks.	STP:PERF 5E10 and later
Requests that the mate network clock node be switched to the master network clock node.	SW:CLOCK 5E10 and later
Requests a set of the given break point at the specified common network interface (CNI) ring node with the action-list provided.	WHEN:RUTIL 5E10 and later

Table 43 Ring Peripheral Controller Node

Topic/Purpose	Message ID/ Message Release
Requests diagnostics of the specified ring peripheral controller node (RPCN).	DGN:RPCN 5E10 and later
Exercises a ring peripheral controller node (RPCN) in an interactive diagnostic mode.	EX:RPCN 5E10 and later
Requests that the specified ring peripheral controller node (RPCN) be removed from service.	RMV:RPCN 5E10 and later
Requests that the specified ring peripheral controller node (RPCN) be restored to service.	RST:RPCN 5E10 and later

Table 44 Signaling Link

Topic/Purpose	Message ID/ Message Release
Requests that the status of the alarm inhibit flag of a signaling link (SLK) be set, reset, or listed.	INH:SLK 5E10 and later
Requests that the link monitor be turned on or off.	MON:SLK 5E10 and later
Requests status information for the signaling links (SLKs).	OP:SLK-A 5E10 - 5E11
Requests status information for the signaling links (SLKs).	OP:SLK-B 5E12 and later
Requests that a change be made to a new key on an encrypted signaling link (SLK).	REKEY:SLK 5E10 and later
Requests a status report of all signaling link (SLK) inhibit alarm flags set (ON).	REPT:SLK 5E10 and later

Table 45 COMMON OBJECT FILE FORMAT

Topic/Purpose	Message ID/ Message Release
Requests that symbolic information be dumped from the common object file format (COFF) file defined by the processor or path identified in the input message.	DUMP:UT-SYMID 5E11 and later

Table 46 COMMUNICATIONS MODULE

Topic/Purpose	Message ID/ Message Release
Allows hardware error checks to be performed on all communication module (CM) units.	ALW:HDW-CM 5E10 and later
Requests that the communication module (CM) be re-synchronized with (unisolated from) the administrative module (AM).	CLR:ISOL-CM 5E10 and later
Inhibits all hardware error checks on all communication module (CM) units.	INH:HDW-CM 5E10 and later
This message is used to reinitialize the CM without affecting the AM.	INIT:CM 5E12 and later
Requests a list of all off-normal circuits in communication modules (CM).	OP:OFFNORM-CM 5E10 and later
Requests that the communication module (CM) be isolated from the administrative module (AM).	SET:ISOL-CM 5E10 and later

Copyright © 1999

Table 47 COMMUNICATION MODULE PROCESSOR

Topic/Purpose	Message ID/ Message Release
Requests that actions on a communication module processor (CMP) be aborted (ABT).	ABT:CMP 5E10 and later
Requests that a communication module processor (CMP) audit be allowed to execute automatically or an audit cycle to execute routinely on one CMP.	ALW:AUD-CMP 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified communication module processor (CMP).	ALW:HDW-CMP 5E10 and later
Requests that generic utility WHEN breakpoint clauses in the communication module processors (CMP) be allowed or enabled.	ALW:UT-CMP 5E10 and later
Requests a communication module processor (CMP) audit to be run in one CMP.	AUD:CMP 5E10 and later
Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the communication module processor (CMP) be removed.	CLR:UT-CMP 5E10 and later
Requests that a value be copied into an address, register, variable, or utility variable of the communications module processor (CMP), and perform any of the following operations:	COPY:UT-CMP-A 5E10 only
Requests that a value be copied into an address, register, global variable (specified by name or symbol index), or utility variable of the communications module processor (CMP), and optionally perform any of the following operations:	COPY:UT-CMP-B 5E11 and later
Requests diagnosis of a communication module processor (CMP) to determine whether it is in satisfactory working order.	DGN:CMP 5E10 and later
Requests that the contents of one or more sequential memory locations in the specified communications module processor (CMP) be dumped.	DUMP:UT-CMP-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified communications module processor (CMP) be dumped.	DUMP:UT-CMP-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified communication module processor message handler (CMPMSG) be dumped.	DUMP:UT-CMPMSG-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified communication module processor message handler (CMPMSG) be dumped.	DUMP:UT-CMPMSG-B 5E11 and later
Requests that the conditional ELSE input message used with the IF input message perform any communications module processor (CMP) generic utility input messages following it, provided the IF input message comparison is not true.	ELSE:UT-CMP 5E10 and later
Requests that a series of communication module processor (CMP) generic utility input messages be ended.	END:UT-CMP 5E10 and later
Requests interactive diagnosis of a communication module processor (CMP).	EX:CMP 5E10 and later
Requests that an unconditional call to a function using parameters or a transfer of execution to an absolute address in the specified communication module processor (CMP) be executed.	EXC:UT-CMP-A 5E10 only
Format 1 requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) be executed.	EXC:UT-CMP-B 5E11 and later
Requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) message handler (CMPMSGH) be executed.	EXC:UT-CMPMSG-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) message handler (CMPMSGH) be executed.	EXC:UT-CMPMSG-B 5E11 and later
Requests that a constant or variable in a communication module processor's (CMP) memory be compared against another constant or variable in the CMP memory.	IF:UT-CMP-A 5E10 only
Requests that a constant or variable in a communication module processor's (CMP) memory be compared against another constant or variable in the CMP memory.	IF:UT-CMP-B 5E11 and later
Signifies the end of an IF-ELSE statement in the communication module processor (CMP) and must be used in combination with the IF:UT-CMP input message.	IF:UT-CMP-ENDIF 5E10 and later
Requests that the automatic execution of an audit or the routine execution of the audit cycle be inhibited in one communication module processor (CMP).	INH:AUD-CMP 5E10 and later
Requests that the hardware checks on the specified communication module processor (CMP) be inhibited.	INH:HDW-CMP 5E10 and later
Requests that a specific generic utility WHEN clause in the communications module processor (CMP), or all such active clauses, be inhibited.	INH:UT-CMP 5E10 and later
Requests that the selected communication module processors (CMPs) be initialized at the specified level.	INIT:CMP 5E10 and later
Requests a single process purge (SPP) of a named process in a selected communication module processor (CMP).	INIT:CMP-SPP 5E10 and later

Copyright © 1999

Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP).	LOAD:UT-CMP-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP).	LOAD:UT-CMP-B 5E11 and later
Requests that a value(s) be loaded into the memory of the specified communication module processor message handler (CMPMSG).	LOAD:UT-CMPMSG-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP) message handler (CMPMSG).	LOAD:UT-CMPMSG-B 5E11 and later
Requests a copy of the postmortem for the communication module processor (CMP).	OP:POSTMORT-CMP 5E10 and later
Requests a report of the status of a specified audit, all audits, or all inhibited audits for a particular communication module processor (CMP) or range of CMPs.	OP:ST-AUD-CMP 5E10 and later
Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the communications module processor (CMP).	OP:UT-CMP 5E10 and later
Requests removal of a communication module processor (CMP) from service.	RMV:CMP 5E10 and later
Requests a conditional or unconditional restore of a communication module processor (CMP) to the active or standby state.	RST:CMP 5E10 and later
Requests a download of the off-line communication module processor (CMP) memory for the specified CMP from the off-line administrative module (AM) disk followed by an off-line verification.	ST:OPUMP-CMP 5E10 and later
Stops the currently executing audit in a communication module processor (CMP).	STP:AUD-CMP 5E10 and later
Requests that specific actions on a communication module processor (CMP) be stopped (Format 1).	STP:CMP 5E10 and later
Requests activation of the standby of the communication module processor (CMP).	SW:CMP 5E10 and later
Requests that a temporary generic utility breakpoint be defined for an application program in the specified communications module processor (CMP).	WHEN:UT-CMP-A 5E10 only
Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified communications module processor (CMP).	WHEN:UT-CMP-B 5E11 and later

Table 48 COMMUNICATIONS LINK

Topic/Purpose	Message ID/ Message Release
Aborts actions on the specified communication link (CLNK).	ABT:CLNK 5E10 and later
Allows level 2 and level 3 hardware checks errors to be performed on one or all communication links (CLNKs).	ALW:HDW-CLNK 5E10 and later
Inhibits level 2 and level 3 hardware checks (errors) on one or all of the specified communication links (CLNKs).	INH:HDW-CLNK 5E10 and later
Requests that a specified communication link (CLNK) be removed from service.	RMV:CLNK 5E10 and later
Requests that one or all of the specified communication links (CLNKs) be restored to an available state ('hardware available', 'active' or 'ready for level 2').	RST:CLNK 5E10 and later

Table 49 Communications Link Digital Facility Interface

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	ABT:CDFI 5E10 and later
Allows maintenance interrupts to occur on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	ALW:HDW-CDFI 5E10 and later
Diagnoses an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit to determine if it is in working order.	DGN:CDFI 5E10 and later
Performs maintenance exercises on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	EX:CDFI 5E10 and later
Requests that an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit be removed from service.	RMV:CDFI 5E10 and later
Requests that an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit be restored to service.	RST:CDFI 5E10 and later

Requests that maintenance actions be stopped on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	STP:CDFI 5E10 and later

Table 50 CONTROL DATA INTERFACE

Topic/Purpose	Message ID/ Message Release
Aborts actions on the control data interface (CDI) at the specified location.	ABT:CDI 5E10 and later
Requests that a control data interface (CDI) be diagnosed to determine whether it is in satisfactory working order.	DGN:CDI 5E10 and later
Interactively diagnoses the control data interface (CDI) unit.	EX:CDI 5E10 and later
Requests that a control data interface (CDI) be removed from service.	RMV:CDI 5E10 and later
Requests that a trunk unit control data interface (CDI) be restored to service.	RST:CDI 5E10 and later
Requests that specified actions on the control data interface (CDI) at the specified location be stopped.	STP:CDI 5E10 and later
Requests the printing of all data collected for a traced call.	OP:TRC-A 5E10 - 5E11
Requests the printing of all data collected for a traced call.	OP:TRC-B 5E12 and later

Table 51 CONTROL UNIT

Topic/Purpose	Message ID/ Message Release
Requests that the standby control unit memory (CUMEM) 1 audit be run in the standby control unit (CU), comparing the contents of the online and off-line main stores when in the ACT/ACT or ACT/STBY modes.	AUD:CUMEM 5E10 and later
Requests that the control unit hardware status (CUSTAT) audit be run in the manual mode.	AUD:CUSTAT 5E10 and later
Diagnoses the specified administrative module (AM) control unit (CU) complex or a specified unit within the CU complex.	DGN:CU 5E10 and later
Requests that an administrative module (AM) control unit (CU) be exercised in an interactive diagnostic mode.	EX:CU 5E10 and later
Requests that the specified administrative module (AM) control unit (CU) be removed from the standby state to the out-of-service (OOS) state.	RMV:CU 5E10 and later
Requests that a control unit (CU) be restored to standby status.	RST:CU 5E10 and later
Requests a graceful switch of the active/standby status of the administrative module (AM) control units (CUs).	SW:CU 5E10 and later

Table 52 COPYING

Topic/Purpose	Message ID/ Message Release
Copies a file from an active disk to an offline (OFL) or out-of-service (OOS) disk.	COPY:ACTDISK 5E10 and later
Requests that data be copied from virtual addresses in main memory to other virtual addresses, registers, or administrative module (AM) generic access package (GRASP) utility variables as a response to a breakpoint.	COPY:ADDR 5E10 and later
Copies selected on-line disk partitions to tape in the load disk from tape (LDFT) format.	COPY:BKDISK 5E10 and later
Compares disk partitions in order to detect differences.	COPY:DIFF-SRC-MHD 5E10 and later
Requests that the equipment configuration database (ECD) and system generation (SG) database files be copied from the primary partition on disk to a magnetic tape.	COPY:ECD-TAPE 5E10 and later
Requests that a specific file be moved into a contiguous area.	COPY:FSYS-CFILE 5E10 and later
Requests that a specific file be copied to another file or directory.	COPY:FSYS-FILE 5E10 and later
Requests that the system office dependent data (ODD) files be copied from disk to magnetic	COPY:ODD-TAPE

tape.	5E10 and later
Copies a specific file from an out-of-service (OOS) disk to an active system disk.	COPY:OOSDISK 5E10 and later
Requests that data be copied from virtual addresses in main memory to the administrative module (AM) generic access package (GRASP) utility variables.	COPY:PID 5E10 and later
Requests that one set of disk partitions be copied into a corresponding set of partitions.	COPY:PTN-ALL 5E10 and later
Requests that data be copied from the administrative module (AM) registers to virtual addresses in main memory and in registers as an action associated with a breakpoint.	COPY:REG 5E10 and later
Copies a specific partition, or a list of partitions, from one of the system disks to an active spare disk.	COPY:SPDISK 5E10 and later
Copies a task oriented practice (TOP) file(s) from disk to tape.	COPY:TAPE-DATA 5E10 and later
Copies data from the emergency dump partition on a disk to a magnetic tape.	COPY:TAPE-EMERDMP 5E10 and later
Copies files from a magnetic tape containing full or relative pathnames and header information, and places them in their respective directories.	COPY:TAPE-IN 5E10 and later
Copies one or more files to a magnetic tape, along with full or relative pathnames and header (status) information.	COPY:TAPE-OUT 5E10 and later
Writes the diagnostic test tape header block onto a magnetic tape.	COPY:TAPE-TEST 5E10 and later
Requests that data be copied from virtual addresses in main memory to administrative module (AM) generic access package (GRASP) utility variables as an immediate action.	COPY:UID 5E10 and later
Requests that a value be copied into an address, register, variable, or utility variable of the packet interface (PI) unit.	COPY:UT-MCTSI-PI-A 5E10 only
Requests that a value be copied into an address, register, global variable (specified by name or symbol index), or utility variable of the packet interface (PI) unit and optionally perform any of the following operations.	COPY:UT-MCTSI-PI-B 5E11 and later
Requests that data be copied from an administrative module (AM) generic access package (GRASP) in utility variable to virtual addresses in main memory and in registers as an action associated with a breakpoint.	COPY:UVAR 5E10 and later
Stops any COPY:DIFF:SRC input messages that are currently executing.	STOP:COPY-DIFF 5E10 and later
Stops any COPY:DIFF:SRC input messages that are currently executing.	STP:COPY-DIFF 5E10 and later

Table 53 CUSTOMER
Customer Account Services

Topic/Purpose	Message ID/ Message Release
Requests that a customer account services (CAS) query be sent to the CAS/network control point (NCP) data base to verify its operation.	TST:CAS 5E10 and later
Requests that a customer account services (CAS) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the CAS/network control point (NCP) or gateway/NCP data base to verify its operation.	TST:CAS7-A 5E10 only
Requests that a customer account services (CAS) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the CAS/network control point (NCP) or gateway/NCP data base to verify its operation.	TST:CAS7-B 5E11 and later

Table 54 Customer Premise Equipment

Topic/Purpose	Message ID/ Message Release
Requests that information describing the configuration of the specified digital subscriber line (DSL) be displayed.	OP:CPE-A 5E10 - 5E11
Requests that information describing the configuration of the specified digital subscriber line (DSL) be displayed.	OP:CPE-B 5E12 and later
Requests removal from service of the specified customer premises equipment (CPE) integrated services digital network (ISDN) terminal on custom multi-point (MP) and standard interface digital subscriber line (DSL).	RMV:CPE-A 5E10 - 5E11
Requests removal from service of the specified customer premises equipment (CPE) integrated services digital network (ISDN) terminal on custom multi-point (MP) and standard	RMV:CPE-B 5E12 and later

Copyright © 1999

interface digital subscriber line (DSL).	
Requests that a specified customer premises equipment (CPE) integrated services digital network (ISDN) terminal on custom multi-point (MP) and standard interface digital subscriber line (DSL) be restored to service.	RST:CPE-A 5E10 - 5E11
Requests that a specified customer premises equipment (CPE) integrated services digital network (ISDN) terminal on custom multi-point (MP) and standard interface digital subscriber line (DSL) be restored to service.	RST:CPE-B 5E12 and later
Requests a test of customer premises equipment (CPE) connected to a digital subscriber line (DSL) at the trunk and line work station (TLWS) test position (TP) number that was seized using a TLWS seize line input message.	TST:WSCPE 5E10 and later

Table 55 CUSTOMER ORIGINATED TRACE

Topic/Purpose	Message ID/ Message Release
Requests output of the mode, priority, and number of messages buffered for the customer-originated trace (COT) feature.	OP:COT-STATUS 5E10 and later
Requests that the mode and/or priority of customer-originated traces (COT) be changed.	SET:COT 5E10 and later

Table 56 CUSTOMER SERVICE COMPUTER ACCESS NETWORK SYSTEM

Topic/Purpose	Message ID/ Message Release
Requests a report containing the current status of the active file receiving process from the Customer Service Computer Access Network System (CSCANS) interface.	UPD:CSCANS-REPT 5E10 and later
Requests that the download of software update files from the remote source be terminated.	UPD:CSCANS-STOP 5E10 and later

Table 57 CUTOVER AND CUTBACK

Topic/Purpose	Message ID/ Message Release
Transfers lines from one switching system to another switching system (cutover and cutback).	EXC:CO 5E10 and later

Table 58 DEBUGGING

Topic/Purpose	Message ID/ Message Release
Requests that debugging messages be allowed to be printed for a given feature.	ALW:DEBUG 5E10 and later
Requests that debugging messages be inhibited from being printed for a given feature.	INH:DEBUG 5E10 and later

Table 59 DEFAULT CELL GROUP

Topic/Purpose	Message ID/ Message Release
Requests that the reporting of information related to calls pegging the default cell group (DCG) be allowed.	ALW:DCGRPT 5E10 and later
Requests that the reporting of information related to calls pegging the default cell group (DCG) be stopped.	STP:DCGRPT 5E10 and later

Table 60 Customer Account Services

Topic/Purpose	Message ID/ Message Release
Deletes a package (PKG) from the five-minute (M5) surveillance data set of packages.	CLR:DSNM5-A 5E10 - 5E11
Deletes a package (PKG) from the five-minute (M5) surveillance data set of packages.	CLR:DSNM5-B 5E12 and later
To refresh the defense switched network (DSN) network management page (page 129).	INIT:DSNPAGE 5E10 and later
Requests a list of a package (PKG) from the five-minute (M5) surveillance data set of packages.	OP:DSNM5-A 5E10 - 5E11
Requests a list of a package (PKG) from the five-minute (M5) surveillance data set of	OP:DSNM5-B

Copyright © 1999

packages.	5E12 and later
Requests that a package (PKG) be added to the five minute (M5) surveillance data set of packages for the on-site network management channel.	SET:DSNM5-A 5E10 - 5E11
Requests that a package (PKG) be added to the five minute (M5) surveillance data set of packages for the on-site network management channel.	SET:DSNM5-B 5E12 and later

Table 61 Customer Premise Equipment

Topic/Purpose	Message ID/ Message Release
Clears destination code cancellation (DCC) controls restricting traffic.	CLR:DCC 5E10 and later
Lists all destination code cancellation (DCC) controls in the office.	OP:DCC 5E10 and later
Requests that a destination code cancellation (DCC) control to be set or modified to restrict traffic to a specified destination code.	SET:DCC 5E10 and later

Table 62 DIAGNOSTIC TESTS

Topic/Purpose	Message ID/ Message Release
Requests to execute the main store (MAS) diagnostic phase with user-supplied address range, refresh rate, number of failures to be collected, data pattern (phase 95), words per array to copy (phase 96), and refresh parity check time (phase 96).	EX:LDPARM 5E10 and later
Requests to perform a specified group of diagnostic tasks repeatedly.	EX:LOOP 5E10 and later
To request to pause or suspend the diagnostic execution at a specified statement number within a diagnostic phase.	EX:PAUSE 5E10 and later
Requests to step through the diagnostic input messages and suspend at the specified statement number.	EX:STEP 5E10 and later
Requests to exit from the interactive diagnostic mode.	EX:STOP 5E10 and later
Requests that a circuit pack return tag is to be printed based on the information taken from the failing diagnostics on the switch.	OP:TAG 5E10 and later

Table 63 DIGITAL AUDIO TAPE

Topic/Purpose	Message ID/ Message Release
Copies the contents of a multi-volume formatted digital audio tape (DAT) from a source DAT drive to a destination DAT drive.	COPY:BKTAPE 5E10 and later
Displays the contents of the multi-volume digital audio tape (DAT) logical volume headers and optionally provides an estimate of how full the tape is.	DUMP:BKTAPE 5E10 and later

Table 64 DIGITAL FACILITY INTERFACE

Topic/Purpose	Message ID/ Message Release
Requests that actions on the digital facility interface (DFI) at the specified location be aborted.	ABT:DFI 5E10 and later
Allows hardware error checks to be performed on the specified digital facility interface (DFI).	ALW:HDW-DFI 5E10 and later
Requests that a digital facility interface (DFI) circuit be removed and diagnosed.	DGN:DFI 5E10 and later
Interactively diagnoses (exercises) the digital facility interface (DFI).	EX:DFI 5E10 and later
Requests that a digital facility interface (DFI) be removed from service.	RMV:DFI-A 5E10 only
Requests that a digital facility interface (DFI) be removed from service.	RMV:DFI-B 5E11 and later
Requests that a digital facility interface (DFI) be restored to service.	RST:DFI 5E10 and later
Requests that actions on the digital facility interface (DFI) at the specified location be stopped.	STP:DFI 5E10 and later

Copyright © 1999

Table 65 Communications Link Digital Facilities Interface

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	ABT:CDFI 5E10 and later
Allows maintenance interrupts to occur on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	ALW:HDW-CDFI 5E10 and later
Diagnoses an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit to determine if it is in working order.	DGN:CDFI 5E10 and later
Performs maintenance exercises on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	EX:CDFI 5E10 and later
Requests that an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit be removed from service.	RMV:CDFI 5E10 and later
Requests that an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit be restored to service.	RST:CDFI 5E10 and later
Requests that maintenance actions be stopped on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	STP:CDFI 5E10 and later

Table 66 Digital Facility Interface Circuit Pair

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH).	ABT:DFIH 5E10 and later
Allows hardware checks to occur on a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH).	ALW:HDW-DFIH 5E10 and later
Diagnoses a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) to determine whether it is in satisfactory working order.	DGN:DFIH 5E10 and later
Exercises a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH).	EX:DFIH 5E10 and later
Inhibits hardware checks in a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH).	INH:HDW-DFIH 5E10 and later
Requests that a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) be removed from service.	RMV:DFIH 5E10 and later
Requests that a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) be restored to the active state.	RST:DFIH 5E10 and later
Requests that maintenance actions on a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) be stopped.	STP:DFIH 5E10 and later

Table 67 DIGITAL NETWORK UNIT - SYNCHRONOUS

Topic/Purpose	Message ID/ Message Release
Requests that maintenance actions be aborted on a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC).	ABT:DNUSCC 5E10 and later
Requests that maintenance actions be aborted on a digital networking unit - synchronous optical network (DNU-S) common data (DNUSCD).	ABT:DNUSCD 5E10 and later
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:DNUSEOC 5E12 and later
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:DNUSTMC 5E12 and later
Requests that maintenance actions be aborted on a digital networking unit - Electrical Carrier Level 1 SONET Termination equipment facility (EC1STE).	ABT:EC1STE 5E13 and later
Requests that a specified action on a remote terminal (RT) facility circuit be aborted (ABT).	ABT:RTFAC 5E12 and later
Requests that hardware checks be allowed on a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC).	ALW:HDW-DNUSCC 5E10 and later
Requests that hardware checks be allowed on a digital networking unit - synchronous optical network (DNU-S) common data (DNUSCD).	ALW:HDW-DNUSCD 5E10 and later
Requests that diagnostics be executed on a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC).	DGN:DNUSCC 5E10 and later
Requests that diagnostics be executed on a digital networking unit - synchronous optical network (DNU-S) common data (DNUSCD).	DGN:DNUSCD 5E10 and later

Requests that maintenance actions be stopped on a digital networking unit - synchronous optical network (DNU-S) digital signal level 1 facility (DS1SFAC).	STP:DS1SFAC-B 5E12 only
Requests that maintenance actions be stopped on a digital networking unit - synchronous optical network (DNU-S) digital signal level 1 facility (DS1SFAC).	STP:DS1SFAC-C 5E13 and later

Table 74 DIRECT LINK NODE

Topic/Purpose	Message ID/ Message Release
Requests that the common network interface (CNI) automatic direct link node (DLN) heartbeat test be allowed.	ALW:DLNHB 5E10 and later
Requests that the common network interface (CNI) automatic direct link node (DLN) heartbeat test be inhibited.	INH:DLNHB 5E10 and later
Requests an initialization of the selected direct link node (DLN) at the specified level.	INIT:DLN 5E10 and later
Requests a single process purge (SPP) of a named process in a selected direct link node (DLN).	INIT:DLN-SPP-PID 5E10 and later
Switches the active standby status of the direct link nodes (DLN) on the common network interface (CNI) ring.	SW:DLN 5E10 and later

Table 75 Direct Signaling Events

Topic/Purpose	Message ID/ Message Release
Requests that the trapping and printing of direct signaling events (DSE) be turned off.	CLR:DSE-A 5E10 only
Requests that the trapping and printing of direct signaling events (DSE) be turned off.	CLR:DSE-B 5E11 only
Requests that the trapping and printing of direct signaling events (DSE) be turned off.	CLR:DSE-C 5E12 and later
Requests that the trapping and printing of direct signaling events (DSEs) be turned on.	SET:DSE-A 5E10 only
Requests that the trapping and printing of direct signaling events (DSEs) be turned on.	SET:DSE-B

	5E11 only
Requests that the trapping and printing of direct signaling events (DSEs) be turned on.	SET:DSE-C 5E12 and later

Table 76 Direct Signaling Translation Test

Topic/Purpose	Message ID/ Message Release
Requests that a direct signaling translation test (DSTT) be initiated.	EXC:DSTT 5E10 and later

Table 77 DIRECT USER INTERFACE

Topic/Purpose	Message ID/ Message Release
Requests that a specified direct user interface (DUI) be removed device from service.	RMV:DUI 5E10 and later
Requests that a direct user interface (DUI) device be restored to service.	RST:DUI 5E10 and later

Table 78 Direct User Interface Controller

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified direct user interface controller (DUIC).	DGN:DUIC 5E10 and later
Exercises a direct user interface controller (DUIC) in an interactive diagnostic mode.	EX:DUIC 5E10 and later
Requests that the specified direct user interface controller (DUIC) be removed from service.	RMV:DUIC 5E10 and later
Requests that a direct user interface controller (DUIC) be restored to service.	RST:DUIC 5E10 and later

Table 79 DIRECTLY CONNECTED OFFICE

Topic/Purpose	Message ID/ Message Release
Requests a list of all offices that have trunk groups terminating at this switch.	OP:DCOFC 5E10 and later

Table 80 DIRECTLY COUPLED TEST UNIT
Directly Coupled Test Unit Common Board

Topic/Purpose	Message ID/ Message Release
Requests that actions on the directly connected test unit common board (DCTUCOM) at the specified location be aborted.	ABT:DCTUCOM 5E10 and later
Requests that a directly connected unit common board (DCTUCOM) be diagnosed to determine whether it is in satisfactory working order.	DGN:DCTUCOM 5E10 and later
Interactively diagnoses (exercises) the directly connected test unit common board (DCTUCOM).	EX:DCTUCOM 5E10 and later
Requests that a directly connected test unit common board (DCTUCOM) circuit be removed from service.	RMV:DCTUCOM 5E10 and later
Requests that a single directly connected test unit common board (DCTUCOM) circuit be restored to service.	RST:DCTUCOM 5E10 and later
Requests that actions on the directly connected test unit common board (DCTUCOM) at the specified location be stopped.	STP:DCTUCOM 5E10 and later

Table 81 Directly Coupled Test Unit Port Circuit

Topic/Purpose	Message ID/ Message Release
Requests that actions on the directly connected test unit port circuit (DCTUPORT) at the specified location be aborted.	ABT:DCTUPORT 5E10 and later
Requests that a directly connected test unit port circuit (DCTUPORT) be diagnosed to determine whether it is in satisfactory working order.	DGN:DCTUPORT 5E10 and later
Requests interactive diagnostics (exercises) of the directly connected test unit port circuit	EX:DCTUPORT

(DCTUPORT).	5E10 and later
Requests that a directly connected test unit port circuit (DCTUPORT) be removed from service.	RMV:DCTUPORT 5E10 and later
Requests that a single directly connected test unit port circuit (DCTUPORT) circuit be restored to service.	RST:DCTUPORT 5E10 and later
Requests that actions on the directly connected test unit port (DCTUPORT) at the specified location be stopped.	STP:DCTUPORT 5E10 and later

Table 82 Equipment Access Network

Topic/Purpose	Message ID/ Message Release
Requests that actions on the equipment access network (EAN) at the specified location be aborted.	ABT:EAN 5E10 and later
Requests that an equipment access network (EAN) be diagnosed to determine whether it is in satisfactory working order.	DGN:EAN 5E10 and later
Interactively diagnoses (exercises) the equipment access network (EAN).	EX:EAN 5E10 and later
Requests that an equipment access network (EAN) be removed from service.	RMV:EAN 5E10 and later
Requests that a single equipment access network (EAN) circuit be restored to service.	RST:EAN 5E10 and later
Requests that actions on the equipment access network (EAN) at the specified location be stopped.	STP:EAN 5E10 and later

Table 83 Precision Measurement Unit

Topic/Purpose	Message ID/ Message Release
Requests that actions on the precision measurement unit (PMU) be aborted at the specified location.	ABT:PMU 5E10 and later
Requests that a precision measurement unit (PMU) be diagnosed to determine whether it is in satisfactory working order.	DGN:PMU 5E10 and later
Requests interactive diagnostics (exercises) of the precision measurement unit (PMU).	EX:PMU 5E10 and later
Requests that a precision measurement unit (PMU) be removed from service.	RMV:PMU 5E10 and later
Requests a single precision measurement unit (PMU) circuit be conditionally or unconditionally restored to service.	RST:PMU 5E10 and later
Requests that actions on the pulse metering unit (PMU) at the specified location be stopped.	STP:PMU 5E10 and later

Table 84 DISK FILE CONTROLLER

Topic/Purpose	Message ID/ Message Release
Requests that the specified disk file controller (DFC) be diagnosed.	DGN:DFC 5E10 and later
Exercises a disk file controller (DFC) in an interactive diagnostic mode.	EX:DFC 5E10 and later
Requests specific information regarding the specified disk file controller (DFC) and equipped sub-devices.	OP:DFC-INFO 5E10 and later
Requests that enhanced information report (EIR) entries of the disk driver logfile be printed and formatted.	OP:DFCELOG 5E10 and later
Requests that a specified disk file controller (DFC) and any associated moving head disks (MHDs) be removed from service.	RMV:DFC 5E10 and later
Requests that a disk file controller (DFC) be restored to service.	RST:DFC 5E10 and later
Requests a download of a pumpcode file into a small computer system interface (SCSI) device file controller's (DFC) non-volatile FLASH memory.	UPD:FLASH-DFC 5E10 and later

Table 85 DISTRIBUTE POINT BOARD

Topic/Purpose	Message ID/ Message Release
Requests that actions on the distribute point board (DIST) at the specified location be aborted.	ABT:DIST

	5E10 and later
Requests that a distribute point board (DIST) be diagnosed to determine whether it is in satisfactory working order.	DGN:DIST 5E10 and later
Interactively diagnoses (exercises) the distribute point board (DIST).	EX:DIST 5E10 and later
Requests that a distribute point board (DIST) be removed from service.	RMV:DIST 5E10 and later
Requests that a distribute point board (DIST) in a metallic service unit be restored to service.	RST:DIST 5E10 and later
Requests that actions on the distribute point board (DIST) at the specified location be stopped.	STP:DIST 5E10 and later

Table 86 DISTRIBUTING FRAME TEST ACCESS CIRCUIT

Topic/Purpose	Message ID/ Message Release
Requests that currently running actions be aborted without cleaning up on the distributing frame test access circuit (DFTAC).	ABT:DFTAC 5E10 and later
Requests that the distributing frame test access circuit (DFTAC) be diagnosed to determine whether it is in satisfactory working order.	DGN:DFTAC 5E10 and later
Interactively diagnoses (exercises) the distributing frame test access circuit (DFTAC) to determine whether it is in satisfactory working order.	EX:DFTAC 5E10 and later
Inhibits the hardware error checks performed on the specified distributing frame test access circuit (DFTAC).	INH:HDW-DFTAC 5E10 and later
Requests that the distributing frame test access circuit (DFTAC) be removed from service.	RMV:DFTAC 5E10 and later
Requests that the distributing frame test access circuit (DFTAC) be restored to the active state.	RST:DFTAC 5E10 and later
Requests that currently running actions on the distributing frame test access circuit (DFTAC) be stopped.	STP:DFTAC 5E10 and later

Table 87 DIVISION OF REVENUE HOURLY REPORT

Topic/Purpose	Message ID/ Message Release
Allows the division of revenue hourly (DRHR) report to be output to the traffic channel.	ALW:DRHR 5E10 and later
Inhibits the division of revenue hourly report (DRHR) from being output to the traffic channel.	INH:DRHR 5E10 and later
Requests either the collection (CLCT) or the print (PRINT) status of the division of revenue hourly report (DRHR), plant hour (PLNTHR), traffic 15 (TRFC15), and all sections of the traffic 30 (TRFC30) reports.	OP:MEASTAT 5E10 and later

Table 88 DMERT APPLICATION PROCESS

Topic/Purpose	Message ID/ Message Release
Allows a kernel process environment (OKP or SMKP) audit to execute automatically or allows an audit cycle in the administrative module (AM) to execute routinely.	ALW:AUD-ENV 5E10 and later
Requests a kernel process environment (OKP or SMKP) audit to be run in the administrative module.	AUD:ENV 5E10 and later
Inhibits the automatic execution of a kernel process environment (OKP or SMKP) audit or the routine execution of the cycle in the administrative module (AM).	INH:AUD-ENV 5E10 and later
Requests the status of a specific audit, all audits or all inhibited audits for a particular kernel process environment.	OP:ST-AUD-ENV 5E10 and later
Requests a report of the status of a specific audit, all audits, or all inhibited audits for a particular switching module (SM) or range of SMs.	OP:ST-AUD-SM 5E10 and later
Requests that the currently executing kernel process environment (OKP or SMKP) audit in the administrative module (AM) be stopped.	STP:AUD-ENV 5E10 and later

Table 89 DUAL LINK INTERFACE

Topic/Purpose	Message ID/ Message Release
Aborts an action on a specific dual link interface (DLI) or range of DLIs in the specified office	ABT:DLI

network and timing complex (ONTC).	5E10 and later
Diagnoses a specific dual link interface (DLI) or a range of DLIs in a switching module (SM) on a specified side of the office network and timing complex (ONTC), and determines if in satisfactory working order.	DGN:DLI 5E10 and later
Requests that the dual link interface (DLI) be exercised in a switching module (SM) on the specified office network and timing complex (ONTC) side in an interactive mode.	EX:DLI 5E10 and later
Requests a removal of a specific dual link interface (DLI) and places it in the 'OOS MAN RMV' state.	RMV:DLI 5E10 and later
Requests that a specific dual link interface (DLI) or range of DLIs be restored to service.	RST:DLI 5E10 and later
Requests that an action on a specific dual link interface (DLI) or range of DLIs in the specified office network and timing complex (ONTC) be stopped.	STP:DLI 5E10 and later

Table 90 DUAL SERIAL CHANNEL/COMPUTER INTERCONNECT

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified dual serial channel/computer interconnect (DCI).	DGN:DCI 5E10 and later
Exercises a dual serial channel/computer interconnect (DCI) in an interactive diagnostic mode.	EX:DCI 5E10 and later
Removes the specified dual serial channel/computer interconnect (DCI) from service.	RMV:DCI 5E10 and later
Restores a dual serial channel/computer interconnect (DCI), conditionally or unconditionally to service.	RST:DCI 5E10 and later
Requests a termination of the DCI process.	STOP:DCI 5E10 and later

Table 91 DUMP

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified moving head disk (MHD).	DGN:MHD 5E10 and later
Requests that the contents of a specified range of virtual addresses in the administrative module (AM) main memory be dumped as an action associated with a breakpoint.	DUMP:ADDR 5E10 and later
Dumps the contents of the offline cache into administrative module (AM) processor main memory.	DUMP:CACHE 5E10 and later
Requests that the contents of an ASCII file be dumped.	DUMP:F-ALL 5E10 and later
Dumps the contents of a file in the specified format.	DUMP:F-FORMAT 5E10 and later
Prints one or more lines of an American standard code for information interchange (ASCII) file.	DUMP:F-PARTL 5E10 and later
Requests that the contents of a specified range of virtual addresses in the administrative module (AM) kernel be dumped as an immediate action.	DUMP:KERN 5E10 and later
Dumps the contents of a specified single disk block or a range of blocks, in hexadecimal.	DUMP:MHD-BLOCK 5E10 and later
Dumps defect management information for a moving head disk (MHD).	DUMP:MHD-DEFECT 5E10 and later
Formats and prints the contents of a disk pack's volume table of contents (VTOC).	DUMP:MHD-VTOC 5E10 and later
Dumps the contents of the specified range of virtual addresses in administrative module (AM) main memory in the address space of the process with the specified process identifier.	DUMP:PID 5E10 and later
Dumps the contents of a specified range of physical addresses in main memory.	DUMP:PMEM 5E10 and later
Dumps the contents of one or more registers, either as an immediate action, or as an action associated with a breakpoint.	DUMP:REG 5E10 and later
Requests a dump of the common channel interoffice signaling (CCIS) signaling measurements (SMEAS) from history files.	DUMP:SMEAS 5E10 and later
Dumps the contents of a specified range of virtual addresses in administrative module (AM) main memory in the address space of the process with the specified utility identifier.	DUMP:UID 5E10 and later
Requests that the contents of one or more sequential memory locations in the specified	DUMP:UT-IDCU-A

integrated digital carrier unit (IDCU) be dumped.	5E10 only
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) be dumped.	DUMP:UT-IDCU-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) loop side interface (LSI) be dumped.	DUMP:UT-IDCULSI-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) loop side interface (LSI) be dumped.	DUMP:UT-IDCULSI-B 5E11 and later
Dumps the contents of one or more administrative module (AM) generic access package (GRASP) utility variables either as an immediate message or as an action associated with a breakpoint.	DUMP:UVAR 5E10 and later

Table 92 DYNAMIC OVERLOAD CONTROLS

Topic/Purpose	Message ID/ Message Release
Requests that dynamic overload control (DOC) treatment be allowed upon the reception of DOC signals for a specified trunk group.	ALW:DOC 5E10 and later
Requests that a dynamic overload control (DOC) response category and action be assigned for a specified common channel signaling (CCS) trunk group.	ASGN:DOC 5E10 and later
Requests that a single dynamic overload control (DOC) be cleared on a specified trunk group.	CLR:DOC 5E10 and later
Requests that the dynamic overload control (DOC) treatment be inhibited upon the reception of DOC signals on a per trunk group basis.	INH:DOC 5E10 and later

Table 93 Dynamic Overload Controls and Selective Incoming Load Control

Topic/Purpose	Message ID/ Message Release
Requests that the transmission of dynamic overload control (DOC) signals and the application of selective incoming load control (SILC) be allowed.	ALW:DSILC 5E10 and later
Requests that the transmission of dynamic overload control (DOC) signals and the application of selective incoming load control (SILC) be inhibited.	INH:DSILC 5E10 and later

Table 94 EMBEDDED OPERATIONS CHANNEL

Topic/Purpose	Message ID/ Message Release
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:DNUSEOC 5E12 and later
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:IDCUEOC 5E12 and later
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:RT-EOC-A 5E10 - 5E11
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:RT-EOC-B 5E12 and later
Requests that information describing the configuration of the embedded operations channel (EOC) and timeslot management channel (TMC) for the specified remote terminal (RT) be displayed.	OP:RT-CHAN 5E10 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:DNUSEOC 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:IDCUEOC 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RT-EOC-A 5E10 - 5E11
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RT-EOC-B 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:DNUSEOC 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:IDCUEOC 5E12 and later

Copyright © 1999

Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:RT-EOC-A 5E10 - 5E11
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:RT-EOC-B 5E12 and later
Request that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:DNUSEOC 5E12 and later
Request that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:IDCUEOC 5E12 and later
Requests that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:RT-EOC-A 5E10 - 5E11
Requests that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:RT-EOC-B 5E12 and later
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:DNUSEOC 5E12 and later
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:IDCUEOC 5E12 and later
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:RT-EOC-A 5E10 - 5E11
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:RT-EOC-B 5E12 and later

Table 95 EMERGENCY ACTION INTERFACE

Topic/Purpose	Message ID/ Message Release
Allows the logging and processing of emergency action interface (EAI) error interrupts from the 3B21D computer control unit (CU) specified in the identification field.	ALW:EAIINT 5E10 and later
Inhibits the logging and processing of emergency action interface (EAI) error interrupts from the 3B21D computer control unit (CU) specified in the identification field.	INH:EAIINT 5E10 and later
Clears the emergency dump partition status flag.	CLR:EMERDMP 5E10 and later
Requests the status of the emergency dump partition on the disk: full or empty.	OP:EMERSTAT 5E10 and later

Table 96 EMERGENCY DUMP

Topic/Purpose	Message ID/ Message Release
Request to clear the forced active state of an enhanced 911 service adjunct (ESA).	CLR:ESA 5E10 and later
Requests the current status of the enhanced 911 service adjuncts (ESAs).	OP:ESA 5E10 and later
Requests to make a specified enhanced 911 service adjunct (ESA) active.	SET:ESA 5E10 and later
Requests that an enhanced 911 (E911) test query be sent to the enhanced 911 service adjunct (ESA) to retrieve an emergency service number (ESN).	TST:E911 5E10 and later

Table 97 ENHANCED 911

Topic/Purpose	Message ID/ Message Release
Requests that the execution of the on-switch ECD audit be allowed.	ALW:ECDAUD 5E10 and later
Requests that the equipment configuration database (ECD) be audited.	AUD:ECD 5E10 and later
Compares the text portions of the disk and core images of a non-killable process.	CMPR:DISK-CORE 5E10 and later
Requests the immediate execution of the on-switch equipment configuration database (ECD) audit to audit the data in the root ECD database.	EXC:ECDAUD 5E10 and later
Requests that the execution of the on-switch ECD audit be inhibited.	INH:ECDAUD 5E10 and later
Requests that the status of a previous execution or a currently running on-switch ECD audit be output.	OP:ECDAUD 5E10 and later
Requests one or all of the available output classes in the equipment configuration database	OP:OUTCLS

(ECD) and the device(s) assigned to these output classes.	5E10 and later
Requests displays of information about all the reports available in the measurement output control (MOC) schedule table (SCHD).	OP:SCHD 5E10 and later
Request that the on-switch ECD audit be scheduled for automatic execution.	SCHED:ECDAUD 5E10 and later
Requests that a currently running on-switch ECD audit be terminated.	STOP:ECDAUD 5E10 and later

Table 98 EQUIPMENT CONFIGURATION DATA

Topic/Purpose	Message ID/ Message Release
Allows the logging and processing of all administrative module (AM) computer error sources.	ALW:ERRCHK 5E10 and later
Requests that the logging and processing of administrative module (AM) error interrupts attached to the unit specified in the identification field be allowed.	ALW:ERRINT 5E10 and later
Requests that the logging and processing of errors specific to the pseudo-nodes representing the administrative module (AM) control unit (CU) communities be allowed.	ALW:ERRSRC 5E10 and later

Table 99 ERROR SOURCES

Topic/Purpose	Message ID/ Message Release
Requests that essential service protection (ESP) be enabled.	ALW:ESP 5E10 and later
Requests that the essential service protection (ESP) be inhibited.	INH:ESP 5E10 and later

Table 100 ESSENTIAL SERVICE PROTECTION

Topic/Purpose	Message ID/ Message Release
Requests that the external sanity monitor (ESM) alarm be cleared.	CLR:ESM 5E10 and later

Table 101 EXTERNAL SANITY MONITOR

Topic/Purpose	Message ID/ Message Release
Request to inhibit reports of transmission facility performance monitoring (PM) threshold crossing alerts (refer to the REPT:FAC output message) for facilities terminated on a digital facility interface (DFI) model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	INH:FAC-A 5E10 - 5E11
Request to inhibit reports of transmission facility performance monitoring (PM) threshold crossing alerts (refer to the REPT:FAC output message) for facilities terminated on a digital facility interface (DFI) model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	INH:FAC-B 5E12 only
Request to inhibit reports of transmission facility performance monitoring (PM) threshold crossing alerts (refer to the REPT:FAC output message) for facilities terminated on a digital facility interface (DFI) model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S) number.	INH:FAC-C 5E13 and later

Table 102 FACILITY PERFORMANCE MONITORING ALERT

Topic/Purpose	Message ID/ Message Release
Requests that a scheduled feature activation counting and reconciliation (FACR) entry be removed.	DEL:FACR 5E10 and later
Requests that the feature activation counting and reconciliation (FACR) audit be started.	EXC:FACR 5E10 and later
Format 1 requests that the password for retrieval of the feature activation counting and reconciliation (FACR) output files be initialized.	INIT:FACR 5E10 and later
Requests for a report on either the state of the feature activation counting and reconciliation (FACR) audit or what scheduled requests have been made for execution of the FACR audit.	OP:FACR 5E10 and later
Requests that the feature activation counting and reconciliation (FACR) audit be scheduled for execution at a specific date and hour.	SCHED:FACR 5E10 and later

Copyright © 1999

Requests that a running feature activation counting and reconciliation (FACR) audit be terminated.	STP:FACR 5E10 and later

Table 103 FEATURE ACTIVATION COUNTING AND RECONCILIATION

Topic/Purpose	Message ID/ Message Release
Requests that a simple existence audit of files on the disks be run.	AUD:FILES 5E10 and later
Appends one line of user-supplied text at a specified location in a regular ASCII file.	IN:F-APND 5E10 and later
Deletes one or more lines from a regular ASCII file.	IN:F-DEL 5E10 and later
Replaces one or more lines of a regular ASCII file with one line of user-supplied text.	IN:F-REPL 5E10 and later
Reports the full pathname of a file in a mounted file system.	OP:FNAME 5E10 and later

Table 104 FILES

Topic/Purpose	Message ID/ Message Release
Requests that the access permissions of a specific file be changed.	ALW:FSYS-ACCESS 5E10 and later
Allows a removable file system to be mounted.	ALW:FSYS-MOUNT 5E10 and later
Requests that the owner and group of a specific file be changed.	ALW:FSYS-OWNER 5E10 and later
Removes a directory from the file system.	CLR:FSYS-DIR 5E10 and later
Request that a file be removed from a directory.	CLR:FSYS-FILE 5E10 and later
Requests that a specific file be moved into a contiguous area.	COPY:FSYS-CFILE 5E10 and later
Requests that a specific file be copied to another file or directory.	COPY:FSYS-FILE 5E10 and later
Creates a specified directory with read, write, and execute permissions for the owner, group and others (mode 777).	IN:FSYS-DIR 5E10 and later
Inhibits the use of a previously mounted file system.	INH:FSYS-UMOUNT 5E10 and later
Requests the number of blocks contained in all files and directories within each specified directory or filename.	OP:ST-DISKUSE 5E10 and later
Requests information about all of the mounted file systems.	OP:ST-FILESYS 5E10 and later
Requests the number of free blocks and free inodes available for online file systems.	OP:ST-FREEDISK 5E10 and later
Requests the contents of a specific directory or file.	OP:ST-LISTDIR 5E10 and later
Requests a 16-bit checksum for a specified file, and prints the number of blocks in the file.	OP:ST-SUM 5E10 and later
Requests a report indicating the space available in the specified file system be generated.	REPT:SPACE 5E10 and later

Table 105 FILE SYSTEMS

Topic/Purpose	Message ID/ Message Release
Requests that a package be deleted from the set of five-minute (M5) surveillance data packages for the on-site network management channel.	CLR:M5-A 5E10 only
Requests that a package be deleted from the set of five-minute (M5) surveillance data packages for the on-site network management channel.	CLR:M5-B 5E11 only
Requests that a package be deleted from the set of five-minute (M5) surveillance data packages for the on-site network management channel.	CLR:M5-C 5E12 only
Requests that a package be deleted from the set of five-minute (M5) surveillance data	CLR:M5-D

packages for the on-site network management channel.	5E13 and later
Requests a specified package from the five-minute (M5) surveillance data.	OP:M5-A 5E10 only
Requests a specified package from the five-minute (M5) surveillance data.	OP:M5-B 5E11 only
Requests a specified package from the five-minute (M5) surveillance data.	OP:M5-C 5E12 only
Requests a specified package from the five-minute (M5) surveillance data.	OP:M5-D 5E13 and later
Requests the five-minute surveillance packages (PKG) assigned for both the remote network management system (RNMS) (the primary channel) and on-site channel (the backup channel).	OP:M5PKG 5E10 and later
Requests that a package be added to the five-minute (M5) surveillance data set of packages for the on-site network management channel.	SET:M5-A 5E10 only
Requests that a package be added to the five-minute (M5) surveillance data set of packages for the on-site network management channel.	SET:M5-B 5E11 only
Requests that a package be added to the five-minute (M5) surveillance data set of packages for the on-site network management channel.	SET:M5-C 5E12 only
Requests that a package be added to the five-minute (M5) surveillance data set of packages for the on-site network management channel.	SET:M5-D 5E13 and later

Table 106 FIVE MINUTE SURVEILLANCE

Topic/Purpose	Message ID/ Message Release
Clears the forced configuration of the message switch control unit (MSCU).	CLR:FRC-MSCU 5E10 and later
Clears the forced configuration on the office network and timing complex common unit (ONTCCOM).	CLR:FRC-ONTCCOM 5E10 and later
Requests that the specified side of the message switch control unit (MSCU) be forced active.	SET:FRC-MSCU 5E10 and later
Requests that the specified side of the office network and timing complex common unit (ONTCCOM) be forced active.	SET:FRC-ONTCCOM 5E10 and later
This request is used to "force" active a particular function pack pair of a transmission rate conversion unit - model III (TRCU3) circuit.	SET:FRC-TRCU3 5E12 and later

Table 107 FORCED CONFIGURATION

Topic/Purpose	Message ID/ Message Release
Aborts actions on the specified foundation peripheral controller (FPC).	ABT:FPC 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified foundation peripheral controller (FPC).	ALW:HDW-FPC 5E10 and later
Requests diagnostics on a foundation peripheral controller (FPC) to determine if it is in satisfactory working order.	DGN:FPC 5E10 and later
Requests that the contents of one or more sequential memory location in the specified foundation peripheral controller (FPC) be dumped.	DUMP:UT-FPC-A 5E10 only
Requests that the contents of one or more sequential memory location in the specified foundation peripheral controller (FPC) be dumped.	DUMP:UT-FPC-B 5E11 and later
Requests that the foundation peripheral controller (FPC) be exercised in an interactive mode.	EX:FPC 5E10 and later
Requests that an unconditional call to a function using parameters in the specified foundation peripheral controller (FPC) be executed.	EXC:UT-FPC-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified foundation peripheral controller (FPC) be executed.	EXC:UT-FPC-B 5E11 and later
Inhibits the hardware error checks on the specified foundation peripheral controller (FPC).	INH:HDW-FPC 5E10 and later
Requests that a value be loaded into the memory of the specified foundation peripheral controller (FPC).	LOAD:UT-FPC-A 5E10 only
Requests that a value be loaded into the memory of the specified foundation peripheral controller (FPC).	LOAD:UT-FPC-B 5E11 and later
Requests that the specified foundation peripheral controller (FPC) be removed from service.	RMV:FPC

	5E10 and later
Requests that the specified foundation peripheral controller (FPC) be restored to service.	RST:FPC 5E10 and later
Requests that actions on the specified foundation peripheral controller (FPC) be stopped.	STP:FPC 5E10 and later
Requests a switch of the foundation peripheral controller (FPC) unit.	SW:FPC 5E10 and later

Table 108 FOUNDATION PERIPHERAL CONTROLLER

Topic/Purpose	Message ID/ Message Release
Requests that actions on the gated diode crosspoint access (GDXACC) be aborted at the specified location.	ABT:GDXACC 5E10 and later
Allows hardware error checks to be performed on the specified gated diode crosspoint access (GDXACC) circuit.	ALW:HDW-GDXACC 5E10 and later
Requests that a gated diode crosspoint access (GDXACC) circuit be removed and diagnosed.	DGN:GDXACC 5E10 and later
Requests interactive diagnostic (exercises) of the gated diode crosspoint access (GDXACC).	EX:GDXACC 5E10 and later
Inhibits the hardware error checks performed on the specified gated diode crosspoint access (GDXACC) circuit.	INH:HDW-GDXACC 5E10 and later
Requests that a GDX access (GDXACC) be removed from service.	RMV:GDXACC 5E10 and later
Requests that a gated diode crosspoint access (GDXACC) service group in a line unit be restored to service.	RST:GDXACC 5E10 and later
Requests that actions be stopped on the gated diode crosspoint access (GDXACC) at the specified location.	STP:GDXACC 5E10 and later

Table 109 GATED DIODE CROSSPOINT
Gated Diode Crosspoint Compensator

Topic/Purpose	Message ID/ Message Release
Requests that actions on the gated diode crosspoint compensator (GDXC) at the specified location be aborted.	ABT:GDXC 5E10 and later
Requests that a gated diode crosspoint compensator (GDXC) circuit be removed and diagnosed.	DGN:GDXC 5E10 and later
Requests interactive diagnostics (exercises) of the gated diode crosspoint compensator (GDXC).	EX:GDXC 5E10 and later
Inhibits the hardware error checks performed on the specified gated diode crosspoint compensator (GDXC) circuit.	INH:HDW-GDXC 5E10 and later
Requests that a gated diode crosspoint compensator (GDXC) be removed from service.	RMV:GDXC 5E10 and later
Requests that a gated diode crosspoint compensator (GDXC) board in a metallic service unit (MSU) be restored to service.	RST:GDXC 5E10 and later
Requests that actions be stopped on the gated diode crosspoint compensator (GDXC) at the specified location.	STP:GDXC 5E10 and later

Table 110 Gated Diode Crosspoint Control

Topic/Purpose	Message ID/ Message Release
Requests that actions on the gated diode crosspoint control (GDXCON) be aborted at the specified location.	ABT:GDXCON 5E10 and later
Allows hardware error checks to be performed on the specified gated diode crosspoint control (GDXCON).	ALW:HDW-GDXCON 5E10 and later
Requests that a gated diode crosspoint control (GDXCON) circuit be removed and diagnosed.	DGN:GDXCON 5E10 and later
Requests interactive diagnostic (exercises) of the gated diode crosspoint control (GDXCON).	EX:GDXCON 5E10 and later
Inhibits the hardware error checks performed on the specified gated diode crosspoint control (GDXCON) circuit.	INH:HDW-GDXCON 5E10 and later
Requests that a gated diode crosspoint control (GDXCON) be removed from service.	RMV:GDXCON

	5E10 and later
Requests that a gated diode crosspoint control (GDXCON) board in a line unit be restored to service as the active controller or to standby.	RST:GDXCON 5E10 and later
Requests that actions be stopped on the gated diode crosspoint control (GDXCON) at the specified location.	STP:GDXCON 5E10 and later
Requests that a gated diode crosspoint controller (GDXCON) be switched from the standby to the active state.	SW:GDXCON 5E10 and later

Table 111 Gated Diode Crosspoint Grid

Topic/Purpose	Message ID/ Message Release
Requests that actions on the gated diode crosspoint (GDX) grid be aborted at the specified location.	ABT:GRID 5E10 and later
Allows hardware error checks to be performed on the specified gated diode crosspoint grid (GRID).	ALW:HDW-GRID 5E10 and later
Requests that a gated diode crosspoint grid (GRID) in a line unit concentrator be removed from service and diagnosed.	DGN:GRID 5E10 and later
Requests interactive diagnostic (exercises) of the gated diode crosspoint grid (GRID).	EX:GRID 5E10 and later
Inhibits the hardware error checks performed on the specified gated diode crosspoint grid (GRID).	INH:HDW-GRID 5E10 and later
Inhibits the hardware error checks performed on the specified line unit model 2 (LU2) or line unit model 3 (LU3) grid board.	INH:HDW-GRIDBD 5E10 and later
Requests that a gated diode crosspoint grid (GRID) be removed from service.	RMV:GRID 5E10 and later
Requests that a gated diode crosspoint grid (GRID) in a line unit concentrator be restored to service.	RST:GRID 5E10 and later
Requests that actions stop on the gated diode crosspoint (GDX) grid at the specified location.	STP:GRID 5E10 and later
Requests the fabric exerciser to be run on a line unit grid.	TST:GRID 5E10 and later

Table 112 GENERIC ACCESS PROGRAM

Topic/Purpose	Message ID/ Message Release
Causes the administrative module (AM) generic access package (GRASP) transfer trace to start monitoring the flow of execution, as previously set up with an INIT:UMEM message.	ALW:UMEM 5E10 and later
Causes the definition of an administrative module (AM) generic access package (GRASP) transfer trace to be removed.	CLR:UMEM 5E10 and later
Requests that data be copied from virtual addresses in main memory to the administrative module (AM) generic access package (GRASP) utility variables.	COPY:PID 5E10 and later
Requests that data be copied from virtual addresses in main memory to administrative module (AM) generic access package (GRASP) utility variables as an immediate action.	COPY:UID 5E10 and later
Dumps the contents of the specified range of virtual addresses in administrative module (AM) main memory in the address space of the process with the specified process identifier.	DUMP:PID 5E10 and later
Dumps the contents of a specified range of virtual addresses in administrative module (AM) main memory in the address space of the process with the specified utility identifier.	DUMP:UID 5E10 and later
Overrides the administrative module (AM) default generic access package (GRASP) dynamic real-time limit with a specified limit until the specified clock time or the end of the debugging session, whichever occurs first.	IN:DTIME 5E10 and later
Causes the generic access package (GRASP) transfer trace to stop monitoring the flow of execution.	INH:UMEM 5E10 and later
Requests that the administration module generic access package (GRASP) be informed that a working utility circuit has been installed so that GRASP will again accept trace and hardware breakpoint definitions, reset the utility circuit if an error occurred, or end the GRASP session.	INIT:UC 5E10 and later
Specifies the definition of an administrative module (AM) generic access package (GRASP) trace to be set up.	INIT:UMEM 5E10 and later
Causes the contents of the administrative module (AM) generic access package (GRASP) trace to be dumped to a file.	OP:UMEM 5E10 and later
Starts a list of administrative module (AM) generic access package (GRASP) input messages that are to be performed when an external event breakpoint condition exists.	WHEN:COND 5E10 and later

Copyright © 1999

Requests that a list of administrative module (AM) generic access package (GRASP) messages be executed when a specified breakpoint condition exists.	WHEN:PID 5E10 and later
Requests that a list of administrative module (AM) generic access package (GRASP) messages that are to be performed when a specified breakpoint condition exists be triggered.	WHEN:UID 5E10 and later

Table 113 GLOBAL DIGITAL SERVICES FUNCTION

Topic/Purpose	Message ID/ Message Release
Aborts actions on the global digital services function (GDSF).	ABT:GDSF 5E10 and later
Allows maintenance hardware checks in a global digital services function (GDSF) circuit to occur.	ALW:HDW-GDSF 5E10 and later
Diagnoses a global digital services function (GDSF) circuit to determine whether it is in satisfactory working order.	DGN:GDSF 5E10 and later
Interactively diagnoses the global digital services function (GDSF) circuit.	EX:GDSF 5E10 and later
Checks hardware in a global digital services function (GDSF) circuit.	INH:HDW-GDSF 5E10 and later
Requests that a global digital services function (GDSF) circuit be removed from service.	RMV:GDSF 5E10 and later
Conditionally or unconditionally restores a global digital services function (GDSF) circuit to service.	RST:GDSF 5E10 and later
Requests that actions on the global digital services function (GDSF) circuit be stopped.	STP:GDSF 5E10 and later

Table 114 GLOBAL DIGITAL SERVICE UNIT COMMON BOARD

Topic/Purpose	Message ID/ Message Release
Requests that actions on the global digital service unit common (GDSUCOM) board be aborted at the specified location.	ABT:GDSUCOM 5E10 and later
Allows hardware error checks to be performed on the specified global digital service unit (DSU) common (GDSUCOM) board.	ALW:HDW-GDSUCOM 5E10 and later
Requests that a global digital service unit common (GDSUCOM) board be diagnosed to determine whether it is in satisfactory working order.	DGN:GDSUCOM 5E10 and later
Requests interactive diagnostics (exercises) of the global digital service circuit unit common (GDSUCOM) board.	EX:GDSUCOM 5E10 and later
Inhibits the hardware error checks performed on the specified global digital service unit common (GDSUCOM) board.	INH:HDW-GDSUCOM 5E10 and later
Requests that a global DSU common (GDSUCOM) board be removed from service.	RMV:GDSUCOM 5E10 and later
Requests that a global digital service unit common (GDSUCOM) board be restored to service.	RST:GDSUCOM 5E10 and later
Requests that actions on the global digital service unit common (GDSUCOM) board at the specified location be stopped.	STP:GDSUCOM 5E10 and later

Table 115 GLOBAL SWITCHING MODULE

Topic/Purpose	Message ID/ Message Release
Requests an initialization of named table(s) in the selected common channel signaling (CCS) global switching module (GSM).	INIT:SCCP-A 5E11 only
Requests an initialization of named table(s) in the selected common channel signaling (CCS) global switching module (GSM).	INIT:SCCP-B 5E12 and later
Requests the linkset or combined linkset servicing each accessible destination point code (DPC) for the common channel signaling (CCS) global switching module (GSM).	OP:CCS-ACDPC-A 5E11 only
Requests the linkset or combined linkset servicing each accessible destination point code (DPC) for the common channel signaling (CCS) global switching module (GSM).	OP:CCS-ACDPC-B 5E12 and later
Requests the number of currently active (in service) signaling links in each signaling linkset on the exchange.	OP:CCS-ACTLK-A 5E11 only
Requests the number of currently active (in service) member(s) in each signaling linkset on a common channel signaling (CCS) global switching module (GSM).	OP:CCS-ACTLK-B 5E12 and later
Generates the report of the members of a combined link set and gives the status of each of	OP:CCS-CLS-A

the members.	5E11 only
Requests status information of all members of one or more combined link sets (CLSs) on a given common channel signaling (CCS) global switching module (GSM).	OP:CCS-CLS-B 5E12 and later
Requests status information for one or more destination point codes (DPC) for a given common channel signaling (CCS) global switching module (GSM).	OP:CCS-DPC-A 5E11 only
Requests status information for one or more destination point codes (DPC) associated with a given common channel signaling (CCS) global switching module (GSM).	OP:CCS-DPC-B 5E12 and later
Requests a report of the destination point codes (DPCs) currently served by a specified SS7 link set or combined link set.	OP:CCS-DPCLS-A 5E11 only
Requests a report of the destination point codes (DPCs) currently served by a specified SS7 linkset or combined linkset on a common channel signaling (CCS) global switching module (GSM).	OP:CCS-DPCLS-B 5E12 and later
Outputs for each global switching modules (GSM) the common channel signaling (CCS) protocol type and status of the signaling links.	OP:CCS-GSM-A 5E11 only
Outputs for each global switching modules (GSM) the common channel signaling (CCS) protocol type and status of the signaling links.	OP:CCS-GSM-B 5E12 and later
Generates the report of the combined link set of which a given link set is a member.	OP:CCS-LSCLS-A 5E11 only
Generates the report of the combined link set of which a given link set is a member.	OP:CCS-LSCLS-B 5E12 and later
Requests status information for one or more signaling connection control part (SCCP) subsystem(s) at one or more destination point codes (DPCs).	OP:CCS-SCMG-A 5E11 only
Requests status information for one or more signaling connection control part (SCCP) subsystem(s) at one or more destination point codes (DPCs).	OP:CCS-SCMG-B 5E12 and later
Requests a display of the normal and current signaling link selection (SLS) distributions for all links currently carrying traffic to the destination point code (DPC) or a display of the normal and current SLS distribution of a link for a linkset (LS) or combined linkset (CLS) specified that is currently serving a DPC.	OP:CCS-SLS-A 5E11 only
Requests a display of the normal and current signaling link selection (SLS) distributions for all links currently carrying traffic to the specified destination point code (DPC) or a display of the normal and current SLS distribution of a link for a specific linkset (LS) or combined linkset (CLS) specified.	OP:CCS-SLS-B 5E12 and later
Requests the status of one or more common channel signaling (CCS) links.	OP:ST-CCSLK-A 5E11 only
Requests the status of one or more common channel signaling (CCS) links.	OP:ST-CCSLK-B 5E12 and later
Requests status of the common channel signaling (CCS) message delivery (MD) network.	OP:ST-MD-A 5E11 only
Requests status of the common channel signaling (CCS) message delivery (MD) network.	OP:ST-MD-B 5E12 and later
Removes a common channel signaling (CCS) link(s) from service by deactivating, inhibiting, or blocking the link(s).	RMV:CCSLK-A 5E11 only
Removes a common channel signaling (CCS) link(s) from service by deactivating, inhibiting, or blocking the link(s).	RMV:CCSLK-B 5E12 and later
Removes a common channel signaling (CCS) intra-global switching module (GSM) message delivery (MD) path internal to the GSM.	RMV:MD-A 5E11 only
Removes a common channel signaling (CCS) intra-global switching module (GSM) message delivery (MD) path internal to the GSM.	RMV:MD-B 5E12 and later
Restores service to a common channel signaling (CCS) link(s) by removing the deactivating, inhibiting, or blocking status on that link(s).	RST:CCSLK-A 5E11 only
Restores service to a common channel signaling (CCS) link(s) by removing the deactivating, inhibiting, or blocking status on that link(s).	RST:CCSLK-B 5E12 and later
Restores the intra-global switching module (GSM) common channel signal (CCS) message delivery (MD) path.	RST:MD-A 5E11 only
Restores the intra-global switching module (GSM) common channel signal (CCS) message delivery (MD) path.	RST:MD-B 5E12 and later
Schedules a link test to be run on a signaling link.	TST:CCSLK-A 5E11 only
Schedules a link test to be run on a signaling link.	TST:CCSLK-B 5E12 and later

Table 116 HARDWARE CHECKS

Topic/Purpose	Message ID/ Message Release
Requests that hardware error checks be allowed to be performed on the specified control data interface (CDI).	ALW:HDW-CDI 5E10 and later
Allows level 2 and level 3 hardware checks errors to be performed on one or all communication links (CLNKs).	ALW:HDW-CLNK 5E10 and later
Allows hardware error checks to be performed on all communication module (CM) units.	ALW:HDW-CM 5E10 and later
Allows hardware error checks to be performed on the specified *SLC*® 96 digital carrier line unit (DCLU).	ALW:HDW-DCLU 5E10 and later
Allows hardware error checks to be performed on the specified directly connected test unit common board (DCTUCOM).	ALW:HDW-DCTUCOM 5E10 and later
Allows hardware error checks to be performed on the specified digital facility interface (DFI).	ALW:HDW-DFI 5E10 and later
Allows hardware checks to occur on a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH).	ALW:HDW-DFIH 5E10 and later
Requests that hardware checks be allowed on a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC).	ALW:HDW-DNUSCC 5E10 and later
Requests that hardware checks be allowed on a digital networking unit - synchronous optical network (DNU-S) common data (DNUSCD).	ALW:HDW-DNUSCD 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified foundation peripheral controller (FPC).	ALW:HDW-FPC 5E10 and later
Allows maintenance hardware checks in a global digital services function (GDSF) circuit to occur.	ALW:HDW-GDSF 5E10 and later
Allows hardware error checks to be performed on the specified global digital service unit (DSU) common (GDSUCOM) board.	ALW:HDW-GDSUCOM 5E10 and later
Allows hardware error checks to be performed on the specified gated diode crosspoint access (GDXACC) circuit.	ALW:HDW-GDXACC 5E10 and later
Allows hardware error checks to be performed on the specified gated diode crosspoint control (GDXCON).	ALW:HDW-GDXCON 5E10 and later
Allows hardware error checks to be performed on the specified gated diode crosspoint grid (GRID).	ALW:HDW-GRID 5E10 and later
Allows hardware error checks to be performed on the specified line unit model 2 (LU2) or line unit model 3 (LU3) grid board.	ALW:HDW-GRIDBD 5E10 and later
Allows hardware error checks to be performed on the specified host switching module (HSM) digital facilities interface (HDFI) circuit.	ALW:HDW-HDFI 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) service group circuit.	ALW:HDW-IDCU 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) facility (IFAC) circuit.	ALW:HDW-IFAC 5E10 and later
Allows hardware checks on an integrated services line unit (ISLU) common controller (CC) or common data (CD).	ALW:HDW-ISLU 5E10 and later
Allows listing of ring trip interrupts in an integrated services line unit (ISLU) high level service circuit (HLSC).	ALW:HDW-ISLUHLSC 5E10 and later
Allows listing of interrupts in an integrated services line unit (ISLU) metallic access network (MAN).	ALW:HDW-ISLUMAN 5E10 and later
Allows listing of error sources in an integrated services line unit (ISLU) ringing generator (RG).	ALW:HDW-ISLURG 5E10 and later
Allows hardware checks in an integrated services test function (ISTF) unit to occur.	ALW:HDW-ISTF 5E10 and later
Allows maintenance hardware checks in a local digital service function (LDSF) circuit to occur.	ALW:HDW-LDSF 5E10 and later
Allows maintenance hardware checks in a local digital service unit - model 2 (LDSU2) board to occur.	ALW:HDW-LDSU 5E10 and later
Allows hardware error checks to be performed on the specified local digital service unit common (LDSUCOM) board.	ALW:HDW-LDSUCOM 5E10 and later
Allows hardware error checks to be performed on the specified line unit channel (LUCHAN).	ALW:HDW-LUCHAN 5E10 and later
Allows hardware error checks to be performed on the specified line unit common control (LUCOMC).	ALW:HDW-LUCOMC 5E10 and later

Allows hardware error checks to be performed on the specified line unit high level service circuit (LUHLSC).	ALW:HDW-LUHLSC 5E10 and later
Requests that a hardware check (HDWCHK) be allowed in a module controller/time-slot interchange unit (MCTSI).	ALW:HDW-MCTSI 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified module message processor (MMP).	ALW:HDW-MMP 5E10 and later
Allows hardware checks (errors) on a message switch control unit (MSCU).	ALW:HDW-MSCU 5E10 and later
Allows hardware error checks to be performed on the specified metallic service unit common (MSUCOM) board.	ALW:HDW-MSUCOM 5E10 and later
Requests that hardware error checks be allowed to be performed on a specified network clock reference (NCREF).	ALW:HDW-NCREF 5E10 and later
Allows hardware error checks to be performed on the specified office network and control complex (ONTC).	ALW:HDW-ONTC 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified pump peripheral controller (PPC).	ALW:HDW-PPC 5E10 and later
Allows hardware checks on a packet switch unit (PSU) common controller (COM) or protocol handler (PH).	ALW:HDW-PSU 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified quad-link packet switch gateway processor (QGP).	ALW:HDW-QGP 5E10 and later
Allows hardware checks in a recorded announcement function (RAF) unit to occur.	ALW:HDW-RAF 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified remote communication link (RCL) circuit between inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuits.	ALW:HDW-RCL 5E10 and later
Allows hardware error checks to be performed on the specified remote clock (RCLK) circuit at the peripheral interface control bus (PICB) level.	ALW:HDW-RCLK 5E10 and later
Allows hardware error checks to be performed on the specified remote clock oscillator (RCOSC) circuit.	ALW:HDW-RCOSC 5E10 and later
Allows hardware error checks to be performed on the specified remote clock oscillator cross couple (RCOXC) link.	ALW:HDW-RCOXC 5E10 and later
Allows hardware error checks to be performed on the specified remote clock reference (RCREF).	ALW:HDW-RCREF 5E10 and later
Allows hardware error checks to be performed on the specified remote clock cross couple (RCXC) circuit.	ALW:HDW-RCXC 5E10 and later
Allows hardware error checks to be performed on the specified remote switching module (RSM) digital facilities interface (RDFI) circuit.	ALW:HDW-RDFI 5E10 and later
Allows hardware error checks to be performed on the specified remote switching module (RSM) remote link interface (RLI) circuit.	ALW:HDW-RLI 5E10 and later
Allows hardware checks to occur on a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK).	ALW:HDW-RRCLK 5E10 and later
Allows hardware error checks to be performed on the specified revertive pulsing transceiver (RVPT).	ALW:HDW-RVPT 5E10 and later
Allows hardware checks in a service announcement system (SAS) unit to occur.	ALW:HDW-SAS 5E10 and later
Allows hardware error checks to be performed on the specified *SLC*® 96 digital facility interface (SDFI).	ALW:HDW-SDFI 5E10 and later
Requests that hardware checks be allowed on a digital networking unit - synchronous optical network (DNU-S) synchronous transport signal electrical interface (STSX-1) facility interface (SFI).	ALW:HDW-SFI 5E10 and later
Allows hardware error checks to be performed on the specified test and access circuit (TAC).	ALW:HDW-TAC 5E10 and later
Allows hardware error checks to be performed on the specified trunk equipment number (TEN).	ALW:HDW-TEN 5E10 and later
Requests that hardware checks be allowed on a digital networking unit - synchronous optical network (DNU-S) transmission multiplexer (TMUX).	ALW:HDW-TMUX 5E10 and later
Allows hardware error checks to be performed on the specified transmission test facility common (TTFCOM) circuit pack.	ALW:HDW-TTFCOM 5E10 and later
Allows hardware error checks to be performed on the specified universal conference (UCONF) circuit board.	ALW:HDW-UCONF 5E10 and later
Allows hardware error checks to be performed on the specified universal tone decoder (UTD).	ALW:HDW-UTD

	5E10 and later
Allows hardware error checks to be performed on the specified universal tone generator (UTG).	ALW:HDW-UTG 5E10 and later
Requests that the system status register be set such that a control unit (CU) switch can be implemented as a normal fault recovery procedure, thereby allowing a switch to the standby administrative module (AM) control unit when a fault occurs in the active AM control unit.	ALW:HDWCHK 5E10 and later
Requests that the printing of a line removal message on the receive-only printer (ROP) be allowed when a line unit, dial tone first (DTF) coin, or integrated services line unit (ISLU) Z-card (analog line) is placed out-of-service (OOS) maintenance (MTCE) high-and-wet (HW) ground (GRD).	ALW:HWGRD 5E10 and later
Inhibits maintenance interrupts on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.	INH:HDW-CDFI 5E10 and later
Inhibits the hardware error checks performed on the specified control data interface (CDI).	INH:HDW-CDI 5E10 and later
Inhibits all hardware error checks on all communication module (CM) units.	INH:HDW-CM 5E10 and later
Inhibits the hardware error checks performed on the specified *SLC*® 96 digital carrier line unit (DCLU).	INH:HDW-DCLU 5E10 and later
Inhibits the hardware error checks performed on the specified directly connected test unit common board (DCTUCOM).	INH:HDW-DCTUCOM 5E10 and later
Inhibits the hardware error checks performed on the specified digital facility interface (DFI).	INH:HDW-DFI 5E10 and later
Inhibits hardware checks in a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH).	INH:HDW-DFIH 5E10 and later
Inhibits the hardware error checks performed on the specified distributing frame test access circuit (DFTAC).	INH:HDW-DFTAC 5E10 and later
Requests that hardware checks be inhibited on a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC).	INH:HDW-DNUSCC 5E10 and later
Requests that hardware checks be inhibited on a digital networking unit - synchronous optical network (DNU-S) common data (DNUSCD).	INH:HDW-DNUSCD 5E10 and later
Inhibits the hardware error checks on the specified foundation peripheral controller (FPC).	INH:HDW-FPC 5E10 and later
Checks hardware in a global digital services function (GDSF) circuit.	INH:HDW-GDSF 5E10 and later
Inhibits the hardware error checks performed on the specified global digital service unit common (GDSUCOM) board.	INH:HDW-GDSUCOM 5E10 and later
Inhibits the hardware error checks performed on the specified gated diode crosspoint access (GDXACC) circuit.	INH:HDW-GDXACC 5E10 and later
Inhibits the hardware error checks performed on the specified gated diode crosspoint compensator (GDXC) circuit.	INH:HDW-GDXC 5E10 and later
Inhibits the hardware error checks performed on the specified gated diode crosspoint control (GDXCON) circuit.	INH:HDW-GDXCON 5E10 and later
Inhibits the hardware error checks performed on the specified gated diode crosspoint grid (GRID).	INH:HDW-GRID 5E10 and later
Inhibits the hardware error checks performed on the specified line unit model 2 (LU2) or line unit model 3 (LU3) grid board.	INH:HDW-GRIDBD 5E10 and later
Inhibits the hardware error checks performed on the specified host switching module (HSM) digital facilities interface (HDFI) circuit.	INH:HDW-HDFI 5E10 and later
Requests that interrupts in an integrated digital carrier unit (IDCU) service group circuit be inhibited.	INH:HDW-IDCU 5E10 and later
Requests that interrupts in an integrated digital carrier unit (IDCU) facility (IFAC) circuit be inhibited.	INH:HDW-IFAC 5E10 and later
Inhibits hardware checks on an integrated services line unit (ISLU) common controller (CC) or common data (CD).	INH:HDW-ISLU 5E10 and later
Inhibits ring trip interrupts in an integrated services line unit (ISLU) high level service circuit (HLSC).	INH:HDW-ISLUHLSC 5E10 and later
Inhibits interrupts in an integrated services line unit (ISLU) metallic access network (MAN).	INH:HDW-ISLUMAN 5E10 and later
Inhibits error sources in an integrated services line unit (ISLU) ringing generator (RG).	INH:HDW-ISLURG 5E10 and later
Inhibits hardware checks in an integrated services test function (ISTF) unit.	INH:HDW-ISTF

	5E10 and later
Checks hardware in a local digital service function (LDSF) circuit.	INH:HDW-LDSF 5E10 and later
Checks hardware in a local digital service unit - model 2 (LDSU2) board.	INH:HDW-LDSU 5E10 and later
Inhibits the hardware error checks performed on the specified local digital service unit common (LDSUCOM) board.	INH:HDW-LDSUCOM 5E10 and later
Inhibits the hardware error checks performed on the specified line unit channel (LUCHAN).	INH:HDW-LUCHAN 5E10 and later
Inhibits the hardware error checks performed on the specified line unit common control (LUCOMC).	INH:HDW-LUCOMC 5E10 and later
Inhibits the hardware error checks performed on the specified line unit high service circuit (LUHLSC).	INH:HDW-LUHLSC 5E10 and later
Requests that a hardware check (HDWCHK) be inhibited in a module controller/time-slot interchange unit (MCTSI).	INH:HDW-MCTSI 5E10 and later
Requests that hardware error checks on the specified module message processor (MMP) be inhibited.	INH:HDW-MMP 5E10 and later
Inhibits hardware checks (errors) on a message switch control unit (MSCU).	INH:HDW-MSCU 5E10 and later
Inhibits the hardware error checks performed on the specified metallic service unit common (MSUCOM) board.	INH:HDW-MSUCOM 5E10 and later
Requests that hardware error checks be inhibited on the specified network clock reference (NCREF).	INH:HDW-NCREF 5E10 and later
Inhibits the hardware error checks from being performed on the specified office network and timing complex (ONTC).	INH:HDW-ONTC 5E10 and later
Inhibits the hardware error checks performed on the specified pump peripheral controller (PPC).	INH:HDW-PPC 5E10 and later
Inhibits hardware checks on a packet switch unit (PSU) common controller (COM) or protocol handler (PH).	INH:HDW-PSU 5E10 and later
Requests that the hardware checks on the specified quad-link packet switch gateway processor (QGP) be inhibited.	INH:HDW-QGP 5E10 and later
Inhibits hardware checks in a recorded announcement function (RAF) unit.	INH:HDW-RAF 5E10 and later
Requests that the hardware error checks performed on the specified remote communication link (RCL) be inhibited.	INH:HDW-RCL 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock (RCLK) circuit at the peripheral interface control bus (PICB) level.	INH:HDW-RCLK 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock oscillator (RCOSC) circuit.	INH:HDW-RCOSC 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock oscillator cross couple (RCOXC) circuit.	INH:HDW-RCOXC 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock reference (RCREF).	INH:HDW-RCREF 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock cross couple (RCXC) circuit.	INH:HDW-RCXC 5E10 and later
Inhibits the hardware error checks performed on the specified remote switching module (RSM) digital facilities interface (RDFI) circuit.	INH:HDW-RDFI 5E10 and later
Inhibits the hardware error checks performed on the specified remote switching module (RSM) remote link interface (RLI) circuit.	INH:HDW-RLI 5E10 and later
Inhibits hardware checks in a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK).	INH:HDW-RRCLK 5E10 and later
Inhibits the hardware error checks performed on the specified revertive pulsing transceiver (RVPT).	INH:HDW-RVPT 5E10 and later
Inhibits hardware checks in a service announcement system (SAS) unit.	INH:HDW-SAS 5E10 and later
Inhibits the hardware error checks performed on the specified *SLC*® 96 digital facility interface (SDFI).	INH:HDW-SDFI 5E10 and later
Requests that hardware checks be inhibited on a digital networking unit - synchronous optical network (DNU-S) synchronous transport signal electrical interface (STSX-1) facility interface (SFI).	INH:HDW-SFI 5E10 and later
Inhibits the hardware error checks performed on the specified test and access circuit (TAC).	INH:HDW-TAC

	5E10 and later
Inhibits the hardware error checks performed on the specified trunk equipment number (TEN) circuit.	INH:HDW-TEN 5E10 and later
Requests that hardware checks be inhibited on a digital networking unit - synchronous optical network (DNU-S) transmission multiplexer (TMUX).	INH:HDW-TMUX 5E10 and later
Inhibits the hardware error checks performed on the specified transmission test facility common (TTFCOM) circuit pack.	INH:HDW-TTFCOM 5E10 and later
Inhibits the hardware error checks performed on the specified universal conference (UCONF) circuit board.	INH:HDW-UCONF 5E10 and later
Inhibits the hardware error checks performed on the specified universal tone decoder (UTD).	INH:HDW-UTD 5E10 and later
Inhibits the hardware error checks performed on the specified universal tone generator (UTG).	INH:HDW-UTG 5E10 and later
Request that the system status register be set such that a control unit (CU) switch is not implemented as a normal fault recovery action.	INH:HDWCHK 5E10 and later
Requests that the printing of a line removal message on the receive-only printer (ROP) be inhibited when a line unit, dial tone first (DTF) coin, or integrated services line unit (ISLU) Z-card (analog line) is placed out-of-service (OOS) maintenance (MTCE) high-and-wet (HW) ground (GRD).	INH:HWGRD 5E10 and later
Requests a printout of the hardware check status of the specified unit or set of units.	OP:HDWCHK 5E10 and later

Table 117 HIGH-SPEED SYNCHRONOUS DATA LINK

Topic/Purpose	Message ID/ Message Release
Requests that the specified high-speed synchronous data link (HSD) subdevice be removed from service.	RMV:HSD 5E10 and later
Requests that the specified high-speed synchronous data link (HSD) subdevice be restored to service.	RST:HSD 5E10 and later

Table 118 High-Speed Synchronous Data Link Controller

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified high-speed synchronous data link controller (HSDC).	DGN:HSDC 5E10 and later
Exercises a high-speed synchronous datalink controller (HSDC) in an interactive diagnostic mode.	EX:HSDC 5E10 and later
Requests that the specified high-speed synchronous data link controller (HSDC) be removed from service.	RMV:HSDC 5E10 and later
Requests that a high-speed synchronous data link (HSD) controller (HSDC) be restored to service.	RST:HSDC 5E10 and later

Table 119 HIGH PRIORITY REMOTE INTERFACE

Topic/Purpose	Message ID/ Message Release
To deactivate the high priority terminal feature.	CLR:HPRI 5E12 and later
To determine the status of high priority terminal feature.	OP:HPRI 5E12 and later
To requests that a terminal be set up as a high priority terminal.	SET:HPRI 5E12 and later

Table 120 INHIBITS

Topic/Purpose	Message ID/ Message Release
Requests a list of all inhibited administrative module error conditions, including ERRINT, ERRSRC, HDWCHK, and SFTCHK.	OP:ERRCHK 5E10 and later

Table 121 IN-PROCESS CALL TRACING

Topic/Purpose	Message ID/ Message Release

Requests an in-progress call trace (IPCT) by using either the directory number (DN), the multiline hunt group and member number (MLHG), the trunk group and member number (TKGMN), or the process ID (PID) of the party to be traced.	TRC:IPCT 5E10 and later

Table 122 INPUT/OUTPUT PROCESSOR

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified input/output processor (IOP).	DGN:IOP 5E10 and later
Exercises an input/output processor (IOP) in an interactive diagnostic mode.	EX:IOP 5E10 and later
Requests that the specified input/output processor (IOP) and any associated peripheral controllers (PCs) be removed from service.	RMV:IOP 5E10 and later
Requests that an input/output processor (IOP) be restored to service.	RST:IOP 5E10 and later

Table 123 Input/Output Processor Driver

Topic/Purpose	Message ID/ Message Release
Requests that option setting be allowed in the input/output processor (IOP) driver to suppress IOP driver messages.	CLR:IODRV 5E10 and later
Reports the current options set for the administrative module (AM) input/output processor (IOP) driver messages.	OP:IODRV 5E10 and later
Requests that the input/output processor (IOP) driver (IODRV) print messages.	SET:IODRV 5E10 and later

Table 124 INPUT MESSAGE CATALOG

Topic/Purpose	Message ID/ Message Release
Invalidates the memory segments of the old input message catalog, forcing the new one to be loaded into the main memory.	CLR:IMCAT 5E10 and later

Table 125 INTEGRATED DIGITAL CARRIER UNIT

Topic/Purpose	Message ID/ Message Release
Requests that a specified action on an integrated digital carrier unit (IDCU) service group be aborted (ABT).	ABT:IDCU 5E10 and later
Requests that a specified action on an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be aborted (ABT).	ABT:IDCUELI 5E10 and later
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:IDCUEOC 5E12 and later
Requests that a specified action on an integrated digital carrier unit (IDCU) peripheral interface data bus (PIDB) or direct PIDB (DPIDB) pair (both IDCU service groups) be aborted (ABT).	ABT:IDCUPIDB 5E10 and later
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:IDCUTMC 5E12 and later
Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) service group circuit.	ALW:HDW-IDCU 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit.	ALW:HDW-IDCUELI 5E10 and later
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be allowed.	ALW:RT-REPT-A 5E10 - 5E11
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be allowed.	ALW:RT-REPT-B 5E12 and later
Requests that equipment numbers relating to remote terminals (RT) that interface to an integrated digital carrier unit (IDCU) be converted.	CNVT:RT-A 5E10 - 5E11
Requests that equipment numbers relating to remote terminals (RT) that interface to an integrated digital carrier unit (IDCU) or a digital networking unit - synchronous optical network (DNU-S) be converted.	CNVT:RT-B 5E12 and later
Requests that an integrated digital carrier unit (IDCU) service group circuit be diagnosed.	DGN:IDCU 5E10 and later

Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) be dumped.	DUMP:UT-IDCU-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) be dumped.	DUMP:UT-IDCU-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) loop side interface (LSI) be dumped.	DUMP:UT-IDCULSI-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) loop side interface (LSI) be dumped.	DUMP:UT-IDCULSI-B 5E11 and later
Requests that an integrated digital carrier unit (IDCU) service group circuit be interactively diagnosed.	EX:IDCU 5E10 and later
Requests the provisioning of a TR303 remote terminal (RT) on an Integrated Digital Carrier Unit (IDCU) or Digital Network Unit SONET (DNU-S).	EXC:RT-PROV-A 5E10 - 5E11
Requests the provisioning of a TR303 remote terminal (RT) on an Integrated Digital Carrier Unit (IDCU) or Digital Network Unit SONET (DNU-S).	EXC:RT-PROV-B 5E12 and later
Requests that interrupts in an integrated digital carrier unit (IDCU) service group circuit be inhibited.	INH:HDW-IDCU 5E10 and later
Requests that interrupts in an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be inhibited.	INH:HDW-IDCUELI 5E10 and later
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be inhibited.	INH:RT-REPT-A 5E10 - 5E11
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be inhibited.	INH:RT-REPT-B 5E12 and later
Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU).	LOAD:UT-IDCU-A 5E10 only
Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU).	LOAD:UT-IDCU-B 5E11 and later
Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU) loop side interface (LSI).	LOAD:UT-IDCULSI-A 5E10 only
Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU) loop side interface (LSI).	LOAD:UT-IDCULSI-B 5E11 and later
Requests a status message of the provisionable elements of a remote terminal (RT) terminating on an IDCU or DNUS.	OP:RT-PROV-A 5E10 - 5E11
Requests a status message of the provisionable elements of a remote terminal (RT) terminating on an IDCU or DNUS.	OP:RT-PROV-B 5E12 and later
Requests the current status of the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC).	OP:RT-REPT-A 5E10 - 5E11
Requests the current status of the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC).	OP:RT-REPT-B 5E12 and later
Requests that an integrated digital carrier unit (IDCU) service group circuit be removed from service.	RMV:IDCU 5E10 and later
Requests that an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be removed from service unconditionally, by preempting the current user.	RMV:IDCUELI 5E10 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:IDCUEOC 5E12 and later
Requests that an integrated digital carrier unit (IDCU) peripheral interface data bus (PIDB) or direct PIDB (DPIDB) pair (both IDCU service groups) be removed from service.	RMV:IDCUPIDB 5E10 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:IDCUTMC 5E12 and later
Requests that an integrated digital carrier unit (IDCU) service group circuit be restored to service either conditionally or unconditionally.	RST:IDCU 5E10 and later
Requests that an integrated digital circuit unit (IDCU) electrical line interface (ELI) circuit be restored to service.	RST:IDCUELI 5E10 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:IDCUEOC 5E12 and later
Requests that an integrated digital carrier unit (IDCU) peripheral interface data bus (PIDB) or direct PIDB (DPIDB) pair (both IDCU service groups) be restored to service.	RST:IDCUPIDB 5E10 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:IDCUTMC 5E12 and later
Requests that actions on an integrated digital carrier unit (IDCU) service group circuit be	STP:IDCU

stopped.	5E10 and later
Requests that actions on an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be stopped.	STP:IDCUELI 5E10 and later
Request that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:IDCUEOC 5E12 and later
Requests that actions on an integrated digital carrier unit (IDCU) peripheral interface data bus (PIDB) or direct PIDB (DPIDB) pair (both IDCU service groups) be stopped.	STP:IDCUPIDB 5E10 and later
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:IDCUTMC 5E12 and later
Requests that the active and standby integrated digital carrier unit (IDCU) service group circuits be switched (interchanged).	SW:IDCU 5E10 and later
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:IDCUEOC 5E12 and later
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:IDCUTMC 5E12 and later

Table 126 INTEGRATED SERVICES DIGITAL NETWORK

Topic/Purpose	Message ID/ Message Release
Requests that the trapping and printing of the intergrated services digital network (ISDN) user part (ISUP) events be turned off.	CLR:ISUP 5E10 and later
Requests that a remote digital test access (RDTA) connection be set up between the port to be tested and the output facility where the protocol analysis equipment is located.	EXC:RDTA-A 5E10 - 5E11
Requests that a remote digital test access (RDTA) connection be set up between the port to be tested and the output facility where the protocol analysis equipment is located.	EXC:RDTA-B 5E12 and later
Requests a listing of the unassigned (UNA) lines, the integrated *SLC*® (ISLC) lines, and/or the integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, *SLC*® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs).	OP:LISTOTO-A 5E10 - 5E11
Requests a listing of the unassigned (UNA) lines, the integrated *SLC*® (ISLC) lines, and/or the integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, *SLC*® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs).	OP:LISTOTO-B 5E12 and later
Requests a report of a specific remote digital test access (RDTA) session or a summary of all currently active RDTA sessions.	OP:RDTA-A 5E10 - 5E11
Requests a report of a specific remote digital test access (RDTA) session or a summary of all currently active RDTA sessions.	OP:RDTA-B 5E12 only
Requests a report of a specific remote digital test access (RDTA) session or a summary of all currently active RDTA sessions.	OP:RDTA-C 5E13 and later
Requests that the trapping and printing of intergrated services digital network (ISDN) user part (ISUP) events be turned on.	SET:ISUP 5E10 and later
Requests that a given active remote digital test access (RDTA) session be stopped.	STP:RDTA 5E10 and later
To update the timer value for a given active remote digital test access (RDTA) session and to change the duration period.	UPD:RDTA 5E10 and later
Requests verification of an active remote digital test access (RDTA) session for a specific port under test (PUT).	VFY:RDTA-A 5E10 - 5E11
Requests verification of an active remote digital test access (RDTA) session for a specific port under test (PUT).	VFY:RDTA-B 5E12 and later

Table 127 INTEGRATED SERVICES LINE UNIT

Topic/Purpose	Message ID/ Message Release
Requests that actions be aborted on an integrated services line unit common controller (ISLUCC).	ABT:ISLUCC 5E10 and later
Requests the actions be aborted on an integrated services line unit common data (ISLUCD).	ABT:ISLUCD 5E10 and later
Allows hardware checks on an integrated services line unit (ISLU) common controller (CC) or common data (CD).	ALW:HDW-ISLU 5E10 and later
Requests that hardware checks be allowed on an integrated services line unit common data (ISLUCD).	ALW:HDW-ISLUCD 5E10 and later
Requests that line card/network termination (NT) mismatch detection be allowed on integrated	ALW:MISMATCH

services digital network (ISDN) lines equipped with U-cards.	5E10 and later
Requests that diagnostics be executed on an integrated services line unit common controller (ISLUCC).	DGN:ISLUCC 5E10 and later
Requests that diagnostics be executed on an integrated services line unit common data (ISLUCD).	DGN:ISLUCD 5E10 and later
Requests that diagnostics be executed on an integrated services line unit line card (ISLULC).	DGN:ISLULC 5E10 and later
Requests that diagnostics be executed on an integrated services line unit line group controller (ISLULGC).	DGN:ISLULGC 5E10 and later
Requests that an integrated services line unit common controller (ISLUCC) be exercised (diagnosed interactively).	EX:ISLUCC 5E10 and later
Requests that an integrated services line unit common data (ISLUCD) be exercised (diagnosed interactively).	EX:ISLUCD 5E10 and later
Requests that an integrated services line unit line card (ISLULC) be exercised (diagnosed interactively).	EX:ISLULC 5E10 and later
Requests an integrated services line unit line group controller (ISLULGC) be exercised (diagnosed interactively).	EX:ISLULGC 5E10 and later
Inhibits hardware checks on an integrated services line unit (ISLU) common controller (CC) or common data (CD).	INH:HDW-ISLU 5E10 and later
Requests that hardware checks be inhibited on an integrated services line unit common controller (ISLUCC).	INH:HDW-ISLUCC 5E10 and later
Requests that hardware checks be inhibited on an integrated services line unit common data (ISLUCD).	INH:HDW-ISLUCD 5E10 and later
Requests that line card/network termination (NT) mismatch detection be inhibited on integrated services digital network (ISDN) lines equipped with U-cards.	INH:MISMATCH 5E10 and later
The OP:HIST input request prints a range of the stored requests from the history buffer to the terminal.	OP:HIST 5E10 and later
Requests the output of the most recently retained (logged) output messages of the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or packet switching unit protocol handler (PSUPH).	OP:HISTORY-A 5E10 - 5E11
Requests the output of the most recently retained (logged) output messages of the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or packet switching unit protocol handler (PSUPH).	OP:HISTORY-B 5E12 only
Requests the printing of the most recently retained (logged) output reports and/or the event history from the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or from the specified packet switching unit protocol handler (PSUPH).	OP:HISTORY-C 5E13 and later
Requests that an integrated services line unit common data (ISLUCD) be removed from service either conditionally or unconditionally.	RMV:ISLUCD 5E10 and later
Requests that an integrated services line unit line card (ISLULC) be removed from service.	RMV:ISLULC 5E10 and later
Requests that an integrated services line unit line group controller (ISLULGC) be removed service.	RMV:ISLULGC 5E10 and later
Requests that an integrated services line unit common controller (ISLUCC) be restored to service.	RST:ISLUCC 5E10 and later
Requests that an integrated services line unit common data (ISLUCD) be restored to service.	RST:ISLUCD 5E10 and later
Requests that an integrated services line unit line card (ISLULC) be restored to service.	RST:ISLULC 5E10 and later
Requests that an integrated services line unit line group controller (ISLULGC) be restored to service.	RST:ISLULGC 5E10 and later
Requests the actions be stopped on an integrated services line unit common controller (ISLUCC).	STP:ISLUCC 5E10 and later
Requests the actions be stopped on an integrated services line unit common data (ISLUCD).	STP:ISLUCD 5E10 and later
Requests the actions be stopped on an integrated services line unit line card (ISLULC).	STP:ISLULC 5E10 and later
Requests the actions be stopped on an integrated services line unit line group controller (ISLULGC).	STP:ISLULGC 5E10 and later
Requests that the active/standby states of the integrated services line unit common controller (ISLUCC) be switched (interchanged).	SW:ISLUCC 5E10 and later
Requests that the active/standby states of the integrated services line unit common data	SW:ISLUCD

(ISLUCD) be switched (interchanged).	5E10 and later

Table 128 Integrated Services Line Unit Common Controller

Topic/Purpose	Message ID/ Message Release
Requests that hardware checks be allowed on an integrated services line unit common controller (ISLUCC).	ALW:HDW-ISLUCC 5E10 and later
Requests that the contents of one or more sequential memory locations in the specified integrated services line unit common controller (ISLUCC) be dumped.	DUMP:UT-ISLUCC-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified integrated services line unit common controller (ISLUCC) be dumped.	DUMP:UT-ISLUCC-B 5E11 and later
Requests that an unconditional call be made to a function using parameters in the specified integrated services line unit common controller (ISLUCC).	EXC:UT-ISLUCC-A 5E10 only
Requests that an unconditional call be made to a function using parameters in the specified integrated services line unit common controller (ISLUCC).	EXC:UT-ISLUCC-B 5E11 and later
Requests that a value be loaded into the memory of the specified integrated services line unit common controller (ISLUCC).	LOAD:UT-ISLUCC-A 5E10 only
Requests that a value be loaded into the memory of the specified integrated services line unit common controller (ISLUCC).	LOAD:UT-ISLUCC-B 5E11 and later
Requests that an integrated services line unit common controller (ISLUCC) be removed from service.	RMV:ISLUCC 5E10 and later

Table 129 Integrated Services Line Unit High Level Service Circuit

Topic/Purpose	Message ID/ Message Release
Aborts a specified action on the integrated services line unit high level service circuit (ISLUHLSC).	ABT:ISLUHLSC 5E10 and later
Allows listing of ring trip interrupts in an integrated services line unit (ISLU) high level service circuit (HLSC).	ALW:HDW-ISLUHLSC 5E10 and later
Diagnoses an integrated services line unit high level service circuit (ISLUHLSC) to determine whether it is in satisfactory working order.	DGN:ISLUHLSC 5E10 and later
Interactively diagnoses the integrated services line unit high level service circuit (ISLUHLSC).	EX:ISLUHLSC 5E10 and later
Inhibits ring trip interrupts in an integrated services line unit (ISLU) high level service circuit (HLSC).	INH:HDW-ISLUHLSC 5E10 and later
Requests that an integrated services line unit high level service circuit (ISLUHLSC) be removed from service.	RMV:ISLUHLSC 5E10 and later
Requests that an integrated services line unit high level service circuit (ISLUHLSC) be restored to service.	RST:ISLUHLSC 5E10 and later
Requests that the specified action on the integrated services line unit high level service circuit (ISLUHLSC) be stopped.	STP:ISLUHLSC 5E10 and later

Table 130 Integrated Services Line Unit Integrated Services Test Function

Topic/Purpose	Message ID/ Message Release
Aborts the specified actions on the integrated services test function (ISTF) unit.	ABT:ISTF 5E10 and later
Allows hardware checks in an integrated services test function (ISTF) unit to occur.	ALW:HDW-ISTF 5E10 and later
Diagnoses and removes an integrated service test function (ISTF) unit to determine whether it is in satisfactory working order.	DGN:ISTF 5E10 and later
Interactively diagnoses the integrated services test function (ISTF) unit.	EX:ISTF 5E10 and later
Inhibits hardware checks in an integrated services test function (ISTF) unit.	INH:HDW-ISTF 5E10 and later
Requests that an integrated services test function (ISTF) unit be removed from service.	RMV:ISTF 5E10 and later
Requests that an integrated services test function (ISTF) unit be restored to service.	RST:ISTF 5E10 and later
Requests that the specified actions on the integrated services test function (ISTF) unit be stopped.	STP:ISTF 5E10 and later

Copyright © 1999

Table 131 Integrated Services Line Unit Line Board

Topic/Purpose	Message ID/ Message Release
Request the actions be aborted on an integrated services line unit line board (ISLULBD).	ABT:ISLULBD 5E10 and later
Requests that diagnostics be executed on an integrated services line unit line board (ISLULBD).	DGN:ISLULBD 5E10 and later
Requests that an integrated services line unit line board (ISLULBD) be exercised (diagnosed interactively).	EX:ISLULBD 5E10 and later
Requests that an integrated services line unit line board (ISLULBD) be removed from service.	RMV:ISLULBD 5E10 and later
Requests that an integrated services line unit line board (ISLULBD) be restored to service.	RST:ISLULBD 5E10 and later
Requests the actions be stopped on an integrated services line unit line board (ISLULBD).	STP:ISLULBD 5E10 and later

Table 132 Integrated Services Line Unit Line Circuit

Topic/Purpose	Message ID/ Message Release
Request the actions be aborted on an integrated services line unit line circuit (ISLULCKT).	ABT:ISLULCKT 5E10 and later
Requests that diagnostics be executed on an integrated services line unit line circuit (ISLULCKT).	DGN:ISLULCKT 5E10 and later
Requests that an integrated services line unit line circuit (ISLULCKT) be exercised (diagnosed interactively).	EX:ISLULCKT 5E10 and later
Requests that an integrated services line unit line circuit (ISLULCKT) be removed from service.	RMV:ISLULCKT 5E10 and later
Requests that an integrated services line unit line circuit (ISLULCKT) be restored to service.	RST:ISLULCKT 5E10 and later
Requests the actions be stopped on an integrated services line unit line circuit (ISLULCKT).	STP:ISLULCKT 5E10 and later

Table 133 Integrated Services Line Unit Line Group

Topic/Purpose	Message ID/ Message Release
Requests actions be aborted on an integrated services line unit line group (ISLULG).	ABT:ISLULG 5E10 and later
Requests that diagnostics be executed on an integrated services line unit line group (ISLULG).	DGN:ISLULG 5E10 and later
Requests that an integrated services line unit line group (ISLULG) be removed service.	RMV:ISLULG 5E10 and later
Requests that an integrated services line unit line group (ISLULG) be restored to service.	RST:ISLULG 5E10 and later
Requests the actions be stopped on an integrated services line unit line group (ISLULG).	STP:ISLULG 5E10 and later

Table 134 Integrated Services Line Unit Metallic Access Network

Topic/Purpose	Message ID/ Message Release
Request the actions be aborted on an integrated services line unit line card (ISLULC).	ABT:ISLULC 5E10 and later
Requests actions be aborted on an integrated services line unit line group controller (ISLULGC).	ABT:ISLULGC 5E10 and later
Aborts a specified action on the integrated services line unit metallic access network (ISLUMAN).	ABT:ISLUMAN 5E10 and later
Allows listing of interrupts in an integrated services line unit (ISLU) metallic access network (MAN).	ALW:HDW-ISLUMAN 5E10 and later
Diagnoses an integrated services line unit metallic access network (ISLUMAN) to determine whether it is in satisfactory working order.	DGN:ISLUMAN 5E10 and later
Interactively diagnoses the integrated services line unit metallic access network (ISLUMAN).	EX:ISLUMAN 5E10 and later
Inhibits interrupts in an integrated services line unit (ISLU) metallic access network (MAN).	INH:HDW-ISLUMAN

	5E10 and later
Requests that an integrated services line unit metallic access network (ISLUMAN) be removed from service.	RMV:ISLUMAN 5E10 and later
Requests that an integrated services line unit metallic access network (ISLUMAN) be restored to service.	RST:ISLUMAN 5E10 and later
Requests that specified action on the integrated services line unit metallic access network (ISLUMAN) be stopped.	STP:ISLUMAN 5E10 and later

Table 135 Integrated Services Line Unit Peripheral Interface Data Bus

Topic/Purpose	Message ID/ Message Release
Aborts actions on an integrated services line unit (ISLU) peripheral interface data bus (PIDB) pair (both service groups).	ABT:ISLUPIDB 5E10 and later
Requests that the contents of one or more sequential memory locations in the specified packet interface (PI) unit be dumped.	DUMP:UT-MCTSI-PI-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified packet interface (PI) unit be dumped.	DUMP:UT-MCTSI-PI-B 5E11 and later
Requests that an unconditional call or a goto to a function be executed using parameters in the specified peripheral interface (PI) unit.	EXC:UT-MCTSI-PI-A 5E10 only
Format 1 requests that an unconditional call to a function using parameters in the specified peripheral interface (PI) unit be executed.	EXC:UT-MCTSI-PI-B 5E11 and later
Requests that a value be loaded into the memory of the specified peripheral interface (PI) unit.	LOAD:UT-MCTSI-PI-A 5E10 only
Requests that a value be loaded into the memory of the specified peripheral interface (PI) unit.	LOAD:UT-MCTSI-PI-B 5E11 and later
Requests that an integrated services line unit peripheral interface data bus (ISLUPIDB) pair be removed from service.	RMV:ISLUPIDB 5E10 and later
Requests that an integrated services line unit peripheral interface data bus (ISLUPIDB) pair be restored to service.	RST:ISLUPIDB 5E10 and later
Requests that removes and restores on an integrated services line unit (ISLU) peripheral interface data bus (PIDB) pair (both service groups) be stopped.	STP:ISLUPIDB 5E10 and later

Table 136 Integrated Services Line Unit Ringing Generator

Topic/Purpose	Message ID/ Message Release
Aborts a specified action on the integrated services line unit ringing generator (ISLURG).	ABT:ISLURG 5E10 and later
Allows listing of error sources in an integrated services line unit (ISLU) ringing generator (RG).	ALW:HDW-ISLURG 5E10 and later
Diagnoses an integrated services line unit ringing generator (ISLURG) to determine whether it is in satisfactory working order.	DGN:ISLURG 5E10 and later
Interactively diagnoses the integrated services line unit ringing generator (ISLURG).	EX:ISLURG 5E10 and later
Inhibits error sources in an integrated services line unit (ISLU) ringing generator (RG).	INH:HDW-ISLURG 5E10 and later
Requests that an integrated services line unit ringing generator (ISLURG) be removed from service.	RMV:ISLURG 5E10 and later
Requests that an integrated services line unit ringing generator (ISLURG) be restored to service.	RST:ISLURG 5E10 and later
Requests that the specified action on the integrated services line unit ringing generator (ISLURG) be stopped.	STP:ISLURG 5E10 and later

Table 137 JOB STATUS

Topic/Purpose	Message ID/ Message Release
Requests a report of the status of all terminal maintenance jobs initiated through the trunk and line work station (TLWS) maintenance automatic task administrator or the *Autoplex*® automatic task administrator (AATA) currently active in the system.	OP:JOBSTATUS-A 5E10 - 5E11
Requests a report of the status of all terminal maintenance jobs initiated through the trunk and line work station (TLWS) maintenance automatic task administrator or the Autoplex(r) automatic task administrator (AATA) currently active in the system.	OP:JOBSTATUS-B 5E12 and later

Copyright © 1999

Table 138 LIBRARY PROGRAM

Topic/Purpose	Message ID/ Message Release
Aborts the library program in the administrative module (AM) and/or switching modules (SMs) as specified, and the scratch area used in the SM for the library program is released.	ABT:LIB 5E10 and later
Clears a library program from the scratch area in the switching module (SM), and another team to use the SM for library program testing.	CLR:LIB 5E10 and later
Requests that the existence of the specified library program be verified and loads the scratch memory area of the listed switching modules (SMs) with the library program.	LOAD:LIB 5E10 and later
Requests information about the library programs that exist on the administrative module (AM) disk.	OP:LIB-DISK 5E10 and later
Requests information about the current status of library programs currently loaded or running on the system.	OP:LIB-STATUS 5E10 and later
Requests that the previously loaded library program be started in the administrative module (AM) and/or switching modules (SMs) specified.	ST:LIB 5E10 and later
Requests that the previously started library program be stopped in the administrative module (AM) and/or switching modules (SMs) specified.	STP:LIB 5E10 and later
Provides the data string entered to the specified library program(s).	TELL:LIB 5E10 and later

Table 139 LINE INSULATION TEST

Topic/Purpose	Message ID/ Message Release
Requests that line insulation testing (LIT) be initiated, altered or verified.	EXC:LIT-A 5E10 only
Requests that line insulation testing (LIT) be initiated, altered or verified.	EXC:LIT-B 5E11 only
Requests that line insulation testing (LIT) be initiated, altered or verified.	EXC:LIT-C 5E12 and later
Reports the progress of automatic line insulation testing (ALIT), showing the ALIT testing status for each modular metallic service unit (MMSU) in the office.	OP:LIT 5E10 and later
Requests a graceful termination of a line insulation testing (LIT) session.	STP:LIT 5E10 and later

Table 140 LINE UNIT

Topic/Purpose	Message ID/ Message Release
Requests that actions on the line unit path exerciser (LUPEX) be aborted at the specified location.	ABT:TST-LEN 5E10 and later
Requests an unconditional restoration of the OOS common controller for each offline pumpable peripheral after a peripheral offline pump has been performed on one or more switching modules (SMs).	RST:PERF 5E10 and later
Requests that actions on the line unit path exerciser (LUPEX) be stopped at the specified location.	STP:TST-LEN 5E10 and later
Requests that a specified path be exercised through the line unit path exerciser (LUPEX).	TST:LEN 5E10 and later

Table 141 Line Unit A-Link

Topic/Purpose	Message ID/ Message Release
Requests that a line unit model 2 (LU2) or a line unit model 3 (LU3) A-link be removed from service.	RMV:ALINK 5E10 and later
Requests that a line unit model 2 (LU2) or a line unit model 3 (LU3) A-link be restored to the active state.	RST:ALINK 5E10 and later
Requests that an out-of-service line unit model 2 (LU2) or a line unit model 3 (LU3) A-link (ALINK) be manually set to a specific state.	SET:ALINK 5E10 and later

Table 142 Line Unit Channel

Topic/Purpose	Message ID/ Message Release
Requests that actions on the line unit channel (LUCHAN) be aborted at the specified location.	ABT:LUCHAN

	5E10 and later
Allows hardware error checks to be performed on the specified line unit channel (LUCHAN).	ALW:HDW-LUCHAN 5E10 and later
Requests that a line unit channel (LUCHAN) on a line unit channel board (LUCHBD) be removed and diagnosed to determine if it is in satisfactory working order.	DGN:LUCHAN 5E10 and later
Interactively diagnoses the line unit channel (LUCHAN).	EX:LUCHAN 5E10 and later
Inhibits the hardware error checks performed on the specified line unit channel (LUCHAN).	INH:HDW-LUCHAN 5E10 and later
Requests that a line unit channel (LUCHAN) be removed from service.	RMV:LUCHAN 5E10 and later
Conditionally or unconditionally restores a single line unit channel (LUCHAN) circuit to service.	RST:LUCHAN 5E10 and later
Requests that an out-of-service line unit channel (LUCHAN) circuit be set to a specific state.	SET:LUCHAN 5E10 and later
Requests that actions on the line unit channel (LUCHAN) at the specified location be stopped.	STP:LUCHAN 5E10 and later

Table 143 Line Unit Channel Board

Topic/Purpose	Message ID/ Message Release
Requests that actions on the line unit channel board (LUCHBD) be aborted at the specified location.	ABT:LUCHBD 5E10 and later
Requests that a line unit channel board (LUCHBD) be removed and diagnosed to determine whether it is in satisfactory working order.	DGN:LUCHBD 5E10 and later
Requests that a line unit channel board (LUCHBD) be removed from service.	RMV:LUCHBD 5E10 and later
Conditionally or unconditionally restores a line unit channel board (LUCHBD) to service.	RST:LUCHBD 5E10 and later
Requests that actions on the line unit channel board (LUCHBD) at the specified location be stopped.	STP:LUCHBD 5E10 and later

Table 144 Line Unit Command Control

Topic/Purpose	Message ID/ Message Release
Requests that actions on the line unit common control (LUCOMC) be aborted at the specified location.	ABT:LUCOMC 5E10 and later
Allows hardware error checks to be performed on the specified line unit common control (LUCOMC).	ALW:HDW-LUCOMC 5E10 and later
Requests that a line unit common control (LUCOMC) be diagnosed.	DGN:LUCOMC 5E10 and later
Interactively diagnoses the line unit common control (LUCOMC).	EX:LUCOMC 5E10 and later
Inhibits the hardware error checks performed on the specified line unit common control (LUCOMC).	INH:HDW-LUCOMC 5E10 and later
Requests that a line unit common control (LUCOMC) be removed from service.	RMV:LUCOMC 5E10 and later
Conditionally or unconditionally restores a line unit common control (LUCOMC) to service.	RST:LUCOMC 5E10 and later
Requests that actions on the line unit common control (LUCOMC) at the specified location be stopped.	STP:LUCOMC 5E10 and later
Requests that the selection of line unit common data and control (LUCOMC) circuits for gated diode crosspoint (GDX) control be switched.	SW:LUCOMC 5E10 and later

Table 145 Line Unit High Level Service Circuit

Topic/Purpose	Message ID/ Message Release
Requests that actions on the line unit high level service circuit (LUHLSC) be aborted at the specified location.	ABT:LUHLSC 5E10 and later
Allows hardware error checks to be performed on the specified line unit high level service circuit (LUHLSC).	ALW:HDW-LUHLSC 5E10 and later

Requests that a line unit high service circuit (LUHLSC) be removed and diagnosed to determine if it is in satisfactory working order.	DGN:LUHLSC 5E10 and later
Interactively diagnoses the line unit high level service circuit (LUHLSC).	EX:LUHLSC 5E10 and later
Inhibits the hardware error checks performed on the specified line unit high service circuit (LUHLSC).	INH:HDW-LUHLSC 5E10 and later
Requests that a line unit high service circuit (LUHLSC) be removed from service.	RMV:LUHLSC 5E10 and later
Conditionally or unconditionally restores a line unit high service circuit (LUHLSC) to service.	RST:LUHLSC 5E10 and later
Requests that actions on the line unit high level service circuit (LUHLSC) at the specified location be stopped.	STP:LUHLSC 5E10 and later

Table 146 Line Unit Model 2 Grid Board

Topic/Purpose	Message ID/ Message Release
Aborts the scheduled action on the line unit model 2 (LU2) or line unit model 3 (LU3) grid board.	ABT:GRIDBD 5E10 and later
Allows hardware error checks to be performed on the specified line unit model 2 (LU2) or line unit model 3 (LU3) grid board.	ALW:HDW-GRIDBD 5E10 and later
Diagnoses a line unit model 2 (LU2) or line unit model 3 (LU3) grid board to determine if it is in satisfactory working order.	DGN:GRIDBD 5E10 and later
Requests interactive diagnostic (exercises) of the line unit model 2 (LU2) or line unit model 3 (LU3) grid board.	EX:GRIDBD 5E10 and later
Requests that a line unit model 2 (LU2) or line unit model 3 (LU3) grid board be removed from service.	RMV:GRIDBD 5E10 and later
Requests that a line unit model 2 (LU2) or line unit model 3 (LU3) grid board be restored to the active state.	RST:GRIDBD 5E10 and later
Requests that currently running actions on a line unit model 2 (LU2) or line unit model 3 (LU3) grid board be stopped.	STP:GRIDBD 5E10 and later
Tests a specified gated diode crosspoint half-grid board in a line unit model 2 (LU2) or a line unit model 3 (LU3) by running a fabric exerciser routine.	TST:GRIDBD 5E10 and later

Table 147 LINK INTERFACE

Topic/Purpose	Message ID/ Message Release
Aborts a diagnostic or exercise on the link interface (LI) subunit of the specified office network and timing complex (ONTC).	ABT:LI 5E10 and later
Requests that the link interface (LI) in the specified office network and timing complex (ONTC) be diagnosed.	DGN:LI 5E10 and later
Requests that the link interface (LI) be exercised in an interactive mode.	EX:LI 5E10 and later
Requests information from internal registers of the link interface (LI) or the specified office network and timing complex (ONTC) side.	OP:ST-LI 5E10 and later
Requests that a diagnostic or exercise on the link interface (LI) on the specified office network and timing complex (ONTC) be stopped.	STP:LI 5E10 and later

Table 148 LOADING

Topic/Purpose	Message ID/ Message Release
Requests that a virtual address be loaded with specified data as an action associated with a breakpoint.	LOAD:ADDR-A 5E10 only
Requests that a virtual address be loaded with specified data as an action associated with a breakpoint.	LOAD:ADDR-B 5E11 and later
Loads an administrative module (AM) physical byte address with specified data as an immediate operation or as a generic access package (GRASP) breakpoint action.	LOAD:PMEM 5E10 and later
Loads an administrative module (AM) register with specified data as a breakpoint action.	LOAD:REG-A 5E10 only
Loads an administrative module (AM) register with specified data as a breakpoint action.	LOAD:REG-B 5E11 and later
Requests that a value be loaded into the memory of the specified foundation peripheral	LOAD:UT-FPC-A

controller (FPC).	5E10 only
Requests that a value be loaded into the memory of the specified foundation peripheral controller (FPC).	LOAD:UT-FPC-B 5E11 and later
Requests that a value be loaded into the memory of the specified module message processor (MMP).	LOAD:UT-MMP-A 5E10 only
Requests that a value be loaded into the memory of the specified module message processor (MMP).	LOAD:UT-MMP-B 5E11 and later
Requests that a value be loaded into the memory of the specified peripheral controller (PPC).	LOAD:UT-PPC-A 5E10 only
Requests that a value be loaded into the memory of the specified pump peripheral controller (PPC).	LOAD:UT-PPC-B 5E11 and later
Loads administrative module (AM) generic access package (GRASP) utility variable with specified data as an immediate operation or as an action associated with a breakpoint.	LOAD:UVAR 5E10 and later

Table 149 LOCAL AREA SIGNALING SERVICES

Topic/Purpose	Message ID/ Message Release
Requests the report of the incoming line history block (ILHB) information for local area signaling services (LASS).	OP:ILHB 5E10 and later
Requests the report of the outgoing line history block (OLHB) information for local area signaling services (LASS).	OP:OLHB 5E10 and later

Table 150 LOCAL NUMBER PORTABILITY

Topic/Purpose	Message ID/ Message Release
Requests that an Operator Services Position System (OSPS) local number portability (LNP) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the LNP/network control point (NCP) data base to verify its operation.	TST:LNP 5E11 and later

Table 151 LOCAL DIGITAL SERVICE FUNCTION

Topic/Purpose	Message ID/ Message Release
Aborts actions on the local digital service function (LDSF).	ABT:LDSF 5E10 and later
Allows maintenance hardware checks in a local digital service function (LDSF) circuit to occur.	ALW:HDW-LDSF 5E10 and later
Diagnoses a local digital service function (LDSF) circuit to determine whether it is in satisfactory working order.	DGN:LDSF 5E10 and later
Interactively diagnoses the local digital service function (LDSF) circuit.	EX:LDSF 5E10 and later
Checks hardware in a local digital service function (LDSF) circuit.	INH:HDW-LDSF 5E10 and later
Requests that a local digital services function (LDSF) circuit be removed from service.	RMV:LDSF 5E10 and later
Conditionally or unconditionally restores a local digital service function (LDSF) circuit to service.	RST:LDSF 5E10 and later
Requests that actions on the local digital service function (LDSF) circuit be stopped.	STP:LDSF 5E10 and later

Table 152 LOCAL DIGITAL SERVICE UNIT

Topic/Purpose	Message ID/ Message Release
Aborts actions on the local digital service unit - model 2 (LDSU2).	ABT:LDSU 5E10 and later
Allows maintenance hardware checks in a local digital service unit - model 2 (LDSU2) board to occur.	ALW:HDW-LDSU 5E10 and later
Diagnoses a local digital service unit - model 2 (LDSU2) board to determine whether it is in satisfactory working order.	DGN:LDSU 5E10 and later
Interactively diagnoses the local digital service unit - model 2 (LDSU2) board.	EX:LDSU 5E10 and later
Checks hardware in a local digital service unit - model 2 (LDSU2) board.	INH:HDW-LDSU

	5E10 and later
Requests that a local digital services unit - model 2 (LDSU2) board be removed from service.	RMV:LDSU 5E10 and later
Conditionally or unconditionally restores a local digital service unit - model 2 (LDSU2) board to service.	RST:LDSU 5E10 and later
Requests that actions on the local digital service unit - model 2 (LDSU2) board be stopped.	STP:LDSU 5E10 and later

Table 153 Local Digital Service Unit Common Board

Topic/Purpose	Message ID/ Message Release
Requests that actions on the local digital service unit common (LDSUCOM) board be aborted at the specified location.	ABT:LDSUCOM 5E10 and later
Allows hardware error checks to be performed on the specified local digital service unit common (LDSUCOM) board.	ALW:HDW-LDSUCOM 5E10 and later
Requests that a local digital service unit common (LDSUCOM) board be diagnosed to determine whether it is in satisfactory working order.	DGN:LDSUCOM 5E10 and later
Interactively diagnoses the local digital service circuit common (LDSUCOM) board.	EX:LDSUCOM 5E10 and later
Inhibits the hardware error checks performed on the specified local digital service unit common (LDSUCOM) board.	INH:HDW-LDSUCOM 5E10 and later
Requests that a local digital services unit common (LDSUCOM) board be removed from service.	RMV:LDSUCOM 5E10 and later
Conditionally or unconditionally restores a local digital service unit common (LDSUCOM) board to service.	RST:LDSUCOM 5E10 and later
Requests that actions on the local digital service unit common board (LDSUCOM) at the specified location be stopped.	STP:LDSUCOM 5E10 and later

Table 154 LOGS

Topic/Purpose	Message ID/ Message Release
Requests that logging of all errors for a specified administrative module (AM) unit and any units beneath it that are reported to CONFIG be allowed.	ALW:CONFLOG 5E10 and later
To enable the logging of customer-originated recent changes for one or more switching modules (SMs).	ALW:CORCLOG-SM 5E10 and later
Requests that logging of recent changes be allowed for all processors.	ALW:RCLOG 5E10 and later
Requests that the log/print status (LPS) of one or all output message class(es) be changed.	CHG:LPS-MSGCLS 5E10 and later
Requests that customer-originated recent change (CORC) logfiles be evolved (converted) and reapplied.	CNVT:CORCLOG 5E10 and later
Requests that recent change (RC) logfiles be Evolved (converted) to a format compatible with the target software release.	CNVT:RCLOG 5E10 and later
Requests that the office dependent data (ODD) recent change (RC) log file be copied from disk to magnetic tape.	COPY:LOG-TAPE 5E10 and later
Requests deletion of selected contents of a logfile and cleans out corrupt entries from the file.	DEL:LOG 5E10 and later
Requests reapplication of customer-originated and/or regular recent changes (RCs) from the disk log.	EXC:ODDRCVY 5E10 and later
Inhibits error logging on the CONFLOG error logfile for all specified central processor units.	INH:CONFLOG 5E10 and later
Inhibits the logging of customer-originated recent changes for one or more switching modules (SMs).	INH:CORCLOG-SM 5E10 and later
Inhibits the logging of recent changes for all processors.	INH:RCLOG 5E10 and later
Reports how much disk space (in bytes) is left for logging recent changes and customer-originated recent changes.	OP:AVAILLOG 5E10 and later
Requests the reporting of the number of customer-originated recent changes (CORCs) that are logged in one or more switching modules (SMs) and/or one or more communication module processors (CMPs).	OP:CORCSTAT-SM 5E10 and later
Requests output of the application hook (APPLHOOK) process log file.	OP:G-APPLLOG

	5E10 and later
Requests output of the central processor or administrative module system update event log.	OP:G-READLOG 5E10 and later
Requests that selected contents of a logfile be printed (output).	OP:LOG 5E10 and later
Requests the current and backup log/print status (LPS).	OP:LPS 5E10 and later
Requests that an interpreted version of the selected MEMLOG entries be reported.	OP:MEMERRS 5E10 and later

Table 155 MACHINE-DETECTED INTEROFFICE IRREGULARITY

Topic/Purpose	Message ID/ Message Release
Requests that a specific machine-detected interoffice irregularity (MDII) that was being suppressed be allowed to be printed again.	ALW:MDII-A 5E10 - 5E11
Requests that a specific machine-detected interoffice irregularity (MDII) that has reporting suppressed be allowed to be printed again.	ALW:MDII-B 5E12 and later
Requests that the printing of a specific machine-detected interoffice irregularity (MDII) be suppressed.	INH:MDII-A 5E10 - 5E11
Requests that the printing of a specific machine-detected interoffice irregularity (MDII) be suppressed.	INH:MDII-B 5E12 and later
Requests a list of all of the trunk groups and machine-detected interoffice irregularities (MDIIs) that are being suppressed by a suppression MDII.	OP:MDII-A 5E10 - 5E11
Format 1 requests a list of all of the trunk groups and machine-detected interoffice irregularities (MDIIs) that are being suppressed by a suppression MDII.	OP:MDII-B 5E12 and later
Requests print-out of the threshold counts, operational all tests passed count, and purge count of a trunk circuit (Formats 1, 2, 3 and 4) or universal tone decoder (UTD) (Format 5), universal tone generator (UTG) (Format 6), or revertive pulsing trunk (Format 7) on the trunk error analysis lists.	OP:TERACNTS-A 5E10 - 5E11
Requests print-out of the threshold counts, operational all tests passed count, and purge count of a trunk circuit (Formats 1, 2, 3 and 4) or universal tone decoder (UTD) (Format 5), universal tone generator (UTG) (Format 6), or revertive pulsing trunk (Format 7) on the trunk error analysis lists.	OP:TERACNTS-B 5E12 only
Requests print-out of the threshold counts, operational all tests passed count, and purge count of a trunk circuit (Formats 1, 2, 3 and 4) or universal tone decoder (UTD) (Format 5), universal tone generator (UTG) (Format 6), or revertive pulsing trunk (Format 7) on the trunk error analysis lists.	OP:TERACNTS-C 5E13 and later

Table 156 MAGNETIC TAPE

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified magnetic tape (MT).	DGN:MT 5E10 and later
Exercises a magnetic tape (MT) in an interactive diagnostic mode.	EX:MT 5E10 and later
Requests the following information regarding the specified small computer system interface (SCSI) magnetic tape (MT) device:	OP:MT-INFO 5E10 and later

Table 157 Magnetic Tape Controller

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified magnetic tape controller (MTC).	DGN:MTC 5E10 and later
Exercises a magnetic tape controller (MTC) in an interactive diagnostic mode.	EX:MTC 5E10 and later
Requests that the specified magnetic tape controller (MTC) and any associated magnetic tape drives be removed from service.	RMV:MTC 5E10 and later
Conditionally or unconditionally restores a magnetic tape controller (MTC) to service.	RST:MTC 5E10 and later

Table 158 Magnetic Tape Device

Copyright © 1999

Topic/Purpose	Message ID/ Message Release
Requests that the specified magnetic tape (MT) device be removed from service.	RMV:MT 5E10 and later
Restores the specified magnetic tape (MT) device to service.	RST:MT 5E10 and later

Table 159 MAINTENANCE STATUS

Topic/Purpose	Message ID/ Message Release
Allows previously inhibited or suspended sources to send automatic maintenance requests to the administrative module (AM) maintenance input request administrator (MIRA).	ALW:DMQ 5E10 and later
Request that the specified source of automatic maintenance requests be inhibited.	INH:DMQ 5E10 and later
Requests a printout of the configuration status of the specified communications module (CM) unit.	OP:CFGSTAT 5E10 and later
Requests output of configuration status information for administrative module (AM) hardware units.	OP:CFGSTAT-3B 5E10 and later
Requests the current configuration status (CFGSTAT) of switching module (SM) circuits.	OP:CFGSTAT-SM 5E10 and later
Requests a list of the queue from the administrative module (AM) maintenance input request administrator.	OP:DMQ 5E10 and later
Requests the status of all active and waiting requests in the deferred maintenance queues (DMQ).	OP:DMQ-CM-SM 5E10 and later
Requests that the specified administrative module (AM) maintenance request be stopped.	STOP:DMQ 5E10 and later
Requests that the specified administrative module (AM) maintenance request be stopped.	STP:DMQ 5E10 and later

Table 160 MAINTENANCE TELETYPEWRITER

Topic/Purpose	Message ID/ Message Release
Requests that the specified maintenance teletypewriter (MTTY) be removed from service.	RMV:MTTY 5E10 and later
Restores the specified maintenance teletypewriter (MTTY) to service.	RST:MTTY 5E10 and later

Table 161 Maintenance Teletypewriter Controller

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified maintenance teletypewriter controller (MTTYC).	DGN:MTTYC 5E10 and later
Exercises a maintenance teletypewriter controller (MTTYC) in an interactive diagnostic mode.	EX:MTTYC 5E10 and later
Requests that the specified maintenance teletypewriter controller (MTTYC) and all associated maintenance teletypewriters, receive-only printers, and switching control center (SCC) data link devices be removed from service.	RMV:MTTYC 5E10 and later
Restores conditionally or unconditionally a maintenance teletypewriter controller (MTTYC) to service.	RST:MTTYC 5E10 and later

Table 162 MASTER CONTROL CENTER

Topic/Purpose	Message ID/ Message Release
Request to display the text, activation status and default confirmation prompt for a specified Master Control Center (MCC) page and poke combination.	OP:CONFIRM 5E10 and later
Request to set the text and/or display status of a user-definable confirmation prompt.	SET:CONFIRM 5E10 and later

Table 163 MEMORY

Topic/Purpose	Message ID/ Message Release
This message configures the switching modules (SMs) physical memory after memory board	CFR:PMEM

growth to incorporate the memory added into the spare memory hole.	5E10 and later
Requests that a section or sections of switching module (SM) memory be allocated/deallocated from the spare memory hole for the peripheral image or images that resides in the peripheral unit specified on the input message line.	CFR:SPRMEM-A 5E10 only
Requests that a section or sections of switching module (SM) memory be allocated/deallocated from the spare memory hole for the peripheral image or images that resides in the peripheral unit specified on the input message line.	CFR:SPRMEM-B 5E11 only
Requests that a section or sections of switching module (SM) memory be allocated/deallocated from the spare memory hole for the peripheral image or images that resides in the peripheral unit specified on the input message line.	CFR:SPRMEM-C 5E12 - 5E13
Requests that a section or sections of switching module (SM) memory be allocated/deallocated from the spare memory hole for the peripheral image or images that resides in the peripheral unit specified on the input message line.	CFR:SPRMEM-D 5E14 and later
Requests that the variable sections of switching module (SM) memory be dumped.	DUMP:SMMAP 5E10 and later
Requests a download into switching module (SM) memory from administrative module (AM) disk of the peripheral image or images that reside in the peripheral unit specified on the input message line.	ST:NIPMP-A 5E10 only
Requests a download into switching module (SM) memory from administrative module (AM) disk of the peripheral image or images that reside in the peripheral unit specified on the input message line.	ST:NIPMP-B 5E11 only
Requests a download into switching module (SM) memory from administrative module (AM) disk of the peripheral image or images that reside in the peripheral unit specified on the input message line.	ST:NIPMP-C 5E12 - 5E13
Requests a download into switching module (SM) memory from administrative module (AM) disk of the peripheral image or images that reside in the peripheral unit specified on the input message line.	ST:NIPMP-D 5E14 and later
Requests that a non-interfering pump for the specified switching module (SM) be canceled.	STP:NIPMP 5E10 and later
Requests an update of flash random access memory (RAM) on a specified peripheral controller (PC).	UPD:FLASH 5E10 and later

Table 164 MESSAGE INTERFACE

Topic/Purpose	Message ID/ Message Release
Aborts a diagnostic or exercise on the message interface (MI) on the specified office network and timing complex (ONTC).	ABT:MI 5E10 and later
Requests that the message interface (MI) in the specified office network and timing complex (ONTC) be diagnosed.	DGN:MI 5E10 and later
Requests that the message interface (MI) be exercised in an interactive mode.	EX:MI 5E10 and later
Requests the hardware state of the message interface (MI).	OP:ST-MI 5E10 and later
Requests that a diagnostic or exercise on the message interface (MI) on the specified office network and timing complex (ONTC) be stopped.	STP:MI 5E10 and later

Table 165 Message Interface Clock Unit

Topic/Purpose	Message ID/ Message Release
Requests that a diagnostic or exercise be aborted on a message interface and clock unit (MICU) subunit of the office network and timing complex (ONTC).	ABT:MICU 5E10 and later
Requests that a message interface control unit (MICU) subunit of the specified office network and timing complex (ONTC) be diagnosed.	DGN:MICU 5E10 and later
Requests that a diagnostic or exercise on the message interface and clock unit (MICU) subunit of the office network and timing complex (ONTC) be stopped.	STP:MICU 5E10 and later

Table 166 MESSAGE SWITCH

Topic/Purpose	Message ID/ Message Release
Aborts actions on a message switch (MSGS).	ABT:MSGS

	5E10 and later
Requests diagnostics on a message switch (MSGS) to determine if it is in satisfactory working order.	DGN:MSGS 5E10 and later
Requests that a message switch (MSGS) be removed from service.	RMV:MSGS 5E10 and later
Restores a message switch (MSGS) to an in service condition.	RST:MSGS 5E10 and later
Requests that specific actions on the specified message switch (MSGS) complex be stopped.	STP:MSGS 5E10 and later

Table 167 Message Switch Control Unit

Topic/Purpose	Message ID/ Message Release
Aborts an action on the message switch control unit (MSCU) on the specified message switch (MSGS).	ABT:MSCU 5E10 and later
Allows hardware checks (errors) on a message switch control unit (MSCU).	ALW:HDW-MSCU 5E10 and later
Diagnoses the specified message switch control unit (MSCU).	DGN:MSCU 5E10 and later
Requests that the message switch control unit (MSCU) be exercised in an interactive mode.	EX:MSCU 5E10 and later
Inhibits hardware checks (errors) on a message switch control unit (MSCU).	INH:HDW-MSCU 5E10 and later
Requests that a message switch control unit (MSCU) be removed from service.	RMV:MSCU 5E10 and later
Conditionally or unconditionally restores a message switch control unit (MSCU) to the active state.	RST:MSCU 5E10 and later
Requests that specific actions on the specified message switch control unit (MSCU) be stopped.	STP:MSCU 5E10 and later

Table 168 MESSAGE WAITING INDICATOR

Topic/Purpose	Message ID/ Message Release
Requests that a Message Service System (MSS) message waiting indicator (MWI) be deactivated for a given seven-digit directory number (DN).	CLR:MWI 5E10 and later
Requests that a Message Service System (MSS) message waiting indicator (MWI) be activated for a given seven-digit directory number (DN).	SET:MWI 5E10 and later

Table 169 METALLIC ACCESS

Topic/Purpose	Message ID/ Message Release
Requests that actions on the metallic access (MA) circuit be aborted at the specified location.	ABT:MA 5E10 and later
Requests that a metallic access (MA) board be diagnosed to determine whether it is in satisfactory working order.	DGN:MA 5E10 and later
Requests interactive diagnostics (exercises) of the metallic access (MA) board.	EX:MA 5E10 and later
Requests that a metallic access (MA) board be removed from service.	RMV:MA 5E10 and later
Requests that a metallic access (MA) board in a metallic service unit (MSU) be conditionally or unconditionally restored to service.	RST:MA 5E10 and later
Requests that actions on the metallic access (MA) board at the specified location be stopped.	STP:MA 5E10 and later

Table 170 Metallic Access Bus

Topic/Purpose	Message ID/ Message Release
Requests that actions on the metallic access bus (MAB) be aborted at the specified locations.	ABT:MAB 5E10 and later
Requests that the metallic access bus (MAB) be diagnosed to determine whether it is in satisfactory working order.	DGN:MAB 5E10 and later
Requests that the metallic access bus (MAB) be exercised to determine whether it is in	EX:MAB

satisfactory working order.	5E10 and later
Requests that the metallic access bus (MAB) be removed from service.	RMV:MAB 5E10 and later
Requests that the metallic access bus (MAB) be restored to the active state conditionally or unconditionally.	RST:MAB 5E10 and later
Requests that actions on the metallic access bus (MAB) at the specified location be stopped.	STP:MAB 5E10 and later

Table 171 METALLIC SERVICE UNIT
Metallic Service Unit Distribute Point

Topic/Purpose	Message ID/ Message Release
Requests that a metallic service unit (MSU) / modular metallic service unit (MMSU) distribute point be exercised.	EX:DISTPT 5E10 and later

Table 172 Metallic Service Unit Common Board

Topic/Purpose	Message ID/ Message Release
Requests that actions on the metallic service unit common (MSUCOM) board be aborted at the specified location.	ABT:MSUCOM 5E10 and later
Requests that a metallic service unit common (MSUCOM) board be diagnosed to determine whether it is in satisfactory working order.	DGN:MSUCOM 5E10 and later
Interactively diagnoses (exercises) the metallic service unit common (MSUCOM) board.	EX:MSUCOM 5E10 and later
Requests that a metallic service unit common (MSUCOM) board be removed from service.	RMV:MSUCOM 5E10 and later
Requests that a metallic service unit common (MSUCOM) board be conditionally or unconditionally restored to service.	RST:MSUCOM 5E10 and later
Requests that actions on the metallic service unit common (MSUCOM) board at the specified location be stopped.	STP:MSUCOM 5E10 and later

Table 173 Metallic Service Unit Scan Points

Topic/Purpose	Message ID/ Message Release
Requests the output of the status of the scan points (SP) on a metallic service unit (MSU) scan board.	OP:MSUSP 5E10 and later

Table 174 METALLIC TEST BUS

Topic/Purpose	Message ID/ Message Release
Requests that metallic setup failure override be allowed when the metallic test bus (MTB) is found to be open between the test bus control unit (TBCU) and the remote terminal (RT).	ALW:RTMTBOVR 5E10 and later
Requests that the printing of the REPT RTMTB SID message be allowed when the metallic test bus (MTB) fails the closed diode protocol test during metallic setup to a remote terminal (RT).	ALW:RTMTBPRT 5E10 and later
Requests that metallic setup failure override be inhibited when the metallic test bus (MTB) is found to be open between the test bus control unit (TBCU) and the remote terminal (RT).	INH:RTMTBOVR 5E10 and later
Requests that the printing of the REPT RTMTB SID message be inhibited when the metallic test bus (MTB) fails the closed diode protocol test during metallic setup to a remote terminal (RT).	INH:RTMTBPRT 5E10 and later

Table 175 METALLIC TEST INTERCONNECT BUS

Topic/Purpose	Message ID/ Message Release
Requests that actions on the metallic test interconnect bus (MTIB) be aborted at the specified locations.	ABT:MTIB 5E10 and later
Requests that the metallic test interconnect bus (MTIB) be diagnosed to determine whether it is in satisfactory working order.	DGN:MTIB 5E10 and later
Exercises the metallic test interconnect bus (MTIB) to determine if it is in satisfactory working order.	EX:MTIB 5E10 and later
Requests that the metallic test interconnect bus (MTIB) be removed from service.	RMV:MTIB

Copyright © 1999

	5E10 and later
Restores the metallic test interconnect bus (MTIB) to the active state conditionally or unconditionally.	RST:MTIB 5E10 and later
Requests that actions on the metallic test interconnect bus (MTIB) at the specified location be stopped.	STP:MTIB 5E10 and later

Table 176 Metallic Test Interconnect Bus Access

Topic/Purpose	Message ID/ Message Release
Requests that actions on the metallic test interconnect bus access (MTIBAX) be aborted at the specified locations.	ABT:MTIBAX 5E10 and later
Requests that the metallic test interconnect bus access (MTIBAX) be diagnosed to determine whether it is in satisfactory working order.	DGN:MTIBAX 5E10 and later
Exercises the metallic test interconnect bus access (MTIBAX) to determine whether it is in satisfactory working order.	EX:MTIBAX 5E10 and later
Requests that the metallic test interconnect bus access (MTIBAX) be removed from service.	RMV:MTIBAX 5E10 and later
Restores the metallic test interconnect bus access (MTIBAX) to the active state conditionally or unconditionally.	RST:MTIBAX 5E10 and later
Requests that actions on the metallic test interconnect bus access (MTIBAX) at the specified location be stopped.	STP:MTIBAX 5E10 and later

Table 177 MODULE CONTROLLER/TIME-SLOT INTERCHANGE

Topic/Purpose	Message ID/ Message Release
Requests that actions on the module controller/time slot interchange (MCTSI) be aborted at the specified location.	ABT:MCTSI 5E10 and later
Clears the forced condition from the module controller time-slot interchange (MCTSI) in the switching modules (SM) specified.	CLR:MCTSI 5E10 and later
Removes and diagnoses a module control/time-slot interchange unit (MCTSI) to determine if it is in satisfactory working order.	DGN:MCTSI 5E10 and later
Requests that the contents of one or more sequential memory locations in the specified message handler (MH) unit be dumped.	DUMP:UT-MCTSI-MH-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified message handler (MH) unit be dumped.	DUMP:UT-MCTSI-MH-B 5E11 and later
Interactively diagnoses (exercises) the module controller/time-slot interchange (MCTSI) unit.	EX:MCTSI 5E10 and later
Requests that an unconditional call to a function be executed using parameters in the specified message handler (MH) unit.	EXC:UT-MCTSI-MH-A 5E10 only
Requests that an unconditional call to a function be executed using parameters in the specified message handler (MH) unit.	EXC:UT-MCTSI-MH-B 5E11 and later
Requests that a value(s) be loaded into the memory of the specified message handler (MH) unit.	LOAD:UT-MCTSI-MH-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified message handler (MH) unit.	LOAD:UT-MCTSI-MH-B 5E11 and later
Requests that a module controller/time-slot interchange unit (MCTSI) be removed from service.	RMV:MCTSI 5E10 and later
Requests that a module control/time slot interchange unit (MCTSI) be conditionally or unconditionally restored to the active state.	RST:MCTSI 5E10 and later
Requests that the specified side of module control/time slot interchange units (MCTSI) be forced to the active state, by using the administrative module intervention (AMI).	SET:MCTSI 5E10 and later
Requests a download of the off-line communication module processor (CMP) memory for the specified CMP from the off-line administrative module (AM) disk followed by an off-line verification.	ST:OPUMP-CMP 5E10 and later
Requests a download of the off-line module controller/time slot interchange (MCTSI) memory for each specified switching module (SM) from the active or off-line administrative module (AM) disk, with or without an off-line verification.	ST:OPUMP-SM-A 5E10 - 5E13
Requests a download of the off-line module controller/time slot interchange (MCTSI) memory for each specified switching module (SM) from the active or off-line administrative module (AM) disk, with or without an off-line verification.	ST:OPUMP-SM-B 5E14 and later
Requests that actions on the module controller/time slot interchange (MCTSI) at the specified	STP:MCTSI

location be stopped.	5E10 and later
Requests that a module controller/time slot interchange (MCTSI) be switched from standby to active.	SW:MCTSI 5E10 and later

Table 178 MCTI Links

Topic/Purpose	Message ID/ Message Release
Requests a printout of the maintenance state of the MCTSI-based ethernet links (MELNKs) and MCTSI-based ethernet pipes (MEPIPEs) on a switching module (SM).	OP:ST-MELNK 5E12 and later
Requests that an MCTSI-based ethernet link (MELNK) be removed from service.	RMV:MELNK 5E12 and later
Requests that a single MCTSI-based ethernet link (MELNK) or all MELNKs on a switching module (SM) be restored to service.	RST:MELNK 5E12 and later

Table 179 MODULE MESSAGE PROCESSOR

Topic/Purpose	Message ID/ Message Release
Requests that actions on the specified module message processor (MMP) be aborted.	ABT:MMP 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified module message processor (MMP).	ALW:HDW-MMP 5E10 and later
Requests that a module message processor (MMP) be diagnosed to determine whether it is in satisfactory working order.	DGN:MMP 5E10 and later
Requests that the contents of one or more sequential memory locations in the specified module message processor (MMP) be dumped.	DUMP:UT-MMP-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified module message processor (MMP) be dumped.	DUMP:UT-MMP-B 5E11 and later
Requests that the module message processor (MMP) be exercised in an interactive mode.	EX:MMP 5E10 and later
Requests that an unconditional call to a function using parameters in the specified module message processor (MMP) be executed.	EXC:UT-MMP-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified module message processor (MMP) be executed.	EXC:UT-MMP-B 5E11 and later
Requests that hardware error checks on the specified module message processor (MMP) be inhibited.	INH:HDW-MMP 5E10 and later
Requests that a value be loaded into the memory of the specified module message processor (MMP).	LOAD:UT-MMP-A 5E10 only
Requests that a value be loaded into the memory of the specified module message processor (MMP).	LOAD:UT-MMP-B 5E11 and later
Requests that the specified module message processor (MMP) be removed from service.	RMV:MMP 5E10 and later
Requests that a message module processor (MMP) be restored to the active state.	RST:MMP 5E10 and later
Requests that actions on the specified module message processor (MMP) be stopped.	STP:MMP 5E10 and later

Table 180 MOVING HEAD DISK

Topic/Purpose	Message ID/ Message Release
Requests that the automatic moving head disk (MHD) configuration feature be enabled for the entire office or for a specific MHD.	ALW:AUTOCFG 5E10 and later
To clear a given moving head disk's (MHD's) media access error counter (MAEC).	CLR:MHD-MAEC 5E10 and later
Compares the contents of two disks or two disk partitions.	CMPR:MHD 5E10 and later
Diagnoses the specified moving head disk (MHD).	DGN:MHD 5E10 and later
Dumps the contents of a specified single disk block or a range of blocks, in hexadecimal.	DUMP:MHD-BLOCK 5E10 and later
Dumps defect management information for a moving head disk (MHD).	DUMP:MHD-DEFECT 5E10 and later
Formats and prints the contents of a disk pack's volume table of contents (VTOC).	DUMP:MHD-VTOC

	5E10 and later
Exercises a moving head disk (MHD) in an interactive diagnostic mode.	EX:MHD 5E10 and later
Requests that the automatic moving head disk (MHD) configuration feature be disabled for the entire office or for a specific MHD.	INH:AUTOCFG 5E10 and later
Formats all or specific disk tracks of the disk pack with initialized sectors.	INIT:MHD 5E10 and later
Loads new defect location data on to a moving head disk (MHD).	LOAD:MHD 5E10 and later
Requests that the executable microcode and/or control information be loaded into the control memory of a small computer system interface (SCSI) moving head disk (MHD).	LOAD:MHD-FIRMWARE 5E10 and later
Requests the current configuration of the moving head disks (MHDs) and the status of the automatic MHD configuration (CFG) feature.	OP:MHD-CFG 5E10 and later
Requests information regarding the specified moving head disk (MHD).	OP:MHD-INFO 5E10 and later
Requests that the specified moving head disk (MHD) be removed from service.	RMV:MHD 5E10 and later
Conditionally or unconditionally restores a moving head disk (MHD) to service.	RST:MHD 5E10 and later
Stops any CMPR:MHD input messages that are currently executing.	STOP:CMPR-MHD 5E10 and later
Stops any CMPR:MHD input messages that are currently executing.	STP:CMPR-MHD 5E10 and later
Requests a software switch of the logical names of the moving head disks (MHDs).	SW:MHD 5E10 and later
Reads all or specific disk tracks/blocks and verifies the header and error-correction code of each sector of the tracks/blocks read.	VFY:MHD 5E10 and later

Table 181 NAIL-UP CONNECTIONS

Topic/Purpose	Message ID/ Message Release
Outputs a status list of all inter-SM (switching module) nailups (ISMNAIL) used for packet transport between two SMs.	OP:LIST-ISMNAIL 5E10 and later
Requests a display of all specified nail-up connections.	OP:NAILUP-A 5E10 - 5E11
Requests a display of all specified nail-up connections.	OP:NAILUP-B 5E12 only
Requests a display of all specified nail-up connections.	OP:NAILUP-C 5E13 and later
Outputs the primary and history states of a single inter-SM (switching module) nailup (ISMNAIL), used for packet transport between two SMs.	OP:ST-ISMNAIL 5E10 and later
Outputs the inter-SM (switching module) timeslot (ISMTS) usage of inter-SM nailups (ISMNAIL), used for packet transport between two SMs.	OP:ST-ISMTS 5E10 and later
Removes an inter-SM (switching module) nailup (ISMNAIL), which is used to support packet transport between two SMs.	RMV:ISMNAIL 5E10 and later
Restores an inter-SM (switching module) nailup (ISMNAIL), which is used to support packet transport between two SMs.	RST:ISMNAIL 5E10 and later
Stops the output of the inter-SM (switching module) nailup (ISMNAIL) list or off-normal request, gracefully.	STP:ISMNAIL 5E10 and later

Table 182 NETWORK CLOCK

Topic/Purpose	Message ID/ Message Release
Aborts a diagnostic procedure or exercise of the network clock (NC) on the specified office network and timing complex (ONTC).	ABT:NC 5E10 and later
Requests that the network clock (NC) in the specified office network and timing complex (ONTC) be diagnosed.	DGN:NC 5E10 and later
Requests a dump of the control and communication buffer, control link receiver/transmitter, and status of the network clock (NC).	DUMP:NC 5E10 and later
Requests that the network clock (NC) be exercised in an interactive mode.	EX:NC 5E10 and later

Requests that the network clock (NC) of the office network and timing complex (ONTC) be set to a specific mode.	SET:NC 5E10 and later
Requests that a diagnostic or exercise on the network clock (NC) on the specified office network and timing complex (ONTC) be stopped.	STP:NC 5E10 and later

Table 183 Network Clock Reference

Topic/Purpose	Message ID/ Message Release
Requests that hardware error checks be allowed to be performed on a specified network clock reference (NCREF).	ALW:HDW-NCREF 5E10 and later
Requests that hardware error checks be inhibited on the specified network clock reference (NCREF).	INH:HDW-NCREF 5E10 and later
Requests that a network clock reference (NCREF) be removed from service.	RMV:NCREF 5E10 and later
Requests that a network clock reference (NCREF) be restored to service.	RST:NCREF 5E10 and later
Requests that a network clock reference (NCREF) be switched to the specified clock reference source.	SW:NCREF 5E10 and later

Table 184 Network Clock Oscillator

Topic/Purpose	Message ID/ Message Release
Requests that the forced (FRC) configuration on the network clock 2 oscillator (NCOSC) be cleared.	CLR:FRC-NCOSC 5E10 and later
Requests that a network clock 2 oscillator (NCOSC) be removed from service.	RMV:NCOSC 5E10 and later
Restores a network clock 2 oscillator (NCOSC) to service.	RST:NCOSC 5E10 and later
Requests that the forced (FRC) condition be set on the specified side of the network clock 2 oscillator (NCOSC) to be used as the timing base for the office.	SET:FRC-NCOSC 5E10 and later
Requests that the network clock 2 oscillator (NCOSC) used to provide the time base signal be switched to the specified network clock side from the one currently in use to the other oscillator.	SW:NCOSC 5E10 and later

Table 185 Network Clock Oscillator Cross-Couple

Topic/Purpose	Message ID/ Message Release
Requests that the network clock 2 oscillator cross-couple (OSCXC) be removed from service.	RMV:OSCXC 5E10 and later
Restores the network clock 2 oscillator cross-couple output (OSCXC) to service.	RST:OSCXC 5E10 and later

Table 186 NETWORK LINK INTERFACE

Topic/Purpose	Message ID/ Message Release
Aborts an action on a specific network link interface (NLI).	ABT:NLI 5E10 and later
Requests diagnosis of a specific network link interface (NLI) in a switching module (SM) on a specified office network and timing complex (ONTC) side, to determine if it is in satisfactory working order.	DGN:NLI 5E10 and later
Requests that the network link interface (NLI) be exercised in a switching module (SM) on the specified office network and timing complex (ONTC) side.	EX:NLI 5E10 and later
Requests a removal of a specific network link interface (NLI) from service.	RMV:NLI 5E10 and later
Requests that a specific network link interface (NLI) be restored to service.	RST:NLI 5E10 and later
Requests that an action be stopped on a specific network link interface (NLI).	STP:NLI 5E10 and later

Table 187 NETWORK MANAGEMENT

Topic/Purpose	Message ID/ Message Release
Requests that the printing of output messages stimulated by the remote network management center (RNMC) be allowed.	ALW:NMOUT 5E10 and later
Requests that node identifiers be assigned to the network management node schedule (NMNODES) for the collection of five-minute node-to-node data.	ASGN:NMNODES 5E10 and later
Requests that trunk groups be assigned to the network management (NM) schedule (SCH).	ASGN:NMSCH 5E10 and later
NMDATA is the audit family name for the group of audits concerned with the integrity of network management dynamic data.	AUD:NMDATA 5E10 and later
Requests that node(s) be removed from the five-minute network management node schedule (NMNODES).	CLR:NMNODES 5E10 and later
Requests that trunk groups be removed from the network management (NM) schedule (SCH).	CLR:NMSCH 5E10 and later
Requests that the printing of output messages stimulated by the remote network management center (RNMC) be inhibited.	INH:NMOUT 5E10 and later
Requests a list of all nodes on the five-minute network management node schedule (NMNODES).	OP:NMNODES 5E10 and later
Requests a list of the current set of network management (NM) output message inhibits on the engineering and administrative data acquisition system (EADAS) stimulated output messages.	OP:NMOUT 5E10 and later
Requests a list of the current values on the Master Control Center (MCC) network management (NM) exception page (NMPGE).	OP:NMPGE 5E10 and later
Requests a list of all trunk groups on the network management (NM) trunk group schedule.	OP:NMSCH 5E10 and later
Requests a list of all network management (NM) threshold (NMTHD) values for maintenance usage, connections per circuit per hour (CCH), and attempts per circuit per hour (ACH) for trunk group indicators in the TRUNK block.	OP:NMTHD 5E10 and later
Requests that the network management threshold (NMTHD) values be changed for a given type of trunk group indicator in the TRUNK block of the defense switched network network management (DSN NM) Exception Page (page 129).	SET:NMTHD 5E10 and later
Requests that further output from a previously requested network management OP input message be stopped.	STP:NMOP 5E10 and later

Table 188 NODE PROCESSOR MEMORY

Topic/Purpose	Message ID/ Message Release
Requests a report of the specified node processor (NP) memory or port locations.	OP:NPMEM-A 5E10 - 5E11
Requests a report of the specified node processor (NP) memory or port locations, and sends the output to a file or to the ROP or both.	OP:NPMEM-B 5E12 and later

Table 189 NON-RESIDENT CALL TRACE LIST

Topic/Purpose	Message ID/ Message Release
Requests that the directory numbers on the calling line identification list (CLID) be printed.	OP:CLID 5E10 and later
Requests that a directory number (DN) be added to or deleted from the calling line identification (CLID) list.	TRC:CLID-A 5E10 - 5E11
Requests that a directory number (DN) be added to or deleted from the calling line identification (CLID) list.	TRC:CLID-B 5E12 and later

Table 190 OFF-NORMAL STATUS

Topic/Purpose	Message ID/ Message Release
Outputs a report of off-normal inter-SM (switching module) nailups (ISMNAILs) used for packet transport between SMs.	OP:OFFNORM-IS 5E10 and later
Requests a list of all off-normal primary rate interface (PRI) integrated services digital network (ISDN) D-channels.	OP:OFFNORM-PRI 5E10 and later
Requests a list of all off-normal circuits in switching modules (SM).	OP:OFFNORM-SM 5E10 and later

Table 191 OFFICE DEPENDENT DATA

Copyright © 1999

Topic/Purpose	Message ID/ Message Release
Requests that office-dependent data (ODD) backup be aborted.	ABT:ODDBKUP 5E10 and later
Requests a backup of the office-dependent data (ODD) to disk.	BKUP:ODD 5E10 and later
Clears the office-dependent data (ODD) backup schedule set by a previous BKUP:ODD message.	CLR:ODDBKUP 5E10 and later
Requests an update of a switching module's (SM) office-dependent data (ODD) to support stand-alone operation.	CNVT:STANDALONE 5E10 and later
Requests that the office dependent data (ODD) recent change (RC) log file be copied from disk to magnetic tape.	COPY:LOG-TAPE 5E10 and later
Outputs all the ODD backup scheduled requests set by the previous BKUP:ODD messages.	OP:BKUPSTAT 5E10 and later
Requests a report of the office-dependent data (ODD) availability in the administrative module (AM), switching module(s) (SMs), and communication module processor CMP(s).	OP:ODD-AM-SM 5E10 and later
Requests a report of office dependent-data (ODD) warning information in the specified processors.	OP:ODDWARN 5E10 and later
Requests that uncommitted application recent changes be backed out.	SET:BACKOUT-A 5E10 - 5E13
Requests that uncommitted application recent changes be backed out.	SET:BACKOUT-B 5E14 and later
be populated for new remote switching modules (RSMs).	ST:MODGRW-RSM 5E10 and later
Increases the size of physical memory allocated to the protected non-redundant database.	ST:NRODDGRW 5E10 and later
Performs the blockid conversion for the redundant office-dependent data (RODD).	ST:ODDBST 5E10 and later
Requests that a new copy of office-dependent data (ODD) be created for a switching module (SM) that is being added to the switch.	ST:ODDCREAT-SM 5E10 and later
Requests that office-dependent data (ODD) files be removed from an switching module (SM) that is being removed from the office.	ST:ODDRM-SM 5E10 and later
Requests initiative of an update of all multi-module remote switching module (MMRSM) site common office dependent data (ODD) in all RSMs which are members of the MMRSM site.	ST:ODDUPD 5E10 and later
Allocates physical memory to the redundant portion of office dependent data (RODD) for the purpose of growth, provided that there is physical memory available.	ST:RODDGRW 5E10 and later
Requests an increase in the size of physical memory allocated to the unprotected (dynamic) office-dependent data (ODD).	ST:UODDGRW-SM 5E10 and later
Requests a graceful stop of the currently printing port list.	STP:LIST 5E10 and later
Requests that the office dependent data (ODD) evolution or double logging process be stopped.	STP:ODDEVOL 5E10 and later

Table 192 OFFICE NETWORK
Office Network and Timing Common Unit

Topic/Purpose	Message ID/ Message Release
Aborts an action on the specified office network and timing common units (ONTCCOM).	ABT:ONTCCOM 5E10 and later
Requests that the specified office network and timing common units (ONTCCOM) be diagnosed.	DGN:ONTCCOM 5E10 and later
Requests that an office network and timing complex common unit (ONTCCOM) be removed from service and placed in the 'out of service, manual removed' (OOS MAN RMV) state.	RMV:ONTCCOM 5E10 and later
Restores office network and timing complex common (ONTCCOM) units to an in-service condition.	RST:ONTCCOM 5E10 and later
REquests that an action on the specified office network and timing complex common unit (ONTCCOM) be stopped.	STP:ONTCCOM 5E10 and later

Table 193 Office Network and Timer Coupler

Topic/Purpose	Message ID/ Message Release
Aborts a diagnostic or conditional restore request on the specified office network and timing	ABT:ONTC

complex (ONTC).	5E10 and later
Requests diagnostics on an office network and timing complex (ONTC) to determine if it is in satisfactory working order.	DGN:ONTC 5E10 and later
Inhibits the hardware error checks from being performed on the specified office network and timing complex (ONTC).	INH:HDW-ONTC 5E10 and later
Requests that an office network and timing complex (ONTC) be removed from service.	RMV:ONTC 5E10 and later
Requests a restore of the office network and timing complex (ONTC) to an in service condition.	RST:ONTC 5E10 and later
Requests that an action on the specified office network and timing complex (ONTC) be stopped.	STP:ONTC 5E10 and later
Requests that the activity of the office network and timing complex (ONTC) be switched.	SW:ONTC 5E10 and later

Table 194 OFFICE RECORDS

Topic/Purpose	Message ID/ Message Release
Requests that all current processing on the on-line office records report generator be aborted.	ABT:OFR 5E10 and later
Inputs all internal operating and scheduling parameters of the online office records control process.	IN:OFR-PARM 5E10 and later
Requests the printing of all categories or one category of office record forms.	OP:OFR-CAT 5E10 and later
Requests printing of an office record form.	OP:OFR-FORM-A 5E10 only
Requests printing of an office record form.	OP:OFR-FORM-B 5E11 only
Requests printing of an office record form.	OP:OFR-FORM-C 5E12 and later
Requests a list of all output requests or all output requests of a specific type that are queued internally by the on-line office records capability and/or lists all the internal operating parameters of the on-line office records capability.	OP:OFR-STATUS 5E10 and later
Requests that any office records print message be stopped.	STP:OFR 5E10 and later

Table 195 OFFICE-TO-OFFICE TESTING

Topic/Purpose	Message ID/ Message Release
Aborts the specified office-to-office (OTO) task.	ABT:OTO-A 5E10 only
Aborts the specified office-to-office (OTO) task.	ABT:OTO-B 5E11 only
Aborts the specified office-to-office (OTO) task.	ABT:OTO-C 5E12 and later
Requests that the office-to-office (OTO) program on analog, integrated *SLC*®, or integrated digital carrier unit (IDCU) lines be exercised to provide pre-cutover verification of cross-connect wiring and line translations during transfer from an existing in-service office to a *5ESS*®-2000 switch office.	EX:OTO-A 5E10 - 5E11
Requests that the office-to-office (OTO) program on analog, integrated *SLC*®, or integrated digital carrier unit (IDCU) lines be exercised to provide pre-cutover verification of cross-connect wiring and line translations during transfer from an existing in-service office to a *5ESS*®-2000 switch office.	EX:OTO-B 5E12 and later
Requests a listing of the unassigned (UNA) lines, the integrated *SLC*® (ISLC) lines, and/or the integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, *SLC*® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs).	OP:LISTOTO-A 5E10 - 5E11
Requests a listing of the unassigned (UNA) lines, the integrated *SLC*® (ISLC) lines, and/or the	OP:LISTOTO-B 5E12 and later

integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, *SLC*® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs).	

Table 196 OPERATING SYSTEM FOR DISTRIBUTED SWITCHING

Topic/Purpose	Message ID/ Message Release
Requests the Operating System for Distributed Switching (OSDS) resource monitoring utility to collect and report usage of OSDS message, process, stack, and timer control blocks.	OP:PERF 5E10 and later

Table 197 Monitor

Topic/Purpose	Message ID/ Message Release
Requests that the operating system for distributed switching (OSDS) monitor actions be allowed.	ALW:MON 5E10 and later
Requests that the specified operating system for distributed switching (OSDS) monitor data collection areas be set to zero.	CLR:MON 5E10 and later
Requests that the operating system for distributed switching (OSDS) monitor actions be inhibited.	INH:MON 5E10 and later
Requests that the control information of the monitor is output to the receive-only printer (ROP) or a file.	OP:MON-CTL 5E10 and later
Requests that the contents of the dispatch array area of the monitor buffer or the contents of the entire monitor buffer be output to the receive-only printer (ROP) or a file.	OP:MON-DSP 5E10 and later
Requests that the count/time data on a specific program ID or all program IDs, or output count/time data on the operating system be output to either the receive-only printer (ROP) or a file.	OP:MON-PID 5E10 and later
Requests that the specific data for use with the operating system for distributed switching (OSDS) monitor be initialized.	SET:MON-DATA 5E10 and later
Requests that the special monitor action flags and/or the special monitor function execution flags be set.	SET:MON-FCN-A 5E10 only
Requests that the special monitor action flags and/or the special monitor function execution flags be set.	SET:MON-FCN-B 5E11 and later
Requests that data words for the timed data dump feature or special function use be initialized.	SET:MON-SPEC 5E10 and later
Requests that the monitor control flags that select "What To Do" actions or "What To Dump" fields be set or cleared.	SET:MON-WTD 5E10 and later
Requests that any action in progress due to an OP:MON-CTL, OP:MON-PID or OP:MON-DSP input message be stopped.	STP:OP-MON 5E10 and later

Table 198 OPERATOR SERVICES POSITION SYSTEM

Topic/Purpose	Message ID/ Message Release
Requests a listing of the external database (XDB) multi-line hunt group (MLHG) which corresponds to three input parameters: OPERATOR SERVICE CENTER (OSC 1-32), OPERATOR SERVING TEAM (ST 0-128), and DATABASE (DB 1-7).	OP:OSPS 5E10 and later
Requests the removal of an operator services position system (OSPS) port (OSPSPORT) from service by placing it in the specified out-of-service (OOS) status.	RMV:OSPSPORT 5E10 and later
Requests the restoration of an operator services position system (OSPS) port (OSPSPORT) to service by deleting the specified out-of-service (OOS) status.	RST:OSPSPORT 5E10 and later
Requests that the Hotel Billing Information System (HOBIS) or hotel billing information center (HOBIC) printer be tested by printing a text string (THE QUICK BROWN FOX JUMPED OVER THE LAZY DOGS.$#: /-'0123456789,").	TST:OSPS 5E10 and later

Table 199 Digital Subscriber Line

Topic/Purpose	Message ID/ Message Release
Requests a single process purge (SPP) and reinitialization of a terminal process in a switching module (SM) that controls the named Operator Services Position System (OSPS) digital subscriber line (DSL).	INIT:DSL 5E10 and later
To test the specified integrated service digital network (ISDN) basic rate interface (BRI) using digital or metallic techniques (DSL and ISDN BRI are used interchangeably in this message).	TST:DSL-A 5E10 - 5E11
To test the specified integrated service digital network (ISDN) basic rate interface (BRI) using	TST:DSL-B

digital, analog or metallic techniques (digital subscriber line (DSL) and BRI are used interchangeably in this message).	5E12 and later

Table 200 OUT-OF-SERVICE UNIT

Topic/Purpose	Message ID/ Message Release
Copies a specific file from an out-of-service (OOS) disk to an active system disk.	COPY:OOSDISK 5E10 and later
Requests that the interprocess message switch (IMS) measurements inhibit flag be changed and displayed.	INH:IMSMEAS 5E10 and later
Requests a list of trunks, lines, data links, or Operator Services Position System ports (OSPSPORTs) that currently match the status specified in the request.	OP:LIST-A 5E10 - 5E12
Requests a list of trunks, lines, data links, or Operator Services Position System ports (OSPSPORTs) that currently match the status specified in the request.	OP:LIST-B 5E13 and later
Requests a listing of the unassigned (UNA) lines, the integrated *SLC*® (ISLC) lines, and/or the integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, *SLC*® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs).	OP:LISTOTO-A 5E10 - 5E11
Requests a listing of the unassigned (UNA) lines, the integrated *SLC*® (ISLC) lines, and/or the integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, *SLC*® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs).	OP:LISTOTO-B 5E12 and later
Requests a list of all currently out-of-service (OOS) administrative module (AM) hardware units.	OP:OOS 5E10 and later
Requests the removal of a data link from service by placing it in the specified out-of-service (OOS) status.	RMV:DATALINK 5E10 and later
Requests that a line be removed from service by the addition of a specified out-of-service (OOS) status.	RMV:LINE-A 5E10 only
Requests that a line be removed from service by the addition of a specified out-of-service (OOS) status.	RMV:LINE-B 5E11 and later
Requests the restoration of a data link to service by deletion of the specified out-of-service (OOS) status.	RST:DATALINK 5E10 and later
Requests that a line be restored to service by deleting the specified out-of-service (OOS) condition.	RST:LINE-A 5E10 only
Requests that a line be restored to service by deleting the specified out-of-service (OOS) condition.	RST:LINE-B 5E11 and later
Requests that active printing tasks initiated by the OP:LISTOTO input message be stopped.	STP:LISTOTO 5E10 and later

Table 201 OUTPUT MESSAGE DATA BASE

Topic/Purpose	Message ID/ Message Release
Requests that the active (incore) output message database (OMDB) be refreshed from the OMDB disk file.	ACTV:OMDB 5E10 and later
Applies previous updates to the new copy of the output message data base (OMDB) disk file during field update.	APPLY:OMDB 5E10 and later
Requests that the message text, message class, and alarm level from an OMDB entry be output for the given key or keys.	OP:OMDB 5E10 and later
Requests that the message class or the alarm level for either one or a list of message keys in the output message data base (OMDB) disk file be updated.	UPD:OMDB 5E10 and later

Table 202 OVERLOAD STATUS

Topic/Purpose	Message ID/ Message Release
Requests an overload status report.	OP:OVRLD-AM-SM 5E10 and later

Table 203 PACKET INTERFACE

Topic/Purpose	Message ID/ Message Release
Requests that generic utility WHEN clauses in the packet interface unit (PI) be allowed or enabled.	ALW:UT-MCTSI-PI 5E10 and later

Copyright © 1999

Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet interface (PI) unit be removed.	CLR:UT-MCTSI-PI 5E10 and later
Requests that a value be copied into an address, register, variable, or utility variable of the packet interface (PI) unit.	COPY:UT-MCTSI-PI-A 5E10 only
Requests that a value be copied into an address, register, global variable (specified by name or symbol index), or utility variable of the packet interface (PI) unit and optionally perform any of the following operations.	COPY:UT-MCTSI-PI-B 5E11 and later
Requests the conditional ELSE input message; which is used with the IF input message to perform any packet interface (PI) unit generic utility input messages following it, provided the IF input message comparison is not true (refer to the IF:UT-MCTSI-PI input message).	ELSE:UT-MCTSI-PI 5E10 and later
Requests that a series of packet interface unit (PI) generic utility input messages be ended.	END:UT-MCTSI-PI 5E10 and later
Requests the end of an IF-ELSE statement in the packet interface (PI) unit and must be used in combination with the IF:UT-MCTSI-PI input message.	IF:UT-MCTSI-PE 5E10 and later
Requests that a constant or variable in a packet interface (PI) unit memory be compared against another constant or variable in the PI memory.	IF:UT-MCTSI-PI-A 5E10 only
Requests that a constant or variable in a packet interface (PI) unit memory be compared against another constant or variable in the PI memory.	IF:UT-MCTSI-PI-B 5E11 and later
Requests that a specific generic utility WHEN clause in the packet interface (PI) unit, or all such active clauses, be inhibited.	INH:UT-MCTSI-PI 5E10 and later
Requests a report on the status of one or all of the generic utilities WHEN clauses in the specified packet interface unit (PI).	OP:UT-MCTSI-PI 5E10 and later
Requests that a generic utility WHEN input message be defined in the specified packet interface unit (PI).	WHEN:UT-MCTSI-PI-A 5E10 only
Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet interface unit (PI).	WHEN:UT-MCTSI-PI-B 5E11 and later

Table 204 PACKET SWITCH UNIT

Topic/Purpose	Message ID/ Message Release
To abort (ABT) actions on either a packet switch unit (PSU) common controller (COM) or protocol handler (PH).	ABT:PSU 5E10 and later
Allows hardware checks on a packet switch unit (PSU) common controller (COM) or protocol handler (PH).	ALW:HDW-PSU 5E10 and later
Requests that a packet switch unit (PSU) common controller (COM) or protocol handler (PH) be diagnosed.	DGN:PSU 5E10 and later
Exercises (interactively diagnoses) a packet switch unit (PSU) common controller (COM) or protocol handler (PH).	EX:PSU 5E10 and later
Inhibits hardware checks on a packet switch unit (PSU) common controller (COM) or protocol handler (PH).	INH:HDW-PSU 5E10 and later
Requests that a packet switch unit (PSU) common controller (COM) or protocol handler (PH) be removed from service.	RMV:PSU 5E10 and later
Request that a packet switch unit (PSU) shelf side be removed from service.	RMV:PSUSHLF 5E12 and later
Requests that actions on a packet switch unit (PSU) common controller (COM) or protocol handler (PH) be stopped.	STP:PSU 5E10 and later
Requests that the specified software fault be inserted into a packet switch unit (PSU) protocol handler (PH).	TST:PSUPH-FAULT 5E10 and later

Table 205 Packet Switch Unit Common Controller

Topic/Purpose	Message ID/ Message Release
Requests that a packet switch unit common controller (PSUCOM) be restored to service.	RST:PSUCOM 5E10 and later
Requests that the active/standby states of the packet switch unit (PSU) common controllers (COM) be switched (interchanged).	SW:PSUCOM 5E10 and later

Table 206 Packet Switch Unit Link

Topic/Purpose	Message ID/ Message Release
Requests that the manually set automatic protection switch (APS) state of the packet switch	CLR:PSLNK

unit (PSU) link (PSLNK) be cleared.	5E11 and later
Convert from a given packet switch unit (PSU) link to the associated protocol handlers (PHs) for asynchronous transfer mode (ATM) (PHAs) that service the individual channels of the PSU link.	OP:CONV-PSLNK-A 5E10 only
Convert from a given packet switch unit (PSU) link (PSLNK) to the associated protocol handlers (PHs) for asynchronous transfer mode (ATM) (PHAs) that service the individual channels of the PSU link.	OP:CONV-PSLNK-B 5E11 and later
Requests the output of the current status of a single packet switch unit (PSU) link or a group of PSU links.	OP:ST-PSLNK-A 5E10 only
Requests the output of the current link status and other information of a single packet switch unit (PSU) link (PSLNK); or the output of the current status of a group of PSU links.	OP:ST-PSLNK-B 5E11 and later
Requests that the automatic protection switch (APS) state of a packet switch unit (PSU) link (PSLNK) be set to a higher priority state.	SET:PSLNK 5E11 and later
Request that the active/standby states of the packet switch unit (PSU) link channels be switched.	SW:PSLNK-A 5E10 only
Request that the active/standby states of the packet switch unit (PSU) link (PSLNK) channels be switched.	SW:PSLNK-B 5E11 and later
Requests an asynchronous transfer mode (ATM) level loop back test between two end points of a packet switch unit (PSU) link (PSLNK) in a point-to-point network configuration (Formats 1 through 3) or between two end points of a virtual path in a point-to-multipoint ATM network (Formats 4 through 6).	TST:PSLNK 5E11 and later

Table 207 Packet Switch Unit Peripheral Interface Data Bus

Topic/Purpose	Message ID/ Message Release
Requests that a specified action on a packet switch unit (PSU) peripheral interface data bus (PIDB) be aborted.	ABT:PSUPIDB 5E10 and later
Requests that a packet switch unit (PSU) shelf peripheral interface data bus (PIDB) pair be removed from service.	RMV:PSUPIDB 5E10 and later
Requests that a packet switch unit (PSU) shelf peripheral interface data bus (PIDB) pair be restored to service.	RST:PSUPIDB 5E10 and later
Requests that actions on a packet switch unit (PSU) shelf peripheral interface data bus (PIDB) be stopped.	STP:PSUPIDB 5E10 and later

Table 208 Packet Switch Unit Protocol Handler

Topic/Purpose	Message ID/ Message Release
Requests that generic utility WHEN breakpoint clauses in the packet switch unit protocol handler (PSUPH) be allowed or enabled.	ALW:UT-PSUPH 5E10 and later
Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet switch unit protocol handler (PSUPH) be removed.	CLR:UT-PSUPH 5E10 and later
Requests that a value be copied into an address, register, variable, or utility variable of the packet switch unit protocol handler (PSUPH), and perform any of the following operations:	COPY:UT-PSUPH-A 5E10 only
Requests that a value be copied into an address, register, global variable (specified for name or symbol index), or utility variable of the packet switch unit protocol handler (PSUPH), and optionally perform any of the following operations:	COPY:UT-PSUPH-B 5E11 and later
Requests that the contents of one more sequential memory locations in the specified packet switch unit protocol handler (PSUPH) be dumped.	DUMP:UT-PSUPH-A 5E10 only
Requests that the contents of one more sequential memory locations in the specified packet switch unit protocol handler (PSUPH) be dumped.	DUMP:UT-PSUPH-B 5E11 and later
Requests that the conditional ELSE input message used with the IF input message perform any packet switch unit protocol handler (PSUPH) generic utility input messages following it, provided the IF input message comparison is not true.	ELSE:UT-PSUPH 5E10 and later
Requests that a series of packet switch unit protocol handler (PSUPH) generic utility input messages be ended.	END:UT-PSUPH 5E10 and later
Requests that an unconditional call to a function using parameters or a transfer of execution to an absolute address in the specified packet switch unit protocol handler (PSUPH) be executed.	EXC:UT-PSUPH-A 5E10 only
Format 1 requests that an unconditional call to a function using parameters in the specified packet switch unit protocol handler (PSUPH) be executed.	EXC:UT-PSUPH-B 5E11 and later
Requests that a constant or variable in a packet switch unit protocol handler's (PSUPH)	IF:UT-PSUPH-A

memory be compared against another constant or variable in the PSUPH memory.	5E10 only
Requests that a constant or variable in a packet switch unit protocol handler's (PSUPH) memory be compared against another constant or variable in the PSUPH memory.	IF:UT-PSUPH-B 5E11 and later
Requests the end of an IF-ELSE statement in the packet switch unit protocol handler (PSUPH) and must be used in combination with the IF:UT-PSUPH input message.	IF:UT-PSUPH-END 5E10 and later
Requests that a specific generic utility WHEN clause in the packet switch unit protocol handler (PSUPH), or all such active clauses, be inhibited.	INH:UT-PSUPH 5E10 and later
Requests that a value(s) be loaded into the memory of the specified packet switch unit protocol handler (PSUPH).	LOAD:UT-PSUPH-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified packet switch unit protocol handler (PSUPH).	LOAD:UT-PSUPH-B 5E11 and later
Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the specified packet switch unit protocol handler (PSUPH).	OP:UT-PSUPH 5E10 and later
Requests that a packet switch unit (PSU) protocol handler (PH) be restored to service.	RST:PSUPH 5E10 and later
Requests that the active/standby states of the packet switch unit (PSU) protocol handlers (PH) be switched.	SW:PSUPH 5E10 and later
Requests that a temporary generic utility breakpoint be defined for an application program in the specified packet switch unit protocol handler (PSUPH).	WHEN:UT-PSUPH-A 5E10 only
Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet switch unit protocol handler (PSUPH).	WHEN:UT-PSUPH-B 5E11 and later

Table 209 PARTITIONS

Topic/Purpose	Message ID/ Message Release
Requests that partitions on a specified disk be cleared (initialized with zeroes).	CLR:PTN 5E10 and later
Requests that one set of disk partitions be copied into a corresponding set of partitions.	COPY:PTN-ALL 5E10 and later
Requests verification of office routing translations, used in call processing, from the originating line or trunk to the terminating line or trunk.	VFY:OFC-A 5E10 only
Requests verification of office routing translations, used in call processing, from the originating line or trunk to the terminating line or trunk.	VFY:OFC-B 5E10 and later

Table 210 PERIODIC PULSE METERING CIRCUIT

Topic/Purpose	Message ID/ Message Release
Requests that a specified action on the periodic pulse metering circuit (PPMTC) be aborted.	ABT:PPMTC 5E10 and later

Table 211 PLANT MEASUREMENTS COMMON REPORT

Topic/Purpose	Message ID/ Message Release
Requests the various plant measurements common reports, detailing system performance statistics.	OP:PMCR 5E10 and later

Table 212 PLANT REPORT - 24 HOUR

Topic/Purpose	Message ID/ Message Release
Requests that the printing of the regularly scheduled 24-hour plant report to the receive-only printer (ROP) be allowed.	ALW:PLNT24 5E10 and later
Requests that the printing of the hourly plant report be allowed.	ALW:PLNTHR 5E10 and later
Requests that the regularly scheduled 24-hour plant report be inhibited from printing to the receive-only printer (ROP).	INH:PLNT24 5E10 and later
Requests that the printing of the hourly plant report be inhibited.	INH:PLNTHR 5E10 and later
Requests the last complete hourly plant report.	OP:PLNTHR 5E10 and later
Requests that the monthly plant report be obtained at a time other than the regularly	OP:PLNTMO

scheduled time.	5E10 and later
Requests the status (inhibited or allowed) of the hourly plant report.	REPT:PLNTHR 5E10 and later

Table 213 PORTS

Topic/Purpose	Message ID/ Message Release
Requests the output of the print mode, overload status, and initialization summary information for the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or packet switching unit protocol handler (PSUPH).	OP:ST 5E10 and later
Requests the status of each connected administrative module (AM) message port.	OP:ST-PORTS 5E10 and later
Requests that all port camp-on activity be stopped.	STP:CAMP 5E10 and later
Requests a switch of the maintenance teletypewriter controller's (MTTYC's) receive-only printer (ROP) and/or maintenance teletypewriter (MTTY) to the alternate MTTYC and a switch of the active/standby status of the MTTY and/or ROP.	SW:PORTSW 5E10 and later

Table 214 POSTMORTEM

Topic/Purpose	Message ID/ Message Release
Requests a list of active protocol monitoring (PM) sessions.	OP:PM 5E10 and later
Requests the output of the port processor's (PP's) postmortem reports saved in the specified module controller time slot interchanger (MCTSI).	OP:PM-PP-MCTSI 5E10 and later
Requests a copy of the specified postmortems from the specified switching module (SM).	OP:PM-SM 5E10 and later
Requests a copy of the postmortem for the digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC), the integrated digital carrier unit (IDCU), the integrated service line unit common controller (ISLUCC) or the transmission multiplexer (TMUX).	OP:POSTMORT 5E10 and later
Requests a copy of the postmortem for the communication module processor (CMP).	OP:POSTMORT-CMP 5E10 and later
Requests the release (unlocking) of the port processor's (PP's) postmortem report save area of the specified module controller time slot interchanger (MCTSI) to allow the capture of the next autonomous packet switching unit protocol handler (PSUPH) or packet interface (PI) initialization postmortem reports.	RLS:PM-PP-MCTSI 5E10 and later
Releases the postmortem save area.	RLS:PM-SM 5E10 and later
Requests the release of the postmortem save area.	RLS:POSTMORT 5E10 and later
Requests that a specific integrated services digital network (ISDN) channel protocol monitoring (PM) session or all protocol monitoring sessions be stopped.	STP:PM 5E10 and later
Requests a change of the print mode of the specified packet interface (PI) and/or packet switching unit protocol handler (PSUPH).	CHG:PRNTMODE-A 5E10 - 5E12
Requests a change to the print mode of the specified packet interface (PI) and/or packet switching unit protocol handler (PSUPH).	CHG:PRNTMODE-B 5E13 and later
Requests printing of the specified section or all the specified sections of the software update (SU) MSGS file on the receive-only printer (ROP).	UPD:PRINT 5E10 and later

Table 215 PROCESSES

Topic/Purpose	Message ID/ Message Release
Requests that a task be executed as either a kernel or supervisor process.	EXC:ENVIR-PROC 5E10 and later
Requests that a task be executed as a user process.	EXC:ENVIR-UPROC 5E10 and later
Requests a report of the size of a relation residing on an operational processor or range of processors.	OP:RELSPACE 5E10 and later
Requests the status of active processes by specific class.	OP:ST-PROC 5E10 and later

Copyright © 1999

Requests that any specified process be stopped.	STOP:EXC-ANY 5E10 and later
Requests that a user process specified either by ID number or by pathname be stopped.	STOP:EXC-USER 5E10 and later
Requests that any process be stopped.	STP:EXC-ANY 5E10 and later
Requests that a user process specified either by ID number or by pathname be stopped.	STP:EXC-USER 5E10 and later

Table 216 PROTOCOL Protocol Circuit

Topic/Purpose	Message ID/ Message Release
Requests the monitoring of a particular level 2 or level 3 protocol on a given integrated services digital network (ISDN) interface and channel.	EXC:PM-A 5E10 only
Requests the monitoring of a particular level 2 or level 3 protocol on a given integrated services digital network (ISDN) interface and channel.	EXC:PM-B 5E11 only
Requests the monitoring of a particular level 2 or level 3 or level 7 protocol on a given interface terminating on the switch provided the protocol stack to be monitored is supported on the interface.	EXC:PM-C 5E12 only
Requests the monitoring of a particular level 2 or level 3 or level 7 protocol on a given interface terminating on the switch provided the protocol stack to be monitored is supported on the interface.	EXC:PM-D 5E13 and later

Table 217 Protocol Monitoring

Topic/Purpose	Message ID/ Message Release
Requests that actions on the protocol circuit (PROTO) be aborted at the specified locations.	ABT:PROTO 5E10 and later
Requests that the protocol circuit (PROTO) be diagnosed to determine whether it is in satisfactory working order.	DGN:PROTO 5E10 and later
Exercises the protocol (PROTO) circuit to determine whether it is in satisfactory working order.	EX:PROTO 5E10 and later
Requests that the protocol circuit (PROTO) be removed from service.	RMV:PROTO 5E10 and later
Restores the protocol (PROTO) circuit to the active state conditionally or unconditionally.	RST:PROTO 5E10 and later
Requests that actions on the protocol circuit (PROTO) at the specified location be stopped.	STP:PROTO 5E10 and later

Table 218 PUMP PERIPHERAL CONTROLLER

Topic/Purpose	Message ID/ Message Release
Aborts actions on the specified pump peripheral controller (PPC).	ABT:PPC 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified pump peripheral controller (PPC).	ALW:HDW-PPC 5E10 and later
Requests diagnostics on a pump peripheral controller (PPC) to determine if it is in satisfactory working order.	DGN:PPC 5E10 and later
Requests that the contents of one or more sequential memory locations in the specified pump peripheral controller (PPC) be dumped.	DUMP:UT-PPC-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified pump peripheral controller (PPC) be dumped.	DUMP:UT-PPC-B 5E11 and later
Requests that the pump peripheral controller (PPC) be exercised in an interactive mode.	EX:PPC 5E10 and later
Requests that an unconditional call to a function using parameters in the specified pump peripheral controller (PPC) be executed.	EXC:UT-PPC-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified pump peripheral controller (PPC) be executed.	EXC:UT-PPC-B 5E11 and later
Inhibits the hardware error checks performed on the specified pump peripheral controller (PPC).	INH:HDW-PPC 5E10 and later

Requests that a value be loaded into the memory of the specified peripheral controller (PPC).	LOAD:UT-PPC-A 5E10 only
Requests that a value be loaded into the memory of the specified pump peripheral controller (PPC).	LOAD:UT-PPC-B 5E11 and later
Requests that the specified pump peripheral controller (PPC) be removed from service.	RMV:PPC 5E10 and later
Restores the specified pump peripheral controller (PPC) to service.	RST:PPC 5E10 and later
Requests that actions on the specified pump peripheral controller (PPC) be stopped.	STP:PPC 5E10 and later
Requests that the activity of the pump peripheral controller (PPC) be switched.	SW:PPC 5E10 and later

Table 219 QUAD-LINK PACKET SWITCH

Topic/Purpose	Message ID/ Message Release
Requests that actions on a quad-link packet switch (QLPS) be aborted (ABT).	ABT:QLPS 5E10 and later
Requests diagnosis of a quad-link packet switch (QLPS) to determine whether it is in satisfactory working order.	DGN:QLPS 5E10 and later
Requests interactive diagnosis of a quad-link packet switch (QLPS).	EX:QLPS 5E10 and later
Requests a report of the status of quad-link packet switch (QLPS) pipes (QPIPEs), QLPS communication links (QLNKs), and inter-switching module QLNKs (ISMQLNKs) and, optionally, the supporting communication module (CM) hardware.	OP:QNETSTAT 5E10 and later
Requests a conditional or unconditional removal of a quad-link packet switch (QLPS) from service.	RMV:QLPS 5E10 and later
Request a conditional or unconditional restore of a quad-link packet switch (QLPS) to the standby state.	RST:QLPS 5E10 and later
Requests that actions on a quad-link packet switch (QLPS) be stopped (STP).	STP:QLPS 5E10 and later
Requests activation of a standby quad-link packet switch (QLPS) processor.	SW:QLPS 5E10 and later

Table 220 Quad-Link Packet Switch Gateway Processor

Topic/Purpose	Message ID/ Message Release
Requests that actions on a quad-link packet switch (QLPS) gateway processor (QGP) be aborted (ABT).	ABT:QGP 5E10 and later
Requests that hardware error checks be allowed to be performed on the specified quad-link packet switch gateway processor (QGP).	ALW:HDW-QGP 5E10 and later
Requests diagnosis of a quad-link packet switch (QLPS) gateway processor (QGP) to determine whether it is in satisfactory working order.	DGN:QGP 5E10 and later
Requests that the contents of one or more sequential memory locations in the specified quad-link packet switch (QLPS) gateway processor (QGP) be dumped.	DUMP:UT-QGP-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified quad-link packet switch (QLPS) gateway processor (QGP) be dumped.	DUMP:UT-QGP-B 5E11 and later
Requests interactive diagnosis of a quad-link packet switch (QLPS) gateway processor (QGP).	EX:QGP 5E10 and later
Requests that an unconditional call to a function using parameters in the specified quad-link packet switch (QLPS) gateway processor (QGP) be executed.	EXC:UT-QGP-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified quad-link packet switch (QLPS) gateway processor (QGP) be executed.	EXC:UT-QGP-B 5E11 and later
Requests that the hardware checks on the specified quad-link packet switch gateway processor (QGP) be inhibited.	INH:HDW-QGP 5E10 and later
Requests that a value(s) be loaded into the memory of the specified quad-link packet switch (QLPS) gateway processor (QGP).	LOAD:UT-QGP-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified quad-link packet switch (QLPS) gateway processor (QGP).	LOAD:UT-QGP-B 5E11 and later
Request a conditional or unconditional removal of a quad-link packet switch (QLPS) gateway processor (QGP) from service.	RMV:QGP 5E10 and later

Request a conditional or unconditional restore of a quad-link packet switch (QLPS) gateway processor (QGP) to the active state.	RST:QGP 5E10 and later
Requests that actions on a quad-link packet switch (QLPS) gateway processor (QGP) be stopped (STP).	STP:QGP 5E10 and later

Table 221 Quad-Link Packet Switch Gateway Processor Link

Topic/Purpose	Message ID/ Message Release
Requests an unconditional restore of a quad-link packet switch (QLPS) gateway processor link (QGL).	RST:QGL 5E10 and later

Table 222 Quad-Link Packet Switch Time Multiplexed Switch Link

Topic/Purpose	Message ID/ Message Release
Requests a unconditional restore of a quad-link packet switch (QLPS) time multiplexed switch link (QTMSLNK) to the active state.	RST:QTMSLNK 5E10 and later

Table 223 RADIO PORT CONTROLLER UNIT

Topic/Purpose	Message ID/ Message Release
Requests a list of alarmed radio port controller units (RPCUs) and their alarm levels.	OP:RPCU 5E11 and later
Requests that the printing of alarmed radio port controller units (RPCUs) by an OP:RPCU input message be stopped.	STP:RPCU 5E11 and later

Table 224 REAL TIME BILLING MEMORY

Topic/Purpose	Message ID/ Message Release
Requests that the size of the Real Time Billing Memory (RTBM) on switching modules (SM's) be configured. Physical memory is allocated to the SM real time billing buffer for growth. The amount specified in the kbytes parameter will become the newly configured real time memory size and must be a multiple of 4.	CFR:RTBM 5E12 and later
Requests verification of the amount of Real Time Billing Memory (RTBM) and the amount currently in use.	VFY:RTBM 5E12 and later

Table 225 REAL TIME CALL DETAIL

Topic/Purpose	Message ID/ Message Release
Requests a printout of the global billing switching module (SM) number and the status of the Real Time Call Detail (RTCD) office option.	OP:RTCD 5E12 and later

Table 226 RECEIVE-ONLY PRINTER

Topic/Purpose	Message ID/ Message Release
Requests that the specified receive-only printer (ROP) be removed from service.	RMV:ROP 5E10 and later
Restores the specified receive-only printer (ROP) to service.	RST:ROP 5E10 and later

Table 227 RECENT CHANGE

Topic/Purpose	Message ID/ Message Release
Requests that customer-originated recent changes (CORCs) be allowed into the system if they were previously inhibited.	ALW:CORC 5E10 and later
To enable the logging of customer-originated recent changes for one or more switching modules (SMs).	ALW:CORCLOG-SM 5E10 and later
Requests that office-dependent data (ODD) recent changes (RCs) be allowed into the system if they were previously inhibited.	ALW:RC 5E10 and later
Requests that telephone activations of recent change delayed messages (RCDMs) be allowed in the system if they were previously inhibited.	ALW:RCDLY 5E10 and later
Requests that logging of recent changes be allowed for all processors.	ALW:RCLOG

Copyright © 1999

	5E10 and later
Requests that customer-originated recent change (CORC) logfiles be evolved (converted) and reapplied.	CNVT:CORCLOG 5E10 and later
Requests that recent change (RC) logfiles be Evolved (converted) to a format compatible with the target software release.	CNVT:RCLOG 5E10 and later
Requests reapplication of customer-originated and/or regular recent changes (RCs) from the disk log.	EXC:ODDRCVY 5E10 and later
Requests the execution of the recent change (RC) or customer originated recent change (CORC) log file decoder.	EXC:RCDECODE 5E10 and later
Requests that all recent changes (RCs) previously entered into the delayed release clerk file(s) be released.	EXC:RCRLS-A 5E10 only
Requests that all recent changes (RCs) previously entered into the delayed release clerk file(s) be released.	EXC:RCRLS-B 5E11 and later
Removes selected recent changes previously entered into the delayed release clerk file.	EXC:RCRMV 5E10 and later
Requests that all customer-originated recent changes (CORC) be inhibited.	INH:CORC 5E10 and later
Inhibits the logging of customer-originated recent changes for one or more switching modules (SMs).	INH:CORCLOG-SM 5E10 and later
Requests that all office-dependent data (ODD) recent change (RC) activity be inhibited.	INH:RC 5E10 and later
Requests that all telephone activations of recent change delayed messages (RCDMs) be inhibited in the system.	INH:RCDLY 5E10 and later
Inhibits the logging of recent changes for all processors.	INH:RCLOG 5E10 and later
Requests the reporting of the number of customer-originated recent changes (CORCs) that are logged in one or more switching modules (SMs) and/or one or more communication module processors (CMPs).	OP:CORCSTAT-SM 5E10 and later
Requests verification of permissions for recent change (RC) access from a specified terminal (TTY).	OP:RCACCESS-A 5E10 - 5E12
Requests verification of permissions for recent change (RC) access from a specified terminal (TTY) associated with the 3B processor or a specified login id (LOGIN) assigned on the administrative services module (ASM).	OP:RCACCESS-B 5E13 and later
Requests that the current telephone activations status of recent change delayed messages (RCDMs) be displayed.	OP:RCDLY 5E10 and later
Requests the status of a previously entered REPT:RCHIST input message.	OP:RCHIST 5E10 and later
Requests the status of a previously entered EXC:RCRLS input message.	OP:RCRLS 5E10 and later
Requests that the status of a previously entered EXC:RCRMV input message be output.	OP:RCRMV 5E10 and later
Requests the number of recent changes applied in the administrative module (AM), one or more communication module processors (CMPs), and/or one or more switching modules (SMs) since the previous backup of the office-dependent data (ODD).	OP:RCSTAT-SM 5E10 and later
Requests a report on the active recent change (RC) process that is accessing the office-dependent data (ODD) and the terminal (TTY), the clerk ID in the case of batch RC, associated with the process.	OP:RCUSER 5E10 and later
Requests a recent change and verify (RC/V) session using the text input option.	RCV:APPTEXT 5E10 and later
Invokes the text recent change and verify (RC/V) activity; this format is used to insert, update, or delete records in the equipment configuration database (ECD) using serial text input.	RCV:DMTECD-RC 5E10 and later
Invokes the text recent change and verify (RC/V) activity; this format is used to review equipment configuration database (ECD) forms using serial text input.	RCV:DMTECD-VFY 5E10 and later
Invokes the text recent change and verify (RC/V) activity.	RCV:DMTSG-RC 5E10 and later
Invokes the text recent change and verify (RC/V) activity.	RCV:DMTSG-VFY 5E10 and later
Requests that the switch access dictionary editor tool (ACCED) be run.	RCV:M-ACCED 5E10 and later
Runs the switch office-dependent data (ODD) application recent change (APPRC) and verify functions.	RCV:M-APPRC 5E10 and later

Requests that the validity of /no5text/bkup/*.ptn files be checked.	RCV:M-BKUPCHK 5E10 and later
Reads or patches an administrative module database using the "browse" tool.	RCV:M-BROWSE 5E10 and later
Requests that the common network interface data base consolidator (CNIDBOC) be run.	RCV:M-CNIDBOC 5E10 and later
Requests that the common network interface (CNI) growth script be executed.	RCV:M-CNIGROWTH 5E10 and later
Compares the equipment configuration database (ECD) and the system generation (SG) database.	RCV:M-COMPAREDB 5E10 and later
Requests that a skeleton equipment configuration database (ECD) be generated.	RCV:M-CREATEECD 5E10 and later
Generates a skeleton system generation (SG).	RCV:M-CREATESG 5E10 and later
Invokes a specified recent change activity; this format is used to evolve a new database from an old one.	RCV:M-EVOL 5E10 and later
Compares of two form types.	RCV:M-FDIFF 5E10 and later
Requests that the automatic generic backup process be started.	RCV:M-GENBKUP 5E10 and later
Compares of two sorted keyfiles.	RCV:M-KEYCMP 5E10 and later
Creates, on the standard output, a list of all keys that are common to two sorted keyfiles.	RCV:M-KEYCOMM 5E10 and later
Creates a sorted list of form keys for all the instances of a given form type found in the equipment configuration database (ECD) and the system generation (SG) database.	RCV:M-KEYS 5E10 and later
Invokes a specified recent change activity.	RCV:M-LOADF3B 5E10 and later
Creates a sorted list of keys for all form types in the equipment configuration database (ECD) and the system generation (SG) database.	RCV:M-NEWDB 5E10 and later
Requests that the office database editor tool (ODBE) be run.	RCV:M-ODBE 5E10 and later
Creates files of form instances when specified data form type(s) from the equipment configuration database (ECD) and the system generation (SG) database are given.	RCV:M-PRINTDB 5E10 and later
Creates a file of all form instances, given a list of form keys, found in the equipment configuration database (ECD) and the system generation (SG) database.	RCV:M-PRINTFRM 5E10 and later
Reviews or modifies an equipment configuration database (ECD) through recent change (RC).	RCV:M-RCVECD 5E10 and later
Reviews or modifies a system generation (SG) database through recent change (RC).	RCV:M-RCVSG 5E10 and later
Requests that tape data of either smtext (text code that resides on switching modules (SMs)) or SM office-dependent data (SMODD) be read in to a disk or a pair of disks other than the primary disk pair.	RCV:M-RDLDFT 5E10 and later
Runs the *5ESS*®-2000 switch screen program that allows the office user to run the *UNIX*® shell, office-dependent data (ODD) database editor (ODBE) and common network interface data base operation consolidator (CNIDBOC), access editor (ACCED) and circuit return tag tool (RTAG) from a recent change and verify (RC/V) terminal, with page-at-a-time output.	RCV:M-SCREEN 5E10 and later
Requests an escape to the shell (enter <cntl d> to return).	RCV:M-SH 5E10 and later
Invokes a specified recent change activity; this format is used to create a translation database when a tree address space and translation specifications are given.	RCV:M-TRANSGEN 5E10 and later
Invokes a specified recent change activity; this format is used to build a tree address space given the old and new form specifications.	RCV:M-TREEBLD 5E10 and later
Checks the syntax of the specified default file (corresponding to the low level recent change and verify (RC/V) equipment configuration data base (ECD) form of the same name), and verifies the low level field names and values contained therein are legal for that low level form.	RCV:M-VFYDFLT 5E10 and later
Requests that administrative module (AM) tape and disk backups be verified as usable.	RCV:M-VFYTXT 5E10 and later
Requests an RC batch history of recent changes (RCs) entered into the RC batch delayed-release clerk files.	REPT:RCHIST 5E10 and later
Requests that permissions for recent change (RC) access from a specified terminal (TTY) be	SET:RCACCESS-A

set.	5E10 - 5E12
Requests that permissions for recent change (RC) access from a specified terminal (TTY) associated with the 3B processor or a specified login id (LOGIN) from the administrative services module (ASM) be set.	SET:RCACCESS-B 5E13 and later
Requests the termination or initialization of the recent change kernel process (RCKP).	ST:OVERLAY 5E10 and later
Requests that a previously entered REPT:RCHIST input message be stopped.	STP:RCHIST 5E10 and later
Requests that a previously entered EXC:RCRLS input message be stopped.	STP:RCRLS 5E10 and later
Requests that a previously entered EXC:RCRMV input message for a delayed release clerkfile be stopped.	STP:RCRMV 5E10 and later

Table 228 Global Recent Change

Topic/Purpose	Message ID/ Message Release
Requests that a global recent change (GRC) job that is waiting in the queue be canceled.	CLR:GRC 5E10 and later
Requests that a global recent change (GRC) operation that is halted be restarted.	EXC:GRC 5E10 and later
Requests that the global recent change (GRC) password for the given clerk identifier be updated or deleted.	EXC:GRCPASSWORD 5E10 and later
Requests that a global recent change (GRC) job that is waiting in the queue be canceled.	GRC:CANCEL 5E10 and later
Requests that a global recent change (GRC) operation that is halted be restarted.	GRC:CONTINUE 5E10 and later
Requests that the execution of the current global recent change (GRC) job be suspended.	GRC:HALT 5E10 and later
Requests that the global recent change (GRC) password for the given clerk identifier be updated or deleted.	GRC:PASSWORD 5E10 and later
Requests that a report of the global recent change (GRC) activity be printed.	GRC:REPORT 5E10 and later
Requests that a global recent change (GRC) job be rescheduled.	GRC:RESCHED 5E10 and later
Requests that the specified global recent change (GRC) job be removed from the switch.	GRC:RMV 5E10 and later
Requests that a global recent change (GRC) test update job be run to verify that the correct updates will be applied.	GRC:TEST-NAME 5E10 and later
Requests that a report of the global recent change (GRC) activity be printed.	REPT:GRC 5E10 and later
Requests that the specified global recent change (GRC) job be removed from the switch.	RMV:GRC 5E10 and later
Requests that a global recent change (GRC) job be rescheduled.	SCHED:GRC 5E10 and later
Requests that the execution of the current global recent change (GRC) job be suspended.	STP:GRC 5E10 and later
Requests that a global recent change (GRC) test update job be run to verify that the correct updates will be applied.	TST:GRC 5E10 and later

Table 229 RECORDED ANNOUNCEMENT FRAME

Topic/Purpose	Message ID/ Message Release
Aborts the specified actions on the recorded announcement function (RAF) unit.	ABT:RAF 5E10 and later
Allows hardware checks in a recorded announcement function (RAF) unit to occur.	ALW:HDW-RAF 5E10 and later
Removes and diagnoses a recorded announcement function (RAF) unit to determine whether it is in satisfactory working order.	DGN:RAF 5E10 and later
Interactively diagnoses (exercises) the recorded announcement function (RAF) unit.	EX:RAF 5E10 and later
Inhibits hardware checks in a recorded announcement function (RAF) unit.	INH:HDW-RAF

	5E10 and later
Requests that a recorded announcement function (RAF) unit be removed from service.	RMV:RAF 5E10 and later
Conditionally or unconditionally restores a recorded announcement function (RAF) unit to service.	RST:RAF 5E10 and later
Requests that the specified actions on the recorded announcement function (RAF) unit be stopped.	STP:RAF 5E10 and later

Table 230 REGISTERS

Topic/Purpose	Message ID/ Message Release
Requests that data be copied from the administrative module (AM) registers to virtual addresses in main memory and in registers as an action associated with a breakpoint.	COPY:REG 5E10 and later
Dumps the contents of one or more registers, either as an immediate action, or as an action associated with a breakpoint.	DUMP:REG 5E10 and later
Requests that the contents of the error registers of the specified hardware unit be initialized.	INIT:REG 5E10 and later
Loads an administrative module (AM) register with specified data as a breakpoint action.	LOAD:REG-A 5E10 only
Loads an administrative module (AM) register with specified data as a breakpoint action.	LOAD:REG-B 5E11 and later
Requests that the contents of the error registers of the specified hardware unit be printed.	OP:REG 5E10 and later

Table 231 REMOTE BUILDING AND MISCELLANEOUS SCAN POINT

Topic/Purpose	Message ID/ Message Release
Inhibits alarms from a single specific REMOTE building or miscellaneous alarm scan point.	INH:RBPSC-SM 5E10 and later

Table 232 REMOTE CLOCK

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on the remote clock (RCLK) circuit.	ABT:RCLK 5E10 and later
Allows hardware error checks to be performed on the specified remote clock (RCLK) circuit at the peripheral interface control bus (PICB) level.	ALW:HDW-RCLK 5E10 and later
Requests a diagnosis of a remote clock (RCLK) side.	DGN:RCLK 5E10 and later
Requests that maintenance exercises be performed on the remote clock (RCLK).	EX:RCLK 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock (RCLK) circuit at the peripheral interface control bus (PICB) level.	INH:HDW-RCLK 5E10 and later
Requests that a specified remote clock (RCLK) circuit be removed from service.	RMV:RCLK 5E10 and later
Requests that the specified remote clock (RCLK) circuit be restored to service.	RST:RCLK 5E10 and later
Requests that a remote clock (RCLK) circuit be set to a specific mode.	SET:RCLK 5E10 and later
Requests that maintenance actions on the remote clock (RCLK) circuit be stopped.	STP:RCLK 5E10 and later
Requests that the status of active and standby remote clock (RCLK) circuits be switched.	SW:RCLK 5E10 and later

Table 233 Remote Clock Cross Couple

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on the remote clock cross couple (RCXC).	ABT:RCXC 5E10 and later
Requests that a specified remote clock cross couple (RCXC) be removed from service.	RMV:RCXC 5E10 and later
Requests that a specified remote clock cross couple (RCXC) be restored to service.	RST:RCXC

	5E10 and later

Table 234 Remote Clock Oscillator

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on the remote clock oscillator (RCOSC).	ABT:RCOSC 5E10 and later
Allows hardware error checks to be performed on the specified remote clock oscillator (RCOSC) circuit.	ALW:HDW-RCOSC 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock oscillator (RCOSC) circuit.	INH:HDW-RCOSC 5E10 and later
Requests that a specified remote clock oscillator (RCOSC) be removed from service.	RMV:RCOSC 5E10 and later
Requests that a specified remote clock oscillator (RCOSC) be restored to service.	RST:RCOSC 5E10 and later
Requests the switch of active remote clock oscillators (RCOSC) to the specified remote clock (RCLK) side.	SW:RCOSC 5E10 and later

Table 235 Remote Clock Oscillator Couple

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on the remote clock oscillator cross couple (RCOXC).	ABT:RCOXC 5E10 and later
Allows hardware error checks to be performed on the specified remote clock oscillator cross couple (RCOXC) link.	ALW:HDW-RCOXC 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock oscillator cross couple (RCOXC) circuit.	INH:HDW-RCOXC 5E10 and later
Requests that a specified remote clock oscillator cross couple (RCOXC) be removed from service.	RMV:RCOXC 5E10 and later
Requests that a specified remote clock oscillator cross couple (RCOXC) be restored to service.	RST:RCOXC 5E10 and later

Table 236 Remote Clock Reference

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on the remote clock reference (RCREF).	ABT:RCREF 5E10 and later
Allows hardware error checks to be performed on the specified remote clock reference (RCREF).	ALW:HDW-RCREF 5E10 and later
Inhibits hardware error checks from being performed on the specified remote clock reference (RCREF).	INH:HDW-RCREF 5E10 and later
Requests that a specified remote clock reference (RCREF) be removed from service.	RMV:RCREF 5E10 and later
Requests that a specified remote clock reference (RCREF) be restored to service.	RST:RCREF 5E10 and later
Requests that an active remote clock reference (RCREF) be switched to the specified clock reference.	SW:RCREF 5E10 and later

Table 237 REMOTE COMMON DATA AND CONTROL

Topic/Purpose	Message ID/ Message Release
Requests that an operation be performed or a status read on a remote common data and control (COMDAC) distribute point.	EX:RCDDP 5E12 and later

Table 238 REMOTE COMMUNICATIONS LINK

Topic/Purpose	Message ID/ Message Release
Requests that maintenance actions on an inter-remote switching module (RSM) remote communication link (RCL) be aborted.	ABT:RCL 5E10 and later
Requests that a remote communication link (RCL) between inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuits be removed from service.	RMV:RCL 5E10 and later
Requests that a remote communication link (RCL) between inter-remote switching module	RST:RCL

(RSM) communication link digital facilities interface (CDFI) circuits be restored to service.	5E10 and later
Requests that maintenance actions on an inter-remote switching module (RSM) communication link (RCL) be stopped.	STP:RCL 5E10 and later

Table 239 REMOTE INTEGRATED SERVICE LINE UNIT
Remote Integrated Service Line Unit Remote Clock Circuit Pack

Topic/Purpose	Message ID/ Message Release
Aborts maintenance actions on a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK).	ABT:RRCLK 5E10 and later
Allows hardware checks to occur on a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK).	ALW:HDW-RRCLK 5E10 and later
Diagnoses a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK) to determine whether it is in satisfactory working order.	DGN:RRCLK 5E10 and later
Exercises a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK).	EX:RRCLK 5E10 and later
Inhibits hardware checks in a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK).	INH:HDW-RRCLK 5E10 and later
Requests that a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK) be removed from service.	RMV:RRCLK 5E10 and later
Requests that a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK) be restored to service.	RST:RRCLK 5E10 and later
Requests that maintenance actions be stopped on a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK).	STP:RRCLK 5E10 and later
Requests that the active/standby states of the remote integrated services line unit (RISLU) remote clock circuit packs (RRCLKs) be switched (interchanged).	SW:RRCLK 5E10 and later

Table 240 REMOTE SWITCHING MODULE
Remote Switching Module Alarm

Topic/Purpose	Message ID/ Message Release
Requests that maintenance actions on the remote switching module (RSM) alarm (RAU) circuit be aborted.	ABT:RAU 5E10 and later
Requests that a remote switching module (RSM) alarm (RAU) circuit be diagnosed to determine if it is in working order.	DGN:RAU 5E10 and later
Performs maintenance exercises on the remote switching module (RSM) alarm (RAU) circuit.	EX:RAU 5E10 and later
Requests that a remote switching module (RSM) alarm (RAU) circuit be removed from service.	RMV:RAU 5E10 and later
Restores a remote switching module (RSM) alarm (RAU) circuit to service.	RST:RAU 5E10 and later
Requests that maintenance actions on the remote switching module (RSM) alarm (RAU) circuit be stopped.	STP:RAU 5E10 and later

Table 241 Remote Switching Module Digital Facility Interface

Topic/Purpose	Message ID/ Message Release
Requests that maintenance actions on the remote switching module (RSM) digital facilities interface (RDFI) circuit be aborted.	ABT:RDFI 5E10 and later
Requests that a remote switching module (RSM) digital facilities interface (RDFI) circuit be diagnosed to determine if it is in working order.	DGN:RDFI 5E10 and later
Performs maintenance exercises on the remote switching module (RSM) digital facilities interface (RDFI) circuit.	EX:RDFI 5E10 and later
Requests that a remote switching module (RSM) digital facilities interface (RDFI) circuit be removed from service.	RMV:RDFI 5E10 and later
Restores a remote switching module (RSM) digital facilities interface (RDFI) circuit to service.	RST:RDFI 5E10 and later
Requests that maintenance actions on the remote switching module (RSM) digital facilities interface (RDFI) circuit be stopped.	STP:RDFI 5E10 and later

Table 242 Remote Switching Module Remote Link Interface

Copyright © 1999

Topic/Purpose	Message ID/ Message Release
Requests that maintenance actions on the remote switching module (RSM) remote link interface (RLI) circuit be aborted.	ABT:RLI 5E10 and later
Allows hardware error checks to be performed on the specified remote switching module (RSM) remote link interface (RLI) circuit.	ALW:HDW-RLI 5E10 and later
Requests that the size of the Stand Alone Billing Memory (SABM) on switching modules (SM's) be configured. Physical memory is allocated to the SM standalone billing buffer for growth. The amount specified in the kbytes parameter will become the newly configured standalone memory size and must be a multiple of 4.	CFR:SAMEM 5E10 and later
Requests that a remote switching module (RSM) remote link interface (RLI) circuit be diagnosed to determine if it is in working order.	DGN:RLI 5E10 and later
Performs maintenance exercises on the remote switching module (RSM) remote link interface (RLI) circuit.	EX:RLI 5E10 and later
Inhibits the hardware error checks performed on the specified remote switching module (RSM) remote link interface (RLI) circuit.	INH:HDW-RLI 5E10 and later
Requests that a remote switching module (RSM) remote link interface (RLI) circuit be removed from service.	RMV:RLI 5E10 and later
Restores a remote switching module (RSM) remote link interface (RLI) circuit to service and makes it active or standby.	RST:RLI 5E10 and later
Requests that maintenance actions be stopped on the remote switching module (RSM) remote link interface (RLI) circuit.	STP:RLI 5E10 and later
Requests that activity of the remote switching module (RSM) remote link interface (RLI) circuit be switched.	SW:RLI 5E10 and later
Requests verification of the amount of Stand Alone Billing Memory (SABM) and the amount currently in use.	VFY:SAMEM 5E10 and later

Table 243 REMOTE TERMINAL

Topic/Purpose	Message ID/ Message Release
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:DNUSEOC 5E12 and later
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:DNUSTMC 5E12 and later
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:IDCUEOC 5E12 and later
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:IDCUTMC 5E12 and later
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:RT-EOC-A 5E10 - 5E11
Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT).	ABT:RT-EOC-B 5E12 and later
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:RT-TMC-A 5E10 - 5E11
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:RT-TMC-B 5E12 and later
Requests that a specified action on a remote terminal (RT) facility circuit be aborted (ABT).	ABT:RTFAC 5E12 and later
Requests that protection (PROT) line switch requests be allowed to be performed on the specified remote terminal (RT) digital signal level one (DS1) facility (FAC) or requests that a DS1 be allowed to be released from protection.	ALW:RT-FAC 5E10 and later
Requests that the printing of remote terminal (RT) report messages be allowed at the Master Control Center (MCC) and the Switching Control Center (SCC).	ALW:RT-PROV-REPT-A 5E10 - 5E11
Requests that the printing of remote terminal (RT) report messages be allowed at the Master Control Center (MCC) and the Switching Control Center (SCC).	ALW:RT-PROV-REPT-B 5E12 and later
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be allowed.	ALW:RT-REPT-A 5E10 - 5E11
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be allowed.	ALW:RT-REPT-B 5E12 and later
Requests that metallic setup failure override be allowed when the metallic test bus (MTB) is found to be open between the test bus control unit (TBCU) and the remote terminal (RT).	ALW:RTMTBOVR 5E10 and later
Requests that the printing of the REPT RTMTB SID message be allowed when the metallic	ALW:RTMTBPRT

test bus (MTB) fails the closed diode protocol test during metallic setup to a remote terminal (RT).	5E10 and later
Requests that a far end loop process (FELP) or a protection (PROT) configuration request be cleared for a particular digital signal level one (DS1) facility (FAC).	CLR:RT-FAC 5E10 and later
Requests the disabling of the option of having the switching module (SM) status indicator updated to off-normal (OFFN) when a remote terminal (RT) T1 is in an off-normal state.	CLR:RT-FACOFFN 5E10 and later
Requests that equipment numbers relating to remote terminals (RT) that interface to an integrated digital carrier unit (IDCU) be converted.	CNVT:RT-A 5E10 - 5E11
Requests that equipment numbers relating to remote terminals (RT) that interface to an integrated digital carrier unit (IDCU) or a digital networking unit - synchronous optical network (DNU-S) be converted.	CNVT:RT-B 5E12 and later
Requests the provisioning of a TR303 remote terminal (RT) on an Integrated Digital Carrier Unit (IDCU) or Digital Network Unit SONET (DNU-S).	EXC:RT-PROV-A 5E10 - 5E11
Requests the provisioning of a TR303 remote terminal (RT) on an Integrated Digital Carrier Unit (IDCU) or Digital Network Unit SONET (DNU-S).	EXC:RT-PROV-B 5E12 and later
Requests that protection (PROT) line switch requests to be performed on the specified remote terminal (RT) digital signal level one (DS1) facility (FAC) circuit be inhibited or requests that a DS1 currently on protection be taken off of protection.	INH:RT-FAC 5E10 and later
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be inhibited.	INH:RT-PROV-REPT-A 5E10 - 5E11
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be inhibited.	INH:RT-PROV-REPT-B 5E12 and later
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be inhibited.	INH:RT-REPT-A 5E10 - 5E11
Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be inhibited.	INH:RT-REPT-B 5E12 and later
Requests that metallic setup failure override be inhibited when the metallic test bus (MTB) is found to be open between the test bus control unit (TBCU) and the remote terminal (RT).	INH:RTMTBOVR 5E10 and later
Requests that the printing of the REPT RTMTB SID message be inhibited when the metallic test bus (MTB) fails the closed diode protocol test during metallic setup to a remote terminal (RT).	INH:RTMTBPRT 5E10 and later
Requests a report of the current off-normal states and alarms for integrated TR008/TR303 remote terminals (RT) in the office, either as a summary or a separate report for each RT.	OP:RT-ALM-ALL-A 5E10 - 5E11
Requests a report of the current off-normal states and alarms for integrated TR008/TR303 remote terminals (RT) in the office, either as a summary or a separate report for each RT.	OP:RT-ALM-ALL-B 5E12 and later
Requests that information describing the configuration of the embedded operations channel (EOC) and timeslot management channel (TMC) for the specified remote terminal (RT) be displayed.	OP:RT-CHAN 5E10 and later
Requests the value of the switching module (SM) status indicator (SET or CLEARED).	OP:RT-FACOFFN 5E10 and later
Requests a status message of the provisionable elements of a remote terminal (RT) terminating on an IDCU or DNUS.	OP:RT-PROV-A 5E10 - 5E11
Requests a status message of the provisionable elements of a remote terminal (RT) terminating on an IDCU or DNUS.	OP:RT-PROV-B 5E12 and later
Requests the current status of the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC).	OP:RT-REPT-A 5E10 - 5E11
Requests the current status of the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC).	OP:RT-REPT-B 5E12 and later
Requests a report of the current off-normal states and alarms for one or more integrated TR008/TR303 remote terminals (RT) in the office.	OP:RT-SID-LRT-A 5E10 - 5E11
Requests a report of the current off-normal states and alarms for one or more integrated TR008/TR303 remote terminals (RT) in the office.	OP:RT-SID-LRT-B 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:DNUSEOC 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:DNUSTMC 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally,	RMV:IDCUEOC 5E12 and later

by preempting the current user.	
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:IDCUTMC 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RT-EOC-A 5E10 - 5E11
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RT-EOC-B 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RT-TMC-A 5E10 - 5E11
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RT-TMC-B 5E12 and later
Requests that a remote terminal (RT) facility (FAC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RTFAC 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:DNUSEOC 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:DNUSTMC 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:IDCUEOC 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:IDCUTMC 5E12 and later
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:RT-EOC-A 5E10 - 5E11
Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.	RST:RT-EOC-B 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:RT-TMC-A 5E10 - 5E11
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:RT-TMC-B 5E12 and later
Requests that a remote terminal (RT) facility (FAC) circuit be restored to service.	RST:RTFAC 5E12 and later
Requests that a far end loop process (FELP) or a protection configuration request (PROT) be set for a particular digital signal level one (DS1) facility (FAC).	SET:RT-FAC 5E10 and later
Requests enabling of the option to update the switching module (SM) status indicator to off-normal when a remote terminal (RT) T1 is in an off-normal state.	SET:RT-FACOFFN 5E10 and later
Request that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:DNUSEOC 5E12 and later
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:DNUSTMC 5E12 and later
Request that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:IDCUEOC 5E12 and later
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:IDCUTMC 5E12 and later
Requests that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:RT-EOC-A 5E10 - 5E11
Requests that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.	STP:RT-EOC-B 5E12 and later
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:RT-TMC-A 5E10 - 5E11
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:RT-TMC-B 5E12 and later
Requests that actions on a remote terminal (RT) facility (FAC) circuit be stopped.	STP:RTFAC 5E12 and later
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:DNUSEOC 5E12 and later

Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:DNUSTMC 5E12 and later
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:IDCUEOC 5E12 and later
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:IDCUTMC 5E12 and later
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:RT-EOC-A 5E10 - 5E11
Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).	SW:RT-EOC-B 5E12 and later
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:RT-TMC-A 5E10 - 5E11
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:RT-TMC-B 5E12 and later

Table 244 REORGANIZATION

Topic/Purpose	Message ID/ Message Release
To allow automatic reorganization of all data base relations listed on the REPT:REORG output message.	ALW:REORG 5E10 and later
Runs the reorganization of the database relations immediately.	EXC:REORG 5E10 and later
Inhibits automatic reorganization of database relations.	INH:REORG 5E10 and later
Requests that the time for reorganization of the database relation to run automatically be set to a specific value.	SET:REORG 5E10 and later

Table 245 REPORTS

Topic/Purpose	Message ID/ Message Release
Requests that the plant report be printed at a time other than the regularly scheduled time.	OP:PLNT24 5E10 and later
Requests the various plant measurements common reports, detailing system performance statistics.	OP:PMCR 5E10 and later

Table 246 RETROFIT

Topic/Purpose	Message ID/ Message Release
Requests a memory forecast report on the amount of processor memory required to retrofit to a subsequent software release.	OP:MEMSIZE 5E10 and later
Requests termination of the OP:MEMSIZE input message.	STP:MEMSIZE 5E10 and later

Table 247 REVERTIVE PULSING TRANSCEIVER

Topic/Purpose	Message ID/ Message Release
Requests that actions currently running on the revertive pulsing transceiver (RVPT) be aborted.	ABT:RVPT 5E10 and later
Allows hardware error checks to be performed on the specified revertive pulsing transceiver (RVPT).	ALW:HDW-RVPT 5E10 and later
Requests that the revertive pulsing transceiver (RVPT) be diagnosed to determine whether it is in satisfactory working order.	DGN:RVPT 5E10 and later
Interactively diagnoses (exercises) the revertive pulsing transceiver (RVPT) to determine whether it is in satisfactory working order.	EX:RVPT 5E10 and later
Inhibits the hardware error checks performed on the specified revertive pulsing transceiver (RVPT).	INH:HDW-RVPT 5E10 and later
Requests that the revertive pulsing transceiver (RVPT) be removed from service.	RMV:RVPT 5E10 and later
Conditionally or unconditionally restores the revertive pulsing transceiver (RVPT) to the active state.	RST:RVPT 5E10 and later
Requests that currently running actions be stopped gracefully on the revertive pulsing	STP:RVPT

transceiver (RVPT) at the specified location.	5E10 and later

Table 248 RING

Topic/Purpose	Message ID/ Message Release
Requests that entry into the ring tracker mode be allowed; a prior INH:RTRACK input message has inhibited ring tracker mode.	ALW:RTRACK 5E11 and later
Requests that the ring tracker mode be initiated.	EXC:RTRACK 5E11 and later
Requests that entry into the ring tracker mode be inhibited.	INH:RTRACK 5E11 and later
Requests that the current status of the ring tracker mode be reported.	OP:RTRACK 5E11 and later
Requests the termination of ring tracker mode.	STOP:RTRACK 5E11 and later

Table 249 Ring Peripheral Controller Node

Topic/Purpose	Message ID/ Message Release
Requests diagnostics of the specified ring peripheral controller node (RPCN).	DGN:RPCN 5E10 and later
Exercises a ring peripheral controller node (RPCN) in an interactive diagnostic mode.	EX:RPCN 5E10 and later
Requests that the directory numbers on the calling line identification list (CLID) be printed.	OP:CLID 5E10 and later
Requests that the specified ring peripheral controller node (RPCN) be removed from service.	RMV:RPCN 5E10 and later
Requests that the specified ring peripheral controller node (RPCN) be restored to service.	RST:RPCN 5E10 and later

Table 250 ROUTINE EXERCISE

Topic/Purpose	Message ID/ Message Release
Requests that any currently running generated key collection and compression routine (GKCCR) processes be aborted in specified processors.	ABT:GKCCR 5E10 and later
Requests that automatic periodic execution of the generated key collection and compression routine (GKCCR) be allowed in specified processors.	ALW:GKCCR 5E10 and later
Requests that routine exercises (REX) be allowed by clearing individual routine exercise inhibits for one or more hardware communities by clearing the REX temporary inhibit(s).	ALW:REX 5E10 and later
Allows either one or all valid test types of routine exercise (REX) of the hardware in the communication module (CM) and all switching modules (SMs) or in the CM or in a range of SMs.	ALW:REX-CM-SM 5E10 and later
Requests that the scheduling of a unit for routine exercise (REX) be allowed in the communication module (CM) or in a switching module (SM).	ALW:REX-UNIT 5E10 and later
Requests execution of a generated key collection and compression routine (GKCCR) in the specified processors.	EXC:GKCCR 5E10 and later
Requests routine exercises (REX) of the hardware in the communication module (CM) and all switching modules (SMs) or in the CM or in a range of SMs be executed.	EXC:REX-CM-SM 5E10 and later
Requests that a routine exercise (REX) and/or automatic line insulation test (ALIT) schedule be generated based on the equipment present.	EXC:SCHED 5E10 and later
Requests the inhibition of automatic executions of the generated key collection and compression routine (GKCCR) in specified processors.	INH:GKCCR 5E10 and later
Requests that routine exercises (REX) be inhibited for one or more hardware communities by setting the REX temporary inhibit(s).	INH:REX 5E10 and later
Inhibits either one or all three test types of routine exercise of the hardware in the administrative module (AM) and switching modules (SMs).	INH:REX-AM-SM 5E10 and later
Inhibits either one or all valid test types for routine exercise (REX) of the hardware in the communication module (CM) and in all switching modules (SMs) or in the CM or in a range of SMs.	INH:REX-CM-SM 5E10 and later
Requests that the scheduling of a unit for routine exercise (REX) be inhibited in the communication module (CM) or in a switching module (SM).	INH:REX-UNIT 5E10 and later

Requests the summary of one or all valid test types of routine exercise (REX) for the hardware in the communication module (CM) and all switching modules (SMs) or in the CM or in an SM.	OP:REX-CM-SM 5E10 and later
Requests the status of routine exercises (REX) in a specific module.	OP:REXINH 5E10 and later
Invokes the installation routine exercise (IREX) user interface tool.	RCV:M-IREX 5E10 and later
Requests that either one or all valid test types of routine exercise (REX) of the hardware be stopped in the communication module (CM) and all switching modules (SMs) or in the CM or in a range of SMs.	STP:REX-CM-SM 5E10 and later

Table 251 ROUTINE PORT CONDITIONING

Topic/Purpose	Message ID/ Message Release
The purpose of this input message is to allow routine port conditioning.	ALW:RPC 5E10 and later
The purpose of this input message is to inhibit routine port conditioning.	INH:RPC 5E10 and later

Table 252 SCAN POINT BOARD

Topic/Purpose	Message ID/ Message Release
Requests that actions on the scan point board at the specified location be aborted.	ABT:SCAN 5E10 and later
Requests that a scan point board (SCAN) be diagnosed to determine whether it is in satisfactory working order.	DGN:SCAN 5E10 and later
Requests interactive diagnostics (exercises) of the scan point board (SCAN).	EX:SCAN 5E10 and later
Reads the state of a particular digital trunk to determine if the far end (originator) is on/off-hook.	ORD:SCAN-A 5E10 - 5E12
Reads the state of a particular digital trunk to determine if the far end (originator) is on/off-hook.	ORD:SCAN-B 5E13 and later
Requests that a scan point board (SCAN) be removed from service.	RMV:SCAN 5E10 and later
Requests that a scan point board (SCAN) in the metallic service unit be conditionally or unconditionally restored to service.	RST:SCAN 5E10 and later
Requests that actions on the scan scan point board (SCAN) at the specified location be stopped.	STP:SCAN 5E10 and later

Table 253 SCANNER AND SIGNAL DISTRIBUTOR
Scanner and Signal Distributor Controller

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified scanner and signal distributor controller (SCSDC).	DGN:SCSDC 5E10 and later
Exercises a scanner and signal distributor controller (SCSDC) in an interactive diagnostic mode.	EX:SCSDC 5E10 and later
Requests that the specified scanner and signal distributor controller (SCSDC) be removed from service.	RMV:SCSDC 5E10 and later
Conditionally or unconditionally restores a scanner and signal distributor controller (SCSDC) to service.	RST:SCSDC 5E10 and later

Table 254 Scanner and Signal Distributor Scan Points

Topic/Purpose	Message ID/ Message Release
Requests that transitions of a scanner and signal distributor (SCSD) scan point be reported.	ALW:SCSD 5E10 and later
Requests that reporting of transitions of a scanner and signal distributor (SCSD) scan point be inhibited.	INH:SCSD 5E10 and later
Requests the inhibit status and the state of scanner and signal distributor (SCSD) scan points.	OP:SCSD 5E10 and later
Requests that one of four distribution operations be performed on a scanner and signal	ORD:SCSD

distributor (SCSD) distribute point.	5E10 and later

Table 255 SELECTIVE INCOMING LOAD CONTROL

Topic/Purpose	Message ID/ Message Release
Requests that the transmission of dynamic overload control (DOC) signals and the application of selective incoming load control (SILC) be allowed.	ALW:DSILC 5E10 and later
Requests that a trunk group be assigned to selective incoming load control (SILC) treatment.	ASGN:SILC 5E10 and later
Requests that a trunk group be removed from selective incoming load control (SILC) treatment with an option to clear the entire list.	CLR:SILC 5E10 and later
Requests that the transmission of dynamic overload control (DOC) signals and the application of selective incoming load control (SILC) be inhibited.	INH:DSILC 5E10 and later
Request a list of all trunk groups assigned to selective incoming load control (SILC) treatment, SILC treatment inhibit, and SILC activation state.	OP:SILC 5E10 and later

Table 256 SERVICE ANNOUNCEMENT SYSTEM

Topic/Purpose	Message ID/ Message Release
Aborts the specified actions on the service announcement system (SAS) unit.	ABT:SAS 5E10 and later
Allows hardware checks in a service announcement system (SAS) unit to occur.	ALW:HDW-SAS 5E10 and later
Removes and diagnoses a service announcement system (SAS) unit to determine whether it is in satisfactory working order.	DGN:SAS 5E10 and later
Interactively diagnoses (exercises) the service announcement system (SAS) unit.	EX:SAS 5E10 and later
Inhibits hardware checks in a service announcement system (SAS) unit.	INH:HDW-SAS 5E10 and later
Requests that a service announcement system (SAS) unit be removed from service.	RMV:SAS 5E10 and later
Conditionally or unconditionally restores a service announcement system (SAS) unit to service.	RST:SAS 5E10 and later
Requests that the specified actions on the service announcement system (SAS) unit be stopped.	STP:SAS 5E10 and later

Table 257 SIGNALING

Topic/Purpose	Message ID/ Message Release
Requests that a pending trap that was entered by the SET:TRAP input message be activated.	ALW:TRAP 5E10 and later
Requests that the message transfer part (MTP) route verification test (MRVT) be initiated.	EXC:MRVT-PC 5E10 and later
Requests that an active trap be temporarily suspended.	INH:TRAP 5E10 and later
Requests a formatted display of the routing data in the cluster, member, and load share tables of the common network and for the signaling connection control part (SCCP) subsystem bit map.	OP:C7NET-A 5E10 only
Requests a formatted display of the routing data in the cluster, member, and load share tables of the common network and for the signaling connection control part (SCCP) subsystem bit map.	OP:C7NET-B 5E11 and later
Requests local area signaling services (LASS) screen list editing (SLE) validation of a ten-digit directory number (DN).	OP:LASSRQST-A 5E10 only
Requests local area signaling services (LASS) screen list editing (SLE) validation of a ten-digit directory number (DN).	OP:LASSRQST-B 5E11 and later
Requests that status information be obtained regarding active, pending, terminated, aborted, inhibited or completed traps.	OP:TRAP 5E10 and later
Requests that a trap be set for CCS6 or CCS7 type messages by entering the specific trap attributes that are to be matched.	SET:TRAP-A 5E10 - 5E11
Requests that a trap be set for CCS7 type messages by entering the specific trap attributes that are to be matched.	SET:TRAP-B 5E12 and later

Copyright © 1999

Requests that a trap be stopped or removed from the internal database.	STOP:TRAP 5E10 and later
Requests testing of the integrity of the common channel signaling (CCS) network and data consistency between the network control point (NCP) and the *5ESS*®-2000 switch.	TST:ACPNUM 5E10 and later

Table 258 SIGNALING SYSTEM 7

Topic/Purpose	Message ID/ Message Release
Requests the output of signaling system 7 (SS7) data for a specific destination point code (DPC), for a DPC and particular or all circuit identification codes (CICs), for an SS7 trunk group, or for an SS7 trunk group and particular or all trunk group members.	OP:SS7-A 5E10 - 5E11
Requests the output of signaling system 7 (SS7) trunk data for the following trunk routes:	OP:SS7-B 5E12 and later
Requests that the processing and output of the signaling system 7 (SS7) trunk data request or task, OP:SS7, be stopped.	STP:SS7-A 5E10 - 5E11
Requests that the processing and output of the signaling system 7 (SS7) trunk data request or task, OP:SS7, be stopped.	STP:SS7-B 5E12 and later

Table 259 Common Channel Signaling System 7

Topic/Purpose	Message ID/ Message Release
Requests an initialization of named table(s) in the selected common channel signaling (CCS) global switching module (GSM).	INIT:SCCP-A 5E11 only
Requests an initialization of named table(s) in the selected common channel signaling (CCS) global switching module (GSM).	INIT:SCCP-B 5E12 and later
Requests the linkset or combined linkset servicing each accessible destination point code (DPC) for the common channel signaling (CCS) global switching module (GSM).	OP:CCS-ACDPC-A 5E11 only
Requests the linkset or combined linkset servicing each accessible destination point code (DPC) for the common channel signaling (CCS) global switching module (GSM).	OP:CCS-ACDPC-B 5E12 and later
Requests the number of currently active (in service) signaling links in each signaling linkset on the exchange.	OP:CCS-ACTLK-A 5E11 only
Requests the number of currently active (in service) member(s) in each signaling linkset on a common channel signaling (CCS) global switching module (GSM).	OP:CCS-ACTLK-B 5E12 and later
Generates the report of the members of a combined link set and gives the status of each of the members.	OP:CCS-CLS-A 5E11 only
Requests status information of all members of one or more combined link sets (CLSs) on a given common channel signaling (CCS) global switching module (GSM).	OP:CCS-CLS-B 5E12 and later
Requests status information for one or more destination point codes (DPC) for a given common channel signaling (CCS) global switching module (GSM).	OP:CCS-DPC-A 5E11 only
Requests status information for one or more destination point codes (DPC) associated with a given common channel signaling (CCS) global switching module (GSM).	OP:CCS-DPC-B 5E12 and later
Requests a report of the destination point codes (DPCs) currently served by a specified SS7 link set or combined link set.	OP:CCS-DPCLS-A 5E11 only
Requests a report of the destination point codes (DPCs) currently served by a specified SS7 linkset or combined linkset on a common channel signaling (CCS) global switching module (GSM).	OP:CCS-DPCLS-B 5E12 and later
Outputs for each global switching modules (GSM) the common channel signaling (CCS) protocol type and status of the signaling links.	OP:CCS-GSM-A 5E11 only
Outputs for each global switching modules (GSM) the common channel signaling (CCS) protocol type and status of the signaling links.	OP:CCS-GSM-B 5E12 and later
Generates the report of the combined link set of which a given link set is a member.	OP:CCS-LSCLS-A 5E11 only
Generates the report of the combined link set of which a given link set is a member.	OP:CCS-LSCLS-B 5E12 and later
Requests status information for one or more signaling connection control part (SCCP) subsystem(s) at one or more destination point codes (DPCs).	OP:CCS-SCMG-A 5E11 only
Requests status information for one or more signaling connection control part (SCCP) subsystem(s) at one or more destination point codes (DPCs).	OP:CCS-SCMG-B 5E12 and later
Requests a display of the normal and current signaling link selection (SLS) distributions for all links currently carrying traffic to the destination point code (DPC) or a display of the normal and current SLS distribution of a link for a linkset (LS) or combined linkset (CLS) specified that	OP:CCS-SLS-A 5E11 only

Copyright © 1999

is currently serving a DPC.	
Requests a display of the normal and current signaling link selection (SLS) distributions for all links currently carrying traffic to the specified destination point code (DPC) or a display of the normal and current SLS distribution of a link for a specific linkset (LS) or combined linkset (CLS) specified.	OP:CCS-SLS-B 5E12 and later
Requests the status of one or more common channel signaling (CCS) links.	OP:ST-CCSLK-A 5E11 only
Requests the status of one or more common channel signaling (CCS) links.	OP:ST-CCSLK-B 5E12 and later
Requests status of the common channel signaling (CCS) message delivery (MD) network.	OP:ST-MD-A 5E11 only
Requests status of the common channel signaling (CCS) message delivery (MD) network.	OP:ST-MD-B 5E12 and later
Requests translation point codes (TPCs) for the specified translation type (TT) be displayed.	OP:TPC 5E10 and later
Removes a common channel signaling (CCS) link(s) from service by deactivating, inhibiting, or blocking the link(s).	RMV:CCSLK-A 5E11 only
Removes a common channel signaling (CCS) link(s) from service by deactivating, inhibiting, or blocking the link(s).	RMV:CCSLK-B 5E12 and later
Removes a common channel signaling (CCS) intra-global switching module (GSM) message delivery (MD) path internal to the GSM.	RMV:MD-A 5E11 only
Removes a common channel signaling (CCS) intra-global switching module (GSM) message delivery (MD) path internal to the GSM.	RMV:MD-B 5E12 and later
Restores service to a common channel signaling (CCS) link(s) by removing the deactivating, inhibiting, or blocking status on that link(s).	RST:CCSLK-A 5E11 only
Restores service to a common channel signaling (CCS) link(s) by removing the deactivating, inhibiting, or blocking status on that link(s).	RST:CCSLK-B 5E12 and later
Restores the intra-global switching module (GSM) common channel signal (CCS) message delivery (MD) path.	RST:MD-A 5E11 only
Restores the intra-global switching module (GSM) common channel signal (CCS) message delivery (MD) path.	RST:MD-B 5E12 and later
Requests that an automated inward line screening (AILS) originating line screening (OLS) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be sent from a call serving Operator Service Position System (OSPS) to a normal serving site OSPS to gather AILS OLS data.	TST:AILS-OLS 5E10 and later
Requests that an automated inward line screening (AILS) terminating code screening (TCS) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be sent from a call serving Operator Service Position System (OSPS) to a normal serving site OSPS to gather AILS TCS data.	TST:AILS-TCS 5E10 and later
Requests that a customer account services (CAS) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the CAS/network control point (NCP) or gateway/NCP data base to verify its operation.	TST:CAS7-A 5E10 only
Requests that a customer account services (CAS) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the CAS/network control point (NCP) or gateway/NCP data base to verify its operation.	TST:CAS7-B 5E11 and later
Schedules a link test to be run on a signaling link.	TST:CCSLK-A 5E11 only
Schedules a link test to be run on a signaling link.	TST:CCSLK-B 5E12 and later
Requests that an international credit card validation (ICCV) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to a foreign data base to verify its operation.	TST:ICCV 5E10 and later
Requests that a line applications for consumers (LAC) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the number 2 LAC (2LAC)/network control point (NCP) to verify its operation.	TST:LAC 5E10 and later

Table 260 Common Channel Signaling Protocol Monitoring

Topic/Purpose	Message ID/ Message Release
Requests that a protocol monitoring session be started for the ISUP or TCAP protocol based	EXC:PMCCS

on the values of particular parameters within the message.	5E12 and later
Requests a list of active CCS protocol monitoring (PM) sessions and provides status of the PM processors.	OP:PMCCS 5E12 and later
Requests that a specific CCS protocol monitoring (PM) session or all CCS protocol monitoring sessions be stopped.	STP:PMCCS 5E12 and later

Table 261 SIGNALING LINK

Topic/Purpose	Message ID/ Message Release
Requests a change in the minor state of a signaling link (SLK) or to request a transfer from the active to the standby voice frequency link (VFL).	CHG:SLK-A 5E10 - 5E11
Requests a change in the minor state of a signaling link (SLK).	CHG:SLK-B 5E12 and later
Requests that the status of the alarm inhibit flag of a signaling link (SLK) be set, reset, or listed.	INH:SLK 5E10 and later
Requests that the link monitor be turned on or off.	MON:SLK 5E10 and later
Requests status information for the signaling links (SLKs).	OP:SLK-A 5E10 - 5E11
Requests status information for the signaling links (SLKs).	OP:SLK-B 5E12 and later
Requests that a change be made to a new key on an encrypted signaling link (SLK).	REKEY:SLK 5E10 and later
Requests a status report of all signaling link (SLK) inhibit alarm flags set (ON).	REPT:SLK 5E10 and later

Table 262 SIGNALING NETWORK ADMINISTRATOR TIME

Topic/Purpose	Message ID/ Message Release
Requests the current view of the common channel interoffice signaling (CCIS) network administration time (SNAT).	OP:SNAT 5E10 and later

Table 263 SMALL COMPUTER SYSTEM INTERFACE

Topic/Purpose	Message ID/ Message Release
Download the pumpcode to the small computer system interface (SCSI) disk file controller (DFC).	LOAD:DFC-PUMP 5E10 and later
Load a specified pumpcode file into the SCSI disk file controller's (DFC's) random access memory (RAM) area.	LOAD:DFC-RAM 5E10 and later
Removes the specified SCSI bus (SBUS) connected to a SCSI disk file controller (DFC).	RMV:SBUS 5E10 and later
Requests that a SCSI bus (SBUS) be restored to service.	RST:SBUS 5E10 and later

Table 264 SOFTWARE CHECK

Topic/Purpose	Message ID/ Message Release
Allows the software error handling routines to incorporate system initialization into their error recovery procedures as a means of handling administrative module (AM) software sanity problems.	ALW:SFTCHK 5E10 and later
Request that the use of system initialization be inhibited when handling administrative module (AM) software errors.	INH:SFTCHK 5E10 and later
Requests that all software error checks be inhibited in one or more switching modules (SMs), or a specified communication module processor (CMP).	INH:SFTCHK-SM-A 5E10 - 5E12
Requests that all software error checks be inhibited in one or more switching modules (SMs), or a specified communication module processor (CMP).	INH:SFTCHK-SM-B 5E13 and later
Requests a list of all inhibited administrative module error conditions, including ERRINT, ERRSRC, HDWCHK, and SFTCHK.	OP:ERRCHK 5E10 and later

Table 265 STATIC OFFICE DEPENDENT DATA

Topic/Purpose	Message ID/ Message Release
Requests that either the full or incremental static office-dependent data (SODD) audit, which is to execute automatically, be allowed.	ALW:AUD-SODD 5E10 and later
Format 1 restarts a full or incremental static office-dependent data (SODD) audit that was previously executing but was stopped for some reason, provided that the conditions permit it to be restarted.	EXC:AUD-SODD-A 5E10 only
Format 1 restarts a full or incremental static office-dependent data (SODD) audit that was previously executing but was stopped for some reason, provided that the conditions permit it to be restarted.	EXC:AUD-SODD-B 5E11 and later
Requests an audit of the redundant (RED) relations to check for split translations in the static office-dependent data (SODD).	EXC:SODD-RED 5E10 and later
Displays the relation currently being audited by the redundant static office dependent data (SODD) audit (invoked by EXC:SODD,RED).	EXC:SODD-RED-OP 5E10 and later
Requests that the current static data audit be stopped.	EXC:SODD-STP 5E10 and later
Requests that the execution of either the full or incremental static office-dependent data (SODD) audit be inhibited.	INH:AUD-SODD 5E10 and later
Requests that either the execution status of the static office-dependent data (SODD) audits be printed or that the full SODD audit's schedule be printed.	OP:AUD-SODD 5E10 and later
Requests the status of the full or incremental static office-dependent data (SODD) audit.	OP:ST-AUD-SODD 5E10 and later
Schedules the day, time, and duration for the full static office-dependent data (SODD) audit.	SCHED:AUD-SODD 5E10 and later
Requests the termination of an executing static office-dependent data (SODD) audit as indicated with the parameter list.	STP:AUD-SODD-A 5E10 only
Requests the termination of an executing static office-dependent data (SODD) audit as indicated with the parameter list.	STP:AUD-SODD-B 5E11 and later

Table 266 STATUS

Topic/Purpose	Message ID/ Message Release
Requests the output of the print mode, overload status, and initialization summary information for the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or packet switching unit protocol handler (PSUPH).	OP:ST 5E10 and later
Requests that the communication status between the *5ESS*®-2000 Digital Cellular Switch and the *Autoplex*® Executive Cellular Processor be queried.	OP:ST-APX 5E10 and later
Requests a report of the status of a specific audit, all audits, or all inhibited audits for a particular switching module (SM) or range of SMs.	OP:ST-AUD-SM 5E10 and later
Requests the status of the full or incremental static office-dependent data (SODD) audit.	OP:ST-AUD-SODD 5E10 and later
Requests a report of the on/off status of the direct signaling events (DSE) trapping and printing.	OP:ST-DSE-A 5E10 only
Requests a report of the on/off status of the direct signaling events (DSE) trapping and printing.	OP:ST-DSE-B 5E11 only
Requests a report of the on/off status of the direct signaling events (DSE) trapping and printing.	OP:ST-DSE-C 5E12 and later
Requests a report of the on/off status of the intergrated services digital network (ISDN) user part (ISUP) events trapping and printing.	OP:ST-ISUP 5E10 and later
Requests information from internal registers of the link interface (LI) or the specified office network and timing complex (ONTC) side.	OP:ST-LI 5E10 and later
Requests the print status of all parts of the 24-hour plant report.	OP:ST-PLNT24 5E10 and later
Requests the status of active processes by specific class.	OP:ST-PROC 5E10 and later
Requests the output of the current status of a single packet switch unit (PSU) link or a group of PSU links.	OP:ST-PSLNK-A 5E10 only
Requests the output of the current link status and other information of a single packet switch unit (PSU) link (PSLNK); or the output of the current status of a group of PSU links.	OP:ST-PSLNK-B 5E11 and later
Requests the status of all sections of the 30-minute traffic report.	OP:ST-TRFC30 5E10 and later
Requests the output of the current status history for a specified trunk, line, data link, or	OP:STATUS-A

Operator Services Position System port (OSPSPORT).	5E10 only
Requests the output of the current status history for a specified trunk, line, data link, or Operator Services Position System port (OSPSPORT).	OP:STATUS-B 5E11 - 5E12
Requests the output of the current status history for a specified trunk, line, data link, or Operator Services Position System port (OSPSPORT).	OP:STATUS-C 5E13 and later
Requests output of the switching module (SM) packet switch unit (PSU) timeslot usage (PSUTSCOUNT) for nailups.	OP:STATUS-PS-A 5E10 only
Requests output of the switching module (SM) packet switch unit (PSU) timeslot usage (PSUTSCOUNT) for nailups.	OP:STATUS-PS-B 5E11 and later

Table 267 STUCK COIN FAILURE

Topic/Purpose	Message ID/ Message Release
Requests a list of all stuck coin failures since the last time the periodic list was printed.	OP:SCF 5E10 and later

Table 268 SUBSCRIBER LINE BUSY

Topic/Purpose	Message ID/ Message Release
Queries the digital network unit - synchronous optical network (SONET) (DNU-S) for the expected and received signal labels for synchronous transport signal facility (STSFAC).	OP:SL-A 5E10 - 5E12
Queries the digital network unit - synchronous optical network (SONET) (DNU-S) for the expected and received signal labels for synchronous transport signal facility (STSFAC).	OP:SL-B 5E13 and later

Table 269 SUBSCRIBER LINE INSTRUMENT MEASUREMENT

Topic/Purpose	Message ID/ Message Release
Requests that actions on the subscriber line instrument measurement (SLIM) board be aborted.	ABT:SLIM 5E10 and later
Request to abort the subscriber line and instrument measurement (SLIM) routine mode test session.	ABT:TSESS 5E10 and later
Resume a subscriber line and instrument measurement (SLIM) routine mode test session that has previously been suspended.	ALW:TSESS 5E10 and later
Requests that a subscriber line instrument measurement (SLIM) board be diagnosed to determine whether it is in satisfactory working order.	DGN:SLIM 5E10 and later
Requests interactive diagnostics (exercises) of the subscriber line instrument measurement (SLIM) board.	EX:SLIM 5E10 and later
Request to suspends subscriber line and instrument measurement (SLIM) routine mode test session.	INH:TSESS 5E10 and later
Request to output the status of subscriber line and instrument measurement (SLIM) routine mode test session in ROP.	OP:TSESS 5E10 and later
Display, on the TLWS SLIM page 162, the status of subscriber line and instrument measurement (SLIM) routine mode test session.	OP:TSESS-DS 5E10 and later
Requests that a subscriber line instrument measurement (SLIM) board be removed from service.	RMV:SLIM 5E10 and later
Requests that a subscriber line instrument measurement (SLIM) board in the metallic service unit be conditionally or unconditionally restored to service.	RST:SLIM 5E10 and later
Requests that actions on the subscriber line instrument measurement (SLIM) board at a specified location be stopped.	STP:SLIM 5E10 and later

Table 270 SUBSCRIBER LOOP CARRIER *SLC*®-96 Digital Carrier Line Unit

Topic/Purpose	Message ID/ Message Release
Aborts actions on a *SLC*® 96 digital carrier line unit (DCLU).	ABT:DCLU 5E10 and later
Requests that a *SLC*® 96 digital carrier line unit (DCLU) be removed and diagnosed.	DGN:DCLU 5E10 and later
Interactively diagnoses (exercises) a *SLC*® 96 digital carrier line unit (DCLU).	EX:DCLU 5E10 and later
Requests a listing of the unassigned (UNA) lines, the integrated *SLC*® (ISLC) lines, and/or the	OP:LISTOTO-A

integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, *SLC*® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs).	5E10 - 5E11
Requests a listing of the unassigned (UNA) lines, the integrated *SLC*® (ISLC) lines, and/or the integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, *SLC*® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs).	OP:LISTOTO-B 5E12 and later
Requests that a *SLC*® 96 digital carrier line unit (DCLU) be removed from service.	RMV:DCLU 5E10 and later
Requests that a *SLC*® 96 digital carrier line unit (DCLU) be restored to service.	RST:DCLU 5E10 and later
Requests that actions on a specified *SLC*® 96 digital carrier line unit (DCLU) stop.	STP:DCLU 5E10 and later

Table 271 *SLC*®-96 Digital Facility Interface

Topic/Purpose	Message ID/ Message Release
Requests that actions on a *SLC*® 96 digital facility interface (SDFI).	ABT:SDFI 5E10 and later
Allows hardware error checks to be performed on the specified *SLC*® 96 digital facility interface (SDFI).	ALW:HDW-SDFI 5E10 and later
Requests that a *SLC*® 96 digital facility interface (SDFI) circuit be removed and diagnosed.	DGN:SDFI 5E10 and later
Interactively diagnoses (exercises) a *SLC*® 96 digital facility interface (SDFI).	EX:SDFI 5E10 and later
Inhibits the hardware error checks performed on the specified *SLC*® 96 digital facility interface (SDFI).	INH:HDW-SDFI 5E10 and later
Requests that a *SLC*® 96 digital facility interface (SDFI) be removed from service.	RMV:SDFI 5E10 and later
Restores either conditionally or unconditionally a *SLC*® 96 digital facility interface (SDFI) to service.	RST:SDFI 5E10 and later
Requests that actions on a specified *SLC*® 96 digital facility interface (SDFI) be stopped.	STP:SDFI 5E10 and later

Table 272 SWITCHING CONTROL CENTER

Topic/Purpose	Message ID/ Message Release
Requests that the specified Switching Control Center (SCC) data link subdevice be removed from service.	RMV:SCC 5E10 and later
Restores the specified Switching Control Center (SCC) data link subdevice to service.	RST:SCC 5E10 and later

Table 273 SWITCHING MODULE

Topic/Purpose	Message ID/ Message Release
Allows a switching module (SM) audit to execute automatically or an audit cycle to execute routinely on one SM or a range of SMs.	ALW:AUD-SM 5E10 and later
Requests that the per-call test failure (PCTF) verbose mode be allowed.	ALW:PCTF 5E10 and later
Requests that generic utility WHEN breakpoint clauses in the switching module (SM) be allowed or enabled.	ALW:UT-SM 5E10 and later
Requests a switching module (SM) audit to be run in one SM or a range of SMs.	AUD:SM 5E10 and later
Requests that one specific WHEN clause or all WHEN clauses be removed from both the application program and the memory of the switching module (SM).	CLR:UT-SM 5E10 and later
Requests that a value be copied into an address, register, variable, or utility variable of the switching module (SM), and can perform any of the following operations.	COPY:UT-SM-A 5E10 only
Requests that a value be copied into an address, register, variable, or utility variable of the switching module (SM), and can perform any of the following operations:	COPY:UT-SM-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified switching module (SM) be dumped.	DUMP:UT-SM-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified	DUMP:UT-SM-B

switching module (SM) be dumped.	5E11 and later
Conditional ELSE input message used with the IF input message will perform any switching module (SM) generic utility input messages following it, provided the IF input message comparison is not true.	ELSE:UT-SM 5E10 and later
Requests that a series of switching module (SM) generic utility input messages be ended.	END:UT-SM 5E10 and later
Requests that an unconditional call to a function be executed using parameters or a transfer of execution to an absolute address in the specified switching module (SM).	EXC:UT-SM-A 5E10 only
Format 1 requests that an unconditional call to a function using parameters in the specified switching module (SM) be executed.	EXC:UT-SM-B 5E11 and later
Requests that a constant or variable in a switching module's (SM) memory be compared against another constant or variable in the SM memory.	IF:UT-SM-A 5E10 only
Requests that a constant or variable in a switching module's (SM) memory be compared against another constant or variable in the SM memory.	IF:UT-SM-B 5E11 and later
Requests that the end of an IF-ELSE statement be signified in the switching module (SM) and must be used together with the IF:UT-SM input message.	IF:UT-SM-ENDIF 5E10 and later
Requests that the per-call test failure (PCTF) verbose mode be inhibited.	INH:PCTF 5E10 and later
Requests initialization of the selected switching modules (SMs) at the specified level.	INIT:SM-A 5E10 - 5E11
Requests initialization of the selected switching modules (SMs) at the specified level.	INIT:SM-B 5E12 only
Requests initialization of the selected switching modules (SMs) at the specified level.	INIT:SM-C 5E13 and later
Requests a single process purge (SPP) of a named process in a selected switching module (SM).	INIT:SM-SPP 5E10 and later
Requests that a value(s) be loaded into the memory of the specified switching module (SM).	LOAD:UT-SM-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified switching module (SM).	LOAD:UT-SM-B 5E11 and later
Requests a printout of all communication module (CM) units and switching modules (SMs) that are in the growth (GROW) or special growth (SGRO) equipage states, or the equipage state of an individual unit.	OP:EQSTAT 5E10 and later
Requests the offline pump status of a switching module's (SM's) peripheral units.	OP:OPUMP 5E10 and later
Requests a list of all per-call test failures (PCTFs) that have occurred in all switching modules (SMs), a range of SMs, or a particular SM since the last time the periodic list was printed.	OP:PCTF 5E10 and later
Requests a common channel interoffice signaling (CCIS) measurement report.	OP:SMR 5E10 and later
Requests information on switching modules (SMs) assigned to terminals using switching module system test (SMST) routing.	OP:SMST 5E10 and later
Requests that the terminal assigned to indicated switching modules (SMs) for switching module system test (SMST) routing be released.	RLS:SMST 5E10 and later
Requests that all output messages originating from the specified switching modules (SMs) be routed to the terminal at which this input message is entered in addition to other normal locations where such output would appear.	RTE:SMST 5E10 and later
To request a graceful stop of the currently printing per call test failure (PCTF) summary.	STP:PCTF 5E10 and later
Format 1 requests that a temporary generic utility breakpoint be defined for an application program in the specified switching module (SM)/SM-2000.	WHEN:UT-SM-A 5E10 only
Format 1 requests that a temporary generic utility breakpoint be defined using and address of an application program in the specified switching module (SM/SM-2000).	WHEN:UT-SM-B 5E11 and later

Table 274 Switching Module Peripheral Error

Topic/Purpose	Message ID/ Message Release
Requests that the verbose status in a single switching module (SM) or a range of SMs be cleared.	CLR:PERPH-SM 5E10 and later
Requests a summary of peripheral (PERPH) transient errors on switching modules (SMs).	OP:PERPH-SM-SUM 5E10 and later
Requests that the verbose status in a single switching module (SM) or a range of SMs be set.	SET:PERPH-SM

	5E10 and later

Table 275 Host Switching Module Digital Facility Interface

Topic/Purpose	Message ID/ Message Release
Requests that maintenance actions on the host switching module (HSM) digital facilities interface (HDFI) circuit be aborted.	ABT:HDFI 5E10 and later
Allows hardware error checks to be performed on the specified host switching module (HSM) digital facilities interface (HDFI) circuit.	ALW:HDW-HDFI 5E10 and later
Takes one or more switching modules (SMs) out of isolation.	CLR:ISOL-SM 5E10 and later
Requests that a host switching module (HSM) digital facilities interface (HDFI) circuit be diagnosed to determine if it is in working order.	DGN:HDFI 5E10 and later
Performs maintenance exercises on the host switching module (HSM) digital facilities interface (HDFI) circuit.	EX:HDFI 5E10 and later
Inhibits the hardware error checks performed on the specified host switching module (HSM) digital facilities interface (HDFI) circuit.	INH:HDW-HDFI 5E10 and later
Requests that a host switching module (HSM) digital facilities interface (HDFI) circuit be removed from service.	RMV:HDFI 5E10 and later
Requests that a host switching module (HSM) digital facilities interface (HDFI) circuit be restored to service.	RST:HDFI 5E10 and later
Requests that a switching module (SM) or a range of SMs be isolated.	SET:ISOL-SM 5E10 and later
Requests that the common network interface (CNI) system be placed into min mode.	SET:MINMODE-CNI 5E10 and later
Requests that maintenance actions on the host switching module (HSM) digital facilities interface (HDFI) circuit be stopped.	STP:HDFI 5E10 and later

Table 276 SYNCHRONOUS DATA LINK

Topic/Purpose	Message ID/ Message Release
Requests that the specified synchronous data link (SDL) subdevice be removed from service.	RMV:SDL 5E10 and later
Restores the specified synchronous data link (SDL) subdevice to service.	RST:SDL 5E10 and later

Table 277 Synchronous Data Link Controller

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified synchronous data link controller (SDLC).	DGN:SDLC 5E10 and later
Exercises a synchronous data link controller (SDLC) in an interactive diagnostic mode.	EX:SDLC 5E10 and later
Requests that the specified synchronous data link controller (SDLC) be removed from service.	RMV:SDLC 5E10 and later
Conditionally or unconditionally restores a synchronous data link controller (SDLC) to service.	RST:SDLC 5E10 and later

Table 278 SYSTEM TAPE

Topic/Purpose	Message ID/ Message Release
Requests verification of the readability of information on administrative module (AM) tapes and the consistency of corresponding hash sums.	VFY:TAPE 5E10 and later

Table 279 T1 FACILITY

Topic/Purpose	Message ID/ Message Release
Requests abort of maintenance actions on a remote switching module (RSM) facility (FAC) or a trunk FAC.	ABT:FAC 5E10 and later
Requests that a specified action on an integrated digital carrier unit (IDCU) digital signal level one (DS1) facility (IFAC) circuit be aborted (ABT).	ABT:IFAC 5E10 and later
Request to allow reports of transmission facility performance monitoring (PM) threshold	ALW:FAC-A

crossing alert (TCA) report output messages (refer to the REPT:FAC output message) for facilities terminated on a digital facilities interface (DFI) model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	5E10 - 5E11
Request to allow reports of transmission facility performance monitoring (PM) threshold crossing alert (TCA) report output messages (refer to the REPT:FAC output message) for facilities terminated on a digital facilities interface (DFI) model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	ALW:FAC-B 5E12 only
Request to allow reports of transmission facility performance monitoring (PM) threshold crossing alert (TCA) report output messages (refer to the REPT:FAC output message) for facilities terminated on a digital facilities interface (DFI) model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S) number.	ALW:FAC-C 5E13 and later
Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) facility (IFAC) circuit.	ALW:HDW-IFAC 5E10 and later
Requests that protection (PROT) line switch requests be allowed to be performed on the specified remote terminal (RT) digital signal level one (DS1) facility (FAC) or requests that a DS1 be allowed to be released from protection.	ALW:RT-FAC 5E10 and later
Requests that the message transfer part (MTP) route verification test (MRVT) delay parameter (D), which is used in the calculation of the T1 timer, be changed or displayed.	CHG:MRVT 5E10 and later
Requests that a far end loop process (FELP) or a protection (PROT) configuration request be cleared for a particular digital signal level one (DS1) facility (FAC).	CLR:RT-FAC 5E10 and later
Requests the disabling of the option of having the switching module (SM) status indicator updated to off-normal (OFFN) when a remote terminal (RT) T1 is in an off-normal state.	CLR:RT-FACOFFN 5E10 and later
Requests that protection (PROT) line switch requests to be performed on the specified remote terminal (RT) digital signal level one (DS1) facility (FAC) circuit be inhibited or requests that a DS1 currently on protection be taken off of protection.	INH:RT-FAC 5E10 and later
Requests initialization of performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	INIT:FAC-A 5E10 - 5E11
Requests initialization of performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	INIT:FAC-B 5E12 only
Requests initialization of performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	INIT:FAC-C 5E13 and later
Requests output of the contents of the performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	OP:FAC-A 5E10 - 5E11
Requests output of the contents of the performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S).	OP:FAC-B 5E12 only
Requests output of the contents of the performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S) number.	OP:FAC-C 5E13 and later
Request output containing the busy/idle status of umbilical T1 facility channels between a host switching module (HSM) and remote switching module (RSM).	OP:FACMAP 5E10 and later
Requests the value of the switching module (SM) status indicator (SET or CLEARED).	OP:RT-FACOFFN 5E10 and later
Requests removal of a remote switching module (RSM) facility (FAC) or a trunk FAC from service.	RMV:FAC-A 5E10 only
Requests removal of a remote switching module (RSM) facility (FAC) or a trunk FAC from service.	RMV:FAC-B 5E11 and later
Requests that an integrated digital carrier unit (IDCU) digital signal level one (DS1) facility (IFAC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:IFAC 5E10 and later
Requests restoration of a remote switching module (RSM) facility (FAC) or a trunk FAC to	RST:FAC

service.	5E10 and later
Requests that an integrated digital carrier unit (IDCU) digital signal level one (DS1) facility (IFAC) circuit be restored to service.	RST:IFAC 5E10 and later
Requests that a far end loop process (FELP) or a protection configuration request (PROT) be set for a particular digital signal level one (DS1) facility (FAC).	SET:RT-FAC 5E10 and later
Requests enabling of the option to update the switching module (SM) status indicator to off-normal when a remote terminal (RT) T1 is in an off-normal state.	SET:RT-FACOFFN 5E10 and later
Requests that maintenance actions be stopped on a remote switching module (RSM) facility (FAC) or a trunk FAC.	STP:FAC 5E10 and later
Requests that action on an integrated digital carrier unit (IDCU) digital signal level one (DS1) facility (IFAC) circuit be stopped.	STP:IFAC 5E10 and later
Requests a test (connectivity exercise) of the connection of a remote switching module (RSM) facility (FAC).	TST:FAC 5E10 and later

Table 280 TAPE WRITER

Topic/Purpose	Message ID/ Message Release
Requests that the copying of the boot disk to tape be stopped.	STOP:BKDISK 5E10 and later
Stops any CMPR:MHD input messages that are currently executing.	STOP:CMPR-MHD 5E10 and later
Stops any COPY:DIFF:SRC input messages that are currently executing.	STOP:COPY-DIFF 5E10 and later
Requests that the copy of the boot disk to tape be stopped.	STP:BKDISK 5E10 and later

Table 281 TELETYPEWRITER

Topic/Purpose	Message ID/ Message Release
Requests that the specified teletypewriter (TTY) be removed from service.	RMV:TTY 5E10 and later
Unconditionally restores the specified teletypewriter (TTY) to service.	RST:TTY 5E10 and later

Table 282 Teletypewriter Controller

Topic/Purpose	Message ID/ Message Release
Diagnoses the specified teletypewriter controller (TTYC).	DGN:TTYC 5E10 and later
Exercises a teletypewriter controller (TTYC).	EX:TTYC 5E10 and later
Requests that the specified teletypewriter controller (TTYC) and any associated teletypewriters be removed from service.	RMV:TTYC 5E10 and later
Conditionally or unconditionally restores a teletypewriter controller (TTYC) to service.	RST:TTYC 5E10 and later

Table 283 TEST AND ACCESS CIRCUIT

Topic/Purpose	Message ID/ Message Release
Requests that actions on the test and access circuit (TAC) be aborted at the specified location.	ABT:TAC 5E10 and later
Allows hardware error checks to be performed on the specified test and access circuit (TAC).	ALW:HDW-TAC 5E10 and later
Requests that a test and access circuit (TAC) be diagnosed to determine whether it is in satisfactory working order.	DGN:TAC 5E10 and later
Interactively diagnoses (exercises) the test and access circuit (TAC).	EX:TAC 5E10 and later
Inhibits the hardware error checks performed on the specified test and access circuit (TAC).	INH:HDW-TAC 5E10 and later
Requests that a test and access (TAC) circuit be removed from service.	RMV:TAC 5E10 and later
Restores either conditionally or unconditionally a test and access (TAC) circuit in a trunk unit	RST:TAC

to service.	5E10 and later
Requests that actions on the trunk and access (TAC) circuit at the specified location be stopped.	STP:TAC 5E10 and later

Table 284 TIME OF DAY

Topic/Purpose	Message ID/ Message Release
Requests that the display of the time of day (TOD) database update failure message be allowed.	ALW:TOD 5E10 and later
Inhibits the display of time of day (TOD) data base update failure message.	INH:TOD 5E10 and later

Table 285 TESTING

Topic/Purpose	Message ID/ Message Release
Requests that the wireless test set will be assigned to an Air Extension user's analog line so that the maintenance personnel can test an user's wireless service without requiring the user's handset phone.	ASGN:TESTSET 5E11 and later
Requests that the set of test sets defined in the WNC and their current state be listed out.	OP:TESTSET 5E11 and later
Request that the wireless test set assigned through ASGN:TESTSET will be de-assigned manually so that the wireless service will be returned to the user.	RLS:TESTSET 5E11 and later
Requests that a currently-running (manually-requested) electronic loop segregation (ELS) test be stopped.	STP:TST-ELS-A 5E10 only
Requests that a currently-running (manually-requested) electronic loop segregation (ELS) test be stopped.	STP:TST-ELS-B 5E11 only
Requests that a currently-running (manually-requested) electronic loop segregation (ELS) test be stopped.	STP:TST-ELS-C 5E12 and later
Requests a manual direct link node (DLN) "heartbeat test" execution for a specific switching module (SM).	TST:DLNHB 5E10 and later
Requests that an inward wide area telecommunications service (INWATS) direct signaling query be sent to the INWATS database to verify its operation.	TST:INWATS 5E10 and later
Requests a test of a modem pool (MP).	TST:MP 5E10 and later
Requests that a network call denial (NCD) query be sent to the NCD database to verify its operation.	TST:NCD 5E10 and later
Requests testing of the integrity of the common channel signaling (CCS) network and data consistency between the service control point (SCP) and the *5ESS*®-2000 switch.	TST:NS800-A 5E10 - 5E11
Requests testing of the integrity of the common channel signaling (CCS) network and data consistency between the service control point (SCP) and the *5ESS*®-2000 switch.	TST:NS800-B 5E12 and later
Requests that a rate query be sent to the real time rating system (RTRS) database to verify its operation.	TST:RATE-A 5E10 only
Requests that a rate query be sent to the real time rating system (RTRS) database to verify its operation.	TST:RATE-B 5E11 and later
Requests an automatic voice frequency link (VFL) test for a specified common channel signaling (CCS) link.	TST:VFL 5E10 and later

Table 286 TIME MULTIPLEX SWITCH

Topic/Purpose	Message ID/ Message Release
Aborts a diagnostic or exercise on the time multiplexed switch (TMS) on the specified office network and timing complex (ONTC).	ABT:TMS 5E10 and later
Requests that the time multiplex switch (TMS) in the specified office network and timing complex (ONTC) be diagnosed.	DGN:TMS 5E10 and later
Requests a dump of the time multiplexed switch (TMS) error source registers (ESRs).	DUMP:TMS 5E10 and later
Requests that the time multiplexed switch (TMS) be exercised in an interactive mode.	EX:TMS 5E10 and later
Requests that a value(s) be loaded into the memory of the specified time multiplex switch (TMS).	LOAD:UT-TMS 5E10 and later
Requests a unconditional restore of a quad-link packet switch (QLPS) time multiplexed switch	RST:QTMSLNK

link (QTMSLNK) to the active state.	5E10 and later
Requests that a specified time multiplexed switch link (TMSLNK) be restored to service.	RST:TMSLNK 5E10 and later
Requests that a diagnostic or exercise on the time-multiplexed switch (TMS) on the specified office network and timing complex (ONTC) be stopped.	STP:TMS 5E10 and later

Table 287 TIMESLOT MANAGEMENT CHANNEL

Topic/Purpose	Message ID/ Message Release
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:DNUSTMC 5E12 and later
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:IDCUTMC 5E12 and later
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:RT-TMC-A 5E10 - 5E11
Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT).	ABT:RT-TMC-B 5E12 and later
Requests that information describing the configuration of the embedded operations channel (EOC) and timeslot management channel (TMC) for the specified remote terminal (RT) be displayed.	OP:RT-CHAN 5E10 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:DNUSTMC 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:IDCUTMC 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RT-TMC-A 5E10 - 5E11
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.	RMV:RT-TMC-B 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:DNUSTMC 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:IDCUTMC 5E12 and later
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:RT-TMC-A 5E10 - 5E11
Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.	RST:RT-TMC-B 5E12 and later
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:DNUSTMC 5E12 and later
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:IDCUTMC 5E12 and later
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:RT-TMC-A 5E10 - 5E11
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.	STP:RT-TMC-B 5E12 and later
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:DNUSTMC 5E12 and later
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:IDCUTMC 5E12 and later
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:RT-TMC-A 5E10 - 5E11
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:RT-TMC-B 5E12 and later
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:TMC-A 5E10 - 5E11
Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).	SW:TMC-B 5E12 and later

Table 288 TRAFFIC MEASUREMENT

Topic/Purpose	Message ID/ Message Release
Requests that the 15-minute traffic report be allowed to be output to the receive-only printer (ROP).	ALW:TRFC15 5E10 and later
Requests that the specified section of the 30-minute traffic report be allowed to be collected (CLCT) or output to the traffic channel (TRFCH) or receive-only printer (ROP) every 30 minutes.	ALW:TRFC30 5E10 and later
Requests that the 15-minute traffic report be inhibited from being output to the receive-only printer (ROP).	INH:TRFC15 5E10 and later
Requests the inhibition of the collection or outputting of the specified section of the 30-minute traffic report.	INH:TRFC30 5E10 and later
Requests the output of the list of measured carriers.	OP:MEASIC 5E10 and later
Requests either the collection (CLCT) or the print (PRINT) status of the division of revenue hourly report (DRHR), plant hour (PLNTHR), traffic 15 (TRFC15), and all sections of the traffic 30 (TRFC30) reports.	OP:MEASTAT 5E10 and later
Requests the 15-minute traffic report at a time other than the regularly scheduled time.	OP:TRFC15 5E10 and later
Requests the immediate output of the specified section of the 30-minute traffic report.	OP:TRFC30 5E10 and later

Table 289 TRANSFER

Topic/Purpose	Message ID/ Message Release
Requests that the remote file transfer system be started, stopped or status be reported.	IN:XFER 5E10 and later

Table 290 TRANSACTIONS

Topic/Purpose	Message ID/ Message Release
Requests that all active office-dependent data (ODD) database transactions be cleared in the administrative module (AM), the communication module processor (CMP) and all switching modules (SMs).	CLR:TRN 5E10 and later
Requests that an American National Standards Institute (ANSI) transaction capabilities application part (TCAP) Type I test query be sent to a billing validation database to verify its operation.	TST:AT1 5E10 and later

Table 291 TRANSLATIONS

Topic/Purpose	Message ID/ Message Release
Requests a conversion (translation) for a particular trunk, line, data link, or Operator Services Position System port (OSPSPORT).	OP:CONV-A 5E10 only
Requests a conversion (translation) for a particular trunk, line, data link, or Operator Services Position System port (OSPSPORT).	OP:CONV-B 5E11 only
Requests a conversion (translation) for a particular trunk, line, data link, or Operator Services Position System port (OSPSPORT).	OP:CONV-C 5E12 only
Requests a conversion (translation) for a particular trunk, line, data link, or Operator Services Position System port (OSPSPORT).	OP:CONV-D 5E13 and later
Requests that translation information for a particular circuit, from its external identifier to its internal circuit name, be output.	OP:CONV-EXT-A 5E10 - 5E11
Requests that translation information for a particular circuit, from its external identifier to its internal circuit name, be output.	OP:CONV-EXT-B 5E12 only
Requests that translation information for a particular circuit, from its external identifier to its internal circuit name, be output.	OP:CONV-EXT-C 5E13 and later
Requests that translation information for a particular circuit, from its internal identifier to its external identifier.	OP:CONV-INT 5E10 and later
Convert from a given protocol handler (PH) for asynchronous transfer mode (ATM) (PHA) to the associated packet switch unit (PSU) link and channel that it services.	OP:CONV-PHA 5E10 and later
Convert from a given packet switch unit (PSU) link to the associated protocol handlers (PHs) for asynchronous transfer mode (ATM) (PHAs) that service the individual channels of the PSU	OP:CONV-PSLNK-A 5E10 only

Copyright © 1999

link.	
Convert from a given packet switch unit (PSU) link (PSLNK) to the associated protocol handlers (PHs) for asynchronous transfer mode (ATM) (PHAs) that service the individual channels of the PSU link.	OP:CONV-PSLNK-B 5E11 and later
Requests consolidated routing information based on requested digit analysis selector (DAS).	OP:DIGTRC 5E10 and later
Requests output of a complete routing]pattern based on input information.	OP:RTITRC 5E10 and later
Requests that an R0 advanced services platform (ASP) test query verifying integrity be sent to the external service control point (SCP) database.	TST:ASP-A 5E10 - 5E11
Requests that an R0 advanced services platform (ASP) test query verifying integrity be sent to the external service control point (SCP) database.	TST:ASP-B 5E12 and later

Table 292 TRANSMISSION RATE CONVERTER UNIT

Topic/Purpose	Message ID/ Message Release
Requests a print-out of the Transmission Rate Converter Unit (TRCU) information associated with the specified TRCU path (TRCP) or the TRCU3 control time slot (TCTS) number.	OP:TRCU 5E12 and later
This request is used to "force" active a particular function pack pair of a transmission rate conversion unit - model III (TRCU3) circuit.	SET:FRC-TRCU3 5E12 and later

Table 293 TRANSMISSION TEST FACILITY COMMON BOARD

Topic/Purpose	Message ID/ Message Release
Requests that actions on the test transmission facility common (TTFCOM) circuit be aborted at the specified location.	ABT:TTFCOM 5E10 and later
Allows hardware error checks to be performed on the specified transmission test facility common (TTFCOM) circuit pack.	ALW:HDW-TTFCOM 5E10 and later
Requests that a transmission test facility common (TTFCOM) circuit be diagnosed to determine whether it is in satisfactory working order.	DGN:TTFCOM 5E10 and later
Interactively diagnoses (exercises) the transmission test facility common (TTFCOM) circuit.	EX:TTFCOM 5E10 and later
Inhibits the hardware error checks performed on the specified transmission test facility common (TTFCOM) circuit pack.	INH:HDW-TTFCOM 5E10 and later
Requests that a transmission test facility common (TTFCOM) circuit pack be removed from service.	RMV:TTFCOM 5E10 and later
Conditionally or unconditionally restores a transmission test facility common (TTFCOM) board in a global digital service unit (GDSU) to service.	RST:TTFCOM 5E10 and later
Requests that actions on the transmission test facility common (TTFCOM) board at the specified location be stopped.	STP:TTFCOM 5E10 and later

Table 294 TRUNK AND LINE WORK STATION

Topic/Purpose	Message ID/ Message Release
Requests that an active trunk and line work station (TLWS) maintenance task or an *Autoplex*® automatic task administrator (AATA) maintenance task be aborted.	ABT:TASK 5E10 and later
Requests that an active trunk and line work station (TLWS) maintenance task be aborted.	ABT:TASK-TLWS 5E10 and later
Requests that the position busy (PB) indicator be cleared at certain trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) assigned to receive incoming 101 test line calls.	CLR:PB 5E10 and later
Clears the status of a route making it available, and stops the signaling route set test (SRST) for the route.	CLR:SRST-DPC 5E10 and later
Requests that the trunk and line work station (TLWS) test position (TP) digital testing defaults be reset to the system defaults.	CLR:WSDGTL 5E10 and later
Requests that the frequency and level be cleared at a particular trunk and line work station (TLWS) test position (TP).	CLR:WSFREQ 5E10 and later
Requests that the digits that are used for automatic outpulsing on the trunk associated with the indicated trunk and line work station (TLWS) test position (TP) be cleared.	CLR:WSOPD 5E10 and later
Requests seizure of an incoming 101TL (test-line) call at a trunk and line work station (TLWS) test position (TP).	CONN:WSIC 5E10 and later

Requests connection of the specified line or trunk at the trunk and line work station (TLWS) test position (TP) to a test access unit (TAU) jack.	CONN:WSJACK 5E10 and later
Requests seizure of (connection to) a line for interactive trunk and line work station (TLWS) testing.	CONN:WSLINE-A 5E10 only
Requests seizure of (connection to) a line for interactive trunk and line work station (TLWS) testing.	CONN:WSLINE-B 5E11 only
Requests seizure of (connection to) a line for interactive trunk and line work station (TLWS) testing.	CONN:WSLINE-C 5E12 and later
Requests to connect the trunk and line work station (TLWS) talk-and-monitor (T&M) phone with the current line or trunk associated with the test position (TP).	CONN:WSPHONE 5E10 and later
Requests that the port (line or trunk) that is associated with the specified trunk and line work station (TLWS) test position (TP) be re-seized.	CONN:WSPORT 5E10 and later
Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS) testing.	CONN:WSTRK-A 5E10 - 5E11
Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS) testing.	CONN:WSTRK-B 5E12 only
Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS) testing.	CONN:WSTRK-C 5E13 and later
Requests that the line that is associated with the specified trunk and line work station (TLWS) test position (TP) be disconnected.	DISC:WSLINE 5E10 and later
Requests that the trunk and line work station (TLWS) talk-and-monitor (T&M) phone be disconnected from the indicated test position (TP).	DISC:WSPHONE 5E10 and later
Requests that the port (line or trunk) that is associated with the specified trunk and line work station (TLWS) test position (TP) be disconnected.	DISC:WSPORT 5E10 and later
Requests that the trunk that was associated with the specified trunk and line work station (TLWS) test position (TP) using an earlier CONN:WSTRK or CONN:WSIC input message be released.	DISC:WSTRK 5E10 and later
Requests the display of the position busy (PB) and not position busy (NPB) status of each of the trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test calls.	OP:PB 5E10 and later
Requests the immediate or automatic printing of test results from the specified trunk and line work station (TLWS) test position (TP).	OP:WSDATA 5E10 and later
Requests the testing status of one or all trunk and line work station (TLWS) test positions (TP).	OP:WSSTAT 5E10 and later
Releases a trunk and line work station (TLWS) test position (TP).	RLS:WSPOS 5E10 and later
Stops the test in progress and releases the associated testing hardware [such as, global digital services function (GDSF), transmission test facility (TTF) or directly connected test unit (DCTU)] at the indicated trunk and line work station (TLWS) test position (TP).	RLS:WSTST 5E10 and later
Requests that the position busy (PB) indicator of certain trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test line calls be set.	SET:PB 5E10 and later
Requests setting the trunk and line work station (TLWS) test position (TP) digital testing defaults.	SET:WSDGTL 5E10 and later
Requests setting the trunk and line work station (TLWS) test position (TP) frequency and/or level.	SET:WSFREQ 5E10 and later
Requests to set the digits that are to be used for automatic outpulsing on a trunk associated with the indicated trunk and line work station (TLWS) test position (TP).	SET:WSOPD-A 5E10 - 5E11
Requests to set the digits that are to be used for automatic outpulsing on a trunk associated with the indicated trunk and line work station (TLWS) test position (TP).	SET:WSOPD-B 5E12 and later
Requests that the mode of the trunk and line work station (TLWS) talk-and-monitor (T&M) phone connected to the indicated test position (TP) be set.	SET:WSPHONE 5E10 and later
Requests a trunk and line work station (TLWS) test position (TP) and testing resources (ID) to associate with the terminal issuing this input message.	SET:WSPOS 5E10 and later
Requests to stop the action of a test at the trunk and line work station (TLWS) test position (TP) started by a digital, metallic, supervision, or transmission test request.	STP:WSTST 5E10 and later
Requests trunk and line work station (TLWS) automatic tests.	TST:WSAUTO-A 5E10 only
Requests trunk and line work station (TLWS) automatic tests.	TST:WSAUTO-B 5E11 and later
Requests a test of customer premises equipment (CPE) connected to a digital subscriber line	TST:WSCPE

(DSL) at the trunk and line work station (TLWS) test position (TP) number that was seized using a TLWS seize line input message.	5E10 and later
Requests digital testing on the port seized at the trunk and line work station (TLWS) test position (TP).	TST:WSDGTL 5E10 and later
Requests to measure signal characteristics in a transmission test on the line or trunk that was seized at the trunk and line work station (TLWS) test position (TP).	TST:WSMEAS 5E10 and later
Requests testing the metallic characteristics of the line or trunk attached to a trunk and line work station (TLWS) test position (TP).	TST:WSMET 5E10 and later
Requests MONITOR access to either a busy or idle port at the trunk and line work station (TLWS) test position (TP), depending on the mode option chosen in the input message.	TST:WSMNTR 5E10 and later
Requests that a tone be sent over, or a termination be applied to, the port currently seized at the trunk and line station (TLWS) test position (TP).	TST:WSSEND 5E10 and later
Requests that supervision characteristics of the line or trunk be tested at the trunk and line work station (TLWS) test position (TP) number that was seized using a TLWS seize line, trunk, or incoming call input message.	TST:WSSUPV-A 5E10 only
Requests that supervision characteristics of the line or trunk be tested at the trunk and line work station (TLWS) test position (TP) number that was seized using a TLWS seize line, trunk, or incoming call input message.	TST:WSSUPV-B 5E11 only
Requests that supervision characteristics of the line or trunk be tested at the trunk and line work station (TLWS) test position (TP) number that was seized using a TLWS seize line, trunk, or incoming call input message.	TST:WSSUPV-C 5E12 and later

Table 295 TRUNK EQUIPMENT NUMBER

Topic/Purpose	Message ID/ Message Release
Requests that actions on the trunk equipment number (TEN) be aborted at the specified location.	ABT:TEN 5E10 and later
Allows hardware error checks to be performed on the specified trunk equipment number (TEN).	ALW:HDW-TEN 5E10 and later
Requests that a trunk equipment number (TEN) be diagnosed to determine whether it is in satisfactory working order.	DGN:TEN 5E10 and later
Interactively diagnoses (exercises) the trunk equipment number (TEN).	EX:TEN 5E10 and later
Inhibits the hardware error checks performed on the specified trunk equipment number (TEN) circuit.	INH:HDW-TEN 5E10 and later
Requests that the analog trunk specified by the trunk equipment number (TEN) be removed from service.	RMV:TEN 5E10 and later
Restores either conditionally or unconditionally a single analog trunk in a trunk unit specified by a trunk equipment number (TEN) circuit in a trunk unit to service.	RST:TEN 5E10 and later
Requests that actions on the analog trunk specified by the trunk equipment number (TEN) be stopped.	STP:TEN 5E10 and later

Table 296 TRUNK GROUPS

Topic/Purpose	Message ID/ Message Release
Assigns trunk groups to the network management (NM) schedule (SCH).	ASGN:DPSCH 5E10 and later
Locates and corrects inconsistencies between near-end and far-end call processing and maintenance states of CCS6 and CCS7 trunks.	AUD:CCSTQ-A 5E10 only
Locates and corrects inconsistencies between near-end and far-end call processing and maintenance states of CCS7 trunks.	AUD:CCSTQ-B 5E11 only
Initiates the common channel signaling (CCS) translation test interoffice audit for CCS6 and CCS7 trunks.	AUD:CCSXLATE-A 5E10 only
Initiates the common channel signaling (CCS) translation test interoffice audit for CCS7 trunks.	AUD:CCSXLATE-B 5E11 only
Removes trunk groups displayed in the TRUNK block of the defense switched network (DSN) network management (NM) exception page (page 129) from display boxes; however it keeps the trunk groups in the NM schedule.	CLR:TRKDP 5E10 and later
Requests that monitoring be stopped of a trunk group marked with stop-go signaling.	CLR:TRUNK 5E10 and later
Initiates the common channel signaling (CCS) translation test (or circuit validation) for a	EXC:CCSXLATE

specific CCS7 trunk.	5E12 and later
Requests that the inhibit for the periodic signaling link test (PSLT) be set, reset or reported.	INH:PSLT-A 5E10 - 5E12
Requests the inhibit for the periodic signaling link test (PSLT).	INH:PSLT-B 5E13 and later
Requests the specified trunk group marked with stop-go signaling be monitored.	MON:TRUNK 5E10 and later
Lists a history over the immediate previous two hours of attempts per circuit per hour (ACH) and connections per circuit per hour (CCH) taken every 5 minutes for a given trunk group displayed in the TRUNK block of the defense switched network (DSN) network management (NM) exception page.	OP:ACCH 5E10 and later
Requests that all dynamic overload controls (DOCs) specified for the office be listed, or lists the control for a single trunk group.	OP:DOC 5E10 and later
Requests print-out of the threshold counts, operational all tests passed count, and purge count of a trunk circuit (Formats 1, 2, 3 and 4) or universal tone decoder (UTD) (Format 5), universal tone generator (UTG) (Format 6), or revertive pulsing trunk (Format 7) on the trunk error analysis lists.	OP:TERACNTS-A 5E10 - 5E11
Requests print-out of the threshold counts, operational all tests passed count, and purge count of a trunk circuit (Formats 1, 2, 3 and 4) or universal tone decoder (UTD) (Format 5), universal tone generator (UTG) (Format 6), or revertive pulsing trunk (Format 7) on the trunk error analysis lists.	OP:TERACNTS-B 5E12 only
Requests print-out of the threshold counts, operational all tests passed count, and purge count of a trunk circuit (Formats 1, 2, 3 and 4) or universal tone decoder (UTD) (Format 5), universal tone generator (UTG) (Format 6), or revertive pulsing trunk (Format 7) on the trunk error analysis lists.	OP:TERACNTS-C 5E13 and later
Reports (outputs) the total number of trunks in a trunk group, the number of in-service trunks, the number of out-of-service (OOS) trunks, and an indicator if the counts may be invalid.	OP:TGCNT 5E10 and later
Requests report of trunks being held off-hook and out of service.	OP:TRUNK 5E10 and later
Establishes or releases a connection between a network digital loop and a specific digital trunk.	ORD:DLOOP-A 5E10 - 5E12
Establishes or releases a connection between a network digital loop and a specific digital trunk.	ORD:DLOOP-B 5E13 and later
Establishes or releases a connection between a network 1004 Hz tone and a specific digital trunk.	ORD:TONE-A 5E10 - 5E12
Establishes or releases a connection between a network 1004 Hz tone and a specific digital trunk.	ORD:TONE-B 5E13 and later
Releases a trunk that is being held off-hook and out-of-service due to a stop-go signaling error.	RLS:TRUNK 5E10 and later
Requests the removal of a trunk from service and places it in the specified out-of-service (OOS) status.	RMV:TRK-A 5E10 only
Requests the removal of a trunk from service and places it in the specified out-of-service (OOS) status.	RMV:TRK-B 5E11 only
Requests the removal of a trunk from service and places it in the specified out-of-service (OOS) status.	RMV:TRK-C 5E12 only
Requests the removal of a trunk from service and places it in the specified out-of-service (OOS) status.	RMV:TRK-D 5E13 and later
Requests that a trunk, a range of trunks in a trunk group, an entire trunk group, a primary rate interface (PRI) group, all trunks on a digital facility interface (DFI), or all trunks on a digital network unit - synchronous optical network (SONET) (DNU-S) virtual tributary 1.5 facility (VT1.5) be returned to service by deleting the specified out-of-service (OOS) condition.	RST:TRK-A 5E10 - 5E11
Requests that a trunk, a range of trunks in a trunk group, an entire trunk group, a primary rate interface (PRI) group, all trunks on a digital facility interface (DFI), or all trunks on a digital network unit - synchronous optical network (SONET) (DNU-S) virtual tributary 1.5 facility (VT1.5) be returned to service by deleting the specified out-of-service (OOS) condition.	RST:TRK-B 5E12 only
Requests that a trunk, a range of trunks in a trunk group, an entire trunk group, a primary rate interface (PRI) group, all trunks on a digital facility interface (DFI), or all trunks on a digital networking unit - synchronous optical network (SONET) (DNU-S) virtual tributary level 1 facility be returned to service by deleting the specified out-of-service (OOS) condition.	RST:TRK-C 5E13 and later
Requests a report to verify all the members of a multi-line hunt group (MLHG).	VFY:MLHG

	5E10 and later

Table 297 Trunk Group Controls

Topic/Purpose	Message ID/ Message Release
Requests that a single service selective trunk reservation (SSTR) control be allowed for a specified trunk group after being inhibited by the INH:SSTR input message or by the INH option of the ASGN:SSTR input message.	ALW:SSTR 5E10 and later
Requests that a single trunk reservation (TR) control be allowed for a specified trunk group.	ALW:TR 5E10 and later
Requests that a service selective trunk reservation (SSTR) control be assigned to a specified trunk group.	ASGN:SSTR 5E10 and later
Requests that a trunk reservation (TR) control be assigned to a specified trunk group.	ASGN:TR 5E10 and later
Requests that a single service selective trunk reservation (SSTR) control be cleared on a specified trunk group.	CLR:SSTR 5E10 and later
Requests that any service selective trunk reservation (SSTR) inhibit override that was set as the result of a SET:SSTROVRD input message be cleared and all SSTR per-trunk-group inhibits be restored to their original state.	CLR:SSTROVRD 5E10 and later
Requests that network management (NM) trunk group controls (TGCs) of a given control type be removed.	CLR:TGC 5E10 and later
Requests that a single trunk reservation (TR) control be cleared on a specified trunk group.	CLR:TR 5E10 and later
Requests that the trunk reservation (TR) inhibit override that was set as the result of a SET:TROVRD input message be cleared and all TR per-trunk-group inhibits be restored to their original state.	CLR:TROVRD 5E10 and later
Requests that a single service selective trunk reservation (SSTR) control be inhibited for a specified trunk group.	INH:SSTR 5E10 and later
Requests that a trunk reservation (TR) control be inhibited on a per trunk group basis.	INH:TR 5E10 and later
Requests a list of all service selective trunk reservation (SSTR) controls that are currently assigned, or lists the SSTR controls for a single trunk group.	OP:SSTR 5E10 and later
Requests a list of all trunk group controls (TGCs) applied to a particular trunk group, all TGCs of a particular type, or all TGCs in the office.	OP:TGC 5E10 and later
Requests that the specified communication module (CM) or switching module (SM) trouble locating procedure (TLP) note be printed.	OP:TLPNOTE 5E10 and later
Requests a list of all trunk reservation (TR) controls that are currently assigned, or lists the TR control for a single trunk group.	OP:TR 5E10 and later
Requests that the manual reroute (RR) trunk group control (TGC) for a single trunk group be set.	SET:RR 5E10 and later
Requests that all service selective trunk reservation (SSTR) per-trunk-group inhibits be overridden.	SET:SSTROVRD 5E10 and later
Requests that a (SKIP), cancel-to (CANT), cancel-from (CANF), or cancel reroute overflow (CRO) trunk group control (TGC) on a trunk group be set for immediate activation (manual control).	SET:TGC 5E10 and later
Requests that all trunk reservation (TR) per-trunk-group inhibits be overridden.	SET:TROVRD 5E10 and later
Requests that further output from a previously requested network management OP input message be stopped.	STP:NMOP 5E10 and later

Table 298 TRUNK TESTING

Topic/Purpose	Message ID/ Message Release
Allows automatic periodic execution of the common channel signaling (CCS) office-wide circuit query.	ALW:CCSCQ 5E12 and later
Execute a circuit query (CQ) request.	EXC:CCSCQ 5E12 and later
Inhibits automatic periodic execution of the common channel signaling (CCS) office-wide circuit query.	INH:CCSCQ 5E12 and later
Determines whether the common channel signaling (CCS) automatic circuit query for CCS7 trunks is inhibited or allowed for the entire office, and the circuit query start time.	OP:CCSCQ 5E12 and later

This message will report the out-going supervision state of a trunk (on/off-hook) or set the trunk to on or off-hook.	ORD:TRK-A 5E10 - 5E12
This message will report the out-going supervision state of a trunk (on/off-hook) or set the trunk to on or off-hook.	ORD:TRK-B 5E13 and later
Requests that the active circuit query request be stopped.	STP:CCSCQ 5E12 and later
Stops a pending or currently running test of a digital subscriber line (DSL).	STP:TST-DSL-A 5E10 - 5E11
Stops pending or currently running test(s) of a integrated service digital network (ISDN) digital subscriber line (DSL).	STP:TST-DSL-B 5E12 and later
Requests that a modem pool (MP) test started by the TST:MP input message be stopped.	STP:TST-MP 5E10 and later
Requests that the testing of trunks initiated by the TST:TRK input message be stopped.	STP:TST-TRK 5E10 and later
Requests that the test of continuity of analog lines terminated on the W-card of WNC be stopped.	STP:TST-WLINE 5E11 and later
Requests that an Operator Services Position System (OSPS) local number portability (LNP) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the LNP/network control point (NCP) data base to verify its operation.	TST:LNP 5E11 and later
Requests automatic operational or transmission tests on individual trunks, a range of trunks in a trunk group, or an entire trunk group.	TST:TRK-A 5E10 - 5E11
Requests automatic operational or transmission tests on individual trunks, a range of trunks in a trunk group, or an entire trunk group.	TST:TRK-B 5E12 only
Requests automatic operational or transmission tests on individual trunks, a range of trunks in a trunk group, or an entire trunk group.	TST:TRK-C 5E13 and later
Requests that the continuity of analog lines terminated on the W-card of WNC be tested and printed out.	TST:WLINE 5E11 and later

Table 299 TRUNK UNIT CHANNEL BOARD

Topic/Purpose	Message ID/ Message Release
Requests that actions on the trunk unit channel board (TUCHBD) be aborted at the specified location.	ABT:TUCHBD 5E10 and later
Requests that a trunk unit channel board (TUCHBD) be diagnosed to determine whether it is in satisfactory working order.	DGN:TUCHBD 5E10 and later
Requests that a trunk unit channel board (TUCHBD) be removed from service.	RMV:TUCHBD 5E10 and later
Conditionally or unconditionally restores a trunk unit channel board (TUCHBD) to the active state.	RST:TUCHBD 5E10 and later
Requests that actions on the trunk unit channel board (TUCHBD) at the specified location be stopped.	STP:TUCHBD 5E10 and later

Table 300 UMBILICAL

Topic/Purpose	Message ID/ Message Release
Requests that a specified action on a a host umbilical (UMBIL) circuit be aborted (ABT).	ABT:UMBIL 5E13 and later
Requests that the user shell accept an input message that it previously rejected because it was not represented in the input message catalog database.	EXC:UCL 5E10 and later
Request output containing the busy/idle status of host umbilical channels	RMV UMBIL 5E13 and later
Requests that a host umbilical (UMBIL) circuit be restored to service.	RST:UMBIL 5E13 and later
Requests that actions on a host umbilical (UMBIL) circuit be stopped.	STP:UMBIL 5E13 and later
Requests a test (connectivity exercise) of the connection of a host umbilical (UMBIL).	TST:UMBIL 5E13 and later

Table 301 UNIVERSAL CONFERENCE CIRCUIT

Topic/Purpose	Message ID/ Message Release

Requests that actions on the universal conference (UCONF) circuit board be aborted at the specified location.	ABT:UCONF 5E10 and later
Allows hardware error checks to be performed on the specified universal conference (UCONF) circuit board.	ALW:HDW-UCONF 5E10 and later
Requests that a universal conference (UCONF) circuit board be diagnosed to determine whether it is in satisfactory working order.	DGN:UCONF 5E10 and later
Interactively diagnoses (exercises) the universal conference circuit (UCONF) board.	EX:UCONF 5E10 and later
Inhibits the hardware error checks performed on the specified universal conference (UCONF) circuit board.	INH:HDW-UCONF 5E10 and later
Requests that a universal conference (UCONF) circuit board be removed from service.	RMV:UCONF 5E10 and later
Conditionally or unconditionally restores a universal conference (UCONF) circuit board in a global digital service unit (GDSU) to service.	RST:UCONF 5E10 and later
Requests that actions on the universal conference (UCONF) circuit at the specified location be stopped.	STP:UCONF 5E10 and later

Table 302 UNIVERSAL TONE
Universal Tone Decoder

Topic/Purpose	Message ID/ Message Release
Requests that actions on the universal tone decoder (UTD) be aborted at the specified location.	ABT:UTD 5E10 and later
Allows hardware error checks to be performed on the specified universal tone decoder (UTD).	ALW:HDW-UTD 5E10 and later
Requests that a universal tone decoder (UTD) board be diagnosed to determine if it is in satisfactory working order.	DGN:UTD 5E10 and later
Interactively diagnoses (exercises) the universal tone detector (UTD).	EX:UTD 5E10 and later
Inhibits the hardware error checks performed on the specified universal tone decoder (UTD).	INH:HDW-UTD 5E10 and later
Requests that a universal tone decoder (UTD) board be removed from service.	RMV:UTD 5E10 and later
Conditionally or unconditionally restores a universal tone decoder (UTD) board, in the local digital service unit, to service.	RST:UTD 5E10 and later
Requests that actions on the universal tone decoder (UTD) board at the specified location be stopped.	STP:UTD 5E10 and later

Table 303 Universal Tone Generator

Topic/Purpose	Message ID/ Message Release
Requests that actions be aborted on the universal tone generator (UTG) at the specified location.	ABT:UTG 5E10 and later
Allows hardware error checks to be performed on the specified universal tone generator (UTG).	ALW:HDW-UTG 5E10 and later
Requests that a universal tone generator (UTG) board be diagnosed to determine if it is in satisfactory working order.	DGN:UTG 5E10 and later
Interactively diagnoses (exercises) the universal tone generator (UTG).	EX:UTG 5E10 and later
Inhibits the hardware error checks performed on the specified universal tone generator (UTG).	INH:HDW-UTG 5E10 and later
Requests that a universal tone generator (UTG) board be removed from service.	RMV:UTG 5E10 and later
Conditionally or unconditionally restores a universal tone generator (UTG) board, in the local digital service unit, to service.	RST:UTG 5E10 and later
Requests that actions on the universal tone generator (UTG) board at the specified location be stopped.	STP:UTG 5E10 and later

Table 304 UPDATES

Topic/Purpose	Message ID/ Message Release

Requests a report about the current status of the active file receiving process.	IN:REMOTE-REPT 5E10 and later
Requests that the administrative module (AM) be put in the remote-file-receive mode.	IN:REMOTE-START 5E10 and later
Requests that the input of update files be terminated from a remote source.	IN:REMOTE-STOP 5E10 and later
Requests that tape header information and, if present, a volume table of contents (VTOC) be read from a load-disk-from-tape (LDFT) formatted tape and output to the receive-only printer (ROP).	OP:G-READHDR 5E10 and later
Requests output of the central processor or administrative module system update event log.	OP:G-READLOG 5E10 and later
Requests an update of the "cluster" data (ODD) relations for a particular multi-module remote switching module (MMRSM) site and updates the RLRTANNGRP relation for affected announcement trunk groups associated with the site.	ST:UPDMHGTRKG 5E10 and later
Requests that the administrative module (AM) system-update message in progress be stopped.	STOP:GEN 5E10 and later
Stops current execution of the software update (SU) installation process.	STP:EXC-UPD 5E10 and later
Requests that the administrative module (AM) system-update message in progress be stopped.	STP:GEN 5E10 and later
Requests application of a byte replacement update associated with a software update.	UPD:APPLY-BYTER 5E10 and later
Requests application of a file replacement update associated with a software update.	UPD:APPLY-FILER 5E10 and later
Requests application of a function replacement update associated with a software update.	UPD:APPLY-FUNCR 5E10 and later
Requests update to the software update database (Cud) after the successful execution of the first input message preceding the first UPD:APPLY message in the APPLY section of the MSGS file in a software update (SU).	UPD:APPLY-UNIX 5E10 and later
Requests that the status of software update (SU) process automation be determined and/or changed.	UPD:AUTO 5E10 and later
Resuests that an office health check be performed (UPD:AUTOCHK) or requests that the results of the last office healthcheck be displayed (UPD:AUTOCHK:STATUS).	UPD:AUTOCHK 5E10 and later
Requests that the software update (SU) process automation office profile be changed according to the arguments and values specified in the input message.	UPD:AUTOPROFILE 5E10 and later
Requests that the named software update (SU) be scheduled for automatic installation (UPNM option) or requests the status of the currently scheduled SU (STATUS option).	UPD:AUTOSCHED 5E10 and later
Requests that software updates be backed out.	UPD:BKOUT 5E10 and later
Requests that the administrative module (AM) minimum-configuration or full-configuration boot image be updated.	UPD:BLDBOOT 5E10 and later
Requests that an official software update be blocked or inhibited from being backed out.	UPD:BLOCK 5E10 and later
Requests that the last official software update be backed out.	UPD:BOLO 5E10 and later
Request to change the name of the apply software update for the easybwm process.	UPD:CHG-APPLY 5E10 and later
Request to change the name of the backout software update for the easybwm process.	UPD:CHG-BKOUT 5E10 and later
Request to change the name of the install software update for the easybwm process.	UPD:CHG-INST 5E10 and later
Request to change the soak timer interval for the install SU in the easybwm process (MCC Page 1940).	UPD:CHG-SKTM 5E10 and later
Requests that one or more software updates be cleared from the administrative module (AM) field update directory.	UPD:CLR 5E10 and later
Requests that information about administrative module (AM) software updates be displayed.	UPD:DISPLAY 5E10 and later
Requests a display of the first portion of the specified section of the software update (SU) MSGS file on the Master Control Center (MCC) 1960 page for the SU that is currently loaded on that same page (using the UPD:UPNAME input message).	UPD:DISPLYUPD 5E10 and later
To enable switching module (SM) or communication module processor (CMP) incore memory	UPD:DUMPCORE

to be dumped to a file.	5E10 and later
Requests execution of all messages in the specified section (APPLY, SOAK, OFC, or BKOUT) of the software update (SU) MSGS file for the SU that is currently loaded on the Master Control Center (MCC) 1960 page.	UPD:EXALL 5E10 and later
Requests execution of the next message(s) in the specified section(s) of the software update (SU) MSGS file for the SU that is currently loaded on the Master Control Center (MCC) 1960 page.	UPD:EXNXT 5E10 and later
Requests that the software update expansion process that takes place automatically during the download of a compressed software update (SU) be manually stopped (STOP), or requests that any compressed files in the software update specified (UPNM=a) be expanded to their original size so that software update application may begin immediately.	UPD:EXPAND 5E10 and later
Requests that function information from a process file's symbol table be displayed for one to twenty five address or function entries.	UPD:FTRC 5E10 and later
Requests execution of the application process, APPLPROC, (/prc/supr/applproc) during a retrofit or update.	UPD:G-APPLPROC 5E10 and later
Requests that the administrative module (AM) be prepared for booting from the old software release if it is necessary to back out of the new software release.	UPD:G-BACKOUT 5E10 and later
Requests the start of the retrofit cycle.	UPD:G-BEGIN 5E10 and later
Requests commitment to the new switch software release by duplexing the disks and completes the propagation of the new software release into the system after the soak period.	UPD:G-COMMIT 5E10 and later
Requests that the continuation of a central processor or administrative module update process that requested a manual action using a UPD:G-[unit] output message.	UPD:G-CONTINUE 5E10 and later
Requests the completion of the retrofit cycle.	UPD:G-END 5E10 and later
Requests that the new software release data be entered into the administrative module.	UPD:G-ENTER 5E10 and later
Requests that the administrative module (AM) be prepared for booting from the new software release.	UPD:G-PROCEED 5E10 and later
Requests that the old software release be restored by removing the new software release from the administrative module (AM).	UPD:G-RESTORE 5E10 and later
Requests a retrofit switch and initialization on switching modules (SMs) that were switched by the UPD:G-SWITCHFWD input message during a retrofit or update.	UPD:G-SWITCHBCK 5E10 and later
Requests a retrofit switch and initialization of switching modules (SMs) that are offline pumped and forced during a retrofit or update.	UPD:G-SWITCHFWD 5E10 and later
Requests the collection and logging of current out-of-service (OOS) trunks and their statuses during a software release transition (retrofit, update, or large terminal growth).	UPD:G-TSM 5E10 and later
To manually control the generation of update files (ufiles) and product files (pfiles) generated by the UPgenpcc process.	UPD:GENP 5E10 and later
To verify the integrity of the disk and core images for hash sum protected products.	UPD:HSCHK 5E10 and later
Invalidates memory segments for the input message catalog (imcatlg), causing the catalog to be read from disk.	UPD:IMCAT 5E10 and later
Requests that the password, the number of login attempts and/or the key, which are used by the Customer Service Computer Access Network System (CSCANS) interface, be initialized.	UPD:INITPW 5E10 and later
Requests display of the next portion of MSGS file on the Master Control Center (MCC) 1960 page for the software update (SU) that is currently loaded on the MCC 1960 page.	UPD:NXTWNDW 5E10 and later
Requests updates associated with a temporary software update be made permanent.	UPD:OFC 5E10 and later
Requests that a pending computer field update (that is, one that has been interrupted) be removed from further consideration.	UPD:OMIT 5E10 and later
Requests that program update compact switch processor's patch space.	UPD:PATCH 5E12 and later
Requests that updates associated with a temporary broadcast warning message (BWM) be made permanent.	UPD:PERM 5E10 and later
Requests that inconsistent pumpable switching module (SM) peripherals be removed and restored.	UPD:PMPPERF 5E10 and later
Requests that execution of an in-progress UPD:PMPPERF input message be stopped.	UPD:PMPSTOP 5E10 and later
Requests printing of the specified section or all the specified sections of the software update (SU) MSGS file on the receive-only printer (ROP).	UPD:PRINT 5E10 and later

Requests printing of the specified file associated with the software update that is currently loaded on the Master Control Center (MCC) 1960 page on the receive-only printer (ROP).	UPD:PRINT-BWM 5E10 and later
Requests the printing of the soak timer information on the receive-only printer (ROP).	UPD:PRINT-SKTM 5E10 and later
Requests that the previous portion of the MSGS file be displayed on the Master Control Center (MCC) 1960 page for the software update (SU) that is currently loaded on the MCC 1960 page.	UPD:PRVWNDW 5E10 and later
Requests that the temporary software update pump map be used during an initialization of the switching modules (SMs) or communication module processors (CMPs).	UPD:PUMPBWM 5E10 and later
Requests that the official pump map be used during an initialization of the switching modules (SM or SM-2000) or communication module processors (CMPs).	UPD:PUMPOFC 5E10 and later
Requests a program update roll backward or roll forward operation.	UPD:RCVRY 5E10 and later
To update the timer value for a given active remote digital test access (RDTA) session and to change the duration period.	UPD:RDTA 5E10 and later
Requests that the software update database be updated to reflect the backing out of any temporary administrative module (AM) updates active at the time of the reboot.	UPD:REBOOT 5E10 and later
Requests a program update roll backward or roll forward operation.	UPD:RECOVERY 5E10 and later
Requests smaller, more concise software update database entries after all updates on the administrative module (AM) have been made official.	UPD:REDUCE 5E10 and later
Requests that the soak timer duration (TM) of the software update (SU) that is currently soaking be updated, or that the soak timer for the SU that is currently soaking be stopped (ABORT), or that the line number (LINE) to be executed next for the SU loaded on the Master Control Center (MCC) 1960 page be changed.	UPD:RESET 5E10 and later
Requests that if an operation to an administrative module (AM) field update fails, that update's status may be "reset" to a previously "accepted" state.	UPD:RESET-3B 5E10 and later
Requests that execution of the software update easybwm process be started.	UPD:START-EASY 5E10 and later
This input message should be used in conjunction with easy software update (SU) installation.	UPD:STOP-SOAK 5E10 and later
Requests verification of software update consistency and a summary of any software update inconsistencies that exist in the system.	UPD:UPDCON 5E10 and later
Requests information about updates to the system through software update procedures.	UPD:UPDDSPLY 5E10 and later
Requests a check for the existence of a software update (SU) in the base directory, and if the SU exists it is loaded on to the Master Control Center (MCC) 1960 page.	UPD:UPNAME 5E10 and later
Requests update of the text version and/or software update level of the file system partitions.	UPD:VERSION 5E10 and later
Requests that software updates which are updates in the field update directory be updated.	UPD:VFY 5E10 and later
Requests verification of the content of a software update, the name of which has been entered using the UPD:UPNAME input message.	UPD:VFYBWM 5E10 and later
Requests verification of update consistency and a summary of all update inconsistencies that exist in the system.	UPD:VFYCON 5E10 and later

Table 305 USER LEVEL AUTOMATIC RESTART

Topic/Purpose	Message ID/ Message Release
Initializes the *UNIX*® level automatic restart process (ULARP).	INIT:ULARP 5E10 and later
Requests the status of run input messages.	OP:ULARP-COM 5E10 and later
Requests a listing of the execution sequence of child processes and run input message during a bootstrap or user initialization procedure.	OP:ULARP-EXEC 5E10 and later
Requests the status of *UNIX*® level automatic restart process (ULARP) child processes.	OP:ULARP-PROC 5E10 and later

Table 306 UTILITIES

Topic/Purpose	Message ID/ Message Release

Requests that generic utility WHEN breakpoint clauses in the communication module processors (CMP) be allowed or enabled.	ALW:UT-CMP 5E10 and later
Requests that generic utility WHEN clauses in the packet interface unit (PI) be allowed or enabled.	ALW:UT-MCTSI-PI 5E10 and later
Requests that generic utility WHEN breakpoint clauses in the packet switch unit protocol handler (PSUPH) be allowed or enabled.	ALW:UT-PSUPH 5E10 and later
Requests that generic utility WHEN breakpoint clauses in the switching module (SM) be allowed or enabled.	ALW:UT-SM 5E10 and later
Requests that all currently defined administrative module (AM) generic access package (GRASP) breakpoints be enabled so that the associated actions are executed when the breakpoint conditions occur.	ALW:UTIL 5E10 and later
Requests that a specific administrative module (AM) generic access package (GRASP) breakpoint be enabled so that the associated actions are executed when the breakpoint condition occurs.	ALW:UTILFLAG 5E10 and later
Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the communication module processor (CMP) be removed.	CLR:UT-CMP 5E10 and later
Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet interface (PI) unit be removed.	CLR:UT-MCTSI-PI 5E10 and later
Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet switch unit protocol handler (PSUPH) be removed.	CLR:UT-PSUPH 5E10 and later
Requests that one specific WHEN clause or all WHEN clauses be removed from both the application program and the memory of the switching module (SM).	CLR:UT-SM 5E10 and later
Removes all currently defined administrative module (AM) generic access package (GRASP) breakpoints; clears definitions.	CLR:UTIL 5E10 and later
Removes the specified administrative module (AM) generic access package (GRASP) breakpoint and clears the definition.	CLR:UTILFLAG 5E10 and later
Requests that a value be copied into an address, register, variable, or utility variable of the packet interface (PI) unit.	COPY:UT-MCTSI-PI-A 5E10 only
Requests that a value be copied into an address, register, global variable (specified by name or symbol index), or utility variable of the packet interface (PI) unit and optionally perform any of the following operations.	COPY:UT-MCTSI-PI-B 5E11 and later
Requests that a value be copied into an address, register, variable, or utility variable of the packet switch unit protocol handler (PSUPH), and perform any of the following operations:	COPY:UT-PSUPH-A 5E10 only
Requests that a value be copied into an address, register, global variable (specified for name or symbol index), or utility variable of the packet switch unit protocol handler (PSUPH), and optionally perform any of the following operations:	COPY:UT-PSUPH-B 5E11 and later
Requests that a value be copied into an address, register, variable, or utility variable of the switching module (SM), and can perform any of the following operations.	COPY:UT-SM-A 5E10 only
Requests that a value be copied into an address, register, variable, or utility variable of the switching module (SM), and can perform any of the following operations:	COPY:UT-SM-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified communications module processor (CMP) be dumped.	DUMP:UT-CMP-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified communications module processor (CMP) be dumped.	DUMP:UT-CMP-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified communication module processor message handler (CMPMSG) be dumped.	DUMP:UT-CMPMSG-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified communication module processor message handler (CMPMSG) be dumped.	DUMP:UT-CMPMSG-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified digital networking unit - SONET (DNU-S) common controller (CC) be dumped.	DUMP:UT-DNUS-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified digital networking unit - synchronous optical network (SONET) (DNU-S) common controller (CC) be dumped.	DUMP:UT-DNUS-B 5E11 and later
Requests that the contents of one or more sequential memory location in the specified foundation peripheral controller (FPC) be dumped.	DUMP:UT-FPC-A 5E10 only
Requests that the contents of one or more sequential memory location in the specified foundation peripheral controller (FPC) be dumped.	DUMP:UT-FPC-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) be dumped.	DUMP:UT-IDCU-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) be dumped.	DUMP:UT-IDCU-B 5E11 and later

Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) loop side interface (LSI) be dumped.	DUMP:UT-IDCULSI-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified integrated digital carrier unit (IDCU) loop side interface (LSI) be dumped.	DUMP:UT-IDCULSI-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified integrated services line unit common controller (ISLUCC) be dumped.	DUMP:UT-ISLUCC-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified integrated services line unit common controller (ISLUCC) be dumped.	DUMP:UT-ISLUCC-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified message handler (MH) unit be dumped.	DUMP:UT-MCTSI-MH-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified message handler (MH) unit be dumped.	DUMP:UT-MCTSI-MH-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified packet interface (PI) unit be dumped.	DUMP:UT-MCTSI-PI-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified packet interface (PI) unit be dumped.	DUMP:UT-MCTSI-PI-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified module message processor (MMP) be dumped.	DUMP:UT-MMP-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified module message processor (MMP) be dumped.	DUMP:UT-MMP-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified pump peripheral controller (PPC) be dumped.	DUMP:UT-PPC-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified pump peripheral controller (PPC) be dumped.	DUMP:UT-PPC-B 5E11 and later
Requests that the contents of one more sequential memory locations in the specified packet switch unit protocol handler (PSUPH) be dumped.	DUMP:UT-PSUPH-A 5E10 only
Requests that the contents of one more sequential memory locations in the specified packet switch unit protocol handler (PSUPH) be dumped.	DUMP:UT-PSUPH-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified quad-link packet switch (QLPS) gateway processor (QGP) be dumped.	DUMP:UT-QGP-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified quad-link packet switch (QLPS) gateway processor (QGP) be dumped.	DUMP:UT-QGP-B 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified switching module (SM) be dumped.	DUMP:UT-SM-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified switching module (SM) be dumped.	DUMP:UT-SM-B 5E11 and later
Requests that symbolic information be dumped from the common object file format (COFF) file defined by the processor or path identified in the input message.	DUMP:UT-SYMID 5E11 and later
Requests that the contents of one or more sequential memory locations in the specified digital networking unit - SONET (DNU-S) transmission multiplexer (TMUX) be dumped.	DUMP:UT-TMUX-A 5E10 only
Requests that the contents of one or more sequential memory locations in the specified digital networking unit - synchronous optical network (SONET) (DNU-S) transmission multiplexer (TMUX) be dumped.	DUMP:UT-TMUX-B 5E11 and later
Requests that the conditional ELSE input message used with the IF input message perform any communications module processor (CMP) generic utility input messages following it, provided the IF input message comparison is not true.	ELSE:UT-CMP 5E10 and later
Requests the conditional ELSE input message; which is used with the IF input message to perform any packet interface (PI) unit generic utility input messages following it, provided the IF input message comparison is not true (refer to the IF:UT-MCTSI-PI input message).	ELSE:UT-MCTSI-PI 5E10 and later
Requests that the conditional ELSE input message used with the IF input message perform any packet switch unit protocol handler (PSUPH) generic utility input messages following it, provided the IF input message comparison is not true.	ELSE:UT-PSUPH 5E10 and later
Conditional ELSE input message used with the IF input message will perform any switching module (SM) generic utility input messages following it, provided the IF input message comparison is not true.	ELSE:UT-SM 5E10 and later
Requests that a series of communication module processor (CMP) generic utility input messages be ended.	END:UT-CMP 5E10 and later
Requests that a series of packet interface unit (PI) generic utility input messages be ended.	END:UT-MCTSI-PI 5E10 and later
Requests that a series of packet switch unit protocol handler (PSUPH) generic utility input messages be ended.	END:UT-PSUPH 5E10 and later

Copyright © 1999

Requests that a series of switching module (SM) generic utility input messages be ended.	END:UT-SM 5E10 and later
Marks the end of a list of administrative module (AM) generic access package (GRASP) messages to be performed when a specified breakpoint condition exists.	END:WHEN 5E10 and later
Requests that an unconditional call to a function using parameters or a transfer of execution to an absolute address in the specified communication module processor (CMP) be executed.	EXC:UT-CMP-A 5E10 only
Format 1 requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) be executed.	EXC:UT-CMP-B 5E11 and later
Requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) message handler (CMPMSGH) be executed.	EXC:UT-CMPMSG-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) message handler (CMPMSGH) be executed.	EXC:UT-CMPMSG-B 5E11 and later
Requests that an unconditional call be made to a function using parameters in the specified digital networking unit - SONET (DNU-S).	EXC:UT-DNUS-A 5E10 only
Requests that an unconditional call be made to a function using parameters in the specified digital networking unit - SONET (DNU-S).	EXC:UT-DNUS-B 5E11 and later
Requests that an unconditional call to a function using parameters in the specified foundation peripheral controller (FPC) be executed.	EXC:UT-FPC-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified foundation peripheral controller (FPC) be executed.	EXC:UT-FPC-B 5E11 and later
Requests that an unconditional call be made to a function using parameters in the specified integrated digital carrier unit (IDCU).	EXC:UT-IDCU-A 5E10 only
Requests that an unconditional call be made to a function using parameters in the specified integrated digital carrier unit (IDCU).	EXC:UT-IDCU-B 5E11 and later
Requests that an unconditional call be made to a function using parameters in the specified integrated digital carrier unit (IDCU) loop side interface (LSI).	EXC:UT-IDCULSI-A 5E10 only
Requests that an unconditional call be made to a function using parameters in the specified integrated digital carrier unit (IDCU) loop side interface (LSI).	EXC:UT-IDCULSI-B 5E11 and later
Requests that an unconditional call be made to a function using parameters in the specified integrated services line unit common controller (ISLUCC).	EXC:UT-ISLUCC-A 5E10 only
Requests that an unconditional call be made to a function using parameters in the specified integrated services line unit common controller (ISLUCC).	EXC:UT-ISLUCC-B 5E11 and later
Requests that an unconditional call to a function be executed using parameters in the specified message handler (MH) unit.	EXC:UT-MCTSI-MH-A 5E10 only
Requests that an unconditional call to a function be executed using parameters in the specified message handler (MH) unit.	EXC:UT-MCTSI-MH-B 5E11 and later
Requests that an unconditional call or a goto to a function be executed using parameters in the specified peripheral interface (PI) unit.	EXC:UT-MCTSI-PI-A 5E10 only
Format 1 requests that an unconditional call to a function using parameters in the specified peripheral interface (PI) unit be executed.	EXC:UT-MCTSI-PI-B 5E11 and later
Requests that an unconditional call to a function using parameters in the specified module message processor (MMP) be executed.	EXC:UT-MMP-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified module message processor (MMP) be executed.	EXC:UT-MMP-B 5E11 and later
Requests that an unconditional call to a function using parameters in the specified pump peripheral controller (PPC) be executed.	EXC:UT-PPC-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified pump peripheral controller (PPC) be executed.	EXC:UT-PPC-B 5E11 and later
Requests that an unconditional call to a function using parameters or a transfer of execution to an absolute address in the specified packet switch unit protocol handler (PSUPH) be executed.	EXC:UT-PSUPH-A 5E10 only
Format 1 requests that an unconditional call to a function using parameters in the specified packet switch unit protocol handler (PSUPH) be executed.	EXC:UT-PSUPH-B 5E11 and later
Requests that an unconditional call to a function using parameters in the specified quad-link packet switch (QLPS) gateway processor (QGP) be executed.	EXC:UT-QGP-A 5E10 only
Requests that an unconditional call to a function using parameters in the specified quad-link packet switch (QLPS) gateway processor (QGP) be executed.	EXC:UT-QGP-B 5E11 and later
Requests that an unconditional call to a function be executed using parameters or a transfer of execution to an absolute address in the specified switching module (SM).	EXC:UT-SM-A 5E10 only
Format 1 requests that an unconditional call to a function using parameters in the specified switching module (SM) be executed.	EXC:UT-SM-B 5E11 and later

Requests that an unconditional call be made to a function using parameters in the specified digital networking unit - SONET (DNU-S) transmission multiplexer (TMUX).	EXC:UT-TMUX-A 5E10 only
Requests that an unconditional call be made to a function using parameters in the specified digital networking unit - SONET (DNU-S) transmission multiplexer (TMUX).	EXC:UT-TMUX-B 5E11 and later
Requests that a constant or variable in a communication module processor's (CMP) memory be compared against another constant or variable in the CMP memory.	IF:UT-CMP-A 5E10 only
Requests that a constant or variable in a communication module processor's (CMP) memory be compared against another constant or variable in the CMP memory.	IF:UT-CMP-B 5E11 and later
Signifies the end of an IF-ELSE statement in the communication module processor (CMP) and must be used in combination with the IF:UT-CMP input message.	IF:UT-CMP-ENDIF 5E10 and later
Requests the end of an IF-ELSE statement in the packet interface (PI) unit and must be used in combination with the IF:UT-MCTSI-PI input message.	IF:UT-MCTSI-PE 5E10 and later
Requests that a constant or variable in a packet interface (PI) unit memory be compared against another constant or variable in the PI memory.	IF:UT-MCTSI-PI-A 5E10 only
Requests that a constant or variable in a packet interface (PI) unit memory be compared against another constant or variable in the PI memory.	IF:UT-MCTSI-PI-B 5E11 and later
Requests that a constant or variable in a packet switch unit protocol handler's (PSUPH) memory be compared against another constant or variable in the PSUPH memory.	IF:UT-PSUPH-A 5E10 only
Requests that a constant or variable in a packet switch unit protocol handler's (PSUPH) memory be compared against another constant or variable in the PSUPH memory.	IF:UT-PSUPH-B 5E11 and later
Requests the end of an IF-ELSE statement in the packet switch unit protocol handler (PSUPH) and must be used in combination with the IF:UT-PSUPH input message.	IF:UT-PSUPH-END 5E10 and later
Requests that a constant or variable in a switching module's (SM) memory be compared against another constant or variable in the SM memory.	IF:UT-SM-A 5E10 only
Requests that a constant or variable in a switching module's (SM) memory be compared against another constant or variable in the SM memory.	IF:UT-SM-B 5E11 and later
Requests that the end of an IF-ELSE statement be signified in the switching module (SM) and must be used together with the IF:UT-SM input message.	IF:UT-SM-ENDIF 5E10 and later
Requests that a specific generic utility WHEN clause in the communications module processor (CMP), or all such active clauses, be inhibited.	INH:UT-CMP 5E10 and later
Requests that a specific generic utility WHEN clause in the packet interface (PI) unit, or all such active clauses, be inhibited.	INH:UT-MCTSI-PI 5E10 and later
Requests that a specific generic utility WHEN clause in the packet switch unit protocol handler (PSUPH), or all such active clauses, be inhibited.	INH:UT-PSUPH 5E10 and later
Disables (but leaves defined) all administrative module (AM) generic access package (GRASP) breakpoints.	INH:UTIL 5E10 and later
Disables (but leaves defined) a specific central processor (CP) generic access package (GRASP) breakpoint.	INH:UTILFLAG 5E10 and later
Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP).	LOAD:UT-CMP-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP).	LOAD:UT-CMP-B 5E11 and later
Requests that a value(s) be loaded into the memory of the specified communication module processor message handler (CMPMSG).	LOAD:UT-CMPMSG-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP) message handler (CMPMSG).	LOAD:UT-CMPMSG-B 5E11 and later
Requests that a value be loaded into the memory of the specified digital networking unit - SONET (DNU-S).	LOAD:UT-DNUS-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified digital networking unit - SONET (DNU-S).	LOAD:UT-DNUS-B 5E11 and later
Requests that a value be loaded into the memory of the specified foundation peripheral controller (FPC).	LOAD:UT-FPC-A 5E10 only
Requests that a value be loaded into the memory of the specified foundation peripheral controller (FPC).	LOAD:UT-FPC-B 5E11 and later
Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU).	LOAD:UT-IDCU-A 5E10 only
Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU).	LOAD:UT-IDCU-B 5E11 and later
Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU) loop side interface (LSI).	LOAD:UT-IDCULSI-A 5E10 only
Requests that a value be loaded into the memory of the specified integrated digital carrier unit	LOAD:UT-IDCULSI-B

(IDCU) loop side interface (LSI).	5E11 and later
Requests that a value be loaded into the memory of the specified integrated services line unit common controller (ISLUCC).	LOAD:UT-ISLUCC-A 5E10 only
Requests that a value be loaded into the memory of the specified integrated services line unit common controller (ISLUCC).	LOAD:UT-ISLUCC-B 5E11 and later
Requests that a value(s) be loaded into the memory of the specified message handler (MH) unit.	LOAD:UT-MCTSI-MH-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified message handler (MH) unit.	LOAD:UT-MCTSI-MH-B 5E11 and later
Requests that a value be loaded into the memory of the specified peripheral interface (PI) unit.	LOAD:UT-MCTSI-PI-A 5E10 only
Requests that a value be loaded into the memory of the specified peripheral interface (PI) unit.	LOAD:UT-MCTSI-PI-B 5E11 and later
Requests that a value be loaded into the memory of the specified module message processor (MMP).	LOAD:UT-MMP-A 5E10 only
Requests that a value be loaded into the memory of the specified module message processor (MMP).	LOAD:UT-MMP-B 5E11 and later
Requests that a value be loaded into the memory of the specified peripheral controller (PPC).	LOAD:UT-PPC-A 5E10 only
Requests that a value be loaded into the memory of the specified pump peripheral controller (PPC).	LOAD:UT-PPC-B 5E11 and later
Requests that a value(s) be loaded into the memory of the specified packet switch unit protocol handler (PSUPH).	LOAD:UT-PSUPH-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified packet switch unit protocol handler (PSUPH).	LOAD:UT-PSUPH-B 5E11 and later
Requests that a value(s) be loaded into the memory of the specified quad-link packet switch (QLPS) gateway processor (QGP).	LOAD:UT-QGP-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified quad-link packet switch (QLPS) gateway processor (QGP).	LOAD:UT-QGP-B 5E11 and later
Requests that a value(s) be loaded into the memory of the specified switching module (SM).	LOAD:UT-SM-A 5E10 only
Requests that a value(s) be loaded into the memory of the specified switching module (SM).	LOAD:UT-SM-B 5E11 and later
Requests that a value(s) be loaded into the memory of the specified time multiplex switch (TMS).	LOAD:UT-TMS 5E10 and later
Requests that a value be loaded into the memory of the specified digital networking unit - SONET (DNU-S) transmission multiplexer (TMUX).	LOAD:UT-TMUX-A 5E10 only
Requests that a value be loaded into the memory of the specified digital networking unit - SONET (DNU-S) transmission multiplexer (TMUX).	LOAD:UT-TMUX-B 5E11 and later
Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the communications module processor (CMP).	OP:UT-CMP 5E10 and later
Requests a report on the status of one or all of the generic utilities WHEN clauses in the specified packet interface unit (PI).	OP:UT-MCTSI-PI 5E10 and later
Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the specified packet switch unit protocol handler (PSUPH).	OP:UT-PSUPH 5E10 and later
Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the switching module (SM).	OP:UT-SM 5E10 and later
Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.	TRC:UTIL-A 5E10 - 5E11
Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.	TRC:UTIL-B 5E12 only
Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.	TRC:UTIL-C 5E13 and later
Requests that a temporary generic utility breakpoint be defined for an application program in the specified communications module processor (CMP).	WHEN:UT-CMP-A 5E10 only
Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified communications module processor (CMP).	WHEN:UT-CMP-B 5E11 and later
Requests that a generic utility WHEN input message be defined in the specified packet interface unit (PI).	WHEN:UT-MCTSI-PI-A 5E10 only
Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet interface unit (PI).	WHEN:UT-MCTSI-PI-B 5E11 and later
Requests that a temporary generic utility breakpoint be defined for an application program in	WHEN:UT-PSUPH-A

the specified packet switch unit protocol handler (PSUPH).	5E10 only
Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet switch unit protocol handler (PSUPH).	WHEN:UT-PSUPH-B 5E11 and later
Format 1 requests that a temporary generic utility breakpoint be defined for an application program in the specified switching module (SM)/SM-2000.	WHEN:UT-SM-A 5E10 only
Format 1 requests that a temporary generic utility breakpoint be defined using and address of an application program in the specified switching module (SM/SM-2000).	WHEN:UT-SM-B 5E11 and later

Table 307 UTILITY CALL TRACE

Topic/Purpose	Message ID/ Message Release
Request output containing the busy/idle status of T1 facility channels, and how they are populated with circuit switched voice (CSV) and circuit switched data (CSD) (DS0 and/or wideband) calls.	OP:CHANMAP-A 5E10 - 5E12
Request output containing the busy/idle status of T1 facility channels, and how they are populated with circuit switched voice (CSV) and circuit switched data (CSD) (DS0 and/or wideband) calls.	OP:CHANMAP-B 5E13 and later

Table 308 UTILITY VARIABLE

Topic/Purpose	Message ID/ Message Release
Requests that data be copied from an administrative module (AM) generic access package (GRASP) in utility variable to virtual addresses in main memory and in registers as an action associated with a breakpoint.	COPY:UVAR 5E10 and later
Dumps the contents of one or more administrative module (AM) generic access package (GRASP) utility variables either as an immediate message or as an action associated with a breakpoint.	DUMP:UVAR 5E10 and later
Loads administrative module (AM) generic access package (GRASP) utility variable with specified data as an immediate operation or as an action associated with a breakpoint.	LOAD:UVAR 5E10 and later

APP:AUD

Software Release: 5E10 and later
Message Class: N/A
Application: 5,3B
Type: Input

1. APPENDIX: SYSTEM RESPONSES FOR AUDIT SYSTEM INPUT MESSAGES

Response	Message	Meaning
?D	EXTRA KEYWORD	Too many keywords in data field.
?D	INVALID CHARACTER	Member number given was not numeric.
?D	INVALID DATA, ERROR 101	Cannot specify a range of member numbers.
?D	INVALID DATA, ERROR 102	Only one member number allowed.
?D	INVALID DATA, ERROR 103	The record for the specified audit name and member number is not found in the equipment configuration database.
?D	INVALID DATA, ERROR 105	An instance can be associated with one and only one audit name and member number.
?D	INVALID DATA, ERROR 201	The data field must be empty.
?D	INVALID DATA, ERROR 202	Only one instance can be specified.
?D	INVALID DATA, ERROR 203	The record for the specified instance is not in the equipment configuration database for the given audit name and member number.
?D	INVALID DATA, ERROR 204	No additional data can be entered when ALL is used as an input to audit user input messages, such as ALW, INH, and OP, or when RUN is used with the OP:AUD input message.
?D	INVALID DATA, ERROR 501	Data string to AUD input message too long.
?D	INVALID DATA, ERROR 502	Data string for AUD input message should not have an argument.
?D	INVALID KEYWORD, ERROR 101	The audit name is too long.
?D	INVALID KEYWORD, ERROR 102	No records for specified audit name were found in the equipment configuration database.
?D	INVALID KEYWORD, ERROR 201	The keyword is not INS.
?D	INVALID KEYWORD, ERROR 501	The keyword is not PARAM.
?D	MISSING DATA, ERROR 101	No member number was given.
?D	MISSING DATA, ERROR 201	The INS keyword was entered but no instance name was specified.
?D	MISSING DATA, ERROR 501	The PARAM keyword was entered but no additional parameter string was specified.
?D	RANGE ERROR	Member number out of range.
?E	INPUT ERROR	The input message could not determine what action was requested.
?I	INCONSISTENT KEYWORDS	Conflicting action items.
?I	INVALID DATA, ERROR 101	Cannot specify a range.
?I	INVALID DATA, ERROR 102	Only one member number allowed.
?I	INVALID DATA, ERROR 103	The record for the specified audit name and member number is not found in the equipment configuration database.
?I	INVALID DATA, ERROR 201	The instance name is too long.
?I	INVALID DATA, ERROR 202	Only one instance can be specified.
?I	INVALID DATA, ERROR 203	The record for the specified instance is not in the equipment configuration database for the given audit name and member number.
?I	INVALID DATA, ERROR 301	First action option keyword must not have a keyword data field.
?I	INVALID DATA, ERROR 302	Second action option keyword must not have a keyword data field.
?I	INVALID DATA, ERROR 401	Keyword data cannot follow keyword AUD.
?I	EXTRA KEYWORD, ERROR 1	Too many action options.
?I	EXTRA KEYWORD, ERROR 2	The third identification field subfield must be empty.
?I	INVALID KEYWORD, ERROR 101	The audit name is too long.
?I	INVALID KEYWORD, ERROR 201	The keyword is not INS.
?I	INVALID KEYWORD, ERROR 202	The keyword is invalid.

		message.
?I	INVALID KEYWORD, ERROR 301	The first action option is not valid.
?I	INVALID KEYWORD, ERROR 401	The second action option is not valid.
?I	INVALID KEYWORD, ERROR 501	ID keywords cannot follow AUD keyword.
?I	MISSING DATA, ERROR 101	No member number was given.
?I	MISSING DATA, ERROR 201	The INS keyword was entered but no instance name was specified.
?I	MISSING KEYWORD, ERROR 1	No audit name was given.
?I	MISSING KEYWORD, ERROR 2	The INS keyword (and its data) is missing.
?I	RANGE ERROR	Member number out of range.
NG	ALREADY ALLOWED, ERROR 1	All member numbers associated with the audit name are already allowed. At least one member must not be currently allowed for the ALW:AUD input message to be executed.
NG	ALREADY ALLOWED, ERROR 2	At least one of the specified members is already allowed. Use the OP:AUD input message to determine which members associated with the audit are currently allowed and which are not.
NG	ALREADY ALLOWED, ERROR 3	The instance of the audit is already allowed.
NG	ALREADY INHIBITED, ERROR 1	All the member numbers associated with the audit name are already inhibited. There must be at least one member number which is not inhibited.
NG	ALREADY INHIBITED, ERROR 2	At least one of the specified members is already inhibited. Use the OP:AUD input message to determine which members associated with the audit are currently inhibited and which are not.
NG	ALREADY INHIBITED, ERROR 3	The instance of the audit is already inhibited.
NG	NO CHANGE	No change.
NG	NOT MANUAL AUDIT	Not manual audit.
NG	NOT RUNNING	The audit specified to be stopped is not running.
RL	ALREADY RUNNING	The requested audit is already running.
RL	AUDIT BLOCKED	Audit blocked.
RL	AUDIT PROCESS NOT FULLY CREATED	Audit has not been dispatched yet. Retry STOP:AUD later.
RL	DIFFERENT MEMBER OF THIS AUDIT RUNNING	Another audit with the same name is already running. Only uniquely named audits are permitted to run at the same time. The OP:AUD input message may be used to obtain further information about currently running audits that may be preventing the initiation of the requested audit.

NOTE: If the following equipment configuration database error conditions continue, obtain technical assistance.

Response	Message	Meaning
RL	ECD INTERFACE ERROR 1	Cannot attach the segments of the equipment configuration database to the input message.
RL	ECD INTERFACE ERROR 2	Cannot connect to the equipment configuration database.
RL	ECD INTERFACE ERROR 3	Cannot read the equipment configuration database control record.
RL	ECD INTERFACE ERROR 4	Cannot open a sequence for all audits with the specified name.
RL	ECD INTERFACE ERROR 5	Error occurred while obtaining an audit record sequentially.
RL	ECD INTERFACE ERROR 6	Error occurred while obtaining an audit record by key.
RL	ECD INTERFACE ERROR 7	Error occurred while obtaining an instance record.
RL	ECD INTERFACE ERROR 8	Cannot read system integrity monitor (SIM) control record.
RL	MAXIMUM KERNEL AUDITS RUNNING	A kernel process is already running. Only one kernel process audit may be run at any one time. (It may have been initiated manually, or by a system process.) The OP:AUD input message may be used to obtain further information about currently running audits that may be preventing the initiation of the requested audit.
RL	MAXIMUM SUPERVISOR AUDITS	The maximum number of supervisor process audits is

	RUNNING	already running. (They may have been initiated manually, or by a system process.) This number is controlled by a parameter in the system integrity monitor control (SIMCNTL) record in the equipment configuration database (ECD). The OP:AUD input message may be used to obtain further information about currently running audits that may be preventing the initiation of the requested audit.
RL	RUNNING AUDIT, ERROR 6	The requested audit is already running.
RL	RUNNING AUDIT, ERROR 7	A kernel process audit is already running. Only one kernel process audit may run at any one time. (It may have been initiated manually or by a system process.) The OP:AUD input message may be used to obtain further information about currently running audits which may be preventing the initiation of the requested audit.
RL	RUNNING AUDIT, ERROR 8	The maximum number of supervisor process audits is already running. (They may have been initiated manually or by a system process.) This number is controlled by a parameter in the SIMCNTL record in the ECD. The OP:AUD input message may be used to obtain further information about currently running audits which may be preventing the initiation of the requested audit.
RL	RUNNING AUDIT, ERROR 11	Another audit with the same name is already running. Only uniquely named audits are permitted to run at the same time. The OP:AUD input message may be used to obtain further information about currently running audits which may be preventing the initiation of the requested audit.
RL	SIM INTERFACE ERROR 3	Audit system initialization is in progress.
RL	SIM INTERFACE ERROR 4	Audit system initialization failed.
RL	SIM INTERFACE ERROR 5	SIM was unable to access an equipment configuration database record using a record identifier (RID) passed to it by the input message program.
RL	SIM INTERFACE ERROR 10	SIM failed to start the audit.
RL	SIM INTERFACE ERROR 15	System integrity output formatter is dead.
RL	SIM INTERFACE ERROR 19	An invalid record identifier (RID) was passed to SIM by the input message program.
RL	SIM INTERFACE ERROR 20	An invalid instance record identifier (RID) was passed to SIM by the input message program.
RL	SIM INTERFACE ERROR 23	Cannot stop a non-segmented audit.

1. APPENDIX

EXPLANATION OF NG RESPONSES APPENDIX

The following is a list of no good (NG) system responses that are used with many of the *5ESS*®-2000 switch input messages for communication module (CM) units. NG acknowledgements are used when the syntax of a message is valid, but the message has been denied. Additional information is printed out to explain why the message was denied. Not all responses apply to all messages.

NG - ALL NOT VALID WITH A SINGLE UNIT = The ALL option was entered along with a single unit request, which is invalid.

NG - ATTEMPT TO ABORT OR STOP FAILED = A failure was encountered when trying to send an abort or stop request to another process. Try again later.

NG - ATTEMPT TO QUEUE OR SEND REQUEST FAILED = The request could not be put on the deferred maintenance queue, or a failure was encountered when trying to send the request.

NG - CM IS NOT ISOLATED FROM AM = The request has been denied because the CM was not isolated from the administrative module (AM) at the time of the request.

NG - CM ISOLATED FROM AM = The requested action cannot be performed because the CM has been manually isolated from the AM.

NG - COMMUNICATION MODULE VINTAGE MUST BE CM2 = The requested action has been denied because the communication module was an incorrect CM vintage.

NG - DEGROW OPTION NOT VALID FOR CM3 = The DEGROW option is no longer valid for the CM3 removal of a QGP or QLPS.

NG - DLI DOES NOT EXIST IN RSM = A message for a dual link interface (DLI) was entered, but the switching module (SM) type was found to be a remote switching module (RSM). No DLIs exist in an RSM.

NG - EX ALREADY QUEUED = An exercise (EX) START message was entered for unit on which an exercise is already running.

NG - EX INVALID FOR UNIT = An exercise (EX) was requested for a unit that an exercise cannot be run on. [Exercises can only be run on subunits; such as, they can be run on a module message processor (MMP), but not the entire message switch (MSGS).]

NG - EX NOT STARTED = An EX message (other than the START message) was entered for a unit on which there was no exercise previously running.

NG - FRC OPTION INVALID = The FORCE option no longer exists for the restore (RST) message.

NG - GROWTH BOARD IN GROWTH STATE = A request was made for a module message processor (MMP), but because the MMP growth board is in the GROWTH state, the request could not be honored.

Copyright © 1999

NG – HELPER OPTION INVALID FOR UNIT = The HELPER option was entered for an invalid unit.

NG – INHIBIT OR ALLOW REQUEST NOT VALID FOR THIS UNIT = An inhibit or allow request was made for a unit for which hardware checks cannot be inhibited or allowed.

NG – INVALID COMMAND OR MISSING OPTION = Either the message entered is invalid or no option was entered for a message where one of several options is required.

NG – INVALID DLI SIDE SPECIFIED = The dual link interface (DLI) side entered in the input message was not 0 or 1.

NG – INVALID HELPER SIDE SPECIFIED The HELPER side entered in the input message was not 0 or 1.

NG – INVALID MESSAGE OPTION = An invalid option was entered in the message. An example would be entering an unconditional (UCL) option on a RMV:MMP message.

NG – INVALID OPTION COMBINATION = Two options were entered together that don't make sense; for example, both MAJOR AND MINOR for an ONTC request.

NG – INVALID OR MISSING OPTION = No option was entered for a message that requires at least one of several options to be entered.

NG – INVALID RANGE = A request was entered with an invalid range, for example a range in decreasing order rather than increasing order.

NG – MAJOR OPTION INVALID FOR UNIT = The MAJOR option was entered for a unit other than the office network and timing complex (ONTC) or office network and timing complex common unit (ONTCCOM).

NG – MATE HELPER NOT IN SERVICE = A HELPER option was entered but the mate HELPER is not in service, therefore the request must be denied.

NG – NEED GROW OPTION FOR UNIT IN GROWTH STATE = The unit is in a growth or special growth state, and the GROW option was not used on the request.

NG – NEED GROW OPTION WHEN SM IS IN GROWTH STATE = All equipped SMs in the specified range are in the SGRO state, but no GROW option was used on the request.

NG – NO DLIs REQUESTED ARE EQUIPPED = No dual link interfaces (DLIs) in the range requested are equipped.

NG – NO HARDWARE CHECKS FOR CM1 MSCU = Messages to inhibit and allow hardware checks are not valid for a communication module model 1 (CM1) message switch control unit (MSCU).

NG – NO SMs REQUESTED ARE EQUIPPED = No switching modules (SMs) in the range requested are equipped.

NG – NO UNITs REQUESTED ARE EQUIPPED = No units in the range requested are equipped.

NG – NOT IN REQUESTED STATE = No units were found in the requested state.

NG – OFFLINE PARTITIONS NOT MOUNTED = The request requires access to files on the offline disk but no offline disk partions are mounted.

NG – REMOVE REQUEST INVALID FOR TMSLNK = A remove is not a valid request for a TMSLNK.

NG – REQUEST ALREADY ACTIVE = A message was entered to stop or abort an action that is in an active state

Copyright © 1999

that cannot be stopped or aborted. An example of this is a remove request. Once it has been scheduled from the deferred maintenance queue (DMQ), it cannot be stopped.

NG - REQUEST CANNOT BE ABORTED OR STOPPED = A message was entered to stop or abort an action that is in a state where it cannot be stopped or aborted. An example of this is a remove request. Once it has been scheduled from the deferred maintenance queue (DMQ), it cannot be stopped.

NG - REQUEST INVALID FOR UNIT = An invalid request was made for the unit.

NG - REQUEST NOT FOUND ON CM DMQ = A stop or abort was entered, and the unit and action could not be found on the communication module deferred maintenance queue (DMQ). Use the OP:DMQ-CM-SM input message to check what is currently on the queue.

NG - REQUEST NOT VALID FOR CM3 = A command was entered which is not supported by offices having CM3 vintage communications modules. Commands to diagnose or exercise individual message switch subunits are not valid for CM3.

NG - RSMCL OPTION NOT VALID FOR CM3 = The RSMCL option is no longer valid for CM3. This option was previously used to select an MMP/SDLC for RSMs. For CM3, this option will now be handled automatically by Recent Change.

NG - STBY OPTION INVALID = The standby (STBY) option was entered for a unit that does not run active/standby.

NG - SWITCH INVALID ON UNIT TYPE = A request was made to switch a unit for which a switch request is not valid.

NG - TOO LATE TO ABORT OR STOP REQUEST = A request was made to stop or abort a diagnostic request after the diagnostic was completed but before it was removed from the deferred maintenance queue (DMQ).

NG - UCL OPTION INVALID = The unconditional (UCL) option is not valid on this type of request.

NG - UNIT HAS NO HDWCHK STATUS = An OP:HDWCHK request was made for a unit that hardware checks cannot be inhibited or allowed on.

NG - UNIT IN GROWTH STATE = The unit is in a growth or special growth state, and the GROWTH option was not used on the request.

NG - UNIT TYPE INCOMPATIBLE WITH NC TYPE = A request was made for a network clock subunit which is inconsistent with the type of clock equipped.

NG - UNIT UNEQUIPPED = The unit the message was entered for is not in an operational state.

APP:MEM-NUM-AUD

Software Release: 5E10 and later
Message Class: N/A
Application: 5,3B
Type: Input

1. APPENDIX

Audit Name	Member Number	Audit Description
CNC	1	Critical node control.
CUMEM	1	Control unit memory comparison.
CUSTAT	1	Control unit hardware status.
ECD	1	Incore equipment configuration database (ECD) structure.
_	2	Disk ECD structure.
_	3	Incore ECD raw data.
ECDOWN	1	ECD record ownership.
FMGR	1	File manager task queue.
_	2	File manager incore inode table.
_	3	File manager hash table & inode pointer.
_	4	File manager file table.
_	5	File manager capability table.
_	6	File manager buffers.
_	7	File manager mount table.
_	8	File manager delayed queue.
_	9	File manager message queue.
FSBLK	1	File system block (all file systems).
FSCMPT	1	File system compaction (all file systems).
FSLINK	1	File system link (all file systems).
LKNODE	1	Link node data audit.
MMGR	1	Memory manager segment descriptor table.
_	2	Memory manager page tables.
_	3	Memory manager page descriptor table.
_	4	Memory manager segment release.
_	5	Memory manager segment unlock.
_	9	Memory manager swap space compaction.
MSGBUF	1	Message buffer queues.
_	2	Message buffer extenders.
NIDATA	1	Internal office identification data audit.
_	2	Internal link configuration data audit.
_	3	Internal logical-physical translation data audit.
_	4	Internal cluster/member data audit.
_	5	Internal subsystem information audit.
_	8	Internal global title translator data audit.
_	9	Internal network identifier routing data audit.
_	10	Internal protocol timers/parameters data audit.
NMDATA	1 or 2	Network management audit.
NODEST	1	Node state audit.
PMS	1	Plant measurements database integrity.
_	2	Plant measurements database recovery.
PROAD	1	Process administration.

APP:MEM-NUM-CU

Software Release: 5E10 and later
Message Class: N/A
Application: 5,3B
Type: Input

1. APPENDIX: MEMBER NUMBERS

Administrative module (AM) Control Unit (CU) Subunit Names and Member Numbers

Subunit Name	Meaning	Allowed Member Numbers
CC	Central control unit.	0
CH	Channel	0 - 19.
CSU	Cache store unit.	0
DMA	Direct memory access unit.	0 or 1
MASC	Main store controller.	0 or 1
SAT	Store address translator.	0
UC	Utility circuit.	0

Copyright © 1999

APP:MEM-NUM-UNIT

Software Release: 5E10 and later
Message Class: N/A
Application: 5,3B
Type: Input

1. APPENDIX: MEMBER NUMBERS

Administrative Module (AM) Hardware Unit Names And Member Numbers

Unit Name	Meaning	*Allowed Member Numbers
CU	Control unit	0 or 1
DCI	Dual serial channel/computer interconnect	0 - 255
DFC	Disk file controller	0 - 7
DUI	Direct user interface	0 - 255
DUIC	DUI controller	0 - 255
HSD	High-speed synchronous data link	0 - 255
HSDC	HSD controller	0 - 255
IOP	Input/output processor	0 - 15
LN00	Link node (group 00)	1 - 6
LN32	Link node (group 32)	1 - 6
MHD	Moving head disk	0 - 255
MSGS	Message switch	0 or 1
MT	Magnetic tape drive	0 - 255
MTC	Magnetic tape controller	0 - 255
MTTY	Maintenance terminal	0 - 255
MTTYC	MTTY controller	0 - 255
RPCN00	Ring peripheral controller node (group 00)	0
RPCN32	Ring peripheral controller node (group 32)	0
ROP	Receive-only printer	0 - 255
SBUS	SCSI Bus	0 - 255
SCC	Switching control center data link	0 - 255
SCSDC	Scanner and signal distributor controller	0 - 255
SDL	Synchronous data link	0 - 255
SDLC	Synchronous data link controller	0 - 255
TTY	Terminal (other than MTTY)	0 - 255
TTYC	TTY controller (other than MTTYC)	0 - 255

* These represent the limits imposed by input messages. The actual member numbers of units in a administrative module (AM) computer system are defined in the equipment configuration data base for that system.

APP:PID-AM-OKP

Software Release: 5E10 and later
Message Class: N/A
Application: 5
Type: Input

1. APPENDIX: SYSTEM PIDs FOR OKP

PID	VALID RELEASE	DESCRIPTION
1	5E10 and later	OKP integrity control process
2	5E10 and later	Line insulation test process
4	5E10 and later	Cutover process
5	5E10 and later	Diagnostic supervisor time slot allocation control process
6	5E10 and later	Port status administrator
7	5E10 and later	Terminal maintenance error analysis
8	5E10 and later	Database logging system process
10	5E10 and later	Data delivery message control process
11	5E10 and later	Overload control CP system process
12	5E10 and later	Trunk line work station automatic administrator
13	5E10 and later	RSM call trace list periodic refresh
14	5E10 and later	ISDN automatic customer rearrangement process
15	5E10 and later	CM test process
16	5E10 and later	CTTU job administrator process
17	5E10 and later	Database local transaction manager
18	5E10 and later	CP carrier group alarm process
19	5E10 and later	EADAS high priority message response process
20	5E10 and later	Automatic trunk progression testing
21	5E10 and later	Elevated audits system process
22	5E10 and later	AMA data controller process
23	5E10 and later	Utility call trace capability
25	5E10 and later	Measurements user input message process
26	5E10 and later	Measurements report output control process
27	5E10 and later	EADAS low priority message response process
28	5E10 and later	System output controller process
29	5E10 and later	Port status out-of-service list coordinator
30	5E10 and later	Service evaluation central manager
31	5E10 and later	Data delivery deferred work scheduler
32	5E10 and later	CP routine exercise controller
34	5E10 and later	Controls interactive trunk and line maintenance tasks
35	5E10 and later	CP timing process
37	5E10 and later	Controls 100 second usage scanning
38	5E10 and later	Maintenance user input message handler
40	5E10 and later	Maintenance user output message handler
41	5E10 and later	Audits I/O communications process
43	5E10 and later	Maintains CCS signaling data consistency
44	5E10 and later	Integrity monitor process
45	5E10 and later	EDLCP/OSDS communication initialization process
46	5E10 and later	Supervisor for database roll forward
47	5E10 and later	Fast pump facility
55	5E10 and later	Maintains PSA, PST, and AML counts
60	5E10 and later	Network management control and administration
61	5E10 and later	Program update check patch count in PCB's
62	5E10 and later	Trunk error analysis process
63	5E10 and later	MCC display page update process
64	5E10 and later	Routine audits system process
69	5E10 and later	Network management system process
70	5E10 and later	Interprocessor data transport
71	5E10 and later	Receives MLT-2 messages
72	5E10 and later	Customer originated recent change administrator
73	5E10 and later	Time of day controller
76	5E10 and later	Provides CCS signaling message between switch and CNI ring
77	5E10 and later	Message broadcast capability
78	5E10 and later	Common channel signaling maintenance
79	5E10 and later	Group status administration process
80	5E10 and later	Handles request from EADAS for 5 minute NM report
81	5E10 and later	CCS trunk group message handling
83	5E10 and later	OSPS common measurements administration

Copyright © 1999

86	5E10 and later	RMS-D3 control process
91	5E10 and later	Controls attached processor communication and flow control
92	5E10 and later	Receives and prints error messages from DLN
93	5E10 and later	Provides handling for CCS direct signaling messages
97	5E11 and later	*Air Extension*[SM] alarm message handling
99	5E10 and later	Controls protocol monitoring sessions
100	5E10 and later	Receives and responds to high priority messages from RNMS using EDLCP
101	5E10 and later	Receives and responds to medium priority messages from RNMS using EDLCP
102	5E10 and later	Receives and responds to low priority messages from RNMS using EDLCP
103	5E10 and later	Transfers segment name of shared data segment to EDLAP process
107	5E10 and later	Routing for call processing not handled by the CMP
126	5E10 and later	CCS call monitor system process

1. APPENDIX: SYSTEM PIDs FOR THE CMP

PID	VALID RELEASE	DESCRIPTION
1	5E10 and later	Module integrity control process
2	5E10 and later	High priority resident fault recovery
3	5E10 and later	Network control system process
9	5E10 and later	Data delivery system process
11	5E10 and later	Resource and real time overload monitoring
13	5E10 and later	Low priority resident fault recovery
17	5E10 and later	Database local transaction manager
19	5E10 and later	Generic utilities system process
21	5E10 and later	Elevated audits system process
24	5E10 and later	Database roll forward system process
28	5E10 and later	System output controller process
29	5E10 and later	10 second measurement scanning
30	5E10 and later	Scans OSPS ACD serving teams for spare capacity
31	5E10 and later	Automatic reconfiguration of OSPS operators
35	5E10 and later	System time synchronization process
37	5E10 and later	100 second measurement scanning
38	5E10 and later	Controlling and collecting of CMP measurements data
41	5E10 and later	Audit I/O communication process
43	5E10 and later	Maintains CCS signaling data consistency
44	5E10 and later	Integrity monitor system process
45	5E10 and later	Master system process for message handling
50	5E10 and later	Program update text and data overwrites
61	5E10 and later	Program update check patch count in PCB's
64	5E10 and later	Module routine audit process
66	5E10 and later	Routing and terminal allocation call processing
68	5E10 and later	Network control administration
72	5E10 and later	Customer originated recent change administrator
73	5E10 and later	Time of day controller
77	5E10 and later	Message broadcast capability
111	5E10 and later	Controls AP to SM communication
112	5E10 and later	ISDN DN busy indicator message handler
128	5E10 and later	Packet call processing system process

68	5E10 and later	Retrofit off-line pump system process
69	5E10 and later	System process for automatic controls
70	5E10 and later	Interprocessor data transport process
71	5E10 and later	Network control system process (multiway calling)
72	5E10 and later	Customer originated recent change administrator
73	5E10 and later	Time of day controller
74	5E10 and later	Controls billing for call forwarding legs of a call
75	5E10 and later	Customer originated recent change logging
76	5E10 and later	Automatic call back calling feature
77	5E10 and later	Intra-cluster status transport process
78	5E10 and later	Operate DDL communication for multimodule RSM intra-cluster
80	5E10 and later	Maintenance and fault recovery of DDL communication links
81	5E10 and later	Terminal maintenance periodic task scheduler
82	5E10 and later	Maintenance of remote clock unit
83	5E10 and later	Distributed control of associate terminals
84	5E10 and later	Packet unloader for packet interface
87	5E11 and later	Relay CCS messages from AM to PSU using SM
91	5E10 and later	Integrated services port administration
92	5E10 and later	Nail-up system process
93	5E10 and later	Responsible for CCS message dispensing in the SM
94	5E10 and later	Maintenance request administrator input handler
95	5E10 and later	Maintenance request administrator output handler
96	5E10 and later	National ISDN-1 terminal init timers
97	5E10 and later	MCC page maintenance
101	5E10 and later	Controls CCS maintenance functions
102	5E10 and later	RISLU alarm administration
103	5E10 and later	Authorization code change and deletion handler
105	5E10 and later	Provides current information status for all OSPS OAPs
107	5E10 and later	RMS-D3 control process
108	5E10 and later	Data transport and user I/O for ISDN
109	5E10 and later	Automatic charge quotation service system process
110	5E10 and later	System process for real time rating system
111	5E10 and later	Control AP to SM communication on DSL line
112	5E10 and later	ISDN attendant DN busy indicator system process
113	5E10 and later	Inter-SM system process for support of nail-up network
114	5E10 and later	Control and collect AMA records from PH
115	5E10 and later	Receive and process messages from AP
116	5E10 and later	Monitor resource requests from TCAP process
117	5E10 and later	Network management manual code controls
122	5E10 and later	Software resource reporting tool
123	5E10 and later	TCAP message formatting and parsing
127	5E10 and later	Shared call system process for shared DN
128	5E10 and later	Packet routing system process for packet call processing
129	5E10 and later	Stress testing and verifying applications processor
130	5E10 and later	Performance and protocol monitoring
131	5E10 and later	Routine port conditioning
132	5E10 and later	Cyclic update for multi-line hunt group lamps
133	5E10 and later	Protocol error record handling
134	5E10 and later	Remote access system process
135	5E10 and later	ATS system process
136	5E10 and later	ACD/BRCS system process (ACDSP)
137	5E10 and later	Authentication center/home location register
138	5E10 and later	Access manager/visiting location register
144	5E12 and later	General purpose timer manager

APP:POINT-CODE

Software Release: 5E12 and later
Message Class: N/A
Application: 5
Type: Input

1. APPENDIX

The following describes the destination point code (entered as DPC or DPCID in input messages) and origination point code (entered as OPC) input parameters are entered as 9-digit numbers of the form :

```
aaabbcddd
```

These parameters can be parsed into four possible formats.

The last format is used for CNI inter-module trunks (IMTs) and only applies to DPCs.

Format 1: *ANSI*® format

variable	value(s)
aaa	network (001-235, 237-253, 255)
bbc	cluster (000-255)
ddd	cluster member (000-255)

Format 2: AT&T format

variable	value(s)
aaa	network (254)
bb	cluster region (00-31)
c	cluster type (0-7)
ddd	cluster member (000-255)

Format 3: UNITEL format

variable	value(s)
aaa	network (236)
bb	cluster region (00-31)
c	cluster type (0-7)
ddd	cluster member (000-255)

Format 4: IMT format

variable	value(s)
aaa	network (000)
bbc	near SM number (1-192)
ddd	far SM number (1-192)

An OPC is entered based upon the value of its network. DPCs are entered based upon their own network and the network of their corresponding OPCs, as delineated in the table below:

DPC network	OPC uses Format 1	OPC uses Format 2	OPC uses Format 3
	network = 001-235, 237-253, 255	**network = 254**	**network = 236**
network=001-235, 237-253, 255	use Format 1	use Format 1	use Format 1
network = 254	use Format 1	use Format 2	use Format 1
network = 236	use Format 1	use Format 1	use Format 3
network = 0	use Format 4	use Format 4	use Format 4

APP:RANGES

Software Release: 5E10 and later
Message Class: N/A
Application: 5
Type: Input

1. APPENDIX: UNIT/EQUIPMENT RANGES FOR INPUT MESSAGES

This appendix is a list of units/equipment and the valid maximum range for use in input messages. This maximum may not coincide with the way that an individual switch is configured.

Access Interface Unit (AIU)

Unit/Equipment	When Used With	Valid Range(s)/Value(s)
aiu	AIU	[0-7], with SM-2000 [0-42]
aiu	AIUCOM	[0-7],with SM-2000 [0-42]
aiu	AIULC	[0-7], with SM-2000 [0-42]
aiu	AIULP	[0-7], with SM-2000 [0-42]
aiu	AIURG	[0-7], with SM-2000 [0-42]
aiu	AIUTSGRP	[0-7],with SM-2000 [0-42]
aiu	AIUEN	[0-7], with SM-2000 [0-42]

Analog Line Card (ZLC)

Unit/Equipment	When Used With	Valid Range(s)/Value(s)
zlc	ISLU-Z	[0-31]

Block Sequence Number (BLK)

Unit/Equipment	When Used With	Valid Range(s)/Value(s)
blk	BLK	[1-999999]

Board (BRD)

Unit/Equipment	When Used With	Valid Range(s)/Value(s)
brd	ALINK	[0-1]
brd	ALIT	[0-31]
brd	DFTAC	[0-31]
brd	DIST	[0-31]
brd	GDXC	[0-31]
brd	GRIDBD	[0-1]
brd	HDFI	[0-7]
brd	LEN	[0-1]
brd	LUCHAN	[0-3]
brd	LUCHBD	[0-3]
brd	MA	[0-31]
brd	TEN	[0-7]
brd	TUCHBD	[0-7]

CC (Refer to: Common Controller)

CD (Refer to: Common Data)

Center

Unit/Equipment	When Used With	Valid Range(s)/Value(s)

APP:SYS-RESPONSE

Software Release: 5E10 and later
Message Class: N/A
Application: 5
Type: Input

1. APPENDIX: SYSTEM RESPONSES

Acknowledgement	Meaning
IP	In progress. Request received and initiated. Further output will follow.
NA	No acknowledgment. Normally, the system acknowledges an input request within 5 to 10 seconds. If control of the message processing has been lost, NA is output to indicate an acknowledgment failure. Input message execution may or may not complete. Normal results will occur if the execution completes successfully. The NA response should only occur during abnormal circumstances such as overload conditions.
NG	No good. The message was received, but the request conflicts with the current system or equipment status; for example, an attempt was made to restore a unit that is being diagnosed.
NO	Feature not available. The requested action failed because the feature required to process the request is not present in the switch or the given module.
OK	Good. The message was received, the appropriate process was initiated, and work was completed.
PF	Printout follows. The request was received and will be acted upon. A printout will follow sometime later to explain in detail the results of the work initiated by the IM. This printout may be a termination report that may include the result of the work initiated by the IM.
RL	Retry later. Request cannot be executed now because resources are unavailable or the requested process is busy. The message may be entered again later.
?A	Action field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted.
?D	Data field or a block of parameters following the DATA parameter contains an error. It may mean that an item was incorrectly typed or improper data was entered, or that a keyword or execute symbol was omitted. The message should be checked in the Input Messages document.
?E	Error exists in the message but cannot be resolved to the proper field.
?T	Time-out has occurred on the channel. Input has not been received within the allotted time, and processing of the message has been aborted.
?V	Verb field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted.
?X	A request has been made to abort the current message or to interrupt the current output process.

APP:TRFC-SECTION

Software Release: 5E10 and later
Message Class: N/A
Application: 5
Type: Input

1. APPENDIX: TRAFFIC SECTIONS

This appendix identifies the sections of the 30-minute traffic report (TRFC30) by section number and section name.

Some section names are followed by an 'x' which denotes that an identifier is required for requests to allow (ALW) or inhibit (INH) that section for TRFC30 for collection (CLCT) and/or for output to the receive-only printer (ROP). The descriptions (contents) for those sections include "For CLCT" and/or "For ROP/OP" with information as to what identifiers are required for CLCT and/or ROP/OP.

For the sections that are limited for collection the section description includes "For CLCT"; the input message format is for example:

```
{ALW|INH}:TRFC30,CLCT,PSPORT=sm-shelf-dslg
```

The description also indicates the maximum number of units that can be collected.

Some of those sections have limited ROP output and when "for ROP/OP" specifies "'x' equals one of the following" and lists the possible keywords (UNIT, HIGH, LOW, HILO); the input message format is for example:

```
{ALW|INH}:TRFC30,ROP,PSPORT,HIGH=1
```

For other sections that have limited ROP "for ROP/OP" specifies "'x' = some identifier; the input message format is for example:

```
{ALW|INH}:TRFC30,ROP,TG="trunk group identifier(s)"
```

The sections whose section names are followed by 'x' can also be requested for output (OP) (of the most recent report) using identifiers for example:

```
OP:TRFC30,PSPORT,HIGH=2
```

in which case the requested records are output (if available). However, if no identifiers are provided for example:

```
OP:TRFC30,PSPORT
```

the previously allowed records are output (if any were allowed).

Other section names are followed by '[o]' which denotes that an identifier is optional for ALW, INH, or OP input messages. For these sections there are no "For CLCT" cases since everything generated will be collected; the option applies only to output. If no identifiers are specified the default is that all records collected will be output for example:

```
OP:TRFC30,CORC
```

However, specific records can be output using keywords for example:

```
OP:TRFC30,CORC,UNIT=sm
```

To allow (ALW) or inhibit (INH) specific records using keywords for example:

```
{ALW|INH}:TRFC30,ROP,CORC,UNIT=sm
```

Copyright © 1999

For sections where there is no 'x' or '[o]' (that is, cannot accept an identifier)

```
ALW:TRFC30,ROP,"section name"
```

will cause all collected records to print every time the report is generated until inhibited for output by

```
INH:TRFC30,ROP,"section name".
```

While:

```
OP:TRFC30,"section name"
```

will print every record collected for the most recent report.

Unless specifics are provided "for CLCT", ALW/INH for CLCT requires only the section name: ALW/INH for TRFCH requires only the section name.

> ***NOTE:*** When entering variables, separate the field and its variable with an equal sign. For lists, elements are hyphen (-) separated.

Section Name	Section Number	Contents
ACDBRCS	182	Automatic call distributor (ACD)/business and residential customer services (BRCS) measures.
ACSR x	108	Automatic customer station rearrangement (ACSR) measures. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = ACSR Group ID, a maximum of six IDs can be entered.
ADPIDB x	229	AIU Directly-Connected Peripheral Interface Data Bus counts (5E12+). For CLCT/ROP, first allow this section for collection or printing ('x' is not used), then enable at least one SHELF and AIU using RC/V View 13.7/13.8. For OP, 'x' is a SM-SHELF-AIU set and is identified completely by SM#-SHELF#-AIU#. A maximum of six (6) sets can be entered.
AIU	216	Access interface unit (AIU) counts (5E11+). Allow this section for collection and then select AIU(s) using RC/V View 13.7/13.8. For ROP printing, all AIUs selected for collection are printed when the ALW input message is used (5E11+). For ROP printing, allow this section first and then select AIUs using RC/V View 13.7/13.8. If no AIUs are selected, the default set of AIUs selected for collection will be printed (5E12+).
AIULC x	218	AIU line counts for a specific AIU (5E11+). For CLCT, allow this section for collection and then select one single AIU using RC/V View 13.7/13.8. An AIU is defined as a SM#-AIU# and a maximum of one AIU can be requested through RC/V. For ROP/OP, 'x' is a line component and is identified completely by SM#-AIU#-AP#-LC#. A maximum of six (6) line component patterns can be entered where SM#-AIU# is consistent (5E11+). For ROP printing, allow this section first (without specifying 'x') and then select individual lines using RC/V View 13.7/13.8 (5E12+).

Copyright © 1999

		Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
AIULN x	217	AIU line counts (5E11+). For CLCT, allow this section for collection and then select a line(s) using RC/V View 13.7/13.8. A line is defined as a SM#-AIU#-AP#-LC# and a maximum of 640 lines can be requested through RC/V. For ROP/OP, 'x' is a line and is identified completely by SM#-AIU#-AP#-LC#. A maximum of six (6) lines can be entered (5E11+). For ROP printing, allow this section first (without specifying 'x') and then select individual lines using RC/V View 13.7/13.8 (5E12+). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
APDL	59	Application processor data link (APDL) measures.
ANNC	46	Announcement services measures.
APSODB x	228	AIU Packet Switching On-Demand B-channel counts (5E12+). For CLCT/ROP, first allow this section for collection or printing ('x' is not used), then enable at least one AIU using RC/V View 13.7/13.8. For OP, 'x' is a SM-AIU set and is identified completely by SM#-AIU#. A maximum of six (6) AIUs can be entered.
ARS x	35	Automatic route selection (ARS) measures. For ROP/OP, where 'x' = the lead (MCRTIDX) of an ARS pattern group, a maximum of five patterns can be entered.
ASP	117	Advanced service platform part a basic access office counts. This section is treated as double precision <5E11 only>
ASP	118	Advanced service platform part b basic access office counts. This section is treated as single precision <5E11 - only>
ASP	231	Advanced service platform non toll free (5E12+)
ASPLG	117	Advanced service platform large (5E12+)
ASPTF	232	Advanced service platform toll free (5E12+)
ATTG x	33	Attendant group (ATTG) measures. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = attendant group ID, a maximum of five IDs can be entered.
BCHNEG	80	B-CHannel Negotiation (BCHNEG) (5E14+). For CLCT and ROP printing, enable components using RC/V View 13.7/13.8 before allowing this section for collection. A BCHNEG is defined as a BTG# and a maximum of 640 components can be requested. For OP request, where 'x' equal BTG#, a maximum of six units can be entered.
BCLID x	147	Bulk calling line identification (BCLID). For CLCT, `[ALW|INH]:TRFC30,CLCT,BCLID=x-x-x-x-x-x-x-x-x` where 'x' equals business customer identifier (BCID), a maximum of 25 can be studied in an office; nine can be entered with a single input request. ALL (with INH only) inhibits all BCIDs that are allowed for collection; the list of BCIDs is saved. PREV (with ALW only) reactivates the previously allowed list of BCIDs if PREV is the first ALW request after the list was inhibited.

		For ROP/OP, where 'x' equals one of the following: UNIT=Business customer identifier# HIGH=count# LOW=count# HILO=count# a maximum of six units or one count can be entered.
BRCF x	29	Business and residential customer service feature (BRCF) measures. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = BRCS feature (feature ID), a maximum of five features is allowed.
BRCS	26	Business and residential customer services (BRCS) office totals.
CDN x	128	Customer directory number (CDN) counts reported on a directory number (DN) basis (analog lines only). For CLCT, 'x' equals one of the following: `DN=DN(7 digits)` = A maximum of six hyphen separated DNs can be entered with a single input request. (This applies for {ALW|INH} ROP also). `DN=ALL` = (with INH only) Inhibits all DNs that are currently allowed for collection; the list of DNs is saved. `DN=PREV` = (with ALW only) Reactivates the previously inhibited list of DNs if PREV is the first ALW request after the list was inhibited. `RANGE=DN1&&DN2` = This section has introduced the allowing/inhibiting of a DN range to ease data entry. This range is limited to 25 DNs. DN1 and DN2 are the lower and upper bounds of the range of DNs respectively. A maximum of 250 DNs can be studied in an office, where all DNs studied can reside on any one SM. Up to 20 DNs under study may be allowed for ROP output.
CMP	126	Communication module processor (CMP).
CORC [o]	27	Customer-originated RC/V (CORC) traffic measures. For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six switching modules (SMs) or one count can be entered.
CT	5	Call type (CT) information.
CTS x	125	Control time slot (CTS) link occupancy measurements. For ROP/OP, where 'x' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count can be entered.
DCLU	21	Digital carrier line unit (DCLU).

Copyright © 1999

DLINE x	222	Digital network unit synchronous optical network (SONET) (DNU-S) - lines counts (5E12+). For CLCT and ROP printing, enable one or more lines using RC/V View 13.7/13.8 before allowing this section for collection. A line is defined as a SM#-DNUS#-RDT#-LINE# and a maximum of 512 lines can be requested through RC/V. For OP request, 'x' is a line and is identified completely by a IDLC network equipment number (INEN): SM#-DNUS#-RDT#-LINE#. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. A maximum of six line patterns can be entered.
DLN	66	Direct link node (DLN).
DLTU	16	Digital line/trunk unit (DLTU).
DMLHG	65	Defense switched network/automatic voice network (DSN/AUTOVON) multi-line hunt group (MLHG) (DMLHG); the same MLHGs allowed for section 34 (MLHG) will print for DMLHG.
DNUS	189	Digital networking unit-SONET (DNU-S).
DODB x	223	DNU-S - ODB counts (5E12+). For CLCT and ROP printing, enable a maximum of one DNU-S using RC/V View 13.7/13.8 before allowing this section for collection. A individual DNU-S is defined as a SM#-DNUS# For OP request, where 'x' equals SM#-DNUS#-PSU#-PSU_SHELF#, a maximum of six units can be entered.
DPIDB x	106	ISDN packet switching directly connected peripheral interface data bus (DPIDB) counts. For CLCT, where 'x' equals SM#, a maximum of one SM can be entered. For ROP/OP, where 'x' equals one of the following: UNIT=ISLU#-PSUSHELF# HIGH=count# LOW=count# HILO=count# a maximum of six units or one count can be entered.
DSIG	36	Direct signaling (DSIG).
DSL x	77	Integrated services digital network (ISDN) digital subscriber line (DSL) (5E10+). For CLCT, where 'x' equals one of the following (only one of the study sets can be active): LCEN=SM#-ISLU# LCKEN=SM#-ISLU# for allowing all (up to maximum of 1024) DSLs on one ISLU. A maximum of one ISLU can be entered. For allowing individually selected DSLs served by an ISLU (LCEN) or an ISLU2 (LCKEN). A maximum of 1024 can be selected, four per request. LCEN=SM#-ISLU#-LGC#-LC# LCKEN=SM#-ISLU#-LG#-LB#-LCKT# PREV (with ALW only) reactivates the previously allowed individually selected DSLs if PREV is the first request after an INH-ALL. ALL (with INH only) inhibits whichever study set is allowed for collection. If an individual

		study set is allowed for collection then the list of DSLs will be saved when the section is inhibited for collection. If an ISLU study set is allowed for collection, nothing is saved when it is inhibited. For ROP/OP, where 'x' equals one of the following: LCEN=SM#-ISLU#-LGC#-LC# LCKEN=SM#-ISLU#-LG#-LB#-LCKT# HIGH=count# HILO=count# LOW=count# a maximum of four DSLs or one count can be entered (5E10+).
DSL x	107	For CLCT, where 'x' equals one of the following (only one of the study sets can be active): SM#-ISLU# for allowing all (up to maximum of 512) DSLs on one ISLU. A maximum of one ISLU can be entered. SM#-ISLU#-LGC#-LC# for allowing individually selected DSLs. A maximum of 512 can be selected, six per request. PREV (with ALW only) reactivates the previously allowed individually selected DSLs if PREV is the first request after an INH. ALL (with INH only) inhibits whichever study set is allowed for collection. If an individual study set is allowed for collection then the list of DSLs will be saved when the section is inhibited for collection. If an ISLU study set is allowed for collection, nothing is saved when it is inhibited. For ROP/OP, where 'x' equals one of the following: UNIT=SM#-ISLU#-LGC#-LC# HIGH=count# HILO=count# LOW=count# a maximum of six DSLs or one count can be entered.
DSLG	52	Integrated services digital network (ISDN) digital subscriber line group (DSLG) <5E8-5E11>. Channel Group Measurements (5E12+).
DSNOFC	47	DSN/AUTOVON office totals.
DSNTG	48	DSN/AUTOVON trunk group (DSNTG); the same trunk groups allowed for section 12 (TG) will print for this section.
E911	148	Enhanced 911 (E911) measurements.
ECDN x	235	Expanded Customer Directory Number (ECDN) counts reported on a directory number (DN) basis (analog lines only) (5E12+). To allow/inhibit for collection ALW|INH:TRFC30,CLCT,ECDN To allow/inhibit for output ALW|INH:TRFC30,ROP,ECDN Request for immediate output OP:TRFC30,ROP,ECDN,DN=x-x-x-x-x-x (max of 6 DNs)

		A maximum of 250 DNs can be studied in an office, where all DNs studied can reside on any one SM. Up to 20 DNs under study may be allowed for ROP output.
EDSC	73	ISDN BRCS electronic directory customer counts. Enable groups using RC/V View 24.9 before allowing this section (or ALL) for collection.
EPCS x	236	Expanded Personal communications services directory number (EPCS) special study counts reported on a directory number (DN) basis (EPCS lines only). To allow/inhibit for collection ALW|INH:TRFC30,CLCT,EPCS To allow/inhibit for output ALW|INH:TRFC30,ROP,EPCS Request for immediate output OP:TRFC30,ROP,EPCS,DN=x-x-x-x-x-x (max of 6 DNs) A maximum of 250 PCS DNs can be studied in an office, where all DNs studied can reside on any one SM. Up to 20 DNs under study may be allowed for ROP output (5E12+).
FRPH x	193	Frame relay protocol handler (FRPH) counts. For CLCT, where 'x' equals the following: SM#-PSU#-SHLF#-CHGRP# A maximum of 80 FRPHs can be entered, six per request (5E10+).
HLSC	8	High-level service circuits (HLSC).
IA	6	Ineffective attempts (IA).
IBROFC	72	ISDN BRCS and Analog Office totals.
IC x	164	InterLATA carrier (IC) measurements. For ROP/OP, where 'x' equals FGRP-CIC#, the value FGRP may be either 'B' or 'D' for feature group B and D respectively. The value for CIC# is in the range 0 - 9999. A maximum of 10 carrier IDs can be entered.
ICL	37	Intra-RSM communication link (ICL) measures.
IDP x	31	Individual dialing plan (IDP) measures. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = IDP group, a maximum of five groups can be entered.
IDPIDB x	140	Integrated digital carrier unit (IDCU) directly connected peripheral interface data bus (DPIDB) counts.
ILINE x	141	IDCU line counts. For CLCT, where 'x' equals SM#-IDCU#-RT#-RTLINE#, a maximum of 512 lines can be entered, six per request. PREV (with ALW only) reactivates the previously allowed list of lines if PREV is the first ALW request after the list was inhibited. ALL (with INH only) inhibits all lines that were allowed for collection; the list of lines is saved. For ROP/OP, where 'x' equals one of the following: UNIT=SM#-IDCU#-RT#-RTLINE#

		HIGH=count# LOW=count# HILO=count# a maximum of six units or one count can be entered.
IODB x	142	IDCU on-demand B-channel (ODB) counts. For CLCT, where 'x' equals SM#-IDCU#, a maximum of one SM-IDCU pair can be entered.
IPIDB x	139	IDCU peripheral interface data bus (PIDB) counts.
IRT x	143	IDCU remote digital terminal (RT) counts. For CLCT, where 'x' equals one of the following (only one of the study sets can be active at one time): GROUP=SM#-IDCU# for allowing all RTs on an IDCU. A maximum of eight SM-IDCU pairs can be entered, eight per request. PREV (with ALW only) reactivates the previously allowed study set if PREV is the first request after an INH. ALL, with INH, inhibits whichever study set is allowed for collection. The study set is saved. ALL, with ALW, allows all existing (but not more than 800) RTs for collection. UNIT=SM#-IDCU#-RT# for allowing individual RTs. A maximum of 256 RTs can be entered, eight per request. For ROP/OP, where 'x' equals one of the following: UNIT=SM#-IDCU#-RT# HIGH=count# LOW=count# HILO=count# a maximum of six units or one count can be entered.
ISLU	49	Integrated services line unit (ISLU).
ISM [o]	53	ISDN switching module (ISM). For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count can be entered.
ISOFC	50	ISDN office totals (ISOFC).
ISPI [o]	51	ISDN packet interface (PI) (ISPI) <5E8-5E11>. Packet interface (PI) measurements (5E12+). For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count can be entered.
ISUP	120	ISDN user part (ISUP) office totals.
IPT	198	Intelligent peripheral trunks (IPT).

Copyright © 1999

		For CLCT, a maximum of 25 can be studied in an office using RC/V. If none is allowed for collection then inhibit collection will be set. For ROP/OP, execute: `ALW:TRFC30,rop,IPT` `OP:TRFC30,IPT` (5E10+).
LASS	76	Local area signaling services (LASS) office totals.

LGC x	145	Line group controller (LGC) measurements.
		
		For CLCT, where 'x' equals a study group (1-5). The members of an LGC study group consist of unique SM/ISLU(RISLU) pairs; however, the same SM/ISLU(RISLU) pairs may appear in multiple study groups. These SM/ISLU(RISLU) pairs are assigned to a study group using RC view 13.6 (up to 100 unique pairs per study group can be assigned). A maximum of five study groups can be allowed for collection.
		
		NOTE: If an LGC(s) becomes operational on any ISLU that is a member of a study group previously allowed for collection, the counts will not be generated on those additional LGC(s) until the study group is reallowed for CLCT.
		
		For ROP/OP, where 'x' equals one of the following:
		`UNIT=SM#-ISLU#-LGC#`
		`HIGH=count#`
		`HILO=count#`
		`LOW=count#`
		a maximum of six LGCs or one count can be entered.

LINE x	90	Per LINE measurements on a concentrator basis. Only lines with non-zero counts will be printed on the ROP.
		
		For CLCT: ([ALW|INH]:TRFC30,CLCT,),
		`LINE=SM#-line unit#-concentrator#`
		`ILA=SM#-line unit#-concentrator#-line#`
		
		LINE=ALL or ILA=ALL (with INH only) inhibits all lines and individual line assignments that were allowed for collection.
		
		A maximum of 20 concentrators and/or 128 individual line assignments (ILA) can be under study simultaneously. A maximum of eight concentrators or six ILAs can be entered with a single input message.
		
		This data can alternatively be entered using RC/V Views 13.4 and 13.5.
		
		Conversion chart CONC to grid and board:
		`conc 0 1 2 3 4 5 6 7 8`
		`grid 0 0 1 1 2 2 3 3 4`
		`board 0 1 0 1 0 1 0 1 0`
		
		`conc 9 10 11 12 13 14 15`
		`grid 4 5 5 6 6 7 7`
		`board 1 0 1 0 1 0 1`
		
		Conversion chart from line number to switch and level:
		`line num 0 1 2 3 4 5 6 7 8 9 10 11`
		`switch 0 0 0 0 1 1 1 1 2 2 2 2`
		`level 0 1 2 3 0 1 2 3 0 1 2 3`

		line num 12 13 14 15 16 17 18 19 20 21 switch 3 3 3 3 4 4 4 4 5 5 level 0 1 2 3 0 1 2 3 0 1 line num 22 23 24 25 26 27 28 29 30 31 switch 5 5 6 6 6 6 7 7 7 7 level 2 3 0 1 2 3 0 1 2 3
LN	121	Leased network (LN) office totals.
LU	11	Line unit (LU) measures.

MBG x	192	Multiswitch business group (MBG).
		
		For CLCT, `[ALW|INH]:TRFC30,CLCT,MBG=x-x-x-x-x-x-x-x-x` where 'x' equals multiswitch business group (MBG), a maximum of 20 can be studied in an office; nine can be entered with a single input request.
		
		For ROP/OP, execute:
		`ALW:TRFC30,rop,MBG`
		
		`OP:TRFC30,MBG`

MGSC	74	ISDN BRCS message service customer counts. Enable groups using RC/V View 24.11 before allowing this section (or ALL) for collection.
MGSG	75	ISDN BRCS message service multi-line hunt group counts. Enable groups using RC/V View 24.10 before allowing this section (or ALL) for collection.
MH	185	Message Handler (MH) measurements taken on a per MH basis only on SM2000 SMs. Measurements on all active MHs on the switch will be collected and reported.
MHPIPE	177	MH-QLPS pipe occupancy.
MLHG x	34	Multi-line hunt group (MLHG) measures. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = MLHG ID, a maximum of five IDs can be entered.
MMP	18	Module message processor (MMP).

MOD1 x	122	Miscellaneous per SM measurements (MOD1).
		
		For ROP/OP, where 'x' equals one of the following:
		`UNIT=SM#`
		`HIGH=count#`
		`LOW=count#`
		`HILO=count#`
		a maximum of six SMs or one count can be entered.

MSGS	19	Message switch (MSGS) controller.
NODE	146	Leased Network node-to-node traffic measurements for selective service trunk reservation (SSTR). In an FTS2000 office this section will always be allowed for CLCT (that is, cannot be inhibited). This section will be sent to the network servicing system (ANSER) using EADAS link. However, in a non-FTS2000 office this section will always be inhibited for CLCT (that is, cannot be allowed). This section is inhibited for ROP (that is, cannot be allowed) in every office.
NP	241	Number portability (NP) (5E12+).
NS	91	Number services (NS) office totals.
O800A	196	OSPS 800 Access (O800A) measures.
OATQ	109	OSPS *ANSI*® transaction capabilities application part (TCAP) query and reply measurements.

OCAS	110	OSPS customer account services (OCAS) measures.
OCAS7	135	OSPS customer account services common channel signaling System 7/international credit card validation signaling measures.
OCOIN	100	OSPS coin measurements.
OCTD x	103	OSPS centralized automatic message accounting (CAMA) tone decoder measurements. For ROP/OP, where 'x' equals SM#, a maximum of five SMs can be entered.
ODACCIN	134	OSPS directory assistance (DA) call completion and intercept measures.
ODBPSU x	221	On-demand B-channel - PSU Shelf counts (5E12+). For CLCT and ROP printing, enable components using RC/V View 13.7/13.8 before allowing this section for collection. A individual PSU shelf is defined as a SM#-PSU#-PSU_SHELF# and a maximum of 115 components can be requested. For OP request, where 'x' equals SM#-DNUS#-PSU#-PSU_SHELF#, a maximum of six units can be entered.
OEIS x	124	OSPS external information system (OEIS) data links measures. One measurement per EIS link with a maximum of 320 links. For ROP/OP, where 'x' equals one of the following: UNIT=EIS_ID#-LINKNO# HIGH=count# LOW=count# HILO=count# a maximum of six units or one count can be entered.
OFA	61	OSPS facility administration (OFA) measures.
OFC	3	Office (OFC) totals.
OFF	127	OSPS fast features (OFF) measures.
OINTA	97	OSPS interflow listing services/commercial-automatic call distributor (C-ACD) measures (OINTA). This was formerly titled OSPS interflow non-toll and assistance (T&A) calls sent measures (OINTA).
OIRCV	96	OSPS interflow T&A calls received (OIRCV) measures.
OISNT	95	OSPS interflow T&A calls sent (OISNT) measures.
OLAC	195	OSPS line applications for consumers (OLAC) signaling measures.
OMISC	123	OSPS miscellaneous calls measures.
ORTR	63	OSPS real-time rating (ORTR) query measures.
OSPS	44	Operator services position system measurements.
OSPSDL [o]	45	Operator Services Position System data links (OSPS-DL) directory assistance system/computer (DAS/C) and/or management information system/computer (MIS/C) measurements. For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of five SMs or one count can be entered.
OTA	64	OSPS miscellaneous calls.
OTAP	102	OSPS performance.
OVMS	168	OSPS voice messaging service (OVMS) measures.
OVOEQ	101	OSPS call volume and equipment usage.
PBG x	119	Packet business group (PBG) counts For ROP/OP, where 'x' equals one of the following: UNIT=PBG# HIGH=count# LOW=count# HILO=count#

Copyright © 1999

		a maximum of five PBGs or one count can be entered.
PC x	234	Message Transfer Part Point Code (PC) measurements (5E12+). For CLCT and ROP printing, enable one or more PC using RC/V View 13.7/13.8 before allowing this section for collection. A PC is defined as a GSM#-NETWORK#-CLUSTER#-MEMBER# and a maximum of 640 PC can be requested through RC/V. For OP request, 'x' is a PC and is identified completely by a: GSM#-NETWORK#-CLUSTER#-MEMBER# Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. A maximum of six line patterns can be entered.
PCSDN x	199	Personal communications services directory number (PCSDN) special study counts reported on a directory number (DN) basis (PCS lines only). For CLCT, 'x' equals the following: `=DN(7 digits)` = A maximum of six hyphen separated DNs can be entered with a single input request. A maximum of 48 PCS DNs can be studied in an office, where all DNs studied can reside on any one SM (5E10+).
PCSOFC	200	Personal communications services office (PCSOFC) total measurements.
PROC	15	Processor (PROC) performance.

PSGRP x	71	ISDN packet switching groups (PSGRP) for modem pooling and multi-line hunt groups. For ROP/OP, where 'x' equals one of the following:
		`UNIT=GRP#`
		`HIGH=count#`
		`LOW=count#`
		`HILO=count#`
		a maximum of six groups or one count can be entered.

PSODB x	105	ISDN packet switching on-demand B-channel (ODB) counts.
		
		For ROP/OP, where 'x' equals one of the following:
		`UNIT=SM#-ISLU#`
		`HIGH=count#`
		`LOW=count#`
		`HILO=count#`
		a maximum of six units or one count can be entered.

PSOFC	69	ISDN packet switching office (PSOFC) totals.

PSPH x	68	ISDN packet switching PH/DSLG (PSPH) counts.
		
		For ROP/OP, where 'x' equals one of the following:
		`UNIT=SM#-SHELF#-DSLG#`
		`HIGH=count#`
		`LOW=count#`
		`HILO=count#`
		a maximum of six units or one count can be entered.

PSPORT x	67	ISDN packet switching protocol handler (PH) port (PSPORT) counts. A port is identified completely by SM#-SHELF#-DSLG#-PORT# where SM values are in the range (1-192), SHELF values are in the range (0-4), DSLG values are in the range (0-15), and

		PORT values are channel numbers in the range (0-127). For CLCT, where 'x' equals one of the following (only one of the study sets can be active): SM#-SHELF#-DSLG# for allowing a DSLG. A maximum of one DSLG can be entered. SM#-SHELF#-DSLG#-PORT# for allowing arbitrarily selected ports. A maximum of 128 ports can entered, six per input message line. PREV (with ALW only) reactivates the previously allowed study set of arbitrarily selected ports if PREV is the first request after an INH. ALL (with inhibit only) inhibits whichever study set was allowed. If arbitrarily selected ports study set had been allowed then the list of ports allowed is saved; if a DSLG was allowed, nothing is saved. For ROP/OP, 'x' equals (only one is active at a time): UNIT=PORT# for up to six ports belonging to one DSLG. UNIT=SM#-SHELF#-DSLG#-PORT# for arbitrarily selected ports. a maximum of six ports can be selected. HIGH=count# LOW=count# HILO=count# a maximum of one count can be selected.
PSSM x	132	ISDN packet switching per switching module processor (PSSM) counts. For ROP/OP, where 'x' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count may be entered.
PSTG x	92	ISDN packet switching trunk group counts. For ROP/OP, where 'x' equals one of the following: UNIT=trunk group# HIGH=count# LOW=count# HILO=count# a maximum of six units or one count can be entered.
PSULNK x	197	Protocol handler for asynchronous transfer mode (ATM) link counts For ROP/OP, where 'x' = Near Community address (NCA)-Far Community Address (FCA) Maximum of 10 sets of IDs can be entered.
QANN x	42	Announcements for queuing (QANN) multi-line hunt groups. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = MLHG ID. For each ID entered for output, 5 records are output to the ROP (a maximum of 25 records).

		A maximum of five IDs can be entered.
QGP	175	QGP processor performance (QGP).
QMLHG x	40	Queuing for multi-line hunt group (QMLHG). Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = MLHG ID with queuing. A maximum of five IDs can be entered.
QPIPE	176	QLPS-QGP pipe occupancy.
QSF x	57	Queuing for simulated facility (QSF) groups. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = simulated facility group (SFG) ID. A maximum of five SFG IDs can be entered.
QTG x	55	Queuing for trunk groups (QTG). Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = trunk group ID, a maximum of five trunk group IDs can be entered.
RAS	93	Remote access services (RAS) measurements.
RDT x	224	DNU-S - RDT counts (5E12+). For CLCT and ROP printing, enable a RDT(s) using RC/V View 13.7/13.8 before allowing this section for collection. A RDT is defined as a SM#-DNUS#-RDT# and a maximum of 256 RDTs can be requested through RC/V. For OP request, 'x' is a RDT and is identified completely by SM#-DNUS#-RDT#. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. A maximum of six RDT patterns can be entered.
RDTDNU x	225	Digital networking unit - synchronous optical network (SONET) (DNU-S) - RDT DNU-S counts (5E12+). For CLCT and ROP printing, enable DNU-S(s) using RC/V View 13.7/13.8 before allowing this section for collection. A RDT is identified by a SM#-DNUS# and a maximum of 2 DNU-S can be requested through RC/V. For OP request, 'x' is a RDT and is identified completely by SM#-DNUS#-RDT#. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. A maximum of six RDT patterns can be entered.
RSIT	39	Remote site (RSIT) stand-alone measures.
RT	20	Remote terminal - DCLU.
RVPT [o]	25	Revertive pulsing transceivers (RVPT). For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count can be entered.
SAD [o]	4	System access delay (SAD)

		For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count can be entered.
SCCP x	233	Signalling Connection Control Part (SCCP) measurements (5E12+). For CLCT and ROP printing, enable one or more SCCP using RC/V View 13.7/13.8 before allowing this section for collection. A SCCP is defined as a GSM# and a maximum of 16 SCCP can be requested through RC/V. For OP request, 'x' is a SCCP and is identified completely by a: GSM# Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. A maximum of six line patterns can be entered.
SDN	94	Action control point for software defined networks.
SFG x	32	Simulated facility group (SFG) measures. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = SFG ID, a maximum of five IDs can be entered.
SG x	144	Switch group (SG) (also know as half-grid) measurements. For CLCT, where 'x' equals a study group (1-5). The members of an SG study group consist of unique SM/LU pairs; however, the same SM/LU pairs may appear in multiple study groups. These SM/LU pairs are assigned to a study group using RC view 13.6 (up to 100 unique pairs per study group can be assigned). A maximum of five study groups can be allowed for collection. ***NOTE:*** If an SG(s) becomes operational on any LU that is a member of a study group previously allowed for collection, the counts will not be generated on those additional SG(s) until the study group is reallowed for CLCT. For ROP/OP, where 'x' equals one of the following: UNIT=SM#-LU#-concentrator#-SG# HIGH=count# HILO=count# LOW=count# a maximum of six SGs or one count can be entered.
SH	194	Speech handler (SH) measurement counts (5E10+).
SMS [o]	22	Switching module system (SMS). For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count can be entered.
SL x	230	Message Transfer Part Signaling Link (SL) measurements (5E12+). For CLCT and ROP printing, enable one or more SL using RC/V View 13.7/13.8 before allowing this section for collection. A SL is defined as a GSM#-LSNUM#-MEMBER# and a maximum of 512 SL can be requested through RC/V.

		For OP request, 'x' is a SL and is identified completely by a: GSM#-LSNUM#-MEMBER# Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. A maximum of six line patterns can be entered.
SPA	98	Special access (SPA) measurement counts.
SQA x	58	Simulated facility group (SFG) queuing announcement (SAQ). Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = simulated facility group with queuing announcements, a maximum of five SFGs can be entered.
TD [o]	9	Tone decoders (TD). For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count can be entered.
TG x	12	Trunk group (TG) measures. For ROP/OP, where 'x' = identifiers of trunk groups (TGID). 'x' can be entered as a single number or as a list of up to five identifiers. It cannot be used with CLCT or TRFCH in an ALW or INH message.
TQA x	56	Trunk group queuing announcements (TQA). Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = trunk group ID, a maximum of five trunk group IDs can be entered.
TRFC15	2	Fifteen minute traffic report.
TRMG x	30	Terminal group (TRMG) measures. Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection. For ROP/OP, where 'x' = terminal group ID, a maximum of five IDs can be entered.
TU	14	Trunk unit (TU) measures.
TX [o]	60	Tone transceivers (TX). For ROP/OP, where 'o' equals one of the following: UNIT=SM# HIGH=count# LOW=count# HILO=count# a maximum of six SMs or one count can be entered.
UCONF	10	Universal conference (UCONF) circuits.
UTS	23	Umbilical time slot (UTS).
VLD	1	Validity (VLD) measures.

APP:TST-DSL

Software Release: 5E10 and later
Message Class: N/A
Application: 5
Type: Input

1. APPENDIX: TST:DSL INPUT MESSAGE

1.1 ABSTRACT

This appendix is intended to provide detailed information to support the TST:DSL input message. This appendix provides information which will be helpful for the experienced, as well as the new user.

NOTE: ISLU is supported only on SM where as ISLU2 is supported on both SM-2000 and the SM. It also should be noted that ISLU2 is supported in 5E10 and later releases. The term LCKEN and ISLU2 in this section is associated with 5E10 and later releases.

1.2 TEST PROCEDURE LIMITATIONS

A test procedure independent of the TST:DSL input message can test any digital subscriber line (DSL) or, more accurately, any basic rate interface (BRI). Presently, testing of DSLs is supported in all configurations of the integrated services line unit (ISLU) and integrated digital carrier unit (IDCU). In addition, testing DSLs of both custom and standard (layer 3) interface types is supported.

The types of DSL (layer 1) interfaces supported are the T-interface (T) and the U-interface (U). The U-interface DSLs (U-DSLs), are supported by alternate mark inversion (AMI) and 2 binary 1 quaternary (2B1Q) technologies. The 2B1Q version supports the standard defined by the *ANSI*®. For the remainder of this document and the TST:DSL output message manual, the term *ANSI*® will refer to the 2B1Q version.

For IDCU the equivalent of the ISLU line card (LC) is called a channel unit (CU). Throughout this message, the LC and IDCU CU will be collectively referred to as the line termination (LT). For ISLU2, 8 of these line terminations are integrated on a single pack called line board. Since there is no unique physical hardware associated with these for ISLU2, we associate ISLU2 with the term "line circuit". The term LC is allowed on input as a value for the TERM parameter; however, LT is preferred and will always be used in output messages and associated documentation.

Any TST:DSL request may be terminated using the STP:TST:DSL input message. The only exception is the IDCU CRC test, which as per specification, must execute until completion.

The following message formats indicate the parameters that apply to specific test types as used for ISLU and IDCU applications. If a parameter not shown within a specific format is used, the parameter will be optionally ignored (if the parameter is unneeded) or the request will be rejected (either partially or completely). The TST:DSL

1.3 ENTRY CRITERIA

Before a TST:DSL test request can be executed, specific conditions must be satisfied, most importantly, the DSL port to be tested must be adequately identified. For TST:DSL, the SM and internal port name are not currently accepted on input; therefore, other external identifiers must be used.

NOTE: The ports that are not assigned the accepted external identifiers cannot be tested using TST:DSL (such as, inter-SM ports).

A complete TST:DSL request can be generated by providing a DN or an OE number on an input. The following requests fully specify LPBK testing on all populated DSL channels (that is, using default parameters).

Copyright © 1999

```
TST:DSL,DN=X
TST:DSL,LCEN=A-B-C-D
```

If an OE number is entered and a CPE LPBK is intended or a USER mode test has been specified, a valid TEI must be entered. The following sections clarify the use of the accepted external identifiers.

1.3.1 Directory Number (DN)

The DN is the most complete external identifier that can be submitted. From the DN, the OE number and assigned TEI can be determined.

On a single-point/point-to-point DSL there can only be one active (CSV|CSD) user; therefore, the service order profile (USOP) can immediately be associated with an attached CPE. On a multi-point DSL there can be eight (CSV|CSD) users. Each user is associated with an attached CPE when a valid service profile identifier (SPID) is programmed into the CPE. The SPID contains the DN of the user; therefore, the appropriate service order profile (USOP) can be associated with the CPE.

1.4 Equipment Numbers (ILEN|LCEN|LCKEN)

The line termination equipment numbers (LCEN), the line circuit equipment number (LCKEN), or the IDCU line equipment number (ILEN) may be used to identify a particular DSL. This identifier is sufficient for single mode LPBK testing of particular DSL channels using any available termination (excluding the CPE) or to perform a mismatch or CRC test. These external identifiers are NOT sufficient when a particular DSL user must be identified.

In such cases, a valid TEI may be submitted (in addition), to complete the user/equipment identification.

1.4.1 Terminal Endpoint Identifier (TEI)

The TEI is used to identify a specific CPE that is attached to a DSL. Up to eight CPE may be simultaneously connected to a multipoint DSL. When a CPE is plugged in, the switch assigns a unique number to that CPE. The number, which can range from 0 to 126, is called a TEI. Each time a CPE is disconnected and then reconnected to the switch, a different TEI will be assigned.

The presence of a CPE on the T-interface is acknowledged when the switch assigns that CPE a TEI. If the CPE is plugged in and a TEI is not assigned, the CPE will be inoperative. The assigned TEIs can be obtained using the OP:CPE input message.

For TST:DSL, the primary purpose for using a TEI on input, is to identify a specific CPE for LPBK testing; however, the TEI can also be used to identify a particular user of the DSL, if the associated CPE is bound. If the CPE is cut off from the switch for a period of time, the CPE will request a new TEI. This can occur when long duration D-channel LPBK or metallic tests are performed.

1.4.2 CPE binding

Binding is the process of formally associating a particular USOP with individual CPE. When CPE is "bound", the customer is allowed to access a predefined set of subscribed services with that CPE. Specifically, the communication services for which the customer/user is periodically billed.

Binding on a single-point/point-to-point DSL occurs automatically, after the CPE is connected and assigned a TEI. This is possible because there can only be one active (CSV|CSD) user on this type of DSL.

On a multi-point DSL there can be eight (CSV|CSD) users. When CPE are connected, TEIs are assigned; however, the DSL users cannot be associated with specific CPE. Each user is "bound" to specific CPE when a valid SPID is programmed into the CPE. The SPID contains the DN of the user; therefore, the appropriate USOP can be

Copyright © 1999

associated with the CPE and on input, a OE number with a bound TEI can be used to derive the user DN. A CPE can be "bound" to set of "default services" (that is, if defined for the DSL). In this case, a specific DSL user has not been bound to the CPE.

1.5 CONCURRENT DSL ACTIVITIES

A TST:DSL procedure can coexist with other DSL maintenance procedures or customer calls. A TST:DSL procedure will only seize control (that is, take ownership) of DSL resources that are required to complete the specified test. For example, if TST:DSL is to evaluate the B1-channel, the D-channel and B2-channel may be free to process customer calls or perform other maintenance activities. Examples of other maintenance activities are RMV:LINE, RMV:CPE or another TST:DSL request.

When customer service must be blocked The customer impact associated with testing can be reduced or eliminated through the use of

1.5.1 DSL Resource Ownership

For TST:DSL, the scope of DSL ownership required is determined by the DSL channels to be tested, as well as the hardware that must be used. For digital LPBK testing, the hardware unit providing the LPBK termination may not be capable of looping back individual DSL channels. In such a case, all DSL channels must always be placed in LPBK; therefore, all DSL channels must be owned by the test procedure. Such a limitation would be evident when an individual channel is tested, as all DSL channels would be blocked for testing.

To determine the DSL ownership required for a test request, the capabilities of the unit providing the LPBK termination must be understood. This information is provided in the TST:DSL input manual for each unit, under the TERM parameter. Consider the port ownership required on an *ANSI*® DSL given the following test:

```
TST:DSL,DN=X,CH=D,TERM=NT1;
```

The input manual indicates that the *ANSI*® NT1 is capable of providing a LPBK on one or both B-channels or on all DSL channels. If the D-channel must be tested, all DSL channels must be looped back at the NT1; therefore, all DSL channels must be owned by the test procedure (albeit, only the D-channel is tested).

Testing on the D-channel will always require the test procedure to take ownership of all circuit switched (CS) B-channels. Call setup procedures are performed in-band on the D-channel; therefore, when the D-channel is tested, the CS B-channels cannot be used for customer calls. This is event given the following test:

```
TST:DSL,DN=X,CH=D,TERM=LT;
```

The input manual indicates that the LT is capable of providing a LPBK on any DSL channel or all DSL channels. In addition, a LPBK terminations may be selectively removed. The LT hardware attributes do not require that CS B-channels be owned by the test procedure; however, the "testing begins" message will indicate that CS B-channels are owned.

NOTE: If a PPB-channel is populated, it is not owned by the test procedure. The PPB service does not require use of the D-channel for call setup (signaling is in-band).

For *ANSI*® DSLs, the hardware units that provide LPBK terminations are resources that can be owned by a test procedure. If a test procedure owns the *ANSI*® NT1, subsequent procedures requiring control of the NT1 will camp-on (that is, wait in line) for ownership of that resource. Consider the following test sequence on an *ANSI*® DSL:

Copyright © 1999

```
TST:DSL,DN=X,CH=B1,TERM=NT1;
TST:DSL,DN=X,CH=B2,TERM=NT1;
```

The input manual indicates that for *ANSI*® NT1 requests to remove a LPBK condition, all DSL channels (looped back) will be affected. Given this hardware restriction, if both requests where allowed to proceed, the first request to complete would unloop the NT1 on all channels. To eliminate potential conflict, the second request will camp-on for ownership of the NT1.

On *ANSI*® DSLs, orders to provide LPBKs within specific units on the loop are transmitted on the embedded operations channel (EOC). This channel can only be used by one procedure at a time; therefore, to allow other procedures access, the EOC resource is released after use. For LPBK testing the EOC is owned only while a request to establish or remove a LPBK is in progress. Consider the following sequence of maintenance requests that will run concurrently:

```
TST:DSL,DN=X,TEST=CRC;
TST:DSL,DN=X,CH=B1,TERM=CU3;
TST:DSL,DN=X,CH=B2,TERM=LT;
TST:DSL,DN=X,TEST=CRC,DUR=0,V;
```

In the above test sequence, a CRC test, a B1 CU3 LPBK test, a B2 LT LPBK test, and the PM counts at the CUs and LT are being read concurrently. In this case, to avoid EOC camp-on, reading the PM counts at the CUs would have to be done last, as the use of the EOC is required for the duration of the PM read. The other tests only need the EOC for a short period of time.

In general, if required DSL resources are unavailable (such as, B-channel, NT1, EOC, and so forth), the associated maintenance procedure will camp-on for ownership.

1.5.2 AMI N-Channel

The N-Channel is used to communicate with transmission equipment on the AMI DSL loop. Specifically, TST:DSL uses the N-channel to communicate with the NT1 and populated CUs. The implementation of the N-channel is similar to other AMI DSL channels; however, the N-channel is used solely for maintenance purposes.

The N-Channel supports setting up and removing LPBKs and to administer the layer 1 protocol.

1.5.3 *ANSI*® Embedded Operations Channel (EOC)

The EOC is used to communicate with *ANSI*® NT1s and CUs. The implementation of the EOC is similar to other *ANSI*® DSL channels; however, the EOC is used solely for maintenance purposes.

The EOC is used to set up LPBKs, reset PM counts, read PM counts, request bad CRC from the NT1, remove LPBKs, turn off the request for bad CRC, and perform a CU PM interval freeze operation (that is, shift the "current" PM counters to the "previous" PM counters in the CU and then reset the "current" PM counters in the CU).

Concurrent testing at the NT1 and CUs for *ANSI*® U-DSLs is possible because the EOC operations are held active by the NT1 or CU. Once the operation is active, the EOC is available for other operations. For AMI U-DSLs, N-channel operations at the NT1 and CUs can only be held active by the LT. This ties up the N-Channel for the duration of the operation. Thus, concurrent operations at the NT1 or CU for AMI U-DSLs are not possible.

1.5.4 EOC Camp-on

The EOC channel is generally used for very brief periods to set up or tear down an operation. The EOC is a system resource. As such, each test must wait its turn to gain access to it. Most operations only require use of the EOC for a few seconds. Reading CU PM counts, however, nominally takes about 25 seconds (the time to read current and previous PM counts for 6 CUs). This means other tests may camp on for use of the EOC. If the camp-on is required to set up a test, a camp-on message will be printed. If the camp-on is required to end a test, a camp-on message is not printed. However, if the camp-on fails in this later case, a failing test status "CANNOT RE-GAIN EOC RSC" is printed. In critical cases (like LPBKs), the test will preempt for the EOC so that the LPBK can be removed. An INTERRUPT string is printed on the TST:DSL output message to indicate that a test could not terminate normally. The TST:DSL output message manual specifies procedures for handling these situations.

Even if the EOC channel is idle, some tests cannot be run at the same time because they require the same system resources for the duration of the test. For example, a B1 LPBK at the NT1 and the LT is not possible as they require the same B-channel resource. In these cases, the tests will camp-on for the specified CAMP time.

1.6 LOOP-BACK TESTING

Depending on the options selected, this message will perform a digital loop-back (LPBK) test on all the assigned D- and B-channels or only a single assigned channel.

1.6.1 LPBK Terminations (TERM)

A LPBK test is performed by first establishing a LPBK at the specified termination. The termination is entered with the TERM option. Then test data is transmitted over the channel(s) to be tested. The returned data from the LPBK is verified and the test results are printed.

A LPBK termination may be placed at the assigned protocol handler (PH), the DSL LT, channel units (CU1 to CU6), the network termination 1 (NT1), or the customer premises equipment (CPE). Testing to externally applied LPBK terminations at the customer premises is also supported.

1.6.2 Acceptable Bit Error Rate (ABER)

The pass/fail criteria of any CS digital test may be modified using the acceptable bit error rate (ABER) input parameter. This parameter is particularly useful when using the sectionalization (SECT) option to do fault isolation (refer to the FAULT ISOLATION TESTING section below for details).

The ABER is not used to specify the pass/fail criteria for PS digital tests. For PS tests, the pass/fail criterion is fixed. If fewer than 98% of the transmitted packets are received without error, then the test is considered failed.

1.6.3 Protocol Error Record (PER) Interactions

When performing any form of loopback testing, the generation of PERs will be inhibited for the duration of the test. After the test has been completed, PER generation will remain inhibited for a period of three to six minutes. Use the ALW:ALE input message to allow PER generation prior to the expiration of this period.

1.7 FAULT ISOLATION TESTING

Three distinct testing modes are possible. These modes determine how many terminations are to be used during testing:

- Default (single termination used)
- Sectionalization (SECT - all terminations may be used)
- Sequential (SEQ - all terminations may be used)

Copyright © 1999

The default mode tests the single termination (that is, CPE, NT1, CUs, LT, or PH) specified. The remaining two modes test multiple terminations.

1.7.1 Elapsed Testing Time

The maximum duration for each termination of a SECT or SEQ test is one hour. Therefore, the maximum elapsed time for a SECT or SEQ test is ten hours. This is the time to test all possible terminations (CPE, NT1, CU6, ..., CU1, LT, and PH).

1.8 MISMATCH TEST

The mismatch test (TEST=MSMTCH) will detect a mismatch of an LT and the first metallic termination beyond the LT on U-DSLs. This test is used to ensure compatibility between the LT and the first unit (CU or NT1) connected to the LT. This message cannot be used to detect NT1 mismatches when CUs are present.

The mismatch test also tests for loop resistance that is too high or too low between the tip and ring of the LT connected to the first metallic termination (NT1 or CU), and the mismatch test tests for loop resistance that is too low between tip and ground or ring and ground.

For AMI U-DSLs, the mismatch test will also detect a tip and ring reversal at the NT1 (when no CUs are present). Tip and ring reversals at CUs do not matter.

Mismatch detection is possible even if the first termination (NT1 or CU) is powered down (but still connected to the loop).

1.8.1 Mismatch Testing Performed After Certain Loop-backs.

There are many conditions that can cause layer 1 (U-interface) to be down. These include certain metallic loop faults, NT1 "quiet mode", faulty equipment (NT1, CUs, LT), "mismatch", etc. Since some of these conditions are checked by the mismatch test, the mismatch test is automatically run whenever layer 1 is found down at the U-interface and a LPBK of all channels has been requested at an NT1 or CU. Any problems found by the mismatch test will be printed on the ROP.

As a positive indication that the mismatch test was run as part of a LPBK test, a "test qualifier" of the form (MMT xxxx) is printed. Refer to the TST:DSL output message for details.

1.8.2 Mismatch Test Results

For cases when the mismatch test detects high or low loop resistance, it is recommended that voltage, resistance, and capacitance metallic tests be run on the loop to determine the specific characteristics of any metallic loop fault that may be present. Metallic loop tests are available using mechanized loop testing (MLT) systems, or they are available from the trunk and line work station (TLWS) metallic testing menu 5600/5700 (5E10+).

1.8.3 Mismatch Condition - Exists

If the mismatch test determines that an LT or NT1/CU mismatch exists, then the out-of-service port status will be changed to reflect the mismatch condition.

1.8.4 Mismatch Condition - Does Not Exist

If the mismatch test determines that a mismatch does not exist but layer 1 at the"U-interface is down", then the out-of-service port status may be changed to indicate that the "NT1 power is lost" or the "U-interface is down". The choice depends on two things:

- What the port status was prior to running the mismatch test and

- Whether the mismatch test found that the loop between the LT and the first metallic termination (NT1 or CU1) was open or connected.

If the out-of-service port status was "dying gasp under study" and the loop was "connected", then the dying gasp is assumed to have been received from the NT1 due to a loss of power to the NT1. For this case, the port status will be changed to "NT1 power is lost". If the loop is faulty (that is, one that is not properly connected or one that is opened), it is assumed that any information (dying gasp or otherwise) cannot be received from the NT1. For this case, the "dying gasp under study" indication will be replaced with "U-interface is down", as the dying gasp is assumed to have been erroneously generated from the faulty loop.

The technique used by the mismatch test to evaluate the out-of-service "dying gasp under study" port status works even when BRITE CUs are equipped on the U-DSL. This is because the BRITE CU will ignore any dying gasp indication at the instant that it detects a faulty loop (for example, the loss of the U-interface between the NT1 and the last CU). This means that if a proper connection exists between the LT and CU1, then any dying gasp indication received by the LT from CU1 must have originated from the NT1 prior to the loss of the U-interface.

If the port status was "Mismatch", then the port status would be changed to "U-interface is down". If the port status was anything else, then the port status would be unchanged.

The key is that the out-of-service port statuses (that is, dying gasp under study, NT1 power is lost, mismatch, and U-interface is down) indicate that the U-interface is down. The "NT1 power is lost" signifies that the loss of the U-interface is likely due to customer premises equipment (that is, NT1) problems rather than network (that is, 2-wire loop, CU or LT) problems. Other statuses may indicate customer premises equipment (that is, CPE or NT1) or network equipment problems.

NOTE: "U-interface is down" includes the out-of-service port statuses of UINTF, LINKx, TESTx, NTPWR, and so forth. Refer to the APP:PORT-STATUS appendix in Appendixes section of the Output Message manual for more information.

1.9 CORRUPT CRC TESTING

The PM freeze interval boundary refers to the PM report interval defined on the RC/V View 8.1 (OFFICE PARAMETERS). The LT current hour PM counts are flagged as corrupt. There is no way to indicate when the CU PM counts are corrupt.

The PM counts are left with the values at the end of the test. This is to allow the PM counters to be read again if desired. The user can clear these PM counts if it is not desirable for performance monitoring to continue based on the values of the counters at the end of the test. The EXC:ALE-RESET input message can be used to clear the PM counts.

The CRC testing procedure includes the following operations:

- Clears the CU interval PM counts (current and previous),
- Clears the LT hour PM counts (current only),
- Marks the current hour LT PM counts as corrupt,
- Sends bad (corrupted) CRC downstream,
- requests the NT1 to send bad CRC upstream (the NT1 must be functional for the CRC test to work),
- Prevents the hourly and interval PM freeze from occurring on this DSL should the CRC test cross a

PM freeze (hour or interval) boundary while the test is running,

- Runs the test for the duration (DUR) specified then stops the test (that is, stop sending bad CRC to the NT1 and requests that the NT1 stop sending bad CRC to the switch), and
- Reads the PM counts and prints the results,
- The PM counts are left with the values at the end of the test.

1.9.1 Interpreting CRC Test Results

The corrupt CRC test results are output in tabular format detailing both the previous and current hour PM counts for the LT. If the V (verbose) parameter is selected, counts will be printed for each equipped channel unit. The PM counts for the upstream direction (that is, NT1 to the LT) and the downstream direction (that is, LT to the NT1) of transmission include numerical results for block errors (BE), severe errored seconds (SES) and errored seconds (ES).

The LT previous hour PM counts, which are displayed on output, will not be modified by the CRC test. In addition, the CU previous interval PM counts should remain at zero. The current PM counts at the LT and CUs will vary based on the duration (DUR) of CRC testing.

The CRC test generates one BE for every *ANSI*® superframe (12 milliseconds) transmitted upstream and downstream. This means that the BE counter will accumulate at a rate of 83.3 block errors per second. The ES counter will increment once for every second the test runs. The BE count should be approximately 83.3 times the ES count. The ES and SES should be very nearly equal (refer to the WARNING below).

A severely errored second (SES) occurs when a given number of bit errors (BE)s occur in one second. For CUs, the allowable number of BEs is fixed at 3/sec. For LTs, the number of allowable BEs/sec is recent changeable [refer to RC/V View 8.1 (OFFICE PARAMETERS)]. The CU SES counts and the LT SES counts can only be correlated, if the allowable BEs/sec is the same in each case.

1.9.2 Reading PM counts

If a CRC test duration is specified to be zero seconds, no CRC test will take place; however, a the PM counts will be read and output. This is useful for obtaining the current PM counts prior to testing or obtaining the counts associated with a CRC test that has just previously been run. The success/failure STATUS associated with reading of the PM counts is output, in addition to the equipped channel units and the elapsed time (ET) taken to read the CU PM counts. The presence of a satellite link may be deduced using the ET output parameter, as the ET will be greater when a satellite transmission link is present.

The PM counts at the CU or LT are not altered by this request. The EXC:ALE input message may also be used to read the PM counts.

1.9.3 CRC Testing and PM Alerts

The purpose of CRC testing is to verify that the performance monitoring (PM) counters at the LT and the CUs can detect and maintain a record of BEs. In addition, if the reporting of PM alerts has been turned on, a PM alert (REPT ALE LEVEL 1 output message) should be triggered if the CRC test duration (DUR) is long enough to cause an LT PM count threshold to be reached.

There are several reasons why it may not be possible to trigger a PM alert. In general, alerts will not be fired if PM has been turned off or an alert has already been triggered. Only one PM alert can be triggered per hour (for hourly alerts) and only one PM alert can be triggered per day (for daily alerts). A CRC test cannot be used to trigger an alert, if the alert has already been triggered for the associated day or hour. Once PM has been turned off, PM counts

Copyright © 1999

will not be incremented; therefore, PM will not be triggered. The PM can be turned off on a specific LT for the following reasons:

- U-interface is down at the LT (port status states: UINTF, MSMTCH, etc.).
- The LT is out-of-service (OOS).
- U-DSL D-channel has been manually removed OOS.
- The DSL is unassigned.
- PM has been turned off for the PM group [RC/V View 22.15 (PM THRESHOLD GROUP)].
- PM has been turned off for the SM with the INH:ALE input message using the `LEVEL1,SM=a` options.
- PM has been turned off for the Office [RC/V View 8.1 (RC OFFICE PARAMETERS)].

The PM threshold information is available in the following recent change (RC) views:

- RC/V View 22.15 (PM - THRESHOLD GROUP) shows the PM threshold values for a specific PM group.
- RC/V View 23.2 (DIGITAL SUBSCRIBER LINE - NON BRCS), RC/V View 23.8 (DSL/BRCS ASSIGNMENT) shows the PM group assigned to a specific U-DSL.
- RC/V View 22.7 (ISLU LINE CARD) shows the PM group assigned to a specific U-DSL.

1.10 EQUIPPED CHANNEL UNITS

It is not possible to determine the presence of AMI CUs, as there is no internal record of CUs and the switch interface does not support responses to CU requests; however, the *ANSI*® U-DSL interface standard allows all requests to be acknowledged.

For *ANSI*® U-DSLs, the presence of CUs is detected by polling for each possible CU. In general, the number equipped CUs (EQCU) is provided in the output for all test types.

If the EQCUs cannot be determined, the EQCU output will indicate the faulty portion of the transmission link. For example, if the U-interface beyond CU2 is down, then the equipped CUs cannot be determined; however, information will be output to identify link two as faulty (that is, EQCU=LINK2). This information is similar to the port status information provided by the OP:ST-PORT output message. Refer to the TST:DSL output message for details.

APP:UT-IM-REASON

Software Release: 5E10 and later
Message Class: N/A
Application: 5
Type: Input

1. APPENDIX: EXPLANATION OF RESPONSES

The following is a list of system responses that are used with many of the *5ESS*®-2000 switch generic utilities (UT) input requests. The acknowledgements are used when the syntax of a request is valid, but the request has been denied. Additional information is printed out to explain why the request was denied. Not all responses apply to all requests.

`IP` = In progress. The request was received at the destination and initiated.

`NA` = No acknowledgment. A symbolic look-up is in progress for a unit serviced by the generic utilities input requests. The request is being held in the buffer and will be acted upon when the symbolic look-up has been completed.

`NG` = No good. The request syntax is valid but the request conflicts with current system or equipment status.

`NG - CM ISOLATED FROM AM` = The input request can not be sent at this time because the AM is isolated from the CM. This situation affects all of the UT manually entered input requests. The request must be run again after communications are re-established.

`NG - COMMAND MUST BE PART OF A CLAUSE` = The input request must be part of a clause. The request can not stand alone.

`NG - COMMAND NOT ALLOWED FOR UNIT TYPE` = The request can not be used for this type of unit.

`NG - COULD NOT RECOGNIZE MESSAGE` = This request was passed to the UT controlling process but the structure is not recognized by the UT code.

`NG - INTERNAL ERROR` = Requests to this processor must be immediate requests and not part of a clause.

`NG - ILLEGAL FPC NUMBER` = The requested FPC number does not exist.

`NG - ILLEGAL MMP NUMBER` = The requested MMP number does not exist.

`NG - ILLEGAL PCR NUMBER` = The requested processor does not exist or is not in a valid state for operation.

`NG - ILLEGAL PPC NUMBER` = The requested PPC number does not exist.

`NG - ILLEGAL SM NUMBER` = The requested SM does not exist or is not in a valid state for operation.

`NG - NO OPERATIONAL PCR IN SPECIFIED RANGE` = The requested range of processors does not contain any units which have an operational or special grow state.

`NG - NO OPERATIONAL SM IN SPECIFIED RANGE` = The requested range of SMs does not contain any operational or special grow SMs.

`NG - PCR DOES NOT MATCH PCR IN THE PREVIOUS COMMAND` = This request, being part of a clause, must be sent to the same processor as the request that preceded it.

Copyright © 1999

`NG - SM DOES NOT MATCH SM IN PREVIOUS COMMAND` = The syntax for the request is correct but a series of requests is being entered at this terminal for a different SM. The clause is still active and waiting to be finished and this request has not been included in the clause.

`NG - SM NOT SPECIFIED` = This request is part of a clause but is not being allowed because the SM number is not indicated. The request needs to be re-entered with the desired SM number.

`OK` = The request syntax is correct, the processor is available, and the request has been accepted and will be processed.

`PF` = Printout follows. A corresponding output message will follow in response to the request.

`RL` = Retry later. System resources could not be allocated to process the request.

`RL - ANOTHER TERMINAL IN MIDDLE OF CLAUSE` = The requested processor is being set-up with a clause from another terminal.

`RL - PCR IS ISOLATED` = The requested processor is valid but communications were not established at the time of the request.

`RL - SM IS ISOLATED` = The requested SM is a valid processor but communications were not established at the time of the request.

`ERROR` = The request syntax was correct but UT does not recognize the request.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts actions on the bootstrapper board (BTSR) at the specified location.

WARNING: This message causes the intended process to be purged. It also causes an SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]BTSR=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the BTSR). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.
- `TST` = Test.

`b` = Switching module (SM) number.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. Followed by ABT:BTSR output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts maintenance actions on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]CDFI=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the CDFI). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number.

`c` = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = CDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:

```
NOT STARTED UNIT IN GROWTH STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

`PF` = Printout follows. An ABT:CDFI output message follows in response to the request.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ABT:CLNK

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts actions on the specified communication link (CLNK).

2. FORMAT

```
ABT:a,CLNK=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted. The default is the action previously requested on the specified unit. Valid value(s):

- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number.

`c` = Office network and timing complex number.

`d` = Type of module message processor (MMP). Valid value(s):

- `0` = MMP that handles the even control time slot associated with the SM.
- `1` = MMP that handles the odd control time slot associated with the SM.

`e` = Message switch (MSGS) number.

4. SYSTEM RESPONSE

`NG` = No good. Request was invalid.

`PF` = Printout follows.

ABT:CMP

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on a communication module processor (CMP) be aborted (ABT).

WARNING: This message causes the CMP action to be killed. It is recommended that the stop (STP) verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]CMP=b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted. Valid value(s):

`DGN`	= Diagnose. (Not valid for CM3)
`EX`	= Exercise. (Not valid for CM3)
`RST`	= Restore.

Note: The default is all actions currently waiting or executing on the CMP.

`b` = Message switch side number.

`c` = CMP number.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has been completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:DFIH

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts maintenance actions on a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH).

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]DFIH=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted. Valid value(s):

`DGN`	= Diagnose.
`EX`	= Exercise.
`RMV`	= Remove.
`RST`	= Restore.

NOTE: The default is the action currently executing on the DFIH.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = RISLU digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

```
CONFLICT WITH UNIT STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

`PF` = Printout follows. An ABT:DFIH output message follows in response to the request.

ABT:DFTAC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that currently running actions be aborted without cleaning up on the distributing frame test access circuit (DFTAC).

This input message should be used only if STP:DFTAC has been attempted and has failed to terminate the previous action. Since both hardware and data may be left in an invalid state as a consequence of the ABT:DFTAC message, a number of other outputs, such as audits and asserts, may follow.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[e,]DFTAC=a-b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module number.

`b` = MSU number.

`c` = Service group.

`d` = Circuit number.

`e` = The action to be aborted. Valid value(s):

```
DGN
EX
RMV
RST
```

4. SYSTEM RESPONSE

`NG` = No good. Invalid SM number, MSU number, or service group number.

`PF` = Printout follows. Followed by ABT:DFTAC output message.

`RL` = Retry later. The request cannot be executed now (that is, SM is not linked).

ABT:DIST

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the distribute point board (DIST) at the specified location be aborted.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]DIST=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted. The default is the action currently executing on the distribute point board.
Valid value(s):

`DGN`	= Diagnose.
`EX`	= Exercise.
`RMV`	= Remove.
`RST`	= Restore.

`b` = Switching module number.

`c` = Metallic service unit number.

`d` = Service group number.

`e` = Distribute point board number.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:DIST output message.

ABT:DLI

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts an action on a specific dual link interface (DLI) or range of DLIs in the specified office network and timing complex (ONTC).

'Abort' is differentiated from 'stop' by the action of the request. An abort action is immediate and without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (that is, the end of a phase) and will attempt to leave the hardware in a sane state.

NOTE: An 'ABT' should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]DLI={b|b&&c}-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is any action currently waiting or executing on the DLI). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RST` = Restore.

`b` = Number of the switching module (SM) that the DLI is on. Also specifies the lower limit for the range of DLIs that is to be aborted, where the DLI number is equivalent to the SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Upper limit of a range of DLIs to be aborted.

`d` = ONTC side that the DLI is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:DNUSCC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that maintenance actions be aborted on a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC).

NOTE: Execution of this message may require further action to put the unit into a sane state. Refer to the References section of this message.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of other asserts and audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]DNUSCC=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (default is the action currently executing on the DNUSCC). Valid value(s):

- `DGN` = Diagnose.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Digital networking unit - synchronous optical network (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. An ABT:DNUSCC output message will follow.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ABT:DNUSEOC

Software Release: 5E12 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT). This message is applicable for TR303 RTs (that is, AT&T Series 5 RTs running Feature Package 303G) terminating on an digital networking unit - synchronous optical network (DNU-S).

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]DNUSEOC=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (the default action is the action currently executing on the DNUSEOC). Valid values are:
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. An ABT:DNUSEOC output message will follow.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ABT:DNUSTMC

Software Release: 5E12 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT). This message is applicable for TR303 RTs (that is, AT&T Series 5 RTs running Feature Package 303G) terminating on a digital networking unit - synchronous optical network (DNU-S)

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]DNUSTMC=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (the default action is the action currently executing on the DNUSTMC). Valid value(s):
- `RMV` = Remove
- `RST` = Restore

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = TMC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. An ABT:DNUSTMC output message will follow.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E10 - 5E11
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that maintenance actions be aborted on a digital networking unit - synchronous optical network (DNU-S) digital signal level 1 facility (DS1SFAC).

NOTE: Execution of this message may require further action to put the unit into a sane state. Refer to the REFERENCES section of this message.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of other asserts and audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]DS1SFAC=b-c-d-e-f;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (default is the action currently executing on the DS1SFAC). Valid value(s):
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`f` = Virtual tributary level 1 (VT1) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. An ABT:DS1SFAC output message will follow.

ABT:EOC

Software Release: 5E10 - 5E11
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT). This message is applicable for TR303 RTs (that is, Series 5 RTs running feature package 303G) terminating on an integrated digital carrier unit (IDCU).

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]EOC=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (the default action is the action currently executing on the RT EOC). Valid value(s):
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. An ABT:EOC output message will follow.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ABT:FAC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests abort of maintenance actions on a remote switching module (RSM) facility (FAC) or a trunk FAC.

A remote switching module (RSM) FAC can be a host-remote facility between a host switching module (HSM) and an RSM, or a remote facility between two RSMs. A trunk FAC is a inter-office trunk.

WARNING: This message causes the intended process to be purged. It also causes an SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]FAC=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the FAC). Valid value(s):

- `RMV` = Remove.
- `RST` = Restore.
- `TST` = Test.

`b` = Switching module (SM) number.

`c` = Digital line and trunk unit (DLTU) number.

`d` = RSM digital facilities interface (RDFI) number, inter-RSM communication link digital facilities interface (CDFI) number, or inter-office trunk DFI number.

`e` = Facility number. The FAC number is the T1 facility number on a RDFI, CDFI, or DFI. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:

```
NOT STARTED UNIT IN GROWTH STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

Copyright © 1999

PF = Printout follows. An ABT:FAC output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

ABT:FPC

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts actions on the specified foundation peripheral controller (FPC).

'Abort' is differentiated from 'stop' by the action of the request. An abort action is immediate, not caring about the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (that is, the end of a phase) and will attempt to leave the hardware in a sane state.
Note: Abort should only be used if the STP:FPC input message fails.

2. FORMAT

```
ABT:[a,]FPC=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted. The default is any action currently waiting or executing on the specified unit.
Valid value(s):

`DGN`	= Diagnose. (Not valid for CM3)
`EX`	= Exercise. (Not valid for CM3)
`RST`	= Restore.

`b` = FPC number.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:GKCCR

Software Release: 5E10 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests that any currently running generated key collection and compression routine (GKCCR) processes be aborted in specified processors. Either specific processors can be specified or no processors can be specified. If no processors are specified, then the GKCCR will be aborted on every processor.

ABT:GKCCR aborts GKCCR whether the GKCCR was invoked automatically or manually. Automatic GKCCR runs periodically unless GKCCR is inhibited using the INH:GKCCR input request. Manual GKCCR runs as a result of the EXC:GKCCR input request.

No data corruption will occur as a result of the abort. The GKCCR processes are purged immediately and the user should not expect to see any subsequent EXC:GKCCR or REPT:GKCCR output messages from the purged GKCCR processes.

Any queued manual GKCCR requests are de-queued for the specified processors.

2. FORMAT

```
ABT:GKCCR[,SM=a[&&b]][,CMP=c[-{PRIM|MATE}]][,AM];
```

3. EXPLANATION OF MESSAGE

`MATE` = Mate CMP.

`PRIM` = Primary CMP.

`a` = Switching module (SM) number or the lower limit of a range of SM numbers.

`b` = The upper limit of a range of SM numbers.

`c` = Communications module processor (CMP) number.

4. SYSTEM RESPONSE

`NG` = No good. The input request is invalid. May also include:

`- NO VALID PROCESSOR SPECIFIED` = Specific processor(s) were specified in the input request line but no requested processor was operational. If specific processors are to be requested, at least one requested processor must be operational.

`PF` = Printout follows. The request was accepted. An ABT:GKCCR output message will report the status of the request.

ABT:GRID

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the gated diode crosspoint (GDX) grid be aborted at the specified location.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]GRID=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (the default is the action currently executing on the GDX grid). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.
- `TST` = Test.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:GRID output message.

ABT:GRIDBD

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts the scheduled action on the line unit model 2; (LU2) or line unit model 3; (LU3) grid board.

WARNING: This message causes the intended process to be purged. It also causes an SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]GRIDBD=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the GRIDBD):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.
- `TST` = Test.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Grid number (LU2). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Grid number (LU3). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. Followed by an ABT:GRIDBD output message.

ABT:HDFI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that maintenance actions on the host switching module (HSM) digital facilities interface (HDFI) circuit be aborted. This message results in a process purge in the HSM.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]HDFI=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted. If the action being aborted is a conditional removal of an HDFI, there is a corresponding conditional removal of the T1 facility (T1FAC) in the remote switching module (RSM) being processed. The T1FAC action in the RSM may be manually aborted if desired. Default is the action currently executing on the HDFI. Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number.

`c` = Digital line and trunk unit (DLTU) number.

`d` = HDFI number.

4. SYSTEM RESPONSE

`NG` = No good. Request denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:HDFI output message.

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Request the actions be aborted on an integrated services line unit line card (ISLULC).

NOTE: Execution of this message may require further action to put the unit into a sane state. Refer to the References section of this message.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]ISLULC=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted. Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

NOTE: The default is the action currently executing on the ISLULC circuit.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. An ABT:ISLULC output message will follow.

ABT:LI

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts a diagnostic or exercise on the link interface (LI) subunit of the specified office network and timing complex (ONTC).

"Abort" is differentiated from "stop" by the action of the request. An abort action is immediate and without regard to the state of the hardware, while "stop" will wait for a "clean" point of termination, (that is, the end of a phase) and will attempt to leave the hardware in a sane state.

NOTE 1: This message is only valid for offices with communication module model 1; (CM1) hardware.

NOTE 2: An 'ABT' should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]LI=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is any action currently waiting or executing on the LI). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.

`b` = Side of the ONTC that the LI is on.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:LIB

Software Release: 5E10 and later
Command Group: ADMIN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts the library program in the administrative module (AM) and/or switching modules (SMs) as specified, and the scratch area used in the SM for the library program is released.

WARNING: This input message can leave the resources used by the library program in an unknown state. It should only be used when a normal STP:LIB input message fails.

2. FORMAT

```
ABT:LIB:TEAM=a[,AM][,SM=b|,SM=c&&d];
```

3. EXPLANATION OF MESSAGE

`a` = Team number (1-15) to which this input message applies. This number is specified in the LOAD:LIB input message, and is used so that more than one person may test at the same time, using different team numbers.

`b` = SMs that this message should be directed to. The team specified must have a library program running in the SM(s) listed. There can be up to five SM numbers listed. A range could be used instead, as indicated.

`c` = The optional first SM in the range '`c`' to '`d`'.

`d` = The optional last SM in the range '`c`' to '`d`'.

NOTE: If neither the AM or any SMs are specified, the ABT:LIB message is sent to the AM and all SMs with clients loaded under the same team as those specified.

4. SYSTEM RESPONSE

`NG` = No good. Either the team number or SM number(s) is illegal. SMs that have not initialized cannot be sent messages.

`PF` = Printout follows. Message has been sent to the SMs/AM or team specified.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the line unit common control (LUCOMC) be aborted at the specified location.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]LUCOMC=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (the default is the action currently executing on the LUCOMC). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:LUCOMC output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the line unit high level service circuit (LUHLSC) be aborted at the specified location.

WARNING: This message causes a specified action to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]LUHLSC=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (the default is the action currently executing on the LUHLSC). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = High-level service circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:LUHLSC output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the metallic access (MA) circuit be aborted at the specified location.

WARNING: This message causes the specified action to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]MA=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (the default is the action currently executing on the MA circuit). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Metallic access board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

ABT:MI

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts a diagnostic or exercise on the message interface (MI) on the specified office network and timing complex (ONTC).

Abort is differentiated from stop by the action of the request. An abort action is immediate, without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination (such as, the end of a phase), and will attempt to leave the hardware in a "sane" state.

NOTE: Abort should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]MI=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is any action currently waiting or executing on the MI). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.

`b` = Side of ONTC that the MI is on.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:MICU

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that a diagnostic or exercise be aborted on a message interface and clock unit (MICU) subunit of the office network and timing complex (ONTC).

2. FORMAT

```
ABT:[a,]MICU=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the MICU). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.

`b` = Side of ONTC that the MICU is on.

4. SYSTEM RESPONSE

`NG` = No good. The message format was correct but the request conflicts with current status.

`OK` = Good. The action will be aborted.

ABT:MMP

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that actions on the specified module message processor (MMP) be aborted.

Abort is differentiated from 'stop' by the action of the request. An abort action is immediate, without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (for example, the end of a phase) and will attempt to leave the hardware in a sane state.
Note: Abort should only be used if an 'STP' message fails.

2. FORMAT

```
ABT:[a,]MMP=b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted. The default is any action currently waiting or executing on the specified unit.
Valid value(s):

`DGN`	= Diagnose. (Not valid for CM3)
`EX`	= Exercise. (Not valid for CM3)
`RST`	= Restore.

`b` = Message switch number.

`c` = MMP logical identification number.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:MSCU

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts an action on the message switch control unit (MSCU) on the specified message switch (MSGS).

Abort is differentiated from stop by the action of the request. An abort action is immediate, not caring about the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (for example, the end of a phase) and will attempt to leave the hardware in a sane state.
Note: Abort should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]MSCU=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is any action currently waiting or executing on the MSCU). Valid value(s):

- `DGN` = Diagnose. (Not valid for CM3)
- `EX` = Exercise. (Not valid for CM3)
- `RST` = Restore.

`b` = Side of MSGS that the MSCU is on.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

APP:CM-IM-REASON

ABT:NLI

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts an action on a specific network link interface (NLI).

"Abort" is differentiated from "stop" by the action of the request. An abort action is immediate and without regard for the state of the hardware, while "stop" waits for a "clean" point of termination, (that is, the end of a phase) and attempts to leave the hardware in a correct state.

NOTE: An 'ABT' should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]NLI=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is any action currently waiting or executing on the NLI). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RST` = Restore.

NOTE: A remove or unconditional restore cannot be stopped once it is accepted.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = NLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = ONTC side number.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message is printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of this manual for a list of possible reasons for denying the request.

Application: 5
Type: Input

1. PURPOSE

Requests that all current processing on the on-line office records report generator be aborted. Any office record forms print requests scheduled by the OP:OFR-CAT input message are removed unless the DELAY option was specified.

2. FORMAT

```
ABT:OFR;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. Invalid request. Followed by an ABT:OFR output message.

`PF` = Printout follows. Valid request. Output message ABT:OFR follows.

5. REFERENCES

Input Message(s):

ABT:ONTC

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts a diagnostic or conditional restore request on the specified office network and timing complex (ONTC).

Abort is differentiated from stop by the action of the request. An abort action is immediate, without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (such as, the end of a phase) and will attempt to leave the hardware in a "sane" state.

NOTE: Abort should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]ONTC=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is any action currently waiting or executing on the ONTC). Valid value(s):

`DGN` = Diagnose.
`RST` = Conditional restore.

NOTE: A removal, unconditional restoration, or switch cannot be aborted once it is accepted.

`b` = Side of the ONTC.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:ONTCCOM

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts an action on the specified office network and timing common units (ONTCCOM). The ONTCCOM is made up of the following entities:

- Message interface (MI).
- Network clock (NC).
- Time multiplexed switch (TMS) excluding the network control and timing links (NCTLNKs).
- Link interface (LI), which exists only in the communication module model 1 (CM1) hardware.

Abort is differentiated from stop by the action of the request. An abort action is immediate, without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (that is, the end of a phase) and will attempt to leave the hardware in a sane state.

NOTE: Abort should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]ONTCCOM=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is any action currently waiting or executing on the ONTC). Valid value(s):

`DGN` = Diagnose.
`RST` = Restore.

NOTE: A removal, unconditional restoration, or switch cannot be aborted once it is accepted.

`b` = ONTC common side.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:OTO-A

Software Release: 5E10 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Aborts the specified office-to-office (OTO) task. If directory number (DN), *SLC*® line equipment number (SLEN), integrated digital carrier unit (IDCU) line equipment number (ILEN), and OTO request number are omitted, all currently active OTO tasks will be aborted.

2. FORMAT

```
ABT:OTO[,DN=a-b|,SLEN=c-d-e-f|,ILEN=c-g-h-f|,REQ=i];
```

3. EXPLANATION OF MESSAGE

`a` = Three-digit office code.

`b` = Local digits.

`c` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Digital carrier line unit (DCLU) number.

`e` = Remote terminal (RT) number.

`f` = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`g` = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`h` = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`i` = OTO request number of task to be aborted. The request number can be found on the printout follows (PF) acknowledgement message of the EX:OTO input message that is to be aborted. In addition, it is displayed on all EX:OTO output messages associated with that task.

NOTE: If a DN, SLEN, ILEN, or request number are not specified, then all active office-to-office tasks are aborted.

4. SYSTEM RESPONSE

`NG` = No good. No office-to-office tasks are currently active, or specified task not found to be currently active. May also include:

```
OTO NOT ACTIVE
REQ NOT ACTIVE
STARTING DN NOT ACTIVE
STARTING SLEN NOT ACTIVE
```

Copyright © 1999

```
STARTING ILEN NOT ACTIVE
```

`PF` = Printout follows. The request is accepted and the specified task(s) will be aborted. An EX:OTO output message will follow.

Application: 5
Type: Input

1. PURPOSE

Aborts the specified office-to-office (OTO) task. If directory number (DN), *SLC*® line equipment number (SLEN), integrated digital carrier unit (IDCU) line equipment number (ILEN), digital network equipment number(INEN), and OTO request number are omitted, all currently active OTO tasks will be aborted.

2. FORMAT

```
ABT:OTO[,NPA=l][,h];
```

3. EXPLANATION OF MESSAGE

`a` = Three-digit office code.

`b` = Local digits.

`c` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Digital carrier line unit (DCLU) number.

`e` = Remote terminal (RT) number.

`f` = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: If a DN, SLEN, ILEN, INEN or request number are not specified, then all active office-to-office tasks are aborted.

`g` = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`h` = Valid value(s):

DN=a-b
ILEN=c-g-e-f
INEN=c-j-k-f
REQ=i
SLEN=c-d-e-f

`i` = OTO request number of task to be aborted. The request number can be found on the printout follows (PF) acknowledgement message of the EX:OTO input message that is to be aborted. In addition, it is displayed on all EX:OTO output messages associated with that task.

`j` = Digital network unit (DNU) number.

`k` = Remote terminal (RT) number.

`l` = Numbering Plan Area or Area Code of the DN.

ABT:PMU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the precision measurement unit (PMU) be aborted at the specified location.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]PMU=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted. The default is the action currently executing on the PMU. Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Directly connected test unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:PMU output message.

ABT:PPC

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts actions on the specified pump peripheral controller (PPC).

Abort is differentiated from 'stop' by the action of the request. An abort action is immediate, without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (that is, the end of a phase) and will attempt to leave the hardware in a sane state.
Note: An 'ABT' should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]PPC=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted. The default is any action currently waiting or executing on the PPC. Valid value(s):

`DGN`	= Diagnose. (Not valid for CM3)
`EX`	= Exercise. (Not valid for CM3)
`RST`	= Restore.

`b` = PPC number.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:PPMTC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a specified action on the periodic pulse metering circuit (PPMTC) be aborted.

2. FORMAT

```
ABT:[a,]PPMTC=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted. Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

NOTE: The default is the action currently executing in the PPMTC.

`b` = Switching module (SM) number.

`c` = Modular metallic service unit number.

`d` = Service group.

`e` = Board number.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message is valid but the request conflicts with the current status.

`PF` = Printout follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

To abort (ABT) actions on either a packet switch unit (PSU) common controller (COM) or protocol handler (PH).

Note: Execution of this input message may require further action to put the unit into a sane state. Refer to the References section of this message.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]PSU{b}=c-d-e[-f];
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted. Valid value(s):
- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.
- Note: The default is the action currently executing on the PSU circuit.

`b` = Circuit name. Valid value(s):
- `COM` = Common controller.
- `PH` = Protocol handler.

`c` = Switching module (SM) number.
`d` = PSU number.
`e` = Valid value(s):

If 'b' =	'e' =
COM	Service group number.
PH	Shelf number.

`f` = Protocol handler number.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with current status.
`PF` = Printout follows. An ABT:PSU output message will follow.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that maintenance actions on an inter-remote switching module (RSM) remote communication link (RCL) be aborted.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]RCL=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the RCL). Valid value(s):
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number.

`c` = Digital line and trunk unit (DLTU) number.

`d` = Inter-RSM communication link digital facilities interface (CDFI) number.

`e` = Facility (FAC) number. The FAC number is the T1 facility number on a CDFI.

4. SYSTEM RESPONSE

`NG` = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:

```
NOT STARTED UNIT IN GROWTH STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

`PF` = Printout follows. An ABT:RCL output message follows in response to the request.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts maintenance actions on the remote clock (RCLK) circuit.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]RCLK=b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the RCLK). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number.

`c` = RCLK side.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

```
NOT STARTED UNIT IN GROWTH STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

`PF` = Printout follows. An ABT:RCLK output message follows in response to the request.

Software Release: 5E10 - 5E11
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specified action on a remote terminal (RT) embedded operations channel (EOC) circuit be aborted (ABT). This message is applicable for TR303 RTs (for example, Series 5 RTs running feature package 303G) terminating on an integrated digital carrier unit (IDCU).

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,] RT,EOC=b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (the default action is the action currently executing on the RT EOC). Valid value are:

`RMV`	= Remove
`RST`	= Restore

`b` = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. An ABT:RT-EOC output message will follow.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ABT:RVPT

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions currently running on the revertive pulsing transceiver (RVPT) be aborted. This input message should be used only if the STP:RVPT input message has been attempted first and has failed to terminate the previous action. Because both hardware and data may be left in an invalid state as a consequence of one ABT:RVPT message, a number of other outputs, such as audits and asserts, may follow.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[e,]RVPT=a-b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module number.

`b` = Unit number.

`c` = Service group.

`d` = Circuit number.

`e` = Action being aborted. Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. Followed by ABT:RVPT output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

```

ABT:SAS

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts the specified actions on the service announcement system (SAS) unit.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]SAS=b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the SAS unit). Valid value(s):
- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number.

`c` = SAS unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because it conflicts with current equipment status. May also include:
- `SM DOES NOT EXIST` = The requested SM does not exist in the system.
- `SM UNEQUIPPED` = The SM specified in the request is unequipped.
- `UNIT DOES NOT EXIST` = The requested unit does not exist in the system.

`PF` = Printout follows. The request has been accepted. Output message ABT:SAS follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the scan point board at the specified location be aborted.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]SCAN=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted. The default is the action currently executing on the scan point board. Valid values are:

`DGN`	= Diagnose.
`EX`	= Exercise.
`RMV`	= Remove.
`RST`	= Restore.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Scan point board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:SCAN output message.

Software Release: 5E10 - 5E11
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specified action on a remote terminal (RT) timeslot management channel (TMC) circuit be aborted (ABT). This message is applicable for TR303 RTs (that is, Series 5 RTs running feature package 303G) terminating on an integrated digital carrier unit (IDCU).

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]TMC=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (the default action is the action currently executing on the RT TMC). Valid value(s):

`RMV`	= Remove
`RST`	= Restore

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = TMC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. An ABT:TMC output message will follow.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

MCC Display Page(s):

188xyy (IDCU REMOTE TERMINAL)

ABT:TMS

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts a diagnostic or exercise on the time multiplexed switch (TMS) on the specified office network and timing complex (ONTC).

Abort is differentiated from stop by the action of the request. An abort action is immediate, without regard for the state of the hardware. 'Stop' will wait for a 'clean' point of termination, (such as, the end of a phase) and will attempt to leave the hardware in a sane state.

NOTE: Abort should only be used if an 'STP' input message fails.

2. FORMAT

```
ABT:[a,]TMS=b;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is any action currently waiting or executing on the TMS). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.

`b` = Side of ONTC.

4. SYSTEM RESPONSE

`IP` = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

ABT:TST-LEN

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the line unit path exerciser (LUPEX) be aborted at the specified location.

WARNING: This message causes the intended process to be purged. It also causes an assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:TST,LEN=a-b-c-d-e-f;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Grid board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Grid board switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`f` = Grid board switch level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:TST-LEN output message.

`RL` = Retry later. The request has been denied due to unavailable system resources.

ABT:TTFCOM

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the test transmission facility common (TTFCOM) circuit be aborted at the specified location.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]TTFCOM=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the TTFCOM circuit). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Global digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:TTFCOM output message.

ABT:TUCHBD

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the trunk unit channel board (TUCHBD) be aborted at the specified location.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]TUCHBD=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the TUCHBD). Valid value(s):
- `DGN` = Diagnose.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:TUCHBD output message.

ABT:UMBIL

Software Release: 5E13 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specified action on a a host umbilical (UMBIL) circuit be aborted (ABT). This message is applicable for host umbilicals terminating on a digital line and trunk unit (DLTU) or on a digital networking unit - synchronous optical network (DNU-S).

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]UMBIL=b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (the default action is the action currently executing on the UMBIL). Valid value(s):
- `RMV` = Remove
- `RST` = Restore

`b` = Host Switch Module (HSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Remote Switch Module (RSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = UMBIL number Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. An ABT:UMBIL output message will follow.
`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.
`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ABT:UTD

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the universal tone decoder (UTD) be aborted at the specified location.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]UTD=b-c-d-e;
```

3. EXPLANATION OF MESSAGE

`a` = Action being aborted (default is the action currently executing on the UTD). Valid value(s):

- `DGN` = Diagnose.
- `EX` = Exercise.
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Local digital service unit (DSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = DSU board position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because of a conflict with current status.

`PF` = Printout follows. Followed by the ABT:UTD output message.

ABT:VT1FAC-A

Software Release: 5E10 - 5E11
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that maintenance actions be aborted on a digital networking unit - synchronous optical network (SONET) (DNU-S) virtual tributary level 1 facility (VT1FAC).

NOTE: Execution of this message may require further action to put the unit into a sane state. Refer to the References section of this message.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of other asserts and audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT:[a,]VT1FAC=b-c-d-e-f;
```

3. EXPLANATION OF MESSAGE

`a` = Action to be aborted (default is the action currently executing on the VT1FAC). Valid value(s):
- `RMV` = Remove.
- `RST` = Restore.

`b` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`f` = Virtual tributary level 1 (VT1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. An ABT:VT1FAC output message will follow.

Copyright © 1999

8. ADD

Copyright © 1999

ADD:PAUTH

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Adds a new person identity (IDENT) with its related password (PSSWD) to the person authority (PAUTH) database.

This input message is not printed (echoed) on the read-only printer (ROP) in order to keep passwords private.

This input message is used in administering security of the maintenance interface. Refer to the Authority Management section of the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
ADD:PAUTH,IDENT="a",PSSWD="b";
```

3. EXPLANATION OF MESSAGE

`a` = Identity of the person that uses the password, in one to eight letters and/or digits. To avoid collisions with terminal identities, person identities may not begin with "tty" and equal four characters in length.

`b` = Password in six to thirteen characters.

4. SYSTEM RESPONSE

`NG` = No good. Valid value(s):

- `PASSWORD ILLEGAL LENGTH` = The given password is less than six characters or greater than 13 characters in length.
- `PERSON IDENTITY NOT UNIQUE` = The given person identity already exists in the person authority database or the person identity is four characters in length and begins with "tty".
- `UNABLE TO ACCESS AUTHORITY ADMINISTRATION` = The person authority database is inaccessible.

`OK` = Good. The identity and password are added to the person authority database.

`RL` = Retry later. Valid value(s):

- `AUTHORITY ADMINISTRATION UNDER UPDATE` = The person authority database is currently being updated.

Other Manual(s):

235-105-210 *Routine Operations and Maintenance*

ADD:PCGRP

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

This input message adds a command group or profile to the person-command group (PCGRP) relation for the given person identity (IDENT).

Format 1 associates a command group (COMGR) with a person identity (IDENT), allowing a user to access the messages in the command group. Format 2 associates a profile (PROFL) with an IDENT, allowing a user to access all the messages associated with a set of command groups. These input messages are used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
[1]    ADD:PCGRP:IDENT=a,COMGR=b;

[2]    ADD:PCGRP:IDENT=a,PROFL=c;
```

3. EXPLANATION OF MESSAGE

a = Identity of the person in one to eight letters and/or digits.

b = Command group. Valid value(s):

ADMIN	= System administrator only activities.
ALARM	= Alarm manipulation.
AM	= Administrative module maintenance.
AMA	= Automatic message accounting.
AUDIT	= Audits.
AUTH	= Command and authority administration.
CCS	= Common channel signaling.
CM	= Communications module maintenance.
FHADM	= File handling and administration.
MAINT	= Routine maintenance activities.
MEAS	= Measurements.
NMOC	= Network management and overload control.
ODD	= Office dependent data activities.
PASS	= Personal password modification.
RCV	= Recent change and verify activities.
SM	= Switching module maintenance.
SPECRCV	= Special RC/V input messages.
SFTMGT	= Software management (update, software release retrofit).
SFTUTIL	= Software utilities.
SUPERUSR	= Super user authority (bypass terminal authority).
SYSRCVY	= System recovery activities.
TRACE	= Call trace.
TRKLN	= Trunk and line maintenance.

Copyright © 1999

Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

c = A profile name which has been previously created using ADD:PROFL. The name is one to eight letters and/or digits.

4. SYSTEM RESPONSE

NG = No good. May also include:
- COMMAND GROUP ALREADY ASSIGNED TO THIS PERSON = The given command group has already been assigned to this person identity.
- NON-EXISTENT PERSON IDENTITY = The given person identity does not exist in the person authority database.
- PROFILE ALREADY ASSIGNED = The given command profile (PROFL) has already been assigned to this person identity.
- PROFILE IDENTITY DOES NOT EXIST = The given profile does not exist in the profile authority database.
- UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The person authority database is inaccessible.

OK = Good. The command group or profile is associated with the person identity.

RL = Retry later. May also include:
- AUTHORITY ADMINISTRATION UNDER UPDATE = The person authority database is currently being updated.

ADD:PROFL

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Adds a new profile identity (IDENT) to the profile authority database (PROFL). A profile is a set of command groups, which are detailed in the APP:COMMAND-GRP appendix of the Input Messages manual. A maximum of 64 profiles are allowed.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
ADD:PROFL,IDENT=a;
```

3. EXPLANATION OF MESSAGE

`a` = Identity of the profile to be added to the profile authority database. A maximum of eight characters may be used.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `MAXIMUM NUMBER OF PROFILES EXCEEDED` = The maximum of 64 profiles are already defined.
- `PROFILE IDENTITY NOT UNIQUE` = The given profile identity is already in the profile authority database.
- `UNABLE TO ACCESS PROFILE ADMINISTRATION` = The profile authority database is inaccessible.

`OK` = Good. The profile name is successfully added to the profile authority database.

`RL` = Retry later. May also include:
- `PROFILE ADMINISTRATION UNDER UPDATE` = The profile authority database is currently being updated.

ADD:TAUTH

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Adds a terminal identity (TERM) to the terminal authority (TAUTH) database.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
ADD:TAUTH:TERM=a;
```

3. EXPLANATION OF MESSAGE

`a` = Terminal identity in four characters, starting with "tty".

4. SYSTEM RESPONSE

`NG` No good. May also include:
- `INVALID TERMINAL IDENTITY` = The given terminal identity is either not four characters in length or does not start with "tty".
- `TERMINAL IDENTITY ALREADY EXISTS` = The given terminal identity already exists in the terminal authority database.
- `UNABLE TO ACCESS AUTHORITY ADMINISTRATION` = The terminal authority database is inaccessible.

`OK` = Good. The terminal identity is added to the terminal authority database.

`RL` = Retry later. May also include:
- `AUTHORITY ADMINISTRATION UNDER UPDATE` = The terminal authority database is currently being updated.

ADD:TCGRP

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

This command adds a command group or profile to the terminal-command group (TCGRP) relation for a given terminal identity (TERM).

Format 1 associates a command group (COMGR) with a terminal identity (TERM), allowing a user to access the messages in the command group from that terminal. Format 2 associates a profile (PROFL) with a TERM, allowing a user to access all the messages associated with a set of command groups from that terminal. This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
[1]    ADD:TCGRP:TERM=a,COMGR=b;

[2]    ADD:TCGRP:TERM=a,PROFL=c;
```

3. EXPLANATION OF MESSAGE

`a` = Terminal identity in four characters. The first three characters must be "tty". The fourth character must be the terminal ID.

`b` = Command group. Valid value(s):

`ADMIN`	= System administrator only activities.
`ALARM`	= Alarm manipulation.
`AM`	= Administrative module maintenance.
`AMA`	= Automatic message accounting.
`AUDIT`	= Audits.
`AUTH`	= Command and authority administration.
`CCS`	= Common channel signaling.
`CM`	= Communications module maintenance.
`FHADM`	= File handling and administration.
`MAINT`	= Routine maintenance activities.
`MEAS`	= Measurements.
`NMOC`	= Network management and overload control.
`ODD`	= Office dependent data activities.
`PASS`	= Personal password modification.
`RCV`	= Recent change and verify activities.
`SM`	= Switching module maintenance.
`SPECRCV`	= Special RC/V input messages.
`SFTMGT`	= Software management (update, software release retrofit).
`SFTUTIL`	= Software utilities.
`SUPERUSR`	= Super user authority (bypass terminal authority).
`SYSRCVY`	= System recovery activities.
`TRACE`	= Call trace.
`TRKLN`	= Trunk and line maintenance.

Copyright © 1999

Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

`c` = A profile name which has been previously created using ADD:PROFL. The name is one to eight letters and/or digits.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `COMMAND GROUP ALREADY ASSIGNED TO THIS TERMINAL` = The given command group has already been assigned to this terminal identity.
- `INVALID TERMINAL IDENTITY` = The given terminal identity is either not four characters in length or does not start with "tty".
- `NON-EXISTENT TERMINAL IDENTITY` = The given terminal identity does not exist in the terminal authority database.
- `PROFILE ALREADY ASSIGNED` = The given command profile (PROFL) has already been assigned to this terminal identity.
- `PROFILE IDENTITY DOES NOT EXIST` = The given profile does not exist in the profile authority database.
- `UNABLE TO ACCESS AUTHORITY ADMINISTRATION` = The terminal authority database is inaccessible.

`OK` = Good. The command group or profile is associated with the terminal identity.

`RL` = Retry later. May also include:
- `AUTHORITY ADMINISTRATION UNDER UPDATE` = The terminal authority database is currently being updated.

ALW:ACSR

Software Release: 5E10 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that automatic customer station rearrangement (ACSR) requests be added or deleted from the ACSR queue. Machine-generated inhibitions of ACSR cannot be overridden with this input message.

2. FORMAT

```
ALW:ACSR,{ENQ|DEQ|ALL};
```

3. EXPLANATION OF MESSAGE

`ALL` = Allow adding and deleting of ACSR requests.

`DEQ` = Allow deleting (dequeueing) of ACSR requests.

`ENQ` = Allow adding (enqueueing) of ACSR requests.

4. SYSTEM RESPONSE

`OK` = Good. ACSR enqueueing or dequeueing request was received.

ALW:ALE-A

Software Release: 5E10 - 5E11
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the operation of automatic line evaluation (ALE) be allowed for the specified option. The parameters are grouped into three classes:

A Automatic ALE session output controls:

The parameters LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session.

The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

B Switching module (SM) controls:

The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

Note: Automatically generated reports as well as the actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not resume for a period of up to 5 minutes.

If the PER generation parameter is inhibited, then no PERs will be recorded for any integrated services digital network (ISDN) protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.

C Line/trunk controls:

Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

Format 1 is used to allow the automatic session controls. Format 2 is used to inhibit the SM control parameters. Format 3 is used to inhibit the PER generation for a ISDN protocol channel. The level 1 control parameters for U-interface DSLs are manipulated using the RC/V view 8.1 and 22.15 for performance monitoring group definitions.

For example, the input message

Copyright © 1999

```
ALW:ALE,LEVEL2,PER=REPT,PRINT
```

will allow the LEVEL2, PER=REPT, and PRINT controls prohibiting the execution of the LEVEL2 and PER jobs for automatically initiated ALE sessions. In addition, this message indicates that the results from the automatic session will be printed on the receive-only printer (ROP).

The input message

```
ALW:ALE,PER=GEN,SM=7
```

will allow the PER generation control that enables the collection of PERs on SM.

The input message

```
ALW:ALE,PER=GEN,DN=2204000
```

will allow the PER generation control that enables the collection of PERs for the D-channel associated with the DSL for DN 2204000. In this case, the SM inhibit supersedes the channel inhibit; therefore, if the SM is inhibited, then PERs will not be collected for the channel regardless of the state of the channel inhibit.

2. FORMAT

```
[1]    ALW:ALE{[,LEVEL2][,PRINT][,PER=REPT]};

[2]    ALW:ALE,SM=a[&&b]{[,LEVEL1][,PER=GEN]};

[3]    ALW:ALE,c[,CH=a1],PER=GEN;
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`LEVEL1` = Allow level 1 performance monitoring for the indicated SM. The default is level 1 allowed.

`LEVEL2` = Process level 2 error counts. These counters exist in the protocol handler (PH). Allowing level 2 automatic ALE will report packet error counts and automatically reset the counters. The default is level 2 allowed.

`PER=GEN` = Allow PER generation for the indicated SM or channel. The default is that PER generation is allowed for the indicated SM or channel.

`PER=REPT` = Allow PER reporting for the automatically requested ALE sessions. The default is that PER reporting is allowed. Set the specified protocol error record (PER) parameters.

`PRINT` = Send output to the receive-only printer (ROP). The default is ROP output allowed.

`a` = SM number or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line identification. Valid value(s):

BST=d-e	NEN=f-h[1]-i[1]-j[1]-k[1]-l[1]	
DEN=f-g-h-i	OAPO=d	
DN=j	OPT=d-e	
DSLGM=f-k-l	PKTDN=j	
EOC=f-m-n-o	PSUEN=f-b[1]-c[1]-d[1]-l	
ILEN=f-m-n-p	PORT=f-v	
LCEN=f-q-r-s	RTRS=w-x	
LCKEN=f-e[1]-m[1]-f[1]-g[1]	TKGMN=y-z	
MLHG=t-u	TMC=f-m-n-o	

d = Operator Service Center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = The directory number associated with the port. This parameter can only be used to identify channels associated with DSLs.

k = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Remote terminal number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Primary/protection identifier.

p = Channel unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

t = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a[1] = Channel type to be allowed (valid only for LCEN line identification). Valid value(s):

B1 = Channel B1.
B2 = Channel B2.
D = D-channel (default).

b[1] = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c[1] = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d[1] = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e[1] = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f[1] = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g[1] = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h[1] = Digital network unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i[1] = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j[1] = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k[1] = Virtual tributary (VT1.5) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

`l`[1] = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`m`[1] = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. This message was not recognized or was not acceptable. Valid value(s):
- `ALE FEATURE NOT LOADED` = The ALE feature is not loaded in the switch software configuration.
- `COMMUNICATION FAILURE` = A system error has occurred.
- `INVALID INPUT` = Parameter to allow does not match entity to allow.
- `PROCESS CREATION FAILURE` = A system error has occurred.

`OK` = Good. Requested parameter has been allowed.

`PF` = Printout follows. Requested parameter allow has been initiated and the ALW ALE message follows.

`RL` = Retry later. Valid value(s):
- `AM IN MIN MODE` = The AM is in minimum operation mode.
- `REQUEST ALREADY IN PROGRESS` = An ALE allow request is already running. Only one allow request is permitted at a time.

8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]
22.15 (PERFORMANCE MONITORING - THRESHOLD GROUP)

ALW:ALE-B

Software Release: 5E12 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the operation of automatic line evaluation (ALE) be allowed for the specified option. The parameters are grouped into three classes:

A Automatic ALE session output controls:

The parameters LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session.

The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

B Switching module (SM) controls:

The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

Note: Automatically generated reports as well as the actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not resume for a period of up to 5 minutes.

If the PER generation parameter is inhibited, then no PERs will be recorded for any integrated services digital network (ISDN) protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.

C Line/trunk controls:

Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

Format 1 is used to allow the automatic session controls.

Format 2 is used to allow the SM control parameters.

Format 3 is used to allow the PER generation for a ISDN protocol channel.

Copyright © 1999

The level 1 control parameters for U-interface DSLs are manipulated using the RC/V view 8.1 and 22.15 for performance monitoring group definitions.

For example, the input message

```
ALW:ALE,LEVEL2,PER=REPT,PRINT
```

will allow the LEVEL2, PER=REPT, and PRINT controls allowing the execution of the LEVEL2 and PER jobs for automatically initiated ALE sessions. In addition, this message indicates that the results from the automatic session will be printed on the receive-only printer (ROP).

The input message

```
ALW:ALE,PER=GEN,SM=7
```

will allow the PER generation control that enables the collection of PERs on SM 7;.

The input message

```
ALW:ALE,PER=GEN,DN=2204000
```

will allow the PER generation control that enables the collection of PERs for the D-channel associated with the DSL for DN 2204000. In this case, the SM inhibit supersedes the channel inhibit; therefore, if the SM is inhibited, then PERs will not be collected for the channel regardless of the state of the channel inhibit.

2. FORMAT

1. PURPOSE

Requests that the operation of automatic line evaluation (ALE) be allowed for the specified option. The parameters are grouped into three classes:

A Automatic ALE session output controls:

The parameters LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session.

The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

B Switching module (SM) controls:

The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

Note: Automatically generated reports as well as the actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not resume for a period of up to 5 minutes.

If the PER generation parameter is inhibited, then no PERs will be recorded for any integrated services digital network (ISDN) protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.

C Line/trunk controls:

Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

Format 1 is used to allow the automatic session controls.

Format 2 is used to allow the SM control parameters.

Format 3 is used to allow the PER generation for a ISDN protocol channel.

Copyright © 1999

The level 1 control parameters for U-interface DSLs are manipulated using the RC/V view 8.1 and 22.15 for performance monitoring group definitions.

For example, the input message

```
ALW:ALE,LEVEL2,PER=REPT,PRINT
```

will allow the LEVEL2, PER=REPT, and PRINT controls allowing the execution of the LEVEL2 and PER jobs for automatically initiated ALE sessions. In addition, this message indicates that the results from the automatic session will be printed on the receive-only printer (ROP).

The input message

```
ALW:ALE,PER=GEN,SM=7
```

will allow the PER generation control that enables the collection of PERs on SM 7;.

The input message

```
ALW:ALE,PER=GEN,DN=2204000
```

will allow the PER generation control that enables the collection of PERs for the D-channel associated with the DSL for DN 2204000. In this case, the SM inhibit supersedes the channel inhibit; therefore, if the SM is inhibited, then PERs will not be collected for the channel regardless of the state of the channel inhibit.

2. FORMAT

```
[1]    ALW:ALE{[,LEVEL2][,PRINT][,PER=REPT]};

[2]    ALW:ALE,SM=a[&&b]{[,LEVEL1][,PER=GEN]};

[3]    ALW:ALE,c[,CH=a1],PER=GEN;
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`LEVEL1` = Allow level 1 performance monitoring for the indicated SM. The default is level 1 allowed.

`LEVEL2` = Process level 2 error counts. These counters exist in the protocol handler (PH). Allowing level 2 automatic ALE will report packet error counts and automatically reset the counters. The default is level 2 allowed.

`PER=GEN` = Allow PER generation for the indicated SM or channel. The default is that PER generation is allowed for the indicated SM or channel.

`PER=REPT` = Allow PER reporting for the automatically requested ALE sessions. The default is that PER reporting is allowed. Set the specified protocol error record (PER) parameters.

`PRINT` = Send output to the receive-only printer (ROP). The default is ROP output allowed.

`a` = SM number or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the

Appendixes section of the Input Messages manual.

c = Line identification. Valid value(s):

AIUEN=f-n[1]-o[1]-p[1]	LCEN=f-q-r-s
BST=d-e	LCKEN=f-e[1]-m[1]-f[1]-g[1]
DEN=f-g-h-i	MLHG=t-u
DN=j	NEN=f-h[1]-i[1]-q[1]-j[1]-k[1]-r[1]-l[1]
DNUSEOC=f-h[1]-n-o	OAPO=d
DNUSTMC=f-h[1]-n-o	OPT=d-e
DSLGM=f-k-l	PKTDN=j
IDCUEOC=f-m-n-o	PORT=f-v
IDCUTMC=f-m-n-o	PSUEN=f-b[1]-c[1]-d[1]-l
ILEN=f-m-n-p	RTRS=w-x
INEN=f-h[1]-n-p	TKGMN=y-z

d = Operator Service Center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = The directory number associated with the port. This parameter can only be used to identify channels associated with DSLs.

k = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

r = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a[1] = Channel type to be allowed (valid only for LCEN line identification). Valid value(s):

B1 = Channel B1.
B2 = Channel B2.
D = D-channel (default).

b[1] = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c[1] = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d[1] = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e[1] = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f[1] = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g[1] = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h[1] = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i[1] = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the

Copyright © 1999

Input Messages manual.

j[1] = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k[1] = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l[1] = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m[1] = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n[1] = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o[1] = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p[1] = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q[1] = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r[1] = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. This message was not recognized or was not acceptable. Valid value(s):
- ALE FEATURE NOT LOADED = The ALE feature is not loaded in the switch software configuration.
- COMMUNICATION FAILURE = A system error has occurred.
- INVALID INPUT = Parameter to allow does not match entity to allow.
- PROCESS CREATION FAILURE = A system error has occurred.

OK = Good. Requested parameter has been allowed.

PF = Printout follows. Requested parameter allow has been initiated and the ALW ALE message follows.

RL = Retry later. Valid value(s):
- AM IN MIN MODE = The AM is in minimum operation mode.
- REQUEST ALREADY IN PROGRESS = An ALE allow request is already running. Only one allow request is permitted at a time.

ALW:ALM-A

Software Release: 5E10 - 5E11
Command Group: ALARM
Application: 5
Type: Input

1. PURPOSE

Requests that alarm reporting on a scan point be allowed, according to type. Formats 1 through 4 are for alarms assigned to input/output processor (IOP) scan points. Format 5 is for alarms assigned to remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) metallic service unit (MSU) scan points and is available only in a multimodule RSM, ORM or TRM that has the alarm input option. Format 6 is for alarms assigned to the remote integrated services line unit (RISLU) building/miscellaneous alarm scan points.

2. FORMAT

```
[1]    ALW:ALM,{BPSC=a|MFFUSE=b|MFFAN|MISC=c};

[2]    ALW:ALM,ESM[,PWR];

[3]    ALW:ALM,CNI,{FANALM|FRMFUSE|PWR};

[4]    ALW:ALM,{MSGS=b|ONTC=b|TMS=b},{FANALM|FRMFUSE};

[5]    ALW:ALM,RBPSC=d,SM=e;

[6]    ALW:ALM,RIBMSC=f,SITE=g;
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`FANALM` = CNI, MSGS, ONTC, or TMS fan alarm.

`FRMFUSE` = CNI, MSGS, ONTC, or TMS frame fuse alarm.

`MISC` = Miscellaneous IOP scan point.

`a` = Building/power scan point number.

`b` = Unit number. MSGS and TMS are for CM1 offices only. ONTC is for CM2 offices only.

`c` = IOP MISC scan point number.

`d` = RBPSC number.

`e` = SM number.

`f` = RIBMSC number.

`g` = RISLU site number.

4. SYSTEM RESPONSE

Copyright © 1999

`NG` = No good. Invalid scan point, SM number or site number.

`PF` = Printout follows. The ALW:ALM output message follows.

`RL` = Retry later. Unable to process request or unable to communicate with SM.

Software Release: 5E12 and later
Command Group: ALARM
Application: 5
Type: Input

1. PURPOSE

Requests that alarm reporting on a scan point be allowed, according to type. Formats 1 through 4 are for alarms assigned to input/output processor (IOP) scan points. Format 5 is for alarms assigned to remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) metallic service unit (MSU) scan points and is available only in a multimodule RSM, ORM or TRM that has the alarm input option. Format 6 is for alarms assigned to remote alarm section (RAS) scan points. Format 7 is for alarms assigned to expansion access interface unit (EAIU) scan points.

2. FORMAT

```
[1]    ALW:ALM,{BPSC=a|MFFUSE=b|MFFAN|MISC=c};

[2]    ALW:ALM,ESM[,PWR];

[3]    ALW:ALM,CNI,{FANALM|FRMFUSE|PWR};

[4]    ALW:ALM,{MSGS=b|ONTC=b|TMS=b},{FANALM|FRMFUSE};

[5]    ALW:ALM,RBPSC=d,SM=e;

[6]    ALW:ALM,RAS,SCPT=f,SITE=g;

[7]    ALW:ALM,EAIU=e-h,SCPT=f;
```

3. EXPLANATION OF MESSAGE

`CNI` = Common network interface.

`ESM` = External sanity monitor.

`FANALM` = Fan alarm.

`FRMFUSE` = Frame fuse alarm.

`MFFAN` = Miscellaneous frame fan.

`MFFUSE` = Miscellaneous frame fuse.

`MSGS` = Message switch.

`ONTC` = Office network timing complex.

`PWR` = Power.

`SCPT` = Scan point.

`TMS` = Time multiplexed switch.

`a` = Building/power scan point (BPSC) number.

Copyright © 1999

`b` = Unit number. MSGS and TMS are for CM1 offices only. ONTC is for CM2 offices only.

`c` = Miscellaneous (MISC) IOP scan point number.

`d` = Remote building/power scan point (RBPSC) number.

`e` = Switching module (SM) number.

`f` = Scan point number.

`g` = Remote peripheral site number.

`h` = EAIU unit number.

4. SYSTEM RESPONSE

`NG` = No good. Invalid scan point, SM number or site number.

`PF` = Printout follows. The ALW:ALM output message follows.

`RL` = Retry later. Unable to process request or unable to communicate with SM.

ALW:AMA-AUTOST

Software Release: 5E10 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that automatic message accounting (AMA) automatic tape writing be allowed. This input message is required following offline AMA automatic tape-writing sessions during software transitions since AMA sessions are inhibited when these sessions are ended.

2. FORMAT

```
ALW:AMA:AUTOST[,ST1|,ST2];
```

3. EXPLANATION OF MESSAGE

`ST1` = Used if AMA data goes to the ST1 data stream.

`ST2` = Used if AMA data goes to the ST2 data stream.

NOTE: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

4. SYSTEM RESPONSE

`IP` = In progress. Request accepted. The AMA monitor process has been called to cancel manual blocking of AMA automatic tape writing sessions previously blocked using the INH:AMA-AUTOST message. When the request is complete, the contents of the AMA control file will be output. Refer to the REPT:AMA-CONT output message.

`NG` = No good. Data stream checks failed.

`RL` = Retry later. A message could not be sent to the AMA monitor process. May also include:

`- EVEN OFFLINE MHDS COULD NOT BE ACCESSED` = Disk file controller (DFC) 0 could not be accessed in the equipment configuration database (ECD) or is not active (ACT) and/or DFC 2 can be accessed in the ECD but is not ACT or unequipped (UNEQIP). When this is the case, wait until all controllers for the even offline moving head disks (MHDs) are restored, or restore the appropriate controller using the RST:DFC input message with the UCL option. This message could occur prior to an offline AMA session during software transitions.

ALW:AMA-SESSION

Software Release: 5E10 and later
Command Group: AMA
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that automatic message accounting (AMA) teleprocessing sessions or tape writing sessions be allowed. This input message is required following offline AMA sessions during software transitions since AMA sessions are inhibited when these sessions end.

WARNING: It is important to note that since sessions following an offline tape or AMATPS session are being inhibited, that the user invoke the OP:AMA-DISK input message prior to the next session. If this is not done prior to the next ALW:AMA-SESSION and/or ALW:AMA-AUTOST and the amount of data on the offline disks is 0% and 0 block (no more data) as indicated by the termination message from the last session, it will be necessary to manually remove the retrofit site file (/updtmp/site/access.oflama).

2. FORMAT

```
ALW:AMA:SESSION[,ST1|,ST2];
```

3. EXPLANATION OF MESSAGE

`ST1` = Used if AMA data goes to the ST1 data stream.

`ST2` = Used if AMA data goes to the ST2 data stream.

NOTE: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

4. SYSTEM RESPONSE

`IP` = In progress. Request accepted. The AMA monitor process has been called to allow AMA teleprocessing or tape writing sessions that were inhibited with the INH:AMA-SESSION message. When the request is complete, the contents of the AMA control file will be output. Refer to the REPT:AMA-CONT output message.

`NG` = No good. Data stream checks failed.

`RL` = Retry later. A message could not be sent to the AMA monitor process. May also include:

`- EVEN OFFLINE MHDS COULD NOT BE ACCESSED` = Disk file controller (DFC) 0 could not be accessed in the equipment configuration database (ECD) or is not active (ACT) and/or DFC 2 can be accessed in the ECD but is not ACT or unequipped (UNEQIP). When this is the case, wait until all controllers for the even offline moving head disks (MHDs) are restored, or restore the appropriate controller using the RST:DFC input message with the UCL option. This message could occur prior to an offline AMA session during software transitions.

ALW:AMAIRR

Software Release: 5E10 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of data related to an automatic message accounting irregularity (AMAIRR) be allowed when and if such an irregularity occurs.

2. FORMAT

```
ALW:AMAIRR;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`OK` = Good. The request has been received. A REPT:AMAIRR message will be printed for each subsequent call for which automatic message accounting cannot be determined.

5. REFERENCES

Input Message(s):

ALW:AMALOST

Software Release: 5E10 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of data related to a lost automatic message accounting (AMALOST) record be allowed when and if such a loss occurs.

2. FORMAT

```
ALW:AMALOST[,TRC];
```

3. EXPLANATION OF MESSAGE

`TRC` = Invoke an AMA trace of an AMALOST record if either a complete or a partial AMA record exists.

4. SYSTEM RESPONSE

`OK` = Good. The request has been received. All subsequent occurrences of lost AMA records will print an information report (REPT:AMALOST).

Copyright © 1999

ALW:AMATRC-A

Software Release: 5E10 - 5E11
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Format 1 requests that the printing of an automatic message accounting (AMA) record be allowed on the receive-only printer (ROP) for a specific originating and/or terminating directory number (DN). When an AMA record is generated whose originating or terminating DN matches any of the up to 5 DN(s) selected (that is, DN and PS flag are equal) the AMA record will be printed on the ROP.

NOTE: When placing a call to an INWATS or feature group A (FGA) facility the DN associated with the INWATS or FGA facility will be placed in the originating DN field of the AMA record.

With multiple DN tracing allowed, a maximum of five DNs can be entered for tracing. Without multiple DN tracing, a maximum of one DN can be entered for tracing. When a DN entered for tracing matches an existing DN, the trace option will be overwritten by the trace option of the DN entered. Refer to the Billing Features and Specifications manual for additional information about this feature.

NOTE: If several simultaneous (on average 7 or more) AMA records are generated matching the selected DN, there is a possibility that the ROP will get flooded and some AMA records may not get printed. The number that can be printed is dependent on the length of the individual records, as well as the size of the shared memory buffer available between the operational kernel process (OKP) and AM system processes.

Format 2 requests that each AMA record that is sent to the ROP using AMATRC be placed in the AMTRCLOG log file. When the FILE parameter is specified, each time a AMA record whose originating or terminating number matches any of the existing DN(s) is generated, the record will be printed on the ROP. In addition to being sent to the ROP the AMA record will be placed in the AMTRCLOG log file.

2. FORMAT

```
[1]    ALW:AMATRC:DN=a[,PS][,b];

[2]    ALW:AMATRC:FILE;
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`FILE` = Requests that AMATRC output be placed in the AMATRC Log File in addition to the ROP.

`a` = The seven- or ten-digit directory number.

`b` = The option for tracing ORIG, TERM, or BOTH. The default will be ORIG if option for tracing is omitted.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID DIGIT ENTERED` = Only digits, no alpha or special characters are accepted.
- `SEVEN OR TEN DIGITS REQUIRED` = Either seven or ten digits are required to perform the

Copyright © 1999

trace.

- `EXCEEDED 5 DN LIMIT` = One or more DNs must be inhibited before another DN can be allowed for tracing.

`OK` = Good. The request has been received. All subsequent AMA entries generated with the given originating or terminating directory number will be printed on the ROP. Refer to the REPT:AMATRC output message.

ALW:AUD

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the routine execution of one or more audits controlled by the system integrity monitor (SIM) that were previously inhibited be allowed. Entering the ALW:AUD input message clears one or more audit inhibits previously set to the manually inhibited or automatically inhibited state.

Separate inhibit states are provided for:

- All audits. When the inhibit state for ALL audits is set, routine audit scheduling is completely turned off. Entering the ALW:AUD input message with the ALL option reinitializes the audit control subsystem and turns on routine audit scheduling, but it has no effect on the inhibit states of individual audits.
- Each audit, identified by audit name and member number. When an audit is inhibited, either manually or automatically, it is not scheduled to run routinely or in response to a software request.
- - Each instance of an audit. One instance of an audit may be inhibited while other instances are allowed to run routinely.

Audit inhibit states may be displayed by entering the OP:AUD input message.

2. FORMAT

```
ALW:AUD,{ALL|a[=b]|a=c,INS=d};
```

3. EXPLANATION OF MESSAGE

`ALL` = Specifies all audits controlled by SIM:

Clears a master inhibit state which is independent of the inhibit states for individual audits. Causes SIM to attempt to initialize the audit control system if it has not been successfully initialized.

If the control record in the equipment configuration data base for SIM has been modified, ALL causes SIM to reinitialize its internal control parameters according to the new content of the control record.

`a` = Audit name. Refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual for administrative module (AM) audit names.

NOTE: If '`a`' is specified without '`b`', all members of the audit will be allowed.

`b` = Member number. Refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual. May be specified as a single number or a list of numbers.

`c` = Single member number. Refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual.

`d` = Instance name.

Copyright © 1999

4. SYSTEM RESPONSE

Refer to the APP:AUD appendix in the Appendixes section of the Input Messages manual.

ALW:AUD-CMP

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests that a communication module processor (CMP) audit be allowed to execute automatically or an audit cycle to execute routinely on one CMP.

2. FORMAT

```
ALW:AUD[=a],CMP=0;
```

3. EXPLANATION OF MESSAGE

`a` = Audit ID. Valid value(s):
`CYCLE` = Allow the routine execution of the audit cycle (default).

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `AUDIT NOT AVAILABLE IN CMP` = The request has been denied because the audit specified in the '`a`' variable does not exist in the CMP specified.
- `INVALID CMP` = The specified CMP does not exist.

`OK` = Good. The request has been received and completed. Audit or cycle has been allowed.

5. REFERENCES

Input Message(s):

ALW:AUD-ENV

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Allows a kernel process environment (OKP or SMKP) audit to execute automatically or allows an audit cycle in the administrative module (AM) to execute routinely.

2. FORMAT

```
ALW:AUD[=a],ENV=b;
```

3. EXPLANATION OF MESSAGE

`a` = Audit(s) to be allowed. Valid value(s):
`Audit ID`
`CYCLE` = Routine audit cycle.

`b` = Type of process. Valid value(s):
`OKP` = Operational kernel process.
`SMKP` = Switch maintenance kernel process.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `ARGUMENT FOR ENV MISSING` = The request has been denied because neither OKP nor SMKP were specified for variable '`b`'.
- `AUDIT NOT AVAILABLE IN SPECIFIED ENV` = The request has been denied because the specified audit is not available in the requested kernel process.
- `SM TYPE NOT VALID FOR THIS REQUEST` = The request has been denied because an SM type (RSM, LSM, or HSM) was specified for a kernel process environment.

`OK` = Good. The request has been received and completed. Audit or audit cycle has been allowed.

ALW:AUD-SM

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Allows a switching module (SM) audit to execute automatically or an audit cycle to execute routinely on one SM or a range of SMs.

2. FORMAT

```
ALW:AUD[=a],SM=b[&&c][,RSM][,LSM][,HSM][,ORM][,TRM];
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = Audit(s) to be allowed. The default is CYCLE. Valid value(s):

`Audit ID`

`CYCLE` = Allow the routine execution of the audit cycle.

`b` = SM number, or lower limit of a range of SM number. The default is any type of SM.

`c` = Upper limit of a range of SM number.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

- `AUDIT NOT AVAILABLE IN SM TYPE` = The request has been denied because the audit specified in the 'a' variable does not exist in the SM type specified or does not exist in any SM type.
- `INVALID SM RANGE/TYPE COMBINATION` = The request has been denied because either the range is not in ascending order, or there is not at least one SM of the specified type (or any type) within the range.

`OK` = Good. The request has been received and completed. Audit or cycle has been allowed.

`RL` = Retry later. May also include:

- `MESSAGE BROADCAST INTERNAL ERROR` = The message cannot be sent to the specified SM(s) at the present time due to problems scheduling a job to broadcast the message.

ALW:AUD-SODD

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests that either the full or incremental static office-dependent data (SODD) audit, which is to execute automatically, be allowed. The full audit will restart provided there are at least 15 minutes remaining in the audit schedule (refer to the SCHED:AUD-SODD input message.) The incremental audit will restart provided there are unaudited log files from the last ODD backup.

2. FORMAT

```
ALW:AUD=SODD,{FULL|INCR};
```

3. EXPLANATION OF MESSAGE

`FULL` = Allow the full SODD audit to be executed.

`INCR` = Allow the incremental SODD audit to be executed.

4. SYSTEM RESPONSE

`OK` = Good. The request has been received and completed; the SODD audit has been allowed.

5. REFERENCES

Input Message(s):

ALW:AUTOCFG

Software Release: 5E10 and later
Command Group: AM
Application: 5
Type: Input

1. PURPOSE

Requests that the automatic moving head disk (MHD) configuration feature be enabled for the entire office or for a specific MHD.

2. FORMAT

```
ALW:AUTOCFG[:MHD=a];
```

3. EXPLANATION OF MESSAGE

`a` = Number of the MHD to be enabled for auto MHD configuration. If not specified, it defaults to the entire office.

4. SYSTEM RESPONSE

`OK` = Good. Requested inhibit has been released.

ALW:BCI

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Allows originating (ORIG) or terminating (TERM) blocked call indication (BCI) reporting when a path is not available through both the A- and B-links of a line unit concentrator. Use this message to identify the lines in an office that experience A- and B-link blockages, and to indicate the severity of this problem on a line unit basis.

WARNING: The use of system resources to report A- and B-link blockages will negatively affect call processing capacity when frequent blockages occur. It is recommended that originating and terminating blockage studies not be done at the same time, and that the selected value for maximum messages (MAX) be kept small to avoid excessive message processing.

2. FORMAT

```
ALW:BCI,{ORIG|TERM},SM=a[&&b][,MAX=c];
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number, or the lower limit in a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Upper limit SM number in a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Maximum number of blocked-call messages to be reported by an included SM before reporting is automatically halted for that SM.

4. SYSTEM RESPONSE

`PF` = Printout follows. The request was received and the REPT:BCI output message follows as blockages occur.

ALW:BREVC-A

Software Release: 5E10 - 5E13
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the effect of the INH:BREVC input message be canceled, and allows automatic brevity control to be reapplied.

Brevity control (BREVC) restricts and prints application terminal (TTY) output messages by message class and priority to reduce the quantity of messages printed at the receive-only printer (ROP). Brevity control does not affect manual or alarmed messages.

The brevity status for each MSGCLS can be printed out using the OP:BREVC input message. The status for each system can be printed using the OP:SYSSTAT input message.

2. FORMAT

```
ALW:BREVC,{MSGCLS=a|CMP=b|AM|SM=c[&&d][,LSM][,HSM][,RSM][,ORM][,TRM]};
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`ALL` = Allow all message classes.

`a` = Message class mnemonic. The MSGCLS for a particular message can be found on the corresponding output message manual page. The valid MSGCLS codes can be listed using the OP:LPS input message.

`b` = CMP number.

`c` = SM number or lower limit of a range of SM numbers.

`d` = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. An illegal SM number or range was specified or, an illegal CMP number was specified.

`OK` = Good. The message was accepted and the action completed.

ALW:CCSCQ

Software Release: 5E12 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Allows automatic periodic execution of the common channel signaling (CCS) office-wide circuit query. This interoffice circuit query will correct the inconsistencies of near-end and far-end call processing and maintenance states of individual trunk circuits. This command will not affect any circuit query request that is currently in progress.

However, the automatic circuit query will not be allowed if the circuit query start time has not been set.

2. FORMAT

```
ALW:CCSCQ;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`OK` = Request accepted.

`NG` = No good. May also include are:
- `CQ START TIME NOT SET` = Use RC/V 8.15 (Office Parameter View) to select a CQ START TIME, the re enter this command again.

ALW:CONFLOG

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that logging of all errors for a specified administrative module (AM) unit and any units beneath it that are reported to CONFIG be allowed. Error logging continues until the INH:CONFLOG input message is executed.

2. FORMAT

```
ALW:CONFLOG:a=b;
```

3. EXPLANATION OF MESSAGE

`a` = Unit name, as specified in the unit control block (UCB). Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

`b` = Unit number, as specified in the UCB. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`OK` = Good. Request completed.

`PF` = Printout follows. Followed by the ALW:CONFLOG output message.

`RL` = Retry later. Equipment configuration database (ECD) access failure.

ALW:CORCLOG-SM

Software Release: 5E10 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

To enable the logging of customer-originated recent changes for one or more switching modules (SMs).

2. FORMAT

```
ALW:CORCLOG,SM=a;
```

3. EXPLANATION OF MESSAGE

`a` = SM number or range lower limit if a of SM numbers.

`b` = Upper limit if a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The input message is not valid.

`OK` = Good. The request is accepted.

5. REFERENCES

Input Message(s):

`ALW:RCLOG`

ALW:CPUQADM

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Permits the redistribution of call pick up (CPU) queues from one switching module (SM) to another SM based on the resources available per SM.

2. FORMAT

```
ALW:CPUQADM;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows. May also include:

- `CPU QUEUE ADMINISTRATION SUCCESSFULLY COMPLETED` = All processing in determining CPU queue redistribution has been completed along with redistributing the queues to another SM if needed.
- `REDISTRIBUTION OF CPU QUEUES NOT NECESSARY AT THIS TIME` = The read of certain data has indicated that there is no reason to redistribute the CPU queues.
- `UNABLE TO REDISTRIBUTE CPU QUEUES AT THIS TIME` = The read or update of certain static relations have failed due to data base inconsistency or inability to perform cross processor reads or updates. A check to see if any SM is not linked to the administration module (AM) will determine if the redistribution of CPU queues should be tried again at a time when all SMs are linked.

5. REFERENCES

None.

ALW:DCGRPT

Software Release: 5E10 and later
Command Group: MEAS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the reporting of information related to calls pegging the default cell group (DCG) be allowed. The default cell group is the zero cell group. Cell groups are used for division of revenue traffic separation. Calls pegging the zero cell group are due to division of revenue translation errors. Allowing this report under those conditions will provide reports of originating and terminating information for the calls pegging the zero cell group. The report will be terminated automatically after printing 32 reports.

WARNING: This message should not be used during periods of heavy receive-only printer (ROP) usage. The output from this message, REPT DCGRPT, can be throttled during periods of heavy ROP output. The impact of throttling is that anywhere from one to all of the reports, including the "Auto Termination" message, may not be printed.

2. FORMAT

```
ALW:DCGRPT;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `ALREADY ALLOWED` = The request has been denied because the report has already been allowed.
- `NOT ALLOWED - DIV OF REV OPTION OFF` = The request has been denied because division of revenue option must be on.

`OK` = Good. The request has been accepted. All subsequent occurrences of calls pegging the default cell group will print an information report. Refer to the REPT:DCGRPT output message.

ALW:DEBUG-A

Software Release: 5E10 - 5E11
Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that debugging messages be allowed to be printed for a given feature. Allowing debugging messages on a switching module (SM) causes additional ASSERT and PTRACE messages to be printed during error handling.

Note: The PTRACE message class must be allowed in order to print PTRACE messages - refer to the CHG:LPS-MSGCLS input message.

WARNING: Before using this input message, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual. The user is responsible for any effects on system operation that result from the use of this input message.

Do not leave the debugger allowed for an indefinite period of time.

Format 1 is for ALE, CCS7MTCE, DIGITAL, METALLIC and MLT SM only cases. Format 2 is for CCS7MTCE and MLT AM only cases. Format 3 is for MLT AM and SM cases.

2. FORMAT

```
[1]    ALW:DEBUG,a,SM[=b[&&c]];

[2]    ALW:DEBUG,a,AM;

[3]    ALW:DEBUG,a;
```

3. EXPLANATION OF MESSAGE

`AM` = Administrative module.

`SM` = Switching module.

`a` = Feature with additional debugging messages. Valid value(s):

- `ALE` = Automatic line evaluation.
- `CCS7MTCE` = Common channel signal maintenance activity.
- `DIGITAL` = Digital testing of lines (TST:DSL) and trunks (TST:TRK).
- `METALLIC` = Metallic path setup.
- `MLT` = Mechanized loop test.

`b` = SM number or the lower limit of a range of SM numbers (defaults to all equipped SMs). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.

PF = Printout follows. Followed by ALW:DEBUG output message.

3. EXPLANATION OF MESSAGE

`AM` = Administrative module.

`SM` = Switching module.

`a` = Feature with additional debugging messages. Valid value(s):

- `ALE` = Automatic line evaluation.
- `CCS7MTCE` = Common channel signal maintenance activity.
- `DIGITAL` = Digital testing of lines (TST:DSL) and trunks (TST:TRK).
- `METALLIC` = Metallic path setup.
- `METPTRACE` = Metallic related PTRACEs.
- `METALLMSG` = Metallic path setup blockage and failure (REPT:METALLIC).

Copyright © 1999

METRESBLK = Metallic path setup resource blockage (REPT:METALLIC).
METSWBLK = Metallic path setup software blockage (REPT:METALLIC).
METHWFAIL = Metallic path setup hardware failure (REPT:METALLIC).
MLT = Mechanized loop test.

b = SM number or the lower limit of a range of SM numbers (defaults to all equipped SMs). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.

PF = Printout follows. Followed by ALW:DEBUG output message.

ALW:DEBUG-C

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that debugging messages be allowed to be printed for a given feature. Allowing debugging messages on a switching module (SM) causes additional ASSERT, PTRACE, and debugging output messages to be printed during error handling.

Note: The PTRACE message class must be allowed in order to print PTRACE messages - refer to the CHG:LPS-MSGCLS input message.

WARNING: Before using this input message, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual. The user is responsible for any effects on system operation that result from the use of this input message.

Using the METSUCCESS option will result in the output message REPT:METALLIC being printed for every successful metallic path setup completion. This could result in a large number of output messages being sent to the read-only printer if automated metallic testing is being done with this option allowed.

Do not leave the debugger allowed for an indefinite period of time.

Note: Using METALLMSG will allow METRESBLK, METSWBLK, and METHWFAIL.

Format 1 is for ALE, CCS7MTCE, DIGITAL, METALLIC, METPTRACE, METALLMSG, METRESBLK, METSWBLK, METHWFAIL, METSUCCESS, and MLT SM only cases. Format 2 is for CCS7MTCE and MLT AM only cases. Format 3 is for MLT AM and SM cases.

2. FORMAT

```
[1]    ALW:DEBUG,a,SM[=b[&&c]];

[2]    ALW:DEBUG,a,AM;

[3]    ALW:DEBUG,a;
```

3. EXPLANATION OF MESSAGE

`AM` = Administrative module.

`SM` = Switching module.

`a` = Feature with additional debugging messages. Valid value(s):

`ALE` = Automatic line evaluation.

Copyright © 1999

CCS7MTCE = Common channel signal maintenance activity.

DIGITAL = Digital testing of lines (TST:DSL) and trunks (TST:TRK).

METALLIC = Metallic path setup ASSERT and PTRACE messages with low-level unformatted information, not intended for general customer use.

METPTRACE = Metallic related PTRACE messages.

METALLMSG = Metallic path setup blockage and failure (REPT:METALLIC).

METRESBLK = Metallic path setup resource blockage (REPT:METALLIC).

METSWBLK = Metallic path setup software blockage (REPT:METALLIC).

METHWFAIL = Metallic path setup hardware failure (REPT:METALLIC).

METSUCCESS = Metallic path setup completed successfully (REPT:METALLIC).

MLT = Mechanized loop test.

b = SM number or the lower limit of a range of SM numbers (defaults to all equipped SMs). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.

PF = Printout follows. Followed by ALW:DEBUG output message.

ALW:DLNHB

Software Release: 5E10 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the common network interface (CNI) automatic direct link node (DLN) heartbeat test be allowed. The ALW:DLNHB and INH:DLNHB input messages form the basic on/off mechanism for DLN heartbeat. When the ALW:DLNHB is issued, the "DLN heartbeat test" checks each switching module (SM) for its ability to communicate with the DLN. It cycles through all the SMs checking one every 30 seconds. This input message will allow the automatic testing to continue until and INH:DLNHB is issued.

2. FORMAT

```
ALW:DLNHB;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `DLNs ARE NOT EQUIPPED` = DLN heartbeat is neither necessary nor enabled when the CNI ring is not equipped with DLNs.

`OK` = Good. Automatic testing allowed.

5. REFERENCES

Input Message(s):

ALW:DMQ

Software Release: 5E10 and later
Command Group: MAINT
Application: 5,3B
Type: Input

1. PURPOSE

Allows previously inhibited or suspended sources to send automatic maintenance requests to the administrative module (AM) maintenance input request administrator (MIRA).

Format 1 reverses the effect of an inhibit source message (INH:DMQ) for a specified source of automatic maintenance requests. Format 2 is valid only while execution of deferred maintenance requests is suspended during system recovery. It allows execution of deferred maintenance requests during system recovery.

2. FORMAT

```
[1]    ALW:DMQ:SRC=a;

[2]    ALW:DMQ:RUN;
```

3. EXPLANATION OF MESSAGE

`a` = Three-character source name. Valid value(s):

- `ADP` = Automatic diagnostic process.
- `ALL` = Allows all automatic maintenance requests by clearing the inhibited sources.
- `ARR` = Automatic ring recovery.
- `REX` = Routine exerciser.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ALW:DMQ output message.

5. REFERENCES

Input Message(s):

```

ALW:DOC

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that dynamic overload control (DOC) treatment be allowed upon the reception of DOC signals for a specified trunk group.

2. FORMAT

```
ALW:DOC,TG=a;
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group number.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID REQUEST` = The request has been denied. This office is not equipped to process the request entered.

`PF` = Printout follows. Followed by the ALW:DOC output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The necessary resources are not available.

ALW:DRHR

Software Release: 5E10 and later
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Allows the division of revenue hourly (DRHR) report to be output to the traffic channel. The report will continue to be made until turned off by the INH:DRHR message.

2. FORMAT

```
ALW:DRHR;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `PRINT ALLOCATION EXCEEDED` = The message allocation for this office has reached its limit. The requested report has not been allowed.

`OK` = Good. The requested report has been allowed. May also include:
- `DIV OF REV OPTION OFF` = The report has been allowed, but may not be seen because the option for division of revenue reporting or for an hourly report is turned off.
- `LPS SET TO DISCARD` = The report has been allowed, but may not be seen because the log/print status is set to discard this class of message.

ALW:DSILC

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that the transmission of dynamic overload control (DOC) signals and the application of selective incoming load control (SILC) be allowed.

2. FORMAT

```
ALW:DSILC;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID REQUEST` = The request has been denied. This office is not equipped to process the request entered.

`PF` = Printout follows. Followed by the ALW:DSILC output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The necessary resources are not available.

ALW:EAIINT

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5,3B
Type: Input

1. PURPOSE

Allows the logging and processing of emergency action interface (EAI) error interrupts from the 3B21D computer control unit (CU) specified in the identification field. If a CU is not specified with the input request, EAI error interrupts for both CUs are allowed.

NOTE: The 3B20D computer CUs do not have EAI error interrupts.

2. FORMAT

```
[1]    ALW:EAIINT;

[2]    ALW:EAIINT:CU a;
```

3. EXPLANATION OF MESSAGE

`a` = CU number 0 or 1.

4. SYSTEM RESPONSE

`PF` = Printout Follows. Followed by the ALW:EAIINT output message.

`?I` = Invalid response. May also include:
- `INPUT ERROR` = Identification field error.

ALW:ERRCHK

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5,3B
Type: Input

1. PURPOSE

Allows the logging and processing of all administrative module (AM) computer error sources. This message causes the inhibit administrator to set the inhibit status to allowed for all AM computer inhibit sources. These include HDWCHK, SFTCHK, ERRINT, and the ERRSRC representing the control unit (CU) complexes.

2. FORMAT

```
ALW:ERRCHK;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ALW:ERRCHK output message.

5. REFERENCES

Input Message(s):

OP:ERRCHK
```

Copyright © 1999

ALW:ERRINT

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the logging and processing of administrative module (AM) error interrupts attached to the unit specified in the identification field be allowed. If a unit name is not specified with the input request, then error interrupts for all AM units are allowed.

2. FORMAT

```
ALW:ERRINT[:(a b[,c d])];
```

3. EXPLANATION OF MESSAGE

`a` = Unit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for computer unit names.

NOTE: Allowing a control unit (CU) in an active/standby duplex configuration allows both CUs since they must be kept in identical states.

`b` = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

`c` = Subunit name, if `a` = `CU`. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual for subunit names.

`d` = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. Indicates the unit name and number specified was found in the database but is unequipped.

`PF` = Printout follows. Followed by the ALW:ERRINT output message.

`?I` = Identification field error. Possibly indicates the unit name and number specified cannot be found in the database.

ALW:FAC-A

Software Release: 5E10 - 5E11
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Request to allow reports of transmission facility performance monitoring (PM) threshold crossing alert (TCA) report output messages (refer to the REPT:FAC output message) for facilities terminated on a digital facilities interface (DFI) model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S). This message does not override alert inhibits specified using recent change/verify (RC/V) views 8.1, 20.23, 20.25, or 22.15. To determine a unit's alert control status refer to the OP:FAC input message.

2. FORMAT

```
ALW:FAC,a;
```

3. EXPLANATION OF MESSAGE

a = Valid value(s):

DFAC=n-b-c-d[,e]	IFAC=n-f-g[,e]
DFI=n-b-c[,e]	RT=n-f-h[,e]
DLTU=n-b[,e]	SM=n
DNUS=n-i[,e]	STEFAC=n-i-j-k[,e]
DS1SFAC=n-i-j-l-m[,e]	VT1FAC=n-i-j-l-m[,e]
IDCU=n-f[,e]	

b = DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Type of alerts to allow. Valid value(s):

- ALL = Both 15-minute and daily alerts (default).
- DAY = Daily alerts.
- INT = 15-minute interval alerts.

f = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = IFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = TR303 RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

`j` = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`k` = STE facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`l` = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`m` = VT1.5 facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`n` = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. The request has been accepted and the ALW:FAC output message follows.
`NG` = No good. The input contained an illegal specification.
`RL` = Retry later. The request has been denied, probably due to system load.

ALW:FSYS-ACCESS

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the access permissions of a specific file be changed. Permissions allow the owner, group, and others to read, write, and execute a file.

WARNING: Incorrect permission values can prevent the system from accessing needed files or executing input messages and processes.

2. FORMAT

```
ALW:FILESYS,ACCESS=a,FN="b";
```

3. EXPLANATION OF MESSAGE

`a` = A 3-digit number giving access permissions for owner, group and others, in that order. Valid value(s):

- `1` = Execute (search in directory) only.
- `2` = Write only.
- `3` = Write and execute (search).
- `4` = Read only.
- `5` = Read and execute (search).
- `6` = Read and write.
- `7` = Read, write, and execute (search).

`b` = Full pathname of the file or directory.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ALW:FSYS-ACCESS output message.

5. REFERENCES

ALW:FSYS-MOUNT

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Allows a removable file system to be mounted.

2. FORMAT

```
ALW:FILESYS,MOUNT,FN="a",BSDIR="b"[,RO][,AUD];
```

3. EXPLANATION OF MESSAGE

`AUD` = File manager is to audit the file system prior to mounting it.

`RO` = File system is to be mounted read only.

`a` = Special device filename of the file system to be mounted. Refer to the ECD/SG manual.

`b` = The base directory of the mounted file system, from which all file names in that file system must descend.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ALW:FSYS-MOUNT output message and a PRM output message.

ALW:FSYS-OWNER

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the owner and group of a specific file be changed.

WARNING: Incorrect owner specifications can prevent the system from accessing needed files.

2. FORMAT

```
ALW:FILESYS,OWNER="a", FN="b";
```

3. EXPLANATION OF MESSAGE

`a` = User ID of the new owner of the file.

`b` = Pathname of the file.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ALW:FSYS-OWNER output message.

ALW:GKCCR

Software Release: 5E10 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests that automatic periodic execution of the generated key collection and compression routine (GKCCR) be allowed in specified processors. Either specific processors can be specified or no processors can be specified. If no processors are specified, then the GKCCR will be allowed in every processor.

2. FORMAT

```
ALW:GKCCR[,SM=a[&&b]][,CMP=c][,AM];
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = Switching module (SM) number or the lower limit of a range of SM numbers.

`b` = The upper limit of a range of SM numbers.

`c` = Communications module processor (CMP) number.

4. SYSTEM RESPONSE

`NG` = No good. The input request is invalid. May also include:
`- NO VALID PROCESSOR SPECIFIED` = Specific processor(s) were specified in the input request line, but no requested processor was operational. If specific processors are to be requested, at least one requested processor must be operational.

`OK` = Good. Request was accepted.

ALW:HDW-AIU

Software Release: 5E11 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware checks on an access interface unit (AIU).

2. FORMAT

```
ALW:HDWCHK,AIU=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = AIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. Followed by the ALW:HDW-AIU output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-CDFI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows maintenance interrupts to occur on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit. The system enables the interrupts if internal checks allow the transition.

2. FORMAT

```
ALW:HDWCHK,CDFI=a-b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number.

`b` = Digital line and trunk unit (DLTU) number.

`c` = CDFI number.

4. SYSTEM RESPONSE

`NG` = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:

- `NOT STARTED UNIT IN GROWTH STATE`
- `SM DOES NOT EXIST`
- `SM UNEQUIPPED`
- `UNIT DOES NOT EXIST`

`PF` = Printout follows. The ALW:HDW-CDFI output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-CDI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified control data interface (CDI).

2. FORMAT

```
ALW:HDWCHK,CDI=a-b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. The ALW:HDW-CDI output message follows.

5. REFERENCES

Output Message(s):

`ALW:HDW-CDI`

Input Appendix(es):

`APP:RANGES`

ALW:HDW-CLNK

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Allows level 2 and level 3 hardware checks errors to be performed on one or all communication links (CLNKs). (Refer to the Corrective Maintenance Manual for an explanation of level 2 and level 3 errors.)

2. FORMAT

```
ALW:HDWCHK,CLNK{=a-b-c-d|,ALL};
```

3. EXPLANATION OF MESSAGE

`ALL` = Allow errors on all communication links.

`a` = Switching module (SM) number.

`b` = Office network and timing complex (ONTC) side.

`c` = Module message processor (MMP) type. Valid value(s):
- `0` = Alpha.
- `1` = Beta.

`d` = Message switch (MSGS) side.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `- ALL NOT VALID WITH A SINGLE UNIT` = A single CLNK and ALL may not be specified together.
- `- UNIT UNEQUIPPED` = The specified single CLNK is unequipped.

`PF` = Printout follows. A printout will follow when the requested action is completed.

ALW:HDW-CM

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on all communication module (CM) units. This includes the message switch control unit (MSCU) (for communication module model 2; hardware only), foundation peripheral controller (FPC), pump peripheral controller (PPC), module message processor (MMP), office network and timing complex (ONTC), and communication links (CLNKs).

2. FORMAT

```
ALW:HDWCHK,CM;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`IP` = In progress. May also include:
`- PENDING EXIT FROM MANUAL CM ISOLATION` = The request cannot be executed now because the communication module (CM) is isolated from the administrative module (AM) by a manual request. The request will be acted upon once AM communication with the CM is re-established.

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows. The request has been accepted and the ALW:HDW-CM output message follows.

`RL` = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full; try again later.

ALW:HDW-CMP

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified communication module processor (CMP).

Note: This command is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

```
ALW:HDWCHK,{CMP=a-b|CMP=b,{PRIM|MATE}};
```

3. EXPLANATION OF MESSAGE

`MATE` = Mate, or non-active, CMP member.

`PRIM` = Primary, or active, CMP member.

`a` = Message switch side number.

`b` = CMP number.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows. The ALW:HDW-CMP output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-DFIH

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware checks to occur on a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH). The system enables the hardware checks if internal status allows the transition.

2. FORMAT

```
ALW:HDWCHK,DFIH=a-b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = RISLU digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

```
CONFLICT WITH UNIT STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

`PF` = Printout follows. The ALW:HDW-DFIH output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) service group circuit.

2. FORMAT

```
ALW:HDWCHK,IDCU=a-b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = IDCU service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. The ALW:HDW-IDCU output message follows.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-IDCUELI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit.

2. FORMAT

```
ALW:HDWCHK,IDCUELI=a-b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = ELI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. The ALW:HDW-IDCUELI output message follows.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-IFAC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) facility (IFAC) circuit. This input message will only work on IFACs associated with the A and P facilities for the TR008 remote terminal (RT) and on the protection line for the TR303 RT.

2. FORMAT

```
ALW:HDWCHK,IFAC=a-b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = IFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. The ALW:HDW-IFAC output message follows.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-ISLU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware checks on an integrated services line unit (ISLU) common controller (CC) or common data (CD).

2. FORMAT

```
ALW:HDWCHK,ISLU{a}=b-c-d;
```

3. EXPLANATION OF MESSAGE

a = Circuit name. Valid value(s):
- CC = Common controller.
- CD = Common data.

b = Switching module (SM) number.

c = Integrated services line unit number.

d = Valid value(s):

If 'a' =	'd' =
CC	Common controller number.
CD	Common data number.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.

PF = Printout follows. The ALW:HDW-ISLU output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-ISLUCC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware checks be allowed on an integrated services line unit common controller (ISLUCC).

2. FORMAT

```
ALW:HDWCHK,ISLUCC(a,b,c)!
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. The ALW:HDW-ISLUCC output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-ISTF

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware checks in an integrated services test function (ISTF) unit to occur. The system enables the indicated interrupt if internal checks allow the transition.

2. FORMAT

```
ALW:HDWCHK,ISTF=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number.

`b` = ISTF unit number.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because it conflicts with current equipment status. May also include:
- `SM DOES NOT EXIST` = The requested SM does not exist in the system.
- `SM UNEQUIPPED` = The SM specified in the request is unequipped.
- `UNIT DOES NOT EXIST` = The request unit does not exist in the system.

`PF` = Printout follows. The request has been accepted. Followed by the ALW:HDW-ISTF output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

ALW:HDW-LDSF

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows maintenance hardware checks in a local digital service function (LDSF) circuit to occur. The system enables the indicated interrupt if internal checks allow the transition.

2. FORMAT

```
ALW:HDWCHK,LDSF=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number.

`b` = LDSF number.

4. SYSTEM RESPONSE

`NG` = No good. Message syntax is valid, but the request conflicts with current equipment status. This includes a text explanation.

`PF` = Printout follows. The request has been accepted. Followed by the ALW:HDW-LDSF output message.

`RL` = Retry later. This includes a text explanation for why the user should retry later.

ALW:HDW-LDSU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows maintenance hardware checks in a local digital service unit - model 2 (LDSU2) board to occur. The system enables the indicated interrupt if internal checks allow the transition.

2. FORMAT

```
ALW:HDWCHK,LDSU=a-b-c;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Local digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. Message syntax is valid, but the request conflicts with current equipment status. This includes a text explanation.

`PF` = Printout follows. The request has been accepted. The ALW:HDW-LDSU output message follows.

`RL` = Retry later. This includes a text explanation for why the user should retry later.

ALW:HDW-MCTSI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a hardware check (HDWCHK) be allowed in a module controller/time-slot interchange unit (MCTSI). The system enables the indicated HDWCHK if internal checks allow the transition.

2. FORMAT

```
ALW:HDWCHK,MCTSI=a-b,c;
```

3. EXPLANATION OF MESSAGE

a = Switching module (SM)/SM-2000 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Module controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Keyword that specifies inhibit bit name. Valid value(s):

NOTE: If the keyword is invalid for the specified SM/SM-2000, the request will be denied with the message `STOPPED REQUEST NOT ALLOWED`.

- `ALL` = All valid module controller maintenance errors.
- `AFFCI` = Active flip-flop cleared interrupt. Valid for SMs with the MCTU3 (module controller/time slot interchange unit 3) and for SM-2000s.
- `ARPV` = Arbitration protocol violation error. Valid for SM-2000 only.
- `ASDPE` = Synchronous data link controller (SDLC) A reset. Not valid for SM-2000.
- `BSDPE` = SDLC B reset. Not valid for SM-2000.
- `CACHE` = Cache errors. Allowing CACHE on SM-2000s with cache allows the interrupts source while on non-SM-2000s with caches it enables the cache area (the normal mode of operation) as well, which speeds up the operation of the processor. This option is only valid for SMs with the MCTU2 (module controller/time slot interchange unit 2), the extended memory addressing (EMA) 20 or SM-2000s equipped with a CORE60 processor pack. If this error has been inhibited, allowing it will improve processor performance.
- `CADPR` = Memory address mismatch error. Valid for SM-2000 only.
- `CBERR` = Correctable bit error. If this error has been inhibited, allowing it will improve processor performance. Inhibiting this has no performance impact on SM-2000 or MCTU3.
- `CI0IN` = Control interface 0 interrupt.
- `CI1IN` = Control interface 1 interrupt.
- `CPINT` = Enhanced central processor intervention interrupt.
- `DCODE` = Decode error. Valid for SM-2000 only.
- `DL0PE` = Dual link interface (DLI) 0 parity error. Not valid for SM-2000.
- `DL1PE` = DLI 1 parity error. Not valid for SM-2000.
- `DLI0I` = Data link 0 interrupt. Not valid for SM-2000.
- `DLI1I` = Data link 1 interrupt. Not valid for SM-2000.
- `DLISW` = DLI switch error. Not valid for SM-2000.

Copyright © 1999

IAC0	= DLI0 illegal access error. Not valid for SM-2000.
IAC1	= DLI 1 illegal access error. Not valid for SM-2000.
LPVER	= Bus lock violation. Valid for SM-2000 only.
MADPE	= Address parity error.
MAPCMSC	= Application controller miscellaneous errors (loss of clock, receive cyclic-redundancy-check error, loss of synchronization, and subunit mismatch error). Valid for SM-2000 only.
MCINT	= Resets in the mate controller.
MDLIE	= DLI interface error. Not valid for SM-2000.
MH0IN	= Message handler 0 interrupt. Valid for SM-2000 only.
MH1IN	= Message handler 1 interrupt. Valid for SM-2000 only.
MH2IN	= Message handler 2 interrupt. Valid for SM-2000 only.
MIOIO	= I/O invalid operation error.
MIOLE	= I/O timer lock error.
MIOPE	= I/O bus parity error. Not valid for SM-2000.
MIOTO	= I/O timer time out error.
MIOUE	= I/O unlock error.
MMEME	= Memory system error. Not valid for SM-2000.
MPRIN	= Maintenance interrupts in the mate MCTSI.
MRDYT	= Ready time out.
MRSPERR	= Multiple response error. Valid for MCTU2 and SM-2000 only.
MRWPE	= Read or write parity error.
MSUSM	= Subunit select mismatch. Not valid for SM-2000.
MWPER	= Write protect error.
NCBERR	= Non-correctable bit error. Valid for SM-2000 only.
PIINT	= Packet interface (PI) interrupt.
PUMPHW	= Pump hardware errors. Valid for MCTU2, MCTU3, and SM-2000 only.
REFE	= Dynamic RAM refresh fail error. Valid for SM-2000 only.
SPINT	= Signal processor interrupt. Not valid for SM-2000.
SSYNC	= Scanned I/O sync error. Valid for SM-2000 only.
STKE	= Stack protect error. Not valid for SM-2000.
TSIIN	= Time-slot interchange (TSI) interrupt. For SM-2000, this will allow interrupts from network link interfaces (NLIs) if the NLIs are not inhibited by an INH:HDWCHK-ONTC request.
TSI4IN	= TSI model four interrupt. Allowing this bit will not affect the inhibits for NLIs. Use this if you want to inhibit only TSI interrupts. Valid for SM-2000 only.

4. SYSTEM RESPONSE

PF	= Printout follows. Followed by the ALW:HDW-MCTSI output message.
RL	= Retry later. The message cannot be processed, so try the message again later. This response will be output if the AM cannot communicate with the requested SM/SM-2000.

ALW:HDW-NCREF

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on a specified network clock reference (NCREF).

2. FORMAT

```
ALW:HDWCHK,NCREF,a=b;
```

3. EXPLANATION OF MESSAGE

`a` = Network clock reference (NCREF).

Network clock type:	Valid value(s):
Network clock 1 (NC1)	`PRIM` = Primary reference. `SEC` = Secondary reference. `XC` = Cross-couple reference.
Network clock 2 (NC2)	`REFn` = Reference number. `XC` = Cross-couple reference.

`b` = Network clock side.

4. SYSTEM RESPONSE

`NG` = No good. The message syntax is valid, but the request conflicts with the current system or equipment status.

`PF` = Printout follows. The ALW:HDW-NCREF output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-ONTC

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on the specified office network and control complex (ONTC).

2. FORMAT

```
ALW:HDWCHK,ONTC=a;
```

3. EXPLANATION OF MESSAGE

`a` = Side of ONTC.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows.

`RL` = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

ALW:HDW-PPC

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified pump peripheral controller (PPC).

2. FORMAT

```
ALW:HDWCHK,PPC=a;
```

3. EXPLANATION OF MESSAGE

`a` = PPC number.

4. SYSTEM RESPONSE

`NG` = No good. The message was invalid.

`PF` = Printout follows.

ALW:HDW-PSU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware checks on a packet switch unit (PSU) common controller (COM) or protocol handler (PH).

2. FORMAT

```
ALW:HDWCHK,PSU{a}=b-c-d[-e];
```

3. EXPLANATION OF MESSAGE

a = Circuit name. Valid value(s):
- COM = Common controller.
- PH = Protocol handler.

b = Switching module (SM) number.

c = PSU number.

d = Valid value(s):

If 'a' =	'd' =
COM	Service group number.
PH	Shelf number.

e = Protocol handler number.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The ALW:HDWCHK-PSU output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-QGP

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified quad-link packet switch gateway processor (QGP).

2. FORMAT

```
ALW:HDWCHK,QGP=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Message switch (MSGS) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows. The ALW:HDW-QGP output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-RAF

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware checks in a recorded announcement function (RAF) unit to occur. The system enables the indicated interrupt if internal checks allow the transition.

2. FORMAT

```
ALW:HDWCHK,RAF=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number.

`b` = RAF unit number.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `SM DOES NOT EXIST` = The requested SM does not exist in the system.
- `SM UNEQUIPPED` = The SM specified in the request is unequipped.
- `UNIT DOES NOT EXIST` = The requested unit does not exist in the system.

`PF` = Printout follows. The request has been accepted. Followed by the ALW:HDW-RAF output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

ALW:HDW-RCL

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified remote communication link (RCL) circuit between inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuits.

2. FORMAT

```
ALW:HDWCHK,RCL=a-b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number.

`b` = Digital line and trunk unit (DLTU) number.

`c` = CDFI number.

`d` = Facility (FAC) number. The FAC number is the T1 facility number on a CDFI.

4. SYSTEM RESPONSE

Refer to the System Responses Table in the Input Messages User Guidelines.

ALW:HDW-RCLK

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on the specified remote clock (RCLK) circuit at the peripheral interface control bus (PICB) level. This message will also allow hardware checks to occur on the mate remote clock cross couple (RCXC) if the RCXC is in service.

2. FORMAT

```
ALW:HDWCHK,RCLK=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number.

`b` = RCLK side.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

```
NOT STARTED UNIT IN GROWTH STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

`PF` = Printout follows. The ALW:HDW-RCLK output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-RCOSC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on the specified remote clock oscillator (RCOSC) circuit. This message will also allow hardware checks to occur on the remote clock oscillator cross couple (RCOXC) if the RCOXC is in service.

2. FORMAT

```
ALW:HDWCHK,RCOSC=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number.

`b` = RCOSC side.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

```
NOT STARTED UNIT IN GROWTH STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

`PF` = Printout follows. The ALW:HDW-RCOSC output message follows.

`RL` = Repeat later. The request cannot be executed now due to unavailable system resources.

ALW:HDW-RCREF

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on the specified remote clock reference (RCREF).

2. FORMAT

```
ALW:HDWCHK,RCREF=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number.

`b` = Equipped reference number.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

```
NOT STARTED UNIT IN GROWTH STATE
SM DOES NOT EXIST
SM UNEQUIPPED
UNIT DOES NOT EXIST
```

`PF` = Printout follows. The ALW:HDW-RCREF output message follows.

ALW:HDW-SM-A

Software Release: 5E10 - 5E13
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows all hardware error checks in one or more switching modules (SMs). This message cancels the effect of the INH:HDWCHK input message.

2. FORMAT

```
ALW:HDWCHK,SM=a[&&b][,LSM][,HSM][,RSM][,ORM][,TRM];
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = SM number or lower limit of a range of SMs.

`b` = Upper limit of the range of SM numbers.

4. SYSTEM RESPONSE

`IP` = In progress. The message was accepted and the request is in progress.

`NG` = No good. The message was not accepted because an illegal SM number or range was specified.

ALW:HDW-UCONF

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on the specified universal conference (UCONF) circuit board.

2. FORMAT

```
ALW:HDWCHK,UCONF=a-b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Digital service circuit board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

Refer to the System Responses Table in the Input Messages User Guidelines.

5. REFERENCES

Input Appendix(es):

`APP:RANGES`

Copyright © 1999

ALW:HDW-UTD

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on the specified universal tone decoder (UTD).

2. FORMAT

```
ALW:HDWCHK,UTD=a-b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Local digital service unit (LDSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = DSU board position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

Refer to the System Responses Table in the Input Messages User Guidelines.

5. REFERENCES

Input Appendix(es):

`APP:RANGES`

Copyright © 1999

ALW:HDW-UTG

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on the specified universal tone generator (UTG).

2. FORMAT

```
ALW:HDWCHK,UTG=a-b-c-d;
```

3. EXPLANATION OF MESSAGE

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Local digital service unit (LDSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = DSU board position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

Refer to the System Responses Table in the Input Messages User Guidelines.

ALW:HDWCHK

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the system status register be set such that a control unit (CU) switch can be implemented as a normal fault recovery procedure, thereby allowing a switch to the standby administrative module (AM) control unit when a fault occurs in the active AM control unit.

2. FORMAT

```
ALW:HDWCHK;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ALW:HDWCHK output message.

5. REFERENCES

Input Message(s):

ALW:HIST

Software Release: 5E10 and later
Command Group: NOCHK
Application: 5
Type: Input

1. PURPOSE

Allows history recording for the terminal upon which it is entered. Subsequent input requests entered at the terminal will be stored and available for recall and edit. ALW:HIST does not clear the command history buffer.

By default, history recording is enabled when a terminal comes into service.

2. FORMAT

```
ALW:HIST
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`OK` = OK. Input request was accepted and has been applied.

ALW:HWGRD

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of a line removal message on the receive-only printer (ROP) be allowed when a line unit, dial tone first (DTF) coin, or integrated services line unit (ISLU) Z-card (analog line) is placed out-of-service (OOS) maintenance (MTCE) high-and-wet (HW) ground (GRD).

2. FORMAT

```
ALW:HWGRD[,SM=a[&&b]];
```

3. EXPLANATION OF MESSAGE

`a` = SM number or the lower limit of a range of SMs. If no SM number or range is specified, all equipped and operational SMs will be allowed.

`b` = The upper limit of a range of SMs.

4. SYSTEM RESPONSE

`NG` = No good. The message was not recognized or acceptable.

`PF` = Printout follows. Followed by ALW:HWGRD output message.

5. REFERENCES

Input Message(s):

ALW:MDII-A

Software Release: 5E10 - 5E11
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that a specific machine-detected interoffice irregularity (MDII) that was being suppressed be allowed to be printed again.

2. FORMAT

```
ALW:MDII=a,TG=b;
```

3. EXPLANATION OF MESSAGE

`a` = The MDII suppressed on a trunk group. Valid value(s):

- `2SPDT` = Partial dial timeout in the second stage of a traditional 2-stage international outbound call.
- `2SPST` = Permanent signal timeout in the second stage of a traditional 2-stage international outbound call.
- `2SVCA` = Vacant code in the second stage of a traditional 2-stage international outbound call.
- `ABF` = Abandon failure.
- `ACK` = No acknowledgment wink.
- `ANF` = Failure to receive automatic number identification (ANI) digits on incoming LATA trunk.
- `ANF2` = ANI collected by an operator following a failure to receive ANI digits on an incoming centralized automatic message accounting (CAMA) trunk.
- `ANI` = Time-out waiting for far off-hook from Traffic Service Position System (TSPS) before sending ANI digits.
- `AST` = Position acknowledge seizure signal time-out.
- `ATO` = Time-out waiting for address complete signal.
- `BAF` = Blocking acknowledgment failure.
- `BLFCA` = Blocking a fully coded addressed international outbound call routed to a non-CCS trunk.
- `CAF` = Circuit reset acknowledgment failure.
- `CAI` = Address incomplete received.
- `CII` = Initial address message (IAM) irregularity (incoming).
- `CKF` = Continuity check failure (incoming).
- `COF` = Confusion received (outgoing).
- `CRA` = Circuit reservation message (CRM) timer timed out while waiting for a circuit reservation acknowledgment (CRA) message.
- `CRR` = Reset received (incoming).
- `CTO` = Continuity timeout (incoming).
- `CVN` = Vacant national number received (outgoing).
- `DDF` = Delay dial, steady off-hook.
- `DSN` = Delay dial, steady on-hook.
- `EXD` = Extra digit.
- `EXP` = Extra pulse.
- `FCA` = Final closure abandon.

Copyright © 1999

FKP = False key pulse.
FSA = False start abandon.
HGBAF = Hardware group blocking acknowledgment failure.
HGUAF = Hardware group unblocking acknowledgment failure.
IAD = Incomplete address detected (incoming).
IAM = CRA timer timed out while waiting for an IAM.
ICA = Incoming advance.
IDIG = Invalid digit.
KPST = Received call on equal access trunk which contains a KP + ST ANI sequence.
MCA = Misrouted CAMA.
MGBAF = Maintenance group blocking acknowledgment failure.
MGUAF = Maintenance group unblocking acknowledgment failure.
MPS = Misplaced start pulse.
MRF = Message refusal received (outgoing).
MTD = Mutilated digit.
NACK = No ground acknowledgment received on a ground start private facility (FX) trunk.
NKP = No key pulse.
NOANI = Received call on an equal access trunk which contains no ANI information. This call will not be blocked.
ONOA = OSPS nature of address.
OSI = Operator services information.
PAT = Position attached signal time-out.
PDA = Partial dial abandon.
PDT = Partial dial time-out.
PFR = Polarity failure.
PST = Permanent signal time-out.
RLG = Release guard on unstable call (outgoing).
RST = Reset received (outgoing).
SGD = Failure to receive station group designator (SGD).
SSD = No second start dial wink.
TRR = Tip-ring reversal.
TTR = Operator trunk trouble reports.
UAF = Unblocking acknowledgment failure.
UCA = Unauthorized CAMA.
UQL = Unequipped label received (outgoing).
UXS = Unexpected stop.
VCA = Vacant code.
VPA = Voice path assurance timeout (outgoing).
WBF = Incoming wideband call spans facilities or trunk groups.
WSN = Wink start, steady on-hook.
WSR = Wink start, steady off-hook.
XST = Expected stop time-out.

b = Trunk group number.

4. SYSTEM RESPONSE

NA = No acknowledgment. Request has not been acknowledged. It is probable that the request has been lost.

Copyright © 1999

PF	= Printout follows. Request has been accepted. The ALW:MDII output message will follow identifying the results of the request.

ALW:MISMATCH

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that line card/network termination (NT) mismatch detection be allowed on integrated services digital network (ISDN) lines equipped with U-cards. To be certain of the results of this message, the following three conditions should be noted.

First, ALW:MISMATCH without the report (REPT) option will only enable mismatch detection. No output will be provided on the receive-only printer (ROP), but the port status of out-of-service (OOS) blocked (BLKD) lines will be updated to OOS BLKD mismatch (MSMTCH) for those lines having mismatches. Second, ALW:MISMATCH,REPT will provide a printout on the ROP of the lines that have mismatches only if the ALW:MISMATCH message is also entered on a separate message line. ALW:MISMATCH,REPT does not turn on mismatch detection. Third, to allow the NT mismatch detection and the NT mismatch report on a switching module (SM), the office parameters for NT mismatch detection and NT mismatch report must also be set to Y, using Recent Change/Verify (RC/V) OFFICE PARAMETERS view 8.1 (refer to MISMATCH DETECTION ENABLE and REPORT on RC/V view 8.1).

2. FORMAT

```
ALW:MISMATCH[,REPT][,SM=a[&&b]];
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`REPT` = Allow the reporting on the ROP of the lines found to have mismatches, provided that mismatch detection has been allowed.

`a` = SM number or the lower limit of a range of SM numbers. If no SM number or range is specified, all equipped and operational SMs will be allowed.

`b` = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The message was not recognized or acceptable.

`PF` = Printout follows. Followed by ALW:MISMATCH output message.

ALW:MON

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the operating system for distributed switching (OSDS) monitor actions be allowed.

The ALW:MON messages activates the OSDS monitor by setting the monitor control word a non-zero value. This is the first word of the OShisarray monitor buffer in the administrative module (AM) or the SIhistory monitor buffer in the switching module (SM) or the communications module processor (CMP).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it. This message should be used under the guidance of high-level technical support.

NOTE: An increase in the processor occupancy is directly related to the number of options specified for the SET:MON-WTD, SET:MON-DATA, SET:MON-FCN, SET:MON-SPEC input messages.

2. FORMAT

```
ALW:MON,{AM|SM=a|CMP=b-c};
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = Switching module (SM) number.

`b` = Message switch side.

`c` = Communications module processor (CMP) number.

4. SYSTEM RESPONSE

`NG` = No good. Error in format.

`PF` = Printout follows. Followed by ALW:MON output message.

`RL` = Retry later. System resource shortage.

ALW:NMOUT

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of output messages stimulated by the remote network management center (RNMC) be allowed.

2. FORMAT

```
ALW:NMOUT[,TYPE=a];
```

3. EXPLANATION OF MESSAGE

`a` = Message type. The default is to allow all output messages resulting from RNMC actions. Valid value(s):

- `CGAP` = Call gapping code controls messages.
- `DOC` = Dynamic overload controls messages.
- `SILC` = Selective incoming load controls messages.
- `SSTR` = Service selective trunk reservation controls messages.
- `TGC` = Manual trunk group controls messages.
- `TR` = Trunk reservation controls messages.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. May also include:

- `INVALID REQUEST` = This office is not equipped to process the request entered.
- `INVALID TYPE` = An invalid message type was entered.

`OK` = Good. The input message executed successfully.

ALW:PCTF

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the per-call test failure (PCTF) verbose mode be allowed. Allowing the PCTF verbose mode on a switching module (SM) causes individual REPT:PCTF reports to be generated for every PCTF that occurs on the SM. When the PCTF verbose mode is not allowed (inhibited), only the first and tenth occurrences of a PCTF type on a line is reported.

2. FORMAT

```
ALW:PCTF,VERBOSE[,SM=a[&&b]];
```

3. EXPLANATION OF MESSAGE

`a` = SM number or the lower limit of a range of SM numbers. The default is all equipped SMs.

`b` = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The message was not recognized or acceptable.

`PF` = Printout follows. Followed by ALW:PCTF output message.

ALW:PLNT24

Software Release: 5E10 and later
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of the regularly scheduled 24-hour plant report to the receive-only printer (ROP) be allowed. The specified part(s) will continue to be automatically printed until inhibited by the INH:PLNT24 input message.

NOTE: By default, PART24 is inhibited for the ROP and ALW:PLNT24; ALL will not cause PART24 to be allowed for the ROP. PART24 can only be allowed for the ROP by entering `ALW:PLNT24;PART24`.

2. FORMAT

```
ALW:PLNT24:{a|ALL};
```

3. EXPLANATION OF MESSAGE

`ALL` = Allow all parts of the 24-hour plant report (except PART24).

`a` = Name of report part to be allowed. Valid value(s):

- `PART1` = Service measurements.
- `PART2` = Equipment performance.
- `PART3` = Performance measurements.
- `PART4` = Remote switching module (RSM) maintenance service and performance.
- `PART5` = Trunk error analysis.
- `PART6` = Interlata carrier measurements.
- `PART7` = Network call denial.
- `PART8` = RSM cluster measurements.
- `PART9` = Integrated services digital network (ISDN) packet switching office totals.
- `PART10` = Operator Services Position System (OSPS) processors counts.
- `PART11` = ISDN Office totals.
- `PART13` = OSPS real-time rating query measures.
- `PART14` = OSPS facility administration measures.
- `PART15` = OSPS measurements.
- `PART16` = OSPS interflow measures.
- `PART17` = OSPS line information data base (LIDB) measures.
- `PART18` = OSPS customer account services (CAS).
- `PART19` = Action control point (ACP) for software defined networks.
- `PART21` = Leased network action point.
- `PART22` = OSPS intercept measures.
- `PART23` = OSPS customer account services release 3 signaling measures.
- `PART24` = Machine detected inter-office irregularity (MDII) trunk group measurements.
- `PART25` = ISDN user part (ISUP) office totals.
- `PART26` = DS1 measurements.
- `PART27` = Static proportionate bidding (PB) measurements.
- `PART28` = OSPS international credit card validation (ICCV) measures by foreign database.
- `PART29` = OSPS line applications for consumers (LAC) signaling measures.

Copyright © 1999

4. SYSTEM RESPONSE

NG = No good. The request was made during the automatic preparation of the report. The OP:PLNT24-NOT output message will follow. May also include:
- DATA NOT AVAILABLE AT THIS TIME = Report is being generated and, therefore, manual requests are locked out, or the report has not generated since an initialization.

OK = Good. The part(s) was/were allowed.

ALW:PLNTHR

Software Release: 5E10 and later
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of the hourly plant report be allowed. The report will be output until it is inhibited using the INH:PLNTHR input message.

2. FORMAT

```
ALW:PLNTHR;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `PRINT ALLOCATION EXCEEDED` = The message allocation for this office has reached its limit. The requested report has not been allowed.

`OK` = Good. The request was accepted and completed. May also include:
- `LPS SET TO DISCARD` = The report has been allowed, but may not be seen because the log/print status is set to discard this class of message.

ALW:PSLT

Software Release: 5E13 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests the allow for the periodic signaling link test (PSLT).

2. FORMAT

```
ALW:CCS,PSLT,SM=a,[SET=b[MEMBER=c]];
```

3. EXPLANATION OF MESSAGE

`a` = CCS global switching module (GSM) number.

`b` = Link set number (SET). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Link set member (MEMBER). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ALW:CCS,PSLT output message. Shall indicate the success or failure of the allow request.

ALW:PUMP-SM-A

Software Release: 5E10 - 5E13
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests that automatic pump of one or more switching modules (SMs) or a selected communication module processor (CMP) be allowed on a major initialization (selective initialization or full initialization). This message cancels the effect of the INH:PUMP-SM input message.

2. FORMAT

```
ALW:PUMP,{CMP=a|SM=b[&&c]}[,LSM][,HSM][,RSM][,ORM][,TRM];
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = CMP number.

`b` = SM number, or lower limit of a range of SM numbers.

`c` = Upper limit of the range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The message was not accepted because an illegal SM number or invalid range/type combination was specified. The message was not accepted because an illegal CMP number was specified.

`OK` = Good. The message was accepted and the action completed.

ALW:PUMP-SM-B

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests that automatic pump of one or more switching modules (SMs) or a selected communication module processor (CMP) be allowed on a major initialization (selective initialization or full initialization). This message cancels the effect of the INH:PUMP-SM input message.

2. FORMAT

```
ALW:PUMP,{CMP=a|SM=b[&&c]}[,LSM][,HSM][,RSM][,ORM][,TRM];
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = CMP number.

`b` = SM number, or lower limit of a range of SM numbers.

`c` = Upper limit of the range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The message was not accepted because an illegal SM number or invalid range/type combination was specified. The message was not accepted because an illegal CMP number was specified.

`OK` = Good. The message was accepted and the action completed.

ALW:REORD-SM

Software Release: 5E10 and later
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Requests that additional information on calls that are routed to reorder be collected for a switching module (SM) or a range of SMs, and the information be reported on the receive-only printer (ROP) after 15 minutes have elapsed or information for the first 30 reorder events has been collected, whichever occurs first.

2. FORMAT

```
ALW:REORD,SM=a[&&b];
```

3. EXPLANATION OF MESSAGE

`a` = SM number, or the lower limit in a range of SM numbers.

`b` = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The request was denied because the requested feature is already active.

`OK` = Good. Request was accepted.

`RL` = Retry later. Reorder timer is currently unavailable.

ALW:REX

Software Release: 5E10 and later
Command Group: MAINT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that routine exercises (REX) be allowed by clearing individual routine exercise inhibits for one or more hardware communities by clearing the REX temporary inhibit(s). A hardware community consists of a major device controller and its associated subdevices. If a hardware community has REX permanently inhibited, its REX temporary inhibit is not available.

WARNING: It may be desirable to keep REX inhibited on some units. Unless units are specified with this message, all administrative module (AM) controllers including the ring peripheral controller nodes (RPCNs) will be allowed for REX. Because of the configuration of the common network interface (CNI) ring, RPCNs should never be allowed for REX. Allowing REX on RPCNs may lead to service degradation or interruption.

2. FORMAT

```
ALW:REX[,a[=b]];
```

3. EXPLANATION OF MESSAGE

`ALL` = Clear the temporary REX inhibits for all major community controllers that are not permanently inhibited from REX.

`a` = Unit name of a major community controller. Applications may add additional major controllers which may be allowed by this input message. Valid value(s):

- `CU` = Control unit.
- `DCI` = Dual serial channel/computer interconnect.
- `IOP` = Input/output processor.

NOTE: If not specified, then routine exercises will be allowed for all AM controllers.

`b` = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual. If not specified, then all controllers with the specified unit name are allowed.

4. SYSTEM RESPONSE

`NG` = No good. Routing exercises are permanently inhibited for the unit specified or for all the units specified.

`OK` = Good. Routine exercises are allowed for the units specified or for at least one of the units specified.

`PF` = Printout follows. Followed by an ALW:REX output message.

Copyright © 1999

RL = Retry later. The database manager or a database record could not be opened. Try again at a later time. If this persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

ALW:REX-CM-SM

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Allows either one or all valid test types of routine exercise (REX) of the hardware in the communication module (CM) and all switching modules (SMs) or in the CM or in a range of SMs.

2. FORMAT

```
ALW:REX[,CM][,SM=a[&&b]][,c];
```

3. EXPLANATION OF MESSAGE

`a` = SM number, or lower limit of a range of SM numbers.

`b` = Upper limit of a range of SM numbers.

`c` = REX test type to be allowed (default is to allow all three test types). Valid value(s):

- `DGN` = Allow diagnostic exercise.
- `ELS` = Allow electronic loop segregation tests. This is not a valid test type for the CM.
- `FAB` = Allow fabric exerciser tests of grids. This is not a valid test type for the CM.

NOTE: If neither CM nor SM is specified, the default is to exercise hardware in the CM and all SMs.

4. SYSTEM RESPONSE

`NG` = No good. The request was not a valid entry.

`OK` = Good. Request is valid and accepted.

`RL` = Retry later. SM is in an abnormal state. The request cannot be executed now.

ALW:REX-UNIT

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the scheduling of a unit for routine exercise (REX) be allowed in the communication module (CM) or in a switching module (SM). This applies only to diagnostic (DGN) tests.

2. FORMAT

```
ALW:REX{,CM[,d[=c]]|,SM=a,b[=c]};
```

3. EXPLANATION OF MESSAGE

`a` = SM number.

`b` = The SM unit type to be allowed. DGN tests are the only test types that may be inhibited on a unit basis. Valid value(s):

`ASC`	= Alarm service circuit.
`BTSR`	= Bootstrapper circuit.
`DCLU`	= Digital carrier line unit.
`DCTU`	= Directly connected test unit.
`DLTU`	= Digital line and trunk unit.
`DNUS`	= Digital networking unit - synchronous optical network (SONET) (DNU-S).
`GDSF`	= Global digital services function.
`GDSU`	= Global digital service unit.
`IDCU`	= Integrated digital carrier unit.
`ISLU`	= Integrated services line unit.
`ISTF`	= Integrated services test facility.
`LDSU`	= Local digital service unit.
`LU`	= Line unit.
`MCTSI`	= Module controller/time slot interchanger.
`MSU`	= Metallic service unit.
`MTIB`	= Metallic test interface bus.
`PSU`	= Packet switching unit.
`RAF`	= Recorded announcement frame.
`RAU`	= Remote answering unit.
`RCLK`	= Remote clock.
`RLI`	= Remote line interface.
`SAS`	= Service announcement system.
`TU`	= Trunk unit.

`c` = Unit number.

`d` = The CM unit type to be inhibited. Valid value(s):

`MSGS`	= Message switch.
`ONTC`	= Office network timing complex.

Copyright © 1999

4. SYSTEM RESPONSE

NG = No good. The request was not a valid entry.

OK = Good. Request is valid and accepted.

RL = Retry later. SM is in an abnormal state. The request cannot be executed now.

ALW:RPC

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

The purpose of this input message is to allow routine port conditioning. Port conditioning is the process of determining the status of a port, and depending on the port type, setting the hardware and scanning registers to reflect that status.

2. FORMAT

```
ALW:RPC[,SM=a[&&b]];
```

3. EXPLANATION OF MESSAGE

`a` = SM number or the lower limit of a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Upper limit of a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

NOTE: If no SM number or range is specified, all equipped and operational SMs will be allowed.

4. SYSTEM RESPONSE

`PF` = Printout follows. The request has been accepted and the ALW:RPC output message will follow.

`NG` = No good. The input message was not recognized or acceptable.

ALW:RT-FAC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that protection (PROT) line switch requests be allowed to be performed on the specified remote terminal (RT) digital signal level one (DS1) facility (FAC) or requests that a DS1 be allowed to be released from protection. This message is applicable for RTs terminating on an integrated digital carrier unit (IDCU) or a digital carrier line unit (DCLU).

2. FORMAT

```
ALW:RT,FAC=a-b,{PROT|RELEASE};
```

3. EXPLANATION OF MESSAGE

`PROT` = Allow switching from the specified DS1 FAC to the protection line (for use with the DCLU or the IDCU).

`RELEASE` = Allow a DS1 to be released from protection (for use with the IDCU only).

`a` = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = RT DS1 FAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`PF` = Printout follows. An ALW:RT-FAC output message will follow.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

ALW:RTMTBOVR

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that metallic setup failure override be allowed when the metallic test bus (MTB) is found to be open between the test bus control unit (TBCU) and the remote terminal (RT). If the MTB is really open and override is allowed, metallic setup will succeed. The system default is to allow metallic setup failure override.

This message will set an override flag in a switching module (SM) to the allow state. The flag can be set in one SM or in all SMs. If individual SMs are set differently, be aware that if the modular metallic service unit (MMSU) and RT are in different SMs a remote read of the flag stored in the RT SM is done from the MMSU SM. If the remote read fails, the default of the override flag will be that stored in the MMSU SM.

2. FORMAT

```
ALW:RTMTBOVR[,SM=a[&&b]];
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = SM number, or the lower limit of a range of SM numbers. If no SM number or range is specified, all equipped and operational SMs will be allowed.

`b` = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The message was not recognized or acceptable.

`PF` = Printout follows. The request has been accepted and a ALW:RTMTBOVR message will follow.

ALW:RTMTBPRT

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of the REPTRTMTBSID message be allowed when the metallic test bus (MTB) fails the closed diode protocol test during metallic setup to a remote terminal (RT).

The system default is to allow the printing of this message. This can be inhibited with the input message INH:RTMTBPRT. By inhibiting the printing of this message, the ability to see the cause of metallic setup failure will be lost. If, however, metallic setup override is allowed with the message ALW:RTMTBOVR, then it might be desirable not to have the message print. Consider carefully what configuration is desired in the office.

This message will set a print flag in a switching module (SM) to the allow state. The flag can be set in one or in all SMs. If individual SMs are set differently, be aware that if the modular metallic service unit (MMSU) and RT are in different SMs a remote read of the flag stored in the RT SM is done from the MMSU SM. If the remote read fails, the default of the print flag will be that stored in the MMSU SM.

2. FORMAT

```
ALW:RTMTBPRT[,SM=a[&&b]];
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = SM number, or the lower limit of a range of SM numbers. If no SM number or range is specified, all equipped and operational SMs will be allowed.

`b` = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The message was not recognized or acceptable.

`PF` = Printout follows. The request has been accepted and an ALW:RTMTBPRT message will follow.

```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Specific break point to be allowed.

`d` = Maximum number of hits to be allowed for that break point. If not specified MHIT is set to 10.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ALW:RUTILFLAG output message.

ALW:SCORPT

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that information related to switch cutoff calls be allowed, either with or without an accompanying hardware call trace.

A switch cutoff (SCO) occurs when an established connection is broken for some reason other than an onhook by one of the talking parties (that is, hardware or software failures, procedural errors or exhausted resources).

2. FORMAT

```
ALW:SCORPT[,a];
```

3. EXPLANATION OF MESSAGE

`a` = Option selected. Valid value(s):

`DEBUG` = If this option is selected, a more detailed SCO report from a software viewpoint is generated.

NOTE 1: Because of the large amount of information that will print with this option, support personnel should implement this ONLY if a large number of SCOs still occur after all hardware and resource problems have been resolved.

NOTE 2: Additional possible call cutoffs that were not pegged on the measurements report may be shown in this report with this option. This is the only way to see these "possible" call cutoffs.

`TRC` = Print a hardware call trace (TRC:UTIL-LINE) with each SCO report that occurs.

4. SYSTEM RESPONSE

`OK` = Good. The request has been received. All subsequent occurrences of switch cutoff calls will print an information report (REPT:SWITCH-CC).

5. REFERENCES

Input Message(s):

```
INH:SCORPT
```

Output Message(s):

ALW:SCSD

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that transitions of a scanner and signal distributor (SCSD) scan point be reported. Scan points can be identified by physical location (as in Format 1) or by logical address (as in Format 2).

2. FORMAT

```
[1]    ALW:SCSD:UNIT=a,PT=b[-b-b-b-b-b-b-b];

[2]    ALW:SCSD:GRPN="c",DUPID=d,PT=e[-e-e-e-e-e];
```

3. EXPLANATION OF MESSAGE

`a` = SCSD unit member number.

`b` = Physical scan point number on an SCSD.

`c` = Name of the logical SCSD group. Valid value(s):

```
FANACU0
FANACU1
PDF0
PRSWCU0
PRSWCU1
PRSWIOP0
PRSWIOP1
PRSWDFC0
PRSWDFC1
PRSWMHD0
PRSWMHD1
PTSWROP
PTSWMCR
```

`d` = Duplex point ID.

`e` = Number of a point within a logical group.

4. SYSTEM RESPONSE

`NG` = No good. The SCSD administrator process is not active; no communication with SCSD points is possible.

`PF` = Printout follows. Followed by ALW:SCSD output message.

`RL` = Retry later.

ALW:SFTCHK-SM-A

Software Release: 5E10 - 5E13
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests that all software error checks be allowed in one or more switching modules (SMs), or a specified communication module processor (CMP). This message cancels the effect of the INH:SFTCHK input message.

2. FORMAT

```
ALW:SFTCHK,{CMP=a|SM=b[&&c][,LSM][,HSM][,RSM][,ORM][,TRM]};
```

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of any acronyms shown in the format.

`a` = CMP number.

`b` = SM number, or lower limit of a range of SM numbers.

`c` = Upper limit of the range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The message was not accepted because an illegal SM number or invalid range/type combination was specified.

`OK` = Good. The message was accepted and the action completed.

ALW:SRM

Software Release: 5E11 and later
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Requests that the reporting of software resource measurement (SRM) information be allowed for a switching module (SM).

2. FORMAT

```
ALW:SRM,SM=a;
```

3. EXPLANATION OF MESSAGE

`a` = SM number.

4. SYSTEM RESPONSE

`OK` = The request has been accepted. Software resource measurement information will be reported every 30 minutes for the requested SM.

ALW:SSTR

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a single service selective trunk reservation (SSTR) control be allowed for a specified trunk group after being inhibited by the INH:SSTR input message or by the INH option of the ASGN:SSTR input message.

2. FORMAT

```
ALW:SSTR,TG=a;
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group (TG) number that has a SSTR control assigned.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by an ALW:SSTR output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The request could not be accepted because the necessary resources are not available.

ALW:TRACE

Software Release: 5E10 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that tracing be allowed to take place according to the previously input trace parameter settings. The ALW:TRACE and the INH:TRACE input messages form the basic on/off mechanism for trace. The parameter settings may be changed at any time through use of the SET:TRACE (whether tracing is allowed or inhibited). Until the ALW:TRACE request is issued, no trace report will be attempted (although it will consume a certain amount of fixed overhead).

NOTE: The interprocessor message switch (IMS) driver process must be running before trace updates can be sent to the node processors (NP).

2. FORMAT

```
ALW:TRACE;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows. The ALW:TRACE output message will be printed.

5. REFERENCES

Input Message(s):

ALW:TRAP

Software Release: 5E10 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that a pending trap that was entered by the SET:TRAP input message be activated. In addition, this input message will allow a trap that was temporarily suspended/inhibited or that has completed due to duration or message count criterion being satisfied to be resumed.

Traps that have been aborted before completing can be restarted by entering the ALW:TRAP input message. Traps that have been stopped by a STOP:TRAP input message can not be reactivated with an ALW:TRAP input message. These traps can only be activated by entering a new SET:TRAP input message. Traps will be activated for the specified identification numbers.

2. FORMAT

```
ALW:TRAP:ID={a[-a[-a[-a]]]|ALL};
```

3. EXPLANATION OF MESSAGE

`ALL` = Activate all pending traps.

`a` = Trap identification number.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by an ALW:TRAP output message.

ALW:TRFC15

Software Release: 5E10 and later
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Requests that the 15-minute traffic report be allowed to be output to the receive-only printer (ROP). The report will continue to be output until turned off by the INH:TRFC15 message.

2. FORMAT

```
ALW:TRFC15;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `PRINT ALLOCATION EXCEEDED` = The message allocation for this office has reached its limit. The requested report has not been allowed.

`OK` = Good. The requested report has been allowed. May also include:
- `LPS SET TO DISCARD` = The report has been allowed, but output may not be seen because the log/print status is set to discard messages of this class.

ALW:TRFC30

Software Release: 5E10 and later
Command Group: MEAS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the specified section of the 30-minute traffic report be allowed to be collected (CLCT) or output to the traffic channel (TRFCH) or receive-only printer (ROP) every 30 minutes. The specified section will continue to be collected in the administrative module (AM) or output every 30 minutes until it is inhibited using the INH:TRFC30 input message. If no section is specified, an attempt will be made to allow all sections starting with Section 1. Those sections which do not fit in the buffer will remain inhibited. Sections which require identifiers in addition to the section name are not included in ALL or the default case.

NOTE: Some recent changes may need to be done first before allowing some sections. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual.

WARNING: If no sections are specified, all sections that do not require arguments will be allowed.

2. FORMAT

```
ALW:TRFC30,{CLCT|TRFCH|ROP}[:a|:ALL];
```

3. EXPLANATION OF MESSAGE

NOTE: Collection must be allowed before directions to print or prior to being allowed for the traffic channel.

`ALL` = Allow all sections that do not require identifiers default.

`a` = Section name that is to be allowed. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

- `CONFIGURATION NOT SUPPORTED` = The section requested represents a configuration not present in this office.
- `DATABASE ERROR` = A database error prevented the request from being successfully completed.
- `INCOMPLETE UNIT ID` = The identifiers entered incompletely specified a unit.
- `INVALID UNIT IDENTIFIERS` = The identifier entered did not specify a unit for which data can be collected, or too many identifiers were entered for the ALW:TRFC30-ROP when a section with multiple study sets was requested.
- `MEMORY ALLOCATION EXCEEDED` = The TRFC30 buffer (memory) allocation would be exceeded if the section were allowed.
- `MUST INHIBIT CURRENTLY ALLOWED STUDY SET` = This section is a special study section that can not have study sets allowed for collection concurrently. The study set that is currently allowed must be inhibited before any other study set from this section will be allowed for collection.

Copyright © 1999

- NOT ALLOWED FOR COLLECTION = The section cannot be allowed for output because it is not allowed for collection.
- PREVIOUS SAVED STUDY SET DOES NOT EXIST = This section is a special study section that did not save the arbitrary study set or the arbitrary study set does not exist.
- PRINT ALLOCATION EXCEEDED = The printing time allocation would be exceeded if the section were allowed for output to the ROP and/or TRFCH.
- SECTION NOT ALLOWABLE FOR PRINT = The section cannot be allowed for the ROP and/or TRFCH.
- SOME NOT ALLOWED- MEMORY ALLOCATION EXCEEDED = The TRFC30 buffer (memory) allocation would be exceeded if ALL sections were allowed; some section(s) remain inhibited.
- SOME NOT ALLOWED - PRINT ALLOCATION EXCEEDED = The printing time allocation would be exceeded if ALL sections were allowed; some section(s) remain inhibited.
- SOME SECTIONS NOT ALLOWED FOR ROP|TRFCH = ALL sections were requested, one or more sections are not allowed for output because they are not allowed for collection. Use the OP:STATUS,TRFC30 input message to determine which sections are inhibited for ROP|TRFCH. OP:MEASTAT,CLCT input message can be used to determine which sections are inhibited for collection.
- NO GROUPS ENABLED = Enable group by using the recent change/verify (RC/V) view before allowing specific sections. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual for information on which RC/V views are appropriate for specific sections.

NO = The requested action failed. May also include:
- FEATURE NOT AVAILABLE = The feature required to process the request is not present in the switch.

OK = Good. The section(s) were allowed that could be allowed; however, section(s) that could not be allowed for ROP and/or TRFCH will remain inhibited when ALW:TRFC30,ROP,ALL is requested. May also include:
- LPS SET TO DISCARD = The section(s) were allowed, but output may not be seen because the log print status (LPS) is set to discard messages of this class.

PF = Printout follows. The ALW:TRFC30 output message will be printed.

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Causes the administrative module (AM) generic access package (GRASP) transfer trace to start monitoring the flow of execution, as previously set up with an INIT:UMEM message. The transfer trace goes into the running state with successful completion of the message. This message can be used either as an immediate action, or it can be used in the action list of a WHEN message.

WARNING: Use of this GRASP capability can degrade system performance. It should not be used without expert technical assistance.

2. FORMAT

```
ALW:UMEM{!|;}
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`IP` = In progress. The message has been added to the WHEN action list.

`NG` = No good. No trace is defined.

`PF` = Printout follows. Followed by ALW:UMEM output message.

`RL` = Retry later or wait for the previous OP:UMEM to complete. The system is in an overload condition.

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that generic utility WHEN breakpoint clauses in the communication module processors (CMP) be allowed or enabled.

This message may be used together with any of the other CMP generic utility input messages. Refer to the References section of this message.

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
ALW:UT:CMP=a,{MATE|PRIM},{UTIL|UTILFLAG=b}{!|;}
```

3. EXPLANATION OF MESSAGE

`MATE` = Execute this input message on the standby CMP.

`PRIM` = Execute this input message on the active CMP.

`UTIL` = Execute this input message on all of the WHEN clauses in the specified CMP.

`a` = CMP number.

`b` = The identification number of a specific WHEN clause, which is to be enabled to an active state. Must be a number from 0 to 127.

NOTE: When requesting the enabling of WHEN clauses which have the TIME parameter specified, a maximum of 20 WHEN clauses may be enabled in one allow input message.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

ALW:UT-PSUPH

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that generic utility WHEN breakpoint clauses in the packet switch unit protocol handler (PSUPH) be allowed or enabled.

NOTE: This input message is only supported on PSUPHs of the PH3/PH4 hardware type (that is, not PH2 hardware types).

This message may be used together with any of the other PSUPH generic utility input messages.

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
ALW:UT:PSUPH=a-0-b-c,{UTIL|UTILFLAG=d}{!|;}
```

3. EXPLANATION OF MESSAGE

`UTIL` = Execute this input message on all of the WHEN clauses in the specified PSUPH.

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` The identification number of a specific WHEN clause, which is to be enabled to an active state.

NOTE: When requesting the enabling of WHEN clauses which have the TIME parameter specified, a maximum of 20 WHEN clauses may be enabled in one allow input message.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that generic utility WHEN breakpoint clauses in the switching module (SM) be allowed or enabled.

This message may be used together with any of the other SM generic utility input messages. If this message is used together with other generic utility messages, the END:UT-SM input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
ALW:UT:SM=a[&&b],{UTIL|UTILFLAG=c}{!|;}
```

3. EXPLANATION OF MESSAGE

`UTIL` = Execute this input message on all of the WHEN clauses in the specified SM(s).

`a` = SM number or the lower limit of a range of SM numbers.

`b` = Upper limit of a range of SM numbers.

`c` = The identification number of a specific WHEN clause, which is to be enabled to an active state.

NOTE: When requesting the enabling of WHEN clauses which have the TIME parameter specified, a maximum of 20 WHEN clauses may be enabled in one allow input message.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

ALW:UTIL

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that all currently defined administrative module (AM) generic access package (GRASP) breakpoints be enabled so that the associated actions are executed when the breakpoint conditions occur.

WARNING: Use of this GRASP capability can degrade system performance. It should not be used without expert technical assistance.

2. FORMAT

```
ALW:UTIL{;|!}
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`IP` = In progress. The message has been added to the WHEN action list.

`NG` = No good. No GRASP breakpoints are currently defined.

`PF` = Printout follows. Followed by ALW:UTIL output message.

`RL` = Retry later. The system is in an overload condition or completing previous OP:UMEM message.

ALW:UTILFLAG

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that a specific administrative module (AM) generic access package (GRASP) breakpoint be enabled so that the associated actions are executed when the breakpoint condition occurs. The ALW:UTILFLAG message can be used to enable a breakpoint immediately, or as an action associated with a breakpoint.

2. FORMAT

```
ALW:UTILFLAG=a{;|!}
```

3. EXPLANATION OF MESSAGE

`a` = Numeric identifier (one or more decimal digits) for the breakpoint to be enabled.

4. SYSTEM RESPONSE

`IP` = In progress. The message was added to the WHEN action list.

`NG` = No good. Identifier does not correspond to a currently defined breakpoint.

`PF` = Printout follows. Followed by ALW:UTILFLAG output message.

`RL` = Retry later. The system is in an overload condition or completing the previous OP:UMEM message.

ASGN:DOC

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a dynamic overload control (DOC) response category and action be assigned for a specified common channel signaling (CCS) trunk group.

Note: For the *Autoplex*® application, this message will not have any effect on the application software. It can be entered, but it will not take effect.

2. FORMAT

```
ASGN:DOC,TG=a,RESP=b[,CNTL=c];
```

3. EXPLANATION OF MESSAGE

a = CCS trunk group number. Must be a one-way outgoing or a two-way trunk group.
b = Response category. These categories designated 'A' through 'F' along with traffic type and level of DOC received determine the percentage of calls on which to apply DOC as shown in Exhibit A.

Table 1 Exhibit A: DOC Response Category

DOC LEVEL RECEIVED	TRAFFIC	RESPONSE CATEGORY TYPE					
		A	B	C	D	E	F
DOC1	Alternate route	0%	0%	75%	0%	0%	100%
	Direct route	0%	0%	50%	0%	0%	0%
DOC2	Alternate route	0%	0%	75%	100%	100%	100%
	Direct route	0%	0%	75%	0%	75%	75%
DOC3	All traffic	100%	100%	100%	100%	100%	100%

Note: For example, the office receives a DOC2 level. If the user assigns DOC and the response category chosen is E, DOC will be applied to 100% of the alternate route traffic and 75% of the direct route traffic.

c = Control action. Valid value(s):
- CANT = DOC CANT control.
- SKIP = DOC SKIP control.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.

PF = Printout follows. Followed by the ASGN:DOC output message.
RL = Retry later. Valid value(s):
- RESOURCE SHORTAGE = The necessary resources are not available.

ASGN:DPSCH

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Assigns trunk groups to the network management (NM) schedule (SCH). This teletypewriter (TTY) message is only valid for defense switched network (DSN) switches. This message also has options to permit the display of trunk groups in the TRUNK block of the DSN exception page. Each trunk group displayed in the TRUNK block has three indicators associated with it, the level of maintenance usage of the trunk group, the number of attempts per circuit per hour (ACH) of the trunk group, and the level of connections per circuit per hour (CCH).

2. FORMAT

```
ASGN:DPSCH,TG=a[-a][-a][-a][-a][-a][-a][-a][,ROW=b][,COL=c];
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group number.

`b` = Row number of the TRUNK block in the DSN exception page. Zero is the default.

`c` = Column number of the TRUNK block in the DSN exception page. Zero is the default.

There are 24 display boxes in the TRUNK block with six boxes per row and four boxes per column. A particular display is identified by its row number and column number.

If neither row number nor column number is entered, one to eight trunk groups may be specified. These trunk groups will be added only to the schedule list. These trunk groups are not displayed in the TRUNK block. If only column number is entered, up to four trunk groups may be specified. These trunk groups are displayed on the designated column from top to bottom. The row defaults to 1 in the TRUNK block.

If only row number is entered, up to six trunk groups may be specified. The specified trunk groups are displayed on the designated row from left to right. The column defaults to 1 in the TRUNK block.

If both row and column numbers are entered, only one trunk group may be specified and it will be displayed in the designated box. If row=0 and col=0 is specified, the trunk group is only added to the schedule list. This trunk group is not displayed in the TRUNK block.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ASGN:DPSCH output message.

`NG` = No good. May also include:
- `INVALID PARAMETER` = Column/row number not in valid range.
- `TOO MANY TGs` = Too many trunk groups are specified for the give column/row number. (Refer to variable '`c`' for maximum number of trunk groups allowed for a column/row).

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The necessary resources are not available.

ASGN:NMNODES

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that node identifiers be assigned to the network management node schedule (NMNODES) for the collection of five-minute node-to-node data. This request is for the five-minute package LNNODE. A node is identified by a common language location identifier (CLLI) code and the voice/data indicator.

2. FORMAT

```
ASGN:NMNODES,NODES=a-b[-a-b][-a-b][-a-b];
```

3. EXPLANATION OF MESSAGE

`a` = CLLI code.

`b` = Voice/data indicator. Valid value(s):
- `V` = Voice indicator.
- `D` = Data indicator.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ASGN:NMNODES output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The request could not be accepted because the necessary resources are not available.

ASGN:SSTR

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a service selective trunk reservation (SSTR) control be assigned to a specified trunk group.

2. FORMAT

```
ASGN:SSTR,TG=a[,RL=b][,INH=c];
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group (TG) number. Must be a one-way outgoing or a two-way trunk group. The LN TYPE attribute for the TG in the RC/V view 5.1 (TRUNK GROUP) must not be NULL.

`b` = Reservation level (RL). The number of circuits to be reserved in the specified trunk group (1 - 15, default 1). RL must be assigned with a value 1 <= RL < RL2 < RL1 <= 15. RL1 and RL2 are the reservation levels possibly assigned by any ASGN:TR input message for this trunk group.

`c` = Control status. Valid value(s):

- `N` = The control will be in effect (default).
- `Y` = Inhibit (INH) control until allowed by the ALW:SSTR input message.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the ASGN:SSTR output message.

`RL` = Retry later. May also include:

- `RESOURCE SHORTAGE` = The request could not be accepted because the necessary resources are not available.

5.1 (TRUNK GROUP)

ASGN:TESTSET

Software Release: 5E11 and later
Command Group: TRKLN
Application: AEWNC
Type: Input

1. PURPOSE

Requests that the wireless test set will be assigned to an *Air Extension*^{SM} user's analog line so that the maintenance personnel can test an user's wireless service without requiring the user's handset phone. After the test set is assigned to an user's analog line it will act just like the handset (wireless phone).

2. FORMAT

```
ASGN:TESTSET,TSDN=a,USERDN=b{,TIME=c,d} {,UCL}
```

3. EXPLANATION OF MESSAGE

`a` = 10 digit DN of the test set to be used.

`b` = 10 digit DN of the analog phone to be tested.

`c` = Length of time the test set is to be assigned in hours (default is 1 hour).

`d` = Minutes.

4. SYSTEM RESPONSE

`RL` = Retry later. The request has been denied, probably due to system load.

`PF` = Printout follows. The request has been accepted and is followed by an ASGN:TESTSET output message.

ASGN:TR

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a trunk reservation (TR) control be assigned to a specified trunk group.

Note: For the *Autoplex*® application, this message will not have any effect on the application software. It can be entered, but it will not take effect.

2. FORMAT

```
ASGN:TR,TG=a,{RL1=b[,RL2=c]|RL2=c},RESP=d[,CNTL=e][,ARA=f][,INH=g];
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group (TG) number. Must be a one-way outgoing or a two-way trunk group.

`b` = Reservation level 1 (RL1). Number of idle circuits per trunk group to be reserved - (0 - 15, default 0).

`c` = Reservation level 2 (RL2). Number of idle circuits per trunk group to be reserved - (0 - 15, default 0).

Note: At least one reservation level (RL1 or RL2) must be non-zero. If both are non-zero, then RL1 must be greater than RL2. If an SSTR control has been assigned for TG '`a`' by an ASGN:SSTR input message, RL1 and RL2 must be assigned with a value 1 <= RL < RL2 < RL1 <= 15. RL is the reservation level possibly assigned by any ASGN:SSTR input message for this trunk group.

`d` = Response category (RESP). These categories, designated 'A' through 'E', along with the reservation level triggered determine the percentage of calls to control as shown in Exhibit A.

Table 1 Exhibit A: TR Response Category

RESERVATION LEVEL	TRAFFIC	RESPONSE CATEGORY TYPE				
		A	B	C	D	E
RL1	Alternate route	0%	0%	0%	100%	0%
	Direct route	0%	0%	0%	0%	0%
RL2	Alternate route	0%	100%	100%	100%	0%
	Direct route	0%	0%	0%	100%	0%

Note: For example, if the RL2 reservation level is triggered and the response category chosen is 'C', TR will be applied to 100% of the alternate route traffic and 0% of the direct route traffic.

`e` = Control (CNTL) action. Valid value(s):

`CANT` = TR cancel-to control (default).

`SKIP` = TR skip control.

`f` = Automatic reservation adjustment (ARA) status. Valid value(s):

`N` = ARA is not in effect (default).

`Y` = ARA is in effect.

Note: If ARA is '`Y`', then RL1 and RL2 must be specified as non-zero.

Copyright © 1999

g = Control status. Valid value(s):
- N = The control will be in effect (default).
- Y = Inhibit (INH) control until allowed by the ALW:TR input message.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the ASGN:TR output message.
RL = Retry later. Valid value(s):
- RESOURCE SHORTAGE = The necessary resources are not available.

AUD:CCSTQ-A

Software Release: 5E10 only
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Locates and corrects inconsistencies between near-end and far-end call processing and maintenance states of CCS6 and CCS7 trunks. The common channel signaling (CCS) trunk query (TQ) interoffice audit detects and corrects errors. For CCS7, the trunk query request will cause the audit to be run on the trunk member input, plus trunks associated with the next 15 consecutive circuit identification codes. For CCS6, every trunk query audit request processes all trunks in the band associated with the specified trunk. A band contains up to 16 trunk members.

2. FORMAT

```
AUD:CCSTQ,TKGMN=a-b;
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID TRUNK` = The request has been denied. The trunk is not equipped, or it is not a CCS trunk.

`PF` = Printout follows. The request has been accepted. Followed by the AUD:CCSTQ output message.

`RL` = Retry later. May also include:
- `BUSY` = The request has been denied. Another request is already being executed or automatic trunk query is in progress. Repeat the request later.

```

3. EXPLANATION OF MESSAGE

`a` = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `DATABASE ERROR` = The request has been denied. Required information could not be obtained from the database.
- `INVALID SIGNALING TYPE` = The request has been denied. The trunk group is not a CCS trunk group.
- `INVALID TRUNK` = The request has been denied. The trunk is not equipped, or it is not a CCS trunk.
- `TRUNK QUERY INHIBITED FOR THIS TRUNK GROUP` = The request has been denied. Trunk query requests have been inhibited for this trunk group. Repeat the request later.

`PF` = Printout follows. The request has been accepted. Followed by the AUD:CCSTQ output message.

`RL` = Retry later. May also include:
- `COULD NOT SEND MESSAGE` = The request has been denied. All attempts to send a message to the impacted SMs has failed. Repeat the request later.
- `DPC INACCESSIBLE` = The request has been denied. The far-end destination point code is not accessible.
- `MTP UNAVAILABLE` = The request has been denied. The near-end message transport mechanism is unavailable. For example, the CNI or CCS PSU is inaccessible or in overload.
- `SM INACCESSIBLE` = The request has been denied. The target trunk member's SM is either inaccessible or in min-mode. Repeat the request later.
- `TIMER NOT STARTED` = The request has been denied. The timer used to monitor the time length of this request could not be started. Repeat the request later.
- `TRUNK QUERY ALREADY IN PROGRESS` = The request has been denied. Another request is

3. EXPLANATION OF MESSAGE

`a` = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

- `DATABASE ERROR` = The request has been denied. Required information could not be obtained from the database.
- `INVALID SIGNALING TYPE` = The request has been denied. The trunk group is not a CCS trunk group.
- `INVALID TRUNK` = The request has been denied. The trunk is not equipped, or it is not a CCS trunk.
- `INVALID TRUNK GROUP` = The request has been denied. The trunk group is not equipped, or it is not a CCS trunk group.
- `TRANSLATION TEST INHIBITED FOR THIS TRUNK GROUP` = The request has been denied. Trunk translation test requests have been inhibited by using RC/V View 5.1.

`PF` = Printout follows. The request has been accepted. Followed by the AUD:CCSXLATE output message.

`RL` = Retry later. May also include:

- `DPC INACCESSIBLE` = The request has been denied. The far-end destination point code is not accessible. Repeat the request later.
- `MTP UNAVAILABLE` = The request has been denied. The near-end message transport mechanism is unavailable. For example, the CNI or CCS PSU is inaccessible or in overload. Repeat the request later.
- `SM INACCESSIBLE` = The request has been denied. The target trunk member's SM is either inaccessible or in min-mode. Repeat the request later.
- `TIMER NOT STARTED` = The request has been denied. The timer used to monitor the time length of this request could not be started. Repeat the request later.
- `TRANSLATION TEST ALREADY IN PROGRESS` = The request has been denied. Another

Copyright © 1999

request is already being executed or is in progress. Repeat the request later.

AUD:CMP

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests a communication module processor (CMP) audit to be run in one CMP.

2. FORMAT

```
AUD:a,CMP=b[,PRIM|,MATE];
```

3. EXPLANATION OF MESSAGE

`a` = Audit ID for an application audit.

`b` = CMP number.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `AUDIT NOT AVAILABLE IN CMP` = The request has been denied because the specified audit does not exist in the specified processor type.
- `INVALID REQUEST FOR INTERPROCESSOR AUDIT` = The requested audit is not valid on the specified processor.
- `UNAVAILABLE OR INVALID CMP` = The specified CMP is unavailable or does not exist.

`PF` = Printout follows. The request has been received. One or more of the following audit output messages are printed: AUD:CMP-ABORTED, AUD:CMP-COMPL, AUD:CMP-DUMP, AUD:CMP-ERROR, and AUD:CMP-FAILURE.

5. REFERENCES

Output Message(s):

AUD:CNC

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests that the central node control (CNC) audit be initiated. Internal ring node maintenance records are audited for inconsistencies which could prevent jobs (such as RST:LN) from progressing or cause jobs to be aborted unnecessarily. (This audit is also executed automatically.)

2. FORMAT

```
AUD:CNC=1[:{a|b|a,b}];
```

3. EXPLANATION OF MESSAGE

Routine execution of this audit may be inhibited by *UNIX*® RTR Operating System Administration Module (AM) during outages of the interprocess message switch (IMS) subsystem. This can be checked by using the OP:AUD input message and routine execution can be resumed by using the ALW:AUD input message.

`a` = Specifies whether the audit should correct errors. Valid value(s):
- `CORR` = Correction should occur (default).
- `NCG` = Inhibit error correction.

`b` = Specifies the level of detail of error reporting. Valid value(s):
- `DETL` = Generate a raw data report for each error found (default).
- `SUM` = Generate only an audit completion message when the audit terminates.

4. SYSTEM RESPONSE

Refer to the System Responses Table in the Input Messages User Guidelines.

AUD:CUMEM

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the standby control unit memory (CUMEM) 1 audit be run in the standby control unit (CU), comparing the contents of the online and off-line main stores when in the ACT/ACT or ACT/STBY modes.

WARNING: This audit can take more than 180 minutes to run and can degrade the performance of other *UNIX*® RTR system audits. Excessive audit errors may result in a hardware reconfiguration with one CU being left out-of-service.

2. FORMAT

```
AUD:CUMEM=1 [:a|:b|:a,b];
```

3. EXPLANATION OF MESSAGE

`a` = Indicates whether audit should correct errors. Valid value(s):

- `CORR` = Audit should correct errors (default).
- `NCG` = Audit does not correct errors.

`b` = Indicates what type of report or message to generate. Valid value(s):

- `DETL` = Generate a raw data report for each error found followed by an audit completion message. (Default). (A limited number of reports is generated.)
- `SUM` = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

4. SYSTEM RESPONSE

Refer to the APP:AUD appendix in the Appendixes section of the Output Messages manual.

AUD:CUSTAT

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the control unit hardware status (CUSTAT) audit be run in the manual mode.

WARNING: Excessive audit errors may result in a hardware reconfiguration with one control unit (CU) being left out-of-service.

2. FORMAT

```
AUD:CUSTAT=1[:a|:b|:a,b];
```

3. EXPLANATION OF MESSAGE

`a` = Indicates whether audit should correct errors. Valid value(s):

- `CORR` = Audit should correct errors (default).
- `NCG` = Audit does not correct errors.

`b` = Indicates what type of report or message to generate. Valid value(s):

- `DETL` = Generate a raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)
- `SUM` = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

AUD:ECD

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the equipment configuration database (ECD) be audited.

Format 1 audits the incore ECD. Format 2 runs a structural audit of the minimum configuration ECD. Format 3 runs a structural audit of the full configuration ECD.

WARNING: Running ECD audit 1 or 3;while diagnostics are running can result in mutilation of database records.

2. FORMAT

```
[1]    AUD:ECD=a[:b|:c|:b,c];

[2]    AUD:ECD=2,INS="ecd"[:b|:c|:b,c];

[3]    AUD:ECD=2,INS="appecd"[:b|:c|:b,c];
```

3. EXPLANATION OF MESSAGE

`a` = Specifies the type of incore ECD audit. Valid value(s):
- `1` = Structural audit.
- `3` = Raw data audit.

`b` = Indicates whether audit should correct errors. Valid value(s):
- `CORR` = Audit should correct errors (default).
- `NCG` = Audit does not correct errors.

`c` = Indicates what type of report or message to generate. Valid value(s):
- `DETL` = Generate a raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)
- `SUM` = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

AUD:ECDOWN

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the equipment configuration database manager (ECDMAN) audit of record ownership be run. This audit releases reserved records for processes that have died.

2. FORMAT

```
AUD:ECDOWN=1[:a|:b|:a,b];
```

3. EXPLANATION OF MESSAGE

`a` = Indicates whether audit should correct errors. Valid value(s):

- `CORR` = Audit should correct errors (default).
- `NCG` = Audit does not correct errors.

`b` = Indicates what type of report or message to generate. Valid value(s):

- `DETL` = Generate a raw data report for each error found followed by an audit completion message. (default). (A limited number of reports is generated.)
- `SUM` = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

AUD:ENV

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests a kernel process environment (OKP or SMKP) audit to be run in the administrative module.

2. FORMAT

```
AUD:a,ENV=b;
```

3. EXPLANATION OF MESSAGE

`a` = Audit ID for an application audit.

`b` = Kernel process. Valid value(s):
- `OKP` = Operational.
- `SMKP` = Switch maintenance.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `- AUDIT NOT AVAILABLE IN SPECIFIED ENV` = The request has been denied because the specified audit is not available in the requested kernel process.
- `- AUDIT NOT AVAILABLE IN SPECIFIED ENV=SMKP` = The request has been denied because the specified audit is not available in the requested kernel process. Specifically, ENV=SMKP audits are not available in the very compact digital exchange (VCDX) application.
- `- SM TYPE NOT VALID FOR THIS REQUEST` = The request has been denied because an SM type was specified for a kernel process environment.

`PF` = Printout follows. The AUD:ENV-COMPL output message follows. One or more of the following output messages may also be printed: AUD:ENV-ABORTED, AUD:ENV-DUMP, AUD:ENV-ERROR, AUD:ENV-FAILURE.

5. REFERENCES

Output Message(s):

AUD:FILES

Software Release: 5E10 and later
Command Group: FHADM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a simple existence audit of files on the disks be run.

WARNING: This message is intended to be used as an aid for filesystem maintenance. Improper corrective action could result in missing system files which could lead to system degradation and/or loss of call processing.

2. FORMAT

```
AUD:FILES;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the AUD:FILES output message.

AUD:FMGR

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the resources of the file manager (FMGR) be audited.

2. FORMAT

```
AUD:FMGR=a[:b|:c|:b,c];
```

3. EXPLANATION OF MESSAGE

`a` = Specifies the member number of the FMGR audit. Valid value(s):

- `1` = Task queue audit.
- `2` = Internal inode table audit.
- `3` = Hash table and internal inode pointer table audit.
- `4` = File table audit.
- `5` = Internal capability table audit.
- `6` = Buffer audit.
- `7` = Mount table audit.
- `8` = Delayed queue audit.
- `9` = Message queue audit.

`b` = Indicates whether audit should correct errors. Valid value(s):

- `CORR` = Audit should correct errors (default).
- `NCG` = Audit does not correct errors.

`c` = Indicates what type of report or messages should be generated. Valid value(s):

- `DETL` = Generate a raw data report for each error found followed by an audit completion message. (Default). (A limited number of reports is generated.)
- `SUM` = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

AUD:FSBLK

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the file system block audit be run. This audit can be run on a mounted or unmounted file system.

2. FORMAT

```
AUD:FSBLK=a,INS="b"[:c|:d|:c,d][PARAM="e"];
```

3. EXPLANATION OF MESSAGE

`a` = Member number to be audited.

NOTE: The value input for '`a`' is dependent upon the instance. Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual.

`b` = Instance to be audited. Instance names are the special device files corresponding to the file system audited. Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual for a complete list of device file names.

`c` = Audit action. Valid value(s):

- `CORR` = Audit should correct errors.
- `NCG` = Audit does not correct errors (default).

`d` = Type of report. Valid value(s):

- `DETL` = Generate a detailed raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)
- `SUM` = Generate only a summary audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

`e` = Backup parameter. This field is used to check the file system for the appropriateness of generating a backup tape. When specified, the audit may report error conditions that, normally, would not be considered errors, but could result in the creation of an improper backup tape. These errors are not correctable.

4. SYSTEM RESPONSE

AUD:FSCMPT

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the file system compaction audit be run. This audit can be run on a mounted or unmounted file system.

2. FORMAT

```
AUD:FSCMPT=a,INS "b"[:c|:d|:c,d][:PARAM "{e|f|e,f}"];
```

3. EXPLANATION OF MESSAGE

`a` = Member number of the FSCMPT audit. Valid value(s):
- `1` = The administrative module (AM) audit member number.

`b` = Instance to be audited. Instance names are the special device files corresponding to the file system audited. Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual for specific device file names.

`c` = Audit action. Valid value(s):
- `CORR` = Audit should correct errors, and complete the compaction (default).
- `NCG` = Audit should not correct errors, and should not do the compaction.

`d` = Type of report. Valid value(s):
- `DETL` = Generate a raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)
- `SUM` = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

`e` = Type of effort compaction. Valid value(s):
- `MIN` = Perform or report for a minimum effort compaction (default).
- `MAX` = Perform or report for a maximum effort compaction.

`f` = Amount of regular file blocks to be relocated. Valid value(s):
- `COND` = Limit number of regular file blocks relocated to achieve compaction (default).
- `UCL` = An unlimited number of regular file blocks may be relocated to achieve compaction.

4. SYSTEM RESPONSE

Refer to the APP:AUD appendix in the Appendixes section of the Input Messages manual.

AUD:LKBDST

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,CNI
Type: Input

1. PURPOSE

To initiate the link status and band status audit. This audit compares link status data and band-related status data in the link node and in the administrative module (AM) with associated reference data in the AM. When requested without specifying a particular node or the ALL option, the system will select a single node to be audited. The node selected will be the next node in the routine audit sequence.

NOTE: Routine execution of this audit may be inhibited by the *UNIX*® RTR system during outages of the common network interface (CNI) subsystem. This may be verified using the OP:AUD input message. Routine execution may be resumed by using the ALW:AUD input message.

2. FORMAT

```
AUD:LKBDST=1[:a][:PARAM="NODE{ ALL|(b,c)}"];
```

3. EXPLANATION OF MESSAGE

`ALL` = Audit all nodes. If a particular node is desired, use the group-member number designation.

`a` = Level of detail of error reporting. Valid value(s):

- `DETL` = Generate a raw data report for each error found. This is the default value.
- `SUM` = Generate only an audit completion message when the audit terminates.

`b` = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the AUD:ENV-LKBDST output message.

AUD:MMGR

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the memory manager audits be run. The first three audits validate the segment descriptor table, page tables and the page descriptor table, and recover lost pages and page tables. The segment release audit completes an interrupted segment breakdown procedure. The segment unlock audit releases old iolocked segments.

2. FORMAT

```
AUD:MMGR=a[:b|:c|:b,c];
```

3. EXPLANATION OF MESSAGE

`a` = Member number of the audit. Valid value(s):

- `1` = Segment descriptor table audit.
- `2` = Page table audit.
- `3` = Page descriptor table audit.
- `4` = Segment release audit.
- `5` = Segment unlock audit.
- `9` = Swap space compaction audit.

`b` = Audit action. Valid value(s):

- `CORR` = Audit should correct errors (default).
- `NCG` = Audit does not correct errors.

`c` = Type of report. Valid value(s):

- `DETL` = Generate a raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)
- `SUM` = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

AUD:MSGBUF

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the message buffer (MSGBUF) resources be audited.

2. FORMAT

```
AUD:MSGBUF=a[:b|:c|:b,c];
```

3. EXPLANATION OF MESSAGE

`a` = Member number of the audit. Valid value(s):
- `1` = Message buffer queue audit.
- `2` = Message buffer extender block audit.

`b` = Audit action. Valid value(s):
- `CORR` = Audit should correct errors (default).
- `NCG` = Audit does not correct errors.

`c` = Type of report. Valid value(s):
- `DETL` = Generate a raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)
- `SUM` = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

Other Manual(s):
235-600-400 *Audits*

AUD:NIDATA

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests that the internal data audits be run on the recent changeable tables. These audits compare data table copies stored on disk with copies of the same tables residing in memory in the administrative module (AM) and report any mismatches. Tables are also checked for invalid data within tables and for inconsistencies across tables. Errors that cannot be corrected using recent change will be corrected by the audit mechanism.

2. FORMAT

```
AUD:NIDATA=a[:DETL|:SUM];
```

3. EXPLANATION OF MESSAGE

`DETL` = Generate a raw data report for each error found. (Only a limited number of such reports can be generated.)

`SUM` = Generate an audit completion message when the audit terminates. Do not create raw data reports for any errors that are found.

`a` = The type of data table to be audited. Valid value(s):

- `1` = Office identification data.
- `2` = Link configuration data.
- `3` = Logical-physical translation data.
- `4` = Common channel signaling system 7 (CCS7) routing data.
- `5` = Subsystem information data.
- `8` = Global title translator data.

  NOTE: NIDATA8 has a special trigger mechanism. This audit does not run until after a common network interface (CNI) recent change/verify (RC/V) of screen 15.11 in any mode (I,U,D,R). Any message received before a RC/V transaction is invalid.
- `10` = Protocol timers/parameters data

4. SYSTEM RESPONSE

`PF` = Printout follows. The AUD:NIDATA output message follows.

AUD:NMDATA

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

NMDATA is the audit family name for the group of audits concerned with the integrity of network management dynamic data.

NMDATA 1 audits the routing tables. The routing tables consist of the network table, cluster table, page access table, the member table, the link set translation table, the routing priority index (RPI) status table, and the director index to network table. One aspect of the routing tables structure is the dynamic allocation and deallocation of slots in the page access table and the member table (those tables are also referred to as the paging tables) as different network events (such as remote link failures or congestion) occur. Common network interface (CNI) processes and maintains status information for the point code affected by those events. Those paging tables that are used in the allocation/deallocation of slots are audited to ensure that pointers connecting the tables are valid. The free entries for the paging tables are audited as well as the used entries. The fields in the routing tables that are used when routing or updating status information about a point code are also audited by NMDATA 1. The audit looks at inconsistencies between the different fields and among the different routing tables. A copy of the data being audited is also found in the direct link node (DLN). When changes are made to the administrative module (AM) master copy as a result of error correction, the remote node copy is updated by using REMACS.

NOTE: The application is not notified of the change to the data as a result of error correction. For this reason, it is recommended that NMDATA 1 always runs in error detection mode only.

NMDATA 2 audits the loadshare tables in the AM. The loadshare tables are used for message routing in the direct link node (DLN), the D-channel node (DCHN) and the AM. The copy of the loadshare tables in the AM is the master copy and the remote nodes are updated using REMACS if error correction results in any changes to the master copy.

NOTE: NMDATA 2 is different than NMDATA 1 in that a loadshare table update report will be sent to the application if error correction results in any changes to the master copy of the tables.

WARNING: CNI does not recommend running this audit in error correction mode. Error correction mode should only be used under the guidance of CNI customer support because of the critical nature of the data being audited. CNI customer support should always be notified in the event of an error.

2. FORMAT

```
AUD:NMDATA={a[:b|:c|:b,c];}
```

3. EXPLANATION OF MESSAGE

`a` = Specifies the audit member to be run. Valid value(s):
- `1` = Routing tables linked list and consistency check audit.
- `2` = Loadshare tables audit.

`b` = Audit action. Valid value(s):

CORR = Indicates error-correction mode.
NCG = Indicates error-detection mode.

The default value is contained within the equipment configuration database (ECD) record for this audit (audrec).

c = Type of report. Valid value(s):
DETL = Indicates a raw data report for each error found should be generated (default). The raw data report(s) are followed by an audit completion message. A limited number of reports is generated.
SUM = Indicates only an audit completion message is generated when the audit terminates and in that case raw data reports are not created for any errors that are found.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the AUD:NMDATA output message.

AUD:NODEST

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5,CNI
Type: Input

1. PURPOSE

Requests that ring node (RN) state audits be initiated.

The node availability map audit compares the two principal records within the Interface Module System (IMS) driver process of the states of ring nodes. It does not check the major state in the equipment configuration data base (ECD). This map contains a flag for each ring node indicating whether the node is an IMS user node (IUN) in the active (ACT) state. It is used primarily by the neighboring "audit" and to send state updates after changes in ring configuration and after initializations. The audit compares the map to the major states of the nodes recorded in the IMS driver process. When errors are detected the map is corrected to agree with the major states. Routine execution of these audits may be inhibited by *UNIX*® RTR during outages of the IMS subsystem. This can be checked by using the OP:AUD input message and routine execution can be resumed by using the ALW:AUD input message.

2. FORMAT

```
AUD:NODEST=1[:{a|b|a,b}];
```

3. EXPLANATION OF MESSAGE

`1` = Audit the node availability map. (This audit is also automatically scheduled.)

`a` = Specifies whether the audit should correct errors. Valid value(s):

- `CORR` = Indicates correction should occur (default).
- `NCG` = Inhibits error correction.

`b` = Specifies the level of detail of error reporting. Valid value(s):

- `DETL` = Generate a raw data report for each error found (default).
- `SUM` = Generate only an audit completion message when the audit terminates.

4. SYSTEM RESPONSE

`PF` = Printout follows.

AUD:SM

Software Release: 5E10 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests a switching module (SM) audit to be run in one SM or a range of SMs.

2. FORMAT

```
AUD:a,SM=b[&&c][,RSM][,LSM][,HSM][,ORM][,TRM];
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = Audit ID for an application audit.

`b` = SM number, or lower limit of a range of SM numbers.

`c` = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `AUDIT NOT AVAILABLE IN SM TYPE` = The request has been denied because the specified audit does not exist in the specified processor type.
- `INVALID SM RANGE/TYPE COMBINATION` = The request has been denied because of incorrect order of specified range or no equipped SMs in range.

`PF` = Printout follows. The request has been received. One or more of the following audit output message(s) are printed: AUD:SM-ABORTED, AUD:SM-COMPLETED, AUD:SM-DUMP, AUD:SM-ERROR, and AUD:SM-FAILURE.

13. BKUP

Copyright © 1999

BKUP:ODD

Software Release: 5E10 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests a backup of the office-dependent data (ODD) to disk.

Format 1 requests a backup of the administrative module (AM) ODD, the communications module processor (CMP) ODD, non-redundant ODD (NRODD), redundant ODD (RODD), or the entire system. Format 2 requests to schedule the ODD backup to run periodically at specific intervals.

NOTE: During heavy recent change activity, an ODD backup has a slight chance of aborting because of a lack of resources for the backup to execute. Requesting ODD backup during heavy recent change activity is not recommended because this will affect the ODD backup and recent change performance and response time. If a backup aborts, re-request the ODD backup during a period of light recent change activity.

Failure of ODD backup will cause a minor alarm.

Format 3 requests the ODD backup in preparation for ODD evolution. This message should be entered immediately prior to the final ODD dump and should be used only once during a retrofit or a large terminal growth. This message removes recent change evolution files if they exist, and starts double-logging of recent changes (RCs) and customer originated recent changes (CORCs). Consult the Retrofit Procedures manual or the Large Terminal Growth Procedures manual before using this message.

2. FORMAT

```
[1]    BKUP:ODD[,FULL][,AM][,CMP=0][,NRODD=a[&&b]][,RODD[=a]][,COUNT];

[2]    BKUP:ODD[,FULL][,AM][,CMP=0][,NRODD=a[&&b]][,RODD[=a]],EVERY=c,AT=d;

[3]    BKUP:ODD[,FULL],ODDEVOL,TOGENERIC=e;
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`COUNT` = Report the number of kilobytes of ODD backed up.

`FULL` = Back up the entire ODD unconditionally. If FULL is not specified, only those ODD blocks that have been altered since the last ODD backup will be backed up (a differential backup). The AM ODD backup is always a full backup (that is, a differential backup of the AM ODD is not available).

NOTE: The default is the entire system (the AM, the CMP, NRODDs of all SMs and RODD) if none is specified.

`a` = SM number or the lower limit of a range of SM numbers.

`b` = Upper limit of a range of SM numbers.

`c` = Interval in days (0-90) between successive ODD backup runs.

Copyright © 1999

`d` = Time of day in hours and minutes when ODD is to be backed up.

`e` = Number of the software release to which the ODD is being evolved (for example, 6 for 5E6(1) software release).

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID SM RANGE` = The input request is not valid.
- `INVALID CMP RANGE` = The input request is not valid.

`PF` = Printout follows. Request accepted and the BKUP:ODD output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

CFR:DUPLEXDISKS

Software Release: 5E11 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Configure MHD0 and MHD1 to be the duplex boot disks.

This is only supported on a 3B21D Hardware Platform that is configured to support the recovery from the alternate boot disk feature. For this to complete successfully, the 3B21D must be booted with an alternate boot disk selected as one of the duplex boot disks and the UCB states of the system and alternate boot disks must meet the following criteria:

- If MHD0 is one of the current duplexed boot disks, its state must be ACT. MHD1 and the alternate boot disk must not be in the ACT, STBY, or INIT states.
- If MHD1 is one of the current duplexed boot disks, its state must be ACT. MHD0 and the alternate boot disk must not be in the ACT, STBY, or INIT states.

2. FORMAT

```
CFR:DUPLEXDISKS!
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF	Printout follows. Followed by the CFR:DUPLEXDISKS output message.

CFR:PMEM

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

This message configures the switching modules (SMs) physical memory after memory board growth to incorporate the memory added into the spare memory hole. The spare memory hole is located after standalone billing memory and before any peripheral images that may be loaded. After growing in physical memory, this input message is used to move the peripheral images into the new memory board and to merge the extra amount of memory into the spare memory hole. The SM will not be able to use the extra memory grown in until this input message is executed.

2. FORMAT

```
CFR:PMEM,SM=a[,REQST={GROW}];
```

3. EXPLANATION OF MESSAGE

`a` = SM number.

4. SYSTEM RESPONSE

`PF` = Printout follows. Request accepted and the CFR:PMEM output message follows.

`RL` = Retry later. Memory growth terminal process could not be created.

CFR:RING

Software Release: 5E10 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the common network interface (CNI) ring be configured to include or exclude ring node(s) from the active ring segment, or if the ring is down, to initialize it.

NOTE: Ring reconfigurations abort diagnostics of ring nodes.

Ring configurations established by this request have no special permanence -- they are not remembered as having been requested manually and they do not change the ring interface hardware maintenance states of the nodes. For example, a ring segment isolated by this request and not containing a ring fault may be included back into the active ring segment by any subsequent ring configuration change, such as by a fault recovery, diagnostic, restore or subsequent CFR:RING request. An exception is that nodes in the GROW major state will always be kept isolated to prevent installation from causing ring recoveries.

The ring can not be reconfigured using the INCLUDE or EXCLUDE options if either the current BISO and/or EISO ring node is not active. A ring with an inactive BISO and/or EISO node is in a transient state. Restoration of this node(s) will be given top priority. The MOVFLT option may be used subject to limitations described above.

2. FORMAT

```
CFR:RING[{[,RPCNa=b[,RPCNc=d]]|[,LNa=b[,LNc=d]]}|[,{RPCNa=b[,RPCNc=d]|
LNa=b[,LNc=d]}:EXCLUDE]|[,{RPCNa=b[,RPCNc=d]|LNa=b[,LNcd]}:INCLUDE]|
[,{RPCNa=b|LNa=b}:MOVFLT]];
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`EXCLUDE` = Isolate specified node(s) from the active ring segment. This may cause inclusion or isolation of other nodes to form a workable ring.

Active ring nodes can not be isolated.

A section of the ring can not be isolated such that the remaining active ring segment is too short. That is, the active ring segment must contain a minimum combination of ring nodes and interframe buffers to allow simultaneous propagation of long messages plus the token message. Note that when the system attempts to choose active BISO and EISO ring nodes to isolate a given requested range of node(s), this threshold could be crossed.

As with INCLUDE requests, if an isolated segment currently exists, the node or nodes requested must either include the BISO and/or EISO node(s) or, must already be excluded from the active ring segment.

`INCLUDE` = Make ring nodes part of the active ring segment (default).

If node(s) are specified then only those nodes will be added to the active ring segment in response to this request.

Copyright © 1999

If no nodes are specified then the new configuration will include as many nodes as possible. If the ring is down, it will be initialized.

If an isolated ring segment currently exists, the requested node or nodes must include the nearest isolated neighbor node or segment of the beginning of isolation (BISO) and/or end of isolation (EISO) nodes so as not to fragment the existing isolated segment.

LN = Link node.

MOVFLT = Move an indication of a faulty ring interface from the currently isolated ring node to the adjacent ring node, 'a', and reconfigure the ring so that 'a' becomes the isolated node.

Automatic ring error analysis cannot always determine which of two adjacent nodes is at fault. When manual maintenance indicates that the wrong ring node has been isolated, this request is used to correct the ring configuration. Such correction may not be possible using other methods because it may be essential to have an isolated node adjacent to the fault and the ring may be too small to allow both nodes to be isolated, even temporarily.

This form of the request is accepted only when a single node is currently isolated and the specified node, 'a', is adjacent (that is, 'a' is the BISO or EISO ring node) and is not undergoing restoration.

NOTE: The ring can not be reconfigured if either the current BISO or EISO ring node is not active. A ring with an inactive BISO or EISO node is in a transient state, its restoration is given top priority. The MOVFLT option may be used subject to limitations described above.

When the ring is down, the CFR:RING request (without options) will attempt to initialize the ring. This requires at least one RPCN node in the standby (STBY) state. (A successful RST:RPCN input request will leave the RPCN node in the STBY state when the ring is down). The ring initialization will not, in itself, restore any interprocess message switch (IMS) user node (IUN)s to service.

Ring initializations are much slower than ring reconfigurations. Allow several minutes per one hundred nodes equipped in the office.

NOTE: If the ring initialization is successful, any subsequent problems that cause it to go down will probably abort IMS unless manual ring mode is in effect. Refer to the REPT:MANUAL-RING output message for details.

The ring is reconfigured or initialized as per the INCLUDE or EXCLUDE keyword explanation above.

a = A ring node (RN) group number or lower limit of a range of RN group numbers (in the direction of flow of ring 0).

b = The RN member number or lower limit of a range of RN member numbers.

c = Upper limit of a range of RN's group numbers.

d = Upper limit of a range of RN's member numbers.

4. SYSTEM RESPONSE

PF = Printout follows. The CFR:RING output message follows.

CFR:RTBM

Software Release: 5E12 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the size of the Real Time Billing Memory (RTBM) on switching modules (SM's) be configured. Physical memory is allocated to the SM real time billing buffer for growth. The amount specified in the kbytes parameter will become the newly configured real time memory size and must be a multiple of 4. This message is used to configure the RTBM for all module types.

2. FORMAT

```
CFR:RTBM,SM=a,KBYTES=b;
```

3. EXPLANATION OF MESSAGE

`a` = SM number.

`b` = Number of kilobytes.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `MINIMUM SIZE MUST BE MAINTAINED` = Real time memory must be greater than or equal to a minimum size.
- `REQUEST EXCEEDS AVAILABLE MEMORY` = The amount of real time memory specified exceeds the sum of the current size of real time memory plus the amount of available spare memory.
- `REQUESTED SIZE NOT A MULTIPLE OF 4` = The size of real time billing memory specified by kbytes must be even. All sections of SM memory must be multiples of 4K.

`PF` = Printout follows. Request accepted. The CFR RTBM output message follows.

`RL` = Retry later. May also include:
- `REAL TIME MEMORY NOT EMPTY` = Real time memory is in use.

CFR:SPRMEM-A

Software Release: 5E10 only
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a section or sections of switching module (SM) memory be allocated/deallocated from the spare memory hole for the peripheral image or images that resides in the peripheral unit specified on the input message line. The SM memory layout need no longer contain images for peripherals that are not equipped. This input message must be executed with a request type of GROW during the growth procedures for the first peripheral unit of each type grown on an SM. It should also be executed with a request type of DEGROW after the last peripheral unit of each type is degrown on an SM to reclaim memory and consolidate spare memory. If a request type of growth or degrowth is not specified, growth is the default.

2. FORMAT

```
CFR:SPRMEM,UNIT=a,SM=b[,REQST={c}];
```

3. EXPLANATION OF MESSAGE

`a` = SM peripheral hardware unit. Valid value(s):

- `DNUS` = The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are allocated. This includes the DNUSCC and DNUSTMX images and hashsums.
- `GDSF` = The global digital services function (GDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `IDCU` = The set of three integrated digital carrier unit (IDCU) resident software images and hashsums are allocated. This includes the IDCUCCP, IDCULSI, and IDCUDLP images and hashsums.
- `ISLU` = The integrated services line unit (ISLU) resident software image and hashsum are allocated.
- `ISLU2` = The integrated services line unit model 2 (ISLU2) resident software image and hashsum are allocated.
- `ISTF` = The integrated services test function (ISTF) resident operational software image and hashsum are allocated. The hardware digital service unit (HDSU) diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `LDSF` = The local digital service function (LDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `LDSU` = The local digital service unit (LDSU) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `PH2` = The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.
- `PH3` = The set of two protocol handler model 3 (PH3) resident software images and hashsums are allocated. This includes the PH3C and OIOP images and hashsums.
- `PH4` = The set of three protocol handler model 4 (PH4) resident software images and

Copyright © 1999

hashsums are allocated. This includes the PH4I, IP4I, and IP4F images and hashsums.

PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

PI = The packet interface (PI) resident software image and hashsum are allocated.

PI2 = The packet interface model 2 (PI2) resident software image and hashsum are allocated.

RAF = The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

SAS = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.

b = SM number.

c = Request type. Valid value(s):

```
DEGROW
GROW
```

4. SYSTEM RESPONSE

PF = Printout follows. Request accepted and the CFR:SPRMEM output message follows.

RL = Retry later. Memory growth terminal process could not be created.

Software Release: 5E11 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a section or sections of switching module (SM) memory be allocated/deallocated from the spare memory hole for the peripheral image or images that resides in the peripheral unit specified on the input message line. The SM memory layout need no longer contain images for peripherals that are not equipped. This input message must be executed with a request type of GROW during the growth procedures for the first peripheral unit of each type grown on an SM. It should also be executed with a request type of DEGROW after the last peripheral unit of each type is degrown on an SM to reclaim memory and consolidate spare memory. If a request type of growth or degrowth is not specified, growth is the default.

2. FORMAT

```
CFR:SPRMEM,UNIT=a,SM=b[,REQST={c}][,UCL];
```

3. EXPLANATION OF MESSAGE

`UCL` = Unconditionally process the image(s) for the specified unit, ignoring checks for hardware equipage.

`a` = SM peripheral hardware unit. Valid value(s):

- `DNUS` = The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are allocated. This includes the DNUSCC and DNUSTMX images and hashsums.
- `GDSF` = The global digital services function (GDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `IDCU` = The set of three integrated digital carrier unit (IDCU) resident software images and hashsums are allocated. This includes the IDCUCCP, IDCULSI, and IDCUDLP images and hashsums.
- `ISLU` = The integrated services line unit (ISLU) resident software image and hashsum are allocated.
- `ISLU2` = The integrated services line unit model 2 (ISLU2) resident software image and hashsum are allocated.
- `ISTF` = The integrated services test function (ISTF) resident operational software image and hashsum are allocated. The hardware digital service unit (HDSU) diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `LDSF` = The local digital service function (LDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `LDSU` = The local digital service unit (LDSU) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `PH2` = The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.
- `PH3S` = The set of two protocol handler model 3 (PH3) common channel signaling (CCS)

Copyright © 1999

resident software images and hashsums are pumped from the AM disk. This includes the PH3S and IP3S images and hashsums.

PH3C = The set of two PH3 ISDN resident software images and hashsums are pumped from the AM disk. This includes the PH3C and OIOP images and hashsums.

PH4 = The set of three protocol handler model 4 (PH4) resident software images and hashsums are allocated. This includes the PH4I, IP4I, and IP4F images and hashsums.

PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

PHV3C = The set of two speech handler (PHV3) resident software images and hashsums are allocated. This includes the PHV3C and DSP8K images and hashsums.

DSPEVRC = The EVRC DSP software image and hashsum are allocated, for use with the speech handlers (PHVs) that support downloadable DSPs.

DSP13K = The 13K DSP software image and hashsum are allocated, for use with the speech handlers (PHVs) that support downloadable DSPs.

PHA1 = The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are allocated.

PI = The packet interface (PI) resident software image and hashsum are allocated.

PI2 = The packet interface model 2 (PI2) resident software image and hashsum are allocated.

RAF = The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

SAS = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.

b = SM number.

c = Request type. Valid value(s):

```
DEGROW
GROW
```

4. SYSTEM RESPONSE

PF = Printout follows. Request accepted and the CFR:SPRMEM output message follows.

RL = Retry later. Memory growth terminal process could not be created.

hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

PH2 = The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

PH3S = The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are pumped from the AM disk. This includes the PH3S and IP3S images and hashsums.

PH3C = The set of two PH3 ISDN resident software images and hashsums are pumped from the AM disk. This includes the PH3C and OIOP images and hashsums.

PH4ISDN = The set of two protocol handler model 4 (PH4) resident ISDN software images and hashsums are allocated. This includes the PH4AP and the PH4ISDN IOP images and hashsums.

PH4PP = The protocol handler model 4 (PH4) resident package pipe software IOP image (PH4PP) as hashsum regions are allocated. If not already loaded, the PH4AP and the PH4ISDN IOP (needed for diagnostics) images and hashsums will be allocated as well. These images are used for CDMA and TDMA packet pipe applications.

PH4IFR = The protocol handler model 4 (PH4) resident ISDN frame relay software IOP image (PH4IFR) and hashsum regions are allocated. If not already loaded, the PH4AP and the PH4ISDN IOP (needed for diagnostics) images and hashsums will be allocated as well.

PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

PHV3C = The set of two speech handler (PHV3) resident software images and hashsums are allocated. This includes the PHV3C and DSP8K images and hashsums.

DSPEVRC = The EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSP13K = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPACEHLP = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPVSELP = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

PHV4C = The set of two speech handler (PHV4) resident software images and hashsums are pumped from the AM disk. This includes the PHV4C and V4DSPEVRC images and hashsums.

V4DSP8K = The 8K DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSP13K = the 13K DSP software image and hashsum are pumped from the AM disk, for use with the PH4 speech handlers.

Copyright © 1999

V4DSPACELP = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPVSELP = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

PHA1 = The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are allocated.

PI = The packet interface (PI) resident software image and hashsum are allocated.

PI2 = The packet interface model 2 (PI2) resident software image and hashsum are allocated.

RAF = The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

SAS = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.

b = SM number.

c = Request type. Valid value(s):
DEGROW
GROW

4. SYSTEM RESPONSE

CFR:SPRMEM,ODRID=a,SM=b[,REQST={c}][,UCL];
```

3. EXPLANATION OF MESSAGE

`UCL` = Unconditionally process the image(s) for the specified unit, ignoring checks for hardware equipage.

`a` = SM peripheral hardware unit. Valid value(s):

- `DNUS` = The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are allocated. This includes the DNUSCC and DNUSTMX images and hashsums.
- `GDSF` = The global digital services function (GDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `IDCU` = The set of three integrated digital carrier unit (IDCU) resident software images and hashsums are allocated. This includes the IDCUCCP, IDCULSI, and IDCUDLP images and hashsums.
- `ISLU` = The integrated services line unit (ISLU) resident software image and hashsum are allocated.
- `ISLU2` = The integrated services line unit model 2 (ISLU2) resident software image and hashsum are allocated.
- `ISTF` = The integrated services test function (ISTF) resident operational software image and hashsum are allocated. The hardware digital service unit (HDSU) diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `LDSF` = The local digital service function (LDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
- `LDSU` = The local digital service unit (LDSU) resident operational software image and

Copyright © 1999

hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

PH2 = The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

PH3S = The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH3S and IP3S images and hashsums.

PH3C = The set of two PH3 ISDN resident software images and hashsums are allocated. This includes the PH3C and OIOP images and hashsums.

PH4ISDN = The set of two protocol handler model 4 (PH4) resident ISDN software images and hashsums are allocated. This includes the PH4AP and the PH4ISDN IOP images and hashsums.

PH4PP = The protocol handler model 4 (PH4) resident package pipe software IOP image (PH4PP) as hashsum regions are allocated. If not already loaded, the PH4AP and the PH4ISDN IOP (needed for diagnostics) images and hashsums will be allocated as well. These images are used for CDMA and TDMA packet pipe applications.

PH4IFR = The protocol handler model 4 (PH4) resident ISDN frame relay software IOP image (PH4IFR) and hashsum regions are allocated. If not already loaded, the PH4AP and the PH4ISDN IOP (needed for diagnostics) images and hashsums will be allocated as well.

PH22S = The set of two protocol handler model 22 (PH22) common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH22S and IP22S images and hashsums.

PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

PHV3C = The set of two speech handler (PHV3) resident software images and hashsums are allocated. This includes the PHV3C and DSP8K images and hashsums.

DSPEVRC = The EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSP13K = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPACEHLP = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPVSELP = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

PHV4C = The set of two speech handler (PHV4) resident software images and hashsums are pumped from the AM disk. This includes the PHV4C and V4DSPEVRC images and hashsums.

V4DSP8K = The 8K DSP software image and hashsum are pumped from the AM disk, for use

with the PHV4 speech handlers.

`V4DSP13K` = the 13K DSP software image and hashsum are pumped from the AM disk, for use with the PH4 speech handlers.

`V4DSPACELP` = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

`V4DSPVSELP` = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

`PHA1` = The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are allocated.

`PI` = The packet interface (PI) resident software image and hashsum are allocated.

`PI2` = The packet interface model 2 (PI2) resident software image and hashsum are allocated.

`RAF` = The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

`SAS` = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.

`b` = SM number.

`c` = Request type. Valid value(s):
`DEGROW`
`GROW`

4. SYSTEM RESPONSE

`PF` = Printout follows. Request accepted and the CFR:SPRMEM output message follows.

`RL` = Retry later. Memory growth terminal process could not be created.

CHG:ALM

Software Release: 5E10 and later
Command Group: ALARM
Application: 5
Type: Input

1. PURPOSE

Requests a change to or adds alarm labels, levels, and repeatability status for office assignable building/power or miscellaneous alarms. Any combination of one or more of the keywords TAG, LVL, and REPEAT can be specified.

2. FORMAT

```
CHG:ALM,a=b{[,TAG[="c"]][,LVL=d][,REPEAT=e]};
```

3. EXPLANATION OF MESSAGE

a = Type of alarm. Valid value(s):
- BPSC = Building/power scan point.
- MISC = Miscellaneous.

b = Scan point number. Valid value(s):

If 'a' =	'b' =
BPSC	2 - 27
MISC	0 - 47

c = Alarm label (maximum of 9 characters, plus and minus signs, numbers, or spaces). To remove (not replace) an alarm label, the TAG field 'c' may be entered as a null string (for example, TAG=""), or TAG may be entered without the 'c' argument. If the TAG keyword is not entered or an asterisk (*) is used in field 'c', the alarm label will default to the previous label.

d = Alarm level. If the LVL keyword is not entered, the alarm level will default to the previous level (original default level is MJ). Valid value(s):
- CR = Critical.
- IF = Informational.
- MJ = Major.
- MN = Minor.

e = Alarm repeatability status. If an office assignable alarm is assigned as repeating, when that alarm is activated, it will generate a new alarm every 15 minutes until the stimulus for the alarm is cleared or the alarm is inhibited. If the REPEAT keyword is not entered, the alarm repeatability status will default to the previous value (original default is N). Valid value(s):
- N = No (non-repeating).
- Y = Yes (15-minute repeating).

4. SYSTEM RESPONSE

PF = Printout follows. A CHG:ALM output message will follow in response to the request.
NG = No good. The request has been denied. The office is not equipped to process the request entered.

CHG:GEN

Software Release: 5E10 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests a change in the common network interface (CNI) incore view of the CNI generic identification (ID). It causes the CNI to read the equipment configuration data (ECD) and common network interface release (CNIREL) files in order to change the generic ID of the CNI. This input message is executed automatically with every software update containing the CNIREL product and is not intended to be run manually.

2. FORMAT

```
CHG:GEN;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by an CHG:GEN output message.

5. REFERENCES

Output Message(s):

`CHG:GEN`

Copyright © 1999

CHG:LPS-MSGCLS

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the log/print status (LPS) of one or all output message class(es) be changed. A record of the log/print status of each output message class is kept in the current status table and in the backup status table. If the status of the current table is changed without writing to the backup table, the Master Control Center (MCC) system inhibit lamp will be lit.

This message will only change *5ESS*®-2000 switch message classes. Message classes are listed in the APP:MSGCLS appendix in the Appendixes section of the Output Messages manual.

NOTE: This message will NOT affect critical, major, and minor alarm level output messages and output messages produced as a result of manual inputs. This message will NOT change common network interface (CNI) message classes either.

Format 1 changes the current log and/or print status to ON or OFF, as specified. If TOBKUP is entered, the same change will be applied to the backup status as well.

Format 2 copies the backup status to the current status, or vice-versa.

2. FORMAT

```
[1]    CHG:LPS,MSGCLS={a|ALL},{PRINT=b|LOG=c|PRINT=b,LOG=c}[,TOBKUP];

[2]    CHG:LPS,MSGCLS={a|ALL},{FROMBKUP|TOBKUP};
```

3. EXPLANATION OF MESSAGE

`ALL` = Change all message classes.

`FROMBKUP` Copy the backup status to the current table.

`TOBKUP` = Copy the current status to the backup table. Discard status cannot be copied to backup table.

`a` = Valid message class.

`b` = Equipment configuration database (ECD) routing status (ON or OFF).

`c` = Daylog routing status (ON or OFF).

NOTE: Discard status can be obtained by specifying `PRINT=OFF,LOG=OFF`. Messages with this status will be discarded unless alarmed or manually generated.

4. SYSTEM RESPONSE

`OK` = Good. The request to change current and/or backup statuses was accepted. May also include:
`- EXCEPT CNI MSGCLS'S NOT CHANGED` = The request to change current status of all message classes except CNI message classes was accepted.

Copyright © 1999

`NG` = No good. May also include:
- `DISCARD NOT WRITABLE TO BKUP` = The message class is set to discard and therefore cannot be copied to backup.
- `INTERNAL ERROR` = Failed from lseek, read, or write operations to the disk file that contains the tables.
- `PLEASE REROUTE CNI MESSAGES VIA ECD/RCV` = CNI message classes can only be rerouted using ECD/RCV classdef form on MCC page 199.

`RL` = Retry later. May also include:
- `LPS DISK TABLE (HMlpstable) NOT FOUND` = The disk file that contains the tables cannot be found. A new file will be created and OP:LPS output message will be generated automatically. Retry then.

CHG:MRVT

Software Release: 5E10 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the message transfer part (MTP) route verification test (MRVT) delay parameter (D), which is used in the calculation of the T1 timer, be changed or displayed. If a request is made to change the delay parameter, and it is within range, the requested value is written onto disk and the delay parameter is updated to the new value.

2. FORMAT

```
CHG:MRVT=[a];
```

3. EXPLANATION OF MESSAGE

`a` = The new value of the delay parameter in seconds (default 8).

NOTE: If this argument is not present on the input message line, the current value of the delay parameter is displayed.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by CHG:MRVT output message.

Software Release: 5E10 - 5E13
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that brevity control be activated on messages with CRITICAL, MAJOR, MANUAL and/or MINOR handling priorities. Messages originated with any of these four handling priorities are considered alarmed. Brevity control restricts the number of application terminal (TTY) output messages that are sent to the administrative module (AM) to reduce the quantity of messages. Brevity control is applied for a specific message class and for a specific handling priority.

The brevity control status for each message class can be printed out using the OP:BREVC[,MSGCLS=a] input message. The status for the entire system can be printed out using OP:SYSSTAT input message.

The AM, communications module processor (CMP) and all the switching modules (SMs) normally restrict the generation of output messages through automatic brevity controls on messages with handling priorities lower than the four alarmed levels. Under unusual circumstances, it may be desirable to restrict alarmed messages originating from an SM or CMP which may increase communication link traffic and degrade AM performance and capacity.

Format 1 allows the user to enable/disable brevity control on one or more alarmed message types.

Format 2 allows the user to enable/disable brevity control on one or more alarmed message types and flush the SM or CMP buffers of all messages that are currently covered under brevity control.

Format 3 allows the user to flush the SM or CMP buffers of all messages that are currently covered under brevity control.

This message control is automatically cleared during high-level AM initializations.

WARNING: The indiscriminate use of the CHG:MSGCNTL message may cause alarmed messages to be discarded and delay notification of alarms.

2. FORMAT

```
[1]    CHG:MSGCNTL,{CMP=a|SM=b[&&c][,LSM][,HSM][,RSM][,ORM][,TRM]}
       ,d={NORM|DISCARD};

```
[,FLUSH];
```

3. EXPLANATION OF MESSAGE

CMP = Change the state of brevity for the CMP.

DISCARD = Enable brevity control. (Used with ALL, CRITICAL, MAJOR, MINOR, and MANUAL input messages.)

FLUSH = Allow SM or CMP message buffers to be flushed of all messages that are currently covered under brevity control.

HSM = Change the state of brevity control for host switching modules in range.

LSM = Change the state of brevity control for local switching modules in range.

NORM = Disable brevity control. (Used with ALL, CRITICAL, MAJOR, MINOR, and MANUAL input messages.)

ORM = Change the state of brevity control for optical remote switching modules in range.

RSM = Change the state of brevity control for remote switching modules in range.

SM = Change the state of brevity for one or more SMs.

TRM = Change the state of brevity control for two-mile optical remote switching modules in range.

a = CMP number.

b = SM number or lower limit of a range of SM numbers.

c = Upper limit of a range of SM numbers.

d = The type of alarmed message for which the state of brevity control should be changed. Valid value(s):

- ALL = Change the state of brevity control for all four alarmed messages.
- CRITICAL = Change the state of brevity control for critical messages.
- MAJOR = Change the state of brevity control for major messages.
- MANUAL = Change the state of brevity control for manual messages.
- MINOR = Change the state of brevity control for minor messages.

4. SYSTEM RESPONSE

NG = No good. An illegal SM number or range was specified or illegal CMP number was specified.

OK = Good. The message was accepted and the action completed.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that brevity control be activated on messages with CRITICAL, MAJOR, MANUAL and/or MINOR handling priorities. Messages originated with any of these four handling priorities are considered alarmed. Brevity control restricts the number of application terminal (TTY) output messages that are sent to the administrative module (AM) to reduce the quantity of messages. Brevity control is applied for a specific message class and for a specific handling priority.

The brevity control status for each message class can be printed out using the OP:BREVC[,MSGCLS=a] input message. The status for the entire system can be printed out using OP:SYSSTAT input message. The AM, communications module processor (CMP) and all the switching modules (SMs) normally restrict the generation of output messages through automatic brevity controls on messages with handling priorities lower than the four alarmed levels. Under unusual circumstances, it may be desirable to restrict alarmed messages originating from an SM or CMP which may increase communication link traffic and degrade AM performance and capacity. Format 1 allows the user to enable/disable brevity control on one or more alarmed message types. Format 2 allows the user to enable/disable brevity control on one or more alarmed message types and flush the SM or CMP buffers of all messages that are currently covered under brevity control. Format 3 allows the user to flush the SM or CMP buffers of all messages that are currently covered under brevity control. This message control is automatically cleared during high-level AM initializations.

WARNING: The indiscriminate use of the CHG:MSGCNTL message may cause alarmed messages to be discarded and delay notification of alarms.

2. FORMAT

```
[1]    CHG:MSGCNTL,{CMP=a|SM=b[&&c][,LSM][,HSM][,RSM][,ORM][,TRM]}
       ,d={NORM|DISCARD};
                    .
                    .
                    .

[2]    CHG:MSGCNTL,{CMP=a|SM=b[&&c][,LSM][,HSM][,RSM][,ORM][,TRM]}
       ,d={NORM|DISCARD}
                    .
                    .
                    .
       [,FLUSH];

[3]    CHG:MSGCNTL,{CMP=a|SM=b[&&c][,LSM][,HSM][,RSM][,ORM][,TRM]}
       [,FLUSH];
```

3. EXPLANATION OF MESSAGE

`CMP` = Change the state of brevity for the CMP.

Copyright © 1999

DISCARD = Enable brevity control. (Used with ALL, CRITICAL, MAJOR, MINOR, and MANUAL input messages.)

FLUSH = Allow SM or CMP message buffers to be flushed of all messages that are currently covered under brevity control.

HSM = Change the state of brevity control for host switching modules in range.

LSM = Change the state of brevity control for local switching modules in range.

NORM = Disable brevity control. (Used with ALL, CRITICAL, MAJOR, MINOR, and MANUAL input messages.)

ORM = Change the state of brevity control for optical remote switching modules in range.

RSM = Change the state of brevity control for remote switching modules in range.

SM = Change the state of brevity for one or more SMs.

TRM = Change the state of brevity control for two-mile optical remote switching modules in range.

a = CMP number.

b = SM number or lower limit of a range of SM numbers.

c = Upper limit of a range of SM numbers.

d = The type of alarmed message for which the state of brevity control should be changed. Valid value(s):

- ALL = Change the state of brevity control for all four alarmed messages.
- CRITICAL = Change the state of brevity control for critical messages.
- MAJOR = Change the state of brevity control for major messages.
- MANUAL = Change the state of brevity control for manual messages.
- MINOR = Change the state of brevity control for minor messages.

4. SYSTEM RESPONSE

NG = No good. An illegal SM number or range was specified or illegal CMP number was specified.

OK = Good. The message was accepted and the action completed.

CHG:PAUTH

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Changes the password for a given person identity (IDENT) in the person authority database (PAUTH). The user will be forced to choose a new password upon his or her next login.

This input message is not printed (echoed) on the read-only printer (ROP) in order to keep passwords private. This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
CHG:PAUTH:IDENT="a",PSSWD="b";
```

3. EXPLANATION OF MESSAGE

`a` = Identity of the person that uses the password, in one to eight characters.

`b` = Password in six to thirteen characters.

4. SYSTEM RESPONSE

`NG` = No good. Valid value(s):
- `NON-EXISTENT PERSON IDENTITY` = The given person identity does not exist in the person authority database.
- `PASSWORD INVALID LENGTH` = The given password is greater than 13 characters in length.
- `PASSWORD MUST BE AT LEAST 6 CHARACTERS` = The given password is less than six characters in length.
- `UNABLE TO ACCESS AUTHORITY ADMINISTRATION` = The person authority database is inaccessible.

`OK` = Good. The identity and password have been changed in the person authority database.

`RL` = Retry later. Valid value(s):
- `AUTHORITY ADMINISTRATION UNDER UPDATE` = The person authority database is currently being updated.

CHG:PRNTMODE-A

Software Release: 5E10 - 5E12
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests a change of the print mode of the specified packet interface (PI) and/or packet switching unit protocol handler (PSUPH).

Format 1 changes the print mode of the specified PI of the module controller time slot interchanger (MCTSI) or PSUPH. The desired PSUPH may also be referenced by its currently associated channel group (CHNG). This message will also print the PSUPH's or PI's logged messages if HISTORY is specified in the input message. Format 2 changes the print mode of all PSUPHs and/or all PIs of the specified switching module (SM). Once the print mode of a PSUPH(s) or(/and) PI(s) is set to "ON", the unit's messages will be printed on the ROP (receive-only printer) until manually changed or until 48 hours have elapsed without a PI's or PSUPH's print mode change of "ON".

2. FORMAT

```
[1]    CHG:PRNTMODE={ON|OFF},{PSUPH=a-b-c-d|CHNG=a-b-c-e|MCTSI=a-f,PI}
       [,HISTORY];

[2]    CHG:PRNTMODE={ON|OFF},SM=a,{PSUPH|PI|PP};
```

3. EXPLANATION OF MESSAGE

`CHNG` = Channel group (logical PH).

`HISTORY` = Print all logged output messages in the specified PI or PSUPH.

`MCTSI` = Module controller time slot interchanger.

`OFF` = Set the printing mechanism to OFF for printing the specified PSUPH's or PI's messages. If an SM is specified, the printing mechanism for all PHs and/or all PI's in the SM will be changed to OFF.

`ON` = Set the printing mechanism to ON for printing the specified PSUPH's or PI's messages. If an SM is specified, the printing mechanism for all PHs and/or all PI's in the SM will be changed to ON.

`PI` = Packet interface.

`PP` = Port processor (refers to PSUPH or PI, collectively).

`PSUPH` = Packet switching unit protocol handler (physical PH).

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = PSUPH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input

Copyright © 1999

Messages manual.

`e` = CHNG number.

`f` = MCTSI side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`IP` = In progress. The message was accepted and the print mode is changed as requested. The history output is in progress. (This response is given when a history is requested.)

`NG` = No good. The message was not accepted because the SM is isolated or the equipment does not exist.

`NO` = Feature not available. The requested action failed because the feature required to process the request is not present in the module.

`OK` = Good. The message was accepted and the print mode is changed as requested.

CHG:PRNTMODE-B

Software Release: 5E13 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests a change to the print mode of the specified packet interface (PI) and/or packet switching unit protocol handler (PSUPH).

Format 1 changes the print mode of the specified PI of the module controller time slot interchanger (MCTSI) or PSUPH. The desired PSUPH may also be referenced by its currently associated channel group (CHNG). This input message will also print the PSUPH's or PI's logged recovery output reports if RCVYHST is specified. This input message will also print the PSUPH's or PI's event history if EVENTHST is specified. However, even history dumps are not supported on PIs of hardware type PI1 or on PSUPHs of hardware type PH2. Format 2 changes the print mode of all PSUPHs and/or all PIs of the specified switching module (SM). Once the print mode of a PSUPH(s) or(/and) PI(s) is set to "ON", the unit's output reports will be printed on the ROP (receive-only printer) until manually changed or until 48 hours have elapsed without a PI's or PSUPH's print mode change of "ON".

2. FORMAT

```
[1]    CHG:PRNTMODE={ON|OFF},{PSUPH=a-b-c-d|CHNG=a-b-c-e|MCTSI=a-f,PI}
       [,RCVYHST][,EVENTHST];

[2]    CHG:PRNTMODE={ON|OFF},SM=a,{PSUPH|PI|PP};
```

3. EXPLANATION OF MESSAGE

`CHNG` = Channel group (logical PH).

`RCVYHST` = Print all logged output reports from the specified PI or PSUPH.

`EVENTHST` = Print event history from the specified PI or PSUPH.

`MCTSI` = Module controller time slot interchanger.

`OFF` = Set the printing mechanism to OFF for printing the specified PSUPH's or PI's messages. If an SM is specified, the printing mechanism for all PHs and/or all PI's in the SM will be changed to OFF.

`ON` = Set the printing mechanism to ON for printing the specified PSUPH's or PI's messages. If an SM is specified, the printing mechanism for all PHs and/or all PI's in the SM will be changed to ON.

`PI` = Packet interface.

`PP` = Port processor (refers to PSUPH or PI, collectively).

`PSUPH` = Packet switching unit protocol handler (physical PH).

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

`c` = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = PSUPH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = CHNG number.

`f` = MCTSI side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`IP` = In progress. The message was accepted and the print mode is changed as requested. The printing of the requested history is in progress. (This response is given when a history dump is requested.)

`NG` = No good. The message was not accepted because the SM is isolated or the equipment does not exist.

`NO` = Feature not available. The requested action failed because the feature required to process the request is not present in the module.

`OK` = Good. The message was accepted and the print mode is changed as requested.

CHG:PROFL

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Adds or removes a command group (COMGR) from a profile identity (IDENT) in the profile authority database (PROFL). The IDENT must already be defined by the ADD:PROFL input message.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
CHG:PROFL:IDENT=a,ACTION=b,COMGR=c[-d][-e][-f][-g][-h][-i][-j];
```

3. EXPLANATION OF MESSAGE

`a` = Identity of the profile in one to eight letters and/or digits.

`b` = The action to perform on the profile. Valid value(s):

- `EXCLUDE` = Remove the given command group(s) from the profile.
- `INCLUDE` = Add the given command group(s) to the profile.

`c-j` = Command group. Valid value(s):

- `ADMIN` = System administrator only activities.
- `ALARM` = Alarm manipulation.
- `AM` = Administrative module maintenance.
- `AMA` = Automatic Message Accounting.
- `AUDIT` = Audits.
- `AUTH` = Command and authority administration.
- `CCS` = Common channel signaling.
- `CM` = Communications module maintenance.
- `FHADM` = File handling and administration.
- `MAINT` = Routine maintenance activities.
- `MEAS` = Measurements.
- `NMOC` = Network management and overload control.
- `ODD` = Office Dependent Data activities.
- `PASS` = Personal password modification.
- `RCV` = Recent Change and Verify activities.
- `SM` = Switching module maintenance.
- `SPECRCV` = Special RCV input messages.
- `SFTMGT` = Software management (update, software release retrofit).
- `SFTUTIL` = Software utilities.
- `SUPERUSR` = Super user authority (bypass terminal authority).
- `SYSRCVY` = System recovery activities.
- `TRACE` = Call trace.
- `TRKLN` = Trunk and line maintenance.

Copyright © 1999

Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

4. SYSTEM RESPONSE

NG = No good. May also include:
- PROFILE IDENTITY DOES NOT EXIST = The given profile identity does not exist in the profile authority database.
- UNABLE TO ACCESS PROFILE ADMINISTRATION = The profile authority database is inaccessible.

OK = Good. Command group(s) successfully added to or removed from the given profile.

RL = Retry later. May also include:
- PROFILE ADMINISTRATION UNDER UPDATE = The profile authority database is currently being updated.

CHG:PSSWD

Software Release: 5E10 and later
Command Group: PASS
Application: 5,3B
Type: Input

1. PURPOSE

Changes a user's password (PSSWD) from its current value (OLD) to a new value (NEW). A user may change only his or her own password.

This input message is not printed (echoed) on the Receive Only Printer (ROP) in order to keep passwords private. This input message is associated with maintenance interface security. Refer to the Routine Operations and Maintenance manual further information.

2. FORMAT

```
CHG:PSSWD:OLD=a,NEW=b;
```

3. EXPLANATION OF MESSAGE

`a` = Old password in six to thirteen characters.

`b` = New password in six to thirteen characters.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

- `CURRENT USER IS NOT OWNER OF THE PASSWORD` = A user can change only his or her own password.
- `LESS THAN 'a' WEEK(S) SINCE LAST PASSWORD CHANGE` = A minimum of '`a`' weeks must elapse between password changes, where '`a`' is the minimum password change time defined in the ECD Emergency Action Interface Option (eaiopt) record.
- `OLD PASSWORD INCORRECT` = The given old password does not match the user's current password in the person authority database.
- `PASSWORD CAN NOT BE SIMILAR TO LOGIN ID` = A password must differ from the login (person) identity by at least two character positions. It also must not be the reverse or circular shift of the login identity.
- `PASSWORD CAN NOT BE SIMILAR TO PREVIOUS PASSWORD` = A password must differ from the previous password by at least two character positions. It also must not be the reverse or circular shift of the previous password.
- `PASSWORD MUST BE AT LEAST 6 CHARACTERS` = A password must contain at least six characters.
- `PASSWORD MUST BE DIFFERENT THAN PREVIOUS 3 PASSWORDS` = The last three passwords can not be used as a new password.
- `PASSWORD MUST CONTAIN AT LEAST 2 ALPHA AND 1 DIGIT OR SPECIAL CHAR` = A password must contain at least two alphabetic characters and one digit or special character.
- `UNABLE TO ACCESS AUTHORITY ADMINISTRATION` = The person authority database is inaccessible.

`OK` = Change to password is made in the person authority database.

Copyright © 1999

RL = Retry later. May also include:
- AUTHORITY ADMINISTRATION UNDER UPDATE = The person authority database is currently being updated.

CHG:SLK-A

Software Release: 5E10 - 5E11
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests a change in the minor state of a signaling link (SLK) or to request a transfer from the active to the standby voice frequency link (VFL).

2. FORMAT

```
CHG:SLK=a-b:c;
```

3. EXPLANATION OF MESSAGE

`a` = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Requested minor state. Valid value(s):

- `FIS` = This option may be used to force manual out-of-service restrictions from a Common Channel Signaling System 7 (CCS7) link.
- `GROW` = Place the link in the growth state. This state is used during link installation or removal.
- `IS` = Place the link in-service. Make signaling link available to traffic.
- `MOOS` = Place the link manually out-of-service. Signaling link cannot handle traffic. Typically used when performing maintenance on a link.
- `TEST` = Place the link in test state. This state is used during link installation or removal.
- `XFR` = This message is used by the user in order to request the transfer of a signaling link from active (ACT) to the standby VFL. Valid for signaling links with major state available (AVL), minor state IS or MOOS or with major state unavailable (UNA) and minor state TEST.

A request is made to change the minor state of the particular SLK to the specified state or to request the transfer of the SLK from the active to the standby VFL. It should be noted that entering either of these requests does not guarantee the specified action. Successful SLK prove-in is required to accomplish either of these requested actions. For example, when a link that is in the MOOS state and is being returned to the IS state, it is actually moved from MOOS to OOS, which allows automatic link prove-in to begin. It is not until successful prove-in has been reached that the link is moved to the IS state.

4. SYSTEM RESPONSE

`PF` = Printout follows. The CHG:SLK output message will be printed.

Software Release: 5E12 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests a change in the minor state of a signaling link (SLK).

2. FORMAT

```
CHG:SLK=a-b:c;
```

3. EXPLANATION OF MESSAGE

`a` = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Requested minor state. Valid value(s):

- `FIS` = This option may be used to force manual out-of-service restrictions from a Common Channel Signaling System 7 (CCS7) link.
- `GROW` = Place the link in the growth state. This state is used during link installation or removal.
- `IS` = Place the link in-service. Make signaling link available to traffic.
- `MOOS` = Place the link manually out-of-service. Signaling link cannot handle traffic. Typically used when performing maintenance on a link.
- `TEST` = Place the link in test state. This state is used during link installation or removal.

A request is made to change the minor state of the particular SLK to the specified state. It should be noted that entering this request does not guarantee the specified action. Successful SLK prove-in is required to accomplish the requested action. For example, when a link is in the MOOS state and is being returned to the IS state, it is actually moved from MOOS to OOS, which allows automatic link prove-in to begin. It is not until successful prove-in has been reached that the link is moved to the IS state.

CHG:SRVT

Software Release: 5E10 and later
Command Group: CCS
Application: 5,CNI
Type: Input

1. PURPOSE

Requests that the SCCP routing verification test (SRVT) delay parameter, which is used in the calculation of the T2 timer, be changed or displayed. The expiration of the T2 timer signifies the end of the waiting period for the reception and processing of all expected SCCP routing verification acknowledgement (SRVA) messages.

If a request is made to change the delay parameter, and the requested value is within range, it is written onto disk and the delay parameter is updated to the new value. This new value becomes the new "default", that will be read in on initializations. The initial default is 12.

2. FORMAT

```
CHG:SRVT[=a];
```

3. EXPLANATION OF MESSAGE

`a` = The new value of the delay parameter. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

NOTE: If this argument is not present on the input message line, the current value of the Delay parameter is displayed to the maintenance output class.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CHG:SRVT output message.

CLR:ACKDB

Software Release: 5E10 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the segment name of acknowledgement database (ACKDB) be invalidated so that the next invocation of either the shell or display administration process (DAP) reinitializes the segment name using the ACKDB installed in /cft/she/ackdb. Current running processes will continue to use the old copy of the ACKDB until they are terminated. New processes will typically generate NA BAD ACKDB acknowledgements until the shells and display administration process are restarted using the 805 and 808 pokes on the C/D UPDATE MCC page.

WARNING: This message is intended for field update purposes only.

2. FORMAT

```
CLR:ACKDB;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`IP` = In progress. Request received and initiated. Further output will follow.

CLR:ARC

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Clears one or all alternate route cancellation (ARC) controls of a given control type. This TTY message is valid only for defense switched network (DSN) switches.

2. FORMAT

```
CLR:ARC[,OFFICE=a,],TYPE=b;
```

3. EXPLANATION OF MESSAGE

`a` = Switching office name. The default is for the total office.

`b` = Type of control to be cleared. Valid value(s):

- `CANT` = Clear the cancel to (CANT) control. Refer to the SET:ARC input message for the description of CANT.
- `CANF` = Clear the cancel from (CANF) control. Refer to the SET:ARC input message for the description of CANF.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CLR:ARC output message.

`RL` = Retry later. May also include:

- `RESOURCE SHORTAGE` = The necessary resources are not available.

CLR:ASPTQ-A

Software Release: 5E10 only
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Clears an advanced services platform (ASP) 0.1 test query parameter (or set of parameters) that has been set. All of the fields for a parameter are cleared. By specifying a parameter name, a single parameter may be cleared. By specifying a message type, all of the test query parameters associated with that message are cleared. Since a parameter may be used for more than one message type, clearing such a parameter causes the parameter to be cleared for all message types. Caution should be exercised when choosing the message type option. All of the parameters may be cleared by specifying the ALL message type.

2. FORMAT

```
CLR:ASPTQ,{MSGPARM=a|MSGTYPE=b};
```

3. EXPLANATION OF MESSAGE

`a` = The test query parameter name to be cleared. Valid value(s):

`ACCCD`	= Access code.
`AMAMSMENT`	= AMA measurement.
`AMP`	= Advanced intelligence network maintenance parameter.
`BEARCAP`	= Bearer capability.
`BUSYCAUSE`	= Busy cause.
`CHGNBR`	= Charge number.
`CHGTYPE`	= Charge party station type.
`CLDPTY`	= Called party ID.
`CLDTYPE`	= Called party station type.
`CLEARCS`	= Clear cause.
`CLGBGID`	= Calling party business group ID.
`CLGPTY`	= Calling party ID.
`CLOSECAUSE`	= Close cause.
`COLLADR`	= Collected address information.
`COLLDIGS`	= Collected digits.
`FAILCAUSE`	= Failure cause.
`GENLIST`	= Generic address list.
`GENNAME`	= Generic name.
`GLOBTITLE`	= Global title address.
`LATA`	= Local access and transport area.
`NOTIFYIND`	= Notification indicator.
`ORIGCLDPTY`	= Original called party ID.
`PRMCAR`	= Primary carrier.
`RDIRINFO`	= Redirection information.
`RDIRPTY`	= Redirecting party ID.
`TCMARK`	= Traveling class mark.
`TIMER`	= Timer.
`TRANTYPE`	= Translation type.
`TRIGTYPE`	= Trigger criteria type.
`USERID`	= User ID.

Copyright © 1999

VERTSRVCD = Vertical service code.

b = The message type. For convenience, the test query parameters associated with each message type are listed below. Even though the timer parameter is displayed with each message type (refer to the OP:ASPTQ input message), the timer parameter is not cleared when clearing parameters based upon a message type (except for the ALL message type). Valid value(s):

CLOSE = Close.
- — Advanced intelligence network maintenance parameter.
- — Bearer capability.
- — Close cause.
- — User ID.

INFOANAL = Information analyzed.
- — Access code.
- — Advanced intelligence network maintenance parameter.
- — Bearer capability.
- — Called party ID.
- — Calling party business group ID.
- — Calling party ID.
- — Charge number.
- — Charge party station type.
- — Collected address information.
- — Collected digits.
- — Local access and transport area.
- — Original called party ID.
- — Primary carrier.
- — Redirecting party ID.
- — Redirection information.
- — Translation type.
- — Traveling class mark.
- — Trigger criteria type.
- — User ID.
- — Vertical service code.
- — Global title address.

INFOCOLL = Information collected.
- — Access code.
- — Advanced intelligence network maintenance parameter.
- — Bearer capability.
- — Calling party ID.
- — Charge number.
- — Charge party station type.
- — Collected address information.
- — Collected digits.
- — Generic address list.
- — Local access and transport area.
- — Original called party ID.
- — Primary carrier.
- — Redirecting party ID.
- — Redirection information.
- — Translation type.
- — Traveling class mark.
- — Trigger criteria type.

Copyright © 1999

— User ID.
— Vertical service code.
— Global title address.

OANSWER = Originating answer.
— Advanced intelligence network maintenance parameter.
— Bearer capability.
— Notification indicator.
— User ID.

OCLDPTYBSY = Originating called party busy.
— Advanced intelligence network maintenance parameter.
— Bearer capability.
— Busy cause.
— Notification indicator.
— User ID.

ONOANSWER = Originating no answer.
— Advanced intelligence network maintenance parameter.
— Bearer capability.
— Notification indicator.
— User ID.

ORIGAT = Origination attempt.
— Advanced intelligence network maintenance parameter.
— Bearer capability.
— Calling party ID.
— Charge number.
— Charge party station type.
— Local access and transport area.
— Primary carrier.
— Translation type.
— Trigger criteria type.
— User ID.
— Global title address.

OTERMSZD = Originating termination seized.
— Advanced intelligence network maintenance parameter.
— Bearer capability.
— Notification indicator.
— User ID.

TERMAT = Termination attempt.
— Advanced intelligence network maintenance parameter.
— Bearer capability.
— Called party ID.
— Called party station type.
— Calling party ID.
— Charge number.
— Charge party station type.
— Generic name.
— Local access and transport area.
— Original called party ID.
— Redirecting party ID.

Copyright © 1999

— Redirection information.
— Translation type.
— Traveling class mark.
— Trigger criteria type.
— User ID.
— Global title address.

`RESCLR` = Resource clear.
— Advanced intelligence network maintenance parameter.
— AMA measurement.
— Clear cause.
— Collected address information.
— Collected digits.
— Failure cause.
— Primary carrier.

`ALL` = All of the ASP 0.1 test query parameters.

4. SYSTEM RESPONSE

`NO` = The request is not allowed. May also include:
`- FEATURE NOT AVAILABLE` = The ASP 0.1 feature must be purchased before attempting to clear an ASP 0.1 test query parameter.

`OK` = Good. The request was accepted.

235-190-126 *Advanced Services Platform*

CLR:AUD-A

Software Release: 5E10 - 5E11
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Format 1 requests the clearing of the full static office-dependent data (SODD) audit's schedule. Either part or all of the schedule may be cleared.

Format 2 requests the removal of existing full and incremental SODD audit error logs generated from their previous cycles of execution. All /rclog/SODD/errlog/*.prev files are removed. This input message should be used when the file system space for /rclog is low.

2. FORMAT

```
[1]    CLR:AUD=SODD,SCHED,DAY=a;

[2]    CLR:AUD=SODD,ERRLOG;
```

3. EXPLANATION OF MESSAGE

`a` = Day from the full audit schedule to be cleared. Valid value(s):

- `MON` = Monday.
- `TUE` = Tuesday.
- `WED` = Wednesday.
- `THU` = Thursday.
- `FRI` = Friday.
- `SAT` = Saturday.
- `SUN` = Sunday.
- `ALL` = All days. All entries in the schedule are cleared.

4. SYSTEM RESPONSE

`PF` = Printout follows. May also include:

- `"OP AUD=SODD SCHED" MESSAGE FOLLOWS` = Followed by an OP:AUD-SODD-SCH output message.
- `"OP AUD=SODD" MESSAGE FOLLOWS` = Followed by an OP:AUD-STATUS or OP:AUD-ERROR output message.

Application: 5
Type: Input

1. PURPOSE

Format 1 requests the clearing of the full static office-dependent data (SODD) audit's schedule. Either part or all of the schedule may be cleared.

Format 2 requests the removal of existing full and incremental SODD audit error logs generated from their previous cycles of execution. All /rclog/SODD/errlog/*.prev files are removed. This input message should be used when the file system space for /rclog is low.

Format 3 requests the removal of single or all current audits from the SODDCNTL file.

Format 4 requests the removal of restart files generated by PRC, MFT=ALL and FULL audits.

2. FORMAT

```
[1]    CLR:AUD=SODD,SCHED,DAY=a;

[2]    CLR:AUD=SODD,ERRLOG;

[3]    CLR:AUD=SODD,AUDIT=b;

[4]    CLR:AUD=SODD,c;
```

3. EXPLANATION OF MESSAGE

`a` = Day from the full audit schedule to be cleared. Valid value(s):

`MON`	= Monday.
`TUE`	= Tuesday.
`WED`	= Wednesday.
`THU`	= Thursday.
`FRI`	= Friday.
`SAT`	= Saturday.
`SUN`	= Sunday.
`ALL`	= All days. All entries in the schedule are cleared.

`b` = Audit to be cleared from the SODDCNTL file. Valid value(s):

`BOOT`	= Boot Critical sub audit.
`BRCS`	= BRCS sub audit.
`CCS`	= CCS sub audit.
`DIGIT`	= Digit Analysis sub audit.
`EQUIP`	= Equipment sub audit.
`FULL`	= Full audit.
`GLOBAL`	= Global Parameters sub audit.
`INCR`	= Incremental audit.
`ISDN`	= ISDN sub audit.
`LINE`	= Line sub audit.
`MISC`	= Miscellaneous sub audit.

CLR:BACKOUT-A

Software Release: 5E10 - 5E13
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that non-backed-up application recent changes be cleared from the administrative module (AM) and/or one or more switching modules (SMs) or a communication module processor (CMP) on a bootstrap (pump) of that processor. This message cancels the effect of the SET:BACKOUT input message.

Normally, when a processor undergoes a high-level initialization (selective initialization or full initialization), recently applied recent changes are replaced in the text and/or office dependent data (ODD).

WARNING: Recent changes that have been applied since the last backout will not be included on one or more processors. Permitting backouts of selected processors may introduce inconsistencies between processors which can have adverse effects.

2. FORMAT

```
CLR:BACKOUT,RC,{CMP=a,{PRIM|MATE}|AM|SM=b[&&c],AM|SM=b[&&c]}[,LSM][,HSM]
[,RSM][,ORM][,TRM];
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`MATE` = Mate CMP.

`PRIM` = Primary CMP.

`RC` = Mark the named processor(s) to include all recent changes that have not been backed up on subsequent AM bootstraps and/or SM pumps.

`a` = CMP number.

`b` = SM number, or the lower limit of a range of SM numbers.

`c` = Upper limit of the range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. The message was not accepted because:

- An illegal SM number or invalid range/type combination was specified.
- An illegal CMP number/type combination was specified.
- The processor type was invalid or missing (AM, SM or CMP).

Copyright © 1999

`OK` = Good. The message was accepted and the action completed.

CLR:CALLMON

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests that the verbose mode of the call monitor be turned off.

2. FORMAT

```
CLR:CALLMON,VERBOSE
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`OK` = Good. The request was accepted.

CLR:CGAP

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests clearance of a network management (NM) call gapping (CGAP) code control restricting traffic by issuing a destination code, an access prefix, or both. This message also has an option to clear all CGAP code controls in the office.

Format 1 clears all the CGAP code controls in the office. Format 2 clears the CGAP code control for a specified destination code regardless of the access prefix. Format 3 clears the CGAP code control for a specified prefix regardless of the destination code. Format 4 clears the CGAP code control for a specified destination code and a specified prefix.

2. FORMAT

```
[1]    CLR:CGAP;

[2]    CLR:CGAP,CODE=a,DOM={ALL|c};

[3]    CLR:CGAP,PREFIX=b,DOM={ALL|c};

[4]    CLR:CGAP,CODE=a,PREFIX=b,DOM={ALL|c};
```

3. EXPLANATION OF MESSAGE

`ALL` = Clear code control to all domains. The default is to clear all CGAP code controls in the office.

NOTE: If the control is set on code, prefix, and domain, all three are required in the message to clear the control.

`a` = Destination code (up to 18 characters; valid character set 0-9,"*","#").

`b` = The access prefix. The access prefix only applies to feature group D carriers.

`c` = Switching domain list.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CLR:CGAP output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The necessary resources are not available.

CLR:DCC

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Clears destination code cancellation (DCC) controls restricting traffic. This TTY message is valid only for defense switched network (DSN) switches.

2. FORMAT

```
CLR:DCC[,CODE=a];
```

3. EXPLANATION OF MESSAGE

`a` = Digit destination code (up to 15 digits). The default is all codes.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CLR:DCC output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The necessary resources are not available.

CLR:DOC

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a single dynamic overload control (DOC) be cleared on a specified trunk group.

2. FORMAT

```
CLR:DOC,TG=a;
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group number.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID REQUEST` = The request has been denied. This office is not equipped to process the request entered.

`PF` = Printout follows. Followed by the CLR:DOC output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The necessary resources are not available.

CLR:DSE-A

Software Release: 5E10 only
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the trapping and printing of direct signaling events (DSE) be turned off. These events will be reported in the REPT:ACP-APP-SM, REPT:ASP, REPT:DSE, REPT:MS-TRAPPED, REPT:NS and REPT:OSPS-DSE output messages.

2. FORMAT

```
CLR:DSE=a;
```

3. EXPLANATION OF MESSAGE

`a` = Event trap to be turned off. Valid value(s):

- `ALL` = All events.
- `AILSGMG` = Automated inward line screening (AILS) message received with invalid format reply.
- `AILSMRQ` = AILS error - misrouted query.
- `AILSTOT` = AILS query timed out before a reply was received.
- `AILSTRF` = AILS error - task refused.
- `AILSUDV` = AILS error - message received with unexpected input data value.
- `ASPACGCOMP` = Advanced services platform (ASP) service control point (SCP) response or unidirectional message with an automatic call gap (ACG) component received at the switch.
- `ASPBADRESP` = ASP SCP response message received with invalid data.
- `ASPNORTEMSG` = ASP reject message, return error and a play announcement received at the switch from the SCP.
- `ASPQRYFAIL` = ASP query blocked by network management (NM) ACG, a returned query or conversation received at the switch or a time out received in call processing.
- `ASPSNCOMP` = ASP SCP response message with a send notification component received at the switch.
- `ASPTNMSG` = ASP termination notification message sent from the switch to the SCP.
- `CASDBOV` = Customer account services (CAS) message received indicating database overload.
- `CASDBUN` = CAS message returned - database unable to process.
- `CASGMSG` = CAS message received garbled.
- `CASNBLK` = CAS message returned because of network blockage.
- `CASNCON` = CAS message returned because of network congestion.
- `CASNRTE` = CAS message returned because of no routing data.
- `CASTOUT` = CAS message returned because of timeout.
- `CASUNEQ` = CAS message returned because of unequipped destination.
- `CASURPY` = CAS message received with an unexpected reply.
- `CAS7ABM` = CAS common channel signaling 7 (CCS7) abort message received.
- `CAS7ACG` = CAS CCS7 ACG invoke component received.
- `CAS7GMG` = CAS CCS7 received with invalid format reply.
- `CAS7GWE` = CAS CCS7 error - gateway error.
- `CAS7MPR` = CAS CCS7 error - message received with missing parameter.

Copyright © 1999

CAS7MRQ = CAS CCS7 error - misrouted query.
CAS7NCG = CAS CCS7 message returned because of network congestion.
CAS7NFL = CAS CCS7 message returned because of network failure.
CAS7RCR = CAS CCS7 reject component received.
CAS7SCG = CAS CCS7 message returned because of subsystem congestion.
CAS7SFL = CAS CCS7 message returned because of subsystem failure.
CAS7TAN = CAS CCS7 message returned - no translation data for address of such nature.
CAS7TOT = CAS CCS7 query which timed out before reply received.
CAS7TRF = CAS CCS7 error - task refused.
CAS7TSA = CAS CCS7 message returned - no translation data for this specific address.
CAS7UDV = CAS CCS7 error - message received with unexpected input data value.
CAS7UPR = CAS CCS7 error - message received with unexpected parameter.
CAS7UQD = CAS CCS7 message returned - unqualified.
CAS7URY = CAS CCS7 received with unexpected reply.
CAS7UUR = CAS CCS7 message returned - unequipped user.
CAS7VCD = CAS CCS7 error - vacant code.
CCDDBOV = BVA calling card (CCRD) message received indicating database overload.
CCDDBUN = BVA CCRD message returned because database unable to process.
CCDGMSG = BVA CCRD message received garbled.
CCDNBLK = BVA CCRD message returned because of network blockage.
CCDNCON = BVA CCRD message returned because of network congestion.
CCDNRTE = BVA CCRD message returned because of no routing data.
CCDUNEQ = BVA CCRD message returned because of unequipped destination.
CCDURPY = BVA CCRD message received with an unexpected reply.
ICCVABM = International credit card validation (ICCV) abort message received.
ICCVDBU = ICCV error - message returned - database unavailable.
ICCVEMF = ICCV error in message format.
ICCVGMG = ICCV received with invalid format reply.
ICCVMPR = ICCV error - message received with missing parameter.
ICCVMRQ = ICCV error - misrouted query.
ICCVNCG = ICCV message returned because of network congestion.
ICCVNFL = ICCV message returned because of network failure.
ICCVRCR = ICCV reject component received.
ICCVSCG = ICCV message returned because of subsystem congestion.
ICCVSFL = ICCV message returned because of subsystem failure.
ICCVTAN = ICCV message returned - no translation data for address of such nature.
ICCVTOT = ICCV query which timed out before reply received.
ICCVTSA = ICCV message returned - no translation data for this specific address.
ICCVUDV = ICCV error - message received with unexpected input data value.
ICCVUPR = ICCV error - message received with unexpected parameter.
ICCVUQD = ICCV message returned - unqualified.
ICCVURY = ICCV received with unexpected reply.
ICCVUUR = ICCV message returned - unequipped user.
INWBLKD = Inward wide area telecommunications service (INWATS) returned blocked.
INWBUSY = INWATS all lines busy.
INWCCBL = INWATS code control blocked.
INWDBOV = INWATS database overload.
INWDBTO = INWATS database timeout.
INWDSBL = INWATS direct signaling blocked.
INWNNPA = INWATS nonpurchased numbering plan area (NPA).
INWNOXL = INWATS returned no translation.

Copyright © 1999

INWONPA = INWATS invalid originating numbering plan area (ONPA).
INWOVLD = INWATS returned overload.
INWUNEQ = INWATS returned unequipped.
INWVLIN = INWATS vacant line number.
INWVNXX = INWATS vacant NXX.
LACABM = Line application for consumers (LAC) abort message received.
LACACG = LAC invoke component received.
LACGMG = LAC message received with invalid format.
LACMPR = LAC error - message received with missing parameter.
LACMRQ = LAC error - misrouted query.
LACNCG = LAC message returned because of network congestion.
LACNFL = LAC message returned because of network failure.
LACRCR = LAC reject component received.
LACSCG = LAC message returned because of subsystem congestion.
LACSFL = LAC message returned because of subsystem failure.
LACTAN = LAC message returned - no translation data for address of such nature.
LACTOT = LAC query timed out before a reply was received.
LACTRF = LAC error - task refused.
LACTSA = LAC message returned - no translation data for this specific address.
LACUDV = LAC error - message received with unexpected input data value.
LACUPR = LAC error - message received with unexpected parameter.
LACUQD = LAC message returned - unqualified.
LACURY = LAC unexpected reply.
LACUUR = LAC message returned - unequipped user.
LACVCD = LAC error - vacant code.
LBNCGI = Line information database (LIDB) BNS message with call gapping indicator present.
LBNGM = LIDB BNS garbled message.
LBNMGM = LIDB BNS return value missing group or misrouted.
LBNNAN = LIDB BNS return value no translation for an address of such nature.
LBNNCG = LIDB BNS return value network congestion.
LBNNFL = LIDB BNS return value network failure.
LBNNPG = LIDB BNS return value nonparticipating group.
LBNNSA = LIDB BNS return value no translation for this specific address.
LBNREJ = LIDB BNS reject message received.
LBNSCG = LIDB BNS return value subsystem congestion.
LBNSFL = LIDB BNS return value subsystem failure.
LBNTO = LIDB BNS message missed because of timeout.
LBNUP = LIDB BNS message with unexpected reply.
LBNUUR = LIDB BNS return value unequipped user.
LCDCGI = LIDB CCRD message with call gapping indicator present.
LCDGM = LIDB CCRD garbled message.
LCDMGM = LIDB CCRD return value missing group or misrouted.
LCDNAN = LIDB CCRD return value no translation for an address of such nature.
LCDNCG = LIDB CCRD return value network congestion.
LCDNFL = LIDB CCRD return value network failure.
LCDNPG = LIDB CCRD return value nonparticipating group.
LCDNSA = LIDB CCRD return value no translation for this specific address.
LCDREJ = LIDB CCRD reject message received.
LCDSCG = LIDB CCRD return value subsystem congestion.
LCDSFL = LIDB CCRD return value subsystem failure.

Copyright © 1999

LCDTO	= LIDB CCRD message missed because of timeout.
LCDUP	= LIDB CCRD message with unexpected reply.
LCDUUR	= LIDB CCRD return value unequipped user.
LNBAS	= Call failed due to the query being blocked at the switch.
LNBN	= Call failed due to the query being blocked in the common channel signaling (CCS) network.
LNGTCAP	= Garbled transaction capabilities application part (TCAP) message received - message can not be parsed.
LNNCANI	= Centralized automatic message accounting (CAMA) call failed due to CAMA trunk not providing automatic number identification (ANI) for query.
LNNCFA	= Call failure due to some reason while the transaction with the network control point (NCP) is active.
LNNCFI	= Call failure due to some reason while the transaction with the NCP is inactive.
LNRER	= Call failed due to the conversation with the NCP resulting in a return error response.
LNRR	= Call failed due to the conversation with the NCP resulting in a reject response.
LNTIM	= Call failed due to the query not being answered in time by the NCP.
LNTRF	= Call failed due to the NCP answering with a terminate request.
MSFAILRCVD	= A "Message Service System (MSS) reject" message or a "return error" message was received at the near/far switch from the far/near switch respectively.
MSFAILSENT	= An "MSS reject" message or a "return error" message was sent to the near/far switch respectively.
MSQRYFAIL	= A timeout was received in MSS. A "return query" message was received at the near switch because of network failure or failure to send a query.
NCDAFTA	= Network call denial (NCD) denied after answer.
NCDBEFA	= NCD denied before answer.
NCDBLKD	= NCD returned blocked.
NCDCCBL	= NCD code control blocked.
NCDDBOV	= NCD database overload.
NCDDENY	= NCD deny received.
NCDDSBL	= NCD direct signaling blocked.
NCDNOXL	= NCD returned no translation.
NCDOVLD	= NCD returned overload.
NCDUNEQ	= NCD returned unequipped.
NSACGCOMP	= Number services (NS) SCP response message with an ACG component received at the switch.
NSBADRESP	= NS SCP response message with invalid data.
NSNONRTEMSG	= NS reject message, a return error and a play announcement received at the switch from the SCP.
NSQRYFAIL	= NS query blocked by NM ACG, a returned query received at the switch or a time out received in call processing.
NSSNCOMP	= NS SCP response message with a send notification received at the switch.
NSTNMSG	= NS termination notification message sent from the switch to the SCP.
RATDBOV	= Rating message received indicating database overload.
RATDBUN	= Rating message returned because database unable to process.
RATGMSG	= Rating message received garbled.
RATTOUT	= Rating message returned because of timeout.
RATURPY	= Rating message received with an unexpected reply.
SDNBAS	= Call failed due to the query's being blocked at the switch.
SDNBN	= Call failed due to the query's being blocked in the common channel signaling (CCS) network.
SDNGTCAP	= Garbled transaction capabilities application part (TCAP) message received -

message can not be parsed.

SDNNCANI = Centralized automatic message accounting (CAMA) call failed due to CAMA trunk's not providing automatic number identification (ANI) for query.

SDNNCFA = Call failed while the transaction with the network control point (NCP) was active.

SDNNCFI = Call failed while the transaction with the NCP was inactive.

SDNNOCANI = CAMA call failed due to CAMA trunk's not providing ANI through operator number identification (ONI) for query.

SDNRER = Call failed because to the conversation with the NCP resulting in a return error response.

SDNRR = Call failed because to the conversation with the NCP resulting in a reject response.

SDNTIM = Call failed due to the query's not being answered in time by the NCP.

SDNTRF = Call failed due to the NCP's answering with a terminate request.

4. SYSTEM RESPONSE

OK = Good. The request was received and the trap was deactivated.

Software Release: 5E11 only
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the trapping and printing of direct signaling events (DSE) be turned off. These events will be reported in the REPT:ACP-APP-SM, REPT:ASP, REPT:DSE, REPT:MS-TRAPPED, REPT:NS and REPT:OSPS-DSE output messages.

2. FORMAT

```
CLR:DSE=a;
```

3. EXPLANATION OF MESSAGE

`a` = Event trap to be turned off. Valid value(s):

- `ALL` = All events.
- `AILSGMG` = Automated inward line screening (AILS) message received with invalid format reply.
- `AILSMRQ` = AILS error - misrouted query.
- `AILSTOT` = AILS query timed out before a reply was received.
- `AILSTRF` = AILS error - task refused.
- `AILSUDV` = AILS error - message received with unexpected input data value.
- `ASPACGCOMP` = Advanced services platform (ASP) service control point (SCP) response or unidirectional message with an automatic call gap (ACG) component received at the switch.
- `ASPBADRESP` = ASP SCP response message received with invalid data.
- `ASPNORTEMSG` = ASP reject message, return error and a play announcement received at the switch from the SCP.
- `ASPQRYFAIL` = ASP query blocked by network management (NM) ACG, a returned query or conversation received at the switch or a time out received in call processing.
- `ASPSNCOMP` = ASP SCP response message with a send notification component received at the switch.
- `ASPTNMSG` = ASP termination notification message sent from the switch to the SCP.
- `CASDBOV` = Customer account services (CAS) message received indicating database overload.
- `CASDBUN` = CAS message returned - database unable to process.
- `CASGMSG` = CAS message received garbled.
- `CASNBLK` = CAS message returned because of network blockage.
- `CASNCON` = CAS message returned because of network congestion.
- `CASNRTE` = CAS message returned because of no routing data.
- `CASTOUT` = CAS message returned because of timeout.
- `CASUNEQ` = CAS message returned because of unequipped destination.
- `CASURPY` = CAS message received with an unexpected reply.
- `CAS7ABM` = CAS common channel signaling 7 (CCS7) abort message received.
- `CAS7ACG` = CAS CCS7 ACG invoke component received.
- `CAS7GMG` = CAS CCS7 received with invalid format reply.
- `CAS7GWE` = CAS CCS7 error - gateway error.
- `CAS7MPR` = CAS CCS7 error - message received with missing parameter.

NCDOVLD	= NCD returned overload.
NCDUNEQ	= NCD returned unequipped.
NSACGCOMP	= Number services (NS) SCP response message with an ACG component received at the switch.
NSBADRESP	= NS SCP response message with invalid data.
NSNONRTEMSG	= NS reject message, a return error and a play announcement received at the switch from the SCP.
NSQRYFAIL	= NS query blocked by NM ACG, a returned query received at the switch or a time out received in call processing.
NSSNCOMP	= NS SCP response message with a send notification received at the switch.
NSTNMSG	= NS termination notification message sent from the switch to the SCP.
OLNPABM	= OSPS LNP abort message received.
OLNPACG	= OSPS LNP ACG invoke component received.
OLNPECR	= OSPS LNP error code received.
OLNPGMG	= OSPS LNP received with invalid format reply.
OLNPNCG	= OSPS LNP message returned because of network congestion.
OLNPNFL	= OSPS LNP message returned because of network failure.
OLNPRCR	= OSPS LNP reject component received.
OLNPSCG	= OSPS LNP message returned because of subsystem congestion.
OLNPSFL	= OSPS LNP message returned because of subsystem failure.

Copyright © 1999

OLNPTOT = OSPS LNP query which timed out before reply received.
OLNPTSA = OSPS LNP message returned - no translation data for this specific address.
OLNPTSN = OSPS LNP message returned - no translation data for address of such nature.
OLNPUQD = OSPS LNP message returned - unqualified.
OLNPURY = OSPS LNP received with unexpected reply.
OLNPUUR = OSPS LNP message returned - unequipped user.
RATDBOV = Rating message received indicating database overload.
RATDBUN = Rating message returned because database unable to process.
RATGMSG = Rating message received garbled.
RATTOUT = Rating message returned because of timeout.
RATURPY = Rating message received with an unexpected reply.
SDNBAS = Call failed due to the query's being blocked at the switch.
SDNBN = Call failed due to the query's being blocked in the common channel signaling (CCS) network.
SDNGTCAP = Garbled transaction capabilities application part (TCAP) message received - message can not be parsed.
SDNNCANI = Centralized automatic message accounting (CAMA) call failed due to CAMA trunk's not providing automatic number identification (ANI) for query.
SDNNCFA = Call failed while the transaction with the network control point (NCP) was active.
SDNNCFI = Call failed while the transaction with the NCP was inactive.
SDNNOCANI = CAMA call failed due to CAMA trunk's not providing ANI through operator number identification (ONI) for query.
SDNRER = Call failed because to the conversation with the NCP resulting in a return error response.
SDNRR = Call failed because to the conversation with the NCP resulting in a reject response.
SDNTIM = Call failed due to the query's not being answered in time by the NCP.
SDNTRF = Call failed due to the NCP's answering with a terminate request.

4. SYSTEM RESPONSE

NG = No good. May also include:
REQUESTED TRAP NOT AVAILABLE ON VCDX PLATFORM = The requested trap is not allowed on a very compact digital exchange (VCDX) platform.

OK = Good. The request was received and the trap was deactivated.

CLR:DSE-C

Software Release: 5E12 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the trapping and printing of direct signaling events (DSE) be turned off. These events will be reported in the REPT:ACP-APP-SM, REPT:ASP, REPT:DSE, REPT:MS-TRAPPED, REPT:NS and REPT:OSPS-DSE output messages.

2. FORMAT

```
CLR:DSE=a;
```

3. EXPLANATION OF MESSAGE

`a` = Event trap to be turned off. Valid value(s):

`ALL` = All events.

`AILSGMG` = Automated inward line screening (AILS) message received with invalid format reply.

`AILSMRQ` = AILS error - misrouted query.

`AILSTOT` = AILS query timed out before a reply was received.

`AILSTRF` = AILS error - task refused.

`AILSUDV` = AILS error - message received with unexpected input data value.

`ASPACGCOMP` = Advanced services platform (ASP) service control point (SCP) response or unidirectional message with an automatic call gap (ACG) component received at the switch.

`ASPBADRESP` = ASP SCP response message received with invalid data.

`ASPNORTEMSG` = ASP reject message, return error and a play announcement received at the switch from the SCP.

`ASPQRYFAIL` = ASP query blocked by network management (NM) ACG, a returned query or conversation received at the switch or a time out received in call processing.

`ASPSNCOMP` = ASP SCP response message with a send notification component received at the switch.

`ASPTNMSG` = ASP termination notification message sent from the switch to the SCP.

`CASDBOV` = Customer account services (CAS) message received indicating database overload.

`CASDBUN` = CAS message returned - database unable to process.

Copyright © 1999

CASGMSG = CAS message received garbled.

CASNBLK = CAS message returned because of network blockage.

CASNCON = CAS message returned because of network congestion.

CASNRTE = CAS message returned because of no routing data.

CASTOUT = CAS message returned because of timeout.

CASUNEQ = CAS message returned because of unequipped destination.

CASURPY = CAS message received with an unexpected reply.

CAS7ABM = CAS common channel signaling 7 (CCS7) abort message received.

CAS7ACG = CAS CCS7 ACG invoke component received.

CAS7GMG = CAS CCS7 received with invalid format reply.

CAS7GWE = CAS CCS7 error - gateway error.

CAS7MPR = CAS CCS7 error - message received with missing parameter.

CAS7MRQ = CAS CCS7 error - misrouted query.

CAS7NCG = CAS CCS7 message returned because of network congestion.

CAS7NFL = CAS CCS7 message returned because of network failure.

CAS7RCR = CAS CCS7 reject component received.

CAS7SCG = CAS CCS7 message returned because of subsystem congestion.

CAS7SFL = CAS CCS7 message returned because of subsystem failure.

CAS7TAN = CAS CCS7 message returned - no translation data for address of such nature.

CAS7TOT = CAS CCS7 query which timed out before reply received.

CAS7TRF = CAS CCS7 error - task refused.

CAS7TSA = CAS CCS7 message returned - no translation data for this specific address.

CAS7UDV = CAS CCS7 error - message received with unexpected input data value.

CAS7UPR = CAS CCS7 error - message received with unexpected parameter.

CAS7UQD = CAS CCS7 message returned - unqualified.

CAS7URY = CAS CCS7 received with unexpected reply.

CAS7UUR = CAS CCS7 message returned - unequipped user.

CAS7VCD = CAS CCS7 error - vacant code.

CCDDBOV = BVA calling card (CCRD) message received indicating database overload.

Copyright © 1999

CCDDBUN = BVA CCRD message returned because database unable to process.

CCDGMSG = BVA CCRD message received garbled.

CCDNBLK = BVA CCRD message returned because of network blockage.

CCDNCON = BVA CCRD message returned because of network congestion.

CCDNRTE = BVA CCRD message returned because of no routing data.

CCDUNEQ = BVA CCRD message returned because of unequipped destination.

CCDURPY = BVA CCRD message received with an unexpected reply.

ICCVABM = International credit card validation (ICCV) abort message received.

ICCVDBU = ICCV error - message returned - database unavailable.

ICCVEMF = ICCV error in message format.

ICCVGMG = ICCV received with invalid format reply.

ICCVMPR = ICCV error - message received with missing parameter.

ICCVMRQ = ICCV error - misrouted query.

ICCVNCG = ICCV message returned because of network congestion.

ICCVNFL = ICCV message returned because of network failure.

ICCVRCR = ICCV reject component received.

ICCVSCG = ICCV message returned because of subsystem congestion.

ICCVSFL = ICCV message returned because of subsystem failure.

ICCVTAN = ICCV message returned - no translation data for address of such nature.

ICCVTOT = ICCV query which timed out before reply received.

ICCVTSA = ICCV message returned - no translation data for this specific address.

ICCVUDV = ICCV error - message received with unexpected input data value.

ICCVUPR = ICCV error - message received with unexpected parameter.

ICCVUQD = ICCV message returned - unqualified.

ICCVURY = ICCV received with unexpected reply.

ICCVUUR = ICCV message returned - unequipped user.

INWBLKD = Inward wide area telecommunications service (INWATS) returned blocked.

INWBUSY = INWATS all lines busy.

Copyright © 1999

INWCCBL = INWATS code control blocked.

INWDBOV = INWATS database overload.

INWDBTO = INWATS database timeout.

INWDSBL = INWATS direct signaling blocked.

INWNNPA = INWATS nonpurchased numbering plan area (NPA).

INWNOXL = INWATS returned no translation.

INWONPA = INWATS invalid originating numbering plan area (ONPA).

INWOVLD = INWATS returned overload.

INWUNEQ = INWATS returned unequipped.

INWVLIN = INWATS vacant line number.

INWVNXX = INWATS vacant NXX.

LACABM = Line application for consumers (LAC) abort message received.

LACACG = LAC invoke component received.

LACGMG = LAC message received with invalid format.

LACMPR = LAC error - message received with missing parameter.

LACMRQ = LAC error - misrouted query.

LACNCG = LAC message returned because of network congestion.

LACNFL = LAC message returned because of network failure.

LACRCR = LAC reject component received.

LACSCG = LAC message returned because of subsystem congestion.

LACSFL = LAC message returned because of subsystem failure.

LACTAN = LAC message returned - no translation data for address of such nature.

LACTOT = LAC query timed out before a reply was received.

LACTRF = LAC error - task refused.

LACTSA = LAC message returned - no translation data for this specific address.

LACUDV = LAC error - message received with unexpected input data value.

LACUPR = LAC error - message received with unexpected parameter.

LACUQD = LAC message returned - unqualified.

LACURY = LAC unexpected reply.

Copyright © 1999

LACUUR = LAC message returned - unequipped user.

LACVCD = LAC error - vacant code.

LIDBCGI = Line information database (LIDB) message with call gapping indicator present.

LIDBGM = LIDB garbled message.

LIDBMGM = LIDB return value missing group or misrouted.

LIDBNAN = LIDB return value no translation for an address of such nature.

LIDBNCG = LIDB return value network congestion.

LIDBNFL = LIDB return value network failure.

LIDBNPG = LIDB return value nonparticipating group.

LIDBNSA = LIDB return value no translation for this specific address.

LIDBREJ = LIDB reject message received.

LIDBSCG = LIDB return value subsystem congestion.

LIDBSFL = LIDB return value subsystem failure.

LIDBTO = LIDB message missed because of timeout.

LIDBUP = LIDB message with unexpected reply.

LIDBUUR = LIDB return value unequipped user.

LNBAS = Call failed due to the query being blocked at the switch.

LNBN = Call failed due to the query being blocked in the common channel signaling (CCS) network.

LNGTCAP = Garbled transaction capabilities application part (TCAP) message received - message can not be parsed.

LNNCANI = Centralized automatic message accounting (CAMA) call failed due to CAMA trunk not providing automatic number identification (ANI) for query.

LNNCFA = Call failure due to some reason while the transaction with the network control point (NCP) is active.

LNNCFI = Call failure due to some reason while the transaction with the NCP is inactive.

LNRER = Call failed due to the conversation with the NCP resulting in a return error response.

LNRR = Call failed due to the conversation with the NCP resulting in a reject response.

LNTIM = Call failed due to the query not being answered in time by the NCP.

LNTRF = Call failed due to the NCP answering with a terminate request.

Copyright © 1999

MSFAILRCVD = A "Message Service System (MSS) reject" message or a "return error" message was received at the near/far switch from the far/near switch respectively.

MSFAILSENT = An "MSS reject" message or a "return error" message was sent to the near/far switch respectively.

MSQRYFAIL = A timeout was received in MSS. A "return query" message was received at the near switch because of network failure or failure to send a query.

NCDAFTA = Network call denial (NCD) denied after answer.

NCDBEFA = NCD denied before answer.

NCDBLKD = NCD returned blocked.

NCDCCBL = NCD code control blocked.

NCDDBOV = NCD database overload.

NCDDENY = NCD deny received.

NCDDSBL = NCD direct signaling blocked.

NCDNOXL = NCD returned no translation.

NCDOVLD = NCD returned overload.

NCDUNEQ = NCD returned unequipped.

NSACGCOMP = Number services (NS) SCP response message with an ACG component received at the switch.

NSBADRESP = NS SCP response message with invalid data.

NSNONRTEMSG = NS reject message, a return error and a play announcement received at the switch from the SCP.

NSQRYFAIL = NS query blocked by NM ACG, a returned query received at the switch or a time out received in call processing.

NSSNCOMP = NS SCP response message with a send notification received at the switch.

NSTNMSG = NS termination notification message sent from the switch to the SCP.

OLNPABM = OSPS LNP abort message received.

OLNPACG = OSPS LNP ACG invoke component received.

OLNPECR = OSPS LNP error code received.

OLNPGMG = OSPS LNP received with invalid format reply.

OLNPNCG = OSPS LNP message returned because of network congestion.

OLNPNFL = OSPS LNP message returned because of network failure.

Copyright © 1999

OLNPRCR = OSPS LNP reject component received.

OLNPSCG = OSPS LNP message returned because of subsystem congestion.

OLNPSFL = OSPS LNP message returned because of subsystem failure.

OLNPTOT = OSPS LNP query which timed out before reply received.

OLNPTSA = OSPS LNP message returned - no translation data for this specific address.

OLNPTSN = OSPS LNP message returned - no translation data for address of such nature.

OLNPUQD = OSPS LNP message returned - unqualified.

OLNPURY = OSPS LNP received with unexpected reply.

OLNPUUR = OSPS LNP message returned - unequipped user.

RATDBOV = Rating message received indicating database overload.

RATDBUN = Rating message returned because database unable to process.

RATGMSG = Rating message received garbled.

RATTOUT = Rating message returned because of timeout.

RATURPY = Rating message received with an unexpected reply.

SDNBAS = Call failed due to the query's being blocked at the switch.

SDNBN = Call failed due to the query's being blocked in the common channel signaling (CCS) network.

SDNGTCAP = Garbled transaction capabilities application part (TCAP) message received - message can not be parsed.

SDNNCANI = Centralized automatic message accounting (CAMA) call failed due to CAMA trunk's not providing automatic number identification (ANI) for query.

SDNNCFA = Call failed while the transaction with the network control point (NCP) was active.

SDNNCFI = Call failed while the transaction with the NCP was inactive.

SDNNOCANI = CAMA call failed due to CAMA trunk's not providing ANI through operator number identification (ONI) for query.

SDNRER = Call failed because to the conversation with the NCP resulting in a return error response.

SDNRR = Call failed because to the conversation with the NCP resulting in a reject response.

SDNTIM = Call failed due to the query's not being answered in time by the NCP.

SDNTRF = Call failed due to the NCP's answering with a terminate request.

Copyright © 1999

4. SYSTEM RESPONSE

`OK` = Good. The request was received and the trap was deactivated.

CLR:DSNM5-A

Software Release: 5E10 - 5E11
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Deletes a package (PKG) from the five-minute (M5) surveillance data set of packages. This TTY message is valid only for defense switched network (DSN) switches.

2. FORMAT

```
CLR:DSNM5,PKG=a;
```

3. EXPLANATION OF MESSAGE

`a` = Package. Valid value(s):

- `ARC` = Alternate route cancellation control.
- `CLCT` = Network management control counts.
- `CLDIR` = Call direction.
- `DCC` = Destination code cancellation control.
- `DLYR` = Delayed readiness.
- `IMA` = Additional ineffective machine attempts.
- `OVRLD` = Overload or congestion control.
- `SVC` = Critical service circuits.
- `TGMEAS` = Basic trunk group measurements.

4. SYSTEM RESPONSE

`NG` = No good. Valid value(s):

- `- PACKAGE UNASSIGNED` = Package not assigned for data collection.

`PF` = Printout follows. Followed by the CLR:DSNM5 output message.

`RL` = Retry later. Valid value(s):

- `- LOCKED OUT` = Package data is currently locked out for five-minute data collection.

CLR:EMERDMP

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5,3B
Type: Input

1. PURPOSE

Clears the emergency dump partition status flag. The flag is set whenever an emergency dump is written to disk. Until the flag is cleared, it causes the REPT:EMER-DUMP output message to be printed periodically and prevents a new emergency dump being written to disk until 12 hours later. The user is provided with sufficient time to copy out the partition contents onto a tape.

2. FORMAT

```
CLR:EMERDMP;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`OK` = Good. Emergency dump partition is marked empty.

`PF` = Printout follows. Followed by the CLR:EMERDMP output message.

CLR:ESA

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Request to clear the forced active state of an enhanced 911 service adjunct (ESA).

2. FORMAT

```
CLR:ESA:FRC;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `FAILED TO SEND MESSAGE` = The request has been denied because the message cannot be sent to the communication module processor (CMP) to process the requested information.
- `FEATURE NOT AVAILABLE` = The request has been denied because the dual ESA for E911 (SFID 108) and/or the dual ESA enhancements special feature (SFID 141) have not been purchased.
- `NOT AN ESA OFFICE` = The request has been denied because the ESAs for the office have not been equipped (E911 OPTION field on RC/V View 8.1 is not ESA).

`PF` = Printout follows. The CLR:ESA output message follows.

`RL` = Retry later. May also include:
- `CMP UNAVAILABLE` = The message can not be sent. The communications module processor (CMP) is not available.
- `OTHER REQUEST IN PROGRESS` = Another ESA request is currently in progress.

CLR:FANALM

Software Release: 5E10 and later
Command Group: ALARM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that a fan alarm be cleared.

2. FORMAT

```
CLR:FANALM,a[=b];
```

3. EXPLANATION OF MESSAGE

a = Unit to be cleared. Parameter values are. Valid value(s):

- CNI = Common network interface.
- MFFAN = Miscellaneous frame (CM2 offices only).
- MSGS = Message switch.
- ONTC = Office network and timing complex (CM2 offices only).
- SM = Switching module.
- TMS = Time-multiplexed switch.

b = Valid value(s):

If 'a' =	'b' =
TMS, MSGS or ONTC	Unit number.
SM	SM number.

4. SYSTEM RESPONSE

PF = Printout follows. The CLR:FANALM output message follows.

RL = Retry later (SM case only). Valid value(s):

- REMOTE RESET ALREADY IN PROGRESS = A fan reset operation is already in progress on that SM.

CLR:FANALM-3B

Software Release: 5E10 and later
Command Group: ALARM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that a remote reset of the administrative module (AM) fan alarm (FANALM) distribute point be performed. The points are identified by physical location (Format 1) or by logical address (Format 2).

2. FORMAT

```
[1]    CLR:FANALM:UNIT=a,PT=b[-b-b-b];

[2]    CLR:FANALM:GRPN="c",DUPID=d,PT=e[-e-e-e];
```

3. EXPLANATION OF MESSAGE

`a` = Scanner and signal distributor (SCSD) unit number.

`b` = Physical point number on SCSD.

`c` = Name of the logical SCSD group. Logical SCSD group names for fan alarms begin with the prefix FANA. Valid value(s):

```
FANACU0
FANACU1
```

`d` = Duplex identifier.

`e` = Logical point number.

4. SYSTEM RESPONSE

`NG` = No good. SCSD administrator process is not active; no communication with SD points is possible.

`PF` = Printout follows. Followed by the CLR:FANALM-3B output message.

`RL` = Retry later.

CLR:FRC-MSCU

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Clears the forced configuration of the message switch control unit (MSCU). The maintenance state of the active forced side changes to ACT and the state of the other side changes to OOS MAN RMV.

2. FORMAT

```
CLR:FRC,MSCU;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows.

`RL` = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

CLR:FRC-NCOSC

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the forced (FRC) configuration on the network clock 2 oscillator (NCOSC) be cleared. The maintenance state of the active forced side changes to 'active' (ACT) and the state of the other side changes to OOS MAN RMV.

2. FORMAT

```
CLR:FRC,NCOSC;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. The message syntax is valid, but the request conflicts with the current system or equipment status.

`PF` = Printout follows. The CLR:FRC-NCOSC output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

CLR:FRC-ONTCCOM

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Clears the forced configuration on the office network and timing complex common unit (ONTCCOM). The maintenance state of the active forced side changes to 'active major' (ACT MAJ) and the state of the other side changes to 'out-of-service, manual, removed' (OOS MAN RMV).

2. FORMAT

```
CLR:FRC,ONTCCOM;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows.

`RL` = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

CLR:FRC-TRCU3

Software Release: 5E12 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

This request is used to clear the "force" on a particular function pack pair of a TRCU3 circuit. There is no force state of a function pair, so this request is accomplished by clearing hardware register on the mate function pack which was set by the force command to make it faulty. This command is needed to facilitate TRCU3 function pack replacement.

2. FORMAT

```
CLR:FRC,TRCU3=a-b-c,{HOST|REMOTE};
```

3. EXPLANATION OF MESSAGE

a	= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b	= TRCU Path (TRCUPATH). This is the TRCUPATH connecting a host and remote TRCU3 circuits.
c	= Side. This is the side of the CM which the function pack is connected that is desired to clear the force active.
HOST	"HOST" refers to the TRCU3 at the host location next which connects to the CM.
REMOTE	"REMOTE" refers to the TRCU3 at the remote location which is connected to the optically remoted (switching) module. (ORM).

4. SYSTEM RESPONSE

NG	= No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request. Refer to the CLR FRC TRCU3 output message.
PF	= Printout follows.
RL	= Retry later. The request cannot be executed now.

CLR:FSYS-DIR

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Removes a directory from the file system. The directory must be empty (no files or subdirectories stored under the directory name) before it can be removed.

WARNING: Incorrect use of this input message can result in the removal of needed file system directories.

2. FORMAT

```
CLR:FILESYS,DIR,FN="a";
```

3. EXPLANATION OF MESSAGE

`a` = Pathname of the directory to be removed.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CLR:FSYS-DIR output message.

5. REFERENCES

CLR:GRC

Software Release: 5E10 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that a global recent change (GRC) job that is waiting in the queue be canceled. The GRC job still exists but needs to be rescheduled using the SCHED:GRC input message or recent change/verify (RC/V) View 28.1 to be released. If the GRC job has been split, SECT must be provided.

2. FORMAT

```
CLR:GRC,NAME=a[,SECT=b];
```

3. EXPLANATION OF MESSAGE

`a` = GRC name (up to 10 characters).

`b` = GRC section number.

4. SYSTEM RESPONSE

`PF` = Printout follows. The GRC:STATUS output message follows indicating the beginning of the operation.

`NG` = No good. The request was denied. A GRC:ERROR output message will provide the reason for the failure.

CLR:HIST

Software Release: 5E10 and later
Command Group: NOCHK
Application: 5
Type: Input

1. PURPOSE

Clears out the command history buffer. All previously stored input requests are no longer available and cannot be recalled. CLR:HIST does not affect the status of history recording. Subsequent input commands entered at the terminal will be stored if history recording is allowed.

By default, history recording is allowed when a terminal comes into service.

2. FORMAT

```
CLR:HIST;
```

3. EXPLANATION OF MESSAGE

None.

4. SYSTEM RESPONSE

`OK` = Good. The input request was accepted and has been applied.

CLR:HPRI

Software Release: 5E12 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

To deactivate the high priority terminal feature. This input message will deactivate the high priority terminal feature and reset the terminal to it's original priority. For additional information, refer to the SET:HPRI input message.

2. FORMAT

```
CLR:HPRI
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows. The request was accepted. The CLR:HPRI output message will be printed.

`NG` = No good. The input message entered is invalid. May also include:
- `SPECIAL FEATURE NOT AVAILABLE` = Secured feature bit is not turned on.

CLR:IMCAT

Software Release: 5E10 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Invalidates the memory segments of the old input message catalog, forcing the new one to be loaded into the main memory. This message is used during a field update of the input message catalog.

2. FORMAT

```
CLR:IMCAT;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `FILE` = File did not open.
- `SEGCODE` = No segment names.
- `SEGMENT` = Segments not marked invalid.

`OK` = Good. Segments are marked invalid.

`PF` = Printout follows. Followed by the CLR:IMCAT output message.

CLR:IODRV

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that option setting be allowed in the input/output processor (IOP) driver to suppress IOP driver messages.

NOTE: Entering this input message without the options turns off all severity levels, handler IDs and classes, but leaves the MSGSAVE flag as is.

2. FORMAT

```
CLR:IODRV[:LVL=a[&a[&a]]][,ID=b[&b[&b...]]][,CLASS=[&c[&c...]]]
[,MSGSAVE];
```

3. EXPLANATION OF MESSAGE

`MSGSAVE` = IOP error messages will not be saved in the IODRVLOG logfile.

`a` = Severity level, where one is the most severe setting and three is the least severe.

`b` = Administrative module (AM) handler identification. Valid value(s):

`ALL`	= Turns on all IDs.
`APH`	= Application protocol handler.
`APPL1-APPL5`	= Reserved for application handlers.
`CIH`	= End user interface handler.
`DUIH`	= Direct user interface handler.
`IOP`	= Input/output driver.
`MAINT`	= Maintenance handler.
`MTH`	= Magnetic tape handler.
`NPH`	= Network protocol handler.
`SCSDH`	= Scanner and signal distributor handler.
`SDLH`	= Synchronous data link handler.
`SPH`	= Session protocol handler.
`TPH`	= Transport protocol handler.

`c` = 32 classes available, but none are assigned.

4. SYSTEM RESPONSE

`NG` = No good. Conflict with system status.

`PF` = Printout follows. Followed by the CLR:IODRV output message.

CLR:IOMEM

Software Release: 5E11 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Release a file fromt he input/output drivers cache memory. This is used during the installation of a new version of a file that could have been cached in the memory of the IODRV. Upon successful completion, the next time the file is needed by the IODRV, the file will be read from the disk.

2. FORMAT

```
CLR:IOMEM:FN "a"!
```

3. EXPLANATION OF MESSAGE

a	full pathname that specifies the file to be released from the IODRV's cached memory.

4. SYSTEM RESPONSE

PF	Printout follows. Followed by a CLR:IOMEM output message.

5. REFERENCES

Output Message(s):

CLR:IOMEM

Copyright © 1999

CLR:ISOL-CM

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests that the communication module (CM) be re-synchronized with (unisolated from) the administrative module (AM). This request configures the message switch control unit (MSCU) so that it no longer operates independent of the AM and refreshes CM status maintained in the AM with the actual hardware status obtained from the CM. The re-synchronization is performed conditionally and major errors will cause the AM to attempt to re-isolate the CM.

A complete AM/CM initialization is required to recover from most duplex hardware failures.

This input message is only applicable to offices having CM2-vintage communication modules.

2. FORMAT

```
CLR:ISOL,CM;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message is valid, but could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows. Followed by the CLR:ISOL-CM output message.

CLR:ISOL-SM

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Takes one or more switching modules (SMs) out of isolation. If the SM is a remote switching module (RSM), then the associated control-carrying host digital facility interfaces (HDFIs) at the host switching module (HSM) will also be enabled.

2. FORMAT

```
CLR:ISOL,SM=a[&&b];
```

3. EXPLANATION OF MESSAGE

`a` = SM number, or lower limit of a range of SM number.

`b` = Upper limit of a range of SM number.

4. SYSTEM RESPONSE

`NG` = No good. The message was invalid.

`PF` = Printout follows. Followed by the CLR:ISOL-SM output message.

CLR:ISUP

Software Release: 5E10 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the trapping and printing of the intergrated services digital network (ISDN) user part (ISUP) events be turned off. These events will be reported in the REPT:ISUP output message.

2. FORMAT

```
CLR:ISUP=ATPUUI;
```

3. EXPLANATION OF MESSAGE

No variables.

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

4. SYSTEM RESPONSE

`OK` = Good. The request was received and the trap was deactivated.

CLR:LAMPS

Software Release: 5E10 and later
Command Group: ALARM
Application: 5
Type: Input

1. PURPOSE

Requests that exit pilot lamps (alarms) be extinguished.

2. FORMAT

```
CLR:LAMPS;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows.

5. REFERENCES

Output Message(s):

```
CLR:LAMPS
REPT:ALM
```

CLR:LIB

Software Release: 5E10 and later
Command Group: ADMIN
Application: 5
Type: Input

1. PURPOSE

Clears a library program from the scratch area in the switching module (SM), and another team to use the SM for library program testing. This input message will not clear a running library program.

2. FORMAT

```
CLR:LIB:TEAM=a[,AM][{,SM=b|,SM=c&&d}];
```

3. EXPLANATION OF MESSAGE

`a` = The team number to which this input message applies. This number is specified in the LOAD:LIB input message, and is used so that more than one person may test at the same time, using different team numbers.

`b` = SMs that this message should be directed to. The team specified must have a library program running in the SM(s) listed. There can be up to five SM numbers listed. A range could be used instead, as indicated.

`c` = First SM in the range '`c`' to '`d`'.

`d` = Last SM in the range '`c`' to '`d`'.

NOTE: If neither the AM or any SMs are specified, the CLR:LIB message is sent to the AM and all SMs with clients loaded under the same team as that specified.

4. SYSTEM RESPONSE

`NG` = No good. Either the team number or SM number(s) is illegal. SMs that have not initialized cannot be sent messages.

`PF` = Printout follows. Message has been sent to the SMs/AM or team specified.

CLR:M5-A

Software Release: 5E10 only
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a package be deleted from the set of five-minute (M5) surveillance data packages for the on-site network management channel.

2. FORMAT

```
CLR:M5,PKG=a;
```

3. EXPLANATION OF MESSAGE

`a` = Package. Valid value(s):

- `CCS` = Common channel signaling (CCS) general service measurements.
- `CCSP` = CCS special service measurements.
- `CGAP` = Code control.
- `CLCT` = Network management control counts.
- `CLDIR` = Call direction.
- `DLYR` = Delayed readiness.
- `IECSST` = Inter-exchange carrier start signal timeout counts.
- `IECSTG` = Inter-exchange carrier shared trunk group counts.
- `IMA` = Additional ineffective machine attempts.
- `LN` = Leased network action point.
- `LNCU` = Leased network office-wide measurements for critical users.
- `LNNODE` = Leased network node-to-node measurements.
- `MLNC` = Failure to match and no circuit.
- `NS` = Number services.
- `OVRLD` = Overload or congestion.
- `RRC` = Manual reroute trunk group controls.
- `SDN` = Action control point for software defined networks.
- `SVC` = Critical service circuits.
- `TGFLAG` = Trunk group flags.
- `TGMEAS` = Basic trunk group.
- `WBTGMEAS` = Wideband trunk group.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

- `- INVALID REQUEST` = The request has been denied. This office is not equipped to process the request entered.

`PF` = Printout follows. Followed by the CLR:M5 output message.

`RL` = Retry later. May also include:

- `- RESOURCE SHORTAGE` = The necessary resources are not available.

CLR:MGDSC

Software Release: 5E10 and later
Command Group: N/A
Application: 5
Type: Input

1. PURPOSE

Requests to clear all brevity control message discard (MGDSC) counts and throttling message discard counts for administrative module (AM) operational kernel process, a communication module processor (CMP), or a switching module (SM). The brevity control message discard count contains total number of messages being discarded due to brevity control for the day or since the last CLR:MGDSC input message has been entered. The message throttling discard count contains total number of messages being discarded due to queue overflow for the day or since the last CLR:MGDSC input message has been entered. The discard count for each message class is also automatically reset to zero daily at 23:58:00, two minutes before midnight.

2. FORMAT

```
CLR:MGDSC,{AM|CMP=a|SM=b};
```

3. EXPLANATION OF MESSAGE

`a` = CMP number.

`b` = SM number.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `CMP IS NOT AVAILABLE` = The request cannot be executed now due to the requested CMP is either unavailable or not equipped.
- `SM IS NOT AVAILABLE` = The request cannot be executed now due to the requested SM is either unavailable or not equipped.

`OK` = Good. Request was accepted. All message discard counts have been reset to zero.

CLR:MHD-MAEC

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

To clear a given moving head disk's (MHD's) media access error counter (MAEC). The MAEC for a given MHD is set to zero.

A MAEC counts all errors which could be classified as bad disk blocks (media defects). If upon investigation, some or all of these errors are attributed to specific bad disk blocks, the bad disk blocks should be mapped out using the LOAD:MHD input message, followed by the INIT:MHD input message. This procedure will reset the specified MHD's MAEC back to zero.

If upon investigation, none of these errors are attributed to media defects, then mapping bad blocks and formatting the disk is not necessary. In this case, the CLR:MHD-MAEC input message is used to reset the specified MHD's MAEC back to zero.

2. FORMAT

```
CLR:MHD=a:MAEC;
```

3. EXPLANATION OF MESSAGE

`a` = MHD member number.

4. SYSTEM RESPONSE

`PF` = Followed by the CLR:MHD-MAEC output message.

CLR:MINMODE-CNI

Software Release: 5E10 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Removes (clears) the common network interface (CNI) system from min-mode. This message cancels the effect of the SET:MINMODE-CNI input message. When the CNI system is taken out of minmode, a CNI full initialization (FI) (level 4) will be performed.

NOTE: The CNI system can be taken out of min mode only if the administrative module (AM) is not in min mode.

2. FORMAT

```
CLR:MINMODE,CNI,LVL4;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. The request was unsuccessful because:
- The office is not equipped with CNI.
- The AM is in min mode.
- Software level 5 (S5) initialization of CCSINIT failed.
- Some internal error occurred.

`PF` = Printout follows. The message has been accepted and an output message will follow.

CLR:MINMODE-SM-A

Software Release: 5E10 - 5E13
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Clears the selected switching modules (SMs) from minimum mode (minmode) by resetting the appropriate SM inhibits and performing a full initialization. The SM inhibits which are reset as a result of this message are minmode, software error checks, hardware error checks, application routine exercises, and application routine audits. This message cancels the effect of the SET:MINMODE-SM input message.

WARNING: This message will cause all selected modules to initialize even if the modules were not in minmode prior to the initialization.

2. FORMAT

```
CLR:MINMODE,SM=a[&&b],FI[,PUMP|,NPUMP|,BPUMP][,LSM][,HSM][,RSM][,ORM]
[,TRM];
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`BPUMP` = Request a full SM pump using the backup pump function (SI or FI). This pump uses the control time slots (no special hardware) and may succeed when a normal pump fails; however, it is at least 16 times slower than the normal pump. This option should be used on a pump peripheral controller (PPC) duplex failure of the administrative module (AM) peripheral hardware or failure of the bootstrapper hardware in the SM.

`FI` = Full initialization (clear all stable calls).

`NPUMP` = Request a full SM pump using the normal pump function (SI or FI).

`PUMP` = Request a full SM pump at the requested level (SI or FI). A normal pump (NPUMP) will be used unless a failure occurs, in which case a backup pump (BPUMP) will be selected automatically. This is the recommended option to request a full pump.

`a` = SM number, or lower limit of a range of SM number.

`b` = Upper limit of the range of SM number.

4. SYSTEM RESPONSE

`IP` = In progress. The message was accepted and the request is in progress.

`NG` = No good. The message was not accepted because:

Copyright © 1999

- An illegal SM number or range combination was specified.
- An illegal initialization level was specified.
- An illegal option was specified; only PUMP, NPUMP, or BPUMP are allowed, and only with an FI.

Input Message(s):

```
SET:MINMODE-SM
```

CLR:MON

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5
Type: Input

1. PURPOSE

Requests that the specified operating system for distributed switching (OSDS) monitor data collection areas be set to zero.

2. FORMAT

```
CLR:MON,{AM|SM=a|CMP=b-c},{CTL|PTA|DPA|ALL};
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`ALL` = Set the entire monitor buffer area to zero.

`CTL` = Set the control data area of the monitor buffer to zero.

`DSP` = Set the dispatch area of the monitor buffer to zero.

`PTA` = Set the count and time data area of the monitor buffer to zero.

`a` = Switching module (SM) number.

`b` = Message switch side.

`c` = Communications module processor (CMP) number.

4. SYSTEM RESPONSE

`NG` = No good. Error in format.

`PF` = Printout follows.

`RL` = Retry later. System resource shortage.

5. REFERENCES

None.

Copyright © 1999

CLR:MWI

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that a Message Service System (MSS) message waiting indicator (MWI) be deactivated for a given seven-digit directory number (DN).

2. FORMAT

```
CLR:MWI,DN=a[,FNAME=b];
```

3. EXPLANATION OF MESSAGE

`a` = The seven-digit DN to be validated.

`b` = The MSS feature on the seven-digit DN. If multiple MSS features are assigned to this DN, the feature must be specified to avoid incorrect feature deactivation.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
`- MUST ENTER A 7 DIGIT DN` = The DN field has more or less than seven digits in it. The DN field must contain digits only.

`RL` = Retry later. The message was not accepted because of a temporary lack of available resources.

`PF` = Printout follows. The DN validation request was accepted and the CLR:MWI output message follows.

CLR:NMNODES

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that node(s) be removed from the five-minute network management node schedule (NMNODES). A node is identified by a common language location identifier (CLLI) code and the voice/data indicator.

2. FORMAT

```
CLR:NMNODES[,NODES=a-b[-a-b][-a-b][-a-b]];
```

3. EXPLANATION OF MESSAGE

`a` = CLLI code. If no node identifier has been entered the whole node schedule (NMNODES) will be cleared.

`b` = Voice/data indicator. Valid value(s):
- `D` = Data indicator.
- `V` = Voice indicator.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CLR:NMNODES output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The request could not be accepted because the necessary resources are not available.

CLR:NMSCH

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that trunk groups be removed from the network management (NM) schedule (SCH). The NM schedule is a list of trunk groups of interest to network managers.

2. FORMAT

```
CLR:NMSCH[,TG-a[-a][-a][-a][-a][-a][-a]];
```

3. EXPLANATION OF MESSAGE

`a` = Valid trunk group number.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CLR:NMSCH output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The request cannot be executed now due to unavailable system resources.

CLR:ODDBKUP

Software Release: 5E10 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Clears the office-dependent data (ODD) backup schedule set by a previous BKUP:ODD message. The ODD backup scheduled request will be cleared only if the administrative module (AM), communications module processor (CMP), and/or switching module (SM) non-redundant ODD (NRODD) range and/or SM redundant ODD (RODD) specified in the input request matches exactly those in the scheduled request(s). For example, if the scheduled request is nrodd=2&&25, then the clear request has to be nrodd=2&&25. The default is to clear all the scheduled requests.

2. FORMAT

```
CLR:ODDBKUP[,AM][,CMP=a[&&b]][,NRODD=c[&&d]][,RODD[=c]];
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = CMP number or the lower limit of a range of CMP numbers.

`b` = Upper limit of range of CMP numbers.

`c` = Switching module (SM) number or the lower limit of a range of SM numbers.

`d` = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID CMP RANGE` = No good. The input request is not valid because of an invalid CMP range.
- `INVALID SM RANGE` = The input request is not valid because of an invalid SM range.

`PF` = Printout follows. The request was accepted. The CLR:ODDBKUP output message follows.

CLR:OP-ALM-ALL

Software Release: 5E10 and later
Command Group: ALARM
Application: 5
Type: Input

1. PURPOSE

Requests that the data delivery bits for the OP:ALM-ALL input message feature be cleared, unconditionally. This does not clear any alarms. Use only when it is suspected that the data delivery bits are hung up preventing the use of the OP:ALM-ALL, OP:CGA, and OP:RT-ALM input messages. The conditions to look for in order to decide whether to use this input message or not are as follows:

- Upon requesting OP:ALM-ALL, the acknowledgement is: RL - ALREADY IN PROGRESS, yet no output for OP:ALM-ALL seems to be printing.
- Upon requesting STP:OP-ALM-ALL, the acknowledgement is OK, but no OP ALM ALL MANUAL TERMINATION message prints and the OP:ALM-ALL input request still acknowledges with RL - ALREADY IN PROGRESS.
- Upon requesting OP:CGA, the acknowledgement is: RL - OP ALM ALL CURRENTLY IN PROGRESS
- Upon requesting OP:RT-ALM, the acknowledgement is: RL

NOTE: If this message is requested while a valid instance of OP:ALM-ALL is still in progress, the first instance of OP:ALM-ALL will abort and output a REPT:PTRACE message.

2. FORMAT

```
CLR:OP:ALM,ALL;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`OK` = Good. The request has been accepted.

CLR:PB

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the position busy (PB) indicator be cleared at certain trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) assigned to receive incoming 101 test line calls. The 101 test line calls can now terminate at this trunk work station (TWS) talk and monitor (T&M) phone.

2. FORMAT

```
CLR:PB[,ID=a];
```

3. EXPLANATION OF MESSAGE

`a` = ID of the TLWS or CTTU at which position busy indicator is to be cleared. Valid value(s):

- `c` = CTTU.
- `l` = Local.
- `r` = Remote.

If no ID is specified, all LOCAL positions are set to the available state.

4. SYSTEM RESPONSE

`NA` = No acknowledgement. The request has not been acknowledged. It is probable the request has been lost.

`PF` = Printout follows. The request has been accepted. The CLR:PB output message follows.

`RL` = Retry later. The request has been denied due to system overload.

CLR:PERPH-SM

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the verbose status in a single switching module (SM) or a range of SMs be cleared. When the verbose status is CLEAR, peripheral fault recovery (PFR) will only output messages that indicate that a peripheral (PERPH) error has caused recovery actions on a circuit. When the verbose status is SET, PFR will output transient peripheral error messages which indicate that no recovery action has occurred (that is, "ANALYSIS ONLY"). Output messages may be logged or printed depending on the message class for each unit type.

2. FORMAT

```
CLR:PERPH,SM=a[&&b],VERBOSE;
```

3. EXPLANATION OF MESSAGE

`a` = SM number or lower limit of range of SM number.

`b` = Upper limit of range of SM number.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `SM DOES NOT EXIST` = The request has been denied, SM number does not match any equipped SM.

`OK` = Good. The input message has been completed.

`RL` = Retry later. System resource shortage.

5. REFERENCES

Input Message(s):

```
OP:LPS
SET:PERPH-SM
```

CLR:PSLNK

Software Release: 5E11 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the manually set automatic protection switch (APS) state of the packet switch unit (PSU) link (PSLNK) be cleared.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the far end CA can not be specified by the PSU equipment number and must always be entered as PSU CA.

2. FORMAT

```
[1]    CLR:PSLNK=a-b;

[2]    CLR:PSLNK,PSUCA=a,FARCA=b;

[3]    CLR:PSLNK,PSU=c-0,FARCA=b;
```

3. EXPLANATION OF MESSAGE

`a` = Near PSU community address of the PSU link.

`b` = Far PSU community address of the PSU link.

NOTE: The far end CA must be zero if the PSU link is connected to an asynchronous transfer mode (ATM) switch in a point-to-multipoint configuration network.

`c` = Switching module (SM) number.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

`PF` = Printout follows. Followed by the CLR:PSLNK output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

```

MCC Display Page(s):

1187 (PSU LINKS STATUS)

CLR:PTN

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that partitions on a specified disk be cleared (initialized with zeroes). The partitions to be cleared are determined from a specfile (default /etc/clearspec). Both the disk specified and its mate should be active before this message is entered.

This input message will be used by the applications that have AMA partitions (on removable media disk packs) which need to be cleared whenever a disk copy is generated.

2. FORMAT

```
CLR:PTN:MHD=a[:SPECF="b"];
```

3. EXPLANATION OF MESSAGE

`a` = Identifies of disk unit to be initialized with zeroes.

`b` = Pathname of specification file containing list of partition names that will be initialized with zeroes. Default will be /etc/clearspec.

4. SYSTEM RESPONSE

`NG` = No good. Process not initiated.

`PF` = Printout follows.

CLR:PUPAGE

Software Release: 5E10 and later
Command Group: NOCHK
Application: 5
Type: Input

1. PURPOSE

Requests that the software update installation page (BWM Installation) or program update (PU) maintenance page be cleared.

2. FORMAT

```
CLR:PUPAGE=HMa;
```

3. EXPLANATION OF MESSAGE

`a` = Page definition. Valid value(s):
- `95` = Program update maintenance page.
- `96` = BWM installation page.

4. SYSTEM RESPONSE

`OK` = Good. The message was accepted and the action was completed.

CLR:RT-FAC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a far end loop process (FELP) or a protection (PROT) configuration request be cleared for a particular digital signal level one (DS1) facility (FAC).

If the request to be cleared has not been set for the specified facility, this request will have no effect.

2. FORMAT

```
CLR:RT,FAC=a-b,{FELP|PROT[,UCL]};
```

3. EXPLANATION OF MESSAGE

FELP	= Configure a DS1 FAC to the looped state at the RT (for example, a "virtual pinjack").
PROT	= Switch from the specified DS1 FAC to the protection line.
UCL	= Unconditionally take FAC off PROT (only valid for TR303 RTs).
a	= Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b	= RT DS1 FAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF	= Printout follows. The request was accepted. The CLR:RT-FAC output message follows.
NG	= No good. The request has been denied. The message is valid but the request conflicts with current status.
RL	= Retry later. The request cannot be executed now because the SM is isolated from the administrative module (AM).

CLR:RT-FACOFFN

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests the disabling of the option of having the switching module (SM) status indicator updated to off-normal (OFFN) when a remote terminal (RT) T1 is in an off-normal state. Specifically, it will not be updated to "RT PLS" (RT protection line switch) when a T1 facility (FAC) goes on protection, or to "CKT OOS" (circuit out-of-service) when a T1 facility goes OOS.

2. FORMAT

```
CLR:RT,FACOFFN;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`OK` = Good. The request was accepted and the requested action was completed.

`RL` = Retry later. The system failed to read a database global parameter.

Software Release: 5E10 and later
Command Group: CCS
Application: 5,CNI
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Clears the status of a route making it available, and stops the signaling route set test (SRST) for the route. This is used to reduce the amount of unnecessary signaling network management message traffic for primary or alternate routes.

WARNING: Use of this message may be service affecting.

2. FORMAT

```
[1]    CLR:SRST:DPC=a-b[-c][:LS=d];

[2]    CLR:SRST:DPC=a-e-f[-c][:LS=d];
```

3. EXPLANATION OF MESSAGE

`a` = Destination point code (DPC) network identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = DPC network cluster identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = DPC member identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Link set. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Region identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`f` = Cluster identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`NG` = The message was not recognized. Repeat the request.

`PF` = Printout follows. The request was received and will be acted on. The CLR:SRST output message follows.

`RL` = Retry later. System resources are unavailable to execute this input message now.

CLR:SSTROVRD

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that any service selective trunk reservation (SSTR) inhibit override that was set as the result of a SET:SSTROVRD input message be cleared and all SSTR per-trunk-group inhibits be restored to their original state.

2. FORMAT

```
CLR:SSTROVRD;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CLR:SSTROVRD output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The request could not be accepted because the necessary resources are not available.

CLR:TGC

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that network management (NM) trunk group controls (TGCs) of a given control type be removed.

2. FORMAT

```
CLR:TGC[,TG=a],CNTL=b;
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group number. The default is all trunk groups in the office.

`b` = Control type. Valid value(s):

- `CANT` = Manual cancel-to control.
- `SKIP` = Manual skip control.
- `CRO` = Manual cancel reroute control.
- `RR` = Manual reroute control.
- `CANF` = Manual cancel-from control.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

- `INVALID REQUEST` = The request has been denied. This office is not equipped to process the request entered.

`PF` = Printout follows. Followed by the CLR:TGC output message.

`RL` = Retry later. May also include:

- `RESOURCE SHORTAGE` The necessary resources are not = available.

CLR:TR

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a single trunk reservation (TR) control be cleared on a specified trunk group.

2. FORMAT

```
CLR:TR,TG=a;
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group (TG) number that has a TR control assigned.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CLR:TR output message.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The necessary resources are not available.

CLR:TRKDP

Software Release: 5E10 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Removes trunk groups displayed in the TRUNK block of the defense switched network (DSN) network management (NM) exception page (page 129) from display boxes; however it keeps the trunk groups in the NM schedule. This TTY message is valid only for DSN switches.

2. FORMAT

```
CLR:TRKDP,{COL=a | ROW=b | COL=a, ROW=b};
```

3. EXPLANATION OF MESSAGE

`a` = Column number (1-6).

`b` = Row number (1-4).

The TRUNK block of the DSN NM Exception Page displays traffic status and maintenance usages of trunk groups selected from the NM schedule. A display box in the TRUNK block identified by a column/row pair displays a trunk group number and its traffic and maintenance information.

If '`a`' is not given, trunk groups displayed on the given column are erased.

If '`b`' is not given, trunk groups displayed on the given row are erased.

If both '`a`' and '`b`' are given, the trunk group displayed on the given column and row is erased.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID PARAMETER` = Invalid column and/or row number.

`OK` = Good. The request was accepted and completed, trunk groups displayed in specified boxes are erased.

`RL` = Retry later. May also include:
- `RESOURCE SHORTAGE` = The necessary resources are not available.

CLR:TRUNK

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that monitoring be stopped of a trunk group marked with stop-go signaling. This monitoring is initiated by the MON:TRUNK input message.

NOTE: An OP:TRUNK input message is recommended to verify if any trunks in the specified trunk group are being held off-hook and out-of-service. These trunks will be released from the held state and returned to service if the CLR:TRUNK input message is used.

2. FORMAT

```
CLR:TRUNK:TG=a;
```

3. EXPLANATION OF MESSAGE

`a` = Trunk group identifier.

4. SYSTEM RESPONSE

`PF` = Printout follows. Request accepted. Followed by the CLR:TRUNK output message.

5. REFERENCES

CLR:UMEM

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Causes the definition of an administrative module (AM) generic access package (GRASP) transfer trace to be removed. The trace goes into the UNDEF state with successful completion of the message.

2. FORMAT

```
CLR:UMEM[:UCL];
```

3. EXPLANATION OF MESSAGE

`UCL` = Unconditional execution.

4. SYSTEM RESPONSE

`?A` = Action field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted. May also include:
- `INVALID KEYWORD` = Message not allowed in a WHEN action list.

`NG` = No good. May also include:
- `TRACE NOT DEFINED` = The trace is not defined.
- `UCERR` = The circuit is unavailable.

`PF` = Printout follows. Followed by a CLR:UMEM output message.

`RL` = Retry later or wait for previous OP:UMEM to complete. The system is in an overload condition.

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the communication module processor (CMP) be removed.

This message may be used together with any of the other CMP generic utility input messages. Refer to the References section of this message.

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
CLR:UT:CMP=a,{MATE|PRIM},{UTIL|UTILFLAG=b}{!|;}
```

3. EXPLANATION OF MESSAGE

`MATE` = Execute this input message on the standby CMP.

`PRIM` = Execute this input message on the active CMP.

`UTIL` = Execute this input message on all of the WHEN clauses in the specified CMP.

`a` = CMP number.

`b` = The identification number of a specific WHEN clause, which is to be removed from the CMP.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet interface (PI) unit be removed.

NOTE: This input message is only supported on PIs of the PI2 hardware type.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
CLR:UT:MCTSI=a-b,PI,{UTIL|UTILFLAG=c}{!|;}
```

3. EXPLANATION OF MESSAGE

`UTIL` = Execute this input message on all of the WHEN clauses in the specified PI.

`a` = Switching module (SM) number.

`b` = Side of the module controller/time-slot interchange (MCTSI).

`c` = The identification number of a specific WHEN clause, which is to be removed from the PI.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

CLR:UT-PSUPH

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet switch unit protocol handler (PSUPH) be removed.

NOTE: This input message is only supported on PSUPHs of the PH3/PH4 hardware type (that is, not PH2 hardware types).

This message may be used together with any of the other PSUPH generic utility input messages Refer to the References section of this message.

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
CLR:UT:PSUPH=a-b-c-d,{UTIL|UTILFLAG=b}{!|;}
```

3. EXPLANATION OF MESSAGE

`UTIL` = Execute this input message on all of the WHEN clauses in the specified PSUPH.

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Unit number (always 0).

`c` = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = The identification number of a specific WHEN clause, which is to be removed from the PSUPH.

CLR:UTIL

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Removes all currently defined administrative module (AM) generic access package (GRASP) breakpoints; clears definitions.

2. FORMAT

```
CLR:UTIL[,RESET];
```

3. EXPLANATION OF MESSAGE

`RESET` = The RESET option causes the breakpoint number to be re-initialized; the next breakpoint defined will be given the number 1.

4. SYSTEM RESPONSE

`NG` = No good. No GRASP breakpoints are currently defined.

`PF` = Printout follows. Followed by the CLR:UTIL output message.

`RL` = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

CLR:UTILFLAG

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Removes the specified administrative module (AM) generic access package (GRASP) breakpoint and clears the definition.

2. FORMAT

```
CLR:UTILFLAG=a[,RESET];
```

3. EXPLANATION OF MESSAGE

`RESET` = If '`a`' is the last remaining defined breakpoint, then the RESET option causes breakpoint numbering to be reinitialized; the next defined breakpoint will be given the number 1.

If '`a`' is not the last defined breakpoint, then the RESET keyword is ignored.

`a` = Numeric identifier (one or more decimal digits) for the breakpoint to be cleared.

4. SYSTEM RESPONSE

`NG` = No good. Identifier does not correspond to a currently defined breakpoint.

`PF` = Printout follows. Followed by the CLR:UTILFLAG output message.

`RL` = Retry later. The system is in an overload condition or completing the previous OP:UMEM message.

CLR:WSDGTL

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the trunk and line work station (TLWS) test position (TP) digital testing defaults be reset to the system defaults. The stored defaults are then used when a TST:WSDGTL test is requested and the values are not explicitly set.

There are four system defaults for digital testing. Valid value(s):

`BLKSZ` = 56000.

`CHAN` = ALL channels.

`TERM` = Line termination (LT).

`TESTEQ` = D-channel.

2. FORMAT

```
CLR:WSDGTL,TP=a;
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

`OK` = Good. Digital testing defaults were reset.

CLR:WSFREQ

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the frequency and level be cleared at a particular trunk and line work station (TLWS) test position (TP). Frequency and level returns to the default values of 1004 Hz at 0 db.

2. FORMAT

```
CLR:WSFREQ,TP=a;
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

`OK` = Good. Default frequency and and level reset to 1004 Hz at 0 dBm.

CMPR:DISK-CORE

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Compares the text portions of the disk and core images of a non-killable process. Equipment configuration database (ECD) and public library (PLIB) can also be compared.

2. FORMAT

```
CMPR:DISK,CORE,FN="a"; [, OPTNM= "b",MPT="c",MHDNUM="d"];
```

3. EXPLANATION OF MESSAGE

`a` = Pathname of the file. The pathname is a list of the names of each directory leading to the file, and ends with the name of the specific file. Each name begins with a slash, and the entire pathname is enclosed in quotation marks. For example, "/usr/a1/ssw/test" means that /usr/a1/ssw is the list of directory names and /test is the file name.

`b` = Special device file name on offline partition (that is, /dev/root).

`c` = Pathname of mount point.

`d` = MHD number.

4. SYSTEM RESPONSE

`PF` = Printout follows. The CMPR:DISK-CORE output message follows.

CMPR:MHD

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Compares the contents of two disks or two disk partitions. A disk partition may reside on the disk of its duplex mate, or on an arbitrary disk. Also, both disk partitions may reside on the same disk.

Only one CMPR:MHD or COPY:DIFF-SRC-MHD input message is allowed to run at one time. If more than one is attempted, the disk file controller (DFC) will deny the request and output an error code to that effect.

WARNING: Incorrect use of this input message can degrade system performance. This input message should not be used without expert technical assistance. This message should not be executed during AM or CM REX. Ignoring this warning could lead to call processing problems.

2. FORMAT

```
CMPR:MHD=a[,PTN={b|c&&d}]:[MATE|MHD=e][,PTN={f|g&&h}]
[:DATA[,BLOCKS=i][,RO]];
```

3. EXPLANATION OF MESSAGE

`RO` = All blocks on specified moving head disks (MHDs) or partitions will be read into memory, but no comparison will be performed. If MHD '`e`' or `MATE` is not specified, the reads will only be performed on MHD '`a`'.

`a` = First member number.

`b, f` = Partition numbers, or list of partitions (r1, r2, r3, ..., rn) where the list may include 64 entries.

Default will be all but the FREE, UNASGN, DIAG, SWAP, and PDUMP partitions.

`c-d` = A range of partition numbers where a list of up to 32 ranges (p0-p1, p2-p3, p4-p5, ..., pm-pn) may be specified. A range has the format '`c-d`' where '`d`' must be greater than '`c`'.

`e` = Second member number. If MHD '`e`' or `MATE` is not specified, `MATE` is the default.

`g-h` = A range of partition numbers where a list of up to 32 ranges (p0-p1, p2-p3, p4-p5, ..., pm-pn) may be specified. A range has the format '`g-h`' where '`h`' must be greater than '`g`'.

`i` = An integer value indicating the size of the input/output (I/O) buffers as a multiple of disk blocks. If '`BLOCKS`' is not specified, the default is 256. However, if '`BLOCKS`' is not specified, and the '`RO`' option is used, then the default is 128.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the CMPR:MHD output message.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that customer-originated recent change (CORC) logfiles be evolved (converted) and reapplied. This message the binary plus CORC logfiles for reapplication on the target software release.

WARNING: This message is only applicable during retrofit and should only be used when following procedures detailed in the Software Release Retrofit document.

2. FORMAT

```
CNVT:CORCLOG[,EVOL|,LOAD];
```

3. EXPLANATION OF MESSAGE

NOTE: If none of the options is specified, EVOL will be performed and CORCs will be inhibited.

`EVOL` = Evolves CORC logfiles from binary format of the current software release to binary plus format of the target software release.

`LOAD` = Reapplies binary plus CORC logfiles to target software release.

4. SYSTEM RESPONSE

`NG` = No good. The input request is not valid.

`PF` = Printout follows. Request accepted and the CNVT:CORCLOG output message follows.

CNVT:RT-A

Software Release: 5E10 - 5E11
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that equipment numbers relating to remote terminals (RT) that interface to an integrated digital carrier unit (IDCU) be converted. Given any of the three following identifiers, this message will provide the other two:

A SID = Site identification number

B LRT = Local number for the RT

C For the IDCU:
IFAC = digital signal level one (DS1) facility (IFAC) number

For the DCLU:
SDFI = *SLC*® 96 digital facility interface (SDFI) number

2. FORMAT

```
CNVT:RT,a;
```

3. EXPLANATION OF MESSAGE

a = Valid value(s):

IFAC=c-e-g
LRT=c-{d|e}-b
SDFI=c-d-f
SID=h

b = RT local number for IDCU or for DCLU. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = SDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = IFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The CNVT:RT-SID-LRT output message follows.

NG = No good. Unit does not exist. The specified RT equipment number could not be found in the

Copyright © 1999

database.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

CNVT:RT-B

Software Release: 5E12 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that equipment numbers relating to remote terminals (RT) that interface to an integrated digital carrier unit (IDCU) or a digital networking unit - synchronous optical network (DNU-S) be converted. Given any of the three following identifiers, this message will provide the other two:

A SID = Site identification number

B For the IDCU:
BIDCURT = Local number for an RT terminating on an IDCU.

For the DCLU:
DCLURT = Local number for an RT terminating on an DCLU.

For the DNU-S:
DNUSRT = Local number for an RT terminating on a DNU-S.R

C For the IDCU:
IFAC = Digital signal level one (DS1) facility (IFAC) number

For the DCLU:
SDFI = *SLC*® 96 digital facility interface (SDFI) number

For the DNU-S:
DS1SFAC = DNU-S digital signal level 1 facility (DS1SFAC) number R

2. FORMAT

```
CNVT:RT,a;
```

3. EXPLANATION OF MESSAGE

a = Valid value(s):

IFAC=c-e-h
DCLURT=c-d-b
IDCURT=c-e-b
DNUSRT=c-f-b
SDFI=c-d-g
DS1SFAC=c-f-i
SID=j

b = RT local number for IDCU or for DCLU. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

`d` = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
`e` = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
`f` = DNUS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
`g` = SDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
`h` = IFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
`i` = DS1SFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
`j` = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. The CNVT:RT-SID-LRT output message follows.
`NG` = No good. Unit does not exist. The specified RT equipment number could not be found in the database.
`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

CNVT:STANDALONE

Software Release: 5E10 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests an update of a switching module's (SM) office-dependent data (ODD) to support stand-alone operation. This message populates the directory number (DN) translation data for all lines physically terminating on the given SM, such that the SM is capable of processing intramodule calls even when it becomes isolated from the rest of the switch.

NOTE: This input message is to be used only in conjunction with the SM stand-alone installation procedure. The conversion routine can take several minutes to complete.

2. FORMAT

```
CNVT:STANDALONE,SM=a[,UNDO];
```

3. EXPLANATION OF MESSAGE

`UNDO` = Restore the ODD to the state before conversion in the event that the first attempt to convert the SM aborted.

`a` = SM number of the module to be converted to stand-alone.

4. SYSTEM RESPONSE

`NG` = No good. The input request is not valid.

`PF` = Printout follows. One or more CNVT:STANDALONE output messages follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

CONN:WSIC

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests seizure of an incoming 101TL (test-line) call at a trunk and line work station (TLWS) test position (TP). A test position must be assigned before accepting the call (refer to the SET:WSPOS input message).

2. FORMAT

```
CONN:WSIC,TP=a;
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`IP` = In progress. Request in progress.

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

`RL` = Retry later. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

CONN:WSJACK

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests connection of the specified line or trunk at the trunk and line work station (TLWS) test position (TP) to a test access unit (TAU) jack.

NOTE: If the TLWS talk & monitor (T&M) phone is not busy and the request is for an AC jack connection, the T&M phone will automatically be brought into the connection in the TALK state.

2. FORMAT

```
CONN:WSJACK,TP=a[,JACK=b];
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

`b` = Jack connected. Valid value(s):

`AC1`	= AC jack position 1 (default).
`AC2`	= AC jack position 2.
`DC1`	= DC jack position 1.
`DC2`	= DC jack position 2.

4. SYSTEM RESPONSE

`IP` = In progress. Request in progress.

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

14.3 (TRUNK AND LINE WORK STATION)

Copyright © 1999

CONN:WSLINE-A

Software Release: 5E10 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests seizure of (connection to) a line for interactive trunk and line work station (TLWS) testing. A test position (TP) must first be assigned before seizing a line. Refer to the SET:WSPOS input message.

Lines are specified using one of the eight formats shown below. Format 1 causes the port most recently requested for seizure on the test position to be reseized. A line is otherwise identified by either a directory number (DN, in Format 2), the integrated digital carrier unit (IDCU) line equipment number (ILEN, in Format 3), a line equipment number (LEN, in Format 4), a multi-line hunt group member number (MLHG, in Format 5), a subscriber loop carrier line equipment number (SLEN, in Format 6), a line card equipment number (LCEN, in Format 7), line circuit equipment number on an integrated services line unit, version 2 (LCKEN, in Format 8), or an application processor group member number (AP, in Format 9).

2. FORMAT

```
[1]    CONN:WSLINE,TP=a;

[2]    CONN:WSLINE,TP=a,DN=b[-c][,PKTDN][,CPE|USPID];

[3]    CONN:WSLINE,TP=a,ILEN=d-t-u-v[,CPE|USPID];

[4]    CONN:WSLINE,TP=a,LEN=d-e-f-g-h-i;

[5]    CONN:WSLINE,TP=a,MLHG=j-k[,CPE|USPID];

[6]    CONN:WSLINE,TP=a,SLEN=d-l-m-n;

[7]    CONN:WSLINE,TP=a,LCEN=d-o-p-q[,CPE|USPID];

[8]    CONN:WSLINE,TP=a,LCKEN=d-w-x-y-z[,CPE|USPID];

[9]    CONN:WSLINE,TP=a,AP=r-s;
```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`CPE` = Obtain the customer premises equipment (CPE) information for this line and display on the TLWS screen. Valid only for digital subscriber lines (DSLs). Note: this request is not allowed through MML input.

`USPID` = Obtain the user service profile identifier (USPID) information for this line and display on the TLWS screen. Valid only for DSLs. Note: this request is not allowed through MML input.

`a` = TLWS TP number.

`b` = Directory number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

c = Member number of the MLHG or line time slot bridging (LTSB) line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be seized. For LTSB a member number of 1 will seize the lead line and a member number of 2 will seize the associate line. If no member number is specified, for 1-DN LTSB, the lead line will be seized. If no member number is specified, for 2-DN LTSB, the line associated with the DN entered will be seized.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Switch board number (LU1, LU2, LU3). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = MLHG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Data link (group) number of the AP. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Relative link (member) number of the AP. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the

Appendixes section of the Input Messages manual.

`u` = RT number or the IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`v` = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`w` = Integrated service line unit 2 (ISLU2). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`x` = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`y` = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`z` = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`IP` = In progress.

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

CONN:WSLINE-C

Software Release: 5E12 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests seizure of (connection to) a line for interactive trunk and line work station (TLWS) testing. A test position (TP) must first be assigned before seizing a line (refer to the SET:WSPOS input message).

Lines are specified using one of the eleven formats shown below. Format 1 causes the port most recently requested for seizure on the test position to be reseized. A line is otherwise identified by either a directory number (DN, in Format 2), the integrated digital carrier unit (IDCU) line equipment number (ILEN, in Format 3), a line equipment number (LEN, in Format 4), a multi-line hunt group member number (MLHG, in Format 5), a subscriber loop carrier line equipment number (SLEN, in Format 6), a line card equipment number (LCEN, in Format 7), a line circuit equipment number on an integrated services line unit, version 2 (LCKEN, in Format 8), an application processor group member number (AP, in Format 9), an access interface unit equipment number (AIUEN) on an access interface unit (in Format 10), or an DNU-S (Digital Networking Unit-Synchronous Optical Network) number (INEN, in Format 11).

2. FORMAT

```
[1]    CONN:WSLINE,TP=a;

[2]    CONN:WSLINE,TP=a,DN=b[-c][,PKTDN][,CPE|USPID];

[3]    CONN:WSLINE,TP=a,ILEN=d-t-u-v[,CPE|USPID];

[4]    CONN:WSLINE,TP=a,LEN=d-e-f-g-h-i;

[5]    CONN:WSLINE,TP=a,MLHG=j-k[,CPE|USPID];

```

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

`CPE` = Obtain the customer premises equipment (CPE) information for this line and display on the TLWS screen. Valid only for digital subscriber lines (DSLs). Note: this request is not allowed through MML input.

`USPID` = Obtain the user service profile identifier (USPID) information for this line and display on the TLWS

Copyright © 1999

screen. Valid only for DSLs. Note: this request is not allowed through MML input.

a = TLWS TP number.

b = Directory number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Member number of the MLHG or line time slot bridging (LTSB) line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be seized. For LTSB a member number of 1 will seize the lead line and a member number of 2 will seize the associate line. If no member number is specified, for 1-DN LTSB, the lead line will be seized. If no member number is specified, for 2-DN LTSB, the line associated with the DN entered will be seized.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Switch board number (LU1, LU2, or LU3). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = MLHG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

r = Data link (group) number of the AP. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Relative link (member) number of the AP. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Integrated service line unit 2 (ISLU2). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a[1] = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b[1] = AIU line pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c[1] = AIU line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Input Messages manual.

d[1] = DNU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP = In progress.

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

Application: 5
Type: Input

1. PURPOSE

Requests to connect the trunk and line work station (TLWS) talk-and-monitor (T&M) phone with the current line or trunk associated with the test position (TP).

The T&M phone will be connected in the MONITOR mode of operation (refer to the SET:WSPHONE input message for changing the T&M mode) when it is initially connected.

2. FORMAT

```
CONN:WSPHONE,TP=a;
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`OK` = The phone has been added.

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

CONN:WSPORT

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the port (line or trunk) that is associated with the specified trunk and line work station (TLWS) test position (TP) be re-seized. The association was accomplished earlier using a CONN:WSLINE, CONN:WSTRK or CONN:WSIC input message.

2. FORMAT

```
CONN:WSPORT,TP=a;
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

`OK` = Good. Port seized.

CONN:WSTRK-A

Software Release: 5E10 - 5E11
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS) testing. A test position (TP) must be assigned before seizing the trunk. Refer to the SET:WSPOS input message.

Trunks are seized using one of the seven formats shown below. Format 1 will cause the port most recently requested for seizure on the TP to be reseized. A trunk is otherwise identified by either a digital equipment number (DEN) in Format 2, a trunk (analog) equipment number (TEN) in Format 3, a trunk group (TG) (first member) in Format 4, a specific member of a trunk group (TKGMN) in Format 5, the next member (NEXTMEM) of the trunk group currently being tested in Format 6, a *SLC*® line equipment number (SLEN) in Format 9, the integrated digital carrier unit (IDCU) line equipment number (ILEN) in Format 10, the network equipment number (NEN) in Format 11, or packet switching unit (PSU) equipment number (PSUEN) in Format 12. The digital service unit 2 recorded announcement function (DSU2-RAF) announcement port is seized by using Format 7. The service announcement system (SAS) digital service circuit port is seized by using Format 8.

NOTE: Announcement test function (ATF) will either be a RAF or SAS.

2. FORMAT

```

m = Announcement port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Remote terminal number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Remote terminal line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Remote terminal (RT) number in the IDCU or the digital signaling 1 (DS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = RT line number or the digital signaling 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a^1 = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of

the Input Messages manual.

`b`[1] = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c`[1] = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d`[1] = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

`OK` = Port has been seized.

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

`RL` = Retry later. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

COPY:ACTDISK

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies a file from an active disk to an offline (OFL) or out-of-service (OOS) disk. The file can be a regular file, a contiguous file (type "C" or "x"), or a block device (type "b", partition or file system). For a regular or contiguous file, the destination file will be created with type, owner, and permission flags similar to those of the source file.

2. FORMAT

```
COPY:ACTDISK,MHD=a,SRC="b",PTN="c"[,DEST="d"];
```

3. EXPLANATION OF MESSAGE

`a` = Specifies destination disk unit. This disk should not be active.

`b` = Full pathname of the file to be copied. This file should exist on an active disk.

`c` = Special device filename or number of the destination partition on the non-active disk. If a name is specified, then this partition should exist on the active disk.

`d` = A pathname where the file is to be written, on the non-active file system. If this name is not specified, the path name of the source file will be used. If the name starts with a "`/`", then the mount point will be excluded. This name should not be specified if the source is a partition or file system.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:ACTDISK output message.

5. REFERENCES

Output Message(s):

```
COPY:ACTDISK
```

Copyright © 1999

COPY:ADDR

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from virtual addresses in main memory to other virtual addresses, registers, or administrative module (AM) generic access package (GRASP) utility variables as a response to a breakpoint.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied.

2. FORMAT

```
COPY:ADDR=a[,OFF=b][,L=c|,NL=d]{:ADDR=e|:UVAR=f|:REG=g} [:WORD];
```

3. EXPLANATION OF MESSAGE

`WORD` = All addresses, offsets, and lengths are interpreted in terms of words (including addresses derived in address chains). If this option is omitted, values given are in bytes.

`a` = The starting virtual address for the source data in decimal, octal, or hexadecimal notation.

`b` = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified.

`c` = The length of the copy in bytes unless the WORD option is specified. The maximum is 128 bytes or 32 words. The default is 1 word or byte.

`d` = The operation will use the locations beginning '`d`' lower than the calculated address and ending at the address. The locations are used in ascending order.

`e` = The virtual address of the destination for the data in decimal, octal, or hexadecimal notation.

`f` = A GRASP utility variable, in decimal, to be written as the destination copy. Utility variable values are reset to 0 at the end of a debugging session.

`g` = The name of the register to be written as the destination copy. Valid register names are:

AP	HSR	R4	SBR5	T2
ATBBGR HSRBGC	R5	SBR6	T3	ATBPSW
ISC	R6	SBR7	T4	ATBQ
ISS	R7	SCRATCH	T5	ATBSAR
PA	R8	SCRATCH0	T6	ATBSCR
PPR	R9	SDR	T7	ATBSDR
PSW	RNULL	SM	TIMERS	BGR
R0	RTC	SP	TOPIS	CAR
R1	SBR0	SSRC	UINT0	CDR
R10	SBR1	SSRS	UINT1	ERC
R11	SBR2	SYSBASE	UINT2	FP
R2	SBR3	T0	UINT3	HG
R3	SBR4	T1	UINTER	

Copyright © 1999

4. SYSTEM RESPONSE

`?I` = General syntax error. Valid value(s):
- `INCONSISTENT KEYWORDS (NL-OFF)` = Negative length not allowed without OFF.
- `INVALID KEYWORD` = ADDR is invalid in an immediate action.
- `RANGE ERROR (UVAR)` = Invalid utility variable number was specified.
- `RANGE ERROR (L or NL)` = Length specified is too long.
- `INPUT ERROR (OFF COUNT)` = Too many offsets listed.

`IP` = In progress. The message has been added to the WHEN action list.

`NG` = No good. Valid value(s):
- `BAD REG NAME` = A named register is not a valid destination.

`PF` = Printout follows. Followed by the COPY:ADDR output message.

`RL` = Retry later. The system is in an overload condition.

COPY:BKDISK

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies selected on-line disk partitions to tape in the load disk from tape (LDFT) format. The partitions must be specified in a specification file. The default for the specification file name is "/etc/pdtspec". The full pathname must be given for each partition, and only one partition can appear on each line.

If the system is booted on the primary root file system, for those partitions having backup partitions, the backup partitions are written to tape. If the system is booted on the backup root file system, the primary disk partitions are written to tape. Partitions without backup partitions are written from the primary partitions in both cases. Collectively the partitions make up one logical volume. Format 1 copies the partitions to magnetic tape in single volume format. Format 2 acknowledges the mounting of a new tape by the user and is only used in conjunction with Format 1. Format 3 copies partitions to a digital audio tape (DAT) in multi-volume format. On a 3B21D with a DAT drive, Format 3 is used to format the DAT with multiple logical volumes, provided the tape already contains the TOP file at the beginning of the tape. (The TOP file is considered to be Session 1 Volume 0 and is written by the COPY:TAPE-TOP input request.) One or more of these logical volumes form a backup session. A DAT may be formatted with no more than nine backup sessions in sequential order. A backup session may contain any combination of logical volumes meeting the following criterion: the logical volumes within a session must be ordered such that any given volume identified by its logical volume number has a greater number than the previous volume in the session. Refer to variable '`f`' for the mapping of logical volume numbers to the volume names they represent. By default, Format 3 will try to append logical volumes to the current end of data mark. There are optional parameters for session and volume position to request that a logical volume be appended to the end of a specific logical volume on the DAT for the purpose of overwriting the DAT from that point forward. This option is only valid for overwriting logical volumes within the most recent backup session or for appending a logical volume for the next session to the last logical volume of the specified positioning session.

2. FORMAT

```
[1]    COPY:BKDISK:START:DATA,SRC="a",TD="b",TPSIZE=c
       ,FN="d" [,MRG][,EXT] [,SKP] [,NODMTMSG] [,COM];

[2]    COPY:BKDISK:ACK:DATA,TPSIZE=c;

[3]    COPY:BKDISK:MULTI:DATA,SRC="a",TD="b",SESS=e,VOL=f
       ,PSESS=g, PVOL=h [,FN="d"][,MRG] [,EXT] [,SKP] [,NODMTMSG] [,COM];>
```

3. EXPLANATION OF MESSAGE

`COM` = This option must be used when creating a *UNIX*® RTR disk image that contains a common volume table of contents (VTOC) (a VTOC containing both the 3B20D very large main memory (VLMM) and 3B21D lboot partitions) or when creating other generic text tapes that is shared among 3B20D VLMM and 3B21D processors.

`EXT` = LDFT extended format tapes where the data blocks can be up to 6K bytes. This option cannot be used on a Kennedy tape drive controlled by an UN134 PC.

`MRG` = Writes generic and database partitions as one generic sequence. With this option, the specification file should contain both database and generic partitions. As the default, if the specification file contains generic and database partitions, then two sequences will be created.

Copyright © 1999

NOTE: The default action is not supported for a multi-volume LDFT tape. The user must specify this option when the specification file contains both data base and generic partitions and input request Format 3 is being used.

NODMTMSG = Upon completion, the DISMOUNT TAPE AND LABEL message will not be printed.

SKP = Skip block usage bitmap and unused data blocks when writing file systems to tape. Use of this option is generally recommended, as it will conserve tape, if possible, and save time. Note, however, that tape reading and writing time may approximately double when this option is used with streaming tape drives (tape drives without mechanical tensioners or vacuum columns) in a worst-case data scattering scenario.

a = Pathname that specifies the boot disk.

b = Special device file name of the tape drive to be used. Refer to the ECD/SG manual.

c = Specifies the size of the tape, mounted in feet for 9-track devices, or meters for digital audio tapes (DATs). The acceptable range for a 9-track tape size is 600 to 2400 and the acceptable range for a DAT tape size is 30 to 90. The format requires entry of the tape size separated from the keyword by a space.

d = Specification file name that contains a set of partitions to be written to tape. The full pathname of the file is required.

e = Backup session number which is used to group one or more logical volumes together. The first backup session on tape must be numbered backup session 1 and increased sequentially thereafter with a maximum value of 9.

f = Logical volume number which identifies the group of partitions being written to tape. Valid value(s):

1 = AMTEXT.
2 = AMODD.
3 = SMTEXT.
4 = SMODD1.
5 = SMODD2.
6 = SMODD3.
7 = SMODD4.
8 = SMODD5.
9 = SMODD6.

g = Positioning backup session number which identifies a backup session on tape. The range of positioning backup session numbers is 1 to 9. This number is used along with the positioning logical volume number to locate a specific logical volume on tape to which to append the new logical volume. The absence of the positioning fields will result in the logical volume being appended to the current end of data mark on tape.

h = Positioning logical volume number. The range of positioning logical volume numbers is 0 to 9. Note that 0 is included in this range to allow for appending to the TOP file. Refer to the explanation of field 'g' for more information.

4. SYSTEM RESPONSE

Copyright © 1999

`NG` = No good. A fatal error was encountered because the actual disk writer or the user acknowledgement program (Format 2) could not be initiated. Try to initiate the request again. If the process still fails, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

`PF` = Printout follows. Followed by the COPY:BKDISK output message.

`?D` = Error in the data field.

COPY:BKTAPE

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies the contents of a multi-volume formatted digital audio tape (DAT) from a source DAT drive to a destination DAT drive. The default action is to make a complete copy of the source DAT. If the optional session number is specified, then the multi-volume formatted data is copied from the beginning of the specified session on the source DAT and appended to the end of the previous session on the destination DAT.

2. FORMAT

```
COPY:BKTAPE:SRC="a", DEST="b" [,SESS=c];
```

3. EXPLANATION OF MESSAGE

`a` = Device filename of the source DAT drive. Refer to the User Guidelines for definitions and examples of tape device names.

`b` = Device filename of the destination DAT drive. Refer to the User Guidelines for definitions and examples of tape device names.

`c` = Session number on the source DAT. This session is the starting point for the copy from the source DAT. Valid session numbers are 1 through 9.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by a COPY:BKTAPE output message.

COPY:DIFF-SRC-MHD

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Compares disk partitions in order to detect differences. When a difference is found, data is copied from the source partition to the destination partition. The input arguments can specify disks or specific partitions. A disk partition may reside on the disk of its duplex mate, or on an arbitrary disk. Also, both partitions may reside on the same disk.

A difference generates a message which identifies the location of the difference. A copy will then be performed to correct the difference. The source argument is considered to contain the correct disk data. The mismatch messages provide an audit trail of corrected disk blocks. Only one COPY:DIFF-SRC-MHD or CMPR:MHD input message is allowed to run at one time. If more than one is attempted, the disk file controller (DFC) driver will deny the request and output an error code to that effect.

WARNING: Incorrect use of this input message can degrade system performance and result in disk data mutilation. This input message should not be used without expert technical assistance.

2. FORMAT

```
COPY:DIFF:SRC,MHD=a[,PTN={b|c&&d}]:DEST,{MATE|MHD=e}[,PTN={b|c&&d}]
[,BLOCKS=i];
```

3. EXPLANATION OF MESSAGE

`a` = Source member number.

`b` = Partition number within a range of (0 to 63), or list of partitions (r1, r2, r3, ..., rn) where the list may include 64 entries. Default will be all but the FREE, UNASGN, DIAG, SWAP, and PDUMP partitions.

`c` = Lower limit in a range of partition numbers where a list of up to 32 ranges (p0-p1, p2-p3, p4-p5, ..., pm-pn) may be specified.

`d` = Upper limit in a range of partition numbers.

`e` = Destination member number.

`i` = An integer value indicating the size of the input/output (I/O) buffers as a multiple of disk blocks. The legal values are 1-256. If BLOCKS is not specified, the default number of 128 will be used.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:DIFF-SRC-MHD output message.

COPY:ECD-TAPE

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the equipment configuration database (ECD) and system generation (SG) database files be copied from the primary partition on disk to a magnetic tape. The database files are first converted to a readable format, and then written to tape.

This message is primarily used for preliminary and final office data administration (ODA) database preparation for ECD evolution as a part of retrofit procedure. Files copied to tape are ASCII (dumped) version of "root" ECD and SG in /database (/dev/db) file system.

2. FORMAT

```
COPY:ECD:TAPE[:TU=a][,UCL];
```

3. EXPLANATION OF MESSAGE

`UCL` = Start a new process even when one is already running. The running process will be terminated before the new one is started.

`a` = Tape drive unit (TU). 0, 1, L0 or L1. When 0 or 1 is specified, data will be written in high density if the tape drive is of high density type. Otherwise, data will be written in low density. When L0 (low density unit 0) or L1 is specified, data will be written in low density regardless of the tape drive type (high density tape drive can be used in either density mode). High density write will use much less tape. When TU is not specified, unit 0 is assumed.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:ECD-TAPE output message.

5. REFERENCES

Output Message(s):

```
COPY:ECD-TAPE
```

COPY:FSYS-FILE

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specific file be copied to another file or directory.

WARNING: All existing data in the destination file will be destroyed.

2. FORMAT

```
COPY:FILESYS,FILE,SRC="a",DEST="b"[,{ERASE|NOERASE}];
```

3. EXPLANATION OF MESSAGE

`ERASE` = Sourcefile will be renamed (moved) to the destination indicated in variable '`b`'. As a result, one file will exist.

`NOERASE` = Sourcefile will be copied to the destination indicated in variable '`b`'. As a result, two files will exist. NOERASE is the default value.

NOTE: If ERASE is specified, the source file will be renamed (moved) to the DEST indicated, that is, one file will exist. However, if NOERASE is used the SRC file will be copied to the DEST indicated and two files will exist. Failure to indicate either will default to NOERASE.

`a` = Pathname of the file to be copied. The pathname is a list of the names of each directory leading to the file, and ends with the name of the specific file. Each name begins with a slash, and the entire pathname is enclosed in quotation marks. For example, "/usr/a1/ssw/test" means that /usr/a1/ssw represents the list of directory names and /test represents the file name.

`b` = Pathname of the destination directory or file. '`b`' cannot be identical to '`a`'.

NOTE: If only a filename is given for DEST, the default directory is /cft/shl. Example: `COPY:FILESYS{:[DATA,]|,}FILE,SRC="/tmp/tst",DEST="tmtst";`

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:FSYS-FILE output message.

COPY:LOG-TAPE

Software Release: 5E10 and later
Command Group: FHADM
Application: 5
Type: Input

1. PURPOSE

Requests that the office dependent data (ODD) recent change (RC) log file be copied from disk to magnetic tape.

Format 1 invokes a process that copies the named RC log file to tape. Format 2 restarts the process unconditionally. This format can be used to override the retry later - in progress (RL - IP) system response.

2. FORMAT

```
[1]    COPY:LOG:TAPE,FN="a";

[2]    COPY:LOG:TAPE,FN="a":UCL;
```

3. EXPLANATION OF MESSAGE

`UCL` = Indicates that the request is to be performed unconditionally, possibly interrupting a COPY:LOG-TAPE input message that is in progress.

`a` = Indicates the file name. The full pathnam, surrounded by double quotation marks, of the log file to be written to tape.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by one or more COPY:LOG-TAPE output messages.

`RL` = Retry later. May also include:
`- IP` = In progress. Process already running; needs UCL to proceed (refer to Format 2).

5. REFERENCES

Output Message(s):

Copyright © 1999

COPY:ODD-TAPE

Software Release: 5E10 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the system office dependent data (ODD) files be copied from disk to magnetic tape.

This message is primarily used for preliminary and final office data administration (ODA) database preparation for ODD evolution as a part of retrofit procedure. Files and partitions copied to tape are: disk ODD (/dev/no5dodd1 or /dev/no5dodd2); all the "*odd*.out" (* = any ASCII string) files in /no5odd/cpdata (/dev/no5aodd1 or 2), /no5odd/cidata (/dev/no5codd1 or 2) and /no5odd/imdataN (/dev/no5soddN--N represents a number in newer software release). The sides 1 and 2 are alternated for each ODD backup operation and whichever happens to be the official backup side will be copied to tape. Format 1 starts a process that copies the system ODD files to tape. TU option may be used to specify the tape drive unit and density. If TU option is not specified, unit 0 (side 0) is assumed and write density is determined by the type of the equipment. Format 2 restarts the process (after mounting a new tape) to write the second (and subsequent) tape. The tape must be mounted on the same unit as the first tape. Format 3 restarts the process at a mid-numbered tape. Format 4 kills the currently running process and starts a new process on the tape specified.

2. FORMAT

```
[1]    COPY:ODD,TAPE[,ALL][,PRELIM][,TU=b][,UCL];

[2]    COPY:ODD,TAPE,CONTINUE[,ALL];

[3]    COPY:ODD,TAPE=a[,ALL][,TU=b],CONTINUE;

[4]    COPY:ODD,TAPE=a[,ALL][,TU=b],CONTINUE,UCL;
```

3. EXPLANATION OF MESSAGE

`ALL` = Copy equipment configuration database (ECD) and system generation (SG) database on the same tape as the ODDs mentioned above. The ECD and SG copied here will be "undumped" (non-ASCII) format. If you have a high-density tape drive, using this keyword will reduce the number of tapes needed.

NOTE: Once the "ALL" option is used, you must continue using it in all subsequent COPY:ODD-TAPE input messages until you are finished.

`PRELIM` = Preliminary dump. This option is used when making the preliminary ODD/ECD dump for a software release retrofit. When the final dump tapes are made for the software release retrofit, this parameter should be omitted.

`CONTINUE` = Restart the process (after a new tape is mounted) to write the second (and subsequent) tape(s). The tape must be mounted on the same unit as the first tape. When the process is in waiting state, tape number '`a`' is not needed and will be ignored if present. The waiting process produces tapes in sequential order and knows what tape number to produce.

When there is no waiting process (no other COPY:ODD-TAPE process is running), and the CONTINUE keyword is used, tape number '`a`' is required to signal that you wish to start from a mid-numbered tape rather than starting from the first tape.

Copyright © 1999

`UCL` = Start a new process even when one is already running. The running process will be terminated before the new one is started. Tape drive unit 0 will be used.

`a` = Tape number. The tape number should be specified only when you wish to start from a mid-numbered tape (such as, tape number 2) instead of sequentially starting from tape 1. Refer to the explanation for `CONTINUE`.

`b` = Tape drive unit (TU). 0, 1, L0 or L1. When 0 or 1 is specified, data will be written in high density if the tape drive is of high density type. Otherwise, data will be written in low density. When L0 (low density unit 0) or L1 is specified, data will be written in low density regardless of the tape drive type (high density tape drive can be used in either density mode). High density write will use much less tape. When TU is not specified, unit 0 is assumed.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:ODD-TAPE output message.

`RL` = Retry later. Process is already running. Use Format 4 to proceed.

COPY:OOSDISK

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies a specific file from an out-of-service (OOS) disk to an active system disk. This message is typically used for retrieving a file from a software backup maintained on a spare disk.

2. FORMAT

```
COPY:OOSDISK:MHD=a,SRC="b",DEST="c"[,PTN=d];
```

3. EXPLANATION OF MESSAGE

`a` = Specifies a non-active disk containing the source file (0-255).

`b` = Full pathname that specifies the file to be copied.

`c` = Pathname of the destination file.

`d` = Specifies partition number, where the source file resides in the OOS disk. If not specified, the partition corresponding to the file on the active disk will be used.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:OOSDISK output message.

5. REFERENCES

Output Message(s):

`COPY:OOSDISK`

Copyright © 1999

COPY:PID

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from virtual addresses in main memory to the administrative module (AM) generic access package (GRASP) utility variables.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied.

2. FORMAT

```
COPY:PID=a,ADDR=b[,OFF=c][,L=d|,NL=e]:UVAR=f[:WORD];
```

3. EXPLANATION OF MESSAGE

`WORD` = All addresses, offsets, and lengths are to be interpreted in words, including addresses derived in address chains. If this option is omitted, values given are assumed to be in bytes.

`a` = Process ID (PID) of the target process.

`b` = The starting virtual address for the source data in decimal, octal, or hexadecimal notation.

`c` = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified.

`d` = The length of file to be copied in bytes unless the WORD option is specified. The maximum is 128 bytes or 32 words. The default is 1 byte or 1 word.

`e` = The operation will use the locations beginning 'e' lower than the calculated address and ending at the address. The locations are used in ascending order.

`f` = A GRASP utility variable (1-50), in decimal, to be written as the address of the destination of the copy. Utility variable values are reset to zero at the end of a debugging session.

4. SYSTEM RESPONSE

`?I` = General syntax error. May also include:

- `EXTRA KEYWORD (PID)` = PID is invalid in a breakpoint.
- `INCONSISTENT KEYWORDS (NL-OFF)` = Negative length not allowed without OFF.
- `INPUT ERROR (OFF COUNT)` = Too many offsets listed.
- `INVALID KEYWORD` = Destination of ADDR or REG not valid outside of a WHEN action list.
- `RANGE ERROR (L or NL)` = Length specified is too long.
- `RANGE ERROR (PID)` = Process ID is out of range.
- `RANGE ERROR (UVAR)` = Invalid utility variable number was specified.

Copyright © 1999

NG = No good. May also include:
BAD PID = The PID specified is for a process for which copies are not allowed.

PF = Printout follows. Followed by COPY:PID output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

COPY:PTN-ALL

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that one set of disk partitions be copied into a corresponding set of partitions.

A duplex disk configuration is a prerequisite for the input message to work properly. To ensure data consistency, one of the moving head disks (MHDs) of the duplex pair will be removed from service and the data from its copy of the source partition will be copied to the destination partition on the disk which is left active. After the copy is complete, the MHD which was removed from service will be restored.

WARNING: All existing data in the destination partitions will be destroyed.

2. FORMAT

```
COPY:PTN:DATA,ALL,SRC="a",DEST="b"[,ACT];
```

3. EXPLANATION OF MESSAGE

`ACT` = Leaves the system in a duplex disk configuration as it copies the partitions.

`a` = Full pathname of a file that specifies a list of partitions, or a special device filename of a partition to be copied. Refer to the ECD/SG manual.

`b` = Full pathname of a file that contains the corresponding list of destination partitions, or the special device filename for a destination partition.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:PTN-ALL output message.

5. REFERENCES

COPY:REG

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from the administrative module (AM) registers to virtual addresses in main memory and in registers as an action associated with a breakpoint.

Copies data from registers to the AM generic access package (GRASP) utility variables as either an immediate action or as an action associated with a breakpoint.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied.

Format 1 is executed as an action associated with a breakpoint.

Format 2 is executed as either an immediate action or as an action associated with a breakpoint.

2. FORMAT

```
[1]    COPY:REG=a[,OFF=b][,L=c]{:ADDR=e|:REG=g|:UVAR=f}[:WORD]!

[2]    COPY:REG=a[,L=c]:UVAR=f[:WORD]{!|;}
```

3. EXPLANATION OF MESSAGE

`WORD` = All addresses and lengths are in terms of words. If this option is omitted, values given are assumed to be in bytes.

`a` = Specifies a register to be read as the source for the copy. Valid value(s):

- `AP` = Argument pointer AP.
- `ATBBGR` = Register used by the ATB miss routine to temporarily store the bi-directional gating register (BGR).
- `ATBPSW` = Register used by the ATB miss routine to temporarily store the program status word (PSW) register.
- `ATBQ` = Register used by the ATB miss routine to temporarily store the 'q' register.
- `ATBSAR` = Register used by the address translation buffer (ATB) miss routine to temporarily store the store address register (SAR) contents.
- `ATBSCR` = Register used by the ATB miss routine to temporarily store the store control register (SCR) contents.
- `ATBSDR` = Register used by the ATB miss routine to temporarily store the store data register (SDR) content.
- `BGR` = Bi-directional gating register.
- `CAR` = Channel address register.
- `CDR` = Channel data register.
- `ERC` = Error register (ER) clear.
- `FP` = Frame pointer FP.
- `HG` = Reserved register HG.

Copyright © 1999

HSR	= Hardware status register.
HSRBGC	= Bi-directional gating control bits of the hardware status register (HSR).
IM	= Interrupt mask register IM.
ISC	= IS (interrupt source) register clear.
ISS	= Interrupt source (IS) register set.

4. SYSTEM RESPONSE

?I = General syntax error. Valid value(s):
- EXTRA KEYWORD (OFF) = Indirection not allowed except as action of a WHEN.
- INCONSISTENT KEYWORDS (NL-OFF) = Negative length not allowed without OFF.
- INVALID KEYWORD = Destination of ADDR or REG not valid outside of a WHEN action list.
- RANGE ERROR (UVAR) = Invalid utility variable number was specified.
- RANGE ERROR = Length specified is too long.

IP = In progress. The message has been added to the WHEN action list.

NG = No good. Valid value(s):
- BAD REG NAME = A named register is not a valid source or destination.

PF = Printout follows. Followed by the COPY:REG output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

COPY:SPDISK

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies a specific partition, or a list of partitions, from one of the system disks to an active spare disk. This input message is typically used for generating a backup copy of the software on a system disk. The system disk pair must be duplexed to use this input message.

2. FORMAT

```
COPY:SPDISK:SRC="a",DEST="b";
```

3. EXPLANATION OF MESSAGE

`a` = Full pathname of a file that contains a list of partitions, or a special device file name of a partition, to be copied. Refer to the ECD/SG manual.

`b` = Filename for the corresponding list of destination partitions, or the special device filename for a destination partition.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:SPDISK output message.

5. REFERENCES

Output Message(s):

COPY:TAPE-DATA

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies a task oriented practice (TOP) file(s) from disk to tape. A TOP file contains writable microcode and the load disk from tape (LDFT) program used for a "deadstart." If the COM option is specified, the very large main memory (VLMM) TOP file and 3B21D TOP file are copied from disk to tape, strictly in that order. Otherwise, a hardware-platform-specific TOP file is copied. For example, if the current hardware platform is VLMM, /etc/topfile64 or /etc/topfile is copied to tape.

2. FORMAT

```
COPY:TAPE:DATA,TOP,TD="a"[,COM];
```

3. EXPLANATION OF MESSAGE

COM = Option used to create a common TOP tape which consists of both the VLMM TOP file and the 3B21D TOP file.

NOTE: The input message with the COM option does not copy the standard main memory (SMM) or extended main memory (EMM) TOP file. If this option is not specified, the TOP file copied to tape will be the one for the current hardware platform. Refer to the example in the PURPOSE section.

a = Tape special device file name. Refer to the User Guidelines, for definition and examples of tape device names.

4. SYSTEM RESPONSE

PF Printout follows.

5. REFERENCES

Copyright © 1999

COPY:TAPE-EMERDMP

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies data from the emergency dump partition on a disk to a magnetic tape.

NOTE: If the resulting tape is to be read on a *UNIX*® system, it must be read using the 'dd' input message.

2. FORMAT

```
COPY:TAPE,EMERDMP,TD="a";
```

3. EXPLANATION OF MESSAGE

`a` = Tape special device file name. Refer to the Summary of Pathnames table in the User Guidelines of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:TAPE-EMERDMP output message.

COPY:TAPE-IN

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Copies files from a magnetic tape containing full or relative pathnames and header information, and places them in their respective directories. This input message can also print a table of contents of the tape.

WARNING: If the full path was specified in the COPY:TAPE-OUT input message, directory information is retained and the file will be placed in the same directory it was copied from, overwriting any existing version.

NOTE: If the tape to be read was written on a *UNIX*® system, it must have been written using the cpio message with the -c option.

2. FORMAT

```
COPY:TAPE,IN,TD="a"[,TOC]|[,BSDIR="b"];
```

3. EXPLANATION OF MESSAGE

`TOC` = Table of contents. Prints a list of the files on the tape with their status information. No files are created.

`a` = Tape special device file name. Refer to Table 3 in the User Guidelines of the Input Messages manual.

`b` = Pathname of the base directory into which the files on the tape will be copied. Refer to the User Guidelines of the Input Messages manual for definitions of pathname and directory.

NOTE: If the relative path was specified in the COPY:TAPE-OUT input message, the default base directory is is /cft/shl/cmds. Use the BSDIR option to specify an alternate base directory.

Remember, the BSDIR option does not apply if the full pathname was specified in the COPY:TAPE-OUT input message. Use the TOC option of COPY:TAPE-IN to determine how a file or list of files, were copied to tape, whether by relative pathnames or by full pathnames.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:TAPE-IN output message.

COPY:TAPE-OUT

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Copies one or more files to a magnetic tape, along with full or relative pathnames and header (status) information.

Format 1 is used to copy one or more files with full pathnames. Refer to the User Guidelines of the Input Messages manual for a definition of full pathnames.

WARNING: Use extreme caution when invoking this input message with full pathnames. Reading a tape which contains full pathnames may destroy existing data.

Format 2 is used to copy one or more files with relative pathnames. Refer to the User Guidelines of the Input Messages manual for a definition of relative pathnames.

NOTE: If the resulting tape is to be read on a *UNIX*® system, it must be read using the 'cpio' input message with the -c options.

2. FORMAT

```
[1]    COPY:TAPE,OUT,TD="a"{,FN="b"|,FLIST="c"};

[2]    COPY:TAPE,OUT,TD="a"{,FN="d"|,FLIST="e"},BSDIR="f";
```

3. EXPLANATION OF MESSAGE

`a` = Tape special device file name. Refer to Table 3 in the User Guidelines of the Input Messages manual for examples of tape device names.

`b` = Full pathname of the single file to be written to the tape.

`c` = Pathname of a file that contains a list of full pathnames of the files to be written to the tape. Used if two or more files are to be written.

`d` = Relative pathname of the single file to be written to the tape. Specify the base directory with the BSDIR option.

`e` = Pathname of a relative file that contains a list of pathnames of the files to be written to the tape. Used if two or more files are to be written. Specify the base directory with the BSDIR option.

`f` = Pathname of the base directory where the file to be copied to tape is located. Relative pathnames are relative to this directory.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:TAPE-OUT output message.

COPY:TAPE-TEST

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Writes the diagnostic test tape header block onto a magnetic tape. A demand diagnostic phase for the tape unit verifies the tape has this header block (in low density) before using the tape for testing.

2. FORMAT

```
COPY:TAPE,TEST,TD="a";
```

3. EXPLANATION OF MESSAGE

`a` = Tape special device file name. Select low density and rewind. The diagnostic phase will not accept the tape if the header block is written in high density. Refer to the Summary of Pathnames table in the User Guidelines of the Input Messages manual.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the COPY:TAPE-TEST output message.

5. REFERENCES

Output Message(s):

COPY:TAPE-TOP

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Copies a tape-only program (TOP) file from disk to tape. A TOP file contains writable microcode and the load disk from tape (LDFT) program used for a "deadstart."

2. FORMAT

```
COPY:TAPE:TOP,TD~"a",[COM]!
```

3. EXPLANATION OF MESSAGE

`COM` = Option used to create a common TOP tape consisting of both the VLMM TOP file and hte 3B21D TOP file.

This option does not copy the standard main memory (SMM) or extended main memory (EMM) TOP file.

If the COM option is specified, the very large main memory (VLMM) TOP file and the 3B21D TOP file are copied from disk to tape, strictly in that order.

If this option is not specified, the TOP file copied to tape will be the one for the current hardware platform. For example, if the current hardware platform is VLMM, `/etc/topfile64` or `/etc/topfile` is copied to tape.

`a` = Tape special device file name.

COPY:UID

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from virtual addresses in main memory to administrative module (AM) generic access package (GRASP) utility variables as an immediate action.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied.

2. FORMAT

```
COPY:UID=a,ADDR=b[,OFF=c][,L=d|,NL=e]:UVAR=f[:WORD];
```

3. EXPLANATION OF MESSAGE

`WORD` = All addresses, offsets, and lengths are to be interpreted in words, including addresses derived in address chains. If this option is omitted, values given are assumed to be in bytes.

`a` = The utility ID (UID) of the process from which the source data will be copied.

`b` = The starting virtual address for the data in decimal, octal, or hexadecimal notation.

`c` = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified.

`d` = The length of the copy in bytes unless the WORD option is specified. The maximum is 128 bytes or 32 words. The default is 1 byte or 1 word.

`e` = The operation will use the locations beginning '`e`' lower than the calculated address and ending at the address. The locations are used in ascending order.

`f` = A GRASP utility variable (1-50), in decimal, to be written as the destination copy. Utility variable values are reset to 0 at the end of a debugging session.

4. SYSTEM RESPONSE

`?I` = General syntax error. May also include:

- `EXTRA KEYWORD (UID)` = UID is not valid in a WHEN action list.
- `EXTRA KEYWORD (UID)` = UID is invalid in a breakpoint.
- `INCONSISTENT KEYWORDS (NL-OFF)` = Negative length not allowed without OFF.
- `INVALID KEYWORD` = Destination of ADDR or REG not valid outside of a WHEN action list.
- `RANGE ERROR (UID)` = Utility ID is out of range.
- `RANGE ERROR (UVAR)` = Invalid utility variable number was specified.
- `RANGE ERROR (L or NL)` = Length specified is too long.
- `INPUT ERROR (OFF COUNT)` = Too many offsets listed.

Copyright © 1999

NG = No good. May also include:
- BAD UID = The UID specified is for a process for which copies are not allowed.

PF = Printout follows. Followed by the COPY:UID output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be copied into an address, register, variable, or utility variable of the communications module processor (CMP), and perform any of the following operations:

To perform:	Use:
increment operation	target(1) = value(2) oper=plus value(3)
decrement operation	target(1) = value(2) oper=minus value(3)
multiply operation	target(1) = value(2) oper=mult value(3)
divide operation	target(1) = value(2) oper=div value(3)
logical AND operation	target(1) = value(2) oper=and value(3)
logical OR operation	target(1) = value(2) oper=or value(3)
logical XOR operation	target(1) = value(2) oper=xor value(3)
logical shift left operation	target(1) = value(2) oper=shl value(3)
logical shift right operation	target(1) = value(2) oper=shr value(3)
invert operation	target(1) = value(2) oper=invert

This message may be used together with any of the other CMP generic utility input messages. Refer to the References section of this message.

If this message is used together with other utility messages, the END:UT-SM input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
COPY:UT:CMP=a,{MATE|PRIM} ,{ADDR1=b|REG1=c|UVAR1=d|GVAR1="e"}[,L1=f]
[,INDIR1=g][,OFF1=h[-h[-h]]],EQ[,EA2],{ADDR2=i|REG2=j|UVAR2=k|GVAR2="l"|
VAL2=m}[,L2=n][,INDIR2=o][,OFF2=p[-p[-p]]][,oper=y]
[,EA3][,{ADDR3=q|REG3=r|UVAR3=s|GVAR3="t"|VAL3=u}][,L3=v][,INDIR3=w]
[,OFF3=x[-x[-x]]]{!|;}
```

3. EXPLANATION OF MESSAGE

Note: Variables 'b' through 'h' are field one of the 'copy' input message, this field is also described as the target field.

Note: Variables 'i' through 'p' are field two of the 'copy' input message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the 'copy' input message.

Note: Variables 'q' through 'x' are field three of the 'copy' input message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of the 'copy' input message.

Copyright © 1999

EA2 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

MATE = Execute this input message on the standby CMP.

PRIM = Execute this input message on the active CMP.

a = CMP number.

b = Address that the value is copied into.

c = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.
Note: This option of this input message can only be done as part of a generic utilities WHEN clause.

d = Utility variable (0-14) that the value is copied into.

e = Symbolic name of the global variable that the value is copied into. Must be entered as a string of up to 15 characters, enclosed in double quotes.

f = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1 and GVAR1. If EA2 is specified, the length is set to 4 bytes.

g = Level of indirection (0-3) for the first part of the message. Default is 0.

h = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

i = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

j = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

k = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

l = Symbolic name of the global variable that the value is copied from. Must be entered as a string of up to 15 characters, enclosed in double quotes. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

m = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

Copyright © 1999

`n` = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR1 and GVAR2. If EA3 is specified, the length is always set to 4 bytes.

`o` = Level of indirection (0-3) for the second part of the message. Default is 0.

`p` = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

`q` = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message.

`r` = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message.

`s` = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message.

`t` = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message. Must be entered as a string of up to 15 characters, enclosed in double quotes.

`u` = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message.

`v` = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3 and GVAR3.

`w` = Level of the indirection (0-3) for the third field of 'copy' input message. Default is 0.

`x` = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

`y` = Legal operator. Valid value(s):

- `and` = Logically ANDS ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `div` = Divides ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `invert` = Inverts from on of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `minus` = Subtract ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `mult` = Multiplies ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `or` = Logically ORs ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `plus` = Add ADDR3, REG3, UVAR3 or VAL3 to one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `shl` = Shifts left ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.

Copyright © 1999

`shr`	= Shifts right ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
`xor`	= Logically XORs ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.

4. SYSTEM RESPONSE

NG	= No good. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.
PF	= Printout follows. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be copied into an address, register, global variable (specified by name or symbol index), or utility variable of the communications module processor (CMP), and optionally perform any of the following operations:

To perform:	Use:
increment operation	target(1) = value(2) oper=plus value(3)
decrement operation	target(1) = value(2) oper=minus value(3)
multiply operation	target(1) = value(2) oper=mult value(3)
divide operation	target(1) = value(2) oper=div value(3)
logical AND operation	target(1) = value(2) oper=and value(3)
logical OR operation	target(1) = value(2) oper=or value(3)
logical XOR operation	target(1) = value(2) oper=xor value(3)
logical shift left operation	target(1) = value(2) oper=shl value(3)
logical shift right operation	target(1) = value(2) oper=shr value(3)
invert operation	target(1) = value(2) oper=invert

This message may be used together with any of the other CMP generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
COPY:UT:CMP=a,{MATE|PRIM},{ADDR1=b|REG1=c|UVAR1=d|GVAR1="e"|SYMIDX1=f}

```

3. EXPLANATION OF MESSAGE

Note: Variables 'b' through 'i' are field one of the copy input message, this field is also described as the target field.

Note: Variables 'j' through 'r' are field two of the copy input message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the copy input message.

Note: Variables 's' through 'b1' are field three of the copy input message, this field is also described as the

Copyright © 1999

value(3) field. This field is used together with the arithmetic operator to modify field two of the copy input message.

EA2 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

MATE = Execute this input message on the standby CMP.

PRIM = Execute this input message on the active CMP.

a = CMP number.

b = Address that the value is copied into.

c = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.
Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

d = Utility variable (0-14) that the value is copied into.

e = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'f' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

f = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

h = Level of indirection (0-3) for the first part of the message. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

j = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

k = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.
Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

Copyright © 1999

l = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

m = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number 'n' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

n = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

o = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

p = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2 and SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

q = Level of indirection (0-3) for the second part of the message. Default is 0.

r = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

s = Legal operator. Valid value(s):

and	= Performs logical "and" of the value in field 2 with the value of field 3.
div	= Divides the value of field 2 by the value of field 3.
invert	= Performs a logical binary inversion of the value in field 2.
minus	= Subtracts the value of field 3 from the value of field 2.
mult	= Multiplies the value of field 3 with the value of field 2.
or	= Performs logical "or" of the value in field 2 with the value of field 3.
plus	= Adds the value of field 3 to the value of field 2.
shl	= Shifts left the value in field 2 by the value of field 3.
shr	= Shifts right the value in field 2 by the value of field 3.
xor	= Performs logical "exclusive or" of the value in field 2 with the value of field 3.

t = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

u = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.
Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

v = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify

the addressing mode (or value) in the second field of the copy input message.

w = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'x' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

x = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

y = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

z = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

a^1 = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

b^1 = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

4. SYSTEM RESPONSE

3. EXPLANATION OF MESSAGE

Note: Variables '`c`' through '`i`' are field one of this input message, this field is also described as the target field.

Note: Variables '`j`' through '`q`' and '`z`' are field two. This field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field.

Note: Variables '`r`' through '`y`' are field three. This field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two.

`EA2` = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the second part of this input message.

`EA3` = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the third part of this input message.

`a` = Switching module (SM) number.

`b` = Side of the module controller/time-slot interchange (MCTSI).

`c` = Address that the value is copied into.

Copyright © 1999

d = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.
Note: This option of this input message can only be done as part of a generic utilities WHEN input clause.

e = Utility variable (UVAR) (0-14) that the value is copied into.

f = Symbolic name of the global variable (GVAR) that the value is copied into. Must be entered as a string of up to 15 characters, enclosed in double quotes.

g = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1 and GVAR1. If EA2 is specified, the length is set to 4 bytes.

h = Level of indirection (0-3) for the first part of the message. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

j = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

k = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

l = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

m = Symbolic name of the global variable that the value is copied from. Must be entered as a string of up to 15 characters, enclosed in double quotes. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

n = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

o = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR1 and GVAR2. If EA3 is specified, the length is always set to 4 bytes.

p = Level of indirection (0-3) for the second part of the message. Default is 0.

q = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

r = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

s = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

t = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

u = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field. Must be entered as a string of up to 15 characters, enclosed in double quotes.

v = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

w = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3 and GVAR3.

x = Level of the indirection (0-3) for the third field. Default is 0.

y = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets

Copyright © 1999

greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

z The arithmetic operators that can be used. Valid value(s):

- `plus` = Add ADDR3, REG3, UVAR3 or VAL3 to one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `minus` = Subtract ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `mult` = Multiplies ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `div` = Divides ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `shl` = Shifts left ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `shr` = Shifts right ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `and` = Logically ANDS ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `or` = Logically ORs ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `xor` = Logically XORs ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `invert` = Inverts from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.

3. EXPLANATION OF MESSAGE

Note: Variables 'c' through 'j' are field one of this input message, this field is also described as the target field.

Note: Variables 'k' through 's' are field two. This field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field.

Note: Variables 't' through 'c1' are field three. This field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two.

EA2 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the second part of this input message.

EA3 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the third part of this input message.

a = Switching module (SM) number.

Copyright © 1999

b = Side of the module controller/time-slot interchange (MCTSI).

c = Address that the value is copied into.

d = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.

Note: This option of this input message can only be used as part of a generic utilities WHEN input clause.

e = Utility variable (UVAR) (0-14) that the value is copied into.

f = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

i = Level of indirection (0-3) for the first part of the message. Default is 0.

j = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

k = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

l = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

Note: This option of this input message can only be used as part of a generic utilities WHEN input clause.

m = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

n = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number 'o' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

o = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

p = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

q = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2 and SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

r = Level of indirection (0-3) for the second part of the message. Default is 0.

s = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

t — The arithmetic operators that can be used. Valid value(s):

and	= Performs logical "and" of the value in field 2 with the value of field 3.
div	= Divides the value of field 2 by the value of field 3.
invert	= Performs a logical binary inversion of the value in field 2.
minus	= Subtracts the value of field 3 from the value of field 2.
mult	= Multiplies the value of field 3 with the value of field 2.
or	= Performs logical "or" of the value in field 2 with the value of field 3.
plus	= Adds the value of field 3 to the value of field 2.
shl	= Shifts left the value in field 2 by the value of field 3.
shr	= Shifts right the value in field 2 by the value of field 3.
xor	= Performs logical "exclusive or" of the value in field 2 with the value of field 3.

u = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

v = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

Note: This option of this input message can only be used as part of a generic utilities WHEN input clause.

w = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

x = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'y' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

y = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

z = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

a[1] = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

b[1] = Level of the indirection (0-3) for the third field. Default is 0.

c[1] = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

4. SYSTEM RESPONSE

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be copied into an address, register, variable, or utility variable of the packet switch unit protocol handler (PSUPH), and perform any of the following operations:

To perform:	Use:
increment operation	target(1) = value(2) oper=plus value(3)
decrement operation	target(1) = value(2) oper=minus value(3)
multiply operation	target(1) = value(2) oper=mult value(3)
divide operation	target(1) = value(2) oper=div value(3)
logical AND operation	target(1) = value(2) oper=and value(3)
logical OR operation	target(1) = value(2) oper=or value(3)
logical XOR operation	target(1) = value(2) oper=xor value(3)
logical shift left operation	target(1) = value(2) oper=shl value(3)
logical shift right operation	target(1) = value(2) oper=shr value(3)
invert operation	target(1) = value(2) oper=invert

Note: This input message is only supported on PSUPHs of the PH3/PH4 hardware type (that is, not PH2 hardware types).

This message may be used together with any of the other PSUPH generic utility input messages. Refer to the References section of this message.

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```

3. EXPLANATION OF MESSAGE

Note: Variables 'e' through 'k' are field one of the 'copy' input message. This field is also described as the target field.

Note: Variables 'l' through 's' are field two of the 'copy' input message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the 'copy' input message.

Copyright © 1999

Note: Variables 't' through 'a[1]' are field three of the 'copy' input message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of the 'copy' input message.

EA2 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Address that the value is copied into.

f = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.

Note: This option of this input message can only be done as part of a generic utilities WHEN clause.

g = Utility variable (UVAR) (0-14) that the value is copied into.

h = Symbolic name of the global variable (GVAR) that the value is copied into. Must be entered as a string of up to 15 characters, enclosed in double quotes.

i = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1 and GVAR1. If EA2 is specified, the length is set to 4 bytes.

j = Level of indirection (0-3) for the first part of the message. Default is 0.

k = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

l = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

m = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

n = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

o = Symbolic name of the global variable that the value is copied from. Must be entered as a string of up to 15 characters, enclosed in double quotes. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

p = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

q = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR1 and GVAR2. If EA3 is specified, the length is always set to 4 bytes.

r = Level of indirection (0-3) for the second part of the message. Default is 0.

s = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of

indirection. Maximum number of offsets is 3. Default is 0.

t = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message.

u = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message.

v = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message.

w = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message. Must be entered as a string of up to 15 characters, enclosed in double quotes.

x = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the 'copy' input message.

y = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3 and GVAR3.

z = Level of the indirection (0-3) for the third field of 'copy' input message. Default is 0.

a[1] = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

b[1] = Legal operations. Valid value(s):

- and = Logically ANDS ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- div = Divides ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- invert = Inverts from on of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- minus = Subtract ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- mult = Multiplies ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- or = Logically ORs ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- plus = Add ADDR3, REG3, UVAR3 or VAL3 to one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- shl = Shifts left ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- shr = Shifts right ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- xor = Logically XORs ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

PF = Printout follows.

3. EXPLANATION OF MESSAGE

Note: Variables 'e' through 'l' are field one of the copy input message. This field is also described as the target field.

Note: Variables 'm' through 'u' are field two of the copy input message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using

one of the arithmetic operators together with the third field of the copy input message.

Note: Variables 'v' through 'e[1]' are field three of the copy input message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of the copy input message.

EA2 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Address that the value is copied into.

f = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

g = Utility variable (UVAR) (0-14) that the value is copied into.

h = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'i' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

i = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

j = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

k = Level of indirection (0-3) for the first part of the message. Default is 0.

l = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

m = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

n = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

o = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

p = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters

the symbol index number 'q' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

q = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

r = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

s = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2, SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

t = Level of indirection (0-3) for the second part of the message. Default is 0.

u = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

v = Legal operator. Valid value(s):

- and = Performs logical "and" of the value in field 2 with the value of field 3.
- div = Divides the value of field 2 by the value of field 3.
- invert = Performs a logical binary inversion of the value in field 2.
- minus = Subtracts the value of field 3 from the value of field 2.
- mult = Multiplies the value of field 3 with the value of field 2.
- or = Performs logical "or" of the value in field 2 with the value of field 3.
- plus = Adds the value of field 3 to the value of field 2.
- shl = Shifts left the value in field 2 by the value of field 3.
- shr = Shifts right the value in field 2 by the value of field 3.
- xor = Performs logical "exclusive or" of the value in field 2 with the value of field 3.

w = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

x = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

y = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

z = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'a^1' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

a^1 = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

b^1 = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

c^1 = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

d^1 = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

Copyright © 1999

e[1] = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

1. PURPOSE

Requests that a value be copied into an address, register, variable, or utility variable of the switching module (SM), and can perform any of the following operations.

To perform:	Use:
increment operation	target(1) = value(2) oper=plus value(3)
decrement operation	target(1) = value(2) oper=minus value(3)
multiply operation	target(1) = value(2) oper=mult value(3)
divide operation	target(1) = value(2) oper=div value(3)
logical AND operation	target(1) = value(2) oper=and value(3)
logical OR operation	target(1) = value(2) oper=or value(3)
logical XOR operation	target(1) = value(2) oper=xor value(3)
logical shift left operation	target(1) = value(2) oper=shl value(3)
logical shift right operation	target(1) = value(2) oper=shr value(3)
invert operation	target(1) = value(2) oper=invert

This message may be used together with any of the other SM generic utility input messages (refer to the input messages listed in the References section).

If this message is used together with other utility messages, the END:UT-SM input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

```
COPY:UT:SM=a[,MATE1],{ADDR1=b|REG1=c|UVAR1=d|GVAR1="e"}[,L1=f][,INDIR1=g]
[,OFF1=h[-h[-h]]],EQ [,MATE2][,EA2],{ADDR2=i|REG2=j|UVAR2=k|GVAR2="l"|
VAL2=m}[,L2=n][,INDIR2=o][,OFF2=p[-p[-p]]]
[,oper=y]
[,MATE3][,EA3][,{ADDR3=q|REG3=r|UVAR3=s|GVAR3="t"|VAL3=u}] [,L3=v]

```

3. EXPLANATION OF MESSAGE

Note: Variables 'b' through 'h' are field one of this message, this field is also described as the target field.

Note: Variables 'i' through 'p' are field two of this message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the 'copy' input message.

Note: Variables 'q' through 'x' are field three of this message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of this message.

EA2 = The value which is to be copied is the effective address of the message instead of the contents of

Copyright © 1999

the address for the second part of the input message.

EA3 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

MATE1 = Address, utility variable or symbolic address specified in the first part of the message is in MATE memory (default is active). REG1 and UVAR1 may be used with MATE1 only if a level of indirection is specified.

MATE2 = Address, utility variable or symbolic address specified in the second part of the message is in MATE memory (default is active). REG2 and UVAR2 may be used with MATE2 only if a level of indirection is specified.

MATE3 = Address, register, utility variable or symbolic address specified in the third part of the message is in MATE memory. REG3 and UVAR3 may be used with MATE3 only if a level of indirection is specified.

a = SM number.

b = Address that the value is to be copied into.

c = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is to be copied into.

d = Utility variable (0-14) that the value is to be copied into.
Note: This option of this input message can only be done as part of a generic utilities WHEN clause.

e = Symbolic name of the global variable that the value is to be copied into. Must be entered as a string of up to 15 characters, enclosed in double quotation marks.

f = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1, 1 byte for ADDR1 and GVAR1. If EA2 is specified, the length is set to 4 bytes.

g = Level of indirection (0-3) for the first part of the message. Default is 0.

h = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

i = Address that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the 'copy' input message.

j = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

k = Utility variable (0-14) that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

l = Symbolic name of the global variable that the value is to be copied from. Must be entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by

Copyright © 1999

using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

m = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

n = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, REG2, and VAL2; 1 byte for ADDR1 and GVAR2. If EA3 is specified, the length is always set to 4 bytes.

o = Level of indirection (0-3) for the second part of the message. Default is 0.

p = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

q = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

r = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

s = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

t = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message. Must be entered as a string of up to 15 characters, enclosed in double quotation marks.

u = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

v = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, REG3, and VAL3; 1 byte for ADDR3 and GVAR3.

w = Level of the indirection (0-3) for the third field of 'copy' input message. Default is 0.

x = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

y = Legal operations. Valid value(s):

- `and` = Logically ANDS ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `div` = Divides ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `invert` = Inverts from on of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `minus` = Subtract ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `mult` = Multiplies ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
- `or` = Logically ORs ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.

Copyright © 1999

plus	= Add ADDR3, REG3, UVAR3 or VAL3 to one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
shl	= Shifts left ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
shr	= Shifts right ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.
xor	= Logically XORs ADDR3, REG3, UVAR3 or VAL3 from one of the following addressing modes (or value): ADDR2, REG2, UVAR2 or VAL2.

4. SYSTEM RESPONSE

NG	= No good. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.
PF	= Printout follows.

3. EXPLANATION OF MESSAGE

Note: Variables 'b' through 'i' are field one of this message, this field is also described as the target field.

Note: Variables 'j' through 'r' are field two of this message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the copy input message.

Note: Variables 's' through 'b1' are field three of this message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of this message.

Copyright © 1999

EA2 = The value which is to be copied is the effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

MATE1 = Address, utility variable or symbolic address specified in the first part of the message is in MATE memory (default is active). REG1 and UVAR1 may be used with MATE1 only if a level of indirection is specified.

MATE2 = Address, utility variable or symbolic address specified in the second part of the message is in MATE memory (default is active). REG2 and UVAR2 may be used with MATE2 only if a level of indirection is specified.

MATE3 = Address, register, utility variable or symbolic address specified in the third part of the message is in MATE memory. REG3 and UVAR3 may be used with MATE3 only if a level of indirection is specified.

a = SM number.

b = Address that the value is to be copied into.

c = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is to be copied into.
Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

d = Utility variable (0-14) that the value is to be copied into.

e = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'f' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

f = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

h = Level of indirection (0-3) for the first part of the message. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

j = Address that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

k = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is to be copied from. This value can be modified by using one of the

Copyright © 1999

arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

l = Utility variable (0-14) that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

m = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number 'n' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

n = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

o = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

p = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2 and SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

q = Level of indirection (0-3) for the second part of the message. Default is 0.

r = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

s = Legal operator. Valid value(s):

- and = Performs logical "and" of the value in field 2 with the value of field 3.
- div = Divides the value of field 2 by the value of field 3.
- invert = Performs a logical binary inversion of the value in field 2.
- minus = Subtracts the value of field 3 from the value of field 2.
- mult = Multiplies the value of field 3 with the value of field 2.
- or = Performs logical "or" of the value in field 2 with the value of field 3.
- plus = Adds the value of field 3 to the value of field 2.
- shl = Shifts left the value in field 2 by the value of field 3.
- shr = Shifts right the value in field 2 by the value of field 3.
- xor = Performs logical "exclusive or" of the value in field 2 with the value of field 3.

t = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

u = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

Copyright © 1999

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

v = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

w = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'x' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

x = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

y = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

z = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

a[1] = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

b[1] = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from an administrative module (AM) generic access package (GRASP) in utility variable to virtual addresses in main memory and in registers as an action associated with a breakpoint. Copies data from another GRASP utility variable as an immediate action or as an action triggered by a breakpoint.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied. Format 1 is a required by action to be triggered by a breakpoint. Format 2 is either executed immediately or triggered by a breakpoint.

2. FORMAT

```
[1]    COPY:UVAR=a[,OFF=b][,L=c|,NL=d]{:ADDR=e|:REG=f}[:WORD]!

[2]    COPY:UVAR=a[,L=c|,NL=d]:UVAR=g[:WORD]{!|;}
```

3. EXPLANATION OF MESSAGE

`WORD` = Indicates that all addresses, offsets, and lengths are to be interpreted in terms of words, including addresses derived in address chains. If this option is omitted, values given are assumed to be in bytes.

`a` = A GRASP utility variable, in decimal, as the source for the copy. Utility variable values are reset to zero at the end of a debugging session.

`b` = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified. (Used as an action associated with a breakpoint.)

`c` = The length of the copy in bytes unless the WORD option is specified, in which case, the maximum is 128 bytes or 32 words. The default is 1.

`d` = The operation should use the locations beginning 'd' lower than the calculated address and ending at the address. The locations are used in ascending order.

`e` = The destination virtual address for the data in decimal, octal, or hexadecimal notation. (Used as an action associated with a breakpoint.)

`f` = The register to be written as the destination of the copy. (Used as an action associated with a breakpoint.) Valid value(s):

- `AP` = Argument pointer.
- `ATBBGR` = Register used by the ATB miss routine to temporarily store the bi-directional gating register (BGR).
- `ATBPSW` = Register used by the ATB miss routine to temporarily store the program status word (PSW) register.

Copyright © 1999

ATBQ	= Register used by the ATB miss routine to temporarily store the 'q' register.
ATBSAR	= Register address used by the address translation buffer (ATB) miss routine to temporarily store the store address register (SAR) contents.
ATBSCR	= Register used by the ATB miss routine to temporarily store the store control register (SCR) contents.
ATBSDR	= Register used by the ATB miss routine to temporarily store the store data register (SDR) content.
BGR	= Bi-directional gating register.
CAR	= Channel address register.
CDR	= Channel data register.
ERC	= Error register (ER) clear.

UINT3	= Error microinterrupt hander register UINT3.
UINTER	= Shadow error register (uint_er) loaded during an error microinterrupt.

g = A GRASP utility variable, in decimal, to be written as the destination copy. Utility variable values are reset to 0 at the end of a debugging session. (Can be used as an immediate action or associated with a breakpoint.)

4. SYSTEM RESPONSE

?I = General syntax error. May also include:
- EXTRA KEYWORD (OFF) = Indirection not allowed except as action of a WHEN.
- INCONSISTENT KEYWORDS (NL-OFF) = Negative length not allowed without OFF.
- INVALID KEYWORD = Destination of ADDR or REG not valid outside of a WHEN action list.
- RANGE ERROR (UVAR) = Invalid utility variable number was specified.
- RANGE ERROR (L or NL) = Length specified is too long.

IP = In progress. The message has been added to the WHEN action list.

NG = No good. May also include:
- BAD REG NAME = A named register is not a valid destination.

PF = Printout follows. Followed by the COPY:UVAR output message.

RL = Retry later. The system is in an overload condition or completing the previous OP:UMEM input message.

COPY:UVAR
```

21. CPY

Copyright © 1999

CPY:AMATAPE

Software Release: 5E10 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that primary or secondary automatic message accounting (AMA) data records be copied onto tape.

2. FORMAT

```
CPY:AMATAPE:{PRIM|SEC,SBLK=a,EBLK=b},MT=c[,ST1|,ST2];
```

3. EXPLANATION OF MESSAGE

`PRIM` = Write primary data.

`SEC` = Write secondary data.

`ST1` = Used if AMA data goes to the ST1 data stream.

`ST2` = Used if AMA data goes to the ST2 data stream.

NOTE: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

`a` = Sequence number of the first block of secondary data required. This variable is used only if secondary data is being written onto tape. For secondary data, it is not possible to transmit the oldest 51 blocks of secondary data. Therefore, this number may not reflect the actual first block of secondary data transmitted in the case where the first block falls in that range. To determine the oldest secondary block of data, use OP:AMA-MAPS and determine the FSS from the right side of the maps for the WRITE PARTITION listed at the top of the OP:AMA-MAPS output. This block plus the 50 blocks following cannot be accessed. This is necessary since the oldest secondary AMA data could be overwritten by primary AMA data while a secondary session is in progress.

`b` = Sequence number of the last block of secondary data required. This variable is used only if secondary data is being written onto tape.

`c` = Tape drive number.

4. SYSTEM RESPONSE

`IP` = In progress. Tape writing is allowed and the message was successfully sent to start the tape writing session. When tape writing is completed either a REPT:AMATAPE-ERR message or a REPT:AMATAPE-COMP message will be output indicating the outcome of the request.

`NG` = No good. The teleprocessing option is in effect, a tape session is already in progress, or data transfer sessions have been manually inhibited, or data stream checks have failed.

`PF` = Printout follows. Invalid internal data was encountered while processing the input message. An audit printout will follow.

Copyright © 1999

RL = Retry later. A message could not be sent to start the tape writing process.

DEL:ACSR

Software Release: 5E10 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that one or all automatic customer station rearrangement (ACSR) requests be deleted from the ACSR queue.

2. FORMAT

```
DEL:ACSR,{PDN=a|ALL};
```

3. EXPLANATION OF MESSAGE

`ALL` = Delete all requests from the ACSR queue.

`a` = Primary directory number (PDN). The PDN value may be a 7 or 10 digit directory number (DN). If the NXX exists in more than one area code (i.e., NPA), a 10 digit DN must be entered.

4. SYSTEM RESPONSE

`PF` = Printout follows. The DEL:ACSR output message follows.

DEL:LOG

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests deletion of selected contents of a logfile and cleans out corrupt entries from the file. If the filename is the only criterion entered, only corrupt entries are deleted. Otherwise, only entries in the logfile that meet all the specified criteria are deleted.

Two formats are given, depending on the form of specifying starting and ending dates and times.

2. FORMAT

```
[1]    DEL:LOG:LG="a"[:[DATE=b[&&c],][KW="f".][ID=g,][TYPE=h]];

[2]    DEL:LOG:LG="a"[:[DATE=i[&&j],][TIME=d[&&e],][KW="f".][ID=g,][TYPE=h]];
```

3. EXPLANATION OF MESSAGE

`a` = Name of the logfile. Any valid administrative module (AM) logfile name. For example: ULARP, DAYLOG.

`b` = Start date as a six-digit format (mmddyy) or ten-digit format (mmddyyhhmm). For example, 100257 = October 2, 1957; 0102571000 = January 2, 1957, at 10:00 a.m.

`c` = End date as six-digit format (mmddyy) or ten-digit format (mmddyyhhmm). The default is the start date. If supplied, this date must be in the same format (six or ten digits) as the start date.

`d` = Start time in hours and minutes format (hhmm). For example, 0110 = 1:10 a.m.

`e` = End time in hours and minutes format (hhmm). For example, 1530 = 3:30 p.m. The default is the start time.

NOTE: When the six-digit date range is used in conjunction with a time range, the log entries will be deleted from start time to end time for each day in the range of start date through end date.

The ten-digit date allows the user to delete log entries from the start time on the start date until the end time on the end date. Specifying the start time (variable '`d`') and end time (variable '`e`') with the ten-digit date range is invalid.

`f` = A keyword that appears in all entries that are to be deleted.

`g` = An optional four-digit decimal number that is used to link an item in a logfile with an entry in another file. The ID is filled in by the process that made the logfile entry: for example, 1234, 0017, 0003.

`h` = An optional four-digit decimal number that specifies the type of entry on a logfile. This type is filled in by the process that made the logfile entry; for example, 1234, 0945, 0005.

`i` = Start date, given as a six-digit number in the form mmddyy.

Copyright © 1999

`j` = End date, given as a six-digit number in the form mmddyy. Default is the start date.

4. SYSTEM RESPONSE

`IP` = In progress.

`NG` = No good. May also include:
- `CANNOT ATTACH TO ECD` = Could not attach to the equipment configuration database (EDC).

DEL:PAUTH

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Deletes a person identity (IDENT) from the person authority database (PAUTH).

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
DEL:PAUTH:IDENT="a";
```

3. EXPLANATION OF MESSAGE

`a` = Identity of person authority to delete from the person authority database, in one to eight letters and/or digits.

4. SYSTEM RESPONSE

`NG` = No good. Valid value(s):
- `NON-EXISTENT PERSON IDENTITY` = The given person identity does not exist in the person authority database.
- `UNABLE TO ACCESS AUTHORITY ADMINISTRATION` = The person authority database is inaccessible.

`OK` = Good. Identity deleted from person authority database.

`RL` = Retry later. Valid value(s):
- `AUTHORITY ADMINISTRATION UNDER UPDATE` = The person authority database is currently being updated.

DEL:PCGRP

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

This input message deletes a command group or profile from the person-command group (PCGRP) relation for a given person identity (IDENT).

Format 1 disassociates a command group (COMGR) from a person identity (IDENT), preventing the user from accessing this group of commands. Format 2 disassociates a command profile (PROFL) from a person identity, preventing the user from accessing this command profile. This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
[1]    DEL:PCGRP:IDENT=a,COMGR=b;

[2]    DEL:PCGRP:IDENT=a,PROFL=c;
```

3. EXPLANATION OF MESSAGE

a = Identity of the person in one to eight letters and/or digits.

b Command group. Valid value(s):

ADMIN	= System administrator only activities.
ALARM	= Alarm manipulation.
AM	= Administrative module maintenance.
AMA	= Automatic message accounting.
AUDIT	= Audits.
AUTH	= Command and authority administration.
CCS	= Common channel signaling.
CM	= Communications module maintenance.
FHADM	= File handling and administration.
MAINT	= Routine maintenance activities.
MEAS	= Measurements.
NMOC	= Network management and overload control.
ODD	= Office dependent data activities.
PASS	= Personal password modification.
RCV	= Recent change and verify activities.
SM	= Switching module maintenance.
SPECRCV	= Special RC/V input messages.
SFTMGT	= Software management (update, software release retrofit).
SFTUTIL	= Software utilities.
SUPERUSR	= Super user authority (bypass terminal authority).
SYSRCVY	= System recovery activities.
TRACE	= Call trace.
TRKLN	= Trunk and line maintenance.

Copyright © 1999

Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

`c` = A profile name which has been previously created using ADD:PROFL and assigned to this user with ADD:PCGRP. The name is one to eight letters and/or digits.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

- `COMMAND GROUP NOT ASSIGNED TO THIS PERSON` = The given command group was never assigned to this person identity.
- `NON-EXISTENT PERSON IDENTITY` = The given person identity does not exist in the person authority database.
- `PROFILE IDENTITY DOES NOT EXIST` = The command profile does not exist in the profile authority database.
- `PROFILE NOT ASSIGNED` = The given command profile was never assigned to this person identity.
- `UNABLE TO ACCESS AUTHORITY ADMINISTRATION` = The person authority database is inaccessible.

`OK` = Good. The command group or profile is no longer associated with the person identity.

`RL` = Retry later. May also include:

- `AUTHORITY ADMINISTRATION UNDER UPDATE` = The person authority database is currently being updated.

DEL:PROFL

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Deletes a profile identity (IDENT) from the profile authority database (PROFL). A profile is a set of command groups, which are detailed in the APP:COMMAND-GRP appendix of the Input Messages manual. The profile is also deleted from any person authority (PAUTH) to which it is assigned.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
DEL:PROFL:IDENT=a;
```

3. EXPLANATION OF MESSAGE

`a` = Identifying name of the profile to be deleted from the database. A maximum of eight characters may be used.

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `PROFILE IDENTITY DOES NOT EXIST` = The given profile identity does not exist in the profile authority database.
- `UNABLE TO ACCESS PROFILE ADMINISTRATION` = The profile authority database is inaccessible.

`OK` = Good. The profile is successfully deleted from the profile authority database.

`RL` = Retry later. May also include:
- `AUTHORITY ADMINISTRATION UNDER UPDATE` = The person authority database (PAUTH) is currently being updated.
- `PROFILE ADMINISTRATION UNDER UPDATE` = The profile authority database (PROFL) is currently being updated.

DEL:TAUTH

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Deletes a terminal identity (TERM) from the terminal authority (TAUTH) database.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
DEL:TAUTH:TERM=a;
```

3. EXPLANATION OF MESSAGE

`a` = Terminal identity in four characters, starting with "tty".

4. SYSTEM RESPONSE

`NG` = No good. May also include:
- `INVALID TERMINAL IDENTITY` = The given terminal identity is either not four characters in length or does not start with "tty".
- `NON-EXISTENT TERMINAL IDENTITY` = The given terminal identity does not exist in the terminal authority database.
- `UNABLE TO ACCESS AUTHORITY ADMINISTRATION` = The terminal authority database is inaccessible.

`OK` = Good. The terminal identity is deleted from the terminal authority database.

`RL` = Retry later. May also include:
- `AUTHORITY ADMINISTRATION UNDER UPDATE` = The terminal authority database is currently being updated.

DEL:TCGRP

Software Release: 5E10 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

This command deletes a command group of profile from the terminal-command group (TCGRP) relation for a given terminal (TERM) identity.

Format 1 disassociates a command group (COMGR) from a TERM, preventing the user from accessing this group of commands from that terminal. Format 2 disassociates a command profile (PROFL) from a TERM, preventing the user from accessing this command profile from that terminal. This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

```
[1]    DEL:TCGRP:TERM=a,COMGR=b;

[2]    DEL:TCGRP:TERM=a,PROFL=c;
```

3. EXPLANATION OF MESSAGE

a = Terminal identity in four characters, starting with "tty".

b = Command group. Valid value(s):

ADMIN	= System administrator only activities.
ALARM	= Alarm manipulation.
AM	= Administrative module maintenance.
AMA	= Automatic Message Accounting.
AUDIT	= Audits.
AUTH	= Command and authority administration.
CCS	= Common channel signaling.
CM	= Communications module maintenance.
FHADM	= File handling and administration.
MAINT	= Routine maintenance activities.
MEAS	= Measurements.
NMOC	= Network management and overload control.
ODD	= Office Dependent Data activities.
PASS	= Personal password modification.

Copyright © 1999

DGN:AIUCOM

Software Release: 5E11 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on an access interface unit common data and control controller (COMDAC).

2. FORMAT

```
DGN:AIUCOM=a-b-c[,PH=d[&&e]][,RPT[=f]][,GROW][,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Execute and print all test failures unconditionally rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = COMDAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of the phase to be run, or the lower limit of a range of phases.

`e` = The upper limit of a range of phases to be run.

`f` = The number of times the exercise is to be repeated (1-32676). If '`f`' is not specified, the test will be repeated 32,767 times.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. Followed by the DGN:AIUCOM output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

1321,y,x (AIU PIDB SUMMARY)

DGN:AIURG

Software Release: 5E11 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on an access interface unit (AIU) ring generator (RG).

2. FORMAT

```
DGN:AIURG=a-b-c[,PH=d[&&e]][,RPT[=f]][,GROW][,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Execute and print all test failures unconditionally rather than stopping after the first test failure.

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = RG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of the phase to be run, or the lower limit of a range of phases.

`e` = The upper limit of a range of phases to be run.

`f` = The number of times the exercise is to be repeated (1-32676). If '`f`' is not specified, the test will be repeated 32,767 times.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. Followed by the DGN:AIURG output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:ALIT

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that an automatic line insulation test (ALIT) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:ALIT=a-b-c-d[,RAW][,UCL][,GROW][,RPT[=e]][,PH=f[&&g][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number.

`b` = Metallic service unit (MSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Metallic service unit board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

`f` = Diagnostic phase(s) to be performed, or the lower limit of a range of phases.

`g` = Upper limit of a range of diagnostic phases to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by the DGN:ALIT output message.

DGN:ASC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a multimodule remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC) be diagnosed to determine if it is in working order.

2. FORMAT

```
DGN:ASC=a[,RAW][,UCL][,RPT[b]][,GROW][,PH=c[&&d][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw data from test failure.

`TLP` = Print the ordered pack list if diagnostic fails.

`UCL` = Execute the diagnostic(s) unconditionally.

`a` = Switching module (SM) number.

`b` = Number of times the test will be repeated. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Default=32,767.

`c` = Diagnostic phase(s) to be performed, or the lower limit of a range of diagnostic phases.

`d` = Upper limit of a range of diagnostic phases.

4. SYSTEM RESPONSE

`NG` = No good. Request denied because of a conflict with current status.
`PF` = Printout follows. Followed by the ABT:ASC output message.
Note: Observe the following at the remote site:

AUDIBLE	VISUAL	TIME
CRITICAL	CRITICAL + TIP	5 sec
CRITICAL	STAND-ALONE + TIP	5 sec
MAJOR	MAJOR + TIP	5 sec
MINOR	MINOR + TIP	5 sec
TIP = test in progress.

DGN:BTSR

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the bootstrapper board (BTSR) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:BTSR=a[,RAW][,UCL][,RPT[=b]][,GROW][,PH=c[&&d]][,TLP];
```

3. EXPLANATION OF MESSAGE

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute the removal.

`a` = Switching module number.

`b` = The number of times that the test is to be repeated. If '`b`' is not specified, the test will be repeated 32,767 times.

`c` = If specified as a single argument, the diagnostic phase to be performed. If specified as a range, the first diagnostic phase of the range of phases to be performed.

`d` = The last diagnostic phase of the range of phases starting with '`e`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by the DGN:BTSR output message.

DGN:CDFI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Diagnoses an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit to determine if it is in working order. If the circuit is in service, it is removed from service and diagnosed. The circuit is left out of service at the end of the diagnostic regardless of the result.

2. FORMAT

```
DGN:CDFI=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f][,TPL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw data from test failure.

`TLP` = Print the ordered pack list if a diagnostic fails.

`UCL` = Unconditionally execute and print all test failures. Diagnostic will continue past all non-fatal errors.

`a` = Switching module (SM) number.

`b` = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = CDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Repeat (RPT) the test '`d`' times. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Run phase '`e`'.

`f` = Run phases '`e`' through '`f`'.

4. SYSTEM RESPONSE

`NG` = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:

```
-            NOT STARTED UNIT IN GROWTH STATE
-            SM DOES NOT EXIST
-            SM UNEQUIPPED
-            UNIT DOES NOT EXIST
```

`PF` = Printout follows. The DGN:CDFI output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:CDI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a control data interface (CDI) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:CDI=a-b-c[,RAW][,UCL][,SVG][,RPT[=d]][,GROW][,PH=e[&&f][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`SVG` = Run diagnostics on the entire service group, including the demand phases.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number.

`b` = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Diagnostic phase(s) to be performed. If '`e`' is specified as a single phase, only that phase will be performed. If '`e`' is specified in a range, '`e`' will be the first phase in that range to be performed.

`f` = The last diagnostic phase in the range between and including '`e`' and '`f`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by the DGN:CDI output message.

```

Input Appendix(es):

```
APP:RANGES
```

DGN:CMP

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnosis of a communication module processor (CMP) to determine whether it is in satisfactory working order. Completion of this input message leaves the unit in the out-of-service (OOS) state.

Note 1: If the unit is not OOS, the system will first remove the unit conditionally.

Note 2: This command is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

```
DGN:CMP=a-b[,RAW][,GROW][,UCL][,RPT[=c]][,TLP][,PH=d[&&e]];
```

3. EXPLANATION OF MESSAGE

`GROW` = Run diagnostics on a CMP in the GROW state. If the CMP is GROW, this option must be input to perform the diagnostic.

`RAW` = Print data from raw data test failure.

`RPT` = Repeat the diagnostic '`c`' times.

`TLP` = Print the ordered pack list.

`UCL` = Execute tests unconditionally and print test failures rather than stopping after the first test failure.

`a` = Message switch side number.

`b` = CMP number.

`c` = Number of times the diagnostic is to be repeated (default 32,767). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Phase (PH) number or lower limit of a range of phase numbers.

`e` = Upper limit of a range of phase numbers.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows. The DGN:CMP output message follows.

Copyright © 1999

RL = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:CU

Software Release: 5E10 and later
Command Group: AM,CCS
Application: 3B,CNI
Type: Input

1. PURPOSE

Diagnoses the specified administrative module (AM) control unit (CU) complex or a specified unit within the CU complex.

Format 1 diagnoses the specified CU complex. Format 2 diagnoses the central control (CC) unit. Format 3 diagnoses the specified channel (CH). Format 4 diagnoses the cache store unit (CSU). Format 5 diagnoses the specified direct memory access (DMA) unit. Format 6 diagnoses the specified main store controller unit (MASC). Format 7 diagnoses the store address translator (SAT) circuit pack. Format 8 diagnoses the utility circuit (UC) circuit pack.

2. FORMAT

```
[1]    DGN:CU=a[:[,RAW][,UCL][,REX|,DEX]][,TLP];

[2]    DGN:CU=a,CC=0[:[,RPT=c][,RAW][,UCL][,REX|,DEX]][[,PH=d[&&e]]
       [,TLP];

[3]    DGN:CU=a,CH=b[:[,RPT=c][,RAW][,UCL][,REX|,DEX]][,PH=d[&&e]]
       [,TLP][,{DFC=f|IOP=f|RPCN32=g|RPCN00=g|LN32=g|LN00=g}];

[4]    DGN:CU=a,CSU=0[:[,RPT=c][,RAW][,UCL][,REX|,DEX]][,PH=d[&&e]]
       [,TLP];

[5]    DGN:CU=a,DMA=b[:[,RPT=c][,RAW][,UCL][,REX|,DEX]][,PH=d[&&e]]
       [,CONT][,TLP];

[6]    DGN:CU=a,MASC=b[:[,RPT=c][,RAW][,UCL][,REX|,DEX]][,PH=d[&&e]]
       [,TLP];

[7]    DGN:CU=a,SAT=0[:[,RPT=c][,RAW][,UCL][,REX|,DEX]][,PH=d[&&e]]
       [,TLP];

[8]    DGN:CU=a,UC=0[:[RPT=c][,RAW][,UCL][,REX|,DEX]][,PH=d[&&e]]
       [,TLP];
```

3. EXPLANATION OF MESSAGE

`CONT` = Include only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored. Format 5 is currently used by the DMA. If this parameter is not specified, the DMA controller and all channels connected to it are diagnosed.

`DEX` = Run demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases which require user interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Print the diagnostic results of every phase. Default equals the first five failures of each failing phase.

Copyright © 1999

REX = Run routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: It is recommended that the TLP and UCL parameters not be specified together, as it may produce an improper TLP listing.

UCL = Unconditional execution.

NOTE: This option does not override forced early terminations.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

c = Number of times diagnostic is repeated (maximum is 256) (default is 1).

NOTE: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

d = The number of the first phase to be executed.

e = The number of the last phase to be executed.

f = Member number of the DFC or IOP that is to be used as a helper unit. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped.

g = Member number of the link node (LN) or ring peripheral control node (RPCN) to be used as a helper unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. 0 is used for the RPCN.

4. SYSTEM RESPONSE

?D = General syntax error in the data field, followed by the parameter position. Valid value(s):
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INCONSISTENT KEYWORD = The combination of keywords is not a valid combination.
- INVALID DATA = Not a valid value for the phase option.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.

?E = Input error of undetermined type.

?I = General syntax error, followed by the parameter position. May also include:
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- MISSING DATA = Data required for a keyword in the stated parameter block was not found.
- MISSING KEYWORD = A required keyword is missing from the input. Unit to diagnose must be specified.

Copyright © 1999

- RANGE ERROR = Input is out of the valid range.

PF = Printout follows. Followed by the DGN:CU output message.

RL = Retry later. The system is in an overload condition.

DGN:DCI

Software Release: 5E10 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified dual serial channel/computer interconnect (DCI).

2. FORMAT

```
DGN:DCI=a[:[,RPT=b][,RAW][,UCL][,REX|,DEX]][:DATA[,PH=c[&&d]][,TLP]];
```

3. EXPLANATION OF MESSAGE

`DEX` = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: The `TLP` and `UCL` parameters should not be used together, as additional test results may adversely affect the `TLP` listing.

`UCL` = Unconditional execution.

NOTE: This option does not override forced early terminations.

`a` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times diagnostic is repeated. The maximum is 256. The default is one.

NOTE: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = The number of the first phase to be executed.

`d` = The number of the last phase to be executed.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the DGN:DCI output message.

`RL` = Retry later. The system is in an overload condition.

Copyright © 1999

?I = General syntax error, followed by the parameter position and one of the following reasons:
EXTRA KEYWORD = Duplicate or extraneous keywords were input.
INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
MISSING DATA = Data required for a keyword in the stated parameter block was not found.
MISSING KEYWORD = A required keyword is missing from the input. Unit to diagnose must be specified.
RANGE ERROR = Input is out of the valid range.

?D = General syntax error in the data field, followed by the parameter position and one of the following reasons:
EXTRA KEYWORD = Duplicate or extraneous keywords were input.
INCONSISTENT KEYWORD = The combination of keywords is not a valid combination.
INVALID DATA = Not a valid value for the phase option.
INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.

?E = Input error of undetermined type.

DGN:DCLU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a *SLC*® 96 digital carrier line unit (DCLU) be removed and diagnosed. The circuit will remain out of service (regardless of the diagnostic's result) until a restore (RST) is requested.

The DCLU service groups interface with *SLC*® 96 digital facility interface (SDFI) circuits. There are 4 classes of faults associated with DCLU and SDFI circuits and they are written in the order in which they are most likely to occur:

A DCLU faults that are detected with DCLU diagnosis.

B DCLU faults that are only detected by diagnosing an SDFI circuit (any SDFI).

C SDFI faults that are only detected by diagnosis of the DCLU.

D DCLU faults that are only detected by diagnosing a particular SDFI.

In addition, fault recovery is unable to determine if detected problems are associated with bad DCLU or SDFI circuits. Therefore, fault recovery uses an algorithm in determining which circuits (DCLU or SDFI) to diagnose.

2. FORMAT

```
DGN:DCLU=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Prints raw test results [all tests passed (ATP)/some tests failed (STF)] for each phase executed.

`TLP` = Print the ordered suspect pack if a test fails.

`UCL` = Unconditionally execute and print all test results requested rather than stopping on first failing phase.

`a` = Switching module (SM) number.

`b` = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Diagnostic phase to be performed. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If '`e`' is specified as a single phase, only that phase will be

Copyright © 1999

performed. If 'e' is specified in a range, 'e' will be the first phase in that range to be performed.

f = The last diagnostic phase in the range between and including 'e' and 'f' to be performed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. The DGN:DCLU output message follows when the diagnostic is executed.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1. PURPOSE

Requests that the specified disk file controller (DFC) be diagnosed.

NOTE: The moving head disk (MHD) cannot be diagnosed if the disk file controller (DFC) is not in service. Therefore, a controller and its associated disk units cannot be diagnosed with one input message.

2. FORMAT

```
DGN:DFC=a[:[RPT=b][,RAW][,UCL][,REX|,DEX]][[,PH=c[&&d]][,CONT]
[,TLP][,CU=e]];
```

3. EXPLANATION OF MESSAGE

`CONT` = Includes only the specified unit (controller). Units attached to the specified unit will not be included. Default is diagnose DFC variable '`a`' only.

`DEX` = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: The TLP and UCL parameters should not be used together, as additional test results may adversely affect the TLP listing.

`UCL` = Unconditional execution.

NOTE: This option does not override forced early terminations.

`a` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times diagnostic is repeated. The maximum is 256. The default is one.

NOTE: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = The number of the first phase to be executed.

`d` = The number of the last phase to be executed.

Copyright © 1999

e = Member number of the CU helper unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a helper unit is not required, the specified helper unit is not used. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped. The off-line CU is required as a helper unit when demand phase 15 is executed.

NOTE: The helper CU must be out-of-service (OOS) and must be diagnosed as all tests pass (ATP) before it is used as a helper unit.

4. SYSTEM RESPONSE

?D = General syntax error in the data field, followed by the parameter position. Valid value(s):
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INVALID DATA = Not a valid value for the phase option.
- INCONSISTENT KEYWORD = The combination of keywords is not a valid combination.

?E = Input error of undetermined type.

?I = General syntax error, followed by the parameter position. May also include:
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- MISSING DATA = Data required for a keyword in the stated parameter block was not found.
- RANGE ERROR = Input is out of the valid range.
- MISSING KEYWORD = A required keyword is missing from the input. Unit to diagnose must be specified.

PF = Printout follows. Followed by the DGN:DFC output message.

RL = Retry later. The system is in an overload condition.

DGN:DFI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a digital facility interface (DFI) circuit be removed and diagnosed. This circuit will remain out-of-service (OOS) and the ports will be denied service (regardless of the diagnostic's result), until a restore (RST) is requested.

2. FORMAT

```
DGN:DFI=a-b-c [,RAW][,UCL][,RPT[=d]][,GROW] [,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

GROW	Allow access to growth equipment.
RAW	= Prints raw test results (all tests pass (ATP)/some tests failed (STF)) for each phase executed.
TLP	= Print the ordered suspect pack list if a test fails.
UCL	= Unconditionally execute and print all test results requested rather than stopping on first failing phase.
a	= Switching module (SM) number.
b	= Digital line and trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c	= DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d	= The number of times the test is to be repeated. If 'd' is not specified, the test will be repeated 32,767 times.
e	= Diagnostic phase to be performed. If 'e' is specified as a single phase, only that phase will be performed. If 'e' is specified in a range, 'e' will be the first phase in that range to be performed. The DFI diagnostic has 10 phases associated with the ANN1 type circuit and 9 phases associated with the ANN3 type circuit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f	= The last diagnostic phase in the range between and including 'e' and 'f' to be performed.

4. SYSTEM RESPONSE

NG	= No good. The request has been denied. The message form is valid, but the request conflicts with current status.
PF	= Printout follows. The request was accepted. The DGN:DFI output message follows when the diagnostic is executed.

DGN:DFIH

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Diagnoses a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) to determine whether it is in satisfactory working order. If the circuit is in service, it is conditionally removed from service and diagnosed. The circuit is left out of service at the end of the diagnostic regardless of the result.

2. FORMAT

```
DGN:DFIH=a-b-c[,CAMP=d][,PH=e[&&f]][,RPT[=g]] [,GROW][,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print test failures rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = RISLU digital line and trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Allow a maximum of '`d`' minutes for camp on (CAMP) time. If CAMP is not specified, camp on defaults to 3 minutes. Maximum time allowed is 20 minutes.

`e` = Perform diagnostics phase (PH) '`e`' only.

`f` = Perform all diagnostics phases between and including '`e`' and '`f`'.

`g` = Repeat the test (RPT) '`g`' times. If '`g`' is not specified, the test will be repeated 32,767 times.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

```
-           CONFLICT WITH UNIT STATE
-           SM DOES NOT EXIST
-           SM UNEQUIPPED
-           UNIT DOES NOT EXIST
```

`PF` = Printout follows. The DGN:DFIH output message follows.

Copyright © 1999

RL = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:DFTAC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the distributing frame test access circuit (DFTAC) be diagnosed to determine whether it is in satisfactory working order. The circuit is left out of service when the testing is completed.

2. FORMAT

```
DGN:DFTAC=a-b-c-d[,RAW][,UCL][,GROW][,RPT[=e]][,PH=[f&&g][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the trouble locating procedure ordered pack list.

`UCL` = Perform all phases in the specified or implied range and print all test failures.

`a` = Switching module number.

`b` = Metallic service unit (MSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Repeat the test '`e`' times. If '`e`' is not specified, the test will be repeated 32,767 times. If RPT is not specified, it runs once.

`f` = Perform diagnostic phase '`f`' only.

`f-g` = Perform all existing diagnostic phases between and including '`f`' and '`g`'.

4. SYSTEM RESPONSE

`NG` = No good. Invalid SM number, MSU number, or service group number.

`PF` = Printout follows. The request was accepted. Followed by the DGN:DFTAC output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources (that is, SM is not linked).

Input Appendix(es):

```
APP:RANGES
```

Copyright © 1999

DGN:DLI

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Diagnoses a specific dual link interface (DLI) or a range of DLIs in a switching module (SM) on a specified side of the office network and timing complex (ONTC), and determines if in satisfactory working order.

2. FORMAT

```
DGN:DLI={a|a&&b}-c[,RAW][,UCL][,RPT[=d]][,PH={e|e&&f}][,TLP][,GROW];
```

3. EXPLANATION OF MESSAGE

`GROW` = If an SM is in the GROW or special grow (SGROW) equipage state this option must be input for a diagnostic to execute on the DLI.

`RAW` = Print data from raw data test failure.

`TLP` = Executes the trouble location procedure at the conclusion of the diagnostic. This process generates a list of suspected faulty circuit packs.

`UCL` = Unconditionally execute and print all test results rather than stopping on the first failure.

`a` = Switching module (SM) number that the DLI to be diagnosed is in. This can also be the lower limit for a range of DLIs that are to be diagnosed. (The DLI number and the SM number are identical.)

`b` = Upper limit of a range of DLIs to be diagnosed. All DLIs in the range must be on the same side of the ONTC.

NOTE: Unequipped SMs will be 'ignored' on a manual request for a range of DLIs. SMs that are in a special grow state will only be included in a range if the GROW option is also used.

`c` = ONTC side that the DLI is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Name of the diagnostic phase to be executed. If '`e`' is specified as a single phase, only that phase will be executed. If '`f`' is specified as a range it will be the first phase in that range to be executed.

`f` = The last phase of the diagnostic in the range between '`e`' and including '`f`' to be executed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of reasons for denying the request.

`PF` = Printout follows.

Copyright © 1999

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

DGN:DNUSCC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC).

2. FORMAT

```
DGN:DNUSCC=a-b-c[,PH=d[&&e]][,RPT[=f]][,GROW][,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list if a test fails.

`UCL` = Execute and print all test failures unconditionally rather than stopping after the first test failure.

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of the phase to be run, or the lower limit of a range of phases.

`e` = The upper limit of a range of phases to be run.

`f` = The number of times the diagnostic phases are to be repeated (1-32676). If '`f`' is not specified, the phases will be repeated 32,767 times.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. The DGN:DNUSCC output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

1510 (DNUS STATUS)

DGN:DSC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a digital service circuit (DSC) be removed and diagnosed. This circuit will remain out-of-service (OOS), regardless of the diagnostic's result, until a restore (RST) is requested.

A DSC circuit is defined as a universal tone generator (UTG), universal tone detector (UTD), universal conference circuit (UCONF), or transmission test facility common circuit (TTFCOM) circuit. These circuits are part of local digital service units (LDSU) or global digital service units (GDSU). The LDSU contains the UTG and UTD circuits while the GDSU contains the UCONF and TTFCOM circuits. To obtain a cross reference between the DSC number and the actual circuit, refer to the desired MCC page under LDSU or GDSU.

2. FORMAT

```
DGN:DSC=a-b-c-d[,RAW][,UCL][,TLP][,RPT[=e]][,GROW][,PH=f[&&g];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test results (all tests passed (ATP)/some tests failed (STF)) for each phase executed.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test results requested rather than stopping on first failing phase.

`a` = Switching module (SM) number.

`b` = Local or global digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = DSC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times that the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

NOTE: The UTD diagnostic has 5 phases (1-5). UTG has 3 phases (1-3), UCONF has 5 phases (1-5), and TTFCOM has 13 phases (1-4, 7-15).

`f` = Diagnostic phase to be performed, or the lower limit of a range of phases.

`g` = Upper limit of a range of diagnostic phases to be performed.

4. SYSTEM RESPONSE

Copyright © 1999

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. The DGN:DSC output message follows when the diagnostic is executed.

DGN:DUIC

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified direct user interface controller (DUIC).

NOTE: The input/output processor (IOP) must be in service before the DUIC can be diagnosed.

2. FORMAT

```
DGN:DUIC=a[:[,RPT=b][,RAW][,UCL][,REX|,DEX]][,PH=c[&&d]][,TLP][,CONT];
```

3. EXPLANATION OF MESSAGE

`CONT` = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

`DEX` = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: The TLP and UCL parameters should not be used together, as additional test results may adversely affect the TLP listing.

`UCL` = Unconditional execution.
Note: This option does not override a forced early termination.

`a` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is repeated. The maximum is 256. The default is one.
Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = Number of the phase to be executed, or the first number in a range of phases.

`d` = Specifies the last phase to be executed.

DGN:GDSF

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Diagnoses a global digital services function (GDSF) circuit to determine whether it is in satisfactory working order. The circuit is left out of service (OOS).

2. FORMAT

```
DGN:GDSF=a-b[,RAW][,UCL][,RPT[=c]][,GROW] [,PH=d[&&e][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally executes. DGN will continue past all non-fatal failures.

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = GDSF number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = The number of times the test is to be repeated. If '`c`' is not specified, the test will be repeated 32,767 times.

`d` = Number of the diagnostic phase(s) to be performed. If '`d`' is specified as a single phase, only that phase will be performed. If '`d`' is specified as a range, '`d`' will be the first phase in that range to be performed.

`e` = Number of the last diagnostic phase in the range between and including '`d`' and '`e`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by a DGN:GDSF output message.

5. REFERENCES

Output Message(s):

```

Input Appendix(es):

```
APP:RANGES
```

DGN:GDSUCOM

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a global digital service unit common (GDSUCOM) board be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:GDSUCOM=a-b-c[,RAW][,UCL][,SVG][,RPT[=d]][,GROW][,PH=e[&&f][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`SVG` = Run diagnostics on the entire service group, including the demand phases.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number.

`b` = Global digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Diagnostic phases to be performed. If '`e`' is specified as a single phase, only that phase will be performed. If '`e`' is specified as a range, '`e`' will be the first phase in that range to be performed.

`f` = The last diagnostic phase in the range between and including '`e`' and '`f`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by the DGN:GDSUCOM output message.

```

Input Appendix(es):

```
APP:RANGES
```

DGN:GDXACC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a gated diode crosspoint access (GDXACC) circuit be removed and diagnosed. This circuit will remain out-of-service (OOS), regardless of the diagnostic's result, until a restore (RST) is requested.

2. FORMAT

```
DGN:GDXACC=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f][,TLP];
```

3. EXPLANATION OF MESSAGE

GROW	Allow access to growth equipment.
RAW	= Prints raw test results (all tests passed (ATP)/some tests failed (STF)) for each phase executed.
TLP	= Print the ordered suspect pack list if a test fails.
UCL	= Unconditionally execute and print all test results requested rather than stopping on first failing phase.
a	= Switching module (SM) number.
b	= Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c	= Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d	= The number of times the test is to be repeated. If 'd' is not specified, the test will be repeated 32,767 times.
e	= Diagnostic phase to be performed (1-6). If 'e' is specified as a single phase, only that phase will be performed. If 'e' is specified in a range, 'e' will be the first phase in that range to be performed.
f	= The last diagnostic phase in the range between and including 'e' and 'f' to be performed.

4. SYSTEM RESPONSE

NG	= No good. The request has been denied. The message form is valid, but the request conflicts with current status.
PF	= Printout follows. The request was accepted. The DGN:GDXACC output message follows when the diagnostic is executed.

DGN:GDXC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a gated diode crosspoint compensator (GDXC) circuit be removed and diagnosed. The circuit will remain out-of-service (OOS), regardless of the diagnostic's result until a restore (RST) is requested.

The modular metallic service unit (MSU) GDXC uses a TN880 type circuit pack and the non-modular MSU GDXC uses type TN140 circuit pack.

2. FORMAT

```
DGN:GDXC=a-b-c-d[,RAW][,UCL][,RPT[=e]][,GROW][,PH=f[&&g][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Prints raw test results [all tests passed (ATP)/some tests failed (STF)] for each phase executed.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test results requested rather than stopping on first failing phase.

`a` = Switching module (SM) number.

`b` = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Metallic service unit board position (or metallic service circuit) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

`f` = Diagnostic phase to be performed(1). If '`f`' is specified as a single phase, only that phase will be performed. If '`f`' is specified in a range, '`f`' will be the first phase in that range to be performed.

`g` = The last diagnostic phase in the range between and including '`f`' and '`g`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. The DGN:GDXC output message follows when the

Application: 5
Type: Input

1. PURPOSE

Requests that a gated diode crosspoint control (GDXCON) circuit be removed and diagnosed. This circuit will remain out of service (OOS), regardless of the diagnostic's result, until a restore (RST) is requested.

This circuit does not exist in LU2 line units.

2. FORMAT

```
DGN:GDXCON=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test results [all tests passed (ATP)/some tests failed (STF)] for each phase executed.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test results requested rather than stopping on first failing phase.

`a` = Switching module (SM) number.

`b` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Number of the diagnostic phase to be performed (1-6). If '`e`' is specified as a single phase, only that phase will be performed. If '`e`' is specified in a range, '`e`' will be the first phase in that range to be performed.

`f` = Number of the last diagnostic phase in the range between and including '`e`' and '`f`' to be performed.

DGN:GRID

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a gated diode crosspoint grid (GRID) in a line unit concentrator be removed from service and diagnosed. The grid diagnostic does a check of basic power and control access. For a complete test, restore the grid to service and run in-service grid exercises using the TST:GRID input message.

NOTE: Upon completion of this input message, the grid and all lines it serves will remain out of service until a RST:GRID input message is entered.

2. FORMAT

```
DGN:GRID=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure results for each phase executed.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test failures rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. Default is 32,767.
Note: Use of the default for variable '`d`' is not recommended since lines on the grid will remain out of service for a long time and until a RST input message is entered.

`e` = Number of the diagnostic phase(s) to be performed or the lower limit of a range of diagnostic phases.

`f` = The upper limit of a range of diagnostic phases.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. The DGN:GRID output message follows after the diagnostic is executed.

DGN:GRIDBD

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Diagnoses a line unit model 2; (LU2) or line unit model 3; (LU3) grid board to determine if it is in satisfactory working order.

2. FORMAT

```
DGN:GRIDBD=a-b-c-d[,RAW][,UCL][,RPT[=e]][,GROW][,PH=f[&&g]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute the diagnostic without terminating on the first error.

`a` = Switching module number.

`b` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Grid number (LU2). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Grid number (LU3). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

`f` = The number of the diagnostic phase to be performed, or the lower limit of a range of phases.

`g` = The upper limit in the range of diagnostic phases to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. Followed by the DGN:GRIDBD output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

Application: 5
Type: Input

1. PURPOSE

Requests that a host switching module (HSM) digital facilities interface (HDFI) circuit be diagnosed to determine if it is in working order.

2. FORMAT

```
DGN:HDFI=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw data test failure.

`TLP` = Print the ordered pack list if diagnostic fails.

`UCL` = Unconditionally execute.

`a` = Switching module (SM) number.

`b` = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = HDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Number of the diagnostic phase(s) to be run.

`f` = Last phase in the range from '`e`' to '`f`' to be run.

4. SYSTEM RESPONSE

`NG` = No good. Request denied because of a conflict with current status.

`PF` = Printout follows. Followed by the DGN:HDFI output message.

Copyright © 1999

DGN:HSDC

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified high-speed synchronous data link controller (HSDC).

NOTE: The input/output processor (IOP) must be in service before the HSDC can be diagnosed.

2. FORMAT

```
DGN:HSDC=a[:[,RPT=b][,RAW][,UCL][,REX|,DEX]][,PH=c[&&d]][,TLP]
[,CONT];
```

3. EXPLANATION OF MESSAGE

`CONT` = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

`DEX` = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: The TLP and UCL parameters cannot be used together, as additional test results may adversely affect the TLP listing.

`UCL` = Unconditional execution.

NOTE: This option does not override a forced early termination.

`a` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is repeated. The maximum is 256. The default is one.
Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = Specifies the first phase to be executed.

`d` = Specifies the last phase to be executed.

DGN:IDCU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that an integrated digital carrier unit (IDCU) service group circuit be diagnosed. Completion of this input message leaves the circuit in the out-of-service state.

NOTE: If the circuit is not initially out of service, the system will first remove the circuit conditionally.

2. FORMAT

```
DGN:IDCU=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow diagnostic access to growth equipment

`RAW` = Print raw test failure data.

`TLP` = Trouble location procedure. Print the ordered pack list.

`UCL` = Unconditionally execute past all non-fatal errors and print out all test failures.

`a` = Switching module (SM) number.

`b` = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = IDCU service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Number of times that the test is to be repeated (RPT), default is 32,767 times.

`e` = Diagnostic phase (PH) to be executed, or the lower limit of a range of diagnostic phases.

`f` = The upper limit of a range of diagnostic phases.

4. SYSTEM RESPONSE

`PF` = Printout follows. The DGN:IDCU output message follows.

`NG` = No good. The request has been denied. The message is valid but the request conflicts with current status.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

186x (IDCU CIRCUIT)

DGN:IOP

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified input/output processor (IOP).

NOTE: The peripheral controllers (PCs) cannot be diagnosed if the IOP is not in service. Therefore, an IOP and its associated PCs cannot be diagnosed with one input message.

2. FORMAT

```
DGN:IOP=a[:[RPT=b][,RAW][,UCL][,REX|,DEX]][,PH=c[&&d]][,CONT][,TLP]
[,CU=e];
```

3. EXPLANATION OF MESSAGE

`CONT` = Includes only the specified unit (controller). Units attached to the specified unit will not be included. Defaulted is diagnose IOP `a` only.

`DEX` = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: The TLP and UCL parameters cannot be used together, as additional test results may adversely affect the TLP listing.

`UCL` = Unconditional execution.

NOTE: This option does not override a forced early termination.

`a` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is to be repeated. The maximum is 256. The default is one.

NOTE: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = Specifies the first phase to be executed.

`d` = Specifies the last phase to be executed.

Copyright © 1999

e = Member number of the CU helper unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a helper unit is not required, the specified helper unit is not used. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped. The off-line CU is required as a helper unit when demand phase 15 is executed.

NOTE: The helper CU must be out-of-service (OOS) and must be diagnosed as all tests pass (ATP) before it is used as a helper unit.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the DGN:IOP output message.

RL = Retry later. The system is in an overload condition.

?I = General syntax error followed by the parameter position and one of the following reasons:
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- MISSING DATA = Data required for a keyword in the stated parameter block was not found.
- RANGE ERROR = Input is out of the valid range.

?D = General syntax error in the data field followed by the parameter position and one of the following reasons:
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INCONSISTENT KEYWORD = The combination of keywords is not a valid combination.
- INVALID DATA = Not a valid value for the phrase option.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.

?E = Input error of undetermined type.

DGN:ISLULBD

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on an integrated services line unit line board (ISLULBD).

2. FORMAT

```
DGN:ISLULBD=a-b-c-d[,CAMPON=e][,PH=f[&&g]][,RPT[=h]][,GROW]
[,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print test failures rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Camp-on time in minutes (1-20). If CAMPON is not specified, camp-on time defaults to 6 minutes. Maximum time allowed is 20 minutes.

`f` = The number of the phase to be run, or the lower limit of a range of phases.

`g` = The upper limit of a range of phases to be run.

`h` = The number of times the exercise is to be repeated (1-32676). If '`h`' is not specified, the test will be repeated 32,767 times.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. The DGN:ISLULBD output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on an integrated services line unit line card (ISLULC).

2. FORMAT

```
DGN:ISLULC=a-b-c-d[,CAMPON=e][,PH=f[&&g]][,RPT[=h]][,GROW]
[,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print test failures rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Camp-on time in minutes (1-20). If CAMPON is not specified, camp-on time defaults to 6 minutes. Maximum time allowed is 20 minutes.

`f` = The number of the phase to be run, or the lower limit of a range of phases.

`g` = The upper limit of a range of phases to be run.

`h` = The number of times the exercise is to be repeated (1-32676). If '`h`' is not specified, the test will be repeated 32,767 times.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. The DGN:ISLULC output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:ISLULG

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on an integrated services line unit line group (ISLULG). When diagnosing an ISLU LC sub-unit option, the line group (LG) will be removed from service, which might disrupt the stability of other active line circuits and degrade service.

2. FORMAT

```
DGN:ISLULG=a-b-c[,CAMPON=d][,PH=e[&&f]][,RPT[=g]][,LB=h[&&i]]]
[,GROW][,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Execute and print all test failures unconditionally rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Camp-on time is minutes (1-20). If CAMPON is not specified, camp-on time defaults to 6 minutes. Maximum time allowed is 20 minutes.

`e` = The number of the phase to be run, of the lower limit of range of phases.

`f` = The upper limit of a range of phases to be run.

`g` = The number of times the exercise is to be repeated (1-32676). If variable '`g`' is not specified, the test will be repeated 32,767 times.

`h` = Starting range value of LB (line boards) to perform diagnostics on.

`i` = Ending range value of LB (line boards) on which to perform diagnostics.

If variable '`h`' is specified without variable '`i`' , the single LB specified by variable '`h`' will have diagnostics performed on it.

If '`h`' and '`i`' are specified, all equipped LBs from value '`h`' to '`i`' will have diagnostics performed on them.

Copyright © 1999

If neither 'h' or 'i' is specified, diagnostics of LBs in the range (0-7) is performed.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.

PF = Printout follows. The DGN:ISLULG output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:ISLULGC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on an integrated services line unit line group controller (ISLULGC). When diagnosing an ISLU LC sub-unit option, the line group controller (LGC) will be removed from service, which might disrupt the stability of other active LCs and degrade service.

2. FORMAT

```
DGN:ISLULGC=a-b-c[,CAMPON=d][,PH=e[&&f]][,RPT[=g]][,LC=h[&&i]]]
[,GROW][,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Execute and print all test failures unconditionally rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Camp-on time is minutes (1-20). If CAMPON is not specified, camp-on time defaults to 6 minutes. Maximum time allowed is 20 minutes.

`e` = The number of the phase to be run, of the lower limit of range of phases.

`f` = The upper limit of a range of phases to be run.

`g` = The number of times the exercise is to be repeated (1-32676). If variable '`g`' is not specified, the test will be repeated 32,767 times.

`h` = Starting range value of LC (line cards) to perform diagnostics on.

`i` = Ending range value of LC (line cards) on which to perform diagnostics.

If variable '`h`' specified without variable '`i`', the single LC specified by variable '`h`' will have diagnostics performed on it.

If '`h`' and '`i`' are specified, all equipped LCs from value '`h`' to '`i`' will have diagnostics performed on them.

Copyright © 1999

If neither 'h' or 'i' is specified, diagnostic of only the ISLULGC is performed.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.

PF = Printout follows. The DGN:ISLULGC output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:ISTF

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Diagnoses and removes an integrated service test function (ISTF) unit to determine whether it is in satisfactory working order. The unit is left out-of-service (OOS).

2. FORMAT

```
DGN:ISTF=a-b[,RAW][,UCL][,RPT[=c]][,GROW][,PH-d[&&e]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`RPT` = Repeat test option.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally executes. DGN will continue past all non-fatal failures.

`a` = Switching module (SM) number.

`b` = ISTF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = The number of times the test is to be repeated. If '`c`' is not specified, the test will be repeated 32,767 times.

`d` = Diagnostic phase to be performed. If '`d`' is specified as a single phase, only that phase will be performed. If '`d`' is specified as a range, '`d`' will be the first phase in that range to be performed.

`e` = The last diagnostic phase in the range between and including '`d`' and '`e`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because it conflicts with current equipment status. May also include:
- `SM DOES NOT EXIST` = The requested SM does not exist in the system.
- `SM UNEQUIPPED` = The SM specified in the request is unequipped.
- `UNIT DOES NOT EXIST` = The requested unit does not exist in the system.

`PF` = Printout follows. The request has been accepted. Followed by the DGN:ISTF output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

DGN:LI

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the link interface (LI) in the specified office network and timing complex (ONTC) be diagnosed.

NOTE: This message is only valid for offices with communication module model 1 (CM1) hardware.

2. FORMAT

```
DGN:LI=a[,RAW][,UCL][,RPT[=b]][,PH=c[&&d][,TLP][,HELPER=e];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered suspected pack list if a test fails.

`UCL` = Print all test results unconditionally rather than just printing the first failing test.

`a` = LI side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is to be repeated (RPT) (default 32,767).

`c` = The number of the phase (PH) to be executed, or the lower limit in a range of phases.

`d` = Upper limit in a range of phases.

`e` = Specifies the foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

`PF` = Printout follows. Followed by the DGN:LI output message.

`RL` = Retry later. The request cannot be executed now.

DGN:LN-A

Software Release: 5E10 - 5E11
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the specified link nodes (LN) be diagnosed.

Four sequential system actions are performed in response to this input message.

A The LN is removed from service following the rules for the RMV:LN input message.

B If the resultant LN major state is outofservice (OOS), growth (GROW), offline (OFL), or unavailable (UNAV), an attempt is made to isolate the LN. For other major states, the diagnostic is aborted by the diagnostic monitor (DIAMON).

C The specified (or default) diagnostic phases are run.

D If the LN was in the active ring before the start of the diagnostics and was successfully isolated (in 2 above), an attempt is made at the conclusion of the diagnostic to include the LN back into the active ring. Otherwise the node is left in its original ring configuration state. The LN remains in the OOS, GROW, OFL, or UNAV state.

NOTE: The UCL and TLP parameters must not be used together as it may produce an incorrect TLP listing.

2. FORMAT

```
DGN:LNa=b[:RPT=c][,RAW][,UCL][:PH=d[&&e]][,TLP];
```

3. EXPLANATION OF MESSAGE

`PH` = This option indicates the phase or phases to be run in the diagnostic.

`RAW` = Print the diagnostic results of every phase. The default is to print the results of the first five failures of each failing phase.

`TLP` = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. The TLP generates a list of suspected faulty equipment.

`UCL` = Execute unconditionally. This option overrides early terminations but does not override a forced early termination.

`a` = Ring node group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Number of times the diagnostic is to be repeated (default is 1).

NOTE: This option does not override early termination. UCL should also be specified if the diagnostic is arranged to terminate early.

Copyright © 1999

`d` = Phase number or lower limit of a range of phase numbers to be executed (default, all automatic phases).

`e` = Upper limit of a range of phase numbers to be executed.

4. SYSTEM RESPONSE

`PF` = Printout follows. The DGN:LN output message follows.

D If the LN was in the active ring before the start of the diagnostics and was successfully isolated (in 2 above), an attempt is made at the conclusion of the diagnostic to include the LN back into the active ring. Otherwise the node is left in its original ring configuration state. The LN remains in the OOS, GROW, OFL, or UNAV state.

Note: The UCL and TLP parameters must not be used together as it may produce an incorrect TLP listing.

2. FORMAT

```
DGN:LNa=b[:[RPT=c][,RAW][,UCL]][:PH=d[&&e][,CU=f][,TLP]];
```

3. EXPLANATION OF MESSAGE

`CU` = Helper Control Unit.

`PH` = This option indicates the phase or phases to be run in the diagnostic.

`RAW` = Print the diagnostic results of every phase. The default is to print the results of the first five failures of each failing phase.

`RPT` = This option allows for repetition of the diagnostics c number of times.

`TLP` = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. The TLP generates a list of suspected faulty equipment.

`UCL` = Execute unconditionally. This option overrides early terminations but does not override a forced early termination.

`a` = Ring node group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Copyright © 1999

`c` = Number of times the diagnostic is to be repeated (default is 1, maximum is 256).
Note: This option does not override early termination. UCL should also be specified if the diagnostic is arranged to terminate early.

`d` = Phase number or lower limit of a range of phase numbers to be executed (default, all automatic phases).

`e` = Upper limit of a range of phase numbers to be executed.

`f` = (0 or 1) - Off-line CU required as a helper unit when demand phase 34 is specified for a DLN.
NOTE: The helper CU must be out of service and all tests passed (ATP) before it can be used as a helper.

4. SYSTEM RESPONSE

`PF` = Printout follows. The DGN:LN output message follows.

DGN:LUCHAN

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a line unit channel (LUCHAN) on a line unit channel board (LUCHBD) be removed and diagnosed to determine if it is in satisfactory working order. The channel will remain out of service (regardless of the diagnostic result) until a restore (RST) is entered.

2. FORMAT

```
DGN:LUCHAN=a-b-c-d-e[,RAW][,UCL][,RPT[=f]][,GROW][,PH=g[&&h][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure results for each phase executed.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test failures rather than stopping after the first failure.

`a` = Switching module (SM) number.

`b` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`f` = The number of times the test is to be repeated. If '`f`' is not specified, the test will be repeated 32,767 times.

`g` = Diagnostic phase(s) to be performed. If '`g`' is specified as a single phase, only that phase will be performed. If '`g`' is specified as a range, '`g`' will be the first phase in that range to be performed.

`h` = The last diagnostic phase in the range between and including '`g`' and '`h`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. The DGN:LUCHAN output message follows after the

DGN:LUCHBD

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a line unit channel board (LUCHBD) be removed and diagnosed to determine whether it is in satisfactory working order. All channel circuits and the board are removed from service and each is diagnosed. Failures are reported with a DGN:LUCHAN output message. All channels remain out of service (regardless of the diagnostic result) until a restore (RST) of the LUCHBD is entered.

2. FORMAT

```
DGN:LUCHBD=a-b-c-d[,RAW][,UCL][,RPT[=e]][,GROW][,PH=f[&&g][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure results for each phase of the LUCHAN diagnostic executed on all eight channels.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test failures rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

`f` = Diagnostic phase(s) to be performed. If '`f`' is specified as a single phase, only that phase will be performed. If '`f`' is specified as a range, '`f`' will be the first phase in that range to be performed.

`g` = The last diagnostic phase in the range between and including '`f`' and '`g`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by the DGN:LUCHBD output message.

DGN:LUCOMC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a line unit common control (LUCOMC) be diagnosed. The circuit will remain out-of-service (OOS) (regardless of the diagnostic's result) until a restore (RST) is requested.

2. FORMAT

```
DGN:LUCOMC=a-b-c[,RAW][,UCL][,SVG][,RPT[=d]][,GROW][,PH=e[&&f][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test results (all tests passed (ATP)/some tests failed (STF)) for each phase executed.

`SVG` = Run diagnostics, including the demand phases, on the entire service group.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test results requested rather than stopping on first failing phase.

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Diagnostic beginning phase to be performed. If '`e`' is specified as a single phase, only that phase will be performed. If '`e`' is specified in a range, '`e`' will be the first phase in that range to be performed.

There are 5 phases associated with the LU1 line unit diagnostic and 7 phases associated with the LU2 line unit diagnostic. Phase 5 for LU1 and phase 7 for LU2 are demand-only phases. These phases are concerned with verifying the interface from the common controller to peripheral units (GDXACC, HLSC, CHANBD and GRID) for all-seems-well, service request, and power alarms. The phases should normally be run after replacing a defective controller or to verify the interface to the peripheral circuits.

For LU1 when one module controller/time slot interchanger (MCTSI) is OOS, phases 1 and 4 yield CATP; phase 3 yields no tests run (NTR). For LU2 when one MCTSI is OOS, phases 1 and 6 yield conditional all tests passed (CATP); phase 5 yields NTR.

Copyright © 1999

`f` = The last diagnostic phase in the range between and including '`e`' and '`f`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. The DGN:LUCOMC output message follows when the diagnostic is executed.

DGN:LUHLSC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a line unit high service circuit (LUHLSC) be removed and diagnosed to determine if it is in satisfactory working order.

Note: = The LUHLSC will remain out of service (00S) until a restore (RST) is entered.

2. FORMAT

```
DGN:LUHLSC=a-b-c-d[,RAW][,UCL][,RPT[=e]][,GROW][,PH=f[&&g][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure results for each phase executed.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test failures rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = High-level service circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

`f` = Diagnostic phase(s) to be performed. If '`f`' is specified as a single phase, only that phase will be performed. If '`f`' is specified as a range, '`f`' will be the first phase in that range to be performed.

`g` = The last diagnostic phase in the range between and including '`f`' and '`g`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. The DGN:LUHLSC output message follows after the diagnostic executes.

DGN:MA

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a metallic access (MA) board be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:MA=a-b-c-d[,RAW][,UCL][,RPT[=e]][,GROW][,PH=f[&&g]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Metallic access board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

`f` = Number of the diagnostic phase(s) to be performed. If '`f`' is specified as a single phase, only that phase will be performed. If '`f`' is specified as a range, '`f`' will be the first phase in that range to be performed.

`g` = The last diagnostic phase in the range between and including '`f`' and '`g`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

1. PURPOSE

Requests that the metallic access bus (MAB) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:MAB=a-b-c-d[,RAW][,UCL][,RPT[=e]][,GROW][,PH=f[&&g]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute.

`a` = Switching module number.

`b` = Unit number.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If the number is not specified, the test will be repeated 32,767 times.

`f` = Diagnostic phase(s) to be performed, or the lower limit of a range of phases.

`g` = Upper limit of a range of diagnostic phases to be performed.

Other Manual(s):
235-105-220 *Corrective Maintenance*

DGN:MCTSI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Removes and diagnoses a module control/time-slot interchange unit (MCTSI) to determine if it is in satisfactory working order. The MCTSI will remain out of service (regardless of the result of the diagnostic) until a restore (RST) is entered.

2. FORMAT

```
DGN:MCTSI=a-b[,RAW][,UCL][,RPT[=c]][,GROW] [[,PH=d[&&e]]|[,RETRO]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure results for each phase executed.

`RETRO` = Conditionally execute only the diagnostic phase or range of phases which are designated for use in a retrofit situation. This option and the PH (demand phase) option are redundant and not allowed on the same input message line. Compatible with all other options.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test failures rather than stopping after the first test failures.

`a` = Switching module (SM) number.

`b` = Module control unit/side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = The number of times the test is to be repeated. If '`c`' is not specified, the test will be repeated 32,767 times.

`d` = Number of the diagnostic phase(s) to be performed. If '`d`' is specified as a single phase, only that phase will be performed. If '`d`' is specified as a range, '`d`' will be the first phase in that range to be performed.

Special demand phases may be requested also. Valid value(s):

`Phase 7` = Complete memory tests. Phase 6 (which runs as a part of the MCTSI diagnostic) does a quick test of memory system. Phase 7 does a more exhaustive test which takes several minutes to run. This phase should be requested when a MCTSI is removed from service due to MEM SYSTEM interrupts.

`Phase 90` = Tests TN874 board and is for use only in retrofit situations where module controller time slot interchange unit model 2 (MCTU2) hardware is not involved. Can be run on demand or by specifying the RETRO option on the input message line. The circuits on the board are tested and a checksum test over all EPROM is done using the stored checksum in EPROM. The final test compares the stored microcode number with that in the active MCTSI side. This test will fail if the

Copyright © 1999

microcode number is the same as that in the active side. For retrofit situations involving MCTU2 hardware a range of phases need to be executed to perform retrofit testing requirements. This diagnostic phase selection should be initially keyed by the RETRO option.

`e` = The last diagnostic phase in the range between and including '`d`' and '`e`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. The DGN:MCTSI output message follows when the diagnostic is executed. Use the OP:SM-DMQUE input message to determine if the diagnostic request is waiting in the diagnostic control program's queue.

DGN:MHD

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified moving head disk (MHD).

Note: The disk file controller (DFC) must be in service before the MHD can be diagnosed.

2. FORMAT

```
DGN:MHD=a[:[,RPT=b][,RAW][,UCL][,REX|,DEX]][,PH=c[&&d]][,TLP]
[,CONT];
```

3. EXPLANATION OF MESSAGE

`CONT` = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

`DEX` = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases which require manual interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.
Note: The TLP and UCL parameters cannot be used together, as additional test results may adversely affect the TLP listing.

`UCL` = Unconditional execution.
Note: This option does not override a forced early termination.

`a` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is repeated. The maximum is 256. The default is one.
Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = Number of the first phase to be executed.

`d` = Number of the last phase to be executed.

DGN:MI

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the message interface (MI) in the specified office network and timing complex (ONTC) be diagnosed.

2. FORMAT

```
DGN:MI=a[,RAW][,UCL][,RPT[=b]][,PH=c[&&d]][,TLP][,HELPER=e];
```

3. EXPLANATION OF MESSAGE

`RAW` = Print the ordered suspected pack list if a test fails.

`TLP` = Print the ordered suspected pack list if a test fails.

`UCL` = Print all test results unconditionally rather than just printing the first failing test.

`a` = MI side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is to be repeated (RPT) (default 32,767).

`c` = The number of diagnostic phase (PH) to be performed, or the lower limit in a range of phases.

`d` = Upper limit in a range of phases.

`e` = Specifies the foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

`PF` = Printout follows. Followed by the DGN:MI output message.

DGN:MMP

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that a module message processor (MMP) be diagnosed to determine whether it is in satisfactory working order.

Note: This command is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

```
DGN:MMP=a-b[,RAW][,UCL][,RPT[=c]][,PH=d[&&e]][,TLP][,GROW];
```

3. EXPLANATION OF MESSAGE

`GROW` = Run diagnostics on an MMP in the GROW or SGRO state. If the MMP is GROW or SGRO, this option must be input to perform the diagnostic. If a subpart (for example, synchronous data link controller (SDLC)) of the MMP is in the GROW or SGRO state, the GROW option must be used to diagnose those subpieces. Without the GROW option, only the parts that are operational (OPER) will be diagnosed.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute.

`a` = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = MMP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = The number of times the test is to be repeated. If the number is not specified, the test will be repeated 32,767 times.

`d` = Diagnostic phase(s) to be performed, or the lower limit of a range of phases.

`e` = Upper limit of a range of diagnostic phases to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. Followed by a DGN:MMP output message.

`RL` = Retry later. The request cannot be executed now.

DGN:MSCU

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Diagnoses the specified message switch control unit (MSCU).

Note: This command is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

```
DGN:MSCU=a[,RAW][,UCL][,RPT[=b]][,PH=c[&&d]][,TLP][,GROW];
```

3. EXPLANATION OF MESSAGE

`GROW` = If the unit or one of its subunits is in the GROW or special grow (SGROW) equipage state, this option must be input for a diagnostic to execute on that unit or subunit. If the unit is not in a growth state, the option will have no effect.

`RAW` = Prints the raw test results for each phase that is executed.

`TLP` = Execute the trouble location procedure at the conclusion of the diagnostic. This process prints an ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test results rather than stopping on the first failing phase.

`a` = Message switch (MSGS) side.

`b` = Number of times the diagnostic is executed. If '`b`' is not specified, the test will be repeated 32,767 times.

`c` = Number of diagnostic phase to be executed, or a lower limit of a range of phases.

`d` = Upper limit of a range of numbers if diagnostic phases.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows.

`RL` = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

DGN:MSGS

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnostics on a message switch (MSGS) to determine if it is in satisfactory working order.

2. FORMAT

```
DGN:MSGS=a[,RAW][,UCL][,RPT[=b]][PH=c[&&d]][,TLP];
```

3. EXPLANATION OF MESSAGE

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Execute unconditionally.

`a` = MSGS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = The number of times the test is to be repeated. If '`b`' is not specified, the test will be repeated 32,767 times.

`c` = Diagnostic phase to be performed or lower limit in a range of phases.

`d` = Upper limit in a range of phases.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows.

`RL` = Retry later. The request cannot be executed now.

DGN:MSUCOM

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a metallic service unit common (MSUCOM) board be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:MSUCOM=a-b-c[,RAW][,UCL][,SVG][,RPT[=d]][,GROW]
[,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`SVG` = Run diagnostics on the entire service group, including the demand phases.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number.

`b` = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Number of the diagnostic phases to be performed. If '`e`' is specified as a single phase, only that phase will be performed. If '`e`' is specified as a range, '`e`' will be the first phase in that range to be performed.

`f` = The last diagnostic phase in the range between and including '`e`' and '`f`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by the DGN:MSUCOM output message.

5. REFERENCES

Output Message(s):

```
DGN:MSUCOM
```

Input Appendix(es):

```
APP:RANGES
```

DGN:MT

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified magnetic tape (MT).

Note: The disk file controller (DFC) must be in service before the MT can be diagnosed.

2. FORMAT

```
DGN:MTa[:[,RPT=b][,RAW][,UCL][,REX|,DEX]][:DATA[,PH=c[&&d]][,TLP][,CONT]];
```

3. EXPLANATION OF MESSAGE

`CONT` = Includes only the specified unit controller (CONT). Units attached to the specified unit are not to be included. If the specified unit has no attached units, CONT is ignored.

`DEX` = Runs demand exercise (DEX) phases in addition to REX and normal (automatic) phases. This option does not allow special DEX phases that require user interaction to run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise (REX) phases in addition to the normal (automatic) phases. This option does not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.
Note: The TLP and UCL parameters cannot be used together, because additional test results may adversely affect the TLP listing.

`UCL` = Unconditional (UCL) execution.
Note: This option does not override a forced early termination.

`a` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is repeated. The maximum is 256. The default is one.
Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = Number of the first phase to be executed.

`d` = Number of the last phase to be executed.

Copyright © 1999

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the DGN:MT output message.

`RL` = Retry later. The system is in an overload condition.

`?I` = General syntax error, followed by the parameter position. May also include:
- `EXTRA KEYWORD` = Duplicate or extraneous keywords were input.
- `INVALID KEYWORD` = The keyword in the stated parameter position is not a valid keyword.
- `MISSING DAT` = Data required for a keyword in the stated parameter block was not found.
- `MISSING KEYWORD` = A required keyword is missing from the input. Unit to diagnose must be specified.
- `RANGE ERROR` = Input is out of the valid range.

`?D` = General syntax error in the data field, followed by the parameter position. Valid value(s):
- `EXTRA KEYWORD` = Duplicate or extraneous keywords were input.
- `INCONSISTENT KEYWORD` = The combination of keywords is not a valid combination.
- `INVALID DATA` = Not a valid value for the phase option.
- `INVALID KEYWORD` = The keyword in the stated parameter position is not a valid keyword.

`?E` = Input error of undetermined type.

DGN:MTB

Software Release: 5E12 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a metallic access test bus (MTB) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:MTB=a-b-c-d-e[,RAW][,UCL][,RPT[=f]][,GROW][,PH=g[&&h]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = Metallic access board number.

`e` = Metallic access test bus number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`f` = The number of times the test is to be repeated. If '`f`' is not specified, the test will be repeated 32,767 times.

`g` = Number of the diagnostic phase(s) to be performed. If '`g`' is specified as a single phase, only that phase will be performed. If '`g`' is specified as a range, '`g`' will be the first phase in that range to be performed.

`h` = The last diagnostic phase in the range between and including '`g`' and '`h`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

MCC Display Page(s):

1135/1145 (MSU MA STATUS)

DGN:MTC

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified magnetic tape controller (MTC).

Note: The input/output processor (IOP) must be in service before the MTC can be diagnosed.

2. FORMAT

```
DGN:MTC=a[:[,RPT=b][,RAW][,UCL][,REX|,DEX]][,PH=c[&&d]][,TLP]
[,CONT][,MT=e];
```

3. EXPLANATION OF MESSAGE

`CONT` = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

`DEX` = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases which require manual interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.
Note: It is not recommended that the TLP and UCL parameters be specified together, as it may produce an improper TLP listing.

`UCL` = Unconditional execution.
Note: This option does not override a forced early termination.

`a` = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is to be repeated. The maximum is 256. The default is one.
Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = Specifies the number of the first phase to be executed.

`d` = Specifies the last phase to be executed.

Copyright © 1999

Note: Before phase 5 is executed, a diagnostic test tape with a write ring must be mounted on the specified MT.

`e` = Member number of the magnetic tape device that is to be used as a helper unit (0-255). When a helper unit is not required, the specified helper unit is ignored. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped. Member number of the magnetic tape (MT) device helper unit is required when demand phase 5 is executed.

DGN:MTIB

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the metallic test interconnect bus (MTIB) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:MTIB=a[,RAW][,UCL][,RPT[=b]][,GROW][,PH=c[&&d]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute.

`a` = MTIB number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Repeat the test '`b`' times. If '`b`' is not specified, the test will be repeated 32,767 times.

`c` = Number of the diagnostic phase(s) to be performed.

`c-d` = Perform all diagnostics phases between and including '`c`' and '`d`'.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

DGN:NC

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the network clock (NC) in the specified office network and timing complex (ONTC) be diagnosed.

2. FORMAT

```
DGN:NC=a[,RAW][,UCL][,RPT[=b]][,PH=c[&&d]][,TLP][,HELPER=e];
```

3. EXPLANATION OF MESSAGE

`RAW` = Print raw test failure data.

`TLP` = Print the ordered suspected pack list if a test fails.

`UCL` = Print all test results unconditionally rather than just printing the first failing test.

`a` = NC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Number of times the diagnostic is to be repeated (RPT) (default 32,767).

`c` = The number of the phase (PH) to be performed, or the lower limit in a range of phases.

`d` = Upper limit in a range of phases.

`e` = The number of the foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

`PF` = Printout follows. Followed by the DGN:NC output message.

`RL` = Retry later. The request cannot be executed now.

DGN:NLI

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnosis of a specific network link interface (NLI) in a switching module (SM) on a specified office network and timing complex (ONTC) side, to determine if it is in satisfactory working order. Completion of this request leaves the unit in the out-of-service (OOS) state.

NOTE: If the unit is not OOS, the system first removes the unit conditionally.

2. FORMAT

```
DGN:NLI=a-b-c[,RAW][,UCL][,RPT[=d]][,PH={e|e&&f}] [,TLP][,GROW];
```

3. EXPLANATION OF MESSAGE

`GROW` = Run the diagnostic on an NLI in the GROW state, or in an SM in the special grow (SGRO) state. If the NLI is GROW or the SM is in the SGRO equipage state, this option must be input to perform the diagnostic.

`RAW` = Print data from raw data test failure.

`RPT` = Repeat the diagnostic '`d`' times.

`TLP` = Executes the trouble location procedure at the conclusion of the diagnostic. This process generates a list of suspected faulty circuit packs.

`UCL` = Unconditionally execute and print all test failures rather than printing only the first failure and stopping.

`a` = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = NLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = ONTC side number.

`d` = The number of times the diagnostic is to be repeated. If '`d`' is not specified, the test is repeated 32,767 times.

`e` = Number of the diagnostic phase (PH) to be executed. If '`e`' is specified as a single phase, only that phase will be executed. If '`f`' is specified as a range it is the first phase in that range to be executed.

`f` = The last phase of the diagnostic in the range between '`e`' and including '`f`' to be executed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input

Copyright © 1999

Messages manual for a list of reasons for denying the request.

DGN:ONTC

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnostics on an office network and timing complex (ONTC) to determine if it is in satisfactory working order.

2. FORMAT

```
DGN:ONTC=a[,RAW][,UCL][,RPT[=b]][,TLP][,HELPER=c];
```

3. EXPLANATION OF MESSAGE

`RAW` = Print raw test failure data.

`TLP` = Print the ordered suspected pack list if a test fails.

`UCL` = Print all test results unconditionally rather than just printing the first failing test. This includes executing all dual link interface (DLI) diagnostics if the ONTC common (ONTCCOM) fails.

NOTE: This may create volumes of ROP output if many failures occur.

`a` = ONTC side.

`b` = The number of times the diagnostic is to be repeated (RPT) (default 32,767).

`c` = Specify the foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

`NG` = No good. The message syntax is valid, but the request could not be processed.

`PF` = Printout follows. Followed by the DGN:ONTC output message.

`RL` = Retry later. The request cannot be executed now.

DGN:ONTCCOM

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the specified office network and timing common units (ONTCCOM) be diagnosed. The ONTCCOM is made up of the following entities:

- Message interface (MI).
- Network clock (NC).
- Time multiplexed switch (TMS) excluding the network control and timing links (NCTLNKs).
- Link interface (LI), which exists only in the communication module model 1 (CM1) hardware.

2. FORMAT

```
DGN:ONTCCOM=a[,RAW][,UCL][,RPT[=b]][,TLP][,HELPER=c];
```

3. EXPLANATION OF MESSAGE

`RAW` = Print raw test failure data.

`TLP` = Print the ordered suspected pack list is a test fails.

`UCL` = Print all test results unconditionally rather than just printing the first failing test.

`a` = ONTC side.

`b` = Number of times the diagnostic is to be executed (RPT) (default 32,767).

`c` = Specify the foundation peripheral controller (FPC) side to be used as a 'helper' unit. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

DGN:PMU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a precision measurement unit (PMU) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:PMU=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module (SM) number.

`b` = Directly connected test unit number.

`c` = Circuit number.

`d` = The number of times the test is to be repeated. If variable '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Diagnostic phase(s) to be performed, or the lower limit of a range of phases.

`f` = Upper limit of a range of diagnostic phases to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

Type: Input

1. PURPOSE

Requests diagnostics on a pump peripheral controller (PPC) to determine if it is in satisfactory working order.

Note: This command is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

```
DGN:PPC=a[,RAW][,UCL][,RPT[=b]][,PH=c[&&d]][,TLP];
```

3. EXPLANATION OF MESSAGE

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Execute unconditionally.

`a` = PPC number.

`b` = The number of times the test is to be repeated. If '`b`' is not specified, the test will be repeated 32,767 times.

`c` = Diagnostic phase to be performed or lower limit in a range of phases.

`d` = Upper limit in a range of phases.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows.

`RL` = Retry later. The request cannot be executed now.

DGN:PROTO

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the protocol circuit (PROTO) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:PROTO=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute.

`a` = Switching module number.

`b` = Unit number.

`c` = Service group number.

`d` = Repeat the test '`d`' times. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Diagnostic phase(s) to be performed, or the lower limit of a range of phases.

`f` = Upper limit of a range of diagnostic phases to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. Followed by the DGN:PROTO output message.

DGN:PSU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a packet switch unit (PSU) common controller (COM) or protocol handler (PH) be diagnosed. Completion of this input message leaves the unit in the out-of-service (OOS) state.

Note: If the unit is not OOS, the system will first remove the unit conditionally.

2. FORMAT

```
DGN:PSU{a}=b-c-d[-e][,PH=f[&&g]][,RPT[=h]][,SHELF=i][,FSTEST][,GROW][,RAW]
[,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

FSTEST = Allows the factory demand phases 80, 81, 82, 83 to be executed.
- These demand phases are intended for factory use only, and should not be used in a live office with active PHs.
- Factory demand phases 80, 81, 82, 83 will be run not only on the PSUPH specified in the DGN input message, but on all out of service PSUPHs.
- FSTEST has no effect on normal PSUPH diagnostic.
- The factory demand phases do not support TLP.
- If factory demand phases are run without the FSTEST option the result is "no test run" (NTR).
- The PERIIA audit must be manually inhibited prior to running these factory demand phases. `INH:AUD=PERIIA,SM=x;`
- The PSUPH specified can be any out of service protocol handler.
- While running factory demand phases 80, 81, 82, 83, restores of PSUCOMs and PSUPH should not be performed.

GROW = Allow access to growth equipment.
RAW = Print data from raw data test failure.
SHELF = Subunit.
TLP = Print the ordered pack list.
UCL = Unconditionally execute and print all test failures rather than stopping after the first test failure.
a = Circuit name. Valid value(s):
- COM = Common controller.
- PH = Protocol handler.

b = Switching module (SM) number.
c = PSU number.
d-e = Valid value(s):

If 'a' =	'd' =	'e' =

COM	Service group number.	
PH	Shelf number.	Protocol handler number.

f = Number of the diagnostic phase to be run or the lower limit of a range of phases.
g = Upper limit of a range of phases.
h = Repeat (RPT) count. Number of times the test is to be repeated. Default (1 - 32,767).
i = The PSUCOM shelf to be diagnosed. If SHELF is not specified, diagnostics will be performed on all shelves. Valid if 'a' equals COM. FSTEST option should only be used for the factory system test.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.
PF = Printout follows. The DGN:PSU output message follows.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:QGP

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnosis of a quad-link packet switch (QLPS) gateway processor (QGP) to determine whether it is in satisfactory working order. Completion of this input message leaves the unit in the out-of-service (OOS) state.

Note 1: If the unit is not OOS, the system will first remove the unit conditionally.

Note 2: This command is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

```
DGN:QGP=a-b[,RAW][,RPT[=c]][,UCL][,TLP][,PH=d&&e][,GROW];
```

3. EXPLANATION OF MESSAGE

`GROW` = Run diagnostics on a QGP in the GROW state. If the QGP is GROW, this option must be input to perform the diagnostic.

`RAW` = Print data from raw data test failure.

`RPT` = Repeat the diagnostic '`c`' times.

`TLP` = Executes the trouble location procedure at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

`UCL` = Execute diagnostic unconditionally.

`a` = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Number of times the diagnostic is to be repeated. The default and maximum is 32767 times.

`d` = Phase (PH) number or lower limit of a range of phase numbers.

`e` = Upper limit of a range of phase numbers.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

Copyright © 1999

PF = Printout follows. The DGN:QGP output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:QLPS

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnosis of a quad-link packet switch (QLPS) to determine whether it is in satisfactory working order. Completion of this input message leaves the unit in the out-of-service (OOS) state.

Note: If the unit is not OOS, the system will first remove the unit conditionally.

2. FORMAT

```
DGN:QLPS=a-b[,RAW][,GROW][,UCL][,RPT[=c]][,TLP][,PH=d&&e][,HELPER=f];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment. Run diagnostics on an QLPS in the GROW state. If the QLPS is GROW, this option must be input to perform the diagnostic. Also allows access to QGPs in the GROW state that are connected to the QLPS using QGLs.

`RAW` = Print data from raw data test failure.

`RPT` = Repeat the diagnostic '`c`' times.

`TLP` = Executes the trouble location procedure at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

`UCL` = Execute tests unconditionally and print test failures rather than stopping after the first test failure.

`a` = Office network timing and control (ONTC) side number.

`b` = QLPS network number.

`c` = Number of times the diagnostic is to be repeated. Maximum and default is 32767 times.

`d` = Phase (PH) number or lower limit of a range of phase numbers.

`e` = Upper limit of a range of phase numbers.

`f` = Foundation peripheral controller (FPC) side number to be used as a 'helper' unit for the diagnostic. If this option is not input the standby FPC will be used.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF` = Printout follows. The DGN:QLPS output message follows.

DGN:RAF

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Removes and diagnoses a recorded announcement function (RAF) unit to determine whether it is in satisfactory working order. The unit is left out-of-service (OOS).

2. FORMAT

```
DGN:RAF=a-b[,RAW][,UCL][,RPT[=c]][,GROWTH][,PH={d|d&&e}][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROWTH` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`RPT` = Repeat test option.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute. DGN will continue past all non-fatal failures.

`a` = Switching module (SM) number.

`b` = RAF unit number.

`c` = The number of times the test is to be repeated. If '`c`' is not specified, the test will be repeated 32,767 times.

`d` = Diagnostic phase to be performed. If '`d`' is specified as a single phase, only that phase will be performed. If '`d`' is specified as a range, '`d`' will be the first phase in that range to be performed.

`e` = The last diagnostic phase in the range between and including '`d`' and '`e`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied because it conflicts with current equipment status. May also include:
- `SM DOES NOT EXIST` = The requested SM does not exist in the system.
- `SM UNEQUIPPED` = The SM specified in the request is unequipped.
- `UNIT DOES NOT EXIST` = The requested unit does not exist in the system.

`PF` = Printout follows. The request has been accepted. Followed by the DGN:RAF output message.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

DGN:RAU

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a remote switching module (RSM) alarm (RAU) circuit be diagnosed to determine if it is in working order.

2. FORMAT

```
DGN:RAU=a[,RAW][,UCL][,RPT[=b]][,GROW][,PH=c[&&d]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw data from test failure.

`TLP` = Print the ordered pack list if diagnostic fails.

`UCL` = Unconditionally execute.

`a` = Switching module (SM) number.

`b` = Repeat the test '`b`' times. If '`b`' is not specified, the test will be repeated 32,767 times.

`c` = Number of the diagnostic phase(s) to be run.

`d` = Last phase of the range of phases to be run.

4. SYSTEM RESPONSE

`NG` = No good. Request denied because of a conflict with current status.
`PF` = Printout follows. Followed by the DGN:RAU output message.

Observe the following at the remote site:

AUDIBLE	VISUAL	TIME
CRITICAL	CRITICAL + TIP	5 sec
CRITICAL	STAND-ALONE + TIP	5 sec
MAJOR	MAJOR + TIP	5 sec
MINOR	MINOT + TIP	5 sec

TIP = Test in progress.

DGN:RCLK

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests a diagnosis of a remote clock (RCLK) side. Valid value(s):

- the remote clock (RCLK)
- the remote clock cross couple (RCXC)
- the remote clock oscillator (RCOSC)
- the mate remote clock oscillator cross couple (RCOXC)
- all the equipped remote clock references (RCREFs)

2. FORMAT

```
DGN:RCLK=a-b[,RAW][,UCL][,RPT[=c]][,GROW] [,PH=d[&&e]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw data from test failure.

`TLP` = Print the ordered pack list if diagnostic fails.

`UCL` = Unconditionally execute and print all test failures. Diagnostic will continue past all non-fatal errors.

Note: TLP and UCL cannot be used together.

`a` = Switching module (SM) number.

`b` = RCLK side.

`c` = Repeat the test '`c`' times. If '`c`' is not specified, the test will be repeated 32767 times.

`d` = Run phase '`d`'.

`d-e` = Run phase '`d`' through '`e`'.

4. SYSTEM RESPONSE

`NG` No good. May also include:
- `NOT STARTED UNIT IN GROWTH STATE`
- `SM DOES NOT EXIST`

Copyright © 1999

```
            -           SM UNEQUIPPED
            -           UNIT DOES NOT EXIST
```

`PF` = Printout follows. The DGN:RCLK output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:RDFI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a remote switching module (RSM) digital facilities interface (RDFI) circuit be diagnosed to determine if it is in working order.

2. FORMAT

```
DGN:RDFI=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw data from test failure.

`TLP` = Print the ordered pack list if diagnostic fails.

`UCL` = Unconditionally execute.

`a` = Switching module number.

`b` = Digital line and trunk unit (DLTU) number.

`c` = RDFI number.

`d` = Number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Number of the diagnostic phase(s) to be run.

`f` = Last phase of the range of phases to be run.

4. SYSTEM RESPONSE

`NG` = No good. Request denied because of a conflict with current status.

`PF` = Printout follows. Followed by the DGN:RDFI output message.

DGN:RLI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a remote switching module (RSM) remote link interface (RLI) circuit be diagnosed to determine if it is in working order.

2. FORMAT

```
DGN:RLI=a-b[,RAW][,UCL][,RPT[=c]][,GROW][,PH=d[&&e]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw data from test failure.

`TLP` = Print the ordered pack list if diagnostic fails.

`UCL` = Unconditionally execute.

`a` = Switching module number.

`b` = RLI number.

`c` = The number of times the test is to be repeated. If '`c`' is not specified, the test will be repeated 32,767 times.

`d` = Number of the diagnostic phase(s) to be run.

`e` = Last phase in the range of phases to be run.

4. SYSTEM RESPONSE

`NG` = No good. Request denied because of a conflict with current status.

`PF` = Printout follows. Followed by the DGN:RLI output message.

5. REFERENCES

Output Message(s):

`DGN:RLI`

DGN:RPCN

Software Release: 5E10 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests diagnostics of the specified ring peripheral controller node (RPCN). Four sequential system actions are performed in response to this input request.

A The RPCN is removed from service following the rules for the RMV:RPCN input message.

B If the resultant RPCN major state is out-of-service (OOS), growth (GROW), offline (OFL), standby (STBY), or unavailable (UNAV), an attempt is made to isolate the RPCN. For other major states, the diagnostic is aborted by the diagnostic monitor (DIAMON).

C The specified (or default) diagnostic phases are run.

D If the RPCN was in the active ring before the start of the diagnostics and was successfully isolated (in 2 above), an attempt is made at the conclusion of the diagnostic to include the RPCN back into the active ring. Otherwise the node is left in its original ring configuration state. The RPCN remains in the OOS, GROW, OFL, STBY, or UNAV state.

2. FORMAT

```
DGN:RPCNa=0[:RPT=b][,RAW][,UCL][:PH=c[&&d]][,CU=e][,TLP];
```

3. EXPLANATION OF MESSAGE

`CU` = Helper control unit.

`PH` = The phase or phases to be run in the diagnostic.

`RAW` = Print the diagnostic results of every phase. The default is to print the results of the first five failures of each phase.

`TLP` = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. The TLP generates a list of suspected faulty equipment.

`UCL` = Execute unconditionally.
Note: This option overrides early terminations but does not override a forced early termination.

`a` Ring node group number.

`b` Number of times the diagnostic is to be repeated (default is 1).

NOTE: This option does not override early termination. UCL should also be specified if the diagnostic is arranged to terminate early.

`c` = Phase number or lower limit of a range of phase numbers to be executed.

`d` = Upper limit of a range of phase numbers.

Copyright © 1999

NOTE: If no phases are specified, all automatic phases are run.

e = Off-line control unit (CU) required as a helper unit when demand phase 14 is specified.

NOTE: The helper CU must be out-of-service and all tests passed (ATP) before it can be used as a helper.

4. SYSTEM RESPONSE

PF = Printout follows. The DGN:RPCN output message follows.

DGN:RRCLK

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Diagnoses a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK) to determine whether it is in satisfactory working order. If the circuit is in service, it is conditionally removed from service and diagnosed. The circuit is left out of service (OOS) at the end of the diagnostic regardless of the result.

2. FORMAT

```
DGN:RRCLK=a-b-c[,PH=d[&&e]][,RPT[=f]] [,GROW][,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print test failures rather than stopping after the first test failure.

`a` = Switching module (SM) number.

`b` = RISLU number.

`c` = RRCLK side.

`d` = Perform diagnostics phase (PH) '`d`' only.

`e` = Perform all diagnostics phases between and including '`d`' and '`e`'.

`f` = Repeat the test (RPT) '`f`' times. If '`f`' is not specified, the test will be repeated 32,767 times.

4. SYSTEM RESPONSE

`NG` = No good. May also include:

```
-            CONFLICT WITH UNIT STATE
-            SM DOES NOT EXIST
-            SM UNEQUIPPED
-            UNIT DOES NOT EXIST
```

`PF` = Printout follows. The DGN:RRCLK output message follows.

DGN:RVPT

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the revertive pulsing transceiver (RVPT) be diagnosed to determine whether it is in satisfactory working order. The circuit is left out of service when the testing is completed.

2. FORMAT

```
DGN:RVPT=a-b-c-d[,RAW][,UCL][,GROW][,RPT[=e]][,PH=f[&&g]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw data from test failure.

`TLP` = Print the ordered pack list.

`UCL` = Perform all phases in the specified or implied range and print all test failures.

`a` = Switching module number.

`b` = Unit number.

`c` = Service group.

`d` = Circuit number.

`e` = Repeat the test '`e`' times. If '`e`' is not specified, the test will be repeated 32,767 times. If RPT is not specified, it runs once.

`f` = Perform diagnostic phase '`f`' only.

`g` = Perform all diagnostic phases between and including '`f`' and '`g`'.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by the DGN:RVPT output message.

(RISLU DLTU)

DGN:SCSDC

Software Release: 5E10 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified scanner and signal distributor controller (SCSDC).

Note: The input/output processor (IOP) must be in service before the SCSDC can be diagnosed.

2. FORMAT

```
DGN:SCSDC=a[:[RPT=b][,RAW][,UCL][,REX|,DEX]][:[PH=c[&&d]][,TLP][,CONT]];
```

3. EXPLANATION OF MESSAGE

`CONT` = Diagnoses only the specified controller. Units attached to the specified controller will not be diagnosed.

`DEX` = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

`RAW` = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

`REX` = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

`TLP` = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.
Note: The TLP and UCL parameters cannot be used together, as additional test results may adversely affect the TLP listing.

`UCL` = Unconditional execution.
Note: This option does not override a forced early termination.

`a` = Member number.

`b` = Number of times the diagnostic is repeated. The maximum is 256. The default is one.

NOTE: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

`c` = Specifies the first phase to be executed.

`d` = Specifies the last phase to be executed.

DGN:SDFI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a *SLC*®96 digital facility interface (SDFI) circuit be removed and diagnosed. The circuit will remain out of service (regardless of the diagnostic's result) until a restore (RST) is requested.

The SDFI interfaces with *SLC*®96 digital carrier line unit (DCLU) service groups. There are 4classes of faults associated with SDFI and DCLU circuits and they are written in the order in which they are most likely to occur:

A SDFI faults that are detected with SDFI diagnosis.

B SDFI faults that are only detected by diagnosing a DCLU.

C DCLU faults that are only detected with a SDFI diagnosis (any SDFI).

D DCLU faults that are only detected by diagnosing a particular SDFI.

Fault recovery is unable to determine if detected problems are associated with bad SDFI or DCLU circuits. Therefore fault recovery uses an algorithm in determining which circuits (SDFI or DCLU) to diagnose.

2. FORMAT

```
DGN:SDFI=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test results [all tests passed (ATP)/some tests failed (STF)] for each phase executed.

`TLP` = Print the ordered suspect pack list if a test fails.

`UCL` = Unconditionally execute and print all test results requested rather than stopping on first failing phase.

`a` = Switching module (SM) number.

`b` = Digital carrier line unit (DCLU) number.

`c` = SDFI number.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Diagnostic phase to be performed. If '`e`' is specified as a single phase, only that phase will be performed. If '`e`' is specified in a range, '`e`' will be the first phase in that range to be performed.

`f` = The last diagnostic phase in the range between and including '`e`' and '`f`' to be performed.

Copyright © 1999

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. The DGN:SDFI output message follows when the diagnostic is executed.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:SFI

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on a digital networking unit - synchronous optical network (DNU-S) synchronous transport signal electrical interface (STSX-1) facility interface (SFI).

2. FORMAT

```
DGN:SFI=a-b-c-d[,PH=e[&&f]][,RPT [=g]][,GROW][,RAW][,TLP][,UCL];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print data from raw data test failure.

`TLP` = Print the ordered pack list if a test fails.

`UCL` = Execute and print all test failures unconditionally rather than stopping after the first test failure.

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = STSX-1 facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of the phase to be run, or the lower limit of a range of phases.

`f` = The upper limit of a range of phases to be run.

`g` = The number of times the diagnostic phases are to be repeated (1-32676). If variable '`g`' is not specified, the phases will be repeated 32,767 times.

4. SYSTEM RESPONSE

`NG` = No good. The message form is valid, but the request conflicts with the current status.

`PF` = Printout follows. The DGN:SFI output message follows.

`RL` = Retry later. The request cannot be executed now due to unavailable system resources.

DGN:SLIM

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a subscriber line instrument measurement (SLIM) board be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:SLIM=a-b-c-d[,RAW][,UCL][,RPT[=e]][,GROW][,PH=f[&&g]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = SLIM board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

`f` = Diagnostic phase(s) to be performed. If '`f`' is specified as a single phase, only that phase will be performed. If variable '`f`' is specified as a range, '`f`' will be the first phase in that range to be performed.

`g` = The last diagnostic phase in the range between and including '`f`' and '`g`' to be performed.

4. SYSTEM RESPONSE

None.

DGN:TAC

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a test and access circuit (TAC) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:TAC=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&&f]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = The number of times the test is to be repeated. If '`d`' is not specified, the test will be repeated 32,767 times.

`e` = Diagnostic phase(s) to be performed. If '`e`' is specified as a single phase, only that phase will be performed. If '`e`' is specified as a range, '`e`' will be the first phase in that range to be performed.

`f` = The last diagnostic phase in the range between and including '`e`' and '`f`' to be performed.

DGN:TEN

Software Release: 5E10 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a trunk equipment number (TEN) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

```
DGN:TEN=a-b-c-d-e[,RAW][,UCL][,RPT[=f]][,GROW][,PH=g[&&h]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = TEN unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = TEN board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = TEN circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`f` = The number of times the test is to be repeated. If '`f`' is not specified, the test will be repeated 32,767 times.

`g` = Diagnostic phase(s) to be performed. If '`g`' is specified as a single phase, only that phase will be performed. If '`g`' is specified as a range, '`g`' will be the first phase in that range to be performed.

`h` = The last diagnostic phase in the range between and including '`g`' and '`h`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. Input request not valid.

`PF` = Printout follows. Followed by the DGN:TEN output message.

DGN:TMS

Software Release: 5E10 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the time multiplex switch (TMS) in the specified office network and timing complex (ONTC) be diagnosed.

2. FORMAT

```
DGN:TMS=a[,RAW][,UCL][,RPT[=b]][,PH=c[&&d]][,TLP][,HELPER=e][,GROW];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allows access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered suspected pack list if a test fails.

`UCL` = Print all test results unconditionally rather than just printing the first failing test.

`a` = TMS side.

`b` = Number of times the diagnostic is to be repeated (RPT) (default 32,767).

`c` = The number of the phase (PH) to be executed, or the lower limit in a range of phases.

`d` = Upper limit in a range of phases.

`e` = The number of the foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

`PF` = Printout follows. Followed by the DGN:TMS output message.

`RL` = Retry later. The request cannot be executed now.

Type: Input

1. PURPOSE

Requests that a universal tone generator (UTG) board be diagnosed to determine if it is in satisfactory working order.

2. FORMAT

```
DGN:UTG=a-b-c-d[,RAW][,UCL][,RPT[=e]][,GROW][,PH=f[&&g]][,TLP];
```

3. EXPLANATION OF MESSAGE

`GROW` = Allow access to growth equipment.

`RAW` = Print raw test failure data.

`TLP` = Print the ordered pack list.

`UCL` = Unconditionally execute and print all test failures.

`a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`b` = Local digital service unit (DSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`c` = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`d` = DSU board position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

`e` = The number of times the test is to be repeated. If '`e`' is not specified, the test will be repeated 32,767 times.

`f` = Diagnostic phase(s) to be performed. If '`f`' is specified as a single phase, only that phase will be performed. If '`f`' is specified as a range, '`f`' will be the first phase in that range to be performed.

`g` = The last diagnostic phase in the range between and including '`f`' and '`g`' to be performed.

4. SYSTEM RESPONSE

`NG` = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

`PF` = Printout follows. The request was accepted. Followed by the DGN:UTG output message.

DISC:WSLINE

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the line that is associated with the specified trunk and line work station (TLWS) test position (TP) be disconnected. The association was accomplished earlier using a CONN:WSLINE or CONN:WSIC input message. If tests are ongoing, they are automatically cancelled.

2. FORMAT

```
DISC:WSLINE,TP=a;
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

`OK` = Good. The line was released.

DISC:WSPHONE

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the trunk and line work station (TLWS) talk-and-monitor (T&M) phone be disconnected from the indicated test position (TP). A TLWS TP must have already been selected using the SET:WSPOS input message.

2. FORMAT

```
DISC:WSPHONE,TP=a;
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

`OK` = Good. The T&M phone was released.

DISC:WSPORT

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the port (line or trunk) that is associated with the specified trunk and line work station (TLWS) test position (TP) be disconnected. The association was accomplished earlier using a CONN:WSLINE, CONN:WSPORT, CONN:WSTRK or CONN:WSIC input message. If tests are ongoing, they are automatically cancelled.

2. FORMAT

```
DISC:WSPORT,TP=a;
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

`OK` = Good. The port was released.

DISC:WSTRK

Software Release: 5E10 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the trunk that was associated with the specified trunk and line work station (TLWS) test position (TP) using an earlier CONN:WSTRK or CONN:WSIC input message be released. If tests are occurring at this TP, they are automatically cancelled.

2. FORMAT

```
DISC:WSTRK,TP=a;
```

3. EXPLANATION OF MESSAGE

`a` = TLWS TP number.

4. SYSTEM RESPONSE

`NG` = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

`OK` = Good. The trunk was released.

DUMP:ACSR

Software Release: 5E10 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that automatic customer station rearrangement (ACSR) recent change log and error data files be printed.

2. FORMAT

```
DUMP:ACSR:DATA=a,FILE=b,DEVICE=c;
```

3. EXPLANATION OF MESSAGE

`a` = Data file type. Valid value(s):
- `LOG` = ACSR recent change log file.
- `ERR` = ACSR recent change error data file.

`b` = Age of log or error data files in days. Valid value(s):
- `1` = Current day's log or error data file.
- `2` = Yesterday's log or error data file.
- `3` = Log and error data files from two days ago.
- `ALL` = All log or error data files.

`c` = Output device name. Valid value(s):
- `TERM` = Output device is the input terminal.
- `ROP` = Output device is the receive-only printer (ROP).
- `ALL` = Output devices are the ROP and the input terminal.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the DUMP:ACSR output message.

DUMP:ADDR

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the contents of a specified range of virtual addresses in the administrative module (AM) main memory be dumped as an action associated with a breakpoint.

The range is specified by two addresses or an address and a length. The length defaults to a value of one. If only one address is given, indirect addressing may be specified. In this case, the first offset listed is added to the contents of the given address and the result is interpreted as a virtual address. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of dump locations. For example, a single offset with value zero uses the virtual address found in the location specified in the DUMP:ADDR input message for the dump location.

2. FORMAT

```
DUMP:ADDR={a&&b|a}[,OFF=c][,{L=d|NL=e}][:WORD]!
```

3. EXPLANATION OF MESSAGE

`WORD` = Indicates that all addresses, offsets, and lengths are to be interpreted as words, including addresses derived in address chains. If this option is omitted, they are assumed to be byte values.

`a` = Virtual address or the lower limit of a range of virtual addresses of the dump in decimal, binary, octal, or hexadecimal notation. Assumed to be a byte address unless the WORD option is used.

`b` = Upper limit of a range of virtual addresses. Assumed to be a byte address unless the WORD option is used.

`c` = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is used.

`d` = The length of the dump, assumed to be in bytes unless the WORD option is used. Maximum 128 bytes or 32 words. Default is one, unless a range is explicitly specified. The actual range of addresses dumped will be rounded out to word address boundaries.

`e` = Indicator that the operation should use the locations beginning '`e`' lower than the calculated address and ending at the address. The locations are used in ascending order. Usage and limitation are the same as for the L option.

4. SYSTEM RESPONSE

`IP` = In progress. The input message has been added to the WHEN action list.

`RL` = Retry later. The system is in an overload condition.

```
DUMP:ADDR
```

DUMP:ATDTA

Software Release: 5E10 and later
Command Group: N/A
Application: 5
Type: Input

1. PURPOSE

Dumps the entries in the automatic trunk test scheduler (ATTS) schedule database which relate to a specified ATTS test schedule.

2. FORMAT

```
DUMP:ATDTA[,SCHED=a][,WEEK=b][,DAY=c][,TGID=d];
```

3. EXPLANATION OF MESSAGE

`a` = The number of the ATTS test schedule whose test session entries are to be output (1 - 20).

`b` = The number of the ATTS schedule week for which test session entries are to be selected for dumping (1 - 8).

`c` = The number of the day in the week for which test session entries are to be selected for dumping (1 - 7, where `1` corresponds to Monday).

`d` = The number of the trunk group associated with test session entries which are to be selected for dumping (1 - maximum TGs per office).

- If neither variables '`b`', '`c`', nor '`d`' are specified, then all test session entries for the specified ATTS test schedule are dumped.
- If variable '`d`' is specified, then only test session entries related to the specified trunk group are dumped, according to the setting of parameters '`b`' and '`c`'.
- If variable '`b`' is specified and variable '`c`' is not, then only test session entries related to any day of the given schedule week are dumped.
- If variable '`c`' is specified and variable '`b`' is not, then only test session entries related to the given day of the schedule week which is currently in effect are dumped.
- If variables '`b`' and '`c`' are both specified, then only test session entries related to the given day of the given schedule week are dumped.

4. SYSTEM RESPONSE

`PF` = Printout follows. The request has been accepted. Followed by the DUMP:ATDTA output message.

DUMP:ATLOG

Software Release: 5E10 and later
Command Group: N/A
Application: 5
Type: Input

1. PURPOSE

Retrieves scheduled trunk test data from automatic trunk test scheduler (ATTS) log files. Searching can be limited to: trunk tests defined in a particular schedule, or across all schedules (variable 'a'); trunk tests executed on a particular schedule week, or during any schedule week (variable 'b'); trunk tests executed on a particular schedule day, or during any schedule day (variable 'c'); trunk test data for members of a particular trunk group or for members of all trunk groups (variable 'd'); and/or passed, failed, aborted, non-passing, or all trunk test results (variable 'e').

2. FORMAT

```
DUMP:ATLOG[,SCHED=a][,WEEK=b][,DAY=c][,TGID=d][,STAT=e];
```

3. EXPLANATION OF MESSAGE

a = Schedule number (1 - 20). If this parameter is defaulted, all schedules are searched for test data conforming to the other parameters.

b = Schedule week number (1 - 8).

c = Schedule day number (1 - 7).

d = Trunk group identifier (1 - maximum TGs per office).

e = Status type. Valid value(s):

A	= Print aborted trunk test results only.
F	= Print failed trunk test results only. This is the default value.
FA	= Print failed or aborted (that is, non-passing) trunk test results only.
FU	= Print failed and/or unavailable trunk test results only.
P	= Print passed trunk test results only.
PFA	= Print all trunk test results.

4. SYSTEM RESPONSE

ATTS retrieves the requested information from the log files and outputs the formatted test result data in tabular form, if any logged test result data matches the input parameters.

NG = No good. May also include:
- INSUFFICIENT RESOURCES

PF = Printout follows. The request has been accepted. Followed by the DUMP:ATLOG output message.

Application: 5
Type: Input

1. PURPOSE

Dumps the entries in the automatic trunk test scheduler (ATTS) parameters database which relate to a specified ATTS test schedule.

2. FORMAT

```
DUMP:ATPRM,SCHED=a;
```

3. EXPLANATION OF MESSAGE

`a` = The number of the ATTS test schedule whose parameters are to be dumped (1 - 20).

4. SYSTEM RESPONSE

`PF` = Printout follows. The request has been accepted. Followed by the DUMP:ATPRM output message.

DUMP:BKTAPE

Software Release: 5E10 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Displays the contents of the multi-volume digital audio tape (DAT) logical volume headers and optionally provides an estimate of how full the tape is.

2. FORMAT

```
DUMP:BKTAPE:TD="a" [,TPSIZE=b];
```

3. EXPLANATION OF MESSAGE

`a` = Device filename of the DAT drive. Refer to the User Guidelines for definitions and examples of tape device names.

`b` = Length in meters of the DAT mounted on the specified drive. The length is used to estimate how full the tape is. Valid lengths are 30 through 90 meters.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by a DUMP:BKTAPE output message.

DUMP:CACHE

Software Release: 5E10 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Dumps the contents of the offline cache into administrative module (AM) processor main memory. The portions of cache dumped are the ones which map to the kernel and interrupt stacks. The input message will not be accepted if the other control unit (CU) is in the standby state.

The cache (1Kbytes) is placed at virtual address 0x80000 for the interrupt stack portion and at virtual address 0x6a0000 for the kernel stack. In the case of the kernel stack, the address dumped to will not correspond to the actual start of the kernel stack. This offset is necessary to preserve the portions of the kernel stack which are not resident in the cache but which do map to the address range used for the cache kernel stack. Whether a particular stack entry is in cache or main memory is dependent upon whether the hardware is present and enabled, and the state of the ISTK bit in the program status word (PSW) of the running process. The reconstruction of the kernel stack (both cache and main memory) is left to the user.

2. FORMAT

```
DUMP:CACHE;
```

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

`NG` = No good. Could not access or reserve the unit control block (UCB) record of the mate CU, or the mate CU was not out of service.

`PF` = Printout follows. Followed by the DUMP:CACHE output message.

5. REFERENCES

Output Message(s):

```
DUMP:CACHE
```

DUMP:F-ALL

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the contents of an ASCII file be dumped.

2. FORMAT

```
DUMP:FILE,ALL,FN="a"[,OPL=b];
```

3. EXPLANATION OF MESSAGE

`a` = Pathname of the file.

NOTE: Dumps of directories and/or non-ASCII files may produce unpredictable output.

`b` = Number of segments output, specified in decimal. Default is 10 segments. Maximum number of segments is 999. Each segment has a maximum size of 1000 bytes or 20 lines.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the DUMP:F-ALL output message.

DUMP:F-FORMAT

Software Release: 5E10 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Dumps the contents of a file in the specified format. If no format is given, the dump is printed in octal.

2. FORMAT

```
DUMP:FILE,FORMAT, FN="a" [,b] [,OPL=c];
```

3. EXPLANATION OF MESSAGE

`a` = Pathname of the file. The pathname is a list of the names of each directory leading to the file, and ends with the name of the specific file. Each name begins with a slash, and the entire pathname is enclosed in quotation marks. For example, "usr/a1/ssw/test" means that /usr/a1/ssw/ represents the list of directory names and /test represents the file name.

`b` = Specifies the output format (default is octal). Valid value(s):

- `C` = Interprets bytes in ASCII notation.
- `D` = Interprets words in decimal notation.
- `O` = Interprets words in octal notation.
- `X` = Interprets words in hexadecimal notation.

`c` = Number of segments output, specified in decimal. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Default is 10 segments. Each segment has a maximum size of 1000 bytes or 20 lines.

4. SYSTEM RESPONSE

`PF` = Printout follows. Followed by the DUMP:F-FORMAT output message.
