TITLE: 3B20D and 3B21D PDS Output Messages Manual Addendum

Enclosed is the "COMPLETE UPDATE" Addendum to the 3B20D and 3B21D Computers UNIX® Operating System, Output Messages Manual - PDS (254-303-111). This Addendum contains all new updated replacements to all the PDS Output Message Manual. Note that the ‘‘No. of Sheets’’ represents the physical number of sheets, not the number of pages for the given message.

Section 1

Introduction

1.1 Purpose of Manuals

The *AT&T 3B20D and 3B21D Computers UNIX® RTR Operating System Output Messages Manual* describes all output messages available on the maintenance interface channels of the AT&T 3B20D and 3B21D computers. The output messages documented in these manuals adhere to the Program Documentation Standards (PDS). For a full description of PDS, please refer to the *Program Documentation Standards* Reference Manual, available from AT&T Bell Laboratories.

The primary purpose of output messages is to report on the maintenance and administration functions initiated with input messages. To understand the contents of output messages, you should be familiar with the system architecture of the AT&T 3B20D or 3B21D computer. Output messages are typically used by system installers, maintainers, operators, and administrators, and are reported at the maintenance console.

The PDS output message manuals are a six-volume set designed to be used with the PDS *AT&T 3B20D and 3B21D Computers UNIX RTR Operating System PDS Input Messages* manuals. All messages in Issue 6 of these manuals represent the supported messages for generics UNIX RTR Release 1.5 and later.

1.2 Functions of Output Messages

Output messages perform the following functions:

- report status or action resulting from an input message request
- inform support personnel of changing system conditions
- report automatic operations performed by the system

You can use the information reported via output messages for system troubleshooting, monitoring subsystem status, and analyzing audit testing results.

Because output messages vary in length and complexity, you need to understand the basic information fields of an output message. Section 2 of this manual reviews the basic structure and format of output messages. When reading output messages, be sure to note the contents of the priority of action field (discussed in Section 2.2). This field indicates the importance of the message, as well as the urgency of any subsequent action that you may need to take in response to the message.

1.3 Organization of Manuals

The output message manual set contains three major sections of information:

- Overview (Volume 1 only)
- Message Descriptions (Volumes 1 through 5)
- Supplementary Information (Volume 6)

SEE PROPRIETARY NOTICE ON COVER PAGE

The information found in each of these sections is described as follows.

Overview

The Overview section, found in Volume 1, introduces the manual set, explains the basic content of output messages and documentation format rules, and presents an alphabetical listing of all output messages.

Message Descriptions

This section contains a manual page for each output message available on the maintenance interface channels. The message descriptions are presented in alphabetical order in Volumes 1 through 5. For each message, the following information is documented:

- Keyblock
- Format
- Reason for Output
- Variable Fields
- Action to Be Taken
- Alarms
- References

Keyblock

An output message keyblock identifies the name of the message and the relevant software generic. The keyblock for each output message is located in the upper right corner of the first page of the message description. The following entries are found in every keyblock:

- ID - A unique identifier used in all output messages for organization. Note that the message ID is not necessarily the same as the message name. Message descriptions in the manuals are in alphabetical order by message IDs.

  If changes from one generic to another have affected a message, then the message is "split," and two or more separate message descriptions will be given for the same message name. Such a split will be indicated by the last character of the message ID. If separate message descriptions exist for the same message name, then the ID for the first message description will be followed by
  "-A", the second by "-B", and so on.

- GENERIC - The generic or range of generics to which a message applies. The following are some examples of possible release entries.

  UNIX RTR R1.5 and later Message applies to UNIX RTR Release 1.5 and later.

  UNIX RTR R1.5 - R6.3 Message applies to UNIX RTR Release 1.5 through UNIX RTR Release 6.3.

- TYPE - Identifies the message type: Input, Output, or Input/Output (indicates information relevant to both input and output message usage).

SEE PROPRIETARY NOTICE ON COVER PAGE

- MESSAGE CLASS - Identifies the report destination name. For additional details, see the the Message Class Appendix, `MSGCLS-APP`.

Format

Message formats shows the different ways that output messages can be reported at the maintenance console. The format section of a message description is important, because it shows the exact order of the reported data variables.

For UNIX RTR R1.5 and later output messages, each format line also includes one or more associated Output Message Data Base (OMDB) keys, listed in the "REFERENCES" section at the end of the message. How to use OMDB keys is discussed in Section 2.

Reason for Output

This section offers a basic explanation of why an output message was generated.

Variable Fields

This section defines the variables used in the message. Variables for multiple formats are explained where appropriate. Additional explanatory text, notes, or tables may also be included to assist message interpretation.

Action to Be Taken

For each message, this section explains what action is required, if any, as a result of the message.

Alarms

Any alarms that are associated with this output message are listed in this section.

References

All associated OMDB keys are listed. All related input and output messages are listed. In addition, any related documentation references are given.

Supplementary Information

This section, which is located in Volume 6, contains the appendixes referred to in the output message descriptions. These appendixes provide further subsystem information that will help you understand output message content.

1.4 Error Reporting Procedures

We encourage you to report any errors that you may find in this set of manuals. Error reporting by users is an effective way of identifying inaccuracies that can be corrected in future issues of the books. For your convenience, an error-reporting form is provided in the back of this manual.

In addition, if you have any suggestions and/or comments that you would like to make about these manuals, please take a few minutes to note them. Your suggestions and comments will be used in preparing future issues. A comment card is also provided in the back of this manual for your use.

Section 2

User Guidelines

2.1 Introduction

Message fields and formats are important to note when using 3B20D and 3B21D computer output messages. This section contains a description of the standard output message fields and format, along with guidelines for interpreting the message descriptions provided in documentation.

2.2 Output Message Structure

The format of a 3B20D or 3B21D computer output message consists of a series of fields of information that are printed on the console in a prescribed order. Information fields report several different variables that must be interpreted. The following example shows how an output message might be displayed at the console:

```
   4321 82-02-19 20:59:30 12333
A 59 RMV CU 0 ABORTED 1
```

This sample message contains the following six fields:

`4321`	= Source identification (unique code used to identify instance of message).
`82-02-19 20:59:30`	= Date (year, month, day) and timestamp (hours, minutes, seconds).
`12333`	= Sequence number of message on console.
`A`	= Priority of action.
`59`	= Abbreviated time (minutes).
`RMV CU 0 ABORTED 1`	= Body of message.
`CLS`	= Class of message (optional field).

Most output messages have the fields illustrated above in the order shown. For system administrators and maintenance technicians, the most important fields to note are the date and timestamp, the priority of action, the abbreviated time, and the body of the message. Each of these fields conveys a specific type of information:

- Class field - Optional field that identifies the class of output messages. If this field is SPERR, then an error has occurred and the message sequence number will be the same as the previous message. See the `REPT-SOP` output message for more information.
- Full date and time field - Optional field that identifies the full date and timestamp associated with an output message (`82-02-19 20:59:30`). The reported information includes the month, day, and year (separated by dashes) followed by the hour, minutes, and seconds (separated by colons). The timestamp, which is based on a 24-hour clock, refers to the time that an output message was translated (ready for output); this time may or may not agree with the abbreviated time field.
- Priority of action field - Indicates the priority level of any subsequent required action and whether an audible alarm is generated (audible alarms are site-specific, but most sites typically have audible warnings for critical, major, and minor alarms). The

SEE PROPRIETARY NOTICE ON COVER PAGE

characters or blanks printed in this field have the following meanings:

Printed Characters	Priority	Alarm/Nonalarm Action
*C	Critical	Accompanied by a critical alarm. Immediate action required.
**	Major	Accompanied by a major alarm, for example, power failure. Immediate action required.
*	Minor	Accompanied by a minor alarm. Action required.
M	Manual	Response to a manual request.
A	Action	Automatically generated. Action may be required.
	Information	Gives information about a specific event or problem. Automatically generated.

- Abbreviated time field - This field identifies the minutes after the hour when the message started printing (59). It may or may not be printed and may or may not be consistent with the timestamp. Control of the printing of this field is contained within the system. It is not user-definable.
- Body of message - Contains message data, including message name, termination report, and, if applicable, detailed results (`RMV CU 0 ABORTED 1`). When reading output messages, you should refer to the message descriptions for exact information about the reported message data.

2.3 Documentation Format Notation

Most output messages support several formats that vary depending on what is being reported. For example, the content of the `DGN-CU` output message varies depending on whether diagnostic reports are being given for an entire hardware unit or one diagnostic phase.

For each output message, you should refer to the message descriptions in these manuals for an explanation of the information that is reported. The documentation uses a standard format to help you interpret the reported data.

In the message descriptions, lowercase letters are used to denote variables. For example, the format of the `RMV-DFC` message is documented as:

`RMV-DFC` *a b*

SEE PROPRIETARY NOTICE ON COVER PAGE

The variables *a* and *b* represent the member number of the DFC and the termination report of the message. The actual data variables printed at the console may be:

```
RMV DFC 1 COMPLETED
```

The message formats shown in the manuals use another notation that is not part of the message itself:

[] Brackets indicate optional responses.

{} Braces indicate two or more possible responses where one, and only one, is reported.

| OR bars separate entries within braces and brackets.

This notation is more relevant to input messages than output messages. In output messages, you will see this notation when a message contains a number of possible responses and one or more may be printed. For more information about how this notation is used in documentation, refer to Section 2 (User Guidelines) in Volume 1 of the *UNIX RTR MML Input Messages Manual* set.

For UNIX RTR R1.5 and later output messages, each format line may also have one or more associated Output Message Data Base (OMDB) keys, which are listed in the "REFERENCES" section at the end of the message. For example, the OMDB key reference for the the `RMV-DFC` output message appears in the "REFERENCES" section as follows:

OMDB Keys (UNIX RTR R1.5 and later)
There are OMDB keys of 308 and 601.

OMDB keys relate to the alarm level and message class for an output message. The alarm level indicates the severity of the output message; message class defines a set of output devices (for example, read-only printer, log file, or Switching Control Center System) to which an output message is reported or recorded. An output message format may have more than one OMDB key associated with it, because a message can be generated with different alarm levels or message classes. If a message format is not listed under the OMDB key references, it does not have an OMDB key associated with it (applicable to message formats that must be available even if the output message database is not).

OMDB keys are useful for the input messages that allow you to change the message class or alarm level for a message (`UPD:OMDB` and `OP:OMDB`) and for examining OMDB entries. To determine which output messages relate to a specific key number, you can use the input message `OP:OMDB;KEY=`*XX*, where *XX* is the key number. (See the input message description for `OP:OMDB` for more information about this.)

OMDB keys can also be used when an output message database entry becomes inaccessible. In this case, an output message will be reported to the console in "primitive mode", which means that the associated data is reported as a hexadecimal dump. The key for the message can be used with the hexadecimal dump to determine what the message would have reported had it been accessible from the database. For more information about this, see the OMDB Cross Reference Appendix in Volume 6, and the output message description for `REPT-CSOP,PRIMITIVE MODE`, which describes the layout of a primitive mode message and how to decode it.

ID . . . . . ACTV-OMDB
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1]
```
ACTV OMDB COMPLETED
 OMDB SEGMENTS:
TOTAL          ACTIVE
 a       b
```

[2]
```
ACTV OMDB FAILED
```

[3]
```
ACTV OMDB ABORTED
UNABLE TO SEND REQUEST TO CSOP
```

2. REASON FOR OUTPUT

To report the completion of processing an `ACTV:OMDB` input message to refresh the active (incore) output message database (OMDB).

3. VARIABLE FIELD DEFINITIONS

a = Total number of segments that the OMDB requires.

b = Number of segments that are active (incore).

4. ACTION TO BE TAKEN

For Format 2, `REPT-CSOP` message(s) found in the receive-only printer (ROP) output preceding this message should give more information about the nature of the error. If they indicate that the file `/cft/spl/omdb` is not accessible, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the `OP:STATUS;LISTDIR` input message for `/cft/spl/omdb`. If neither of these actions determines a probable cause, there may be insufficient memory available to bring a fresh copy of the OMDB incore.

For Format 3, verify that the coordinator of spooler output processes craft output spooler (CSOP) is running.

5. ALARMS

None. This alarm is a manually-requested report.

SEE PROPRIETARY NOTICE ON COVER PAGE

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `ALW AUD COMPLETED`

[2] `ALW AUD NOT STARTED`
`CONFLICT WITH CURRENT SYSTEM STATUS` *a* `| RETRY LATER` *b* `|`
`UNABLE TO IDENTIFY ERROR INPUT ERROR`

2. REASON FOR OUTPUT

To report the termination status of the `ALW:AUD` input message.

3. VARIABLE FIELD DEFINITIONS

a = Explanation of error. See Output Audit Appendix C, `AUD-APPC`.

b = Explanation of error. See Output Audit Appendix D, `AUD-APPD`.

NOTE: See Output Audit Appendixes A and B, `AUD-APPA` and `AUD-APPB`, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

In case of failure (Format 2), use the `OP:AUD` input message to determine the current system status.

5. ALARMS

None.

ID . . . . . ALW-DMQ-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `ALW DMQ COMPLETED`

[2] `ALW DMQ SOURCE` *a* `IS NOT INHIBITED`

[3] `ALW DMQ ENABLED` *a*

2. REASON FOR OUTPUT

Format 1 indicates that an `ALW:DMQ` input message has completed.

Format 2 indicates that an `ALW:DMQ` input message was entered for a non-inhibited source.

Format 3 reports that a specific source of automatic maintenance requests is no longer inhibited. It is now allowed to send requests to the maintenance input request administrator (MIRA).

3. VARIABLE FIELD DEFINITIONS

a = Three-character name of the source currently allowed to make automatic maintenance requests. The computer source names are:

`REX` — routine exercises.
`ADP` — automatic diagnostic process.
`ALL` — allows all automatic maintenance requests by clearing the inhibited sources that were inhibited by `ALL`.

4. ACTION TO BE TAKEN

Use the `OP:DMQ` input message to determine which diagnostic sources are inhibited.

5. ALARMS

None. This alarm is a manually-requested report.

1. FORMAT

This message has four formats.

[1] `ALW DMQ COMPLETED`

[2] `ALW DMQ SOURCE` *a* `IS NOT INHIBITED`

[3] `ALW DMQ SOURCE` *a* `IS INHIBITED BY SOURCE ALL`

[4] `ALW DMQ ENABLED` *a*

2. REASON FOR OUTPUT

Format 1 indicates that an `ALW:DMQ` input message has completed.

Format 2 indicates that an `ALW:DMQ` input message was entered for a non-inhibited source.

Format 3 indicates that an `ALW:DMQ` input message was entered for a source inhibited by `ALL`. A source cannot be allowed if the source `ALL` is inhibited.

Format 4 reports that a specific source of automatic maintenance requests is no longer inhibited. It is now allowed to send requests to the maintenance input request administrator (MIRA).

3. VARIABLE FIELD DEFINITIONS

a = Three-character name of the source currently allowed to make automatic maintenance requests. The computer source names are:

`REX` — routine exercises.
`ADP` — automatic diagnostic process.
`ALL` — allows all automatic maintenance requests by clearing the inhibited sources that were inhibited by `ALL`.

4. ACTION TO BE TAKEN

Use the `OP:DMQ` input message to determine which diagnostic sources are inhibited.

ID . . . . . ALW-EAIINT
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `ALW EAIINT` *a* `COMPLETED`

[2] `ALW EAIINT` *a* `COMPLETED WITH` *c*

[3] `ALW EAIINT` *a* `ABORTED` *b*

2. REASON FOR OUTPUT

To indicate the result of a request to allow emergency action interface (EAI) error interrupts on a specified 3B21D computer control unit (CU), or on both 3B21D computer CUs.

NOTE: The 3B20D computer CUs do not have EAI error interrupts.

Format 1 indicates successful completion.

Format 2 indicates successful completion with a message port problem.

Format 3 indicates an error.

3. VARIABLE FIELD DEFINITIONS

a = One of the following: CU 0, CU 1, or CU 0 and CU 1.

b = One of the following error codes:

- `50` — message could not be sent to a driver or real time status (RTS) report
- `51` — equipment configuration data base (ECD) access function completed unsuccessfully
- `52` — error in message communication
- `53` — error internal to the inhibit administrator

c = One of the following port problems:

`AN INVALID SYSTEM PORT SPECIFIED`
`AN INVALID SYSTEM PORT SPECIFIED FOR AIM` (application integrity monitor)
`NO PROCESS ATTACHED TO THE SPECIFIED PORT`
`NO PROCESS ATTACHED TO THE AIM PORT`

4. ACTION TO BE TAKEN

For Format 1, no action is necessary.

For Format 2, seek technical assistance.

For Format 3, use the `OP:ERRCHK` input message to learn the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

5. ALARMS

None. This report is either a manually-requested report or an automatically-generated report for information only.

1. FORMAT

This message has four formats.

[1] `ALW ERRCHK COMPLETED`

[2] `ALW ERRCHK COMPLETED WITH` *b*

[3] `ALW ERRCHK ABORTED` *a*

[4] `ALW ERRCHK NOT STARTED`
`INVALID ID FIELD`

2. REASON FOR OUTPUT

To indicate the result of a request to allow all computer error sources.

3. VARIABLE FIELD DEFINITIONS

a = One of the following error codes:

- `50` — message could not be sent to a driver or real time status report (RTS)
- `51` — equipment configuration data base (ECD) access function completed unsuccessfully
- `52` — error in message communication
- `53` — error internal to the inhibit administrator

b = One of the following port problems:

- — Invalid system port specified.
- — Invalid system port specified for analog interface module (AIM).
- — No process attached to the specified port.
- — No process attached to the AIM port.

4. ACTION TO BE TAKEN

If an error was reported, use the `OP:ERRCHK` input message to find out the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

If the process completes with a port problem, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

For format 1, none. This report is a manually-requested report.

For format 2 and 3, none. This automatically-generated report is for information only.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 406.
Format 2 has an OMDB key of 658.
Format 3 has an OMDB key of 414.

Input Messages
`ALW:ERRCHK`
`INH:ERRCHK`
`OP:ERRCHK`

Output Messages
`INH-ERRCHK`
`OP-ERRCHK`

ID . . . . . ALW-ERRINT-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `ALW ERRINT COMPLETED`

[2] `ALW ERRINT ABORTED` *a*

[3]
```
ALW ERRINT NOT STARTED
INVALID ID FIELD - INPUT ERROR
```

[4]
```
ALW ERRINT NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS - UNEQUIPPED UNIT
```

2. REASON FOR OUTPUT

To indicate the result of a request to allow error interrupts on a particular computer unit or complex, or on all computer hardware units.

Format 1 indicates successful completion.

Format 2 indicates an error.

Format 3 indicates an error in the identification field of the input. Possibly, the unit name and number specified cannot be found in the data base.

Format 4 indicates unit name and number specified was found in the data base, but is unequipped.

3. VARIABLE FIELD DEFINITIONS

a = One of the following error codes:

- `50` — a message could not be sent to a driver or real time status (RTS) report
- `51` — an equipment configuration data base (ECD) access function completed unsuccessfully
- `52` — an error in message communication
- `53` — an error internal to the inhibit administrator
- `55` — an invalid system port was specified
- `56` — no process is attached to the specified port

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Formats 1, 3, and 4, no action is necessary.

For Format 2, use the `OP:ERRCHK` input message to learn the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

5. ALARMS

None. This report is either a manually-requested report or an automatically-generated report for information only.

1. FORMAT

This message has five formats.

[1] `ALW ERRINT COMPLETED`

[2] `ALW ERRINT COMPLETED WITH` *b*

[3] `ALW ERRINT ABORTED` *a*

[4]
```
ALW ERRINT NOT STARTED
INVALID ID FIELD - INPUT ERROR
```

[5]
```
ALW ERRINT NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS - UNEQUIPPED UNIT
```

2. REASON FOR OUTPUT

To indicate the result of a request to allow error interrupts on a particular hardware unit or complex, or on all hardware units.

Format 1 indicates successful completion.

Format 2 indicates successful completion with a message port problem.

Format 3 indicates an error.

Format 4 indicates an error in the identification field of the input. Possibly, the unit name and number specified cannot be found in the data base.

Format 5 indicates unit name and number specified was found in the data base, but is unequipped.

3. VARIABLE FIELD DEFINITIONS

a = One of the following error codes:

- `50` — a message could not be sent to a driver or real time status (RTS) report
- `51` — an equipment configuration data base (ECD) access function completed unsuccessfully
- `52` — an error in message communication
- `53` — an error internal to the inhibit administrator

SEE PROPRIETARY NOTICE ON COVER PAGE

b = One of the following port problems:

`AN INVALID SYSTEM PORT SPECIFIED`

`AN INVALID SYSTEM PORT SPECIFIED FOR AIM` (application integrity monitor)

`NO PROCESS ATTACHED TO THE SPECIFIED PORT`

`NO PROCESS ATTACHED TO THE AIM PORT`

4. ACTION TO BE TAKEN

For Formats 1, 4, and 5, no action is necessary.

For Format 2, seek technical assistance.

For Format 3, use the `OP:ERRCHK` input message to learn the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `ALW REX COMPLETED`

[2] `ALW REX NOT STARTED`
`{CONFLICT WITH CURRENT SYSTEM STATUS`
`|RETRY LATER }`

2. REASON FOR OUTPUT

To report the termination status of the `ALW:REX` input message.

3. ACTION TO BE TAKEN

For Format 1, no action is needed.

For Format 2, `CONFLICT WITH CURRENT SYSTEM STATUS` indicates that temporary routine exercise (REX) inhibits are not available for the unit specified, or all the units specified due to active permanent REX inhibit(s). Use the `OP:REXINH` input message with the `PERM` option to determine the current permanent `REX` inhibits.

`RETRY LATER` indicates that the database manager or a database record could not be opened; try again at a later time. If this persists, seek technical assistance.

4. ALARMS

None.

5. REFERENCES

Input Messages
`ALW:REX`
`OP:REXINH`

Output Message
`OP-REXINH`

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . ALW-SCSD
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `ALW SCSD UNIT` *a* `PT` *b*[*bbbbbbb*] *f*

[2] `ALW SCSD GRPN` *c* `DUPID` *d* `PT` *e*[*eeeee*] *f*

[3]
```
ALW SCSD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
```

2. REASON FOR OUTPUT

To indicate whether a scan point has been enabled as a result of executing an `ALW:SCSD` input message. This allows a scan point transition to be reported.

Format 1 is used when a scan point is identified by physical location.

Format 2 is used when a scan point is identified by logical address.

Format 3 is used when the SCSD administration process is not active. No communication with scanner and signal distributor (SCSD) points is possible.

3. VARIABLE FIELD DEFINITIONS

a = Member number of SCSD unit.

b = Physical scan point number on an SCSD (`0-47`).

c = Name of the logical group.

d = Duplex group ID (`0` or `1`).

e = Number of a point within a logical group.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = Termination status:

`FAILED` — Action could not be completed by SCSD Administrator.

Possible reasons for failure are:

— SCSD unit number is invalid.

— Point number is invalid for the logical group.

— Logical group name is invalid and either the SCSD unit is out-of-service (OOS) or is in an inactive state to the SCSD Administrator.

`COMPLETED` — Action completed.

4. ACTION TO BE TAKEN

Issue the `OP:OOS` input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter recent change and verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`ALW UMEM` *a* `WAS` *b* `NOW` *c* *#d*

2. REASON FOR OUTPUT

To report the disposition of an `ALW:UMEM` input message.

3. VARIABLE FIELD DEFINITIONS

a = Status of the operation:

- `COMPLETED` — The trace has begun monitoring the flow of execution.
- `NOT STARTED` — The operation was ignored because data loss might have resulted.
- `STOPPED UCERR` — The operation could not be completed because the utility circuit either does not respond or does not match the circuit present when the trace was defined.

b = The state of the trace before the operation was attempted:

- `DUMPED` — The trace was not running and its data had already been dumped.
- `NEW` — The trace was not running and did not have data.
- `RUNNING` — The trace was collecting data.
- `STOPPED` — The trace was not running and did have data.
- `UNDEF` — No trace was defined.

c = The state of the trace after the operation was attempted.

- `RUNNING` — The trace is collecting data.
- `STOPPED` — The trace is stopped and does contain data.
- `UNDEF` — No trace is defined.

d = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If *a* is `NOT STARTED`, the trace must be in the `NEW` or `DUMPED` state in order to be started. Use the `INH:UMEM` and/or the `OP:UMEM` input messages before reissuing the `ALW:UMEM` input message.

If *a* is `STOPPED UCERR`, check the utility circuit hardware. After it is fixed, use the `INIT:UC` input message to reinitialize the circuit.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`ALW UTILFLAG` *a b #c*

2. REASON FOR OUTPUT

To report the disposition of an `ALW:UTILFLAG` input message.

3. VARIABLE FIELD DEFINITIONS

a = Numeric identifier (one or more decimal digits) for the breakpoint that was enabled.

b = Termination status:

`COMPLETED` — The associated actions will be executed when the breakpoint conditions occur.

`STOPPED UCERR` — The operations could not be performed because the utility circuit either does not respond or does not match the circuit present when the breakpoint was defined.

c = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If *b* is `STOPPED UCERR`, check the utility circuit hardware. After it is fixed, use the `INIT:UC` input message to reinitialize the circuit.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Key
This message has an OMDB key of 494.

Input Messages
`INH:UTIL`
`INH:UTILFLAG`
`INIT:UC`
`OP:UTIL`

Output Message
`OP-UTIL`

```

2. REASON FOR OUTPUT

To print trouble location information for a failing diagnostic.

Format 1 is always printed after diagnostic failures have occurred. This message summarizes the failing trouble locating procedure (TLP) key information for each failing phase.

Formats 2 - 4 are printed only when diagnostic failures have occurred and the TLP option was specified in the input command. The information in these messages is used to repair the failing unit.

See Practices 254-301-100, or 254-302-100 for further details. Also see *System Maintenance Manual*, 254-303-106.

3. VARIABLE FIELD DEFINITIONS

a = Unit and side that failed diagnostic (for example, `CU 0`).

b = Failing diagnostic phase number.

c = Failing TLP keys - word 1. One bit set for each failing TLP key, `0-31`.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Failing TLP keys - word 2. One bit set for each failing TLP key, 32-63.

e = First failing TLP key number.

f = Unique decimal number identifying the TLP process.

g = Model version (mv) of the unit being diagnosed.

h = Equipment code.

i = Equipment location.

j = Functional schematic number for the equipment.

k = Functional schematic symbol number for the equipment.

l = Schematic diagram number for the unit.

m = Unit(s) containing the equipment when not the same as the unit being diagnosed. DO NOT REMOVE POWER OR EQUIPMENT FROM AN ACTIVE OR IN-SERVICE UNIT. ONL in the unit column means on-line or active unit. PU in the unit column means peripheral unit such as disk file controller (DFC) or input output processor (IOP).

n = Weight on a scale from 1 to 10 with the equipment most likely to be faulty having the highest number.

o = Note number. If note is nonzero, see Table 1. Note 0 is not used.

Table 1

Note Number	Definition
CC NOTE 01	Do not remove power or equipment from an active or in-service unit.
CC NOTE 02	Cable to the maintenance channel of the CU.
CC NOTE 03	CU could be held stopped by micro level test set (MLTS) or bus display unit (BDU).
CC NOTE 05	MLTS, TN16, or UN16 if equipped.
CC NOTE 06	CU could be powered down.
CC NOTE 07	Power switch board or one of the power converters may be bad. If ALARM is lighted on power switch board, power cycle CU. If light remains on in one of the power converters, that converter may be bad. If lights go out on all converters and CU fails to power up, power switch board may be bad. (Model 1 3B20 CU power switch circuitry includes EAI board, TN11.)

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
CC NOTE 10	Board is in input output process (IOP) 0.
CC NOTE 11	Board is in IOP 1.
CC NOTE 50	Channel board in the channel 0 position.
CC NOTE 51	Channel board in the channel 1 position.
CC NOTE 52	Channel board in the channel 2 position.
CC NOTE 53	Channel board in the channel 3 position.
CC NOTE 54	Channel board in the channel 4 position.
CC NOTE 55	Channel board in the channel 5 position.
CC NOTE 56	Channel board in the channel 6 position.
CC NOTE 57	Board in the DMA 0 position (Model 1 UN36).
CC NOTE 58	Board in the DMA 1 position (Model 1 UN36).
CC NOTE 59	A channel address lead is being held active by CU, channel, or DMA.
CC NOTE 60	A channel or DMA bus may be responding and/or acknowledging falsely.
CC NOTE 61	A channel or DMA is holding channel error (ER bit 16) active (low).
CH NOTE 01	Suspect any channel (CH) or direct memory access (DMA).
CH NOTE 02	Unterminated or defective cable on port under test.
CSU NOTE 01	Verify hardware for the kernel stack in interrupt stack cache memory feature corresponds with the cache store unit (CSU's) unit control block (UCB) hardware version (HV) field. A 1 in bit 0 of this field indicates the feature is present. The hardware for this feature is a UN45C store address translation (SAT), with pins 149 and 047 wired together on the SAT backplane to enable the feature. Discrepancy between HV value and hardware should be corrected.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
DMA NOTE 01	Suspect any channel or DMA.
DUIC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
DUIC NOTE 02	Replacement equipment must have same microcode (MC) number.
DCI NOTE 01	The dual serial channel/computer interconnect (DCI) could be powered down. This board is located in the attached processor.
DCI NOTE 02	The attached processor or its software may be the cause of this phase failing.
DFC NOTE 01	The disk file controller (or) disk file control frame (DFC) could be powered down.
DFC NOTE 02	Do not remove power or equipment from an active or in-service unit.
IOP NOTE 01	The input output processor (IOP) could be powered down.
IOP NOTE 02	Do not remove power or equipment from an active or in-service unit.
MASC NOTE 01	Do not remove power or equipment from an active or in-service unit.
MASC NOTE 09	Array identified by DGN CU_ MASC_ PH_ MEMORY FAILURE RESULTS output message.
MASC NOTE 10	Other units on the store bus: CC, other MASC in CU under test (in CUs with two UN39-UN40 MASCs), DMA(s), CSU (if equipped), SAT.
MASC NOTE 12	Any array in Main Store Controller (MASC).
MASC NOTE 13	Other MASC (in CUs with 2 UN39-UN40 MASCs) may have error(s) active in CC ER.
MHD NOTE 01	Part of the DFC, the DFC must be removed from service and powered down before this equipment can be replaced.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MHD NOTE 09	Refer to the Maintenance Instruction Manual for KS-21995,L2 and KS-22707,L2 Memory available from Century Data System, part number 76261-3xx.
MHD NOTE 10	These circuit cards are located in the logic card cage of the KS-22707,L2 Memory unit. Also refer to MHD NOTE 09.
MHD NOTE 11	The Power Amplifier, VP58 is located behind the logic card cage. Also refer to MHD NOTE 09.
MHD NOTE 12	Codes for all circuit cards in the KS-22707,L1 Memory are a four-character string of alpha-numeric or alpha characters. The first character in the string determines the revision level and the last three characters determine the circuit card code. Identification of the circuit card, therefore, is based on the last three characters.
MHD NOTE 13	Read MHD NOTE 12 then proceed. These circuit cards are located in the logic chassis. Refer to Practice 254-302-210, 300 Megabyte Moving Head Disk Drives, General Description, 3B20D Model 2 Processor.
MHD NOTE 14	Read MHD NOTE 12 then proceed. These circuit cards are located on the deck plate of the memory unit. Refer to Maintenance Instruction Manual for KS-22702,L1 memory.
MHD NOTE 16	MHD could be spun down.
MHD NOTE 17	MHD could be powered down. Check power inverter for alarm or no power. Check MHD power cord, power switch, and power indicator. On KS-22875 340MB MHD, check the diagnostic mode switch behind the front panel to ensure it is not in the diagnostic mode and the diagnostic mode indicator light is extinguished.
MHD NOTE 18	Incorrect ID setting could be the cause of this failure.
MT NOTE 18	Incorrect ID setting could be the cause of this failure.
MTC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
MTC NOTE 02	The indicated faulty equipment is in the transport.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MTTYC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
SCSDC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
SDLC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
TTYC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
UC NOTE 01	Field test set (FTS) may have control of the utility circuit (UC).

4. ACTION TO BE TAKEN

Format 1 is failing TLP key summary information. If the failing diagnostic did not have the TLP option specified, request the diagnostic again with the TLP option. The failing TLP key summary information can be used to monitor changes in failing TLP keys. No actions based on the contents of this message are required.

Format 2 provides the ID of the TLP process which is running. No actions based on the contents of this message are required.

Formats 3 and 4 are used to repair the faulty unit using the suspected faulty equipment list. The most likely equipment is at the top of the list.

If the NOTE column *o* has non-zero entries, first read the identified TLP notes for the failing unit from Table 1. TLP notes may contain information regarding the cause of the trouble. Check for any specific trouble identified by the TLP notes. In some cases, the trouble can be resolved without replacing equipment.

If the UNIT column *m* has non-blank entries, the suspected faulty equipment is not in the unit that failed diagnostics. Defer replacing equipment in other units until all suspected equipment in the failing unit has been tried. It may be necessary to reconfigure the system to allow the other unit(s) to be removed from service. It will be necessary to remove from service and power down the other unit(s) before replacing equipment in the other unit(s).

Replace the equipment at the top of the list with a spare, and retest the unit with the diagnostics. If the unit still fails, restore the original equipment to the unit and replace the next equipment on the list with a spare. Continue until faulty equipment found or list exhausted.

When faulty equipment is found, verify it causes the diagnostic failure by restoring it to the unit and rerunning diagnostics. If the diagnostics DO NOT fail as before, suspect the faulty equipment is intermittent or temperature sensitive. Occasionally, removing and

restoring power to the unit or reseating equipment clears the trouble. Note the equipment involved in clearing the trouble. If the diagnostic failure returns and the same equipment is involved in clearing the trouble, replace the equipment.

If asterisks (*) are printed in the equipment location field *i*, TLP cannot directly determine the location of the equipment from the failing diagnostic *a*. If the `UNIT` column *m* is blank, all equipment of the code identified in *h* are implicated in the failing unit. If the `UNIT` column *m* identifies another unit (or units), all equipment of the code identified in *h* are implicated in the unit (or units) identified by *m*. In some cases, further resolution is possible; see below.

If *h* = `UN09`, TLP may not be able to directly determine the channel based on the unit under test. Channel diagnostics should be run to more accurately determine the faulty equipment. For example, if the DMA 0 diagnostic failed and TLP implicated the UN09, run DMA 0 channel diagnostics (CH 11-14).

If *h* = `UN19`, this indicates that TLP cannot directly determine the channel based on the unit under test. Channel diagnostics (CH 0-9) should be run to more accurately determine the faulty equipment.

If *h* = `TN69` or `TN70`, the TN69 or TN70 equipment in the peripheral device being used as a helper unit is being implicated. See the diagnostic listing for further information on the peripheral device involved with the phase which failed. Table 2 translates some of the channel diagnostic phases to the subchannel being tested.

Table 2

Failing CH Phase	Subchannel Under Test
8 or 24	0
9 or 25	1
10 or 26	2
11 or 27	3
12 or 28	4
13 or 29	5
14 or 30	6
15 or 31	7
16 or 32	8
17 or 33	9
18 or 34	10
19 or 35	11
20 or 36	12
21 or 37	13
22 or 38	14
23 or 39	15

SEE PROPRIETARY NOTICE ON COVER PAGE

If *h* = TN14, TN28 or TN56, or TN2012, this indicates TLP may not be able to determine the failing mainstore array (MASA) based on the unit under test. Some MASC diagnostic phases have a histogram output message that identifies the failing MASA. If the MASC diagnostic was not run, the MASC diagnostic should be run to more accurately determine the faulty equipment.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To print trouble location information for a failing diagnostic.

Format 1 is always printed after diagnostic failures have occurred. This message summarizes the failing trouble locating procedure (TLP) key information for each failing phase.

Formats 2 - 4 are printed only when diagnostic failures have occurred and the TLP option was specified in the input command. The information in these messages is used to repair the failing unit.

See Practices 254-301-100, or 254-302-100 for further details. Also see *System Maintenance Manual*, 254-303-106.

3. VARIABLE FIELD DEFINITIONS

a = Unit and side that failed diagnostic (for example, `CU 0`).

b = Failing diagnostic phase number.

c = Failing TLP keys - word 1. One bit set for each failing TLP key, `0-31`.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Failing TLP keys - word 2. One bit set for each failing TLP key, 32-63.

e = First failing TLP key number.

f = Unique decimal number identifying the TLP process.

g = Model version (mv) of the unit being diagnosed.

h = Equipment code.

i = Equipment location.

j = Functional schematic number for the equipment.

k = Functional schematic symbol number for the equipment.

l = Schematic diagram number for the unit.

m = Unit(s) containing the equipment when not the same as the unit being diagnosed. DO NOT REMOVE POWER OR EQUIPMENT FROM AN ACTIVE OR IN-SERVICE UNIT. ONL in the unit column means on-line or active unit. PU in the unit column means peripheral unit such as disk file controller (DFC) or input output processor (IOP).

n = Weight on a scale from 1 to 10 with the equipment most likely to be faulty having the highest number.

o = Note number. If note is nonzero, see Table 1. Note 0 is not used.

Table 1

Note Number	Definition
CC NOTE 01	Do not remove power or equipment from an active or in-service unit.
CC NOTE 02	Cable to the maintenance channel of the CU.
CC NOTE 03	CU could be held stopped by micro level test set (MLTS) or bus display unit (BDU).
CC NOTE 04	If a ‘‘forced switch’’ of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
CC NOTE 05	MLTS, TN16, or UN16 if equipped.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1

Note Number	Definition
CC NOTE 06	CU could be powered down.
CC NOTE 07	Power switch board or one of the power converters may be bad. If ALARM is lighted on power switch board, power cycle CU. If light remains on in one of the power converters, that converter may be bad. If lights go out on all converters and CU fails to power up, power switch board may be bad. (Model 1 3B20 CU power switch circuitry includes EAI board, TN11.)
CC NOTE 10	Board is in input output process (IOP) 0.
CC NOTE 11	Board is in IOP 1.
CC NOTE 50	Channel board in the channel 0 position.
CC NOTE 51	Channel board in the channel 1 position.
CC NOTE 52	Channel board in the channel 2 position.
CC NOTE 53	Channel board in the channel 3 position.
CC NOTE 54	Channel board in the channel 4 position.
CC NOTE 55	Channel board in the channel 5 position.
CC NOTE 56	Channel board in the channel 6 position.
CC NOTE 57	Board in the DMA 0 position (Model 1 UN36).
CC NOTE 58	Board in the DMA 1 position (Model 1 UN36).
CC NOTE 59	A channel address lead is being held active by CU, channel, or DMA.
CC NOTE 60	A channel or DMA bus may be responding and/or acknowledging falsely.
CC NOTE 61	A channel or DMA is holding channel error (ER bit 16) active (low).
CH NOTE 01	Suspect any channel (CH) or direct memory access (DMA).
CH NOTE 02	Unterminated or defective cable on port under test.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
CH NOTE 03	Suspect Helper Unit circuit packs. IOP and DFC circuit packs may be at fault. For the SCSI DFC, these circuit packs include the Host Adapter (HA) and the DFC.
CH NOTE 04	The under-test CH is connected, via the DSCH cable, to another circuit pack. Suspect the DDSBS logic in that circuit pack or the DSCH cable.
CSU NOTE 01	Verify hardware for the kernel stack in interrupt stack cache memory feature corresponds with the cache store unit (CSU's) unit control block (UCB) hardware version (HV) field. A 1 in bit 0 of this field indicates the feature is present. The hardware for this feature is a UN45C store address translation (SAT), with pins 149 and 047 wired together on the SAT backplane to enable the feature. Discrepancy between HV value and hardware should be corrected.
CSU NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
DMA NOTE 01	Suspect any channel or DMA.
DMA NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
DUIC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
DUIC NOTE 02	Replacement equipment must have same microcode (MC) number.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
DCI NOTE 01	The dual serial channel/computer interconnect (DCI) could be powered down. This board is located in the attached processor.
DCI NOTE 02	The attached processor or its software may be the cause of this phase failing.
DFC NOTE 01	The disk file controller (or) disk file control frame (DFC) could be powered down.
DFC NOTE 02	Do not remove power or equipment from an active or in-service unit.
IOP NOTE 01	The input output processor (IOP) could be powered down.
IOP NOTE 02	Do not remove power or equipment from an active or in-service unit.
MASC NOTE 01	Do not remove power or equipment from an active or in-service unit.
MASC NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
MASC NOTE 09	Array identified by DGN CU_ MASC_ PH_ MEMORY FAILURE RESULTS output message.
MASC NOTE 10	Other units on the store bus: CC, other MASC in CU under test (in CUs with two UN39-UN40 MASCs), DMA(s), CSU (if equipped), SAT.
MASC NOTE 12	Any array in Main Store Controller (MASC).
MASC NOTE 13	Other MASC (in CUs with 2 UN39-UN40 MASCs) may have error(s) active in CC ER.
MHD NOTE 01	Part of the DFC, the DFC must be removed from service and powered down before this equipment can be replaced.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MHD NOTE 09	Refer to the Maintenance Instruction Manual for KS-21995,L2 and KS-22707,L2 Memory available from Century Data System, part number 76261-3xx.
MHD NOTE 10	These circuit cards are located in the logic card cage of the KS-22707,L2 Memory unit. Also refer to MHD NOTE 09.
MHD NOTE 11	The Power Amplifier, VP58 is located behind the logic card cage. Also refer to MHD NOTE 09.
MHD NOTE 12	Codes for all circuit cards in the KS-22707,L1 Memory are a four-character string of alpha-numeric or alpha characters. The first character in the string determines the revision level and the last three characters determine the circuit card code. Identification of the circuit card, therefore, is based on the last three characters.
MHD NOTE 13	Read MHD NOTE 12 then proceed. These circuit cards are located in the logic chassis. Refer to Practice 254-302-210, 300 Megabyte Moving Head Disk Drives, General Description, 3B20D Model 2 Processor.
MHD NOTE 14	Read MHD NOTE 12 then proceed. These circuit cards are located on the deck plate of the memory unit. Refer to Maintenance Instruction Manual for KS-22702,L1 memory.
MHD NOTE 16	MHD could be spun down.
MHD NOTE 17	MHD could be powered down. Check power inverter for alarm or no power. Check MHD power cord, power switch, and power indicator. On KS-22875 340MB MHD, check the diagnostic mode switch behind the front panel to ensure it is not in the diagnostic mode and the diagnostic mode indicator light is extinguished.
MHD NOTE 18	Incorrect ID setting could be the cause of this failure.
MT NOTE 18	Incorrect ID setting could be the cause of this failure.
MTC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
MTC NOTE 02	The indicated faulty equipment is in the transport.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MTTYC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
SCSDC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
SDLC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
TTYC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
UC NOTE 01	Field test set (FTS) may have control of the utility circuit (UC).

4. ACTION TO BE TAKEN

Format 1 is failing TLP key summary information. If the failing diagnostic did not have the TLP option specified, request the diagnostic again with the TLP option. The failing TLP key summary information can be used to monitor changes in failing TLP keys. No actions based on the contents of this message are required.

Format 2 provides the ID of the TLP process which is running. No actions based on the contents of this message are required.

Formats 3 and 4 are used to repair the faulty unit using the suspected faulty equipment list. The most likely equipment is at the top of the list.

If the NOTE column *o* has non-zero entries, first read the identified TLP notes for the failing unit from Table 1. TLP notes may contain information regarding the cause of the trouble. Check for any specific trouble identified by the TLP notes. In some cases, the trouble can be resolved without replacing equipment.

If the UNIT column *m* has non-blank entries, the suspected faulty equipment is not in the unit that failed diagnostics. Defer replacing equipment in other units until all suspected equipment in the failing unit has been tried. It may be necessary to reconfigure the system to allow the other unit(s) to be removed from service. It will be necessary to remove from service and power down the other unit(s) before replacing equipment in the other unit(s).

Replace the equipment at the top of the list with a spare, and retest the unit with the diagnostics. If the unit still fails, restore the original equipment to the unit and replace the next equipment on the list with a spare. Continue until faulty equipment found or list exhausted.

When faulty equipment is found, verify it causes the diagnostic failure by restoring it to the unit and rerunning diagnostics. If the diagnostics DO NOT fail as before, suspect the faulty equipment is intermittent or temperature sensitive. Occasionally, removing and

restoring power to the unit or reseating equipment clears the trouble. Note the equipment involved in clearing the trouble. If the diagnostic failure returns and the same equipment is involved in clearing the trouble, replace the equipment.

If asterisks (*) are printed in the equipment location field *i*, TLP cannot directly determine the location of the equipment from the failing diagnostic *a*. If the `UNIT` column *m* is blank, all equipment of the code identified in *h* are implicated in the failing unit. If the `UNIT` column *m* identifies another unit (or units), all equipment of the code identified in *h* are implicated in the unit (or units) identified by *m*. In some cases, further resolution is possible; see below.

If *h* = `UN09`, TLP may not be able to directly determine the channel based on the unit under test. Channel diagnostics should be run to more accurately determine the faulty equipment. For example, if the DMA 0 diagnostic failed and TLP implicated the UN09, run DMA 0 channel diagnostics (CH 11-14).

If *h* = `UN19`, this indicates that TLP cannot directly determine the channel based on the unit under test. Channel diagnostics (CH 0-9) should be run to more accurately determine the faulty equipment.

If *h* = `TN69` or `TN70`, the TN69 or TN70 equipment in the peripheral device being used as a helper unit is being implicated. See the diagnostic listing for further information on the peripheral device involved with the phase which failed. Table 2 translates some of the channel diagnostic phases to the subchannel being tested.

Table 2

Failing CH Phase	Subchannel Under Test
8 or 24	0
9 or 25	1
10 or 26	2
11 or 27	3
12 or 28	4
13 or 29	5
14 or 30	6
15 or 31	7
16 or 32	8
17 or 33	9
18 or 34	10
19 or 35	11
20 or 36	12
21 or 37	13
22 or 38	14
23 or 39	15

SEE PROPRIETARY NOTICE ON COVER PAGE

If *h* = TN14, TN28 or TN56, or TN2012, this indicates TLP may not be able to determine the failing mainstore array (MASA) based on the unit under test. Some MASC diagnostic phases have a histogram output message that identifies the failing MASA. If the MASC diagnostic was not run, the MASC diagnostic should be run to more accurately determine the faulty equipment.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To print trouble location information for a failing diagnostic.

Format 1 is always printed after diagnostic failures have occurred. This message summarizes the failing trouble locating procedure (TLP) key information for each failing phase.

Formats 2 - 4 are printed only when diagnostic failures have occurred and the TLP option was specified in the input command. The information in these messages is used to repair the failing unit.

See Practices 254-301-100, or 254-302-100 for further details. Also see *System Maintenance Manual*, 254-303-106.

3. VARIABLE FIELD DEFINITIONS

a = Unit and side that failed diagnostic (for example, `CU 0`).

b = Failing diagnostic phase number.

c = Failing TLP keys - word 1. One bit set for each failing TLP key, `0-31`.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Failing TLP keys - word 2. One bit set for each failing TLP key, 32-63.

e = First failing TLP key number.

f = Unique decimal number identifying the TLP process.

g = Model version (mv) of the unit being diagnosed.

h = Equipment code.

i = Equipment location.

j = Functional schematic number for the equipment.

k = Functional schematic symbol number for the equipment.

l = Schematic diagram number for the unit.

m = Unit(s) containing the equipment when not the same as the unit being diagnosed. DO NOT REMOVE POWER OR EQUIPMENT FROM AN ACTIVE OR IN-SERVICE UNIT. ONL in the unit column means on-line or active unit. PU in the unit column means peripheral unit such as disk file controller (DFC) or input output processor (IOP).

n = Weight on a scale from 1 to 10 with the equipment most likely to be faulty having the highest number.

o = Note number. If note is nonzero, see Table 1. Note 0 is not used.

Table 1

Note Number	Definition
CC NOTE 01	Do not remove power or equipment from an active or in-service unit.
CC NOTE 02	Cable to the maintenance channel of the CU.
CC NOTE 03	CU could be held stopped by micro level test set (MLTS) or bus display unit (BDU).
CC NOTE 04	If a ‘‘forced switch’’ of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.

Table 1

Note Number	Definition
CC NOTE 05	MLTS, TN16, or UN16 if equipped.
CC NOTE 06	CU could be powered down.
CC NOTE 07	Power switch board or one of the power converters may be bad. If ALARM is lighted on power switch board, power cycle CU. If light remains on in one of the power converters, that converter may be bad. If lights go out on all converters and CU fails to power up, power switch board may be bad. (Model 1 3B20 CU power switch circuitry includes EAI board, TN11.)
CC NOTE 10	Board is in input output process (IOP) 0.
CC NOTE 11	Board is in IOP 1.
CC NOTE 50	Channel board in the channel 0 position.
CC NOTE 51	Channel board in the channel 1 position.
CC NOTE 52	Channel board in the channel 2 position.
CC NOTE 53	Channel board in the channel 3 position.
CC NOTE 54	Channel board in the channel 4 position.
CC NOTE 55	Channel board in the channel 5 position.
CC NOTE 56	Channel board in the channel 6 position.
CC NOTE 57	Board in the DMA 0 position (Model 1 UN36).
CC NOTE 58	Board in the DMA 1 position (Model 1 UN36).
CC NOTE 59	A channel address lead is being held active by CU, channel, or DMA.
CC NOTE 60	A channel or DMA bus may be responding and/or acknowledging falsely.
CC NOTE 61	A channel or DMA is holding channel error (ER bit 16) active (low).

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
CH NOTE 01	Suspect any channel (CH) or direct memory access (DMA).
CH NOTE 02	Unterminated or defective cable on port under test.
CSU NOTE 01	Verify hardware for the kernel stack in interrupt stack cache memory feature corresponds with the cache store unit (CSU's) unit control block (UCB) hardware version (HV) field. A 1 in bit 0 of this field indicates the feature is present. The hardware for this feature is a UN45C store address translation (SAT), with pins 149 and 047 wired together on the SAT backplane to enable the feature. Discrepancy between HV value and hardware should be corrected.
CSU NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
DMA NOTE 01	Suspect any channel or DMA.
DMA NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
DUIC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
DUIC NOTE 02	Replacement equipment must have same microcode (MC) number.
DCI NOTE 01	The dual serial channel/computer interconnect (DCI) could be powered down. This board is located in the attached processor.
DCI NOTE 02	The attached processor or its software may be the cause of this phase failing.
DFC NOTE 01	The disk file controller (or) disk file control frame (DFC) could be powered down.
DFC NOTE 02	Do not remove power or equipment from an active or in-service unit.
IOP NOTE 01	The input output processor (IOP) could be powered down.
IOP NOTE 02	Do not remove power or equipment from an active or in-service unit.
MASC NOTE 01	Do not remove power or equipment from an active or in-service unit.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MASC NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
MASC NOTE 09	Array identified by DGN CU_ MASC_ PH_ MEMORY FAILURE RESULTS output message.
MASC NOTE 10	Other units on the store bus: CC, other MASC in CU under test (in CUs with two UN39-UN40 MASCs), DMA(s), CSU (if equipped), SAT.
MASC NOTE 12	Any array in Main Store Controller (MASC).
MASC NOTE 13	Other MASC (in CUs with 2 UN39-UN40 MASCs) may have error(s) active in CC ER.
MHD NOTE 01	Part of the DFC, the DFC must be removed from service and powered down before this equipment can be replaced.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MHD NOTE 09	Refer to the Maintenance Instruction Manual for KS-21995,L2 and KS-22707,L2 Memory available from Century Data System, part number 76261-3xx.
MHD NOTE 10	These circuit cards are located in the logic card cage of the KS-22707,L2 Memory unit. Also refer to MHD NOTE 09.
MHD NOTE 11	The Power Amplifier, VP58 is located behind the logic card cage. Also refer to MHD NOTE 09.
MHD NOTE 12	Codes for all circuit cards in the KS-22707,L1 Memory are a four-character string of alpha-numeric or alpha characters. The first character in the string determines the revision level and the last three characters determine the circuit card code. Identification of the circuit card, therefore, is based on the last three characters.
MHD NOTE 13	Read MHD NOTE 12 then proceed. These circuit cards are located in the logic chassis. Refer to Practice 254-302-210, 300 Megabyte Moving Head Disk Drives, General Description, 3B20D Model 2 Processor.
MHD NOTE 14	Read MHD NOTE 12 then proceed. These circuit cards are located on the deck plate of the memory unit. Refer to Maintenance Instruction Manual for KS-22702,L1 memory.
MHD NOTE 16	MHD could be spun down.
MHD NOTE 17	MHD could be powered down. Check power inverter for alarm or no power. Check MHD power cord, power switch, and power indicator. On KS-22875 340MB MHD, check the diagnostic mode switch behind the front panel to ensure it is not in the diagnostic mode and the diagnostic mode indicator light is extinguished.
MHD NOTE 18	Incorrect ID setting could be the cause of this failure.
MT NOTE 18	Incorrect ID setting could be the cause of this failure.
MTC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
MTC NOTE 02	The indicated faulty equipment is in the transport.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MTTYC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
SCSDC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
SDLC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
TTYC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
UC NOTE 01	Field test set (FTS) may have control of the utility circuit (UC).

4. ACTION TO BE TAKEN

Format 1 is failing TLP key summary information. If the failing diagnostic did not have the TLP option specified, request the diagnostic again with the TLP option. The failing TLP key summary information can be used to monitor changes in failing TLP keys. No actions based on the contents of this message are required.

Format 2 provides the ID of the TLP process which is running. No actions based on the contents of this message are required.

Formats 3 and 4 are used to repair the faulty unit using the suspected faulty equipment list. The most likely equipment is at the top of the list.

If the NOTE column *o* has non-zero entries, first read the identified TLP notes for the failing unit from Table 1. TLP notes may contain information regarding the cause of the trouble. Check for any specific trouble identified by the TLP notes. In some cases, the trouble can be resolved without replacing equipment.

If the UNIT column *m* has non-blank entries, the suspected faulty equipment is not in the unit that failed diagnostics. Defer replacing equipment in other units until all suspected equipment in the failing unit has been tried. It may be necessary to reconfigure the system to allow the other unit(s) to be removed from service. It will be necessary to remove from service and power down the other unit(s) before replacing equipment in the other unit(s).

Replace the equipment at the top of the list with a spare, and retest the unit with the diagnostics. If the unit still fails, restore the original equipment to the unit and replace the next equipment on the list with a spare. Continue until faulty equipment found or list exhausted.

SEE PROPRIETARY NOTICE ON COVER PAGE

When faulty equipment is found, verify it causes the diagnostic failure by restoring it to the unit and rerunning diagnostics. If the diagnostics `DO NOT` fail as before, suspect the faulty equipment is intermittent or temperature sensitive. Occasionally, removing and restoring power to the unit or reseating equipment clears the trouble. Note the equipment involved in clearing the trouble. If the diagnostic failure returns and the same equipment is involved in clearing the trouble, replace the equipment.

If asterisks (*) are printed in the equipment location field *i*, TLP cannot directly determine the location of the equipment from the failing diagnostic *a*. If the `UNIT` column *m* is blank, all equipment of the code identified in *h* are implicated in the failing unit. If the `UNIT` column *m* identifies another unit (or units), all equipment of the code identified in *h* are implicated in the unit (or units) identified by *m*. In some cases, further resolution is possible; see below.

If *h* = `UN09`, TLP may not be able to directly determine the channel based on the unit under test. Channel diagnostics should be run to more accurately determine the faulty equipment. For example, if the DMA 0 diagnostic failed and TLP implicated the UN09, run DMA 0 channel diagnostics (CH 11-14).

If *h* = `UN19`, this indicates that TLP cannot directly determine the channel based on the unit under test. Channel diagnostics (CH 0-9) should be run to more accurately determine the faulty equipment.

If *h* = `TN69` or `TN70`, the TN69 or TN70 equipment in the peripheral device being used as a helper unit is being implicated. See the diagnostic listing for further information on the peripheral device involved with the phase which failed. Table 2 translates some of the channel diagnostic phases to the subchannel being tested.

Table 2

Failing CH Phase	Subchannel Under Test
8 or 24	0
9 or 25	1
10 or 26	2
11 or 27	3
12 or 28	4
13 or 29	5
14 or 30	6
15 or 31	7
16 or 32	8
17 or 33	9
18 or 34	10

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2 continued

Failing CH Phase	Subchannel Under Test
19 or 35	11
20 or 36	12
21 or 37	13
22 or 38	14
23 or 39	15

If *h* = TN14, TN28 or TN56, or TN2012, this indicates TLP may not be able to determine the failing mainstore array (MASA) based on the unit under test. Some MASC diagnostic phases have a histogram output message that identifies the failing MASA. If the MASC diagnostic was not run, the MASC diagnostic should be run to more accurately determine the faulty equipment.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To print trouble location information for a failing diagnostic.

Format 1 is always printed after diagnostic failures have occurred. This message summarizes the failing trouble locating procedure (TLP) key information for each failing phase.

Formats 2 - 4 are printed only when diagnostic failures have occurred and the TLP option was specified in the input command. The information in these messages is used to repair the failing unit.

SEE PROPRIETARY NOTICE ON COVER PAGE

See Practices 254-301-100, or 254-302-100 for further details. Also see *System Maintenance Manual*, 254-303-106.

3. VARIABLE FIELD DEFINITIONS

a = Unit and side that failed diagnostic (for example, `CU 0`).

b = Failing diagnostic phase number.

c = Failing TLP keys - word 1. One bit set for each failing TLP key, `0-31`.

d = Failing TLP keys - word 2. One bit set for each failing TLP key, `32-63`.

e = First failing TLP key number.

f = Unique decimal number identifying the TLP process.

g = Model version (mv) of the unit being diagnosed.

h = Equipment code.

i = Equipment location.

j = Functional schematic number for the equipment.

k = Functional schematic symbol number for the equipment.

l = Schematic diagram number for the unit.

m = Unit(s) containing the equipment when not the same as the unit being diagnosed. `DO NOT REMOVE POWER OR EQUIPMENT FROM AN ACTIVE OR IN-SERVICE UNIT.` `ONL` in the unit column means on-line or active unit. `PU` in the unit column means peripheral unit such as disk file controller (DFC) or input output processor (IOP).

n = Weight on a scale from `1` to `10` with the equipment most likely to be faulty having the highest number.

o = Note number. If note is nonzero, see Table 1. Note 0 is not used.

Table 1

Note Number	Definition
`CC NOTE 01`	Do not remove power or equipment from an active or in-service unit.
`CC NOTE 02`	Cable to the maintenance channel of the CU.
`CC NOTE 03`	CU could be held stopped by micro level test set (MLTS) or bus display unit (BDU).

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1

Note Number	Definition
CC NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
CC NOTE 05	MLTS, TN16, or UN16 if equipped.
CC NOTE 06	CU could be powered down.
CC NOTE 07	Power switch board or one of the power converters may be bad. If ALARM is lighted on power switch board, power cycle CU. If light remains on in one of the power converters, that converter may be bad. If lights go out on all converters and CU fails to power up, power switch board may be bad. (Model 1 3B20 CU power switch circuitry includes EAI board, TN11.)
CC NOTE 10	Board is in input output process (IOP) 0.
CC NOTE 11	Board is in IOP 1.
CC NOTE 50	Channel board in the channel 0 position.
CC NOTE 51	Channel board in the channel 1 position.
CC NOTE 52	Channel board in the channel 2 position.
CC NOTE 53	Channel board in the channel 3 position.
CC NOTE 54	Channel board in the channel 4 position.
CC NOTE 55	Channel board in the channel 5 position.
CC NOTE 56	Channel board in the channel 6 position.
CC NOTE 57	Board in the DMA 0 position (Model 1 UN36).

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
CC NOTE 58	Board in the DMA 1 position (Model 1 UN36).
CC NOTE 59	A channel address lead is being held active by CU, channel, or DMA.
CC NOTE 60	A channel or DMA bus may be responding and/or acknowledging falsely.
CC NOTE 61	A channel or DMA is holding channel error (ER bit 16) active (low).
CH NOTE 01	Suspect any channel (CH) or direct memory access (DMA).
CH NOTE 02	Unterminated or defective cable on port under test.
CH NOTE 03	Suspect Helper Unit circuit packs. IOP and DFC circuit packs may be at fault. For the SCSI DFC, these circuit packs include the Host Adapter (HA) and the DFC.
CH NOTE 04	The under-test CH is connected, via the DSCH cable, to another circuit pack. Suspect the DDSBS logic in that circuit pack or the DSCH cable.
CSU NOTE 01	Verify hardware for the kernel stack in interrupt stack cache memory feature corresponds with the cache store unit (CSU's) unit control block (UCB) hardware version (HV) field. A 1 in bit 0 of this field indicates the feature is present. The hardware for this feature is a UN45C store address translation (SAT), with pins 149 and 047 wired together on the SAT backplane to enable the feature. Discrepancy between HV value and hardware should be corrected.
CSU NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
DMA NOTE 01	Suspect any channel or DMA.
DMA NOTE 04	If a ‘‘forced switch’’ of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
DUIC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
DUIC NOTE 02	Replacement equipment must have same microcode (MC) number.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
DCI NOTE 01	The dual serial channel/computer interconnect (DCI) could be powered down. This board is located in the attached processor.
DCI NOTE 02	The attached processor or its software may be the cause of this phase failing.
DFC NOTE 01	The disk file controller (or) disk file control frame (DFC) could be powered down.
DFC NOTE 02	Do not remove power or equipment from an active or in-service unit.
IOP NOTE 01	The input output processor (IOP) could be powered down.
IOP NOTE 02	Do not remove power or equipment from an active or in-service unit.
MASC NOTE 01	Do not remove power or equipment from an active or in-service unit.
MASC NOTE 04	If a ''forced switch'' of the CU is required, special precautions are required to ensure the appropriate initialization level of the out-of-service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an out-of-service CU.
MASC NOTE 09	Array identified by DGN CU_ MASC_ PH_ MEMORY FAILURE RESULTS output message.
MASC NOTE 10	Other units on the store bus: CC, other MASC in CU under test (in CUs with two UN39-UN40 MASCs), DMA(s), CSU (if equipped), SAT.
MASC NOTE 12	Any array in Main Store Controller (MASC).
MASC NOTE 13	Other MASC (in CUs with 2 UN39-UN40 MASCs) may have error(s) active in CC ER.
MHD NOTE 01	Part of the DFC, the DFC must be removed from service and powered down before this equipment can be replaced.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MHD NOTE 09	Refer to the Maintenance Instruction Manual for KS-21995,L2 and KS-22707,L2 Memory available from Century Data System, part number 76261-3xx.
MHD NOTE 10	These circuit cards are located in the logic card cage of the KS-22707,L2 Memory unit. Also refer to MHD NOTE 09.
MHD NOTE 11	The Power Amplifier, VP58 is located behind the logic card cage. Also refer to MHD NOTE 09.
MHD NOTE 12	Codes for all circuit cards in the KS-22707,L1 Memory are a four-character string of alpha-numeric or alpha characters. The first character in the string determines the revision level and the last three characters determine the circuit card code. Identification of the circuit card, therefore, is based on the last three characters.
MHD NOTE 13	Read MHD NOTE 12 then proceed. These circuit cards are located in the logic chassis. Refer to Practice 254-302-210, 300 Megabyte Moving Head Disk Drives, General Description, 3B20D Model 2 Processor.
MHD NOTE 14	Read MHD NOTE 12 then proceed. These circuit cards are located on the deck plate of the memory unit. Refer to Maintenance Instruction Manual for KS-22702,L1 memory.
MHD NOTE 16	MHD could be spun down.
MHD NOTE 17	MHD could be powered down. Check power inverter for alarm or no power. Check MHD power cord, power switch, and power indicator. On KS-22875 340MB MHD, check the diagnostic mode switch behind the front panel to ensure it is not in the diagnostic mode and the diagnostic mode indicator light is extinguished.
MHD NOTE 18	Incorrect ID setting could be the cause of this failure.
MT NOTE 18	Incorrect ID setting could be the cause of this failure.
MTC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
MTC NOTE 02	The indicated faulty equipment is in the transport.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 *(continued)*

Note Number	Definition
MTTYC NOTE 01	Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
SCSDC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
SDLC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
TTYC NOTE 01	Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
UC NOTE 01	Field test set (FTS) may have control of the utility circuit (UC).

4. ACTION TO BE TAKEN

Format 1 is failing TLP key summary information. If the failing diagnostic did not have the TLP option specified, request the diagnostic again with the TLP option. The failing TLP key summary information can be used to monitor changes in failing TLP keys. No actions based on the contents of this message are required.

Format 2 provides the ID of the TLP process which is running. No actions based on the contents of this message are required.

Formats 3 and 4 are used to repair the faulty unit using the suspected faulty equipment list. The most likely equipment is at the top of the list.

If the NOTE column *o* has non-zero entries, first read the identified TLP notes for the failing unit from Table 1. TLP notes may contain information regarding the cause of the trouble. Check for any specific trouble identified by the TLP notes. In some cases, the trouble can be resolved without replacing equipment.

If the UNIT column *m* has non-blank entries, the suspected faulty equipment is not in the unit that failed diagnostics. Defer replacing equipment in other units until all suspected equipment in the failing unit has been tried. It may be necessary to reconfigure the system to allow the other unit(s) to be removed from service. It will be necessary to remove from service and power down the other unit(s) before replacing equipment in the other unit(s).

Replace the equipment at the top of the list with a spare, and retest the unit with the diagnostics. If the unit still fails, restore the original equipment to the unit and replace the next equipment on the list with a spare. Continue until faulty equipment found or list exhausted.

SEE PROPRIETARY NOTICE ON COVER PAGE

When faulty equipment is found, verify it causes the diagnostic failure by restoring it to the unit and rerunning diagnostics. If the diagnostics `DO NOT` fail as before, suspect the faulty equipment is intermittent or temperature sensitive. Occasionally, removing and restoring power to the unit or reseating equipment clears the trouble. Note the equipment involved in clearing the trouble. If the diagnostic failure returns and the same equipment is involved in clearing the trouble, replace the equipment.

If asterisks (*) are printed in the equipment location field *i*, TLP cannot directly determine the location of the equipment from the failing diagnostic *a*. If the `UNIT` column *m* is blank, all equipment of the code identified in *h* are implicated in the failing unit. If the `UNIT` column *m* identifies another unit (or units), all equipment of the code identified in *h* are implicated in the unit (or units) identified by *m*. In some cases, further resolution is possible; see below.

If *h* = `UN09`, TLP may not be able to directly determine the channel based on the unit under test. Channel diagnostics should be run to more accurately determine the faulty equipment. For example, if the DMA 0 diagnostic failed and TLP implicated the UN09, run DMA 0 channel diagnostics (CH 11-14).

If *h* = `UN19`, this indicates that TLP cannot directly determine the channel based on the unit under test. Channel diagnostics (CH 0-9) should be run to more accurately determine the faulty equipment.

If *h* = `TN69` or `TN70`, the TN69 or TN70 equipment in the peripheral device being used as a helper unit is being implicated. See the diagnostic listing for further information on the peripheral device involved with the phase which failed. Table 2 translates some of the channel diagnostic phases to the subchannel being tested.

Table 2

Failing CH Phase	Subchannel Under Test
8 or 24	0
9 or 25	1
10 or 26	2
11 or 27	3
12 or 28	4
13 or 29	5
14 or 30	6
15 or 31	7
16 or 32	8
17 or 33	9
18 or 34	10

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2 continued

Failing CH Phase	Subchannel Under Test
19 or 35	11
20 or 36	12
21 or 37	13
22 or 38	14
23 or 39	15

If *h* = TN14, TN28 or TN56, or TN2012, this indicates TLP may not be able to determine the failing mainstore array (MASA) based on the unit under test. Some MASC diagnostic phases have a histogram output message that identifies the failing MASA. If the MASC diagnostic was not run, the MASC diagnostic should be run to more accurately determine the faulty equipment.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

[15] `REPT CSOP FMMV SYSTEM CALL FAILED`
`APPLY OMDB ABORTED`

2. REASON FOR OUTPUT

To report the result of executing an `APPLY:OMDB` input message.

3. VARIABLE FIELD DEFINITIONS

a = List of message keys for which the `APPLY:OMDB` completed successfully.

b = List of message keys for which the `APPLY:OMDB` failed, that is, these keys no longer exist in the OMDB disk file.

c = Logfile entry containing the syntax error.

d = File name of a temporary file that contains the original contents of the file `OMDB_LOG`.

e = Logfile that contains the update information for the OMDB.

4. ACTION TO BE TAKEN

For Format 1, the list of successful keys can be found in the file `/cft/cpl/OMDB_LOG`.

For Format 4, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the `OP:STATUS-LISTDIR` input message for `/cft/spl/omdb`.

Format 5 most likely results from direct manipulation of the logfile. The entry in error should be examined for the cause of the error, and if appropriate, the `UPD:OMDB` input message can be used to reapply that update with the corrected data. The format of each logfile entry is: a keyword indicating the type of update (either `ALARM` or `MSGCLS`), the new value for either the alarm level or the message class, and a list of keys for which the update had been performed.

Formats 6 and 7 indicate a possible file system problem, such as lack of available disk space.

For Format 8, verify that the coordinator of spooler output processes (CSOP) is running.

For Format 9, re-execute command. If `APPLY` fails again, seek technical assistance.

For Format 10, manually move file d to file e using the UNIX® command mv.

For Formats 11 and 12, re-execute command. If `APPLY` fails again, seek technical assistance.

Format 13 indicates a possible lack of disk space.

For Formats 14 and 15, re-execute command. If APPLY fails again, seek technical assistance.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

2. REASON FOR OUTPUT

To report the result of executing an APPLY:OMDB input message. Format 1 indicates successful execution of the command. Formats 2, 3, 5, and 6 are warning messages. In some cases, updates may have taken place. All other formats indicate complete failure.

3. VARIABLE FIELD DEFINITIONS

a = List of message keys for which the APPLY:OMDB failed, that is, these keys no longer exist in the OMDB disk file.

b = Logfile entry containing the syntax error.

4. ACTION TO BE TAKEN

Format 1 indicates success; no action is required. However, the list of successful updates can be found in the file /cft/cpl/OMDB_LOG.

Format 2 indicates that no record of previous updates could be found. If no updates have been made to the OMDB previously, this message can be ignored. If previous updates have been made to the OMDB, seek technical assistance.

Format 3 indicates that some of the updates failed. This generally indicates that keys have been removed from the OMDB. Verify that the keys listed no longer exist using the OP:OMDB input message to examine the DISK copy of the OMDB. If the keys do not exist, the message can be ignored. If the keys do exist, seek technical assistance.

Format 4 indicates that the OMDB disk file could not be accessed. Seek technical assistance.

Format 5 most likely results from direct manipulation of the logfile. The entry in error should be examined for the cause of the error, and if appropriate, the UPD:OMDB input message can be used to reapply that update with the corrected data. The format of each logfile entry is: a keyword indicating the type of update (either ALARM or MSGCLS), the new value for either the alarm level or the message class, and a list of keys for which the update had been performed.

Formats 6 and 7 indicate a possible file system problem. Use the OP:STATUS:FREEDISK input message to check if the root file system is out of place. If the file system is out of place, clean up unused files and retry the command. If the file system is not out of space, seek technical assistance.

Format 8 indicates that the command could not send a message to the coordinator of spooler output processes (CSOP). Seek technical assistance.

Formats 9 through 12 indicate that CSOP could not make a new temporary copy of the OMDB for applying updates while the OMDB is in the temporary state. Seek technical assistance.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

2. REASON FOR OUTPUT

To report the result of executing an APPLY:OMDB input message. Format 1 indicates successful execution of the command. Formats 2, 3, 5, and 6 are warning messages. In some cases, updates may have taken place. All other formats indicate complete failure.

3. VARIABLE FIELD DEFINITIONS

a = List of message keys for which the APPLY:OMDB failed, that is, these keys no longer exist in the OMDB disk file.

b = Logfile entry containing the syntax error.

4. ACTION TO BE TAKEN

Format 1 indicates success; no action is required. However, the list of successful updates can be found in the file /cft/cpl/OMDB_LOG.

Format 2 indicates that no record of previous updates could be found. If no updates have been made to the OMDB previously, this message can be ignored. If previous updates have been made to the OMDB, seek technical assistance.

Format 3 indicates that some of the updates failed. This generally indicates that keys have been removed from the OMDB. Verify that the keys listed no longer exist using the OP:OMDB input message to examine the DISK copy of the OMDB. If the keys do not exist, the message can be ignored. If the keys do exist, seek technical assistance.

Format 4 indicates that the OMDB disk file could not be accessed. Seek technical assistance.

Format 5 most likely results from direct manipulation of the logfile. The entry in error should be examined for the cause of the error, and if appropriate, the UPD:OMDB input message can be used to reapply that update with the corrected data. The format of each logfile entry is: a keyword indicating the type of update (either ALARM or MSGCLS), the new value for either the alarm level or the message class, and a list of keys for which the update had been performed.

Formats 6 and 7 indicate a possible file system problem. Use the OP:STATUS:FREEDISK input message to check if the root file system is out of place. If the file system is out of place, clean up unused files and retry the command. If the file system is not out of space, seek technical assistance.

Format 8 indicates that the command could not send a message to the coordinator of spooler output processes (CSOP). Seek technical assistance.

Formats 9 through 12 indicate that CSOP could not make a new temporary copy of the OMDB for applying updates while the OMDB is in the temporary state. Seek technical assistance.

{`CONFLICT WITH CURRENT SYSTEM STATUS` *i*
|`RETRY LATER` *j*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *k*}

[6] `AUD CUMEM 1 AUTOMATICALLY` *l*

2. REASON FOR OUTPUT

To report the termination status of the cumem audit and/or any error found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.

d = Error code, in decimal notation. Possible error codes are:

2 — Bad data in the equipment configuration data base (ECD) for a control unit (CU) unit or subunit.
4 — Could not access the ECD. Possibly a bad record identification number (RID).
6 — Maintenance channel failed.
8 — Could not read the offline mainstore.
10 — Call to the kconfig library failed.
12 — Erroneous major state for a CU unit or subunit.
14 — Bad online system status register (SSR) value.
16 — Bad offline SSR value.
18 — Bad online hardware status register (HSR) value.
20 — Bad offline HSR value.
24 — Plant measurements library call failed.
26 — Audit control library call failed.
28 — Internal CUMEM error.
30 — Offline store access failed.
32 — Internal error during memory compare.
34 — Memory mismatch mainstore error.
36 — Memory mismatch cache error.
38 — CUMEM tried to run, CUs not in active standby.

e = Audit test number that failed. If *d* = 30, 34, or 36, then this is the physical mainstore address at which the test failed.

Test Number	Description
0x2000	Memory audit did not complete its entire memory block comparison.
0x2001	Call to kconfig *rptrerr* unsuccessful.
0x2002	Call to kconfig *rptrerr* unsuccessful.
0x2003	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x2004	CUMEM called when offline CU was not standby.

f = Was error corrected.

1 — Yes.
15 — No.

g = Complemented offline SSR value (asserted = 1). If *d* = 30, 34, or 36, this field is not used and has value equal to 0.

h = Complemented online SSR value (asserted = 1). If *d* = 30, 34, or 36, this field is not used and has value equal to 0.

i = Explanation of error - see Audit Appendix C, AUD-APPC.

j = Explanation of error - see Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Audit Appendixes A and B, AUD-APPA and AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. See the *System Maintenance Manual* for additional information on audits. The following table contains some possible actions to specific error codes. If the message persists, contact your next level of technical assistance.

Error Number:	Action:
4	Run the ECD 1 audit.
6	If the offline CU was not taken out of service, remove it. Diagnose it, repair it if necessary, and restore it. Then switch CUs and remove, diagnose, repair and restore the other CU.
8	The offline CU should have been removed automatically. Diagnose it, repair it if necessary, and restore it. Then switch CUs and remove, diagnose, repair, and restore the other CU.
24	Run the PMS 1 audit.
30	The offline CU should have been removed automatically. Diagnose it, repair it if necessary, and restore it. Then switch CUs and remove, diagnose, repair, and restore the other CU.

SEE PROPRIETARY NOTICE ON COVER PAGE

34	If the offline CU was not taken out of service, remove it. Diagnose it, repair it if necessary, and restore it.
36	If the online CU was not taken out of service, switch CUs and remove it. Diagnose it, repair it if necessary, and restore it.

5. ALARMS

2. REASON FOR OUTPUT

To report the termination status of the custat audit and/or any error found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code in decimal notation. Possible error codes are:

2 — Bad data in the equipment configuration data base (ECD) for a CU unit or subunit.
4 — Could not access the ECD. Possibly a bad process identification (PID).
6 — Maintenance channel failed.
8 — Could not read the off-line mainstore.
10 — Call to the kconfig library failed.
12 — Erroneous major state for a CU unit or subunit.
14 — Bad on-line system status resister (SSR) value.
16 — Bad off-line SSR value.
18 — Bad on-line hardware status resister (HSR) value.
20 — Bad off-line HSR value.
24 — Plant measurements library call failed.
26 — Audit control library call failed.
28 — Internal CUSTAT error.
30 — Off-line store access failed.
32 — Internal error during memory compare.
34 — Memory mismatch mainstore error.
36 — Memory mismatch cache error.
38 — CUMEM tried to run, CUs not in active standby.
42 — EAI buffers mismatch.

e = Audit test number that failed. If *d* = 30, 34, or 36, then this is the physical mainstore address at which the test failed.

Test Number	Description
0x1000	RID for on-line CU is IDNULL.
0x1001	Call to ECD lla_rdget to get on-line CU UCB unsuccessful.
0x1002	On-line CU UCB indicates device type other than DEV_CU.
0x1003	RID for off-line CU is same as RID for on-line CU.
0x1004	Call to ECD lla_rdget to get off-line CU UCB unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description *(continued)*
0x1005	Off-line CU UCB indicates device type other than DEV_CU.
0x1006	Call to ECD lla_rdget to get on-line CU minor device chain table (MDCT) unsuccessful.
0x1007	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x1008	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x1009	MDCT *m_minxt[0]* equals *m_minxt[1]* indicating that CU0 and CU1 have same RIDs.
0x100a	MDCT *m_minxt[0]* does not equal RID for on-line or off-line CU.
0x100b	MDCT *m_minxt[1]* does not equal RID for on-line or off-line CU.
0x1100	Maintenance channel (MCH) not functional.
0x1101	Off-line CU memory access failure; update circuit not functional.
0x1102	Call to kconfig fltdrvr to remove other CU unsuccessful.
0x1103	Call to kconfig fltdrvr to remove other CU unsuccessful.
0x1200	On-line CU UCB major state not active or init.
0x1201	Call to kconfig chgstate for on-line CU ACT unsuccessful.
0x1202	Off-line CU SSR (SSR_CC bit 19) indicates it is the on-line CU.
0x1203	Call to PCPAUD initofl to initialize off-line CU unsuccessful;
0x1204	Call to kconfig fltdrvr to remove other CU unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description *(continued)*
0x1205	Off-line CU UCB major state active.
0x1206	Call to kconfig fltdrvr to remove other CU unsuccessful. Other CU UCB has major state of active.
0x1207	Simplex mode on-line CU SSR has force off-line (SSR_FOFL bit 9) asserted.
0x1208	On-line CU HSR bit 8 (backup maintenance channel bit) asserted.
0x1209	On-line CU HSR bit 8 or bit 9 (backup maintenance channel bits) asserted.
0x120a	Call to kconfig fltdrvr to remove other CU unsuccessful.
0x120b	On-line CU SSR IO disable (SSR_DSAB bit 30) asserted.
0x120c	On-line CU SSR isolate DMA from MAS bus (SSR_ISOD bit 20) asserted.
0x120d	Off-line CU SSR initialization sequence control bits (SSR_ISC0 or SSR_ISC1 bits 4 and 5) asserted.
0x1300	On-line CU SSR is in enable update mode (SSR_UPD bit 19 asserted) but off-line CU SSR has isolate other (on-line) CU from main store bus (SSR_ISOU bit 21) asserted.
0x1301	Call to kconfig fltdrvr to remove other CU unsuccessful.
0x1302	Off-line CU SSR is in enable update mode (SSR_UPD bit 19 asserted) or off-line CU SSR has isolate other (on-line) CU from main store bus (SSR_ISOU bit 21) asserted.
0x1303	Call to PCPAUD initofl to initialize off-line CU unsuccessful.
0x1304	Call to kconfig fltdrvr to remove other CU unsuccessful.
0x1305	Simplex on-line CU SSR in enable update mode (SSR_UPD bit 19 asserted).

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description *(continued)*
0x1306	On-line CU SSR not isolating other (off-line) CU from its main store bus (SSR_ISOU bit 21 not asserted).
0x1307	3B21D CUs only: On-line CU SSR not isolating its expansion slots from its main store bus (SSR_ISOE bit 22 not asserted).
0x1308	3B21D CUs only: Off-line CU SSR not isolating its expansion slots from its main store bus (SSR_ISOE bit 22 not asserted).
0x1309	Call to init the off-line CU unsuccessful.
0x1400	On-line CU UCB not marked as updated.
0x1401	Call to ECD lla_rdget to get on-line CU UCB unsuccessful.
0x1402	Call to ECD lla_uprid to update on-line CU UCB to updated failed.
0x1403	Off-line CU UCB marked standby, but its UCB not marked updated or on-line CU SSR not in enable update mode (SSR_UPD bit 19 not asserted).
0x1404	Call to kconfig fltdrvr to remove other CU unsuccessful.
0x1405	On-line CU SSR not in enable update mode (SSR_UPD bit 19 not asserted), but off-line CU UCB marked updated.
0x1406	Call to ECD chucb to update off-line CU UCBs to not updated unsuccessful.
0x1500	3B20D CUs only: Duplex configuration, but on-line CU SSR indicating simplex (SSR_SIDU bit 2 not asserted).
0x1501	3B20D CUs only: Same as 0x1500 except off-line CU SSR indicating simplex (SSR_SIDU bit 2 not asserted).
0x1502	Simplex configuration but on-line CU indicating duplex (SSR_SIDU bit 2 asserted).

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description *(continued)*
0x1503	Off-line CU SSR has force on-line (SSR-FONL bit 10) asserted.
0x1504	On-line CU SSR forced on-line (SSR_FONL bit 10) asserted, off-line CU SSR forced off-line (SSR_FONL bit 9) not asserted).
0x1505	On-line CU SSR forced on-line (SSR_FONL bit 10) not asserted, off-line CU SSR forced off-line (SSR_FOFL bit 9) asserted.
0x1506	Both CU SSRs indicate they are CU 1 (SSR_CCID bit 0 asserted).
0x1507	Both CU SSRs indicate they are CU 0 (SSR_CCID bit 0 not asserted).
0x1508	Off-line CU SSR has power clear (SSR_PCLR bit 15) asserted.
0x1509	Call to PCPAUD initofl to initialize off-line CU unsuccessful.
0x150a	Off-line CU has HSR bit 8, 9, or 31 asserted.
0x150b	Call to PCPAUD initofl to initialize off-line CU unsuccessful.
0x150c	Call to ECD *gnxt* unsuccessful in on-line CU UCB chain.
0x150d	Calls to ECD *gnxt* did not find a CC UCB (u_dtype=DEV_CC) in the on-line CU UCB chain.
0x150e	Call to ECD *gnxt* unsuccessful in off-line CU UCB chain.
0x150f	Calls to ECD *gnxt* did not find a CC UCB (u_dtype=DEV_CC) in the off-line CU UCB chain.
0x1510	On-line CU 1 CC 0 UCB does not have *u_opccid* (bit 4) asserted in *u_equip*.
0x1511	On-line CU 0 CC 0 UCB has *u_opccid* (bit 4) asserted in *u_equip*.
0x1512	Off-line CU 0 CC 0 UCB has *u_opccid* (bit 4) asserted in *u_equip*.

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description *(continued)*
0x1513	Off-line CU 1 CC 0 UCB does not have *u_opccid* (bit 4) asserted in *u_equip*.
0x1514	3B20D CUs only: Duplex configuration, but on-line CU CC 0 UCB specifying simplex (*u_opsimdup* bit 6 not asserted in *u_equip*).
0x1515	3B20D CUs only: Duplex configuration, but off-line CU CC 0 UCB specifying simplex (*u_opsimdup* bit 6 not asserted in *u_equip*).
0x1516	3B20D CUs only: Simplex configuration, but CU CC 0 UCB specifying duplex (*u_opsimdup* bit 6 asserted in *u_equip*).
0x1517	On-line CU SSR has power clear (SSR_PCLR bit 15) asserted.
0x1518	ECD access of the on-line MASC UCB failed. Call to ECD lla_rdget to get on-line CU MASC UCB unsuccessful.
0x1519	ECD access of the off-line MASC UCB failed. Call to ECD lla_rdget to get off-line CU MASC UCB unsuccessful.
0x151a	3B20D CUs only: On-line CU memory controller type indicators inconsistent between the SSR (SSR_VLMAS bit 1) and the MASC UCB.
0x151b	3B20D CUs only: Off-line CU memory controller type indicators inconsistent between the SSR (SSR_VLMAS bit 1) and the MASC UCB.
0x151c	Call to kconfig fltdrvr to remove other CU unsuccessful.
0x1600	CU 0 and CU 1 EAI data buffers mismatch.
0x1601	Call to PCPAUD getoflipb to read off-line CU EAI IPB unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description *(continued)*
0x2000	Memory comparison did not complete its entire memory block comparison.
0x2001	Call to kconfig *rptrerr* unsuccessful.
0x2002	Call to kconfig *rptrerr* unsuccessful.
0x2003	Call to kconfig *fltdrvr* to remove other CU unsuccessful.

f = Was error corrected?

`1` — Yes.

`15` — No.

g = Complemented off-line SSR value (asserted = 1). If *d* = `30`, `34`, or `36`, this field is not used and has value equal to `0`.

h = Complemented on-line SSR value (asserted = 1). If *d* = `30`, `34`, or `36`, this field is not used and has value equal to `0`.

i = Explanation of error - see Audit Appendix C, `AUD-APPC`.

j = Explanation of error - see Audit Appendix D, `AUD-APPD`.

NOTE: See Audit Appendixes A and B, `AUD-APPA` and `AUD-APPB`, for assorted parsing errors when the IM catalog is not active.

k = Explanation of error - see Audit Appendix B, `AUD-APPB`.

l = Inhibit status. Possible values are:

`INHIBITED` — Audit has been automatically inhibited by SIM.
`ALLOWED` — Audit has been automatically allowed by SIM.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. See the *System Maintenance Manual* for additional information on audits. The following table contains some possible actions to specific error codes. If the message persists, contact your next level of technical assistance.

Fault Type	Action
4	Run ECD 1 audit.
6	Check maintenance channel cable. Run CU diagnostics on the off-line CU. The problem could also be in the on-line CU maintenance channel. Switch CUs, run CU diagnostics. The problem is serious and should be taken care of as soon as possible.
8	Run CU diagnostics, switch CUs, run CU diagnostics.
14	Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.
16	Take action on this error only if it occurs repeatedly. Run CU diagnostics.
18	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.

SEE PROPRIETARY NOTICE ON COVER PAGE

20	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
24	Run plant measurements system (PMS) 1 audit.
30	Run CU diagnostics, switch CUs, run CU diagnostics.
42	Clear the EAIs with a poke 14 on the EAI page of the MTTY. Take further action on this error only if it occurs repeatedly. Run CU diagnostics, switch CUs, run CU diagnostics.

5. ALARMS

To report the termination status of the custat audit and/or any error found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.

SEE PROPRIETARY NOTICE ON COVER PAGE

7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code in decimal notation. Possible error codes are:

2 — Bad data in the equipment configuration data base (ECD) for a CU unit or subunit.
4 — Could not access the ECD. Possibly a bad process identification (PID).
6 — Maintenance channel failed.
8 — Could not read the off-line mainstore.
10 — Call to the kconfig library failed.
12 — Erroneous major state for a CU unit or subunit.
14 — Bad on-line system status resister (SSR) value.
16 — Bad off-line SSR value.
18 — Bad on-line hardware status resister (HSR) value.
20 — Bad off-line HSR value.
24 — Plant measurements library call failed.
26 — Audit control library call failed.
28 — Internal CUSTAT error.
30 — Off-line store access failed.
32 — Internal error during memory compare.
34 — Memory mismatch mainstore error.
36 — Memory mismatch cache error.
38 — CUMEM tried to run, CUs not in active standby.
42 — EAI buffers mismatch.
44 — SSR values inconsistent between CUs.

e = Audit test number that failed. If *d* = 30, 34, or 36, then this is the physical mainstore address at which the test failed.

Test Number	Description
0x1000	RID for on-line CU is IDNULL.
0x1001	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x1002	On-line CU UCB *u_dtype* (device type) not DEV_CU.

Test Number	Description
0x1003	RID for off-line CU is same as RID for on-line CU.
0x1004	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x1005	Off-line CU UCB *u_dtype* (device type) not DEV_CU.
0x1006	Call to ECD *lla_rdget* to get on-line CU minor device chain table (MDCT) unsuccessful.
0x1007	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x1008	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x1009	MDCT *m_minxt[0]* equals *m_minxt[1]* indicating that CU0 and CU1 have same RIDs.
0x100a	MDCT *m_minxt[0]* does not equal RID for on-line or off-line CU.
0x100b	MDCT *m_minxt[1]* does not equal RID for on-line or off-line CU.
0x1100	Maintenance channel (MCH) not functional.
0x1101	Off-line CU memory access failure; update circuit not functional.
0x1102	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x1103	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x1105	Maintenance channel (MCH) and update circuit not functional; but other CU UCB *u_stat* is STBY (standby).
0x1106	Call to kconfig *fltdrvr* to remove other CU unsuccessful.

Test Number	Description (*continued*)
0x1107	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x1108	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x1109	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x110b	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x110c	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x110d	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x110e	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x1200	On-line CU UCB *u_stat* not ACT (active) or INIT (initializing).
0x1201	Call to kconfig *chgstate* to change on-line CU UCB *u_stat* to ACT unsuccessful.
0x1202	Off-line CU SSR (SSR_CC bit 19) indicates it is the on-line CU.
0x1203	Call to PCPAUD *initofl* to initialize off-line CU unsuccessful.
0x1204	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x1205	Off-line CU UCB *u_stat* is ACT.
0x1206	Call to kconfig *fltdrvr* to remove other CU unsuccessful; Other CU UCB *u_stat* is ACT.
0x1207	Simplex mode on-line CU SSR has force off-line (SSR_FOFL bit 9) asserted.
0x1208	On-line CU HSR bit 8 (backup maintenance channel bit) asserted.

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description (*continued*)
0x1209	On-line CU HSR bit 8 or bit 9 (backup maintenance channel bits) asserted.
0x120a	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x120b	On-line CU SSR IO disable (SSR_DSAB bit 30) asserted.
0x120c	On-line CU SSR isolate DMA from MAS bus (SSR_ISOD bit 20) asserted.
0x120d	Off-line CU SSR initialization sequence control bits (SSR_ISC0 or SSR_ISC1 bits 4 and 5) asserted.
0x1300	On-line CU SSR is in enable update mode (SSR_UPD bit 19 asserted) but off-line CU SSR has isolate other (on-line) CU from main store bus (SSR_ISOU bit 21) asserted.
0x1301	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x1302	Off-line CU SSR is in enable update mode (SSR_UPD bit 19 asserted) or off-line CU SSR has isolate other (on-line) CU from main store bus (SSR_ISOU bit 21) asserted.
0x1303	Call to PCPAUD *initofl* to initialize off-line CU unsuccessful.
0x1304	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x1305	Simplex on-line CU SSR in enable update mode (SSR_UPD bit 19 asserted).
0x1306	On-line CU SSR not isolating other (off-line) CU from its main store bus (SSR_ISOU bit 21 not asserted).
0x1307	3B21D CUs only: On-line CU SSR not isolating its expansion slots from its main store bus (SSR_ISOE bit 22 not asserted).

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description (*continued*)
0x1308	3B21D CUs only: Off-line CU SSR not isolating its expansion slots from its main store bus (SSR_ISOE bit 22 not asserted).
0x1309	Call to PCPAUD *initofl* to initialize off-line CU unsuccessful.
0x1400	On-line CU UCB *u_update* is OFF (not updated).
0x1401	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x1402	Call to ECD *lla_uprid* to change on-line CU UCB *u_update* to ON (updated) unsuccessful.
0x1403	Off-line CU UCB *u_stat* is STBY (standby), but off-line CU UCB *u_update* is OFF (not updated) or on-line CU SSR is not in enable update mode (SSR_UPD bit 19 not asserted).
0x1404	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x1405	On-line CU SSR not in enable update mode (SSR_UPD bit 19 not asserted), but off-line CU UCB *u_update* is ON (updated).
0x1406	Call to ECD *chucb* to change off-line CU UCBs *u_update* to OFF unsuccessful.
0x1500	3B20D CUs only: Duplex configuration, but on-line CU SSR indicating simplex (SSR_SIDU bit 2 not asserted).
0x1501	3B20D CUs only: Same as 0x1500 except off-line CU SSR indicating simplex (SSR_SIDU bit 2 not asserted).
0x1502	Simplex configuration but on-line CU indicating duplex (SSR_SIDU bit 2 asserted).
0x1503	Off-line CU SSR has force on-line (SSR-FONL bit 10) asserted.
0x1504	On-line CU SSR forced on-line (SSR_FONL bit 10) asserted, off-line CU SSR forced off-line (SSR_FONL bit 9) not asserted).

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description (*continued*)
0x1505	On-line CU SSR forced on-line (SSR_FONL bit 10) not asserted, off-line CU SSR forced off-line (SSR_FOFL bit 9) asserted.
0x1506	Both CU SSRs indicate they are CU 1 (SSR_CCID bit 0 asserted).
0x1507	Both CU SSRs indicate they are CU 0 (SSR_CCID bit 0 not asserted).
0x1508	Off-line CU SSR has power clear (SSR_PCLR bit 15) asserted.
0x1509	Call to PCPAUD *initofl* to initialize off-line CU unsuccessful.
0x150a	Off-line CU has HSR bit 8, 9, or 31 asserted.
0x150b	Call to PCPAUD *initofl* to initialize off-line CU unsuccessful.
0x150c	Call to ECD *gnxt* unsuccessful in on-line CU UCB chain.
0x150d	Calls to ECD *gnxt* did not find a CC UCB (*u_dtype*=DEV_CC) in the on-line CU UCB chain.
0x150e	Call to ECD *gnxt* unsuccessful in off-line CU UCB chain.
0x150f	Calls to ECD *gnxt* did not find a CC UCB (*u_dtype*=DEV_CC) in the off-line CU UCB chain.
0x1510	On-line CU 1 CC 0 UCB does not have *u_opccid* (bit 4) asserted in *u_equip*.
0x1511	On-line CU 0 CC 0 UCB has *u_opccid* (bit 4) asserted in *u_equip*.
0x1512	Off-line CU 0 CC 0 UCB has *u_opccid* (bit 4) asserted in *u_equip*.
0x1513	Off-line CU 1 CC 0 UCB does not have *u_opccid* (bit 4) asserted in *u_equip*.

SEE PROPRIETARY NOTICE ON COVER PAGE

Test Number	Description (*continued*)
0x1514	3B20D CUs only: Duplex configuration, but on-line CU CC 0 UCB specifying simplex (*u_opsimdup* bit 6 not asserted in *u_equip*).
0x1515	3B20D CUs only: Duplex configuration, but off-line CU CC 0 UCB specifying simplex (*u_opsimdup* bit 6 not asserted in *u_equip*).
0x1516	3B20D CUs only: Simplex configuration, but CU CC 0 UCB specifying duplex (*u_opsimdup* bit 6 asserted in *u_equip*).
0x1517	On-line CU SSR has power clear (SSR_PCLR bit 15) asserted.
0x1518	Call to ECD *lla_rdget* to get on-line CU MASC UCB unsuccessful.
0x1519	Call to ECD *lla_rdget* to get off-line CU MASC UCB unsuccessful.
0x151a	3B20D CUs only: On-line CU memory controller type indicators inconsistent between the SSR (SSR_VLMAS bit 1) and the MASC UCB.
0x151b	3B20D CUs only: Off-line CU memory controller type indicators inconsistent between the SSR (SSR_VLMAS bit 1) and the MASC UCB.
0x151c	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x151d	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x1600	CU 0 and CU 1 EAI data buffers mismatch.
0x1601	Call to PCPAUD *getoflipb* to read off-line CU EAI IPB (Initialization Parameter Buffer) unsuccessful.
0x2000	Memory comparison did not complete its entire memory block comparison.
0x2001	Call to kconfig *rptrerr* unsuccessful.
0x2002	Call to kconfig *rptrerr* unsuccessful.
0x2003	Call to kconfig *fltdrvr* to remove other CU unsuccessful.

f = Was error corrected?

1 — Yes.
15 — No.

g = Complemented off-line SSR value (asserted = 1). If *d* = 30, 34, or 36, this field is not used and has value equal to 0.

h = Complemented on-line SSR value (asserted = 1). If *d* = 30, 34, or 36, this field is not used and has value equal to 0.

i = Explanation of error - see Audit Appendix C, AUD-APPC.

j = Explanation of error - see Audit Appendix D, AUD-APPD.

NOTE: See Audit Appendixes A and B, AUD-APPA and AUD-APPB, for assorted parsing errors when the IM catalog is not active.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. See the *System Maintenance Manual* for additional information on audits. The following table contains some possible actions to specific error codes. If the message persists, contact your next level of technical assistance.

Fault Type	Action
4	Run ECD 1 audit.
6	Check maintenance channel cable. Run CU diagnostics on the off-line CU. The problem could also be in the on-line CU maintenance channel. Switch CUs, run CU diagnostics. The problem is serious and should be taken care of as soon as possible.
8	Run CU diagnostics, switch CUs, run CU diagnostics.

SEE PROPRIETARY NOTICE ON COVER PAGE

Fault Type	Action
14	Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.
16	Take action on this error only if it occurs repeatedly. Run CU diagnostics.
18	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
4	Run ECD 1 audit.
20	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
24	Run plant measurements system (PMS) 1 audit.
30	Run CU diagnostics, switch CUs, run CU diagnostics.
42	Clear the EAIs with a poke 14 on the EAI page of the MTTY. Take further action on this error only if it occurs repeatedly. Run CU diagnostics, switch CUs, run CU diagnostics.
44	Take action on this error only if it occurs repeatedly. Either CU could cause inconsistent values between the SSRs. Run CU diagnostics, switch CUs, run CU diagnostics.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

|`RETRY LATER` *i*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *j*}

[7] `AUD` *a* `AUTOMATICALLY` *k*

2. REASON FOR OUTPUT

To report the termination status of the equipment configuration data base (ECD) audit and / or any errors found.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Audit member. One of the following:

1 — Structural incore ECD audit.
2 — Structural disk ECD audit.
3 — Raw data incore ECD audit.

b = Instance name (appears when *a* = 2).

ECD — DMERT only ECD.
APPECD — Application ECD.

c = Total number of errors found.

d = Total number of errors corrected.

e = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.

f = Error code. Possible error codes are:

(1-2999) — LLA structural error.
(3000-3999) — Fatal error.
(4000-4999) — Error.
(5000-5999) — Correction.

g = Explanation of error identified by error code. If error code is 1-2999, see the LLA-APP appendix in the Appendixes section of this manual. If error code is 3000-5999, see Table 1.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1

f:	*g*:
3000	Cannot open incore ECD, errno = *x*.
3001	'malloc' failure, errno = *x*.
3001	'malloc' failure.
3002	Read failure for *z*, errno = *x*.
3002	Read failure for *z*.
3003	Incore ECD has fewer records than audit ECD, *z*.
3004	Incore ECD has more records than audit ECD, *z*.
3005	'lla_rdget' failure for incore ECD to check RCV semaphore.
3006	Recent change in progress.
3007	'lla_ainit' failure for structural audit.
3008	'lla_irel' failure for incore ECD.
3009	'lla_dbrel' failure for *z*.
3010	Cannot open disk ECD, *z*, errno = *x*.
3010	Cannot open disk ECD, *z*.
3011	'lla_nsqrid' failure for *z*.
3012	'getport' failure, errno = *x*.
3013	'getseg' failure, errno -*x*.
3014	'lla_iatt' failure for incore ECD.
3015	'lla_opensq' failure for incore ECD.
3016	Audit copy corrupted, z.
3017	Fopen failure for *z*, errno = *x*.
3017	Fopen failure for *z*.
3018	Fread failure for *z*, errno = *x*.
3018	Fread failure for *z*.
3019	Fseek failure for *z*, errno = *x*.
3019	Fseek failure for *z*.
3020	Fwrite failure for *z*, errno = *x*.
3020	Fwrite failure for *z*.
3021	The incore ECD does not match the disk ECD z.
3022	Driver PID notification table entries out of space.
3023	Unable to create segment because of insufficient swap space, or there is insufficient address space in the user's address space for the segment.
4000	'lla_rinfo' failure for *z*, RID = *y*.
4001	Incore RID does not match audit (*z*) RID.
4002	'lla_rdget' failure for *z*, RID = *y*.
4003	Record size of incore ECD does not match record size of audit *z*.

Table 1 *(continued)*

f:	*g*:
4004	Record type of incore does not match audit, *z*, RID = *y*.
4005	`'lla_uprid'` failure for *z*, RID = *y*.
4006	Local copy record changes: unable to notify driver, PID = *x*.
4007	Possible inconsistency (structure corrected) of disk ECD, *z*.
4008	Structural audit cannot continue without previous corrections.
4009	UCB *a b c d* points down to a UCB which does not point back up for *z*.
4010	UCB *a b c d* has incorrect UP0 pointer for its side chain for *z*.
4011	UCB *a b c d* has incorrect UP1 pointer for its side chain for *z*.
4012	UCB *a b c d* points down to the beginning of a side chain loop for *z*.
4013	UCB *a b c d* should not have a side pointer for *z*.
4014	UCB *a b c d* points down to itself for *z*.
5000	Record corrected, RID = *y*, record = *z*. Incore record data will be followed by audit record data.
5001	Record corrected, RID = *y*, record = *z*. Incore record data will be followed by audit record data. For *lla* audit error messages reference file *w*.

a = ucb complex unit
b = ucb unit
c = ucb complex unit
d = ucb name
w = file name one of the following:
/etc/log/ecdaud-disk - for disk audit
/etc/log/ecdaud-struc - for structural incore audit
/etc/log/ecdaud-raw - for raw audit
x = integer
y = hexadecimal integer
z = database name

h = Explanation of error - see Audit Appendix C, AUD-APPC.

i = Explanation of error - see Audit Appendix D, AUD-APPD, in the Appendixes section of this manual.

j = Explanation of error - see Audit Appendix B, AUD-APPB.

k = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

SEE PROPRIETARY NOTICE ON COVER PAGE

NOTE: See Audit Appendixes A and B, AUD-APPA and AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit was manually run in the noncorrecting mode and the output indicates that corrections are needed, rerun the audit in correcting mode.

Note that recent changes should not be applied while an audit that uses the ECD is running.

Seek technical assistance if errors occur.

5. ALARMS

None.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 78.
Formats 2 and 3 have an OMDB key of 76.
Format 4 has an OMDB key of 52.
Format 5 has an OMDB key of 64.

The following OMDB keys apply to the error codes listed in Table 1.

Error codes 3000, 3001, 3003, 3004, 3005, 3007, 3008, 3009, 3011, 3012, 3013, 3014, 3015, 3016, 3021, 3022, 4006, 4007, and 4008 have an OMDB key of 459.
Error codes 3002, 3010, 3017, 3018, 3019, and 3020 have an OMDB key of 458.
Error code 3021 has an OMDB key of 607.
Error codes 4000, 4002, 4004, and 4005 have an OMDB key of 457.
Error code 4001 has an OMDB key of 456.
Error code 4003 has an OMDB key of 455.
Error codes 4009, 4010, 4011, 4012, 4013, 4014 have an OMDB key of 617.
Error code 5000 has an OMDB key of 454.
Error code 5001 has OMDB keys of 454 and 459.

2. REASON FOR OUTPUT

To report the termination status of the equipment configuration data base (ECD) audit and / or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. One of the following:

1 - Structural incore ECD audit.
2 - Structural disk ECD audit.
3 - Raw data incore ECD audit.

b = Instance name (appears only when *a* = 2).

`ECD` — DMERT only ECD.
`APPECD` — Application ECD.

c = Total number of errors found.

d = Total number of errors corrected.

e = Abort code. Possible values are:

`3` — Audit was aborted without completing its work.
`4` — Audit was faulted while correcting errors.
`5` — System integrity monitor (SIM) could not start or dispatch the audit.
`6` — An error was encountered in the audit control/audit library interface.
`7` — Audit exceeded its timeout or segment limit.
`8` — SIM aborted an executing routine audit because of a blocking request.
`9` — Transient process that was running the process terminated.
`10` — A segmented audit exceeded an error threshold.

f = Error code. Possible error codes are:

(`1-2999`) - LLA structural error.
(`3000-3999`) - Fatal error.
(`4000-4999`) - Error.
(`5000-5999`) - Correction.

g = Explanation of error identified by error code. If error code is `1-2999`, see the `LLA-APP` appendix in the Supplementary Information section of this manual. If error code is `3000-5999`, see Table 1 in this message.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1

f:	*g*:
3000	Cannot open incore ECD, errno = *x*.
3001	'malloc' failure, errno = *x*.
3001	'malloc' failure.
3002	Read failure for *z*, errno = *x*.
3002	Read failure for *z*.
3003	Audit ECD *z* has more records than incore ECD.
3004	Incore ECD has more records than audit ECD *z*.
3005	'lla_rdget' failure for incore ECD to check RCV semaphore.
3006	Audits blocked during RCV session - try later.
3007	'lla_ainit' failure for structural audit.
3008	'lla_irel' failure for incore ECD.
3009	'lla_dbrel' failure for *z*.
3010	Cannot open disk ECD *z*, errno = *x*.
3010	Cannot open disk ECD *z*.
3011	'lla_nsqrid' failure for *z*.
3012	'getport' failure, errno = *x*.
3013	'getseg' failure, errno = *x*.
3014	'lla_iatt' failure for incore ECD.
3015	'lla_opensq' failure for incore ECD.
3016	Audit copy *z* corrupted.
3017	fopen failure for *z*, errno = *x*.
3017	fopen failure for *z*.
3018	fread failure for *z*, errno = *x*.
3018	fread failure for *z*.
3019	fseek failure for *z*, errno = *x*.
3019	fseek failure for *z*.
3020	fwrite failure for *z*, errno = *x*.
3020	fwrite failure for *z*.
3021	The incore ECD does not match the disk ECD *z*.
3022	Driver PID notification table out of space, entries = *x*.
3023	makeseg failure - cannot create new segment.
3024	Audits blocked during offline boot - try later.
4000	'lla_rinfo' failure for *z*, RID = *y*.
4001	Incore RID does not match audit (*z*) RID.
4002	'lla_rdget' failure for *z*, RID = *y*.
4003	Record size of incore ECD does not match record size of audit *z*.
4004	Record type of incore does not match audit *z*, RID = *y*.
4005	'lla_uprid' failure for *z*, RID = *y*.
4006	Local copy record changes: unable to notify driver, PID = *x*.
4007	Possible inconsistency (structure corrected) of disk ECD *z*.

Table 1 *(continued)*

f:	*g*:
4008	Structural audit cannot continue without previous corrections.
4009	UCB *a b c d* points down to a UCB which does not point back up for *z*.
4010	UCB *a b c d* has incorrect UP0 pointer for its side chain for *z*.
4011	UCB *a b c d* has incorrect UP1 pointer for its side chain for *z*.
4012	UCB *a b c d* points down to the beginning of a side chain loop for *z*.
4013	UCB *a b c d* should not have a side pointer for *z*.
4014	UCB *a b c d* points down to itself for *z*.
5000	Record corrected, RID = *y*, record = *z*. Incore record data will be followed by audit record data.
5001	Record needs correction, RID = *y*, record = *z*. Incore record data will be followed by audit record data. For LLA audit error messages reference file w.

a = UCB complex unit
b = UCB unit
c = UCB complex unit
d = UCB name
w = file name one of the following:
`/etc/log/ecdaud-disk` - for disk audit
`/etc/log/ecdaud-struc` - for structural incore audit
`/etc/log/ecdaud-raw-` for raw audit
x = integer
y = hexadecimal integer
z = database name

h = Explanation of error; see Audit Appendix C, `AUD-APPC`.

i = Explanation of error; see Audit Appendix D, `AUD-APPD`, in the Supplementary Information section of this manual.

j = Explanation of error - see Audit Appendix B, `AUD-APPB`.

k = Inhibit status. Possible values are:

`INHIBITED` — Audit has been automatically inhibited by SIM.
`ALLOWED` — Audit has been automatically allowed by SIM.

NOTE: See Audit Appendixes A and B, `AUD-APPA` and `AUD-APPB`, for assorted parsing errors when the IM catalog is not active.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If the audit was manually run in the noncorrecting mode and the output indicates that corrections are needed, rerun the audit in correcting mode.

Note that recent changes should not be applied while an audit that uses the ECD is running.

Seek technical assistance if errors occur.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 78.
Formats 2 and 3 have an OMDB key of 76.
Format 4 has an OMDB key of 52.
Format 5 has an OMDB key of 64.
Format 8 has an OMDB key of 720.

The following OMDB keys apply to the error codes listed in Table 1.

Error codes `3000`, `3001`, `3003`, `3004`, `3007`, `3008`, `3009`, `3011` through `3016`, `3022`, `4006`, `4007`, and `4008` have an OMDB key of 459.
Error codes `3002`, `3010`, and `3017` through `3020` have an OMDB key of 458.
Error code `3021` has an OMDB key of 607.
Error code `3024` has an OMDB key of 720.
Error codes `4000`, `4002`, `4004`, and `4005` have an OMDB key of 457.
Error code `4001` has an OMDB key of 456.
Error code `4003` has an OMDB key of 455.
Error codes `4009` through `4014` have an OMDB key of 619.
Error code `5000` has an OMDB key of 454.
Error code `5001` has OMDB keys of 454 and 459.

1. FORMAT

This message has seven formats.

[1] `AUD ECDOWN 1 COMPLETED`
a `ERRORS FOUND`
b `ERRORS CORRECTED`

[2] `AUD ECDOWN 1 STOPPED`

[3] `AUD ECDOWN 1 ABORTED CODE` *c*

[4] `AUD ECDOWN 1 ERROR` *d* `{CORR | NON CORR}`
`REPORT {STARTED | IN PROGRESS | COMPLETED}`
`DATA1 X'00000000 DATA2 X'00000000`
`DATA3 X'00000000 DATA4 X'00000000`

`[NO SUPPLEMENTARY DATA]`

[5] `AUD ECDOWN 1 ERROR` *d* `{CORR | NON CORR}`
`REPORT {STARTED | IN PROGRESS | COMPLETED}`
`{SUPPLEMENTARY DATA BLOCK NUMBER` *e* `|`
`SUPPLEMENTARY DATA FILE}`
f

[6] `AUD ECDOWN NOT STARTED`
`{CONFLICT WITH CURRENT SYSTEM STATUS` *g*
`|RETRY LATER` *h*
`|UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *i*`}`

[7] `AUD ECDOWN 1 AUTOMATICALLY` *y*

2. REASON FOR OUTPUT

To report the termination status of the `ECDOWN` audit and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible errors codes are:

Error (100-199)
Correction (200-200)

e = Supplementary data block number.

f = An explanation of the error identified by the error code. See Table 1.

Table 1

If *d* is...	Then *f* is...	And the OMDB Key is...
100	Unable to release special device file, RID = *x*.	460
101	Unable to release Unit Control Block (UCB), RID = *x*.	460
102	Improper reserved entity - not SDF or UCB.	460
200	Special device file released, RID = *x*.	460
201	UCB released, RID = *x*.	460
202	Special device file should be released, RID = *x*.	460
203	UCB should be released, RID = *x*.	460

NOTE: These error codes have an OMDB Key of 460.

g = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

h = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

i = Explanation of error - see Audit Appendix B, AUD-APPB.

x = Hexadecimal integer.

SEE PROPRIETARY NOTICE ON COVER PAGE

y = Inhibited status. Possible values are:

`INHIBITED` — Audit has been automatically inhibited by SIM.
`ALLOWED` — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, `AUD-APPA` and Output Audit Appendix B, `AUD-APPB`, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit was manually run in the noncorrecting mode and the output indicates that corrections are needed, rerun the audit in correcting mode.

Note that recent changes should not be applied while an audit that uses the ECD is running.

Seek technical assistance if errors occur.

5. ALARMS

2. REASON FOR OUTPUT

To report the termination status of the task queue audit (`FMGR 1`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

1 — Bad task status field.
2 — Invalid taskid field.
3 — Invalid sleep address.
4 — Invalid task stack pointer.
5 — Invalid message pointer.
6 — Task too old.
7 — Invalid task time stamp.

e = Address of the error: pointer to the task header information.

f = Erroneous data value.

g = Error index: used to identify the error.

h = Corrected data value.

i = Explanation of error - see Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

[6] `AUD FMGR 2 AUTOMATICALLY` *l*

2. REASON FOR OUTPUT

To report the termination status of the internal inode table audit (`FMGR 2`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

12 — Invalid reference count.
13 — Invalid write count.
14 — Invalid taskid.
15 — Invalid time stamp.
16 — DISK/INCORE inode mismatch.
17 — Invalid file table pointer.
19 — Invalid mount table pointer.
25 — Incorrect inode in use count.
26 — Invalid table size value.
27 — Bad degrow page start pointer.
28 — Invalid mount table or mount table pointer.

e = Address of the error: pointer to the inode table, block device table or character device table.

f = If d = 16, f = mdct-rid (minor device chain table record ID), otherwise, f = erroneous data.

g = Error index:

If *d* = *12*
g = 1, incorrect inode open count.
= 2, inode open count nonzero, but no corresponding file table exists.

If *d* = 16
g = *rstuvwwx*

r — 1, size field mismatch.
s — 1, group ID field mismatch.
t — 1, user id field mismatch.
u — 1, link field mismatch.
v — 1, inode field mismatch.
w — 0, not used.
x — 1-13, Nth address mismatch (1 - d in hex).

If *d* = 19
g = 1, invalid mount table pointer.

If *d* = 28
g = 1, invalid device pointer field inode.
g = 2, device pointer field in inode does not point to start of mount table.

SEE PROPRIETARY NOTICE ON COVER PAGE

g = 3, invalid mount table entry.

NOTE: The variable g is unused for all other values of variable d.

h = Corrected data value. Possible values depend on the value of d.

If *d* is...	Then *h* means...
12	Open count for the file table entry corresponding to the inode.
13	Inode reference count.
14	NULL.
15	Current system time.
16	Partition number inode number.
17	Correct file table pointer.
19	If g=1, valid mount table pointer (if one exists).
25 - 28	NULL.

i = Explanation of error - see Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Output Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

5. ALARMS

None.

1. FORMAT

This message has six formats.

[1] `AUD ENV=RTR FMGR 2 COMPLETED`
a `ERRORS FOUND`
b `ERRORS CORRECTED`

[2] `AUD ENV=RTR FMGR 2 STOPPED`

[3] `AUD ENV=RTR FMGR 2 ABORTED CODE` *c*

[4] `AUD ENV=RTR FMGR 2 ERROR` *d* {`CORR` | `NON CORR`}
`REPORT` {`STARTED` | `IN PROGRESS` | `COMPLETED`}
`DATA1 X'`*e* `DATA2 X'`*f*
`DATA3 X'`*g* `DATA4 X'`*h*

`[NO SUPPLEMENTARY DATA]`

[5] `AUD FMGR 2 NOT STARTED`
{`CONFLICT WITH CURRENT SYSTEM STATUS` *i*
|`RETRY LATER` *j*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *k*}

[6] `AUD ENV=RTR FMGR 2 AUTOMATICALLY` *l*

2. REASON FOR OUTPUT

To report the termination status of the internal inode table audit (`FMGR 2`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

12 — Invalid reference count.
13 — Invalid write count.
14 — Invalid taskid.
15 — Invalid time stamp.
16 — DISK/INCORE inode mismatch.
17 — Invalid file table pointer.
19 — Invalid mount table pointer, or invalid inode flag.
25 — Incorrect inode in use count.
26 — Invalid table size value.
27 — Bad degrow page start pointer.
28 — Invalid mount table or mount table pointer.
92 — Open count for driver is incorrect.

e = Address of the error: pointer to the inode table, block device table or character device table.

f = If d = 16, f = mdct-rid (minor device chain table record ID), otherwise, f = erroneous data.

g = Error index:

If *d* = 12
g = 1, incorrect inode open count.
= 2, inode open count nonzero, but no corresponding file table exists.

If *d* = 16
g = *rstuvwwx*

r — 1, size field mismatch.
s — 1, group ID field mismatch.
t — 1, user id field mismatch.
u — 1, link field mismatch.
v — 1, mode field mismatch.
w — 0, not used.
x — 1-13, Nth address mismatch (1 - d in hex).

If *d* = 19
g = 0, invalid inode flag (i-flag).
g = 1, invalid mount table pointer.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *d* = 28
g = 1, invalid device pointer field inode.
g = 2, device pointer field in inode does not point to start of mount table.
g = 3, invalid mount table entry.

NOTE: The variable g is unused for all other values of variable d.

If d = 92
g = 0, the block device table is incorrect.
g = 1, the character device table is incorrect.

h = Corrected data value. Possible values depend on the value of d.

If *d* is...	Then *h* means...
12	Open count for the file table entry corresponding to the inode.
13	Inode reference count.
14	NULL.
15	Current system time.
16	Partition number inode number.
17	Correct file table pointer.
19	If g=0, valid inode flag (i-flag). If g=1, valid mount table pointer (if one exists).
25 - 28	NULL.
92	Correct open count for driver.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see the Output Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode. If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

5. ALARMS

None.

`[NO SUPPLEMENTARY DATA]`

[5] `AUD FMGR 3 NOT STARTED`
{`CONFLICT WITH CURRENT SYSTEM STATUS` *i*
|`RETRY LATER` *j*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *k*}

[6] `AUD FMGR 3 AUTOMATICALLY` *l*

2. REASON FOR OUTPUT

To report the termination status of the hash table and internal pointer table audit (`FMGR 3`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

21 — Invalid hash table entry.
22 — Invalid forward or backward ilist pointer.
23 — Invalid inode pointer.
24 — Invalid chain pointer.
26 — Invalid inode table size - Inotabsz.
27 — Invalid degrowth page marker.

e = Address of the error; pointer to the ilist table.

f = Erroneous data value.

g = Error index: used to identify the error.

If *d* is...	Then *g* means...
22	One of the following: 1 - Invalid free list chain. 2 - Invalid free list tail pointer. 3 - Invalid hash chain. 5 - Ilist entry not on any chain.

h = Corrected data value.

If *d* is...	Then *g* means...
21	Correct hash table entry.
22	Correct tail pointer.
23,24	NULL.
26	Correct inode table size.
27	Correct start of degrowth page.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

2. REASON FOR OUTPUT

To report the termination status of the file table audit (`FMGR 4`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being initialized.

d = Error code. Possible error codes are:

26 — Invalid file table size - `Filtabsz`.
27 — Invalid degrowth page marker.
31 — Invalid flag field.
32 — Invalid pointer to associated incore inode table entry.
33 — Invalid pointer to associated internal capability table entry.
34 — Invalid pointer to the next file table entry on the chain.
35 — Invalid taskid.
36 — Use count of open files does not match the number of associated capabilities.
39 — Incorrect count of file table entries currently in use - `Nfile`.
40 — Invalid free list.
90 — Invalid file table size - `Filtabsz`.
91 — Invalid degrowth page marker.

e = Address of the error: pointer to the file table entry.

f = Erroneous data value.

g = Error index: used to identify the error.

If *d* is...	And *g* is...	Then the...
36	1	Associated capability table chain is bad.
	2	Use count is incorrect.
40	1	Free chain is broken or looped.
	2	Non-free entry is on free chain.
	3	Free entry is not on chain.
	4	Tail pointer is invalid.

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Corrected data value.

If *d* is...	Then *h* means...
26	Correct file table size.
27	Correct start of degrowth page.
31	Flag field.
32	Valid inode pointer (if one exists).
33	Valid capability table entry (if one exists).
34	Pointer to the next file table entry on its chain.
35	NULL.
36	If 'g' = 1, the capability table must be audited and then the file table re-audited.
39	Correct number of file table slots in use.
40	NULL.
90	Correct file table size.
91	Correct start of degrowth page.
	If *g* = 2, *h* = the correct use count.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

If *d* = 33 or 36, run the capability table audit.

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted the executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

26 — Incorrect capability table size.
27 — Incorrect degrowth page marker.
41 — Nonexistent process.
42 — Invalid file table pointer.
43 — Invalid pointer to the next capability table entry on the chain.
44 — Invalid capability pointer in file table entry.
45 — Invalid capability chain.
46 — Incorrect count of capability table entries currently in use - Ncap.
47 — Invalid free list.
48 — Incorrect capability table size.
49 — Incorrect degrowth page marker.

e = Address of the error: pointer to the file table entry.

f = Erroneous data value.

g = Error index: used to identify the error.

If *d* is...	And *g* is...	Then the...
44	1	Value when error is not corrected.
	2	File table entry's capability pointer restored.
	3	File table entry not in use - capability removed.
47	1	Free chain broken or looped.
	2	Non-free entry on free chain.
	3	Free entry not on chain.
	4	Invalid tail pointer.

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Corrected data value.

If *d* is...	*h* means...
26	Correct capability table size.
27	Correct start of degrowth page.
41	NULL.
42	Pointer to the file table entry associated with this capability.
43	Pointer to the next capability table entry on the chain.
44	Current value of file table entry's capability pointer.
45	Next entry on capability chain.
46	Correct number of capability entries currently in use.
47	NULL.
48	Correct capability table size.
49	Correct start of degrowth page.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

In addition, run the file table audit.

5. ALARMS

None.

[6] `AUD ENV=RTR FMGR 5 AUTOMATICALLY` *l*

2. REASON FOR OUTPUT

To report the termination status of the internal capability table audit (`FMGR 5`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted the executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

41 — Nonexistent process.
42 — Invalid file table pointer.
43 — Invalid pointer to the next capability table entry on the chain.
44 — Invalid capability pointer in file table entry.
45 — Invalid capability chain.
46 — Incorrect count of capability table entries currently in use - Ncap.
47 — Invalid free list.
48 — Incorrect capability table size.
49 — Incorrect degrowth page marker.

e = Address of the error: pointer to the file table entry.

f = Erroneous data value.

g = Error index: used to identify the error.

If *d* is...	And *g* is...	Then the...
44	1	Value when error is not corrected.
	2	File table entry's capability pointer restored.
	3	File table entry not in use - capability removed.
47	1	Free chain broken or looped.
	2	Non-free entry on free chain.
	3	Free entry not on chain.
	4	Invalid tail pointer.

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Corrected data value.

If *d* is...	Then *h* means...
41	NULL.
42	Pointer to the file table entry associated with this capability.
43	Pointer to the next capability table entry on the chain.
44	Current value of file table entry's capability pointer.
45	Next entry on capability chain.
46	Correct number of capability entries currently in use.
47	NULL.
48	Correct capability table size.
49	Correct start of degrowth page.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

In addition, run the file table audit.

2. REASON FOR OUTPUT

To report the termination status of the buffer audit (`FMGR 6`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

51 — Free list chain is broken.
52 — Device chain is broken.
54 — Invalid free list chain pointer.
55 — Invalid device chain pointer.
56 — Invalid buffer pointer.
57 — Invalid mount table pointer.
58 — Invalid taskid.
59 — Buffer is too old.
60 — Invalid time stamp.
61 — Invalid taskid / ilock combination.
62 — Invalid taskid / flock combination.

e = Address of the error: pointer to the file table entry.

f = Erroneous data value.

SEE PROPRIETARY NOTICE ON COVER PAGE

g = Error index: used to identify the error.

If *d* is...	Then *g* means...
51	One of the following: 1 — Forward chain is bad. 2 — Backward chain is bad.
52	One of the following: 1 — Buf's forward device chain is broken. 2 — Buf's backward device chain is broken. 3 — Bdevtab's forward device chain is broken. 4 — Bdevtab's backward device chain is broken.
54	One of the following: 1 — Forward chain pointer is bad. 2 — Backward chain pointer is bad. 3 — Both chain pointers are bad.
55	One of the following: 4 — Forward chain pointer is bad. 8 — Backward chain pointer is bad. c — Both chain pointers are bad. Any value greater than X'c reflects the number of forward or backward chain errors.
57	One of the following: 1 — Mount chain is bad. 2 — Invalid flag / mount pointer combination.

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Corrected data value. Possible values depend on the value of *d*.

If *d* is...	Then *h* means...
51 - 52	NULL.
54 - 55	Pointer to itself (this problem will be repaired later in the audit).

If *e* is...	Then *i* means...
56	Correct buffer pointer.
57	If *g* = 1, pointer to mount table, if any, associated with the buffer, or it is NULL. *i* = mount table pointer. If *g* = 2, NULL, *i* = NULL.
58 - 59	NULL.
60 - 61	Current system time.
62	NULL.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

2. REASON FOR OUTPUT

To report the termination status of the buffer audit (`FMGR 6`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

51 — Free list chain is broken.
52 — Device chain is broken.
54 — Invalid free list chain pointer.
55 — Invalid device chain pointer.
56 — Invalid buffer pointer.
57 — Invalid mount table pointer.
58 — Invalid taskid.
59 — Buffer is too old.
60 — Invalid time stamp.
61 — Invalid taskid / ilock combination.
62 — Invalid taskid / flock combination.
64 — Invalid total number of free inodes.

e = Address of the error:

If *d* is...	Then *e* means...
51 to 60	pointer to the file table entry.
61 to 64	pointer to the superblock.

f = Erroneous data value.

g = Error index: used to identify the error.

If *d* is...	Then *g* means...
51	One of the following: 1 — Forward chain is bad. 2 — Backward chain is bad.
52	One of the following: 1 — Buf's forward device chain is broken. 2 — Buf's backward device chain is broken. 3 — Bdevtab's forward device chain is broken. 4 — Bdevtab's backward device chain is broken.
54	One of the following: 1 — Forward chain pointer is bad. 2 — Backward chain pointer is bad. 3 — Both chain pointers are bad.
55	One of the following: 4 — Forward chain pointer is bad. 8 — Backward chain pointer is bad. c — Both chain pointers are bad. Any value greater than X'c reflects the number of forward or backward chain errors.
57	One of the following: 1 — Mount chain is bad. 2 — Invalid flag / mount pointer combination.
64	Offset in superblock to s_tinode

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Corrected data value. Possible values depend on the value of *d*.

If *d* is...	Then *h* means...
51 - 52	NULL.
54 - 55	Pointer to itself (this problem will be repaired later in the audit).
56	Correct buffer pointer.
57	If *g* = 1, pointer to mount table, if any, associated with the buffer, or it is NULL. i = mount table pointer. If g = 2, NULL, i = NULL.
64	Correct Total Number of Free Inodes

If *e* is...	Then *i* means...
58	NULL.
59 - 60	Current system time.
61 - 62	NULL.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode. If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

5. ALARMS

None.

GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `AUD FMGR 7 COMPLETED`
a `ERRORS FOUND`
b `ERRORS CORRECTED`

[2] `AUD FMGR 7 STOPPED`

[3] `AUD FMGR 7 ABORTED CODE` *c*

[4] `AUD FMGR 7 ERROR` *d* {`CORR` | `NON CORR`}
`REPORT` {`STARTED` | `IN PROGRESS` | `COMPLETED`}
`DATA1 X'`*e* `DATA2 X'`*f*
`DATA3 X'`*g* `DATA4 X'`*h*

`[NO SUPPLEMENTARY DATA]`

[5] `AUD FMGR 7 NOT STARTED`
{`CONFLICT WITH CURRENT SYSTEM STATUS` *i*
|`RETRY LATER` *j*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *k*}

[6] `AUD FMGR 7 AUTOMATICALLY` *l*

2. REASON FOR OUTPUT

To report the termination status of the mount table audit (`FMGR 7`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

71 — Invalid device name.
72 — Buf error.
74 — Inode error.
75 — Invalid inode.
77 — Invalid taskid.

e = Address of the error: pointer to the mount table entry.

f = Erroneous data value.

g = Error index: used to identify the error.

If *d* is...	Then *g* means...
72	One of the following: 1 — Buf table entry associated with the mount table does not have the B_MOUNT flag set. 2 — Invalid buf pointer.
73	One of the following: 1 — Inode table entry associated with the mount table does not have the I_MOUNT flag set. 2 — Invalid inode pointer.

h = Corrected data value.

If *d* is...	Then *h* means...
72	If *g* = 1, *h* = flags field of the associated buf table entry. If *g* = 2, *h* = pointer to the associated buf table entry.
74	If *g* = 1, *h* = flags field of the associated inode table entry. If *g* = 2, *h* = pointer to the associated inode table entry.
75	Pointer to the root inode.
77	NULL.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the termination status of the delayed queue audit (`FMGR 8`) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.

8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Possible error codes are:

82 — The number of delayed open requests is bad.
83 — The number of delayed mount requests is bad.

e = Address of the error: pointer to the `mount_q` table or the `open_q` table.

f = Erroneous data value.

g = Error index: used to identify the error.

h = Corrected data value.

If *d* =	Then *h* =
82	Correct number of delayed open requests.
83	Correct number of delayed mount requests.

i = Explanation of error - see the Output Audit Appendix C, `AUD-APPC`.

j = Explanation of error - see the Output Audit Appendix D, `AUD-APPD`.

k = Explanation of error - see Audit Appendix B, `AUD-APPB`.

l = Inhibit status. Possible values are:

`INHIBITED` — Audit has been automatically inhibited by SIM.
`ALLOWED` — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, `AUD-APPA`, and Output Audit Appendix B, `AUD-APPB`, for assorted parsing errors when the IM catalog is not active.

2. REASON FOR OUTPUT

To report the termination status of the file system block audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of errors found.

d = Total number of errors corrected.

e = Abort code. Possible values are:

`3` — Audit was aborted without completing its work.
`4` — Audit was faulted while correcting errors.
`5` — System integrity monitor (SIM) could not start or dispatch the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label:

g = Not used.
h = File system label.
i = Not used.
j = Not used.

2 — Bad file mode:

g = Inode number (index into inode table).
h = File mode.
i = Index used to locate error.
j = Not used.

3 — Bad file size:

g = Inode number (index into inode table).
h = Incorrect file size.
i = File type. Possible values are:

1 — Regular file direct block.
2 — Single indirect file.
3 — Double indirect file.
4 — Triple indirect file.
5 — Extent file.

j = New file size, if corrected; otherwise, old file size.

4 — Bad block (block out of file system block range):

g = Inode number (index into inode table).
h = Bad block number.
i = Block or file type. Possible values are:

1 — Regular file direct block.
2 — Single indirect file.
3 — Double indirect file.
4 — Triple indirect file.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

SEE PROPRIETARY NOTICE ON COVER PAGE

5 — Duplicate block number:

g = Inode number.
h = Duplicate block number.
i = Block or file type. Possible values are:

1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

6 — Bad address block (address block contains invalid block addresses).

g = Inode number.
h = Bad or duplicate block number.
i = 0x000000AB indicating block or file type. A and B may have the following values:

A = 0 — The block is a data block.
1 — The block is an address block.
B = 1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

10 — Unable to start device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

11 — Device file not a block device.

g = Not used.
h = File type.
i = Index used to locate error.
j = Not used.

12 — Unable to open device file.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

13 — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

14 — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

15 — Unable to read superblock.

16 — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

17 — Unable to get a free block.

g = Inode number of current inode.
h = Not used.
i = Index used to locate error.
j = Not used.

18 — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

19 — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

000c — Failed to allocate a message.
000d — Failed to queue the message.
0013 — Request to remove the segment failed, error returned is found in *h*.

j = Not used.

20 — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

000a — No free mount table entry.
000b — Unable to read superblock.

j = Not used.

21 — Unable to get bitmap segment ID.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

22 — Bitmap I/O failed.

g = Not used.
h = Error returned from I/O attempt.
i = Index used to locate error.
j = Not used.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Minor device chain table (MDCT) record identification (RID) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

k = For explanation of error, see the output Audit Appendix C, AUD-APPC.

l = For explanation of error, see the output Audit Appendix D, AUD-APPD.

SEE PROPRIETARY NOTICE ON COVER PAGE

m = For explanation of error, see the output Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the following defines actions to be taken.

Error codes 1 and 2 are not correctable. Back up the file system from a backup source.

For size and block errors (error codes 3, 4, 5, and 6), use the input message OP:FNAME to print the full pathname of the file. To correct the error, rerun the audit in the CORR mode.

For error codes 8 through 26, seek technical assistance.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `AUD ENV=RTR FSBLK` *a b* `COMPLETED`
c `ERRORS FOUND`
d `ERRORS CORRECTED`

[2] `AUD ENV=RTR FSBLK` *a b* `STOPPED`

[3] `AUD ENV=RTR FSBLK` *a b* `ABORTED CODE` *e*

[4] `AUD ENV=RTR FSBLK` *a b* `ERROR` *f* {`CORR` | `NON CORR`}
`REPORT` {`STARTED` | `IN PROGRESS` | `COMPLETED`}
`DATA1 X'`*g* `DATA2 X'`*h*
`DATA3 X'`*i* `DATA4 X'`*j*

`[NO SUPPLEMENTARY DATA]`

[5] `AUD FSBLK NOT STARTED`
{`CONFLICT WITH CURRENT SYSTEM STATUS` *k*
|`RETRY LATER` *l*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *m*}

[6] `AUD ENV=RTR FSBLK` *a* `AUTOMATICALLY` *n*

2. REASON FOR OUTPUT

To report the termination status of the file system block audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of errors found.

d = Total number of errors corrected.

e = Abort code. Possible values are:

`3` — Audit was aborted without completing its work.
`4` — Audit was faulted while correcting errors.
`5` — System integrity monitor (SIM) could not start or dispatch the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label:

g = Not used.
h = File system label.
i = Not used.
j = Not used.

2 — Bad file mode:

g = Inode number (index into inode table).
h = File mode.
i = Index used to locate error.
j = Not used.

3 — Bad file size:

g = Inode number (index into inode table).
h = Incorrect file size.
i = File type. Possible values are:

1 — Regular file direct block.
2 — Single indirect file.
3 — Double indirect file.
4 — Triple indirect file.
5 — Extent file.

j = New file size, if corrected; otherwise, old file size.

4 — Bad block (block out of file system block range):

g = Inode number (index into inode table).
h = Bad block number.
i = Block or file type. Possible values are:

1 — Regular file direct block.
2 — Single indirect file.
3 — Double indirect file.
4 — Triple indirect file.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

SEE PROPRIETARY NOTICE ON COVER PAGE

`5` — Duplicate block number:

g = Inode number.
h = Duplicate block number.
i = Block or file type. Possible values are:

`1` — Regular file direct block.
`2` — Single indirect block.
`3` — Double indirect block.
`4` — Triple indirect block.
`5` — Extent file.

j = New block number if corrected; otherwise, old block number.

`6` — Bad address block (address block contains invalid block addresses).

g = Inode number.
h = Bad or duplicate block number.
i = `0x000000`*AB* indicating block or file type. *A* and *B* may have the following values:

A = `0` — The block is a data block.
`1` — The block is an address block.
B = `1` — Regular file direct block.
`2` — Single indirect block.
`3` — Double indirect block.
`4` — Triple indirect block.
`5` — Extent file.

j = New block number if corrected; otherwise, old block number.

`8` — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`9` — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

`10` — Unable to start device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

11 — Device file not a block device.

g = Not used.
h = File type.
i = Index used to locate error.
j = Not used.

12 — Unable to open device file.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

13 — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

14 — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

15 — Unable to read superblock.

16 — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

17 — Unable to get a free block.

g = Inode number of current inode.
h = Not used.
i = Index used to locate error.
j = Not used.

18 — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

19 — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

000c — Failed to allocate a message.
000d — Failed to queue the message.
0013 — Request to remove the segment failed; error returned is found in *h*.

j = Not used.

20 — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

000a — No free mount table entry.
000b — Unable to read superblock.

j = Not used.

21 — Unable to get bitmap segment ID.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

22 — Bitmap I/O failed.

g = Not used.
h = Error returned from I/O attempt.
i = Index used to locate error.
j = Not used.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Minor device chain table (MDCT) record identification (RID) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

k = For explanation of error, see the output Audit Appendix C, AUD-APPC.

l = For explanation of error, see the output Audit Appendix D, AUD-APPD.

m = For explanation of error, see the output Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the following defines actions to be taken.

Error codes 1 and 2 are not correctable. Back up the file system from a backup source.

2. REASON FOR OUTPUT

To report the termination status of the file system block audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of errors found.

d = Total number of errors corrected.

e = Abort code. Possible values are:

`3` — Audit was aborted without completing its work.
`4` — Audit was faulted while correcting errors.
`5` — System integrity monitor (SIM) could not start or dispatch

the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label:

g = Not used.
h = File system label.
i = Not used.
j = Not used.

2 — Bad file mode:

g = Inode number (index into inode table).
h = File mode.
i = Index used to locate error.
j = Not used.

3 — Bad file size:

g = Inode number (index into inode table).
h = Incorrect file size.
i = File type. Possible values are:

1 — Regular file direct block.
2 — Single indirect file.
3 — Double indirect file.
4 — Triple indirect file.
5 — Extent file.

j = New file size, if corrected; otherwise, old file size.

4 — Bad block (block out of file system block range):

g = Inode number (index into inode table).
h = Bad block number.
i = Block or file type. Possible values are:

1 — Regular file direct block.
2 — Single indirect file.
3 — Double indirect file.
4 — Triple indirect file.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

SEE PROPRIETARY NOTICE ON COVER PAGE

5 — Duplicate block number:

g = Inode number.
h = Duplicate block number.
i = Block or file type. Possible values are:

1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

6 — Bad address block (address block contains invalid block addresses).

g = Inode number.
h = Bad or duplicate block number.
i = 0x000000*AB* indicating block or file type. *A* and *B* may have the following values:

A = 0 — The block is a data block.
1 — The block is an address block.
B = 1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

7 — Temporary file found in filesystem when audit invoked with PARAM=BACKUP. This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action that is possible or needed for this condition.

g = Inode number.
h = Not used.
i = Not used.
j = Not used.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

10 — Unable to start device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

11 — Device file not a block device.

g = Not used.
h = File type.
i = Index used to locate error.
j = Not used.

12 — Unable to open device file.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

13 — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

14 — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

15 — Unable to read superblock.

16 — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

SEE PROPRIETARY NOTICE ON COVER PAGE

`17` — Unable to get a free block.

g = Inode number of current inode.
h = Not used.
i = Index used to locate error.
j = Not used.

`18` — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

`19` — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

`000c` — Failed to allocate a message.
`000d` — Failed to queue the message.
`0013` — Request to remove the segment failed; error returned is found in *h*.

j = Not used.

`20` — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

`000a` — No free mount table entry.
`000b` — Unable to read superblock.

j = Not used.

`21` — Unable to get bitmap segment ID.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`22` — Bitmap I/O failed.

g = Not used.
h = Error returned from I/O attempt.
i = Index used to locate error.
j = Not used.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Record identification (RID) of the minor device chain table (MDCT) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

k = For explanation of error, see the output Audit Appendix C, AUD-APPC.

l = For explanation of error, see the output Audit Appendix D, AUD-APPD.

m = For explanation of error, see the output Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the following defines actions to be taken.

Error codes 1 and 2 are not correctable. Back up the file system from a backup source.

For size and block errors (error codes 3, 4, 5, and 6), use the input message OP:FNAME to print the full pathname of the file. To correct the error, rerun the audit in the CORR mode.

For error codes 8 through 26, seek technical assistance.

j = New block number if corrected; otherwise, old block number.

5 — Duplicate block number:

g = Inode number.
h = Duplicate block number.
i = Block or file type. Possible values are:

1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

6 — Bad address block (address block contains invalid block addresses).

g = Inode number.
h = Bad or duplicate block number.
i = `0x000000`*AB* indicating block or file type. *A* and *B* may have the following values:

A = 0 — The block is a data block.
1 — The block is an address block.
B = 1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = New block number if corrected; otherwise, old block number.

7 — Temporary file found in filesystem when audit invoked with `PARAM=BACKUP`. This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action that is possible or needed for this condition.

g = Inode number.
h = Not used.
i = Not used.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

10 — Unable to start device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

11 — Device file not a block device.

g = Not used.
h = File type.
i = Index used to locate error.
j = Not used.

12 — Unable to open device file.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

13 — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

14 — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

15 — Unable to read superblock.

16 — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

SEE PROPRIETARY NOTICE ON COVER PAGE

17 — Unable to get a free block.

g = Inode number of current inode.
h = Not used.
i = Index used to locate error.
j = Not used.

18 — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

19 — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

000c — Failed to allocate a message.

000d — Failed to queue the message.

0013 — Request to remove the segment failed; error returned is found in *h*.

j = Not used.

20 — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

000a — No free mount table entry.
000b — Unable to read superblock.

j = Not used.

21 — Unable to get bitmap segment ID.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

22 — Bitmap I/O failed.

g = Not used.
h = Error returned from I/O attempt.
i = Index used to locate error.
j = Not used.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Record identification (RID) of the minor device chain table (MDCT) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

35 — File manager segment list is full.

g = Not used.
h = Not used.
i = Index used to locate error
j = Not used.

k = For explanation of error, see the output Audit Appendix C, AUD-APPC.

l = For explanation of error, see the output Audit Appendix D, AUD-APPD.

m = For explanation of error, see the output Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the following defines actions to be taken.

Error codes 1 and 2 are not correctable. Back up the file system from a backup source.

For size and block errors (error codes 3, 4, 5, and 6), use the input message OP:FNAME to print the full pathname of the file. To correct the error, rerun the audit in the CORR mode.

For error codes 8 through 26, seek technical assistance.

Error code 35 occurs when the maximum number of file manager tasks are running and using all of the available file manager segment table slots. Rerun the audit at a time when there are no other file system audits running. If the problem persists, execute a level 3 craft initialization. If the problem still persists, create an off-line memory dump tape and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

`[NO SUPPLEMENTARY DATA]`

[5] `AUD FSCMPT NOT STARTED`
{`CONFLICT WITH CURRENT SYSTEM STATUS` *k*
|`RETRY LATER` *l*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *m*}

[6] `AUD FSCMPT` *a* `AUTOMATICALLY` *n*

2. REASON FOR OUTPUT

To report the termination status of the file system compaction audit and/or errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of error or report messages.

d = Total number of reports for corrected errors and for compaction completed.

e = Abort Code. Possible values are:

`3` — Audit was aborted without completing its work.
`4` — Audit was faulted while correcting errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout limit.
8 — SIM aborted an executing routine audit because of a blocking request.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label.

g = Not used.
h = File system label.
i = Not used.
j = Not used.

2 — Not a real error. Because, 1) compaction was requested in non-correcting (information only) mode, 2) compaction was requested in either correcting or non-correcting mode and could not complete because of non-corrected errors, or 3) compaction was requested in correcting mode and the projected number of contiguous blocks that could be freed is less than or equal to the current number of contiguous free blocks. Fields *g* through *j* contain the information.

g = Total number of free blocks.
h = Projected number of contiguous free blocks after compaction.
i = Current maximum number of contiguous free blocks.
j = Projected cost of compaction in number of relocations required. If the audit is internally aborted before the cost of compaction could be estimated, this field will be `0xffffffff`. If the audit is internally aborted after some compaction effort has been made, this field is the number of I/O read/write jobs already executed before the internal abort.

3 — Not a real error. Compaction was completed, and fields *g* through *j* are for information only.

g = Total number of free blocks.
h = Number of contiguous free blocks at end of file system after compaction.
i = Maximum number of contiguous free blocks before compaction.
j = Cost of compaction in number of I/O read/write

SEE PROPRIETARY NOTICE ON COVER PAGE

jobs executed. If this field is zero, the file system requires no compaction.

4 — Bad block (block out of file system block range).

5 — Duplicate block number.

6 — Bad address block (address block contains invalid block addresses).

For errors 4, 5, and 6,

g = Inode number.
h = Bad or duplicate block number.
i = `0x000000`*AB* indicating block and file type, or `0x000000`*C*`0` indicating the block usage change that was occurring when the error was detected.

A, *B*, and *C* have the following values.

A = `0` — The block is a data block.
`1` — The block is an address block.
B = `1` — Regular file direct block.
`2` — Single indirect block.
`3` — Double indirect block.
`4` — Triple indirect block.
`5` — Extent file.
C = `3` — A block was being added to a regular file.
`4` — A block was being removed from a regular file.
`5` — Blocks were being added to a multi-extent or contiguous file.
`6` — Blocks were being removed from a multi-extent or contiguous file.

j = If *i* is of the form `0x000000`*AB*, the new block number if corrected; otherwise, old block number.
If *i* is of the form `0x000000`*C*`0`, the number of block usage errors found before termination of the audit.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

10 — Unable to stat device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

11 — Device file not a block device.

g = Not used.
h = File type.
i = Index used to locate error.
j = Not used.

12 — Unable to allocate a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

13 — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

14 — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

16 — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

17 — Unable to get a free block.

g = Inode number of current inode.
h = Not used.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

18 — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

19 — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

000c — Failed to allocate a message.
000d — Failed to queue the message.
0013 — Request to remove the segment failed, error returned is found in *h*.

j = Not used.

20 — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

000a — No free mount table entry.
000b — Unable to read superblock.

j = Not used.

21 — Unable to get bitmap segment ID.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

22 — Bitmap I/O failed.

g = Not used.
h = Error returned from I/O attempt.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

23 — No available structures for mapping allocated blocks for the compaction.

g = Inode number.
h = First block number to be mapped.
i = `0x000000`*AB* indicating block or file type, or `0x000000`*C*`0` indicating the block usage change that was occurring when the error was detected.

A, *B*, and *C* have the following values.

A = `0` — The block is a data block.
`1` — The block is an address block.
B = `1` — Regular file direct block.
`2` — Single indirect block.
`3` — Double indirect block.
`4` — Triple indirect block.
`5` — Extent file.
C = `3` — A block was being added to a regular file.
`4` — A block was being removed from a regular file.
`5` — Blocks were being added to a multi-extent or contiguous file.
`6` — Blocks were being removed from a multi-extent or contiguous file.

j = If *i* is of the form `0x000000`*AB*, first block number to be mapped.
If *i* is of the form `0x000000`*C*`0`, the number of errors found before termination of the audit.

24 — Concurrent file system activity is interfering with the compaction effort.

g = Number of relocations needed at the beginning of an interval.
h = Number of relocations needed at the end of the interval.
i = Number of I/O read/write jobs already executed to achieve compaction.
j = Number of errors found before termination of the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

25 — I/O attempt failed.

g = Type of I/O. Possible values are:

1 — Attempt to read file system blocks failed.
2 — Attempt to write file system blocks failed.
3 — Attempt to update inodes failed.

h = Error returned on read or write attempt.
i = If *g* is 1 or 2, the starting block address. If *g* is 3, the inode number.
j = If *g* is 1 or 2, the number of blocks. If *g* is 3,

0001 — The inode is not in a temp'd state, or the incore copy of the temp'd inode is being updated.
0002 — The disk copy of a temp'd inode is being updated.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Minor device chain table (MDCT) record identification (RID) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

k = For explanation of error, see the output Audit Appendix C, AUD-APPC.

l = For explanation of error, see the output Audit Appendix D, AUD-APPD.

m = For explanation of error, see the output Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, take the following action.

Error code 1 is not correctable. Back up the file system from backup source.

For block errors (error codes 4, 5, and 6), run the block audit in non-correcting mode. If it finds errors, run the block audit in correcting mode. Then try this audit again.

For error codes 8 through 23, 25, and 26, seek technical assistance.

For error code 24, run this audit with reduced file system activity.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

2. REASON FOR OUTPUT

To report the termination status of the file system compaction audit and/or errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of error or report messages.

d = Total number of reports for corrected errors and for compaction completed.

e = Abort Code. Possible values are:

`3` — Audit was aborted without completing its work.
`4` — Audit was faulted while correcting errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout limit.
8 — SIM aborted an executing routine audit because of a blocking request.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label.

g = Not used.
h = File system label.
i = Not used.
j = Not used.

2 — Not a real error. Because, 1) compaction was requested in non-correcting (information only) mode, 2) compaction was requested in either correcting or non-correcting mode and could not complete because of non-corrected errors, or 3) compaction was requested in correcting mode and the projected number of contiguous blocks that could be freed is less than or equal to the current number of contiguous free blocks. Fields *g* through *j* contain the information.

g = Total number of free blocks.
h = Projected number of contiguous free blocks after compaction.
i = Current maximum number of contiguous free blocks.
j = Projected cost of compaction in number of relocations required. If the audit is internally aborted before the cost of compaction could be estimated, this field will be `0x`*ffffffff*. If the audit is internally aborted after some compaction effort has been made, this field is the number of I/O read/write jobs already executed before the internal abort.

3 — Not a real error. Compaction was completed, and fields *g* through *j* are for information only.

g = Total number of free blocks.
h = Number of contiguous free blocks at end of file system after compaction.
i = Maximum number of contiguous free blocks before compaction.
j = Cost of compaction in number of I/O read/write

jobs executed. If this field is zero, the file system requires no compaction.

4 — Bad block (block out of file system block range).

5 — Duplicate block number.

6 — Bad address block (address block contains invalid block addresses).

For errors 4, 5, and 6,

g = Inode number.
h = Bad or duplicate block number.
i = 0x000000*AB* indicating block and file type, or 0x000000*C0* indicating the block usage change that was occurring when the error was detected.

A, *B*, and *C* have the following values.

A = 0 — The block is a data block.
1 — The block is an address block.
B = 1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.
C = 3 — A block was being added to a regular file.
4 — A block was being removed from a regular file.
5 — Blocks were being added to a multi-extent or contiguous file.
6 — Blocks were being removed from a multi-extent or contiguous file.

j = If *i* is of the form 0x00000*0AB*, the new block number if corrected; otherwise, old block number.
If *i* is of the form 0x00000*0C0*, the number of block usage errors found before termination of the audit.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

10 — Unable to stat device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

11 — Device file not a block device.

g = Not used.
h = File type.
i = Index used to locate error.
j = Not used.

12 — Unable to allocate a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

13 — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

14 — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

16 — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

17 — Unable to get a free block.

g = Inode number of current inode.
h = Not used.
i = Index used to locate error.
j = Not used.

18 — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

19 — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are

000c — Failed to allocate a message.
000d — Failed to queue the message.
0013 — Request to remove the segment failed, error returned is found in *h*.

j = Not used.

20 — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

000a — No free mount table entry.
000b — Unable to read superblock.

j = Not used.

21 — Unable to get bitmap segment ID.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

22 — Bitmap I/O failed.

g = Not used.
h = Error returned from I/O attempt.
i = Index used to locate error.
j = Not used.

23 — No available structures for mapping allocated blocks for the compaction.

g = Inode number.
h = First block number to be mapped.
i = 0x000000*AB* indicating block or file type, or 0x000000*C0* indicating the block usage change that was occurring when the error was detected.

A, *B*, and *C* have the following values.

A = 0 — The block is a data block.
1 — The block is an address block.
B = 1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

SEE PROPRIETARY NOTICE ON COVER PAGE

C = 3 — A block was being added to a regular file.
4 — A block was being removed from a regular file.
5 — Blocks were being added to a multi-extent or contiguous file.
6 — Blocks were being removed from a multi-extent or contiguous file.

j = If *i* is of the form `0x000000`*AB*, first block number to be mapped.
If *i* is of the form `0x000000`*C0*, the number of errors found before termination of the audit.

24 — Concurrent file system activity is interfering with the compaction effort.

g = Number of relocations needed at the beginning of an interval.
h = Number of relocations needed at the end of the interval.
i = Number of I/O read/write jobs already executed to achieve compaction.
j = Number of errors found before termination of the audit.

25 — I/O attempt failed.

g = Type of I/O. Possible values are:

1 — Attempt to read file system blocks failed.
2 — Attempt to write file system blocks failed.
3 — Attempt to update inodes failed.

h = Error returned on read or write attempt.
i = If *g* is `1 or 2`, the starting block address. If *g* is 3, the inode number.
j = If *g* is 1 or 2, the number of blocks. If *g* is 3:

`0001` — The inode is not in a temp'd state, or the incore copy of the temp'd inode is being updated.
`0002` — The disk copy of a temp'd inode is being updated.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Mdct-rid for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

SEE PROPRIETARY NOTICE ON COVER PAGE

k = For explanation of error, see the output Audit Appendix C, AUD-APPC.

l = For explanation of error, see the output Audit Appendix D, AUD-APPD.

m = For explanation of error, see the output Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, take the following action.

Error code 1 is not correctable. Back up the file system from backup source.

For block errors (error codes 4, 5, and 6), run the block audit in non-correcting mode. If it finds errors, run the block audit in correcting mode. Then try this audit again.

For error codes 8 through 23, 25, and 26, seek technical assistance.

For error code 24, run this audit with reduced file system activity.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

`[NO SUPPLEMENTARY DATA]`

[5] `AUD ENV=RTR FSCMPT` *a b* `DATA` *k*
`REPORT` {`STARTED` | `IN PROGRESS` | `COMPLETED`}
`DATA1 X'`*g* `DATA2 X'`*h*
`DATA3 X'`*i* `DATA4 X'`*j*

`[NO SUPPLEMENTARY DATA]`

[6] `AUD FSCMPT NOT STARTED`
{`CONFLICT WITH CURRENT SYSTEM STATUS` *l*
|`RETRY LATER` *m*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *n*}

[7] `AUD ENV=RTR FSCMPT` *a* `AUTOMATICALLY` *o*

2. REASON FOR OUTPUT

To report the termination status of the file system compaction audit and/or errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of error or report messages.

d = Total number of reports for corrected errors and for compaction completed.

e = Abort Code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout limit.
8 — SIM aborted an executing routine audit because of a blocking request.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label.

g = Not used.
h = File system label.
i = Not used.
j = Not used.

4 — Bad block (block out of file system block range).

5 — Duplicate block number.

6 — Bad address block (address block contains invalid block addresses).

For errors 4, 5, and 6,

g = Inode number.
h = Bad or duplicate block number.
i = 0x000000*AB* indicating block and file type, or 0x000000*C*0 indicating the block usage change that was occurring when the error was detected.

A, *B*, and *C* have the following values.

A = 0 — The block is a data block.
1 — The block is an address block.

B = 1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

C = 3 — A block was being added to a regular file.

4 — A block was being removed from a regular file.
5 — Blocks were being added to a multi-extent or contiguous file.
6 — Blocks were being removed from a multi-extent or contiguous file.

j = If *i* is of the form `0x000000`*AB*, the new block number if corrected; otherwise, old block number.
If *i* is of the form `0x000000`*C*`0`, the number of block usage errors found before termination of the audit.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

10 — Unable to stat device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

11 — Device file not a block device.

g = Not used.
h = File type.
i = Index used to locate error.
j = Not used.

12 — Unable to allocate a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

13 — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

`14` — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

`16` — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

`17` — Unable to get a free block.

g = Inode number of current inode.
h = Not used.
i = Index used to locate error.
j = Not used.

`18` — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

`19` — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are

`000c` — Failed to allocate a message.
`000d` — Failed to queue the message.
`0013` — Request to remove the segment failed, error returned is found in *h*.

j = Not used.

`20` — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

`000a` — No free mount table entry.
`000b` — Unable to read superblock.

j = Not used.

`21` — Unable to get bitmap segment ID.

g = Not used.
h = Not used.
i = Index used to locate error.

j = Not used.

22 — Bitmap I/O failed.

g = Not used.
h = Error returned from I/O attempt.
i = Index used to locate error.
j = Not used.

23 — No available structures for mapping allocated blocks for the compaction.

g = Inode number.
h = First block number to be mapped.
i = `0x000000`*AB* indicating block or file type, or `0x000000`*C*`0` indicating the block usage change that was occurring when the error was detected.

A, *B*, and *C* have the following values.

A = `0` — The block is a data block.
`1` — The block is an address block.
B = `1` — Regular file direct block.
`2` — Single indirect block.
`3` — Double indirect block.
`4` — Triple indirect block.
`5` — Extent file.
C = `3` — A block was being added to a regular file.
`4` — A block was being removed from a regular file.
`5` — Blocks were being added to a multi-extent or contiguous file.
`6` — Blocks were being removed from a multi-extent or contiguous file.

j = If *i* is of the form `0x000000`*AB*, first block number to be mapped.
If *i* is of the form `0x000000`*C*`0`, the number of errors found before termination of the audit.

24 — Concurrent file system activity is interfering with the compaction effort.

g = Number of relocations needed at the beginning of an interval.
h = Number of relocations needed at the end of the interval.
i = Number of I/O read/write jobs already executed to achieve compaction.
j = Number of errors found before termination of the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

25 — I/O attempt failed.

g = Type of I/O. Possible values are:

1 — Attempt to read file system blocks failed.
2 — Attempt to write file system blocks failed.
3 — Attempt to update inodes failed.

h = Error returned on read or write attempt.
i = If *g* is 1 or 2, the starting block address. If *g* is 3, the inode number.
j = If *g* is 1 or 2, the number of blocks. If *g* is 3:

0001 — The inode is not in a temp'd state, or the incore copy of the temp'd inode is being updated.
0002 — The disk copy of a temp'd inode is being updated.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Mdct-rid for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

k = Data report code. Possible data codes are:

2 — This report is generated for three conditions: 1) compaction was requested in non-correcting (information only) mode, 2) compaction was requested in either correcting or non-correcting mode and could not complete because of non-corrected errors, or 3) compaction was requested in correcting mode and the projected number of contiguous blocks that could be freed is less than or equal to the current number of contiguous free blocks. Fields *g* through *j* contain the following information.

g = Total number of free blocks.
h = Projected number of contiguous free blocks after compaction.
i = Current maximum number of contiguous free blocks.
j = Projected cost of compaction in number of relocations required. If the audit is internally aborted before the cost of compaction could be estimated, this field will be 0xffffffff. If the audit is internally aborted after some compaction effort has been made, this field is the number of I/O read/write jobs already executed before the internal abort.

3 — Compaction was completed, and fields *g* through *j* are for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

g = Total number of free blocks.
h = Number of contiguous free blocks at end of file system after compaction.
i = Maximum number of contiguous free blocks before compaction.
j = Cost of compaction in number of I/O read/write jobs executed. If this field is zero, the file system requires no compaction.

l = For explanation of error, see the output Audit Appendix C, AUD-APPC.

m = For explanation of error, see the output Audit Appendix D, AUD-APPD.

n = For explanation of error, see the output Audit Appendix B, AUD-APPB.

o = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, 6, and 7, no action is necessary.

For Format 4, take the following action.

Error code 1 is not correctable. Back up the file system from backup source.

For block errors (error codes 4, 5, and 6), run the block audit in non-correcting mode. If it finds errors, run the block audit in correcting mode. Then try this audit again.

For error codes 8 through 23, 25, and 26, seek technical assistance.

For error code 24, run this audit with reduced file system activity.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

2. REASON FOR OUTPUT

To report the termination status of the file system compaction audit and/or errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of error or report messages.

d = Total number of reports for corrected errors and for compaction completed.

e = Abort Code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout limit.
8 — SIM aborted an executing routine audit because of a blocking request.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label.

g = Not used.
h = File system label.
i = Not used.
j = Not used.

4 — Bad block (block out of file system block range).

5 — Duplicate block number.

6 — Bad address block (address block contains invalid block addresses).

For errors 4, 5, and 6,

g = Inode number.
h = Bad or duplicate block number.
i = 0x000000*AB* indicating block and file type, or 0x000000*C*0 indicating the block usage change that was occurring when the error was detected.

A, *B*, and *C* have the following values.

A = 0 — The block is a data block.
1 — The block is an address block.

B = 1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

C = 3 — A block was being added to a regular file.

SEE PROPRIETARY NOTICE ON COVER PAGE

4 — A block was being removed from a regular file.
5 — Blocks were being added to a multi-extent or contiguous file.
6 — Blocks were being removed from a multi-extent or contiguous file.

j = If *i* is of the form `0x000000`*AB*, the new block number if corrected; otherwise, old block number.
If *i* is of the form `0x000000`*C*`0`, the number of block usage errors found before termination of the audit.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

10 — Unable to stat device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

11 — Device file not a block device.

g = Not used.
h = File type.
i = Index used to locate error.
j = Not used.

12 — Unable to allocate a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

13 — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`14` — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

`16` — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

`17` — Unable to get a free block.

g = Inode number of current inode.
h = Not used.
i = Index used to locate error.
j = Not used.

`18` — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

`19` — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are

`000c` — Failed to allocate a message.
`000d` — Failed to queue the message.
`0013` — Request to remove the segment failed, error returned is found in *h*.

j = Not used.

`20` — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

`000a` — No free mount table entry.
`000b` — Unable to read superblock.

j = Not used.

`21` — Unable to get bitmap segment ID.

g = Not used.
h = Not used.

i = Index used to locate error.
j = Not used.

22 — Bitmap I/O failed.

g = Not used.
h = Error returned from I/O attempt.
i = Index used to locate error.
j = Not used.

23 — No available structures for mapping allocated blocks for the compaction.

g = Inode number.
h = First block number to be mapped.
i = `0x000000`*AB* indicating block or file type, or `0x000000`*C*`0` indicating the block usage change that was occurring when the error was detected.

A, *B*, and *C* have the following values.

A = `0` — The block is a data block.
`1` — The block is an address block.
B = `1` — Regular file direct block.
`2` — Single indirect block.
`3` — Double indirect block.
`4` — Triple indirect block.
`5` — Extent file.
C = `3` — A block was being added to a regular file.
`4` — A block was being removed from a regular file.
`5` — Blocks were being added to a multi-extent or contiguous file.
`6` — Blocks were being removed from a multi-extent or contiguous file.

j = If *i* is of the form `0x000000`*AB*, first block number to be mapped.
If *i* is of the form `0x000000`*C*`0`, the number of errors found before termination of the audit.

24 — Concurrent file system activity is interfering with the compaction effort.

g = Number of relocations needed at the beginning of an interval.
h = Number of relocations needed at the end of the interval.
i = Number of I/O read/write jobs already executed to achieve compaction.
j = Number of errors found before termination of the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

25 — I/O attempt failed.

g = Type of I/O. Possible values are:

1 — Attempt to read file system blocks failed.
2 — Attempt to write file system blocks failed.
3 — Attempt to update inodes failed.

h = Error returned on read or write attempt.
i = If *g* is 1 or 2, the starting block address. If *g* is 3, the inode number.
j = If *g* is 1 or 2, the number of blocks. If *g* is 3:

0001 — The inode is not in a temp'd state, or the incore copy of the temp'd inode is being updated.
0002 — The disk copy of a temp'd inode is being updated.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Mdct-rid for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

35 — File manager segment list is full.

g = Not used.
h = Not used.
i = Index used to locate error
j = Not used.

k = Data report code. Possible data codes are:

2 — This report is generated for three conditions: 1) compaction was requested in non-correcting (information only) mode, 2) compaction was requested in either correcting or non-correcting mode and could not complete because of non-corrected errors, or 3) compaction was requested in correcting mode and the projected number of contiguous blocks that could be freed is less than or equal to the current number of contiguous free blocks. Fields *g* through *j* contain the following information.

g = Total number of free blocks.
h = Projected number of contiguous free blocks after compaction.
i = Current maximum number of contiguous free blocks.
j = Projected cost of compaction in number of relocations required. If the audit is internally aborted before the cost of compaction could be estimated, this field will be

SEE PROPRIETARY NOTICE ON COVER PAGE

`0xffffffff`. If the audit is internally aborted after some compaction effort has been made, this field is the number of I/O read/write jobs already executed before the internal abort.

`3` — Compaction was completed, and fields *g* through *j* are for information only.

g = Total number of free blocks.
h = Number of contiguous free blocks at end of file system after compaction.
i = Maximum number of contiguous free blocks before compaction.
j = Cost of compaction in number of I/O read/write jobs executed. If this field is zero, the file system requires no compaction.

l = For explanation of error, see the output Audit Appendix C, `AUD-APPC`.

m = For explanation of error, see the output Audit Appendix D, `AUD-APPD`.

n = For explanation of error, see the output Audit Appendix B, `AUD-APPB`.

o = Inhibit status. Possible values are:

`INHIBITED` — Audit has been automatically inhibited by SIM.
`ALLOWED` — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, `AUD-APPA`, and output Audit Appendix B, `AUD-APPB`, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, 6, and 7, no action is necessary.

For Format 4, take the following action.

Error code `1` is not correctable. Back up the file system from backup source.

For block errors (error codes `4`, `5`, and `6`), run the block audit in non-correcting mode. If it finds errors, run the block audit in correcting mode. Then try this audit again.

For error codes `8` through `23`, `25`, and `26`, seek technical assistance.

For error code `24`, run this audit with reduced file system activity.

Error code `35` occurs when the maximum number of file manager tasks are running and using all of the available file manager segment table slots. Rerun the audit at a time when there are no other file system audits running. If the problem persists, execute a level 3 craft

initialization. If the problem still persists, create an off-line memory dump tape and seek technical assistance.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

2. REASON FOR OUTPUT

To report the termination status of file system link audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of errors.

d = Total number of reports for corrected errors and for compaction completed.

e = Abort Code. Possible values are:

`3` — Audit was aborted without completing its work.
`4` — Audit was faulted while correcting errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the audit terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label:

g = 0 - Not used.
h = File system label.
i = 0 - Not used.
j = 0 - Not used.

2 — Trashed inode in the inode table:

g = Inode number (index into inode table).
h = Inode number from inode table entry.
i = Not used.
j = Not used.

3 — Bad directory entry:

g = Inode number (index into inode table).
h = Inode number in the directory entry.
i = File type of directory. Possible values are:

1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = Corrected directory inode number if corrected; otherwise, inode number in the directory entry.

4 — Bad directory block (block out of file system block range):

g = Inode number (index into inode table).
h = Bad block number.
i = Not used.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

5 — Bad link count (the link count in the inode is not the same as the number of references in the directories).

g = Inode number.
h = Bad link count of the inode.
i = Not used.
j = `CORRECTED` (if correcting audit) or `CORRECT` link count.

6 — Unreferenced inode:

g = Inode number.
h = Bad link count of the inode.
i = For non-correcting audit; not used.

For correcting audit, correcting type. Possible values are:

`0` — The unreferenced inode was zeroed out.
`1` — The unreferenced inode was written into a lost and found directory.

j = New link count. Possible values are:

`0` — If corrected and zero-length file.
`1` — If corrected and written to a lost and found directory.
— Otherwise, a count of the bad links.

7 — Link count of the directory inode is less than two:

g = Inode number.
h = Link count in inode.
i = Not used.
j = Not used.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

10 — Unable to stat device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

`11` — Device file not block device.

g = Not used.
h = File type.
i = Index used locate error.
j = Not used.

`12` — Unable to allocate a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`13` — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`14` — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

`16` — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

`18` — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

`19` — Unable to remove a segment

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

`000c` — Failed to allocate a message.
`000d` — Failed to queue the message.
`0013` — Request to remove the segment failed; error returned is found in *h*.

j = Not used.

`20` — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

`000a` — No free mount table entry.
`000b` — Unable to read superblock.

j = Not used.

`26` — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Minor device chain table (MDCT) record identification (RID) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

`30` — References to a free inode.

g = Inode number with invalid references.
h = `0` - not used.
i = `0` - not used.
j = Number of invalid references.

`27` — Current directory entry could not be referenced from the parent directory.

g = Inode number.
h = Bad link count of the inode.
i = Correction type. Possible values are:

`1` — Not corrected - aborted. Parent inode should be two, but it is not.
`2` — Corrected. Parent inode should be two, but it is not.
`3` — Not corrected - aborted. Parent inode is not a directory.
`4` — Corrected. Parent inode is not a directory, but all files under the parent inode have written into the lost+found directory.
`5` — Unable to make the correction. Unable to write into the lost+found directory.
`6` — Corrected. Corrupted inode has been written into the lost+found directory.

j = Value. Zero if unknown; otherwise, the bad inode number.

28 — Current directory entry cannot reference its parent directory.

g = Current directory inode number.
h = Bad link count of the inode.
i = Not used.
j = Parent directory inode number.

29 — Current directory entry has a bad inode.

g = Inode number.
h = Bad link count of the inode.
i = Not used.
j = Bad inode number.

k = For explanation of error, see output Audit Appendix C, AUD-APPC.

l = For explanation of error, see output Audit Appendix D, AUD-APPD.

m = For explanation of error, see output Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the action to be taken depends on the error code.

Error codes 1, 2, 4, and 7, are usually not correctable. Before backing up the file system from the backup source, rerun the audit in the correcting mode; this may correct some of the errors.

For error codes 3, 5, and 6, use the input command OP:FNAME to print the full path name of file. To correct errors, rerun the audit in the correcting (CORR) mode.

For error codes 8 through 20, seek technical assistance.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

[5] `AUD FSLINK NOT STARTED`
{`CONFLICT WITH CURRENT SYSTEM STATUS` *k*
|`RETRY LATER` *l*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *m*}

[6] `AUD ENV=RTR FSLINK` *a* `AUTOMATICALLY` *n*

2. REASON FOR OUTPUT

To report the termination status of file system link audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of errors.

d = Total number of reports for corrected errors and for compaction completed.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Abort Code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the audit terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label:

g = Not used.
h = File system label.
i = Not used.
j = Not used.

2 — Trashed inode in the inode table:

g = Inode number (index into inode table).
h = Inode number from inode table entry.
i = Not used.
j = Not used.

3 — Bad directory entry:

g = Inode number (index into inode table).
h = Inode number in the directory entry.
i = File type of directory. Possible values are:

1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = Corrected directory inode number if corrected; otherwise, inode number in the directory entry.

4 — Bad directory block (block out of file system block range):

g = Inode number (index into inode table).
h = Bad block number.
i = Not used.
j = Not used.

`5` — Bad link count (the link count in the inode is not the same as the number of references in the directories).

g = Inode number.
h = Bad link count of the inode.
i = Not used.
j = `CORRECTED` (if correcting audit) or `CORRECT` link count.

`6` — Unreferenced inode:

g = Inode number.
h = Bad link count of the inode.
i = For non-correcting audit; not used.

For correcting audit, correcting type. Possible values are:

`0` — The unreferenced inode was zeroed out.
`1` — The unreferenced inode was written into a lost and found directory.

j = New link count. Possible values are:

`0` — If corrected and zero-length file.
`1` — If corrected and written to a lost and found directory.
— Otherwise, a count of the bad links.

`7` — Link count of the directory inode is less than two:

g = Inode number.
h = Link count in inode.
i = Not used.
j = Not used.

`8` — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`9` — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

`10` — Unable to stat device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

`11` — Device file not block device.

g = Not used.
h = File type.
i = Index used locate error.
j = Not used.

`12` — Unable to allocate a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`13` — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`14` — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

`16` — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

`18` — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

`19` — Unable to remove a segment

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

`000c` — Failed to allocate a message.
`000d` — Failed to queue the message.
`0013` — Request to remove the segment failed; error returned is found in *h*.

j = Not used.

`20` — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

`000a` — No free mount table entry.
`000b` — Unable to read superblock.

j = Not used.

`26` — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Minor device chain table (MDCT) record identification (RID) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

`30` — References to a free inode.

g = Inode number with invalid references.
h = `0` - not used.
i = `0` - not used.
j = Number of invalid references.

`27` — Current directory entry could not be referenced from the parent directory.

g = Inode number.
h = Bad link count of the inode.
i = Correction type. Possible values are:

`1` — Not corrected - aborted. Parent inode should be two, but it is not.
`2` — Corrected. Parent inode should be two, but it is not.
`3` — Not corrected - aborted. Parent inode is not a directory.
`4` — Corrected. Parent inode is not a directory, but all files under the parent inode have written into the lost+found directory.
`5` — Unable to make the correction. Unable to write into the lost+found directory.
`6` — Corrected. Corrupted inode has been written into the lost+found directory.

j = Value. Zero if unknown; otherwise, the bad inode number.

`28` — Current directory entry cannot reference its parent directory.

g = Current directory inode number.

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Bad link count of the inode.
i = Not used.
j = Parent directory inode number.

29 — Current directory entry has a bad inode.

g = Inode number.
h = Bad link count of the inode.
i = Not used.
j = Bad inode number.

k = For explanation of error, see output Audit Appendix C, AUD-APPC.

l = For explanation of error, see output Audit Appendix D, AUD-APPD.

m = For explanation of error, see Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, f4AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the action to be taken depends on the error code.

Error codes 1, 2, 4, and 7 are usually not correctable. Before backing up the file system from the backup source, rerun the audit in the correcting mode; this may correct some of the errors.

For error codes 3, 5, and 6, use the input command OP:FNAME to print the full path name of file. To correct errors, rerun the audit in the correcting (CORR) mode.

For error codes 8 through 20, seek technical assistance.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

2. REASON FOR OUTPUT

To report the termination status of file system link audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of errors.

d = Total number of reports for corrected errors and for compaction completed.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Abort Code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the audit terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label:

g = Not used.
h = File system label.
i = Not used.
j = Not used.

2 — Trashed inode in the inode table:

g = Inode number (index into inode table).
h = Inode number from inode table entry.
i = Not used.
j = Not used.

3 — Bad directory entry:

g = Inode number (index into inode table).
h = Inode number in the directory entry.
i = File type of directory. Possible values are:

1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = Corrected directory inode number if corrected; otherwise, inode number in the directory entry.

4 — Bad directory block (block out of file system block range):

g = Inode number (index into inode table).
h = Bad block number.
i = Not used.
j = Not used.

5 — Bad link count (link count in inode not same as number of references in directories).

g = Inode number.
h = Bad link count of the inode.
i = Not used.
j = `CORRECTED` (if correcting audit) or `CORRECT` link count.

6 — Unreferenced inode:

g = Inode number.
h = Bad link count of the inode.
i = For non-correcting audit, not used.

For correcting audit, correcting type. Possible values are:

`0` — The unreferenced inode was zeroed out.
`1` — The unreferenced inode was written into a lost+found directory.

j = If non-correcting mode, the number of links from the file system.
If correcting mode and the file was zero length, the file is removed and this value is zero; otherwise, the file is linked into the lost+found directory and this value will be non-zero and the corrected number of links from the file system.

7 — Link count of the directory inode is less than two:

g = Inode number.
h = Link count in inode.
i = Not used.
j = Not used.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

`10` — Unable to stat device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

`11` — Device file not block device.

g = Not used.
h = File type.
i = Index used locate error.
j = Not used.

`12` — Unable to allocate a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`13` — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`14` — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

`16` — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

`18` — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

`19` — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

`000c` — Failed to allocate a message.
`000d` — Failed to queue the message.

SEE PROPRIETARY NOTICE ON COVER PAGE

0013 — Request to remove the segment failed, error returned is found in *h*.

j = Not used.

20 — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

000a — No free mount table entry.
000b — Unable to read superblock.

j = Not used.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Minor device chain table (MDCT) record identification (RID) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

27 — Current directory entry could not be referenced from the parent directory.

g = Inode number.
h = Bad link count of the inode.
i = Correction type. Possible values are:

1 — Not corrected - aborted. Parent inode should be two, but it is not.
2 — Corrected. Parent inode should be two, but it is not.
3 — Not corrected - aborted. Parent inode is not a directory.
4 — Corrected. Parent inode is not a directory, but all files under the parent inode have written into the lost+found directory.
5 — Unable to make the correction. Unable to write into the lost+found directory.
6 — Corrected. Corrupted inode has been written into the lost+found directory.

j = Value (0) if unknown; otherwise, the bad inode number.

28 — Current directory entry cannot reference its parent directory.

g = Current directory inode number.
h = Bad link count of the inode.
i = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Parent directory inode number.

`29` — Current directory entry has a bad inode.

g = Inode number.
h = Bad link count of the inode.
i = Not used.
j = Bad inode number.

`30` — References to a free inode.

g = Inode number with invalid references.
h = Not used.
i = Not used.
j = Zero if corrected; otherwise, number of invalid references.

`31` — Current directory has more than one parent directory.

g = Inode number.
h = Parent inode originally specified by (`..`) in current directory.
i = Not used.
j = Not used.

`32` — Current directory is not reachable from file system root.

g = Inode number.
h = Parent inode originally specified by (`..`) in current directory.
i = Not used.
j = Not used.

`33` — Active but unreferenced file in filesystem when audit invoked with `PARAM=BACKUP`. This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action provided or needed for this condition.

g = Inode number.
h = Number of active opens on this inode.
i = Not used.
j = Process ID of a process (there may be others) with the inode open.

k = For explanation of error, see output Audit Appendix C, `AUD-APPC`.

l = For explanation of error, see output Audit Appendix D, `AUD-APPD`.

m = For explanation of error, see output Audit Appendix B, `AUD-APPB`.

n = Inhibit status. Possible values are:

`INHIBITED` — Audit has been automatically inhibited by SIM.
`ALLOWED` — Audit has been automatically allowed by SIM.

SEE PROPRIETARY NOTICE ON COVER PAGE

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the action to be taken depends on the error code.

Error codes 1, 2, 4, and 7, are usually not correctable. Before backing up the file system from the backup source, rerun the audit in the correcting mode; this may correct some of the errors.

For error codes 3, 5, and 27 through 32, use the input command OP:FNAME to print the full path name of file. To correct errors, rerun the audit in the correcting (CORR) mode. If the audit has detected multiple errors, then file system corruption has occurred. Save a copy of all FSLINK audit error messages and seek technical assistance.

For error code 6, the unreferenced file cannot be reached in the file system by any name. To correct errors, rerun the audit in the correcting (CORR) mode.

For error codes 8, 12, 13, 14, 16, 18, 19, and 20, check disk status and/or system resource usage. Rerun audit when the system is quiet and the disks are active. Disk access error or system resource access error has occurred.

For error codes 9, 10, and 11, check and repair or create a device file that defines the file system. The device file is non-existent or the wrong type.

For error codes 15 and 17, seek technical assistance.

For error code 26, rerun the audit later. If error persists, seek technical assistance.

The correcting mode may not correct all errors. For further investigation, contact your next level of technical assistance.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

2. REASON FOR OUTPUT

To report the termination status of file system link audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. RTR audits have the value `1`, but application audits may be greater than `1`.

b = Name of the file system that was audited.

c = Total number of errors.

d = Total number of reports for corrected errors and for compaction completed.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Abort Code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the audit terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Possible error codes are:

1 — Bad superblock label:

g = Not used.
h = File system label.
i = Not used.
j = Not used.

2 — Trashed inode in the inode table:

g = Inode number (index into inode table).
h = Inode number from inode table entry.
i = Not used.
j = Not used.

3 — Bad directory entry:

g = Inode number (index into inode table).
h = Inode number in the directory entry.
i = File type of directory. Possible values are:

1 — Regular file direct block.
2 — Single indirect block.
3 — Double indirect block.
4 — Triple indirect block.
5 — Extent file.

j = Corrected directory inode number if corrected; otherwise, inode number in the directory entry.

4 — Bad directory block (block out of file system block range):

g = Inode number (index into inode table).
h = Bad block number.
i = Not used.
j = Not used.

5 — Bad link count (link count in inode not same as number of references in directories).

g = Inode number.
h = Bad link count of the inode.
i = Not used.
j = `CORRECTED` (if correcting audit) or `CORRECT` link count.

6 — Unreferenced inode:

g = Inode number.
h = Bad link count of the inode.
i = For non-correcting audit, not used.

For correcting audit, correcting type. Possible values are:

`0` — The unreferenced inode was zeroed out.
`1` — The unreferenced inode was written into a lost+found directory.

j = If non-correcting mode, the number of links from the file system.
If correcting mode and the file was zero length, the file is removed and this value is zero; otherwise, the file is linked into the lost+found directory and this value will be non-zero and the corrected number of links from the file system.

7 — Link count of the directory inode is less than two:

g = Inode number.
h = Link count in inode.
i = Not used.
j = Not used.

8 — Audit library initialization failed.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

9 — Unable to open device file.

g = Not used.
h = Error returned from attempt to open.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

`10` — Unable to stat device file.

g = Not used.
h = Error returned from attempt to get status.
i = Index used to locate error.
j = Not used.

`11` — Device file not block device.

g = Not used.
h = File type.
i = Index used locate error.
j = Not used.

`12` — Unable to allocate a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`13` — Unable to queue a message.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

`14` — Unable to add segments.

g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

`16` — Unable to access block (or get buffer to read block).

g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

`18` — Unable to access inode.

g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

19 — Unable to remove a segment.

g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Possible values are:

000c — Failed to allocate a message.
000d — Failed to queue the message.
0013 — Request to remove the segment failed, error returned is found in *h*.

j = Not used.

20 — Cannot mount the device.

g = Not used.
h = Not used.
i = Index with the following values:

000a — No free mount table entry.
000b — Unable to read superblock.

j = Not used.

26 — The device file is open for writing.

g = Inode number of device file.
h = Number of opens for writing on the device.
i = Minor device chain table (MDCT) record identification (RID) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

27 — Current directory entry could not be referenced from the parent directory.

g = Inode number.
h = Bad link count of the inode.
i = Correction type. Possible values are:

1 — Not corrected - aborted. Parent inode should be two, but it is not.
2 — Corrected. Parent inode should be two, but it is not.
3 — Not corrected - aborted. Parent inode is not a directory.
4 — Corrected. Parent inode is not a directory, but all files under the parent inode have written into the lost+found directory.
5 — Unable to make the correction. Unable to write into the lost+found directory.
6 — Corrected. Corrupted inode has been written into the lost+found directory.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Value. Zero if unknown; otherwise, the bad inode number.

28 — Current directory entry cannot reference its parent directory.

g = Current directory inode number.
h = Bad link count of the inode.
i = Not used.
j = Parent directory inode number.

29 — Current directory entry has a bad inode.

g = Inode number.
h = Bad link count of the inode.
i = Not used.
j = Bad inode number.

30 — References to a free inode.

g = Inode number with invalid references.
h = Not used.
i = Not used.
j = Zero if corrected; otherwise, number of invalid references.

31 — Current directory has more than one parent directory.

g = Inode number.
h = Parent inode originally specified by (`..`) in current directory.
i = Not used.
j = Not used.

32 — Current directory is not reachable from file system root.

g = Inode number.
h = Parent inode originally specified by (`..`) in current directory.
i = Not used.
j = Not used.

33 — Active but unreferenced file in filesystem when audit invoked with `PARAM=BACKUP`. This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action provided or needed for this condition.

g = Inode number.
h = Number of active opens on this inode.
i = Not used.
j = Process ID of a process (there may be others) with the inode open.

SEE PROPRIETARY NOTICE ON COVER PAGE

35 — File manager segment list is full.

g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

k = For explanation of error, see output Audit Appendix C, AUD-APPC.

l = For explanation of error, see output Audit Appendix D, AUD-APPD.

m = For explanation of error, see output Audit Appendix B, AUD-APPB.

n = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See output Audit Appendix A, AUD-APPA, and output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the action to be taken depends on the error code.

Error codes 1, 2, 4, and 7, are usually not correctable. Before backing up the file system from the backup source, rerun the audit in the correcting mode; this may correct some of the errors.

For error codes 3, 5, and 27 through 32, use the input command OP:FNAME to print the full pathname of file. To correct errors, rerun the audit in the correcting (CORR) mode. If the audit has detected multiple errors, then file system corruption has occurred. Save a copy of all FSLINK audit error messages and seek technical assistance.

For error code 6, the unreferenced file cannot be reached in the file system by any name. To correct errors, rerun the audit in the correcting (CORR) mode.

For error codes 8, 12, 13, 14, 16, 18, 19, and 20, check disk status and/or system resource usage. Rerun audit when the system is quiet and the disks are active. Disk access error or system resource access error has occurred.

For error codes 9, 10, and 11, check and repair or create a device file that defines the file system. The device file is non-existent or the wrong type.

For error codes 15 and 17, seek technical assistance.

For error code 26, rerun the audit later. If error persists, seek technical assistance.

Error code 35 occurs when the maximum number of file manager tasks are running and using all of the available file manager segment table slots. Rerun the audit at a time when

there are no other file system audits running. If the problem persists, execute a level 3 craft initialization. If the problem still persists, create an off-line memory dump tape and seek technical assistance.

The correcting mode may not correct all errors. For further investigation, contact your next level of technical assistance.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

2. REASON FOR OUTPUT

To report the termination status of the memory manager audits and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member:

- 1 — Segment descriptor table audit.
- 2 — Page table audit.
- 3 — Page descriptor table audit.
- 4 — Segment release audit.
- 5 — Segment unlock audit.
- 9 — Swap space compaction audit.

b = Total number of errors found.

c = Total number of errors corrected.

d = Abort code:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit.
- 9 — Transient process that was running the audit terminated.
- 10 — A segmented audit exceeded an error threshold.

e - i = Error code and error data. Possible error codes and corresponding error data are:

- 1 — Not a real error. Swap space has been compacted, and fields *f* through *i* are for information only.
  - *f* = Number of holes after compaction.
  - *g* = Size of the largest hole after compaction.
  - *h* = Number of segments "moved" on the swap disk.
  - *i* = Number of segments swapped into memory by the compaction function.

SEE PROPRIETARY NOTICE ON COVER PAGE

2 — The swap space compaction audit was requested to run in a non-correcting mode, which is meaningless for this audit. If *d* = 2, fields *f* through *i* will be 0, field *b* will be 1 (1 error found) and *c* will be 0 (no errors corrected).

3 — The swap space compaction audit was unable to "move" a particular segment. Fields *f* and *g* are for information only.

f = Disk address (block number) of the segment.
g = Segment size in blocks.
h,i = 0 - Not used.

10 — Incorrect values in one or more of the following:
pointer to first segment descriptor, pointer to last segment descriptor, number of segment descriptors.

f = Value in pointer to first segment descriptor.
g = Value in pointer to last segment descriptor.
h = Value in number of segment descriptors.
i = 0 - Not used.

20 — Incorrect values in one or more of the following:
pointer to first page table, pointer to last page table, number of page tables.

f = Value in pointer to first page table.
g = Value in pointer to last page table.
h = Value in number of page tables.
i = 0 - Not used.

30 — Incorrect values in one or more of the following:
pointer to first page descriptor, pointer to last page descriptor, number of page descriptors.

f = Value in pointer to first page descriptor.
g = Value in pointer to last page descriptor.
h = Value in number of page descriptors.
i = 0 - Not used.

101 — Invalid link in the segment descriptor free list.

f = Invalid segment descriptors.
g,h,i = 0 - Not used.

102 — Segment descriptor on the free list is allocated.

f = Pointer to the allocated segment descriptor.
g,h,i = 0 - Not used.

103 — Incorrect value in the number of free segment descriptors.

f = Correct number of free segment descriptors.
g = Incorrect value in the number of free segment descriptors.
h,i = 0 - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

104 — Segment descriptor free list is circular.

f = Pointer to the segment descriptor at which error was found.
g,h, = 0 - Not used.

105 — Segment descriptor on free list not marked on-free-list.

CORR mode:

f = Pointer to the segment descriptor.
g,h,i = 0 - Not used.

NOT CORR mode:

f = Pointer to the segment descriptor.
g = Pointer to first free segment descriptor.
h,i = 0 - Not used.

106 — Free segment descriptor not on the free list.

f = Pointer to the segment descriptor.
g = Pointer to first free segment descriptor.
h,i = 0 - Not used.

107 — Segment descriptor with a valid page table pointer and/or non-zero status not marked allocated.

f = Pointer to the segment descriptor.
g = Uncorrected value of the status word in the segment descriptor.
h,i = 0 - Not used.

108 — Empty page table linked to a segment descriptor that is not page-protected.

f = Pointer to the segment descriptor.
g = Pointer to the page table.
h,i = 0 - Not used.

109 — Page table linked to a segment descriptor not marked allocated.

f = Pointer to the segment descriptor.
g = Pointer to the page table.
h,i = 0 - Not used.

110 — Invalid page table pointer in a segment descriptor.

f = Pointer to the segment descriptor.
g = Invalid page table pointer.
h,i = 0 - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

112 — Incorrect segment index in a page descriptor for a page linked to a segment descriptor.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = Incorrect segment index.

113 — Incorrect page index in a page descriptor for a page linked to a segment descriptor.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = Incorrect page index.

114 — Incorrect in-memory-page-count in segment descriptor.

f = Pointer to the segment descriptor.
g = Correct in-memory-page-count.
h = Incorrect in-memory-page-count in segment descriptor.
i = 0 - Not used.

115 — Page descriptor for a page linked to a segment descriptor not marked allocated.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = 0 - Not used.

(116 - 122) — Serious errors involving segment corruptions.

For these errors, the information reported differs depending on the mode of the audit. In NOT CORR mode, no supplementary data is provided. In CORR mode, one or two blocks of supplementary data is provided. The data field descriptions for NOT CORR mode will be listed for each error code individually. The data field descriptions for CORR mode, which are identical for all these errors, will follow. The SUPPLEMENTARY DATA BLOCK descriptions for these errors are given last.

(116 - 122) NOT CORR mode:

116 — Invalid page address in page table entry for a segment.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = The invalid page address.
i = 0 - not used.

118 — Segment has pages that overlap.

f = Pointer to the segment descriptor.

g = Index of one entry in the page table for the page.
h = Index of the other entry in the page for the page.
i = Page number.

120 — Two segments overlap in a page.

f = Pointer to the segment descriptor for the first segment.
g = Pointer to the segment descriptor for the second segment.
h = 00*PP*00*QQ*, where *PP* (00 - 3F) is the index in the page table of the first segment for the common page, and *QQ* (00 - 3F) is the index in the page table of the second segment for the common page.
i = Page number.

122 — Two segments have the same page table.

f = Pointer to the segment descriptor for the first segment.
g = Pointer to the segment descriptor for the second segment.
h = Pointer to the common page table.
i = 0 - not used.

(116 - 122) CORR mode:

Data field descriptions:

f = Number of segments with error.
g = Number of non-killable processes that have any of these segments in their address spaces.
h = Number of killable processes that have any of these segments in their address spaces.
i = Number of killable processes that have been terminated.

In SUPPLEMENTARY DATA BLOCK NUMBER 1, each line of four data words describes a serious error.

k = Error code. Possible error codes and corresponding error data are:

00000074 (decimal 116) - invalid page address in an entry of the page table for a segment.

m = Pointer to the segment descriptor.
n = 000000*NN*, where *NN* (00 - 3F) is the index of the entry in the page table.
p = The invalid page address.

00000*076* (decimal 118) - overlap of pages within a segment.

m = Pointer to the segment descriptor.

SEE PROPRIETARY NOTICE ON COVER PAGE

n = 000000*NN*, where *NN* (00 - 3F) is the index of one entry in the page table for the page.
p = 000000*PP*, where *PP* (00 - 3F) is the index of the other entry in the page table for the page.

00000078 (decimal 120) - Two segments overlap in a page.

m = Pointer to the segment descriptor for the first segment.
n = Pointer to the segment descriptor for the second segment.
p = 00*PP*00*QQ*, where *PP* (00 - 3F) is the index in the page table of the first segment for the common page, and *QQ* (00 - 3F) is the index in the page table of the second segment for the common page.

0000007*a* (decimal 122) - two segments have the same page table.

m = Pointer to the segment descriptor for the first segment.
n = Pointer to the segment descriptor for the second segment.
p = Pointer to the common page table.

In SUPPLEMENTARY DATA BLOCK NUMBER 2, each pair of data words describes a process that contains in its address space one or more of the segments with serious errors.

RRRRRRRR = Process number of the process.

S = Flags describing the process.

If *S* = 8, the process is a special kernel process.
If *S* = 4, the process is non-killable.
If *S* = 3, the process is killable and a termination message has been sent.
If *S* = 2, the process is killable, but no termination message was sent by this audit of the process.

TTTT = The pcode portion of the utility ID.

201 — Invalid link in the page table free list.

f = Invalid page table pointer.
g = 0 - not used.
h = 0 - not used.

i = `0` - not used.

`202` — Page table on the free list has non-free entries.

f = Pointer to the page table.
g = `0` - not used.
h = `0` - not used.
i = `0` - not used.

`203` — Incorrect value in the number of free page tables.

f = Correct number of free page tables.
g = Incorrect value in the number of free page tables.
h = `0` - Not used.
i = `0` - Not used.

`204` — Page table free list is circular.

f = Pointer to the page table at which error was found.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`205` — Page table on free list not marked on-free-list.

f = Pointer to the page table.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`206` — Page table lost; not on the free list and not linked to a segment descriptor.

f = Pointer to the page table.
g = Pointer to first free page table.
h = `0` - Not used.
i = `0` - Not used.

`301` — Invalid link index in the list of free pages.

f = Invalid link index.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`302` — Page on the free list is allocated.

f = Page number of the page.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

303 — Incorrect value in the number of free pages.

f = Correct number of free pages.
g = Incorrect value in the number of free pages.
h = 0 - Not used.
i = 0 - Not used.

304 — Free page list is circular.

f = Page number at which error was found.
g = 0 - Not used.
h = 0 - Not used.
i = 0 - Not used.

305 — Page descriptor for a page on free list not marked on-free-list.

f = Page number of the page.
g = 0 - Not used.
h = 0 - Not used.
i = 0 - Not used.

306 — Lost page; page not on free list and not linked to a segment descriptor.

f = Page number of the page.
g = Page number of first free page.
h = 0 - Not used.
i = 0 - Not used.

401 — Breakdown of a segment interrupted.

f = Pointer to a segment descriptor.
g = Status word in segment descriptor.
h = Index into segment descriptor table.
i = 0 - Not used.

501 — Old iolocked segment.

f = Pointer to segment descriptor.
g = Age of segment in minutes.
h = Index into segment descriptor table.
i = 0 - Not used.

q = Explanation of error - see Output Audit Appendix C, AUD-APPC.

r = Explanation of error - see Output Audit Appendix D, AUD-APPD.

s = Explanation of error - see Output Audit Appendix B, AUD-APPB.

t = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA, and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit was run in non-correcting mode and reported errors, rerun it in correcting mode.

5. ALARMS

None.

```

2. REASON FOR OUTPUT

To report the termination status of the memory manager audits and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member:

- 1 — Segment descriptor table audit.
- 2 — Page table audit.
- 3 — Page descriptor table audit.
- 4 — Segment release audit.
- 5 — Segment unlock audit.
- 9 — Swap space compaction audit.

b = Total number of errors found.

c = Total number of errors corrected.

d = Abort code:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit.
- 9 — Transient process that was running the audit terminated.
- 10 — A segmented audit exceeded an error threshold.

e - i = Error code and error data. Possible error codes and corresponding error data are:

- 1 — Not a real error. Swap space has been compacted, and fields *f* through *i* are for information only.
  - *f* = Number of holes after compaction.
  - *g* = Size of the largest hole after compaction.
  - *h* = Number of segments "moved" on the swap disk.
  - *i* = Number of segments swapped into memory by the compaction function.
- 2 — The swap space compaction audit was requested to run in a non-correcting mode, which is meaningless for this audit. If *d* = 2, fields *f* through *i* will be 0, field *b* will be 1 (1 error found) and *c* will be 0 (no errors corrected).

SEE PROPRIETARY NOTICE ON COVER PAGE

`3` — The swap space compaction audit was unable to "move" a particular segment. Fields *f* and *g* are for information only.

f = Disk address (block number) of the segment.
g = Segment size in blocks.
h,i = `0` - Not used.

`10` — Incorrect values in one or more of the following:
pointer to first segment descriptor, pointer to last segment descriptor, number of segment descriptors.

f = Value in pointer to first segment descriptor.
g = Value in pointer to last segment descriptor.
h = Value in number of segment descriptors.
i = `0` - Not used.

`20` — Incorrect values in one or more of the following;
pointer to first page table, pointer to last page table, number of page tables.

f = Value in pointer to first page table.
g = Value in pointer to last page table.
h = Value in number of page tables.
i = `0` - Not used.

`30` — Incorrect values in one or more of the following; pointer to first page descriptor, pointer to last page descriptor, number of page descriptors.

f = Value in pointer to first page descriptor.
g = Value in pointer to last page descriptor.
h = Value in number of page descriptors.
i = `0` - Not used.

`101` — Invalid link in the segment descriptor free list.

f = Invalid segment descriptors.
g,h,i = `0` - Not used.

`102` — Segment descriptor on the free list is allocated.

f = Pointer to the allocated segment descriptor.
g,h,i = `0` - Not used.

`103` — Incorrect value in the number of free segment descriptors.

f = Correct number of free segment descriptors.
g = Incorrect value in the number of free segment descriptors.
h,i = `0` - Not used.

`104` — Segment descriptor free list is circular.

f = Pointer to the segment descriptor at which error was found.
g,h,i = `0` - Not used.

`105` — Segment descriptor on free list not marked on-free-list.

SEE PROPRIETARY NOTICE ON COVER PAGE

`CORR` mode:

f = Pointer to the segment descriptor.
g,h,i = `0` - Not used.

`NOT CORR` mode:

f = Pointer to the segment descriptor.
g = Pointer to first free segment descriptor.
h,i = `0` - Not used.

`106` — Free segment descriptor not on the free list.

f = Pointer to the segment descriptor.
g = Pointer to first free segment descriptor.
h,i = `0` - Not used.

`107` — Segment descriptor with a valid page table pointer and/or non-zero status not marked allocated.

f = Pointer to the segment descriptor.
g = Uncorrected value of the status word in the segment descriptor.
h,i = `0` - Not used.

`108` — Empty page table linked to a segment descriptor that is not page-protected.

f = Pointer to the segment descriptor.
g = Pointer to the page table.
h,i = `0` - Not used.

`109` — Page table linked to a segment descriptor not marked allocated.

f = Pointer to the segment descriptor.
g = Pointer to the page table.
h,i = `0` - Not used.

`110` — Invalid page table pointer in a segment descriptor.

f = Pointer to the segment descriptor.
g = Invalid page table pointer.
h,i = `0` - Not used.

`112` — Incorrect segment index in a page descriptor for a page linked to a segment descriptor.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = Incorrect segment index.

`113` — Incorrect page index in a page descriptor for a page linked to a segment descriptor.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Page number.
i = Incorrect page index.

114 — Incorrect in-memory-page-count in segment descriptor.

f = Pointer to the segment descriptor.
g = Correct in-memory-page-count.
h = Incorrect in-memory-page-count in segment descriptor.
i = 0 - Not used.

115 — Page descriptor for a page linked to a segment descriptor not marked allocated.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = 0 - Not used.

(116 - 122) Serious errors involving segment corruptions.

For these errors, the information reported differs depending on the mode of the audit. In NOT CORR mode, no supplementary data is provided. In CORR mode, one or two blocks of supplementary data is provided. The data field descriptions for NOT CORR mode will be listed for each error code individually. The data field descriptions for CORR mode, which are identical for all these errors, will follow. The SUPPLEMENTARY DATA BLOCK descriptions for these errors are given last.

(116 - 122) NOT CORR mode:

116 — Invalid page address in page table entry for a segment.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = The invalid page address.
i = 0 - not used.

118 — Segment has pages that overlap.

f = Pointer to the segment descriptor.
g = Index of one entry in the page table for the page.
h = Index of the other entry in the page for the page.
i = Page number.

120 — Two segments overlap in a page.

f = Pointer to the segment descriptor for the first segment.
g = Pointer to the segment descriptor for the second segment.
h = 00*PP*00*QQ*, where *PP* (00 - 3F) is the index in the page table of the first segment for the common page, and *QQ*(00 - 3F) is the index in the page table of the

second segment for the common page.
i = Page number.

122 — Two segments have the same page table.

f = Pointer to the segment descriptor for the first segment.
g = Pointer to the segment descriptor for the second segment.
h = Pointer to the common page table.
i = 0 - not used.

(116 - 122) CORR mode:

Data field descriptions:

f = Number of segments with error.
g = Number of non-killable processes that have any of these segments in their address spaces.
h = Number of killable processes that have any of these segments in their address spaces.
i = Number of killable processes that have been terminated.

In SUPPLEMENTARY DATA BLOCK NUMBER 1, each line of four data words describes a serious error.

k = Error code. Possible error codes and corresponding error data are:

00000074 (decimal 116) - invalid page address in an entry of the page table for a segment.

m = Pointer to the segment descriptor.
n = 000000*NN*, where *NN* (00 - 3F) is the index of the entry in the page table.
p = The invalid page address.

00000076 (decimal 118) - overlap of pages within a segment.

m = Pointer to the segment descriptor.
n = 000000*NN*, where *NN* (00 - 3F) is the index of one entry in the page table for the page.
p = 000000*PP*, where *PP* (00 - 3F) is the index of the other entry in the page table for the page.

00000078 (decimal 120) - Two segments overlap in a page.

m = Pointer to the segment descriptor for the first segment.
n = Pointer to the segment descriptor for the second segment.
p = 00*PP*00*QQ*, where *PP* (00 - 3F) is the index in the page table of the first segment for the

common page, and *QQ* (00 - 3F) is the index in the page table of the second segment for the common page.

0000007a (decimal 122) - two segments have the same page table.

m = Pointer to the segment descriptor for the first segment.
n = Pointer to the segment descriptor for the second segment.
p = Pointer to the common page table.

In SUPPLEMENTARY DATA BLOCK NUMBER 2, each pair of data words describes a process that contains in its address space one or more of the segments with serious errors.

RRRRRRRR = Process number of the process.

S = Flags describing the process.

If *S* = 8, the process is a special kernel process.
If *S* = 4, the process is non-killable.
If *S* = 3, the process is killable and a termination message has been sent.
If *S* = 2, the process is killable, but no termination message was sent by this audit of the process.

TTTT = The pcode portion of the utility ID.

201 — Invalid link in the page table free list.

f = Invalid page table pointer.
g = 0 - not used.
h = 0 - not used.
i = 0 - not used.

202 — Page table on the free list has non-free entries.

f = Pointer to the page table.
g = 0 - not used.
h = 0 - not used.
i = 0 - not used.

203 — Incorrect value in the number of free page tables.

f = Correct number of free page tables.
g = Incorrect value in the number of free page tables.
h = 0 - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

i = `0` - Not used.

`204` — Page table free list is circular.

f = Pointer to the page table at which error was found.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`205` — Page table on free list not marked on-free-list.

f = Pointer to the page table.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`206` — Page table lost; not on the free list and not linked to a segment descriptor.

f = Pointer to the page table.
g = Pointer to first free page table.
h = `0` - Not used.
i = `0` - Not used.

`301` — Invalid link index in the list of free pages.

f = Invalid link index.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`302` — Page on the free list is allocated.

f = Page number of the page.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`303` — Incorrect value in the number of free pages.

f = Correct number of free pages.
g = Incorrect value in the number of free pages.
h = `0` - Not used.
i = `0` - Not used.

`304` — Free page list is circular.

f = Page number at which error was found.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

305 — Page descriptor for a page on free list not marked on-free-list.

f = Page number of the page.
g = 0 - Not used.
h = 0 - Not used.
i = 0 - Not used.

306 — Lost page; page not on free list and not linked to a segment descriptor.

f = Page number of the page.
g = Page number of first free page.
h = 0 - Not used.
i = 0 - Not used.

401 — Breakdown of a segment interrupted.

f = Pointer to a segment descriptor.
g = Status word in segment descriptor.
h = Index into segment descriptor table.
i = 0 - Not used.

501 — Old iolocked segment.

f = Pointer to segment descriptor.
g = Age of segment in minutes.
h = Index into segment descriptor table.
i = Utility ID of segment's last owner (not necessarily the process that left the segment locked). 0 indicates the utility ID is not available.

q — Explanation of error - see Output Audit Appendix C, AUD-APPC.

r — Explanation of error - see Output Audit Appendix D, AUD-APPD.

s — Explanation of error - see Output Audit Appendix B, AUD-APPB.

t — Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA, and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit was run in non-correcting mode and reported errors, rerun it in correcting mode.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the termination status of the memory manager audits and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member:

- 1 — Segment descriptor table audit.
- 2 — Page table audit.
- 3 — Page descriptor table audit.
- 4 — Segment release audit.
- 5 — Segment unlock audit.
- 9 — Swap space compaction audit.

b = Total number of errors found.

c = Total number of errors corrected.

d = Abort code:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System integrity monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit.
- 9 — Transient process that was running the audit terminated.
- 10 — A segmented audit exceeded an error threshold.

e, f - i = Error code and error data. Possible error codes and corresponding error data are:

- 2 — The swap space compaction audit was requested to run in a non-correcting mode, which is meaningless for this audit. If *d* = 2, fields *f* through *i* will be 0, field *b* will be 1 (1 error found) and *c* will be 0 (no errors corrected).

`3` — The swap space compaction audit was unable to "move" a particular segment. Fields *f* and *g* are for information only.

f = Disk address (block number) of the segment.
g = Segment size in blocks.
h,i = `0` - Not used.

`10` — Incorrect values in one or more of the following:
pointer to first segment descriptor, pointer to last segment descriptor, number of segment descriptors.

f = Value in pointer to first segment descriptor.
g = Value in pointer to last segment descriptor.
h = Value in number of segment descriptors.
i = `0` - Not used.

`20` — Incorrect values in one or more of the following;
pointer to first page table, pointer to last page table, number of page tables.

f = Value in pointer to first page table.
g = Value in pointer to last page table.
h = Value in number of page tables.
i = `0` - Not used.

`30` — Incorrect values in one or more of the following; pointer to first page descriptor, pointer to last page descriptor, number of page descriptors.

f = Value in pointer to first page descriptor.
g = Value in pointer to last page descriptor.
h = Value in number of page descriptors.
i = `0` - Not used.

`101` — Invalid link in the segment descriptor free list.

f = Invalid segment descriptors.
g,h,i = `0` - Not used.

`102` — Segment descriptor on the free list is allocated.

f = Pointer to the allocated segment descriptor.
g,h,i = `0` - Not used.

`103` — Incorrect value in the number of free segment descriptors.

f = Correct number of free segment descriptors.
g = Incorrect value in the number of free segment descriptors.
h,i = `0` - Not used.

`104` — Segment descriptor free list is circular.

f = Pointer to the segment descriptor at which error was found.
g,h,i = `0` - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

105 — Segment descriptor on free list not marked on-free-list.

CORR mode:

f = Pointer to the segment descriptor.
g,h,i = 0 - Not used.

NOT CORR mode:

f = Pointer to the segment descriptor.
g = Pointer to first free segment descriptor.
h,i = 0 - Not used.

106 — Free segment descriptor not on the free list.

f = Pointer to the segment descriptor.
g = Pointer to first free segment descriptor.
h,i = 0 - Not used.

107 — Segment descriptor with a valid page table pointer and/or non-zero status not marked allocated.

f = Pointer to the segment descriptor.
g = Uncorrected value of the status word in the segment descriptor.
h,i = 0 - Not used.

108 — Empty page table linked to a segment descriptor that is not page-protected.

f = Pointer to the segment descriptor.
g = Pointer to the page table.
h,i = 0 - Not used.

109 — Page table linked to a segment descriptor not marked allocated.

f = Pointer to the segment descriptor.
g = Pointer to the page table.
h,i = 0 - Not used.

110 — Invalid page table pointer in a segment descriptor.

f = Pointer to the segment descriptor.
g = Invalid page table pointer.
h,i = 0 - Not used.

112 — Incorrect segment index in a page descriptor for a page linked to a segment descriptor.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = Incorrect segment index.

113 — Incorrect page index in a page descriptor for a page linked to a segment descriptor.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = Incorrect page index.

114 — Incorrect in-memory-page-count in segment descriptor.

f = Pointer to the segment descriptor.
g = Correct in-memory-page-count.
h = Incorrect in-memory-page-count in segment descriptor.
i = 0 - Not used.

115 — Page descriptor for a page linked to a segment descriptor not marked allocated.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = 0 - Not used.

(116 - 122) Serious errors involving segment corruptions.

For these errors, the information reported differs depending on the mode of the audit. In NOT CORR mode, no supplementary data is provided. In CORR mode, one or two blocks of supplementary data is provided. The data field descriptions for NOT CORR mode will be listed for each error code individually. The data field descriptions for CORR mode, which are identical for all these errors, will follow. The SUPPLEMENTARY DATA BLOCK descriptions for these errors are given last.

(116 - 122) NOT CORR mode:

116 — Invalid page address in page table entry for a segment.

f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = The invalid page address.
i = 0 - not used.

118 — Segment has pages that overlap.

f = Pointer to the segment descriptor.
g = Index of one entry in the page table for the page.
h = Index of the other entry in the page for the page.
i = Page number.

120 — Two segments overlap in a page.

f = Pointer to the segment descriptor for the first segment.
g = Pointer to the segment descriptor for the second

segment.

h = 00*PP*00*QQ*, where *PP* (00 - 3F) is the index in the page table of the first segment for the common page, and QQ (00 -3F) is the index in the page table of the second segment for the common page.

i = Page number.

122 — Two segments have the same page table.

f = Pointer to the segment descriptor for the first segment.

g = Pointer to the segment descriptor for the second segment.

h = Pointer to the common page table.

i = 0 - not used.

(116 - 122) CORR mode:

Data field descriptions:

f = Number of segments with error.

g = Number of non-killable processes that have any of these segments in their address spaces.

h = Number of killable processes that have any of these segments in their address spaces.

i = Number of killable processes that have been terminated.

In SUPPLEMENTARY DATA BLOCK NUMBER 1, each line of four data words describes a serious error.

j = Error code. Possible error codes and corresponding error data are:

00000074 (decimal 116) - invalid page address in an entry of the page table for a segment.

k = Pointer to the segment descriptor.

l = 000000*NN*, where *NN* (00 - 3F) is the index of the entry in the page table.

m = The invalid page address.

00000076 (decimal 118) - overlap of pages within a segment.

k = Pointer to the segment descriptor.

l = 000000*NN*, where *NN* (00 - 3F) is the index of one entry in the page table for the page.

m = 000000*PP*, where *PP* (00 - 3F) is the index of the other entry in the page table for the page.

00000078 (decimal 120) - Two segments overlap in a page.

k = Pointer to the segment descriptor for the first segment.

SEE PROPRIETARY NOTICE ON COVER PAGE

l = Pointer to the segment descriptor for the second segment.
m = 00*PP*00*QQ*, where *PP* (00 - 3F) is the index in the page table of the first segment for the common page, and *QQ* (00 - 3F) is the index in the page table of the second segment for the common page.

0000007a (decimal 122) - two segments have the same page table.

k = Pointer to the segment descriptor for the first segment.
l = Pointer to the segment descriptor for the second segment.
m = Pointer to the common page table.

In SUPPLEMENTARY DATA BLOCK NUMBER 2, each pair of data words describes a process that contains, in its address space, one or more of the segments with serious errors.

RRRRRRRR = Process number of the process.

S = Flags describing the process.

If *S* = 8, the process is a special kernel process.
If *S* = 4, the process is non-killable.
If *S* = 3, the process is killable and a termination message has been sent.
If *S* = 2, the process is killable, but no termination message was sent by this audit of the process.

TTTT = The pcode portion of the utility ID.

201 — Invalid link in the page table free list.

f = Invalid page table pointer.
g = 0 - not used.
h = 0 - not used.
i = 0 - not used.

202 — Page table on the free list has non-free entries.

f = Pointer to the page table.
g = 0 - not used.
h = 0 - not used.
i = 0 - not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

`203` — Incorrect value in the number of free page tables.

f = Correct number of free page tables.
g = Incorrect value in the number of free page tables.
h = `0` - Not used.
i = `0` - Not used.

`204` — Page table free list is circular.

f = Pointer to the page table at which error was found.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`205` — Page table on free list not marked on-free-list.

f = Pointer to the page table.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`206` — Page table lost; not on the free list and not linked to a segment descriptor.

f = Pointer to the page table.
g = Pointer to first free page table.
h = `0` - Not used.
i = `0` - Not used.

`301` — Invalid link index in the list of free pages.

f = Invalid link index.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`302` — Page on the free list is allocated.

f = Page number of the page.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

`303` — Incorrect value in the number of free pages.

f = Correct number of free pages.
g = Incorrect value in the number of free pages.
h = `0` - Not used.
i = `0` - Not used.

`304` — Free page list is circular.

f = Page number at which error was found.
g = `0` - Not used.
h = `0` - Not used.
i = `0` - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

305 — Page descriptor for a page on free list not marked on-free-list.

f = Page number of the page.
g = 0 - Not used.
h = 0 - Not used.
i = 0 - Not used.

306 — Lost page; page not on free list and not linked to a segment descriptor.

f = Page number of the page.
g = Page number of first free page.
h = 0 - Not used.
i = 0 - Not used.

401 — Breakdown of a segment interrupted.

f = Pointer to a segment descriptor.
g = Status word in segment descriptor.
h = Index into segment descriptor table.
i = 0 - Not used.

501 — Old iolocked segment.

f = Pointer to segment descriptor.
g = Age of segment in minutes.
h = Index into segment descriptor table.
i = Utility ID of segment's last owner (not necessarily the process that left the segment locked). 0 indicates the utility ID is not available.

n, f - i = Data report code and data values. Possible data codes and corresponding data values are:

1 — Swap space has been compacted, and fields *f* through *i* are for information only.

f = Number of holes after compaction.
g = Size of the largest hole after compaction.
h = Number of segments "moved" on the swap disk.
i = Number of segments swapped into memory by the compaction function.

o = Explanation of error - see Output Audit Appendix C, AUD-APPC.

p = Explanation of error - see Output Audit Appendix D, AUD-APPD.

q = Explanation of error - see Output Audit Appendix B, AUD-APPB.

r = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA, and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit was run in non-correcting mode and reported errors, rerun it in correcting mode.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the termination status of the message buffer (MSGBUF) resources audit and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. One of the following:

1 - Message buffer queue audit.
2 - Message buffer extender block audit.

b = Total number of errors found.

c = Total number of errors corrected.

d = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — SIM could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — System integrity monitor (SIM) aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the audit terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Error code. Possible error codes are:

NOTE: For UNIX® RTR R6.2 and earlier, the utility ID referred to below contains the following information:

bits 31-16	Process dct index
bits 15-5	Process code (utility from process .b file)
bits 4-0	Space (unused)

NOTE: For UNIX® RTR R6.3 and later, the utility ID referred to below contains the following information:

bits 31-16	Process dct index
bits 15-0	Process code (utility from process .b file)

NOTE: A `NULL` utility ID for a queued / dequeued message indicates that the associated process has died.

`110` — Bad message queue head pointer.

f = Address of the queue head pointer.

g = Bad queue head pointer.

h = Utility ID of process owning queue.

i = Corrected queue head pointer if the error was corrected, `0` if it was not. (`0` is also a valid queue head pointer).

`111` — Bad message queue link pointer.

f = Address of the message extender.

g = Bad queue link pointer.

h = Utility ID of process owning queue.

i = Corrected queue link pointer if the error was corrected, `0` if it was not. (`0` is also a valid queue link pointer).

If the corrected queue link pointer is the same as the bad queue link pointer, then the message extender with the bad link pointer was either marked unallocated or unqueued, and was not put onto the rebuilt message queue.

`112` — Allocation bit not set in message extender of queued message.

f = Address of the message extender.

g = Bad extender flags field.

h = Utility ID of process owning queue.

i = `0` - not used.

`113` — Bad on-queue indicator in message extender of queued message.

f = Address of the message extender.

g = Bad extender flags field.

h = Utility ID of process owning queue.

i = Correct extender flags field.

`114` — Allocation bit not set in message header of queued message.

f = Address of the message.

g = Bad message flags field.

h = Utility ID of process owning the queue.

i = Correct message flags field.

`115` — Bad message-to-field in message and bad message owner field in message extender.

f = Address of the message.

g = Process ID in message to field.

h = Process ID in message owner field.

i = Process ID of process owning queue.

`116` — Bad message owner in message extender.

f = Address of the message extender.

g = Process ID in message owner field.

h = Utility ID of process owning queue.

i = Process ID of process owning queue.

`117` — Bad message to field in message.

f = Address of the message.

g = Process ID in message to field.

h = Utility ID of process owning queue.

i = Process ID of process owning queue.

`118` — Message queue out of order.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

SEE PROPRIETARY NOTICE ON COVER PAGE

i = Sender's utility ID (6.2 and later).

`119` — Old audit fault message queued to a non-killable process.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

`120` — Old audit fault message queued to a killable process.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

`121` — Old queued message (except an old queued audit fault message).

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

`122` — Process has a circular message queue.

f = Address of the message extender.

g = Queue link pointer.

h = Utility ID of process owning queue.

i = Corrected queue link pointer if the error was corrected, `0` if it was not. (`0` is also a valid queue link pointer.)

`123` — Bad message queue tail pointer.

f = Address of the queue tail pointer.

g = Bad queue tail pointer.

h = Utility ID of process owning queue.

i = Corrected queue tail pointer if the error was corrected, `0` if it was not. (`0` is also a valid queue tail pointer.)

124 — Bad message queue block count.

e = Address of message queue count.

f = Bad message queue block count.

g = Utility ID of process owning queue.

h = Correct message queue block count.

125 — Old acknowledgment message queued to a non-killable supervisor process.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

126 — Old acknowledgment message queued to a killable supervisor process.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

200 — Allocated message with an invalid owner field.

f = Address of the message.

g = Process ID in message owner field.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

201 — Old allocated message.

f = Address of the message.

g = Owner's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

214 — Allocated bit not set in message header of allocated message.

f = Address of the message.

SEE PROPRIETARY NOTICE ON COVER PAGE

g = Bad message flags field.

h = Utility ID of process owning queue.

i = Correct message flags field.

`216` — Queued message with an invalid owner.

f = Address of the message.

g = Process ID in message owner field.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

`219` — Old audit fault message queued to a non-killable process.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

`220` — Old audit fault message queued to a killable process.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

`221` — Old queued message (except an old queued audit fault message).

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

`270` — Dequeued message with an invalid owner field.

f = Address of the message.

g = Process ID in message owner field.

h = Message type.

SEE PROPRIETARY NOTICE ON COVER PAGE

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

271 — Old dequeued audit fault message owned by a non-killable process.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

272 — Old dequeued audit fault message owned by a killable process.

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

273 — Old dequeued message (except an audit fault message).

f = Address of the message.

g = Receiver's utility ID.

h = Message type.

i = Sender's process ID (prior to 6.2).

i = Sender's utility ID (6.2 and later).

274 — Over nine old non-queued messages (excluding audit fault messages) owned by a killable process.

f = Owner's process ID.

g = Owner's utility ID.

h = 0 - not used.

i = 0 - not used.

290 — Audit fault message response has an invalid message status.

f = Address of the audit fault message.

g = Invalid message status.

h = Sender's process ID.

i = 0 - not used.

291 — Invalid status for a message pointer in an audit fault message response.

f = Address of the audit fault message.

g = Invalid message pointer status.

h = Sender's process ID.

i = Message pointer.

j = Message link.

k = Process ID of message sender.

l = Process ID of message receiver.

m = Size of message in blocks.

n = Message flags.

o = Message type.

p = Message status.

q = Message size in bytes.

r = Old message type.

s = Sequence number.

t = Message identification.

u = Message queue link.

v = Process ID of message owner.

w = Time stamp.

x = Size of message in blocks.

y = Message extender flags.

z = Message type.

aa = Unused.

bb = Explanation of error - see Output Audit Appendix C, AUD-APPC.

cc = Explanation of error - see Output Audit Appendix D, AUD-APPD.

dd = Explanation of error - see Audit Appendix B, AUD-APPB.

ee = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA, and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Errors 119, 120, 219, 220, 271, 272, 290, and 291 indicate that a process has probably mishandled an audit fault message, notify your next level of technical assistance. It is likely that errors 201 and 273 will not be corrected if any of these errors occur.

Errors 121, 125, 126, 201, 221, 273, and 274 indicate that a process may be having problems in processing its messages. Notify your next level of technical assistance.

Errors 219, 220, and 221 indicate an error in a queued message found by the message extender audit. Run the message queue audit (MSGBUF 1) and if the error is not found and corrected, then run the message extender audit (MSGBUF 2) again.

Errors 200, 216, and 270 indicate a problem in the ownership of a message. This may occur if a breakdown happens in a process termination. Run the process administration audit (PROAD 1) to complete the process termination.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the termination status of the message buffer (MSGBUF) resources audit and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. One of the following:

1 — Message buffer queue audit.
2 — Message buffer extender block audit.

b = Total number of errors found.

c = Total number of errors corrected.

d = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — SIM could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — System integrity monitor (SIM) aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the audit terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Error code. Possible error codes are:

NOTE: The high order 16 bits of utility ID indicates process dct (dispatch control table) index, and the low order 16 bits of utility ID indicates pcode (process code).

NOTE: A `NULL` utility ID for a queued / dequeued message indicates that the associated process has died.

`110` — Bad message queue head pointer.

f = Address of the queue head pointer.
g = Bad queue head pointer.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = Corrected queue head pointer if the error was corrected, `0` if it was not. (`0` is also a valid queue head pointer).

`111` — Bad message queue link pointer.

f = Address of the message extender.
g = Bad queue link pointer.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = Corrected queue link pointer if the error was corrected, `0` if it was not. (`0` is also a valid queue link pointer).

If the corrected queue link pointer is the same as the bad queue link pointer, then the message extender with the bad link pointer was either marked unallocated or unqueued, and was not put onto the rebuilt message queue.

`112` — Allocation bit not set in message extender of queued message.

f = Address of the message extender.
g = Bad extender flags field.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = `0` - not used.

`113` — Bad on-queue indicator in message extender of queued message.

f = Address of the message extender.
g = Bad extender flags field.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = Correct extender flags field.

SEE PROPRIETARY NOTICE ON COVER PAGE

114 — Allocation bit not set in message header of queued message.

f = Address of the message.
g = Bad message flags field.
h = Utility ID of process owning the queue. Refer to the *NOTE*s above.
i = Correct message flags field.

115 — Bad message-to-field in message and bad message owner field in message extender.

f = Address of the message.
g = Process ID in message to field.
h = Process ID in message owner field.
i = Process ID of process owning queue.

116 — Bad message owner in message extender.

f = Address of the message extender.
g = Process ID in message owner field.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = Process ID of process owning queue.

117 — Bad message to field in message.

f = Address of the message.
g = Process ID in message to field.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = Process ID of process owning queue.

118 — Message queue out of order.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

119 — Old audit fault message queued to a non-killable process.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

SEE PROPRIETARY NOTICE ON COVER PAGE

`120` — Old audit fault message queued to a killable process.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`121` — Old queued message (except an old queued audit fault message).

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`122` — Process has a circular message queue.

f = Address of the message extender.
g = Queue link pointer.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = Corrected queue link pointer if the error was corrected, 0 if it was not. (0 is also a valid queue link pointer.)

`123` — Bad message queue tail pointer.

f = Address of the queue tail pointer.
g = Bad queue tail pointer.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = Corrected queue tail pointer if the error was corrected, 0 if it was not. (0 is also a valid queue tail pointer.)

`124` — Bad message queue block count.

e = Address of message queue count.
f = Bad message queue block count.
g = Utility ID of process owning queue. Refer to the *NOTE*s above.
h = Correct message queue block count.

SEE PROPRIETARY NOTICE ON COVER PAGE

`125` — Old acknowledgment message queued to a non-killable supervisor process.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`126` — Old acknowledgment message queued to a killable supervisor process.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`200` — Allocated message with an invalid owner field.

f = Address of the message.
g = Process ID in message owner field.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`201` — Old allocated message.

f = Address of the message.
g = Owner's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`214` — Allocated bit not set in message header of allocated message.

f = Address of the message.
g = Bad message flags field.
h = Utility ID of process owning queue. Refer to the *NOTE*s above.
i = Correct message flags field.

`216` — Queued message with an invalid owner.

f = Address of the message.
g = Process ID in message owner field.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

SEE PROPRIETARY NOTICE ON COVER PAGE

`219` — Old audit fault message queued to a non-killable process.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`220` — Old audit fault message queued to a killable process.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`221` — Old queued message (except an old queued audit fault message).

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`270` — Dequeued message with an invalid owner field.

f = Address of the message.
g = Process ID in message owner field.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`271` — Old dequeued audit fault message owned by a non-killable process.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

SEE PROPRIETARY NOTICE ON COVER PAGE

`272` — Old dequeued audit fault message owned by a killable process.

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`273` — Old dequeued message (except an audit fault message).

f = Address of the message.
g = Receiver's utility ID. Refer to the *NOTE*s above.
h = Message type.
i = Sender's process ID (prior to 6.2).
i = Sender's utility ID (6.2 and later). Refer to the *NOTE*s above.

`274` — Over nine old non-queued messages (excluding audit fault messages) owned by a killable process.

f = Owner's process ID.
g = Owner's utility ID. Refer to the *NOTE*s above.
h = `0` - not used.
i = `0` - not used.

`290` — Audit fault message response has an invalid message status.

f = Address of the audit fault message.
g = Invalid message status.
h = Sender's process ID.
i = `0` - not used.

`291` — Invalid status for a message pointer in an audit fault message response.

f = Address of the audit fault message.
g = Invalid message pointer status.
h = Sender's process ID.
i = Message pointer.

j = Message link.

k = Process ID of message sender.

l = Process ID of message receiver.

m = Size of message in blocks.

n = Message flags.

o = Message type.

p = Message status.

q = Message size in bytes.

r = Old message type.

s = Sequence number.

t = Message identification.

u = Message queue link.

v = Process ID of message owner.

w = Time stamp.

x = Size of message in blocks.

y = Message extender flags.

z = Message type.

aa = Unused.

bb = Explanation of error - see Output Audit Appendix C, AUD-APPC.

cc = Explanation of error - see Output Audit Appendix D, AUD-APPD.

dd = Explanation of error - see Audit Appendix B, AUD-APPB.

ee = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA, and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

Errors 119, 120, 219, 220, 271, 272, 290, and 291 indicate that a process has probably mishandled an audit fault message, notify your next level of technical assistance. It is likely that errors 201 and 273 will not be corrected if any of these errors occur.

Errors 121, 125, 126, 201, 221, 273, and 274 indicate that a process may be having problems in processing its messages. Notify your next level of technical assistance.

Errors 219, 220, and 221 indicate an error in a queued message found by the message extender audit. Run the message queue audit (MSGBUF 1) and if the error is not found and corrected, then run the message extender audit (MSGBUF 2) again.

Errors 200, 216, and 270 indicate a problem in the ownership of a message. This may occur if a breakdown happens in a process termination. Run the process administration audit (PROAD 1) to complete the process termination.

[8] `AUD PMS` *a* `AUTOMATICALLY` *k*

2. REASON FOR OUTPUT

Format 1 indicates the input message completed, how many errors were found, and how many were corrected.

Format 2 indicates the audit stopped.

Format 3 indicates the audit aborted.

Formats 4, 5, and 6 indicate that an error has been found in the audit of the plant measurement database (PMS).

Format 7 indicates that the audit can not be started at this time.

Format 8 indicates the inhibit status of the PMS audit.

3. VARIABLE FIELD DEFINITIONS

a = Audit member number. One of the following:

- 1 — Manual, routine, or demand audit.
- 2 — Create the data base.

b = Total number of errors found.

c = Total number of errors corrected.

d = Abort code. Possible values are:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — SIM could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the process terminated.
- 10 — A segmented audit exceeded an error threshold.
- 12 — Audit rejected the request to run from SIM.
- 13 — SIM aborted an executing audit because the audit system is being reinitialized.

e = Error code (0-5034). See CIP 254-303-106 *System Maintenance Manual*, Plant Measurements System (PMS) Audits chapter, for error codes 0-3, 1000, 1001, or 2000-5034. See LLA Output Appendix, LLA-APPA, for error codes 100-1301.

f = Supplementary data block number.

g = An explanation of the error identified by the error code. If the error code is 0-3, 1000, 1001, or 2000-5034, see Table 1. If the error code is 100-1301, see LLA Output Appendix, LLA-APPA.

h = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

i = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

j = Explanation of error - see Audit Appendix B, AUD-APPB.

k = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

Format 1 indicates success. Take no action.

Format 2 is an informational message that the audit has stopped. Take no action.

Format 3 indicates that the audit aborted. The action to be taken varies from retrying the audit to seeking technical advice, depending on the abort code.

Formats 4, 5, and 6 indicate that and error has been found in the audit of the PMS. Look up the error code as described in the variable field description section. Action to be taken varies depending on the error code.

Format 7 indicates that the audit can not be started at this time. Action to be taken varies from retrying the audit to seeking technical advice, depending on the reason for failure. See Audit Appendices C and D, AUD-APPC, and AUD-APPD,

Format 8 indicates the inhibit status of the PMS audit. Take no action.

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Values 100-399 represent errors which occur during process termination. In particular, values 100-199 occur in the scheduler, 200-299 in the capability manager, 300-399 in the process manager. Values 500-799 represent errors which occur during process creation. In particular, values 500-599 represent errors during pcreat of kernel processes, 600-699 represent errors during pcreat of supervisor processes, and 700-799 represent errors during process fork. Value 800 indicates that the process has been suspended from execution for over 30 minutes.

A problem occurred during or after:

100 — The use count was decremented.
110 — term_dct was called.
120 — GRASP/DART was informed.
130 — The DCTE was unlinked from its dispatch chain.
140 — The address translation buffers (ATBs) were flushed.
150 — The acknowledgement message was allocated and copied.
160 — The dispatch control table entry (DCTE) was unlinked from the ready / notready list.
170 — The incarnation count was bumped.
180 — The message has (or should have) gone to the capability manager.
190 — The message has (or should have) gone to the process manager.
200 — The capabilities were removed.
210 — The segments were removed (supervisor).
220 — The segments were removed (kernel process).
300 — The core dump has started.
310 — The message was sent to the capability manager.
500 — pcreat has started (kp).
510 — DCTE was linked.
520 — Initialization event sent.
600 — pcreat has started (sp).
610 — DCTE was linked.
620 — The pstart has completed.
630 — Execute started.
700 — fork started (pfork1).
710 — DUPCAPS message sent to the file manager.
720 — pfork2 started.
730 — Sending the wake up event to the child.
800 — Process has been suspended from execution.

e = Process's utility ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = Value of the real time clock at the start of the audit.

g = Process number.

h = Time stamp.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.

ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

5. ALARMS

None.

`[NO SUPPLEMENTARY DATA]`

[5] `AUD PROAD NOT STARTED`
{`CONFLICT WITH CURRENT SYSTEM STATUS` *i*
|`RETRY LATER` *j*
|`UNABLE TO IDENTIFY ERROR - INVALID DATA ERROR` *k*}

[6] `AUD ENV=RTR PROAD 1 AUTOMATICALLY` *l*

2. REASON FOR OUTPUT

To report the termination status of the process administration audit and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Possible values are:

3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System integrity monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered between the audit control and the audit library interface.
7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

8 — SIM aborted an executing routine audit because of a blocking request.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Values 100-399 represent errors that occur during process termination. In particular, values 100-199 occur in the scheduler, 200-299 in the capability manager, and 300-399 in the process manager. Values 500-799 represent errors that occur during process creation. In particular, values 500-599 represent errors during pcreat of kernel processes, 600-699 represent errors during pcreat of supervisor processes, and 700-799 represent errors during process fork. Value 800 indicates that the process has been suspended from execution for over 30 minutes.

A problem occurred during or after:

100 — The use count was decremented.
110 — `term_dct` was called.
120 — GRASP or DART was informed.
130 — The DCTE was unlinked from its dispatch chain.

220 — The segments were removed (kernel process).
300 — The core dump has started.
310 — The message was sent to the capability manager.
500 — pcreat has started (kp).
510 — DCTE was linked.
520 — Initialization event sent.
600 — pcreat has started (sp).
610 — DCTE was linked.
620 — The pstart has completed.
630 — Execute started.
700 — fork started (pfork1).
710 — DUPCAPS message sent to the file manager.
720 — pfork2 started.
730 — Sending the wake up event to the child.
800 — Process has been suspended from execution.

e = Process's utility ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = The amount of time, in milliseconds, that the process has been stuck.

g = Process number.

h = Correction completion code. Possible values are:

- `00000000` — The error was corrected, or the audit was run in non-correcting mode.
- `00000010` — The DCT pointer failed fault retry validation when trying to send a DUPCAPS message.
- `00000020` — The DCT extender pointer failed fault retry validation when trying to send a DUPCAPS message.
- `00000030` — The PCB segid in the process's DCT entry was found to be invalid when trying to send a DUPCAPS message.
- `00000040` — The audit could not attach to the process's PCB when trying to send a DUPCAPS message.
- `00000050` — The audit could not allocate a DUPCAPS message.
- `00000060` — The audit could not queue a DUPCAPS message.
- `00000070` — The DCT pointer failed fault retry validation when trying to send a terminate message.
- `00000080` — The DCT extender pointer failed fault retry validation when trying to send a terminate message.
- `00000090` — The audit could not allocate a terminate message to kill a suspended process.
- `000000a0` — The audit could not queue a terminate message to kill a suspended process.
- `000000b0` — The PCB segid in the process's DCT entry was found to be invalid when trying to simulate a pcreat acknowledgement message.
- `000000c0` — The audit could not attach to the process's PCB when trying to simulate a pcreat acknowledgement message.
- `000000d0` — The audit could not allocate a pcreat message to simulate a pcreat acknowledgement message.
- `000000e0` — The audit could not queue a pcreat message to simulate a pcreat acknowledgement message.
- `000000f0` — The audit could not allocate a terminate message to kill a process.
- `00000100` — The audit could not queue a terminate message to kill a process.

i = Explanation of error - see the Output Audit Appendix C, AUD-APPC.

j = Explanation of error - see the Output Audit Appendix D, AUD-APPD.

k = Explanation of error - see Audit Appendix B, AUD-APPB.

l = Inhibit status. Possible values are:

INHIBITED — Audit has been automatically inhibited by SIM.
ALLOWED — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, AUD-APPA and Output Audit Appendix B, AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in non-correcting mode and failures occur, rerun the audit in correcting mode.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

- 300 — The core dump has started.
- 310 — The message was sent to the capability manager.
- 500 — `pcreat` has started (kp).
- 510 — DCTE was linked.
- 520 — Initialization event sent.

SEE PROPRIETARY NOTICE ON COVER PAGE

600 — pcreat has started (sp).
610 — DCTE was linked.
620 — The pstart has completed.
630 — Execute started.
700 — fork started (pfork1).
710 — DUPCAPS message sent to the file manager.
720 — pfork2 started.
730 — Sending the wake up event to the child.
800 — Process has been suspended from execution.

e = Process's utility ID.

f = The amount of time, in milliseconds, that the process has been stuck.

g = Process number.

h = Correction completion code. Possible values are:

00000000 — The error was corrected, or the audit was run in non-correcting mode.
00000010 — The DCT pointer failed fault retry validation when trying to send a DUPCAPS message.
00000020 — The DCT extender pointer failed fault retry validation when trying to send a DUPCAPS message.
00000030 — The PCB segid in the process's DCT entry was found to be invalid when trying to send a DUPCAPS message.
00000040 — The audit could not attach to the process's PCB when trying to send a DUPCAPS message.
00000050 — The audit could not allocate a DUPCAPS message.
00000060 — The audit could not queue a DUPCAPS message.
00000070 — The DCT pointer failed fault retry validation when trying to send a terminate message.
00000080 — The DCT extender pointer failed fault retry validation when trying to send a terminate message.
00000090 — The audit could not allocate a terminate message to kill a suspended process.
000000a0 — The audit could not queue a terminate message to kill a suspended process.
000000b0 — The PCB segid in the process's DCT entry was found to be invalid when trying to fake a pcreat acknowledgement message.
000000c0 — The audit could not attach to the process's PCB when trying to fake a pcreat acknowledgement message.
000000d0 — The audit could not allocate a pcreat message to fake a pcreat acknowledgment message.

SEE PROPRIETARY NOTICE ON COVER PAGE

`000000e0` — The audit could not queue a pcreat message to fake a pcreat acknowledgment message.
`000000f0` — The audit could not allocate a terminate message to kill a process.
`00000100` — The audit could not queue a terminate message to kill a process.

i = For explanation of error, see the Output Audit Appendix C, `AUD-APPC`.

j = For explanation of error, see the Output Audit Appendix D, `AUD-APPD`.

k = Explanation of error - see Audit Appendix B, `AUD-APPB`.

l = Inhibit status. Possible values are:

`INHIBITED` — Audit has been automatically inhibited by SIM.
`ALLOWED` — Audit has been automatically allowed by SIM.

NOTE: See Output Audit Appendix A, `AUD-APPA` and Output Audit Appendix B, `AUD-APPB`, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in non-correcting mode and failures occur, rerun the audit in correcting mode.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

Practice 254-341-235 *Audit Facilities Description 3B20D Model 2 Processor*

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . CFR-DUPLEXDISKS
GENERIC . . . . . UNIX RTR R21.27 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `CFR DUPLEXDISKS STOPPED WITH ERROR` *a*

[2] `CFR DUPLEXDISKS COMPLETED`

2. REASON FOR OUTPUT

To report the result of executing the `CFR:DUPLEXDISKS` command.

3. VARIABLE FIELD DEFINITIONS

a = Type of error found.

`X'C000` — ABD is not active

The system is not booted with an Alternate Boot Disk(ABD) selected. MHD 0 and MHD 1 are the current duplexed boot disk pair.

`X'C001` — Failed to get UCB for the current duplexed boot disk pair.

An internal error occurred trying to read the in-core ECD. Additional information is provided by PRMs generated by EIH.

`X'C002` — An invalid state was detected.

If MHD 0 is one of the current duplexed boot disks, it's state must be ACT. MHD 1 and the Alternate Boot Disk must not be in the ACT, STBY, or INIT states.

If MHD 1 is one of the current duplexed boot disks, it's state must be ACT. MHD 0 and the Alternate Boot Disk must not be in the ACT, STBY, or INIT states.

`X'C003` — A failure occurred trying to configure the duplex boot disk pair to the system default.

SEE PROPRIETARY NOTICE ON COVER PAGE

An internal error occurred trying to configure the duplex boot disk pair to MHD 0 and MHD 1. Additional information is provided by PRMs generated by EIH.

`X'C004` — Disk Driver not notified of change.

The 120 Status Page will not show the correct disk status.

`X'C005` — RTS not notified of change.

The 102 Status Page will not show the correct disk configuration.

`X'C006` — This command is only supported on the 3B21D Hardware Platform.

`X'C007` — At least one of MHD 0, MHD 1, or the ABD is reserved by another process.

4. ACTION TO BE TAKEN

If Format 1 is printed, resolve the error condition described above. Seek technical assistance if necessary to resolve the error condition.

Format 2 indicates that the command completed execution successfully. If this format is printed, no action is necessary.

5. ALARMS

None.

1. FORMAT

This message has two formats.

[1] `CLR FILESYS DIR COMPLETED`

[2] `CLR FILESYS DIR STOPPED`
a

2. REASON FOR OUTPUT

To report the result of executing the `CLR:F;DIR` input message to remove a directory.

3. VARIABLE FIELD DEFINITIONS

a = The description of the error encountered.

4. ACTION TO BE TAKEN

Format 1 indicates success. If this format is printed, no action is necessary.

If Format 2 is printed, the explanatory text will indicate the error encountered. Verify that the command which was input is consistent with the `CLR:F;FILE` input message manual page and, using the `OP:ST;LSTDIR` input message, verify that the file exists with the appropriate permissions. If both of these checks fail to uncover the problem, or the description of the error encountered is not self-explanatory, seek technical assistance.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

ID . . . . . CLR-FANALM
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `CLR FANALM UNIT` *a* `PT` *b*[*bbb*] *f*

[2] `CLR FANALM GRPN` *c* `DUPID` *d* `PT` *e*[*eee*] *f*

[3] `CLR FANALM NOT STARTED`
`CONFLICT WITH CURRENT SYSTEM STATUS`

2. REASON FOR OUTPUT

To indicate the result of a fan alarm reset operation requested by a `CLR:FANALM` input message.

Format 1 identifies a distribute point by physical location.

Format 2 identifies a distribute point by logical address.

Format 3 indicates the scanner and signal distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

a = Member number of scanner and signal distributor (SCSD) unit.

b = Physical scan point number on an SCSD (0-31).

c = Logical group name.

d = Duplex group ID (0 or 1).

e = Number of a point within a logical group.

f = Termination status:

`FAILED` — Action could not be completed by SCSD administrator.

Possible reasons for failure are:

— SCSD unit number is invalid.

— Point number is invalid for the logical group.

SEE PROPRIETARY NOTICE ON COVER PAGE

— Logical group name is invalid and either the SCSD unit is out-of-service (OOS) or is in an inactive state to the SCSD administrator.

`COMPLETED` — Action completed.

4. ACTION TO BE TAKEN

Issue the `OP:OOS` input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter recent change and verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists, and/or that the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

`CLR:IMCAT`

ID . . . . . CLR-IODRV
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `CLR IODRV {COMPLETED|ABORTED}`

[2]
```
CLR IODRV NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
```

2. REASON FOR OUTPUT

To report the result of executing a `CLR:IODRV` input message.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

If the message reads `ABORTED`, the command could not be processed due to a conflict with the system status. The command will not be successfully processed until the system status changes. Check system status to determine why command aborted.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Key
Format 1 has an OMDB key of 159.

Input Message
`CLR:IODRV`

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . CLR-IOMEM
GENERIC . . . . . UNIX RTR R21.27 and later
TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL

1. FORMAT

[1] `CLR IOMEM STARTED`

[2] `CLR IOMEM ABORTED` *a*

[3] `CLR IOMEM COMPLETED` *b*

2. REASON FOR OUTPUT

To report the result of executing a `CLR:IOMEM` input message.

3. VARIABLE FIELD DEFINITIONS

a = Reason why the CLR IOMEM command was aborted.

7 — Message to IODRV port failure.
8 — Message reception failure from IODRV.
9 — Message to IODRV timed out.

b = Action taken by the IODRV.

0 — Specified file was found and released by the IODRV.
1 — Specified file has already been released by the IODRV or was never cached by the IODRV.
2 — Specified file was found and unlocked and will be released by the IODRV.

4. ACTION TO BE TAKEN

No action is required for `STARTED` or `COMPLETED` messages.

`ABORTED` messages usually indicate that a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

Input Message
`CLR:IOMEM`

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . CLR-M,MAEC
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL

1. FORMAT

This message has seven formats.

[1] `CLR MHD` *a* `MAEC STARTED`

[2] `CLR MHD` *a* `MAEC IN PROGRESS`

[3] `CLR MHD` *a* `MAEC NOT STARTED` *b c*

[4] `CLR MHD` *a* `MAEC STOPPED` *b c*

[5] `CLR MHD` *a* `MAEC ERROR` *b c*

[6] `CLR MHD` *a* `MAEC ABORTED` *b*

[7] `CLR MHD` *a* `MAEC COMPLETED`

2. REASON FOR OUTPUT

To report the result of executing a `CLR:MHD;MAEC` command.

Format 1 indicates the command was started successfully.

Format 2 indicates command execution is in progress.

Format 3 indicates a system resource was not available, and command execution was discontinued.

Formats 4, 5, and 6 indicate the command encountered an error condition of some type, and command execution was halted.

Format 7 indicates the command completed successfully.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Process step or reason code.

`f03` — cannot open ECD
`f06` — cannot get UCB of unit by name
`f09` — cannot reserve UCB
`f0c` — cannot assign special device file name

SEE PROPRIETARY NOTICE ON COVER PAGE

`f0f` — cannot open special device file
`f12` — cannot set i/o mode of special device file
`f15` — cannot enable message reception
`f18` — see DKDRV error report on ROP
`f1b` — message to port failure
`f1e` — message reception failure
`f21` — process timed out
`f24` — failed to close special device file
`f27` — failed to release special device file
`f2a` — failed to unreserve UCB of unit
`f2d` — failed to close ECD
`f30` — terminated externally with signal

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable, to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

Format 6 indicates that the command was aborted either because the process timed out or because the disk driver could not clear the media access error counter (MAEC) for the specified MHD. In either case, the input request should be retried. If the error condition continues, seek technical assistance from the next level of support.

A termination report specifying completion indicates that all directives of the input request were done, and no failures were encountered.

5. ALARMS

None. This alarm is a manually-requested report.

ID . . . . . CLR-PTN
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `CLR PTN CLEARING` *a* `ON MHD` *b*

[2] `CLR PTN ON MHD` *b* `COMPLETED`

[3] `CLR PTN STOPPED WITH ERROR CODE` *c* `ERRNO` *d*`[,(`*e*`)]`

2. REASON FOR OUTPUT

To report the result of executing a `CLR:PTN` input message, and to provide status information.

3. VARIABLE FIELD DEFINITIONS

a = Path name of partition being initialized with zeroes.

b = Specifies disk unit containing backup disk copy with application partitions cleared.

c = Error code indicating error that caused process to terminate. The first three digits indicate the nature of the error. The last two digits (represented as *xx*) indicate which module the error occurred in.

`101`*xx* — Missing arguments.

`102`*xx* — Destination disk does not exist.

`103`*xx* — Destination disk is not active.

`104`*xx* — Mate of destination disk does not exist.

`105`*xx* — Mate of destination disk is not active.

`106`*xx* — Specification file (see *e*) does not exist.

`107`*xx* — Duplicate partitions in specification file.

`108`*xx* — File name (see *e*) in specification file is not a partition.

`109`*xx* — File name (see *e*) in specification file does not exist.

`110`*xx* — Partition specified (see *e*) does not exist in destination disk.

`111`*xx* — File name (see *e*) in specification file does not have any entry in the volume table of contents (VTOC) (it may be a block device but not a partition).

SEE PROPRIETARY NOTICE ON COVER PAGE

112*xx* — Specification file (see *e*) is empty.

113*xx* — Process was stopped by a termination (SIGTERM) signal.

114*xx* — Partition (see *e*) is not an application partition. This partition needs to be set with correct flag in the VTOC.

Errors associated with system calls:

201*xx* — The `open()` failed to open *e*.

202*xx* — `mknod()` failed to create special device file *e* (temporary file to read VTOC from disk).

203*xx* — `read()` failed to read file *e*.

204*xx* — `mkseg()` failed to allocate one segment of memory.

205*xx* — `lseek()` failed to change offset (see *e*) in out of service disk.

206*xx* — `setio()` failed to set physical IO for *e*.

207*xx* — `write()` failed on segment *e* (on partition being cleared).

208*xx* — `ugucbn()` failed to get unit control block (UCB) information for moving head disk (MHD) *e*.

209*xx* — `ugucb()` failed to get UCB information for MHD *e*.

210*xx* — `unlink()` failed to unlink file *e*.

211*xx* — `ursvucb()` failed to reserve MHD *e*.

212*xx* — `ugsdf()` failed to access out of service (OOS) disk MHD *e*.

213*xx* — `sendpw()` failed to send message to *e*.

214*xx* — `recvw()` failed to receive message from *e*.

215*xx* — `msgenab()` failed.

216*xx* — Bad message received from maintenance input request administrator (MIRA).

217*xx* — After MIRA removed disk from service, database does not have disk as OOS.

218*xx* — `ugmamirids()` failed to get UCB record.

219*xx* — `close()` failed to close file *e*.

220*xx* — `stat()` failed on *e*.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Indicates system error code (See System Error Codes Output Appendix, SYSERR-APP).

e = Supplementary data.

4. ACTION TO BE TAKEN

Craft execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 191.
Format 2 has an OMDB key of 190.
Format 3 has an OMDB key of 189.

Output Appendix
SYSERR-APP

Input Message
CLR:PTN

ID . . . . . CLR-UMEM
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `CLR UMEM [UCL]` *a* `WAS` *b* `NOW` *c* *#d*

[2] `CLR UMEM COMPLETED CKT FAILURE` *#d*

2. REASON FOR OUTPUT

To report the disposition of a `CLR:UMEM` input message or to report that the process identification (PID) listed on the `INIT:UMEM` message aborted.

3. VARIABLE FIELD DEFINITIONS

`UCL` = Unconditional execution.

a = Status of the operation:

- `COMPLETED` — The trace definition has been cleared.
- `NOT STARTED` — The operation was ignored because data loss might have resulted.
- `STOPPED UCERR` — The utility circuit either does not respond or does not match the circuit present when the trace was defined.

b = State of the trace before the operation was attempted:

- `DUMPED` — The trace was not running and its data had already been dumped.
- `NEW` — The trace was not running and did not have data.
- `RUNNING` — The trace was collecting data.
- `STOPPED` — The trace was not running and did have data.

c = State of the trace after the operation was attempted.

- `RUNNING` — The trace is collecting data.
- `STOPPED` — The trace is stopped and does contain data.
- `UNDEF` — No trace is defined.

d = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If *a* is NOT STARTED, the trace must be in the NEW or DUMPED state in order to be cleared. Use the INH:UMEM and/or the OP:UMEM input messages before reissuing the CLR:UMEM input message.

If *a* is STOPPED UCERR, check the utility circuit hardware. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

6. REFERENCES

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`CLR UTIL` [*a*] *b #c*

2. REASON FOR OUTPUT

To report the status of a `CLR:UTIL` input message to remove all breakpoints and their definitions.

3. VARIABLE FIELD DEFINITIONS

a = Numeric identifier (one or more decimal digits) for a breakpoint being removed. Only printed if *b* is `STOPPED NGINST`.

b = Status of the operation:

`COMPLETED` — Printed to indicate the termination of the message.

`STOPPED NGINST` — A software breakpoint instruction was not found at the breakpoint address as expected. The breakpoint definition was removed.

`STOPPED UCERR` — The operation was completed for software breakpoints, but the utility circuit either does not respond or does not match the circuit present when the hardware breakpoints were defined.

c = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If *b* is `STOPPED UCERR`, check the utility circuit hardware. After it is fixed, use the `INIT:UC` input message to reinitialize the circuit.

5. ALARMS

None. This alarm is a manually-requested report.

1. FORMAT

This message has two formats.

[1] `CLR UTILFLAG` *a b #c*

[2] `CLR UTILFLAG` *a* `COMPLETED CKT FAILURE`

2. REASON FOR OUTPUT

To report the status of a `CLR:UTILFLAG` input message to remove a specific generic access package (GRASP) breakpoint and its definition, or report the removal of a breakpoint as required by system conditions.

3. VARIABLE FIELD DEFINITIONS

a = Numeric identifier (one or more decimal digits) for the breakpoint being removed.

b = Status of the operation:

`COMPLETED` — The action was successfully completed.
`STOPPED NGINST` — A software breakpoint instruction was not found at the breakpoint address as expected. The breakpoint definition was removed.
`STOPPED UCERR` — The utility circuit either does not respond, or does not match the circuit present when the breakpoint was defined.

c = GRASP execution sequence number.

4. ACTION TO BE TAKEN

If *b* is `STOPPED UCERR`, check the utility circuit hardware. After it is fixed, use the `INIT:UC` input message to reinitialize the circuit.

18 — library specified is invalid
19 — pfile specified has an invalid magic number
20 — unable to create compare process
21 — start message failed to be sent
22 — compare process still alive

SEE PROPRIETARY NOTICE ON COVER PAGE

23 — disk and core mismatch
24 — file manager open request failed
25 — file manager segcode I/O message failed
26 — call to gettype() failed
27 — bad core size in the segment map
28 — KPUPDATE process died before or during segment attach
29 — KPUPDATE process died after segment attach

g = Breakpoint number.

h = Address where the breakpoint is found.

i = Pathname of the file compared.

j = Error number (errno).

k = Name of the offline partition.

l = Signal number.

m = Return code of the `locklib` call.

n = Return code of the `sendw` call.

o = Return code of the `recvw` call.

p = Return code of the `freelib` call.

q = Address where the mismatch between disk and core is found.

r = Name of the section where the mismatch is found.

s = Sixteen bytes of core memory, taken at the point of mismatch.

t = Sixteen bytes of disk memory, taken at the point of mismatch.

4. ACTION TO BE TAKEN

For Format 1, no action is necessary.

For Format 2, seek technical assistance.

5. ALARMS

None. This output is for information only.

[12] `CMPR MHD` *a* {`RO`} `PARTITION BYPASSED`
`MHD` *a* `PARTITION` *f* `SIZE` *m*
`MHD` *h* `PARTITION` *f* `SIZE` *m*
`PARTITION SIZES NOT EQUAL`
`STIME` *l* `ETIME` *l*

[13] `CMPR MHD` {*a*|*h*} {`RO`} `PARTITION ACCESS FAILURE`
`MHD` {*a*|*h*} {`READ`} `FAILED`
`PARTITION` *f* `OFFSET` *g* `BLOCK` *n*

2. REASON FOR OUTPUT

To report the result of executing an `CMPR:MHD` input message. The [`RO`] is output to indicate that the `READ ONLY` option was used. `STIME` is the time the message was started. `ETIME` is used to indicate the elapsed time for a particular partition. The `ETIME` for the `FINAL` message is the total elapsed time.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the first unit of the moving head disk (MHD) drive.

b = Process step or reason code:

- b*xx* — where *xx* are hex digits - see DFC Output Appendix A, `DFC-APPA`.
- `f03` — cannot open equipment configuration database (ECD)
- `f06` — cannot get unit control block (UCB) of first unit by name
- `f09` — cannot get UCB of second unit by name
- `f12` — cannot get UCB of first unit's mate
- `f15` — cannot get UCB of first unit's mate
- `f18` — cannot reserve UCB of second unit
- `f21` — cannot assign special device file name of second unit
- `f24` — cannot open special device file of second unit
- `f27` — cannot enable message reception
- `f30` — see accompanying DKDRV error report on the ROP
- `f36` — failed to close special device file of second unit
- `f39` — failed to release special device file of second unit
- `f42` — message to port failure
- `f45` — message reception failure
- `f48` — message to port failure
- `f51` — message reception failure
- `f54` — process timed out
- `f57` — failed to close special device file of second unit
- `f60` — failed to release special device file of second unit
- `f63` — failed to unreserve UCB of second unit
- `f66` — failed to close ECD

c = System error code number; see System Error Codes Output Appendix, `SYSERR-APP`.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = First disk block number (of a range) that mismatched or retried while being compared.

e = Last disk block number (of a range) that mismatched, failed, or successfully retried while being compared.

f = Partition number in use when a mismatch was encountered.

g = Offset within partition when mismatch was detected.

h = Member number of the second unit of the MHD drive.

i = Number of mismatches that were detected.

j = Number of Input/Output jobs done.

k = Number of errors detected doing I/O.

l = Time in the form hh:mm:ss, hours, minutes, and seconds.

m = Size of the partition given in disk blocks.

n = Disk block number that failed to read or write.

`ETIME` = Elapsed time for a partition to compare. For the `FINAL SUMMARY` report, the `ETIME` is the total elapsed time of all the partitions.

`RO` = Indicates that the `READ ONLY` option was selected.

`STIME` = The time the compare of the partition was started. For the `FINAL SUMMARY` report, `STIME` indicates the start time of the input message.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation, and try the input request again.

Appropriate mismatch messages will be generated indicating the range of disk blocks where the mismatch occurred. A maximum of eight mismatch error messages will be output per partition. More than eight mismatch messages will result in an early termination.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

This alarm is either a manually-requested report or is automatically-generated for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

SEE PROPRIETARY NOTICE ON COVER PAGE

[12] `CMPR MHD` *a* {`RO`} `PARTITION BYPASSED`
`MHD` *a* `PARTITION` *f* `SIZE` *m*
`MHD` *h* `PARTITION` *f* `SIZE` *m*
`PARTITION SIZES NOT EQUAL`
`STIME` *l* `ETIME` *l*

[13] `CMPR MHD` {*a*|*h*} {`RO`} `PARTITION ACCESS FAILURE`
`MHD` {*a*|*h*} {`READ`} `FAILED`
`PARTITION` *f* `OFFSET` *g* `BLOCK` *n*

2. REASON FOR OUTPUT

To report the result of executing an `CMPR:MHD` input message. The [`RO`] is output to indicate that the `READ ONLY` option was used. `STIME` is the time the message was started. `ETIME` is used to indicate the elapsed time for a particular partition. The `ETIME` for the `FINAL` message is the total elapsed time.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the first unit of the moving head disk (MHD) drive.

b = Process step or reason code:

- b*xx* — where *xx* are hex digits - see DFC Output Appendix A, `DFC-APPA`.
- `f03` — cannot open equipment configuration database (ECD)
- `f06` — cannot get unit control block (UCB) of first unit by name
- `f09` — cannot get UCB of second unit by name
- `f12` — cannot get UCB of first unit's mate
- `f15` — cannot get UCB of first unit's mate
- `f18` — cannot reserve UCB of second unit
- `f21` — cannot assign special device file name of second unit
- `f24` — cannot open special device file of second unit
- `f27` — cannot enable message reception
- `f30` — see accompanying DKDRV error report on the ROP
- `f36` — failed to close special device file of second unit
- `f39` — failed to release special device file of second unit
- `f42` — message to port failure
- `f45` — message reception failure
- `f48` — message to port failure
- `f51` — message reception failure
- `f54` — process timed out
- `f57` — failed to close special device file of second unit
- `f60` — failed to release special device file of second unit
- `f63` — failed to unreserve UCB of second unit
- `f66` — failed to close ECD

c = System error code number; see System Error Codes Output Appendix, `SYSERR-APP`.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = First disk block number (of a range) that mismatched or retried while being compared.

e = Last disk block number (of a range) that mismatched, failed, or successfully retried while being compared.

f = Partition number in use when a mismatch was encountered.

g = Offset within partition when mismatch was detected.

h = Member number of the second unit of the MHD drive.

i = Number of mismatches that were detected.

j = Number of Input/Output jobs done.

k = Number of errors detected doing I/O.

l = Time in the form hh:mm:ss, hours, minutes, and seconds.

m = Size of the partition given in disk blocks.

n = Disk block number that failed to read or write.

`ETIME` = Elapsed time for a partition to compare. For the `FINAL SUMMARY` report, the `ETIME` is the total elapsed time of all the partitions.

`RO` = Indicates that the `READ ONLY` option was selected.

`STIME` = The time the compare of the partition was started. For the `FINAL SUMMARY` report, `STIME` indicates the start time of the input message.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation, and try the input request again.

Appropriate mismatch messages will be generated indicating the range of disk blocks where the mismatch occurred. A maximum of eight mismatch error messages will be output per partition. More than eight mismatch messages will result in an early termination.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

This alarm is either a manually-requested report or is automatically-generated for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

SEE PROPRIETARY NOTICE ON COVER PAGE

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `COPY ACTDISK ON MHD` *a* `COMPLETED`

[2] `COPY ACTDISK STOPPED WITH ERROR CODE` *b* `ERRNO` *c*`[, (`*d*`)]`

2. REASON FOR OUTPUT

To report the result of executing a `COPY:ACTDISK` input message.

3. VARIABLE FIELD DEFINITIONS

a = Disk unit to which file was copied.

b = Error code indicating error that caused process to terminate. The first three digits indicate the nature of the error; the last two (represented as xx) indicate which module the error occurred in (the information is not provided here).

`101`*xx* — Missing arguments. This error is related with the usage of the `/prc/mntfs` process. The arguments expected by this process are: `/prc/mntfs` *-d a -p b -, c -x d*. Where *a* specifies the non-active disk, *b* the target file system, *c* the directory to mount the file system, *d* the name of the process, plus arguments, to be executed. The arguments should consist of files or directory path names, including the mount directory specified in *c*.

`102`*xx* — The partition number that corresponds to the mount point of the destination file, is not the same as the destination partition number. To by pass this check, don't include the mount point in destination file name. For example, to copy `/etc/ularp` to the root file system on the non-active disk, don't specify `/etc/ularp` as the destination file; instead the name `ularp` or `/ularp` should be specified.

`103`*xx* — The source specified is not a regular file, a contiguous file (type `C` or *x*), or a block device (type *b*, a partition or file system).

`104`*xx* — Cannot find mount point for destination file. To avoid the error, exclude the mount point from the destination file path name.

`105`*xx* — The destination disk specified is not in the out-of-service

(OOS) or offline (OFL) state.

`106`*xx* — Cannot find an entry for the destination partition, in the destination disk volume table of contents (VTOC). Make sure that the partition number specified exists in the destination disk.

`107`*xx* — Bad mount directory specified. This error results from the execution of the /prc/mntfs process.

`108`*xx* — The VTOC in the destination disk is bad or does not exist.

`109`*xx* — Bad destination file specified.

`110`*xx* — Process stopped due to SIGTERM signal.

`111`*xx* — The source file specified does not exist.

`112`*xx* — Cannot find entry for the source partition on the active disk VTOC.

`113`*xx* — The destination partition is smaller than the source partition.

`114`*xx* — The partition number specified is greater than the maximum number of partitions on disk.

`115`*xx* — The destination partition does not exist in the destination disk.

Errors Associated with System Calls

`201`*xx* — The `open()` failed to open *d*.

`202`*xx* — `mknod()` failed to create *d*.

`203`*xx* — `read()` failed to read file *d*.

`204`*xx* — `mkseg()` failed to allocate one segment of memory.

`205`*xx* — `lseek()` failed to change offset (see *d*) in out of service disk.

`206`*xx* — `setio()` failed to set physical IO for *d*.

`207`*xx* — `write()` failed on segment *d*.

`208`*xx* — `ugucbn()` failed to get unit control block (UCB) information for moving head disk (MHD) *d*. This error occurs when disk unit specified does not exist.

`209`*xx* — `mount()` failed to mount partition *d*. This error occurs when partition is not a file system, or mount directory is busy.

`210`*xx* — `unlink()` failed to unlink file *d*.

`211`*xx* — `ursvucb()` failed to reserve MHD *d*. This error occurs when the disk is reserved by other process (for example, diagnostics).

`212`*xx* — `udsdf()` failed to get special device file to access MHD *d*. This error occurs when another process failed to release the special device file.

`213`*xx* — `msgport()` failed to send message to the disk driver.

`214`*xx* — `recvw()` failed to receive message from the disk driver.

`215`*xx* — `msgenab()` failed.

`216`*xx* — Bad message received from the disk driver.

SEE PROPRIETARY NOTICE ON COVER PAGE

217*xx* — Bad return code received from the disk driver. This error occurs when the entry in destination disk VTOC does not have all the fields properly set (e.g., the address for the partition may be bad).
218*xx* — `chown()` failed to change `owner` for destination file.
219*xx* — `close()` failed to close *d*.
220*xx* — `stat()` failed on *d*.
221*xx* — `plock()` failed to lock `/prc/mntfs` process in core.
222*xx* — `chmod()` failed to change mode of destination file.
223*xx* — `system()` call returned with an error code *d*.
224*xx* — `create()` failed to create the destination file, on file system in the destination disk. This error occurs when there is no more space in the file system.
225*xx* — `falloc()` failed to allocate contiguous space for a contiguous file, on the file system in the destination disk. This error occurs when the file system does not have enough contiguous space for the file to be created.
226*xx* — `ugetrec()` failed to get UCB record for destination disk MHD *a* in the ECD database.

c = Indicates system error code (see System Error Codes Output Appendix, `SYSERR-APP`).

d = Supplementary data.

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, seek technical assistance.

5. ALARMS

Manual alarm. This alarm is a manually-requested report.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 187.
Format 2 has an OMDB key of 186.

Output Appendix
`SYSERR-APP`

Input Message
`COPY:ACTDISK`

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . COPY-ADDR
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `COPY ADDR` *a b #c*

[2] `COPY ADDR` *d* `NOT STARTED`
`CONFLICT WITH CURRENT SYSTEM STATUS` *e*

[3] `COPY ADDR` *d* `NOT STARTED`
`INVALID ID FIELD` *f*

[4] `COPY ADDR` *d* `NOT STARTED`
`RETRY LATER` *g*

2. REASON FOR OUTPUT

To report the completion of a `COPY` input message.

3. VARIABLE FIELD DEFINITIONS

a = Virtual address.

b = Termination status of the operation:

`COMPLETED` — Request successfully completed.

`NOT STARTED NGPID` — The `COPY` was stopped because the process does not exist.

`NOT STARTED NGUID` — The `COPY` was stopped because no copies of the process exist.

`STOPPED NGADDR` — The `COPY` was stopped because the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were specified.

`STOPPED NGPROT` — The `COPY` was stopped because the destination address does not have write permission granted.

`STOPPED NGCOPY` — The `COPY` was stopped because some other error occurred in moving the data.

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Generic access package (GRASP) execution sequence number.

d = PID.

UID.

e = Bad PID.

f = Test phrase:

— EXTRA KEYWORD (PID).

— INCONSISTENT KEYWORDS (NL-OFF).

— INPUT ERROR (OFF COUNT).

— INVALID KEYWORD.

— RANGE ERROR (L or NL).

— RANGE ERROR (PID).

— RANGE ERROR (UVAR).

g = The system is in an overload condition.

4. ACTION TO BE TAKEN

If *b* is NOT STARTED NGPID, the process did not exist at the time the COPY was attempted. Consider using the process UID instead of the PID.

If *b* is NOT STARTED NGUID, the process did not exist at the time the COPY was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

If *b* is STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the COPY command in the action list. This will help control the exact circumstances under which the operation is performed.

If *b* is STOPPED NGPROT, recheck the destination to verify that it indicates a writable area. To change program text, use the LOAD:UPNM input message.

5. ALARMS

None. This alarm is a manually-requested report.

GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `COPY BKDISK` *a* [*b*]

[2]
```
COPY BKDISK NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
```

2. REASON FOR OUTPUT

To report the progress of the `COPY:BKDISK` input message, or to indicate a problem.

3. VARIABLE FIELD DEFINITIONS

a = One of the following status messages:

`CANNOT LOCK PROCESS IN CORE`
Cannot lock physical disk-to-tape (PDT) writer process program in core. This may slow down the system processing.

`COMPLETED. DISMOUNT DATABASE TAPE AND LABEL`
Dismount the tape and label it as required by local procedures.

`COMPLETED. DISMOUNT GENERIC TAPE AND LABEL`
Dismount the tape and label it as required by local procedures.

`COMPLETED. DISMOUNT TAPE AND LABEL`
Dismount the tape and label it as required by local procedures.

`DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE`
End of tape has been reached. There are ten minutes in which to dismount the tape, label it, and mount a new tape. `COPY:BKDISK;ACK` input message must be entered to continue the process (see `COPY:BKDISK`, Format 2).

`DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE`
If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE
End of tape has been reached. There are 10 minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE
If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT TAPE LABEL AND MOUNT NEXT TAPE
End of tape has been reached. There are ten minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

IN PROGRESS
Procedure is proceeding normally.

NOTE: COMMON TAPE - BOTH LBOOTS WILL BE WRITTEN.
This note informs the user that even though only one lboot partition was specified in the specfile, the lboot partition for the processors will be written to tape. Both partitions are written, since the volume table of contents (VTOC) on the disk is common.

STOPPED
Physical disk-to-tape writer has been stopped.

If *a* = STOPPED:

b = One of the following error messages:

CAN'T OPEN DISK. CHECK DATA FIELD AND TRY AGAIN
The disk name given could not be opened. There may be an error in the arguments to the DISK keyword.

CAN'T OPEN TAPE. CHECK DATA FIELD AND TRY AGAIN
The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CAN'T OPEN TAPE. NEED TO RE-WRITE ENTIRE SEQUENCE
The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

SEE PROPRIETARY NOTICE ON COVER PAGE

CANNOT OPEN TAPE DATA
This message indicates that the open to the tape device failed. This may be due to the tape drive being off-line or the tape being write protected. A message will follow indicating to mount tape and acknowledge. There will be four chances given to mount a tape.

CANNOT RUN WITH SYSTEM OR FIELD UPDATE, OR ANOTHER COPY BKDISK
The COPY:BKDISK message cannot run simultaneously with a field update or system update message (any UPD input message), and cannot run while another COPY:BKDISK message is in progress.

COPY BKDISK START WAS NOT ISSUED
The COPY:BKDISK;ACK input command was issued before a COPY:BKDISK;START command.

ERROR CODE *xx*
The procedure has been terminated for one of the reasons listed below:

1 — A read of VTOC indicated zero bytes read.
2 — Error on read of VTOC.
3 — Second VTOC entry is not for 'VTOC' itself (the VTOC partitions may not be valid).
4 — Failed on setio system call for tape.
5 — Unable to open device directory /dev.
6 — The stat() UNIX® function failed to get device information for the diskname specified.
7 — The stat() UNIX® function failed to get device information for a partition name in the /dev directory.
8 — Two partition names specified in the specification file are duplicate (map into the same partition on disk). Remove one partition name and try again.
9 — Error in reading /dev device directory entries.
10 — Did not find stat() information for all partition names specified in specification file. One or more partition names specified may reside in a different disk. Remove these partition names and try again.
11 — Failed on open of partition.

SEE PROPRIETARY NOTICE ON COVER PAGE

12 — Failed on `setio` system call for disk.
13 — Error on read of partition.
14 — Unable to add data segment to address space.
15 — Cannot open specification file. This file may not exist, or may be zero length. Add required partition names and try again.
16 — The `COPY:BKDISK;ACK` input message cannot open /tmp/pdt to get the process ID of the `COPY:BKDISK;START` message.
17 — Too many partitions specified in the specification file.
18 — The `stat()` function failed to get device information for a partition name in the `/etc/pdtspec` file (this partition may not exist) or the `stat()` function could not find the name of the disk device or tape device entered on the message line. The name entered is not a special device name. Replace the name and try again.
19 — Name specified in the specification file is not a partition (file is not a block device). Replace with the proper partition name and try again.
20 — The `lla_dbatt()` function failed to attach to the system generation (SG) database (to get the SG time stamp that is included in the first header of a tape sequence).
21 — The `lla_rdget()` function failed to get the `sghdr_rec` record from the SG.
22 — Failed on `lla_dbrel` call.
23 — The `getdbseg()` function failed to attach to the equipment configuration database (ECD) (to get the generic version to be included in the first header of a tape sequence).
24 — The `lla_iatt()` function failed trying to attach to the incore database.
25 — A tape sequence was not effective for a generic or database (internal error in the `COPY:BKDISK;START` message). Try the entire procedure again.
26 — The system call `close()` failed when trying to close the partition that was opened to read the data.
27 — The system call `unlink()` failed when trying to unlink the partition already written to tape.
28 — The system call `mknod()` failed when trying to create a special device file or a partition.
29 — The system call `lseek()` failed when trying to find the disk offset to rewrite the tape.
30 — The `lla_rdget()` function failed to get the ecdorg, ucb, or mdct records from the ECD.
31 — The `lla_get()` function failed to get the logdev record from the ECD.

SEE PROPRIETARY NOTICE ON COVER PAGE

`INVALID SPECFILE`
Make sure that partition names were specified in the specification file.

`MOUNT TAPE AGAIN AND ACKNOWLEDGE LAST CHANCE`
This message will be output as the last warning for mounting a tape successfully. The `COPY:BKDISK` message will abort after 20 minutes.

`MOUNT TAPE AND ACKNOWLEDGE`
This message is printed after a previous request to mount a tape failed (for example, the `open()` of the tape failed), or if the `COPY:BKDISK;ACK` input message is not entered to continue the process. There are seven chances to mount a tape successfully, before the `COPY:BKDISK;START` input message aborts.

`MRG OPTION INCORRECTLY USED`
Specification file does not have database and generic partitions. This option should be used when there is a need to create one sequence for generic and database partitions.

`RE-INITIALIZE ENTIRE SEQUENCE`
This message indicates that the entire tape writing procedure must be re-initiated using the `COPY:BKDISK;START` input message.

`TAPE CHANGE ACTION INCORRECT`
The action taken to change the tape was incorrect. This can occur if the time limits were exceeded, an invalid tape size was entered, or no tape size was entered. This message is followed immediately by `RE-INITIATE ENTIRE SEQUENCE.`

`TAPE SIZE OUT OF RANGE RE-ENTER COMMAND`
An incorrect tape size was entered for the tape device specified. The acceptable range for a 9-track tape is 600 to 2400 feet.

`TAPE WRITE ERROR. NEED TO RE-WRITE ENTIRE SEQUENCE`
A physical error was encountered while writing to the tape. This error may also appear if an incorrect device name was specified for 'EXT' (extended) format. Mount tape on proper device if necessary and enter `COPY:BKDISK;START` input message.

`TAPE WRITE ERROR MOUNT NEW TAPE AND TRY AGAIN`
A physical write error was encountered while writing to the tape. It may be necessary to mount a new tape, since write errors occur due to `bad spots` on tape. `COPY:BKDISK;ACK` input message must be entered to rewrite the tape.

4. ACTION TO BE TAKEN

Execution errors (error codes 8, 10, 15, 17, 18, and 19) can be corrected by examining the procedures used for execution of the message. If any other errors occur, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Key
Format 1 has an OMDB key of 185.

Input Messages

ID . . . . . COPY-BKDISK-B
GENERIC . . . . . UNIX RTR R21.3 and R21.11
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `COPY BKDISK` *a* [*b*]

[2]
```
COPY BKDISK NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
```

2. REASON FOR OUTPUT

To report the progress of the `COPY:BKDISK` input message, or to indicate a problem.

3. VARIABLE FIELD DEFINITIONS

a = One of the following status messages:

`CANNOT LOCK PROCESS IN CORE`
Cannot lock physical disk-to-tape (PDT) writer process program in core. This may slow down the system processing.

`COM OPTION MISUSED. ISSUE COMMAND AGAIN.`
The COM option was used on RTR boot disks that do not have a common VTOC. A common RTR VTOC includes both the 3B20D VLMM and the 3B21D lboot partitions. Issue the command again without the COM option.

`COM OPTION NEEDED. ISSUE COMMAND AGAIN.`
The COM option is needed, since the RTR boot disk image being created has a VTOC including both the 3B20D VLMM and the 3B21D lboot partitions. Issue the command again with the COM option.

`COMPLETED. DISMOUNT DATABASE TAPE AND LABEL`
Dismount the tape and label it as required by local procedures.

`COMPLETED. DISMOUNT GENERIC TAPE AND LABEL`
Dismount the tape and label it as required by local procedures.

`COMPLETED. DISMOUNT TAPE AND LABEL`
Dismount the tape and label it as required by local procedures.

`DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE`
End of tape has been reached. There are ten minutes in which to dismount the tape, label it, and mount a new tape.

COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE
If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE
End of tape has been reached. There are 10 minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE
If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT TAPE LABEL AND MOUNT NEXT TAPE
End of tape has been reached. There are ten minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

IN PROGRESS
Procedure is proceeding normally.

NOTE: COMMON TAPE - BOTH LBOOTS WILL BE WRITTEN.
This note informs the user that even though only one lboot partition was specified in the specfile, the lboot partition for the processors will be written to tape. Both partitions are written, since the volume table of contents (VTOC) on the disk is common.

STOPPED
Physical disk-to-tape writer has been stopped.

If *a* = STOPPED:

b = One of the following error messages:

CAN'T OPEN DISK. CHECK DATA FIELD AND TRY AGAIN
The disk name given could not be opened. There may be an error in the arguments to the DISK keyword.

CAN'T OPEN TAPE. CHECK DATA FIELD AND TRY AGAIN
The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CAN'T OPEN TAPE. NEED TO RE-WRITE ENTIRE SEQUENCE
The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CANNOT OPEN TAPE DATA
This message indicates that the open to the tape device failed. This may be due to the tape drive being off-line or the tape being write protected. A message will follow indicating to mount tape and acknowledge. There will be four chances given to mount a tape.

CANNOT RUN WITH SYSTEM OR FIELD UPDATE, OR ANOTHER COPY BKDISK
The COPY:BKDISK message cannot run simultaneously with a field update or system update message (any UPD input message), and cannot run while another COPY:BKDISK message is in progress.

COPY BKDISK START WAS NOT ISSUED
The COPY:BKDISK;ACK input command was issued before a COPY:BKDISK;START command.

ERROR CODE *xx*
The procedure has been terminated for one of the reasons listed below:

1 — A read of VTOC indicated zero bytes read.
2 — Error on read of VTOC.
3 — Second VTOC entry is not for 'VTOC' itself (the VTOC partitions may not be valid).
4 — Failed on setio system call for tape.

6 — The stat() UNIX® function failed to get device information for the diskname specified.
7 — The stat() UNIX® function failed to get device information for a partition name in the /dev directory.
8 — Two partition names specified in the specification file are duplicate (map into the same partition on disk). Remove one partition name and try again.
9 — Error in reading /dev device directory entries.
10 — Did not find stat() information for all partition names specified in specification file. One or more partition names specified may reside in a different disk. Remove these partition names and try again.
11 — Failed on open of partition.

SEE PROPRIETARY NOTICE ON COVER PAGE

12 — Failed on `setio` system call for disk.
13 — Error on read of partition.
14 — Unable to add data segment to address space.
15 — Cannot open specification file. This file may not exist, or may be zero length. Add required partition names and try again.
16 — The `COPY:BKDISK;ACK` input message cannot open /tmp/pdt to get the process ID of the `COPY:BKDISK;START` message.
17 — Too many partitions specified in the specification file.
18 — The `stat()` function failed to get device information for a partition name in the `/etc/pdtspec` file (this partition may not exist) or the `stat()` function could not find the name of the disk device or tape device entered on the message line. The name entered is not a special device name. Replace the name and try again.
19 — Name specified in the specification file is not a partition (file is not a block device). Replace with the proper partition name and try again.
20 — The `lla_dbatt()` function failed to attach to the system generation (SG) database (to get the SG time stamp that is included in the first header of a tape sequence).
21 — The `lla_rdget()` function failed to get the `sghdr_rec` record from the SG.
22 — Failed on `lla_dbrel` call.
23 — The `getdbseg()` function failed to attach to the equipment configuration database (ECD) (to get the generic version to be included in the first header of a tape sequence).
24 — The `lla_iatt()` function failed trying to attach to the incore database.
25 — A tape sequence was not effective for a generic or database (internal error in the `COPY:BKDISK;START` message). Try the entire procedure again.
26 — The system call `close()` failed when trying to close the partition that was opened to read the data.
27 — The system call `unlink()` failed when trying to unlink the partition already written to tape.
28 — The system call `mknod()` failed when trying to create a special device file or a partition.
29 — The system call `lseek()` failed when trying to find the disk offset to rewrite the tape.
30 — The `lla_rdget()` function failed to get the ecdorg, ucb, or mdct records from the ECD.
31 — The `lla_get()` function failed to get the logdev record from the ECD.

SEE PROPRIETARY NOTICE ON COVER PAGE

32 — The tape device being used is not compatible with the EXT option. The EXT option is always compatible with a processor or an Administrative Work Station (AWS) tape device, since data to be written is broken up into 6K-size records by default. On the 3B21D, data is not broken up into 6K-size records by default. This error occurs if you are on the 3B21D and the logdev record for the tape device specified has one of the following characteristics:

1. is of type IOP
2. has a fixed blocking factor
3. has a blocking factor not equal to 6K

The blocking factor for some tape devices can be determined by their naming convention. Refer to the ''Magnetic Tape Special Device File Names'' chapter of the *Lucent Technologies 3B20D and 3B21D Computers UNIX RTR Operating System, System Maintenance Manual* for tape device naming conventions. Seek technical assistance if necessary.

`INVALID SPECFILE`
Make sure that partition names were specified in the specification file.

`MOUNT TAPE AGAIN AND ACKNOWLEDGE LAST CHANCE`
This message will be output as the last warning for mounting a tape successfully. The `COPY:BKDISK` message will abort after 20 minutes.

`MOUNT TAPE AND ACKNOWLEDGE`
This message is printed after a previous request to mount a tape failed (for example, the `open()` of the tape failed), or if the `COPY:BKDISK;ACK` input message is not entered to continue the process. There are seven chances to mount a tape successfully, before the `COPY:BKDISK;START` input message aborts.

`MRG OPTION INCORRECTLY USED`
Specification file does not have database and generic partitions. This option should be used when there is a need to create one sequence for generic and database partitions.

`RE-INITIALIZE ENTIRE SEQUENCE`
This message indicates that the entire tape writing procedure must be re-initiated using the `COPY:BKDISK;START` input message.

TAPE CHANGE ACTION INCORRECT
The action taken to change the tape was incorrect. This can occur if the time limits were exceeded, an invalid tape size was entered, or no tape size was entered. This message is followed immediately by RE-INITIATE ENTIRE SEQUENCE.

TAPE SIZE OUT OF RANGE RE-ENTER COMMAND
An incorrect tape size was entered for the tape device specified. The acceptable range for a 9-track tape is 600 to 2400 feet and the acceptable range for a DAT is 30 to 90 meters.

TAPE WRITE ERROR. NEED TO RE-WRITE ENTIRE SEQUENCE
A physical error was encountered while writing to the tape. This error may also appear if an incorrect device name was specified for 'EXT' (extended) format. Mount tape on proper device if necessary and enter COPY:BKDISK;START input message.

TAPE WRITE ERROR MOUNT NEW TAPE AND TRY AGAIN
A physical write error was encountered while writing to the tape. It may be necessary to mount a new tape, since write errors occur due to bad spots on tape. COPY:BKDISK;ACK input message must be entered to rewrite the tape.

4. ACTION TO BE TAKEN

Execution errors (error codes 8, 10, 15, 17, 18, and 19) can be corrected by examining the procedures used for execution of the message. If any other errors occur, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Key
Format 1 has an OMDB key of 185.

Input Messages

```

[4]
```
COPY BKDISK STOPPED
CANNOT EXECUTE CHILD PROCESS
```

2. REASON FOR OUTPUT

To report the progress of the `COPY:BKDISK` input message, or to indicate a problem.

3. VARIABLE FIELD DEFINITIONS

a = One of the following status messages:

`CANNOT LOCK PROCESS IN CORE`
Cannot lock physical disk-to-tape (PDT) writer process program in core. This may slow down the system processing.

`COM OPTION MISUSED. ISSUE COMMAND AGAIN.`
The COM option was used on RTR boot disks that do not have a common VTOC. A common RTR VTOC includes both the 3B20D VLMM and the 3B21D lboot partitions. Issue the command again without the COM option.

COM OPTION NEEDED. ISSUE COMMAND AGAIN.
The COM option is needed, since the RTR boot disk image being created has a VTOC including both the 3B20D VLMM and the 3B21D lboot partitions. Issue the command again with the COM option.

COMPLETED. DISMOUNT DATABASE TAPE AND LABEL
Dismount the tape and label it as required by local procedures.

COMPLETED. DISMOUNT GENERIC TAPE AND LABEL
Dismount the tape and label it as required by local procedures.

COMPLETED. DISMOUNT TAPE AND LABEL
Dismount the tape and label it as required by local procedures.

DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE
End of tape has been reached. There are ten minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE
If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE
End of tape has been reached. There are 10 minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE
If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT TAPE LABEL AND MOUNT NEXT TAPE
End of tape has been reached. There are ten minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

IN PROGRESS
Procedure is proceeding normally.

NOTE: COMMON TAPE - BOTH LBOOTS WILL BE WRITTEN.
This note informs the user that even though only one lboot partition was specified in the specfile, the lboot partition for the processors will be written to tape. Both partitions are written, since the volume table of contents (VTOC) on the disk is common.

STOPPED
Physical disk-to-tape writer has been stopped.

If *a* = STOPPED:

b = One of the following error messages:

CAN'T OPEN DISK. CHECK DATA FIELD AND TRY AGAIN
The disk name given could not be opened. There may be an error in the arguments to the DISK keyword.

CAN'T OPEN TAPE. CHECK DATA FIELD AND TRY AGAIN
The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CAN'T OPEN TAPE. NEED TO RE-WRITE ENTIRE SEQUENCE
The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CANNOT OPEN TAPE DATA
This message indicates that the open to the tape device failed. This may be due to the tape drive being off-line or the tape being write protected. A message will follow indicating to mount tape and acknowledge. There will be four chances given to mount a tape.

CANNOT RUN WITH SYSTEM OR FIELD UPDATE, OR ANOTHER COPY BKDISK
The COPY:BKDISK message cannot run simultaneously with a field update or system update message (any UPD input message), and cannot run while another COPY:BKDISK message is in progress.

COPY BKDISK START WAS NOT ISSUED
The COPY:BKDISK;ACK input command was issued before a COPY:BKDISK;START command.

ERROR CODE *xx*
The procedure has been terminated for one of the reasons listed below:

1 — A read of VTOC indicated zero bytes read.
2 — Error on read of VTOC.
3 — Second VTOC entry is not for 'VTOC' itself (the VTOC partitions may not be valid).
4 — Failed on `setio` system call for tape.
5 — Unable to open device directory `/dev`.
6 — The `stat()` UNIX® function failed to get device information for the diskname specified.
7 — The `stat()` UNIX® function failed to get device information for a partition name in the `/dev` directory.
8 — Two partition names specified in the specification file are duplicate (map into the same partition on disk). Remove one partition name and try again.
9 — Error in reading /dev device directory entries.
10 — Did not find `stat()` information for all partition names specified in specification file. One or more partition names specified may reside in a different disk. Remove these partition names and try again.
11 — Failed on open of partition.
12 — Failed on `setio` system call for disk.
13 — Error on read of partition.
14 — Unable to add data segment to address space.
15 — Cannot open specification file. This file may not exist, or may be zero length. Add required partition names and try again.
16 — The `COPY:BKDISK;ACK` input message cannot open /tmp/pdt to get the process ID of the `COPY:BKDISK;START` message.
17 — Too many partitions specified in the specification file.
18 — The `stat()` function failed to get device information for a partition name in the `/etc/pdtspec` file (this partition may not exist), or the `stat()` function could not find the name of the disk device or tape device entered on the message line. The name entered is not a special device name. Replace the name and try again.
19 — Name specified in the specification file is not a partition (file is not a block device). Replace with the proper partition name and try again.
20 — The `lla_dbatt()` function failed to attach to the system generation (SG) database (to get the SG time stamp that is included in the first header of a tape sequence).
21 — The `lla_rdget()` function failed to get the `sghdr_rec` record from the SG.
22 — Failed on `lla_dbrel` call.

SEE PROPRIETARY NOTICE ON COVER PAGE

23 — The `getdbseg()` function failed to attach to the equipment configuration database (ECD) (to get the generic version to be included in the first header of a tape sequence).

24 — The `lla_iatt()` function failed trying to attach to the incore database.

25 — A tape sequence was not effective for a generic or database (internal error in the `COPY:BKDISK;START` message). Try the entire procedure again.

26 — The system call `close()` failed when trying to close the partition that was opened to read the data.

27 — The system call `unlink()` failed when trying to unlink the partition already written to tape.

28 — The system call `mknod()` failed when trying to create a special device file or a partition.

29 — The system call `lseek()` failed when trying to find the disk offset to rewrite the tape.

30 — The `lla_rdget()` function failed to get the ecdorg, ucb, or mdct records from the ECD.

31 — The `lla_get()` function failed to get the logdev record from the ECD.

32 — The tape device being used is not compatible with the EXT option. The EXT option is always compatible with a processor or an Administrative Work Station (AWS) tape device, since data to be written is broken up into 6K-size records by default. On the 3B21D, data is not broken up into 6K-size records by default. This error occurs if you are on the 3B21D and the logdev record for the tape device specified has one of the following characteristics:

1. is of type IOP
2. has a fixed blocking factor
3. has a blocking factor not equal to 6K

The blocking factor for some tape devices can be determined by their naming convention. Refer to the ''Magnetic Tape Special Device File Names'' chapter of the *Lucent Technologies 3B20D and 3B21D Computers UNIX RTR Operating System, System Maintenance Manual* for tape device naming conventions. Seek technical assistance if necessary.

33 — The ECD mdct record for the source disk references more than two units.

34 — The ECD mdct record for the source disk does not reference any units.

35 — No BBOOT partition entries were found in the RTR boot disk VTOC.

36 — A BACKUP BBOOT partition entry was not found in the RTR boot disk VTOC.
37 — A PRIMARY BBOOT partition entry was not found in the RTR boot disk VTOC.

`INVALID SPECFILE`
Make sure that partition names were specified in the specification file.

`MOUNT TAPE AGAIN AND ACKNOWLEDGE LAST CHANCE`
This message will be output as the last warning for mounting a tape successfully. The `COPY:BKDISK` message will abort after 20 minutes.

`MOUNT TAPE AND ACKNOWLEDGE`
This message is printed after a previous request to mount a tape failed (for example, the `open()` of the tape failed), or if the `COPY:BKDISK;ACK` input message is not entered to continue the process. There are seven chances to mount a tape successfully, before the `COPY:BKDISK;START` input message aborts.

`MRG OPTION INCORRECTLY USED`
Specification file does not have database and generic partitions. This option should be used when there is a need to create one sequence for generic and database partitions.

`RE-INITIALIZE ENTIRE SEQUENCE`
This message indicates that the entire tape writing procedure must be re-initiated using the `COPY:BKDISK;START` input message.

`TAPE CHANGE ACTION INCORRECT`
The action taken to change the tape was incorrect. This can occur if the time limits were exceeded, an invalid tape size was entered, or no tape size was entered. This message is followed immediately by `RE-INITIATE ENTIRE SEQUENCE.`

`TAPE SIZE OUT OF RANGE RE-ENTER COMMAND`
An incorrect tape size was entered for the tape device specified. The acceptable range for a 9-track tape is 600 to 2400 feet and the acceptable range for a DAT is 30 to 90 meters.

`TAPE WRITE ERROR. NEED TO RE-WRITE ENTIRE SEQUENCE`
A physical error was encountered while writing to the tape. This error may also appear if an incorrect device name was specified for 'EXT' (extended) format. Mount tape on proper device if necessary and enter `COPY:BKDISK;START` input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

`TAPE WRITE ERROR MOUNT NEW TAPE AND TRY AGAIN`
A physical write error was encountered while writing to the tape. It may be necessary to mount a new tape, since write errors occur due to `bad spots` on tape. `COPY:BKDISK;ACK` input message must be entered to rewrite the tape.

c = Tape library error code number (see the Tape Library Error Appendix, TAPE-LIB).

d = System error code number (see the System Error Codes Output Appendix, SYSERR).

4. ACTION TO BE TAKEN

Format 1 execution errors (error codes `8`, `10`, `15`, `17`, `18`, and `19`) can be corrected by examining the procedures used for execution of the message. Seek technical assistance for all other error codes.

Format 3 errors pertain to multi-volume digital audio tapes and will be accompanied by explanatory text. If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and that the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

Format 4 indicates that there is a problem invoking the `/prc/3btpwrt` process. Verify that the process exists and is executable. If these checks fail to uncover the problem, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

UNEXPECTED END OF DATA DETECTED |
WRITE FAILED TO OUTPUT DEVICE, ERROR b ]
```

2. REASON FOR OUTPUT

To report the status of a request to copy the contents of a multi-volume digital audio tape (DAT) to a destination DAT.

3. VARIABLE FIELD DEFINITIONS

a = Request status.

ABORTED	— The copy failed and was aborted.
COMPLETED	— The copy completed with no errors.
IN PROGRESS	— The copy is in progress.
STARTED	— The copy started.
STOPPED	— The copy failed and was stopped.

b = System error code number (see the System Error Codes Output Appendix, SYSERR).

c = Internal error code for failure of an equipment configuration database (ECD) access function.

1 — `getdbseg` failed, could not attach to the ECD
2 — `lla_iatt` failed, could not attach to the incore database
3 — `lla_rdget` failed, could not get the ecdorg record from the ECD
4 — `lla_get` failed, could not get the logdev record for the source tape device from the ECD
5 — `lla_rdget` failed, could not get the mdct record for the source tape device from the ECD
6 — `lla_rdget` failed, could not get the ucb record for the source tape device from the ECD
7 — `lla_get` failed, could not get the logdev record for the destination tape device from the ECD
8 — `lla_rdget` failed, could not get the mdct record for the destination tape device from the ECD
9 — `lla_rdget` failed, could not the the ucb record for the destination tape device from the ECD
10 — `rmovdbseg` failed, could not remove incore database segments

d = Tape library error code number (see the Tape Library Error Appendix, TAPE-LIB).

4. ACTION TO BE TAKEN

Errors will be accompanied by explanatory text. Verify that the command that was input is consistent with the `COPY-BKTAPE` input message manual page. If the message indicates that there is a problem with a tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing a tape drive, verify that a tape is loaded and that the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report for information only.

`MHD` *aa* `PARTITION` *f* `SIZE` *m*
`PARTITION SIZES NOT EQUAL`
`STIME` *hh:mm:ss* `ETIME` *hh:mm:ss*

2. REASON FOR OUTPUT

To report the result of executing a `COPY:DIFF` input message. `STIME` is the time the message was started. `ETIME` is used to indicate the elapsed time for a particular partition. The `ETIME` for the `FINAL` message is the total elapsed time.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the source disk of the moving head disk (MHD) drive.

b = Process step or reason code:

`f03` — Cannot open equipment configuration database (ECD).
`f06` — Cannot get unit control block (UCB) of first unit by name.
`f09` — Cannot get UCB of second unit by name.
`f12` — Cannot get UCB of first unit's mate.
`f15` — Cannot get UCB of first unit's mate.
`f18` — Cannot reserve UCB of second unit.
`f21` — Cannot assign special device file name of second unit.
`f24` — Cannot open special device file of second unit.
`f27` — Cannot enable message reception.
`f30` — See accompanying DKDRV error report on the receive-only printer.
`f36` — Failed to close special device file of second unit.
`f39` — Failed to release special device file of second unit.
`f42` — Message to port failure.
`f45` — Message reception failure.
`f48` — Message to port failure.
`f51` — Message reception failure.
`f54` — Process timed out.
`f57` — Failed to close special device file of second unit.
`f60` — Failed to release special device file of second unit.
`f63` — Failed to unreserve UCB of second unit.
`f66` — Failed to close ECD.

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = First disk block number (of a range) that mismatched while being compared.

e = Last disk block number (of a range) that mismatched while being compared.

f = Partition number in use when a mismatch was encountered.

g = Offset within partition when mismatch was detected.

h = Number of mismatches that were detected.

i = Number of corrections that were made.

j = Number of Input/Output jobs done.

k = Number of errors detected doing I/O.

l = Disk block number that failed to read or write.

m = Size of the partition given in disk blocks.

hh = Hours.

mm = Minutes.

ss = Seconds.

`ETIME` = Elapsed time for a partition to compare. For the `FINAL SUMMARY` report, the `ETIME` is the total elapsed time of all the partitions.

`STIME` = The time the compare of the partition was started. For the `FINAL SUMMARY` report, `STIME` indicates the start time of the input message.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

Appropriate mismatch messages will be generated indicating the range of disk blocks where the mismatch occurred. A maximum of eight mismatch error messages will be output per partition. More than eight mismatch messages will result in an early termination.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

None. This automatically-generated report is for information only.

Manual alarm. This alarm is a manually-requested report.

Major alarm. May not be service affecting, but take immediate action as indicated in the report.

[13] `COPY DIFF SRC MHD` *a* `PARTITION BYPASSED`
`MHD` *a* `PARTITION` *f* `SIZE` *m*
`MHD` *aa* `PARTITION` *f* `SIZE` *m*
`PARTITION SIZES NOT EQUAL`
`STIME` *hh:mm:ss* `ETIME` *hh:mm:ss*

2. REASON FOR OUTPUT

To report the result of executing a `COPY:DIFF` input message. `STIME` is the time the message was started. `ETIME` is used to indicate the elapsed time for a particular partition. The `ETIME` for the `FINAL` message is the total elapsed time.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the source disk of the moving head disk (MHD) drive.

b = Process step or reason code:

`f03` — Cannot open equipment configuration database (ECD).
`f06` — Cannot get unit control block (UCB) of first unit by name.
`f09` — Cannot get UCB of second unit by name.
`f12` — Cannot get UCB of first unit's mate.
`f15` — Cannot get UCB of first unit's mate.
`f18` — Cannot reserve UCB of second unit.
`f21` — Cannot assign special device file name of second unit.
`f24` — Cannot open special device file of second unit.
`f27` — Cannot enable message reception.
`f30` — See accompanying DKDRV error report on the receive-only printer.
`f36` — Failed to close special device file of second unit.
`f39` — Failed to release special device file of second unit.
`f42` — Message to port failure.
`f45` — Message reception failure.
`f48` — Message to port failure.
`f51` — Message reception failure.
`f54` — Process timed out.
`f57` — Failed to close special device file of second unit.
`f60` — Failed to release special device file of second unit.
`f63` — Failed to unreserve UCB of second unit.
`f66` — Failed to close ECD.

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = First disk block number (of a range) that mismatched while being compared.

e = Last disk block number (of a range) that mismatched while being compared.

f = Partition number in use when a mismatch was encountered.

g = Offset within partition when mismatch was detected.

h = Number of mismatches that were detected.

i = Number of corrections that were made.

j = Number of Input/Output jobs done.

k = Number of errors detected doing I/O.

l = Disk block number that failed to read or write.

m = Size of the partition given in disk blocks.

hh = Hours.

mm = Minutes.

ss = Seconds.

`ETIME` = Elapsed time for a partition to compare. For the `FINAL SUMMARY` report, the `ETIME` is the total elapsed time of all the partitions.

`STIME` = The time the compare of the partition was started. For the `FINAL SUMMARY` report, `STIME` indicates the start time of the input message.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

Appropriate mismatch messages will be generated indicating the range of disk blocks where the mismatch occurred. A maximum of eight mismatch error messages will be output per partition. More than eight mismatch messages will result in an early termination.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

None. This automatically-generated report is for information only.

Manual alarm. This alarm is a manually-requested report.

Major alarm. May not be service affecting, but take immediate action as indicated in the report.

1. FORMAT

This message has two formats.

[1] `COPY FILESYS CFILE COMPLETED`

[2] `COPY FILESYS CFILE STOPPED`
a

2. REASON FOR OUTPUT

To report the result of executing a `COPY:FILESYS;CFILE` input message to move a file to a contiguous area.

3. VARIABLE FIELD DEFINITIONS

a = The description of the error encountered.

4. ACTION TO BE TAKEN

Format 1 indicates success, and no action is necessary.

If Format 2 is printed, the explanatory text will indicate the error encountered. Verify that the command that was input is consistent with the `COPY:FILESYS;CFILE` input message manual page. Use the `OP:STATUS;LISTDIR` input message to verify that the file exists with the appropriate permissions. If the message indicates that there is not enough space on the file system, use the `CLR:FILESYS;FILE` input message to remove some files to create the file space.

If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1]
```
COPY PTN ALL COMPLETED
a BLOCKS COPIED
.
.
.
```

[2]
```
COPY PTN ALL STOPPED
{INVALID SOURCE/DESTINATION SPECIFIED b |
PROCESS STOPPED b |
DISK ACCESS PROCEDURE ABORTED b |
CANNOT COPY PARTITION b |
DISK RESTORAL PROCEDURE ABORTED b}
```

2. REASON FOR OUTPUT

Format 1 indicates the input message completed and successfully invoked the process that copies partions. For each partition, the number of blocks copied is output.

Format 2 indicates the process that copies partitions did not complete successfully. The reason for stopping is indicated.

3. VARIABLE FIELD DEFINITIONS

a = Number of blocks copied (for each partition copied).

b = Numeric code for the error that caused the process to terminate. The least significant digit (represented as *x*) indicates the module of UNIX® RTR code in which the error occurred.

Errors associated with UNIX operating system calls:

- 1x — mkseg error.
- 2x — Open error.
- 3x — Read error.
- 4x — Stat error.
- 5x — Write error.
- 6x — Close error.
- 7x — unlink error.
- 8x — setio error.
- 9x — mknod error.
- 10x — msgenab error.

SEE PROPRIETARY NOTICE ON COVER PAGE

`12x` — msgport error.

Errors associated with execution:

`20x` — Invalid arguments.

The source or destination filename may not exist, or does not contain a valid list of partition names. The source/destination partition names specified may not be special devices, or they do not exist in the disk. Make sure that valid source/destination partition names are used.

`21x` — Destination is small.

Cannot copy to a partition that is smaller than the source partition. Make sure that the destination partition specified is not smaller than the source partition.

`22x` — Process stopped by an interrupt or termination signal.

`23x` — Cannot overwrite destination partition.

The destination specified may be an active partition or currently in use. For example, if the system is running on primary, `/dev/root` is an active partition. A partition with no backup is considered an active partition. Make sure that the destination partition specified is not an active partition.

`24x` — Disk is not duplexed.

Need both disks active before attempting to do a partition copy.

Errors associated with the system integrity monitor (SIM), the maintenance input request administrator (MIRA), and the disk driver:

`30x` — Message not what was expected.
`31x` — Tried to reserve two disks.
`32x` — Tried to release unreserved disk.
`33x` — New disk state bad.
`36x` — Timeout for MIRA message.
`37x` — Timeout for disk driver message.
`38x` — Bad MIRA return on message.
`39x` — Bad disk driver return on message.
`40x` — State result bad.
`41x` — Timeout for SIM message.

SEE PROPRIETARY NOTICE ON COVER PAGE

Errors associated with the equipment configuration database manager (ECDMAN) user functions:

50x — ugetucb error.
51x — ugmamirids error.
52x — ursvucb error.
53x — ugsdf error.
54x — urelucb error.
55x — ursdf error.
56x — usettnum error.
57x — usetucb error.
58x — ugetrec error.

4. ACTION TO BE TAKEN

For codes 20x-24x, correct the problem and reenter the input message. Seek technical assistance if any other error message is printed.

5. ALARMS

Manual alarm. This alarm is a manually-requested report.

None. This automatically-generated report is for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . COPY-PID
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `COPY PID` *a b c #d*

[2] `COPY PID` *e* `NOT STARTED`
`CONFLICT WITH CURRENT SYSTEM STATUS` *f*

[3] `COPY PID` *e* `NOT STARTED`
`INVALID ID FIELD` *g*

[4] `COPY PID` *e* `NOT STARTED`
`RETRY LATER` *h*

2. REASON FOR OUTPUT

To report the completion of a `COPY` input message.

3. VARIABLE FIELD DEFINITIONS

a = Process ID.

b = Source of the data copied.

`ADDR` *f*	— Virtual address.
`PID` *h*`, ADDR` *f*	— Process ID of process and virtual address.
`REG` *e*	— Register.
`UID` *g*`, ADDR` *f*	— Utility ID of process and virtual address.
`UVAR` *d*	— Utility variable.

c = Termination status of the operation:

`COMPLETED`	— Request successfully completed.
`NOT STARTED NGPID`	— The `COPY` was stopped because the process does not exist.
`NOT STARTED NGUID`	— The `COPY` was stopped because no copies of the process exist.

SEE PROPRIETARY NOTICE ON COVER PAGE

STOPPED NGADDR — The COPY was stopped because the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were specified.

STOPPED NGPROT — The COPY was stopped because the destination address does not have write permission granted.

STOPPED NGCOPY — The COPY was stopped because some other error occurred in moving the data.

d = Generic access package (GRASP) execution sequence number.

e = PID.

UID.

f = Bad PID.

g = Test phrase:

```
EXTRA KEYWORD (PID).

INCONSISTENT KEYWORDS (NL-OFF).

INPUT ERROR (OFF COUNT).

INVALID KEYWORD.

RANGE ERROR (L or NL).

RANGE ERROR (PID).

RANGE ERROR (UVAR).
```

h = The system is in an overload condition.

4. ACTION TO BE TAKEN

If *c* is NOT STARTED NGPID, the process did not exist at the time the COPY was attempted. Consider using the process UID instead of the PID.

If *c* is NOT STARTED NGUID, the process did not exist at the time the COPY was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

If *c* is STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the COPY command in the action list. This will help control the exact circumstances under which the operation is performed.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *c* is `STOPPED NGPROT`, recheck the destination to verify that it indicates a writable area. To change program text, use the `LOAD:UPNM` input message.

5. ALARMS

None. This alarm is a manually-requested report.

OMDB Key
Formats 1, 2, and 3 have an OMDB key of 188.

Input Message
```
COPY:SPDISK
```

ID . . . . . COPY-SPDISK-B
GENERIC . . . . . UNIX RTR R21.27 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `COPY SPDISK COPIED` *a* `BLOCKS`

[2] `COPY SPDISK COMPLETED`

[3] `COPY SPDISK STOPPED WITH ERROR CODE` *b*

2. REASON FOR OUTPUT

To report the result of executing a `COPY:SPDISK` input message, and to provide status information.

3. VARIABLE FIELD DEFINITIONS

a = Number of blocks written for each partition copied.

b = Numeric code for the error that caused the process to terminate. The least significant digit (represented as *x*) indicates the module in which the error occurred. *x* is not provided.

Errors associated with UNIX® system calls:

`01x` — mkseg error.
`02x` — Open error.
`03x` — Read error.
`04x` — Stat error.
`05x` — Write error.
`06x` — Close error.
`07x` — unlink error.
`08x` — setio error.
`09x` — mknod error.
`10x` — msgenab error.
`11x` — send error.
`12x` — msgport error.
`13x` — mount error.
`14x` — umount error.

SEE PROPRIETARY NOTICE ON COVER PAGE

Errors associated with input message format:

`20x` — Invalid arguments.

The source or destination filename may not exist, or does not contain a valid list of partition names. The source/destination partition names specified may not be special devices, or they do not exist in the disk. Make sure that valid source/destination partition names are used.

`21x` — Destination is small.

Cannot copy to a partition that is smaller than the source partition. Make sure that the destination partition specified is not smaller than the source partition.

`22x` — Process stopped by an interrupt or termination signal.

`24x` — Disk is not duplexed.

Need both disks active before attempting to do a cpspdisk.

Errors associated with the system integrity monitor (SIM), the maintenance input request administrator (MIRA), and the disk driver:

`30x` — Message not what was expected.
`31x` — Tried to reserve two disks.
`32x` — Tried to release unreserved disk.
`33x` — New disk state bad.
`36x` — Timeout for MIRA message.
`37x` — Timeout for disk driver message.
`38x` — Bad MIRA return on message.
`39x` — Bad disk driver return on message.
`40x` — State result bad.
`41x` — Timeout for SIM message.

Errors associated with equipment configuration data base manager (ECDMAN) user functions:

`50x` — ugetucb error.
`51x` — ugmamirids error.
`52x` — ursvucb error.
`53x` — ugsdf error.
`54x` — urelucb error.
`55x` — ursdf error.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, seek technical assistance.

5. ALARMS

Manual alarm. This alarm is a manually-requested report.

Input Message
```
COPY:SPDISK
```

ID . . . . . COPY-T,EMERDMP
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `COPY TAPE EMERDMP COMPLETED`
a `+` *a* `RECORDS IN`
a `+` *a* `RECORDS OUT`

[2] `COPY TAPE EMERDMP STOPPED`
{`DD:CANNOT OPEN /dev/mt` *b* |
`DD:CANNOT CREATE /dev/panic` |
`DD:NOT ENOUGH MEMORY` |
`DD READ ERROR`
`DD WRITE ERROR`}

2. REASON FOR OUTPUT

To report the result of executing a `COPY:TAPE;EMERDMP` input message to copy emergency dump data from a disk partition to a magnetic tape with a header block.

Format 1 is printed when the input message executed successfully. Format 2 is printed when errors were encountered.

3. VARIABLE FIELD DEFINITIONS

a = Record counts.

b = Tape drive specified in the input message.

4. ACTION TO BE TAKEN

Refer to the Input Message manual for the correct format and reenter the input message if `Cannot open /dev/mt...` is printed. Seek technical assistance if any other Format 2 message is printed.

5. ALARMS

Manual alarm. This alarm is a manually-requested report.

None. This automatically-generated report is for information only.

```

Practice 254-341-100 *File System Software Subsystem Description 3B20D Computer*

ID . . . . . COPY-T,IN
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `COPY TAPE IN {STARTED | IN PROGRESS SEGMENT` *a* `| COMPLETED SEGMENT` *a* `}`
b

[2] `COPY TAPE IN STOPPED CANNOT OPEN` *c* `FOR INPUT`

[3] `COPY TAPE IN STOPPED CANNOT CHANGE DIRECTORY TO BSDIR` *c*

[4] `COPY TAPE IN STOPPED`
d

2. REASON FOR OUTPUT

To report the result of executing a `COPY:TAPE;IN` input message to files from a magnetic tape.

Format 1 indicates successful execution.

Format 2 - 4 indicate failure.

3. VARIABLE FIELD DEFINITIONS

a = Output segment number.

b = List of files and / or the number of blocks read from the tape.

c = Pathname specified in the input message.

d = Explanation of the error encountered while reading the tape.

4. ACTION TO BE TAKEN

Format 1 indicates success. Take no action.

If formats 2 or 3 are printed, correct any input message line errors. The existence of a directory can be confirmed using the `OP:STATUS;LISTDIR` input message.

If format 4 is printed and the text is not self-explanatory, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

6. REFERENCES

OMDB Key
There is an OMDB key of 282.

Input Message
```
COPY:T;TEST
```

Practice 254-341-100 *File System Software Subsystem Description 3B20D Computer*

ID . . . . . COPY-T,TOP
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1]
```
COPY TAPE TOP COMPLETED
a + a records in
a + a records out
```

[2]
```
COPY TAPE TOP COMPLETED
a + a records in
a + a records out
a + a records in
a + a records out
```

[3]
```
COPY TAPE TOP STOPPED
{NO TOPFILE EXISTS  |
UNKNOWN HARDWARE PLATFORM |
dd: cannot open b |
dd: cannot create c|
dd: not enough memory |
dd read error |
dd write error}
```

2. REASON FOR OUTPUT

To report the result of executing a `COPY:TAPE;TOP` input message to copy a Tape-Only Program (TOP) file(s) from disk to tape.

Format 1 prints when the input message executes successfully, and the `COM` option is not used. This output prints when copying the standard main memory (SMM) or extended main memory (EMM) TOP file, the very large main memory (VLMM) TOP file, or the 3B21D TOP file, based upon the hardware-platform type.

Format 2 prints when the input message executes successfully, and the `COM` option is used. This output prints when copying both the VLMM TOP file and the 3B21D TOP file. The first set of record counts indicates the VLMM TOP file, and the second set of record counts indicates the 3B21D TOP file.

Format 3 prints when errors are encountered.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Record counts.

b = The pathname of a TOP file: `/etc/topfile`, `/etc/topfile32`, `/etc/topfile64`, or `/etc/topfile21`.

c = The pathname specified in the input command for the tape drive.

4. ACTION TO BE TAKEN

For Format 3, if `NO TOPFILE EXISTS` prints, be sure that the correct topfile is present in the `/etc` directory.

If `dd: cannot create /dev/mt...` prints, refer to the input message manual for the correct format and try the input message again.

Seek technical assistance for any other Format 3 message.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Keys
Formats 1, 2, and 3 have an OMDB key of 288.

Input Message
```
COPY:T;TOP
```

ID . . . . . COPY-UID
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `COPY UID` *a b c #d*

[2] `COPY UID` *e* `NOT STARTED`
`CONFLICT WITH CURRENT SYSTEM STATUS` *f*

[3] `COPY UID` *e* `NOT STARTED`
`INVALID ID FIELD` *g*

[4] `COPY UID` *e* `NOT STARTED`
`RETRY LATER` *h*

2. REASON FOR OUTPUT

To report the completion of a `COPY` input message.

3. VARIABLE FIELD DEFINITIONS

a = Utility ID.

b = Source of the data copied.

`ADDR` *f* — Virtual address.
`PID` *h*`, ADDR` *f* — Process ID of process and virtual address.
`REG` *e* — Register.
`UID` *g*`, ADDR` *f* — Utility ID of process and virtual address.
`UVAR` *d* — Utility variable.

c = Termination status of the operation:

`COMPLETED` — Request successfully completed.

`NOT STARTED NGPID` — The `COPY` was stopped because the process does not exist.

`NOT STARTED NGUID` — The `COPY` was stopped because no copies of the process exist.

SEE PROPRIETARY NOTICE ON COVER PAGE

`STOPPED NGADDR` — The `COPY` was stopped because the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were specified.

`STOPPED NGPROT` — The `COPY` was stopped because the destination address does not have write permission granted.

`STOPPED NGCOPY` — The `COPY` was stopped because some other error occurred in moving the data.

d = Generic access package (GRASP) execution sequence number.

e = PID.

UID.

f = Bad PID.

g = Test phrase:

```
EXTRA KEYWORD (PID).

INCONSISTENT KEYWORDS (NL-OFF).

INPUT ERROR (OFF COUNT).

INVALID KEYWORD.

RANGE ERROR (L or NL).

RANGE ERROR (PID).

RANGE ERROR (UVAR).
```

h = The system is in an overload condition.

4. ACTION TO BE TAKEN

If *c* is `NOT STARTED NGPID`, the process did not exist at the time the `COPY` was attempted. Consider using the process UID instead of the PID.

If *c* is `NOT STARTED NGUID`, the process did not exist at the time the `COPY` was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *c* is `STOPPED NGADDR`, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the `COPY` command in the action list. This will help control the exact circumstances under which the operation is performed.

If *c* is `STOPPED NGPROT`, recheck the destination to verify that it indicates a writable area. To change program text, use the `LOAD:UPNM` input message.

5. ALARMS

None. This alarm is a manually-requested report.

ID . . . . . DEL-LOG
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAIPR,UTIL

1. FORMAT

This message has six formats.

[1] `DEL LOG` *a* *b* `DELETED CORRUPT SEGMENT AT` *c*
d

[2] `DEL LOG` *a* `CANNOT OPEN LOGFILE`

[3] `DEL LOG FILE` *a* `DELETION COMPLETE` *e* `DELETED`

[4] `DEL LOG CANNOT OPEN WORKFILE`

[5] `DEL LOG` *a* `CANNOT OPEN TEMPORARY FILE`

[6] `DEL LOG` *a* `PORT CONNECTION FAILURE`

2. REASON FOR OUTPUT

Formats 1, 2, 4, 5, and 6 are to report that an error occurred when executing the `DEL:LOG` input message.

3. VARIABLE FIELD DEFINITIONS

a = Name of logfile.

b = Pathname of the file in which corruption was discovered.

c = Position in file where corruption was discovered, expressed in characters.

d = Text containing the corrupted information which has been deleted.

e = Number of messages deleted.

4. ACTION TO BE TAKEN

If Format 1 is printed, the contents of the corrupt log file must be SAVED on paper for later reference.

If Format 2 is printed, check to see if the log file exists under the pathname specified in the device record.

If Format 5 is printed, check the `/tmp` file system to see if all the space is used up.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Keys
Formats 1, 2, 5, and 6 have an OMDB key of 277.
Format 3 has an OMDB key of 14.
Format 4 has an OMDB key of 13.

Input Messages
`DEL:LOG`
`OP:LOG`

ID . . . . . DGN-AUDIT
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1]
```
DGN AUDIT a
R = b
DRIVER DATA
D = m
PHASE DATA
T = i A = j S = k I = l
```

[2]
```
DGN AUDIT a
R = b
SYSTEM DATA
D = n
PHASE DATA
T = i A = j S = k I = l
```

[3]
```
DGN AUDIT a
R = b
LEXEC DATA
D = o errno = p
PHASE DATA
T = i A = j S = k I = l
```

2. REASON FOR OUTPUT

Each of the formats has a separate purpose.

Format 1 is used to report a peripheral driver error encountered by the peripheral diagnostic programs.

Format 2 is used to report an error encountered by the peripheral diagnostic programs.

Format 3 is used to report a LEXEC function failure encountered by the peripheral diagnostic programs.

3. VARIABLE FIELD DEFINITIONS

a = Diagnostic reporting the error; disk file controller (DFC), and input/output processor (IOP).

SEE PROPRIETARY NOTICE ON COVER PAGE

b = Reason for audit, in hexadecimal notation.

- 41 — Open special device file failed. For SMD MHDs with UCB device_id field = 0 (first MHD on DFC, usually MHD 0 or 1): MHD type read from DFC backplane may not agree with MHD UCB equipage field or may not be read correctly by DFC TN65 or UN64 board.
- 42 — SETIO failed.
- 43 — Makeseg failed.
- 44 — Sendpw failed.
- 45 — Read PC pump file failed.
- 46 — Driver operation failed.
- 47 — Open PC pump file failed.
- 48 — Msgenab failure.
- 49 — Msgdisab failure.
- 4A — Open processor control process maintenance driver (PCPMD) failed.
- 4B — Write to PCPMD failed.
- 4C — Excofl timed out.
- 4D — Open ECD manager failed.
- 4E — Function "ugucbn" failed.
- 4F — Peripheral interface controller (PIC) microstore size not in UCB.
- 50 — Receive wait failed.
- 51 — LEXEC function failed.
- 52 — E_host of UCB not initialized.
- 53 — Lseek function failure.
- 54 — Drive size not 5 or 19 tracks.
- 55 — Makeseg failed for disk read / write buffer.
- 56 — Write / read segment too small.
- 57 — Function ugetucb failed.
- 58 — DFC not active.
- 59 — IOP not active.
- 5A — SCSI bus not active.
- 61 — SCSI bus not active.
- 64 — Cannot open data table file or micro program.
- 65 — Cannot share DCB from DIAMON.
- 66 — Error in the data table.
- 67 — Invalid number of parameters from DIAMON.
- 68 — Open spooler failed.
- 6A — Invalid interactive mode command.
- 6C — Open tlpfile failed.
- 6D — Signal: illegal instruction.
- 6E — Signal: bus error.
- 6F — Signal: segment violation.
- 70 — Signal: software termination.
- 71 — Function ugnxtucb failed.
- 72 — Illegal device type for DFC.
- 73 — Function ucbrsrv failed.
- 74 — Function ugsdf failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

i = Last test executed, in decimal notation.

j = Data table address, in hexadecimal notation.

k = Data table statement number, in decimal notation.

l = Task routine index, in hexadecimal notation.

m = Peripheral driver error code, in hexadecimal notation. DFC error codes are in Output DFC Appendix A, DFC-APPA.
IOP error codes are in Output IOP Appendix F, IOP-APPF.

n = Error code returned on a failing system call or ECD function call: in decimal notation. See Output System Error Codes Appendix, SYSERR-APP.

o = Error code returned by LEXEC function call, in decimal notation. See Output System Error Codes Appendix, SYSERR-APP.

p = Error code from a PCPMD (the CU maintenance driver) function call, in decimal notation. See Output System Error Codes Appendix, SYSERR-APP.

4. ACTION TO BE TAKEN

Seek technical assistance.

5. ALARMS

None.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `DGN CU` *a* [*b*] [`COMPLETED`] *d* [(*e*)]
{`MESSAGE`|`MSG`} {`IN PROGRESS`|`COMPLETE`}

[2] `DGN CU` *a* [*b*] `PH` *c d* [(*e*)]
{`MESSAGE IN PROGRESS`|`MSG IP`}

[3] `DGN CU` *a* [*b*] `PH` *c* `STF` (*e*) `MSG IP`
`TEST` `MISMATCH` `ACTUAL` `MASK` `EXPECTED`
f *g* *h* *i* *j*

[4] `DGN CU` *a* [*b*] `ABORTED AT PH` *c* `STMNT` *k d* [(*e*)] `MSG IP`

[5] `DGN CU` *a* [*b*] `TERMINATED AT PH` *c* `STMNT` *k* `AFTER TEST` *l*

[6] `DGN CU` *a* [*b*] `TASK` *m*
{`MESSAGE STARTED`|`QUEUED`|`ABORTED`}

2. REASON FOR OUTPUT

To report the result of executing a `DGN:CU` input message to diagnose the control unit, or one of its subunits.

Format 1 specifies the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request cannot be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Member number (0 or 1).

b = Unit type and member number of the subunit under the CU; for example, CC 0, MASC 0, MASC 1, SAT 0, etc.

c = Phase number.

d = The result of the diagnostic.

- ATP — All tests passed.
- CATP — All tests were ATP; some were not executed due to the unavailability of a system resource needed to perform the test.
- NTR — No tests were run.
- STF — Some tests failed.

e = If *d* = CATP or NTR, *e* identifies the reasons tests were skipped by their bit position in a 16-digit hexadecimal number. For example, if *e* = (00000000 00000018), tests were skipped for reasons 3 and 4.

If *d* = STF, *e* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *e* = (7 00000000 00000018), seven tests failed, plus tests were skipped for reasons 3 and 4. The reasons are as follows:

- Bit 0 — Unused.
- Bit 1 — Unit under test is forced on-line.
- Bit 2 — Sanity timers are disabled.
- Bit 3 — Emergency action interface (EAI) forces on CU, disk, sanity timer are active.
- Bit 4 — Peripheral unit controller is out of service.
- Bit 5 — Helper unit not specified or invalid.
- Bit 6 — Helper unit unavailable.
- Bit 7 — Unit under test is forced off-line.
- Bit 8 — EAI initialization parameter buffer data pending; EAI must be cleared.
- Bit 9 — Helper unit not connected to sub-unit under test.
- Bits 10 — 63 - Unused.

f = Test number of the failing test.

g = The bits that were in error. An *1* in a bit position indicates the response from the unit did not match the expected response in that bit.

h = The bits that were actually received from the hardware device.

i = Determines which bits in *h* are included in this test.

j = The value which the test expected.

NOTE: For Format 3, the values for *h*, *i*, and *j* may be set to N/A. This means that this data is not available for the specified device.

SEE PROPRIETARY NOTICE ON COVER PAGE

k = Last statement successfully executed before the diagnostic terminated.

l = Current test number when diagnostic terminated.

m = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *d* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *d* = STF, the unit should be repaired as quickly as possible. See the *Corrective Maintenance Procedures* manual for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

LOGIC	*x*	

2. REASON FOR OUTPUT

To provide failure information when memory failures are detected by the main store controller (MASC) diagnostic. The output contains detailed data on the first memory fault detected and histogram style summary data on all the faults in the sample, which is typically the first 100 faults detected. This information can be used to determine the faulty circuit pack and the faulty device on that circuit pack.

3. VARIABLE FIELD DEFINITIONS

a = Control unit (0 or 1).

b = Main store controller (0 or 1).

c = Phase number, in decimal notation.

d = Type of failing memory array.

e = Equipment location (EQL) of the failing memory array, in decimal notation.
EQL equals distance from floor - distance from frame left.

f = Address of the first memory location to fail as a result of a mismatch between the expected memory contents and the actual memory contents or memory location under test when a mystore error became active (see address trapped indicator in *n*, in hexadecimal notation.

g = Data bit mismatch (bits 0-31) first failing memory location, in hexadecimal notation.

h = Actual data in memory, in hexadecimal notation.

i = Expected data (data that was written), in hexadecimal notation.

j = Parity bit mismatches in bits 31-24, and 2 error indicators in bits 23-22.

Bit 31 - H0.
Bit 30 - H1.
Bit 29 - H2.
Bit 28 - H3.
Bit 27 - PX.
Bit 26 - PY.
Bit 25 - PZ.
Bit 24 - PA.

SEE PROPRIETARY NOTICE ON COVER PAGE

Bit 23 - Multi-bit error is set when an error either

1) causes an address trap (TRAPPED ADDRESS REG bit 27 set) and an error C or D (bits 28 or 29 set) but the correctable parity failure (bit 0) is not set and the noncorrectable parity failure (bit 1) is set, or
2) causes an address trap (bit 27 set) and error C or D active (bits 28 or 29 set) and the correctable parity failure (bit 0) is set, but more than one data and parity bits are mismatching.

Bit 22 - Logic error is set when an error either

1) does not cause an address trap (TRAPPED ADDRESS REG bit 27 not set) but there are data or parity mismatches, or
2) causes an address trap (bit 27 set) but error C or D not active (bits 28 or 29 set), or
3) causes an address trap (bit 27 set) and error C or D active (bit 28 or 29 not set) and correctable (single) bit error indicated (bit 0 set) but group failure bits (MAS ERROR REG 2 bits 6-0) contain a code not recognized as a single bit error.

k = Actual parity in memory, bits 31-24, same format as *j*.

l = Parity expected for the data written to memory in bits 31-24, same format as *j*.

m = Main store error register 2 after a read of the first failing memory location, in hexadecimal notation.

Bit 28 - HA parity group failure - (not available on UN39 type MASC).
Bit 23 - Trapped address bit 25 (UN618 type MASC). See main store trapped address error register.
Bit 21 - Trapped address parity byte 0 (UN59C and UN618 type MASC). See main store trapped address error register.
Bit 6 - PX parity group failure.
Bit 5 - PY parity group failure.
Bit 4 - PZ parity group failure.
Bit 3 - H0 parity group failure.
Bit 2 - H1 parity group failure.
Bit 1 - H2 parity group failure.
Bit 0 - H3 parity group failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

n = Main store trapped address error register after a read of the first failing memory location, in hexadecimal notation. Trapped address parity for byte 0 (UN59C and UN618 type MASC) and trapped address bit 25 (UN618 type MASC) appear in main store error register 2.

Bit 31 - Trapped address bit 24 (UN59C type and UN618 type MASC).
Bit 30 - Trapped address bit 23 (not available on UN39 type MASC).
Bit 29 - Error C
Bit 28 - Error D
Bit 27 - Address trapped indicator.
Bit 23 - Read-write (1) or refresh (0) data parity error.
Bit 1 - Noncorrectable parity failure.
Bit 0 - Correctable (single-bit) parity failure.

o = Main store error register after a read of the first failing memory location in hexadecimal notation.

Bit 22 - Block store go error A.
Bit 11 - No row select on refresh error A.
Bit 10 - Row or column selects on maint op error A.
Bit 9 - Double half plane select row error A.
Bit 8 - Double half plane select column error A.
Bit 7 - Select row and column error A.
Bit 6 - Array address parity error A.
Bit 5 - Command bit parity error A.
Bit 4 - Busy clear F/F state error A.
Bit 3 - Latched normal address parity error A.
Bit 2 - Refresh address counter mismatch error A.
Bit 1 - Write data parity error A.
Bit 0 - Address loop - around F/F error A.

p = Number of failing locations for which histogram information was collected, in decimal notation. The upper limit is usually 100.

q = Number of addresses listed in *r*, in decimal notation.

r = List of the first *q* failing addresses, in hexadecimal notation.

s = Number of times the specified data bit (0-31) or parity bit (H0, H1, H2, H3, PX, PY, PZ, PA) was read as 0 when it was expected to be 1, in decimal notation.

t = Number of times the specified data or parity bit was read as 1 when it was expected to be 0, in decimal notation.

u = Number of times the address bit was 0 when a memory failure was detected, in decimal notation.

SEE PROPRIETARY NOTICE ON COVER PAGE

v = Number of times the address bit was 1 when a memory failure was detected, in decimal notation.

w = Number of times a multi-bit error occurred, in decimal notation. See explanation of item *j*, bit 23.

x = Number of times a logic error occurred, in decimal notion. See explanation of item *j*, bit 22.

y = Central control error register (CC ER) after a read of the first failing memory location or after a store error is detected, in hexadecimal notation.

Usually the under test CU CC ER with byte parities in bits 31-28 from the failing address. For MASC phases 39, 41, and 96, the ACTIVE CU CC ER with byte parities in bits 31-28 from a read of the under test CU MASC at the failing address.

4. ACTION TO BE TAKEN

Replace the memory array identified by the failing array information in the first fault data.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

1. FORMAT

This message has six formats.

[1] `DGN DCI` *a* `[COMPLETED]` *b* `[(`*c*`)]`
`{MESSAGE|MSG} {IN PROGRESS|COMPLETE}`

[2] `DGN DCI` *a* `PH` *d b* `[(`*c*`)] {MESSAGE IN PROGRESS|MSG IP}`

[3] `DGN DCI` *a* `PH` *d* `STF (`*c*`)  MSG IP`
`TEST  MISMATCH  ACTUAL  MASK  EXPECTED`
e f g h i

[4] `DGN DCI` *a* `ABORTED AT PH` *d* `STMNT` *j b* `[(`*c*`)]  MSG IP`

[5] `DGN DCI` *a* `TERMINATED AT PH` *d* `STMNT` *j* `AFTER TEST` *k*

[6] `DGN DCI` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the dual serial channel/computer interconnect (DCI).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
NTR — No tests were run.
STF — Some tests failed.

c = If *b* = CATP or NTR, *c* identifies the reasons tests were skipped by their position in a 16-digit hexadecimal number. For example, if *c* = (00000000 00000018), tests were skipped for reasons 3 and 4.

If *b* = STF, *c* identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if *d* = (00000000 00000006), tests were skipped for reasons 1 and 2. The reason codes are as follows:

Bits 0 - 63 — Unused.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in *g* are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *b* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *b* = STF, the unit should be repaired as quickly as possible. Refer to *Corrective Maintenance Procedures* for repair procedures.

SEE PROPRIETARY NOTICE ON COVER PAGE

[6] `DGN DFC` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the disk file controller (DFC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

- ATP — All tests passed.
- CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
- NTR — No tests were executed.
- STF — Some tests failed.

c = If *b* = CATP or NTR, *c* identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if *c* = (00000000 00000006), tests were skipped for reasons 3 and 4.

If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reasons are as follows:

- Bit 0 — Helper unit invalid or not specified.
- Bit 1 — Helper unit cannot be reserved.
- Bit 2 — Helper unit is not out-of-service.
- Bit 3 — Helper control unit (CU) is not ATP.
- Bit 4 — Helper unit not connected to controller being diagnosed.
- Bits 5 — 63 - Unused.

NOTE: To interpret CATP bits 32-46, the structure of the system must be understood. All device references are relative to the DFC under test, and may not correspond to "real" unit numbers. The down pointer of the DFC will point to the first SBUS. The side pointer of the first SBUS points to the second SBUS. Similarly, the down pointer of an SBUS points to the first MHD beneath it. The side pointer of an MHD points to the next MHD in the chain. These concepts are displayed graphically on display pages 120 and 122. The leftmost SBUS under a DFC is considered first SBUS, with the rightmost SBUS being second. MHD relative numbering for each SBUS is top-down, with the top MHD being first and the bottom being last. Currently only four MHDs per SBUS are supported.

SEE PROPRIETARY NOTICE ON COVER PAGE

Bit	Reason
32	First MHD on first SBUS of DFC did not respond correctly.
33	Second MHD on first SBUS of DFC did not respond correctly.
34	Third MHD on first SBUS of DFC did not respond correctly.
35	Fourth MHD on first SBUS of DFC did not respond correctly.
36	Reserved for fifth MHD on first SBUS of DFC.
37	Reserved for sixth MHD on first SBUS of DFC.
38	Reserved for seventh MHD on first SBUS of DFC.
40	First MHD on second SBUS of DFC did not respond correctly.
41	Second MHD on second SBUS of DFC did not respond correctly.
42	Third MHD on second SBUS of DFC did not respond correctly.
43	Fourth MHD on second SBUS of DFC did not respond correctly.
44	Reserved for fifth MHD on second SBUS of DFC.
45	Reserved for sixth MHD on second SBUS of DFC.
46	Reserved for seventh MHD on second SBUS of DFC.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in *g* are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

[5] `DGN DFC` *a* `TERMINATED AT PH` *d* `STMNT` *j* `AFTER TEST` *k*

[6] `DGN DFC` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

[7] `DGN DFC` *a* `- FLASH MEMORY UPDATE PROCESS IN PROGRESS`
`DO NOT STOP THIS DIAGNOSTIC DURING FLASH MEMORY UPDATE`
`THIS PROCESS SHOULD RUN NO LONGER THAN 15 MINUTES`
`AND MAY RUN ONLY A FEW SECONDS IF NO UPDATE IS REQUIRED`

[8] `DGN DFC` *a* `- FLASH MEMORY UPDATE PROCESS COMPLETE`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the disk file controller (DFC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

Format 7 indicates that the Flash update process has started, warning the user against stopping the diagnostic until the Flash update process has completed.

Format 8 indicates that the Flash update process has completed.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

- `ATP` — All tests passed.
- `CATP` — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
- `NTR` — No tests were executed.
- `STF` — Some tests failed.

c = If *b* = `CATP` or `NTR`, *c* identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if *c* = (00000000 00000006), tests were skipped for reasons 3 and 4.

If *b* = `STF`, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reasons are as follows:

- `Bit 0` — Helper unit invalid or not specified.
- `Bit 1` — Helper unit cannot be reserved.
- `Bit 2` — Helper unit is not out-of-service.
- `Bit 3` — Helper control unit (CU) is not ATP.
- `Bit 4` — Helper unit not connected to controller being diagnosed.
- Bits 5 — 63 - Unused.

NOTE: To interpret `CATP` bits 32-46, the structure of the system must be understood. All device references are relative to the DFC under test, and may not correspond to "real" unit numbers. The down pointer of the DFC will point to the first SBUS. The side pointer of the first SBUS points to the second SBUS. Similarly, the down pointer of an SBUS points to the first MHD beneath it. The side pointer of an MHD points to the next MHD in the chain. These concepts are displayed graphically on display pages 120 and 122. The leftmost SBUS under a DFC is considered first SBUS, with the rightmost SBUS being second. MHD relative numbering for each SBUS is top-down, with the top MHD being first and the bottom being last. Currently only four MHDs per SBUS are supported.

SEE PROPRIETARY NOTICE ON COVER PAGE

Bit	Reason
32	First MHD on first SBUS of DFC did not respond correctly.
33	Second MHD on first SBUS of DFC did not respond correctly.
34	Third MHD on first SBUS of DFC did not respond correctly.
35	Fourth MHD on first SBUS of DFC did not respond correctly.
36	Reserved for fifth MHD on first SBUS of DFC.
37	Reserved for sixth MHD on first SBUS of DFC.
38	Reserved for seventh MHD on first SBUS of DFC.
40	First MHD on second SBUS of DFC did not respond correctly.
41	Second MHD on second SBUS of DFC did not respond correctly.
42	Third MHD on second SBUS of DFC did not respond correctly.
43	Fourth MHD on second SBUS of DFC did not respond correctly.
44	Reserved for fifth MHD on second SBUS of DFC.
45	Reserved for sixth MHD on second SBUS of DFC.
46	Reserved for seventh MHD on second SBUS of DFC.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in *g* are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If *b* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *b* = STF, the unit should be repaired as quickly as possible. Refer to the *Corrective Maintenance Procedures* manual for repair procedures.

NTR — No tests were run.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in *g* are of interest to this test.

i = The value that the test expected.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *b* = STF, the unit should be repaired as quickly as possible. Refer to TOP 235-105-220 for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . DGN-HSDC
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `DGN HSDC` *a* `[COMPLETED]` *b* `[(`*c*`)]`
`{MESSAGE|MSG} {IN PROGRESS|COMPLETE}`

[2] `DGN HSDC` *a* `PH` *d b* `[(`*c*`)] {MESSAGE IN PROGRESS|MSG IP}`

[3] `DGN HSDC` *a* `PH` *d* `STF (`*c*`) MSG IP`
`TEST MISMATCH ACTUAL MASK EXPECTED`
e f g h i

[4] `DGN HSDC` *a* `ABORTED AT PH` *d* `STMNT` *j b* `[(`*c*`)] MSG IP`

[5] `DGN HSDC` *a* `TERMINATED AT PH` *d* `STMNT` *j* `AFTER TEST` *k*

[6] `DGN HSDC` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the high speed data link controller (HSDC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
NTR — No tests were run.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *d* = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in *g* are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *b* = STF, the unit should be repaired as quickly as possible. Refer to *Corrective Maintenance Procedures* for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

SEE PROPRIETARY NOTICE ON COVER PAGE

[6] `DGN IOP` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the input/output processor (IOP).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

- ATP — All tests passed.
- CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
- NTR — No tests were run.
- STF — Some tests failed.

c = If *b* = CATP or NTR, *c* identifies the reasons tests were skipped by their position in a 16-digit hexadecimal number. For example, if *c* = (00000000 00000018), tests were skipped for reasons 3 and 4.

If *b* = STF, *c* identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if *d* = (00000000 00000006), tests were skipped for reasons 1 and 2. The reason codes are as follows:

- Bit 0 — Helper unit not specified or invalid.
- Bit 1 — Helper unit cannot be reserved.
- Bit 2 — Helper unit not out-of-service.
- Bit 3 — Helper control unit (CU) is not ATP.
- Bit 4 — Helper unit not connected to controller being diagnosed.
- Bits 5 — 63 - Unused.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in *g* are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *b* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *b* = STF, the unit should be repaired as quickly as possible. Refer to *Corrective Maintenance Procedures* for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . DGN-MHD
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has seven formats.

[1] `DGN MHD` *a* `[COMPLETED]` *b* `[(`*c*`)]`
`{MESSAGE|MSG} {IN PROGRESS|COMPLETE}`

[2] `DGN MHD` *a* `PH` *d b* `[(`*c*`)]`
`{MESSAGE IN PROGRESS|MSG IP}`

[3] `DGN MHD` *a* `PH` *d* `STF (`*c*`) MSG IP`
`TEST MISMATCH ACTUAL MASK EXPECTED`
e f g h i

[4] `DGN MHD` *a* `ABORTED AT PH` *d* `STMNT` *j b* `[(`*c*`)] MSG IP`

[5] `DGN MHD` *a* `TERMINATED AT PH` *d* `STMNT` *j* `AFTER TEST` *k*

[6] `DGN MHD` *a* `PH 6 DISK READ/WRITE FAILURES`
`ERROR CODE JOB TYPE SECTOR HEAD`
l m n o

[7] `DGN MHD` *a* `TASK` *p* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the moving head disk (MHD).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6, a histogram-type printout of disk read/write test failures, is printed if MHD phase 6 fails the read/write tests.

Format 7 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
NTR — No tests were executed.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in the actual value are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Error code, in hexadecimal notation:

02 — disk read data all zeros
04 — disk read data mismatch
08 — disk read parity mismatch

For other error codes, see DFC Appendix B.

SEE PROPRIETARY NOTICE ON COVER PAGE

m = Numeric code for the job in progress at the time of the error:

- 1 — maintenance sector write worst case data
- 2 — maintenance sector read worst case data
- 3 — maintenance sector write inverted worst case data
- 4 — maintenance sector read inverted worst case data
- 5 — maintenance sector ECC test write
- 6 — maintenance sector ECC test read
- 41 — head selection error for maintenance sector write worst case data
- 42 — head selection error for maintenance sector read worst case data
- 43 — head selection error for maintenance sector write inverted worst case data
- 44 — head selection error for maintenance sector read inverted worst data case
- 45 — head selection error for maintenance sector ECC test write
- 46 — head selection error for maintenance sector ECC test read
- 81 — seek error for maintenance sector write worst case data
- 82 — seek error for maintenance sector read worst case data
- 83 — seek error for maintenance sector write inverted worst case data
- 84 — seek error for maintenance sector read inverted worst case data
- 85 — seek error for maintenance sector ECC test write
- 86 — seek error for maintenance sector ECC test read

n = Sector number where the error occurred.

o = Head number where the error occurred.

p = Task number assigned to the request.

4. ACTION TO BE TAKEN

For Formats 1 and 5, take no action.

For Formats 2, 3, and 4, if *b* = STF, the unit should be repaired as quickly as possible. See the *Lucent Technologies 3B20D Model 2 and Model 3 Computers - Common Systems, Routine Tasks* manual for repair procedures.

For Format 6, repair the unit as quickly as possible. Refer to the *Lucent Technologies 3B20D Model 2 Computer - Common Systems, Trouble Clearing* manual for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

[6] `DGN MT` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the magnetic tape (MT).

Format 1 prints at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was stopped due to an external or internal error in execution, or an input message.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
NTR — No tests were executed.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the number of tests skipped. For example, if *c* = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were received from the hardware device.

h = Determines what bits in the actual value are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3, the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

For Formats 1 and 5, no action is needed.

For Formats 2, 3, and 4, if *b* = STF, the unit should be repaired as quickly as possible; seek technical assistance.

For Format 6, repair the unit as quickly as possible; seek technical assistance.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the magnetic tape controller (MTC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
NTR — No tests were run.
STF — Some tests failed.

c = If *b* = CATP or NTR, *c* identifies the reasons tests were skipped by their position in a 16-digit hexadecimal number. For example, if *c* = (00000000 00000018), tests were skipped for reasons 3 and 4.

If *b* = STF, *c* identifies the reasons tests failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 0000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reason codes are as follows:

Bit 0 — Helper unit not specified or invalid.
Bit 1 — Helper unit cannot be reserved.
Bit 2 — Helper unit not out-of-service.
Bit 3 — Helper unit is not ATP.
Bit 4 — Helper unit not connected to controller being tested.
Bit 17 — Helper MT tape not mounted and/or transport door open.
Bit 18 — Helper MT transport not in "on-line" mode.
Bit 19 — Helper MT tape reel has no write enable ring (WER).
Bit 20 — Helper MT tape too long for diagnostic test tape.
Bit 21 — Helper MT tape has no header block at BOT or header block indicates not diagnostic test tape.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in the actual value are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *b* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *b* = STF, the unit should be repaired as quickly as possible. Refer to TOP 235-105-220 for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

1. FORMAT

This message has six formats.

[1] `DGN MTTYC` *a* `[COMPLETED]` *b* `[(`*c*`)]`
`{MESSAGE|MSG} {IN PROGRESS|COMPLETE}`

[2] `DGN MTTYC` *a* `PH` *d b* `[(`*c*`)] {MESSAGE IN PROGRESS|MSG IP}`

[3] `DGN MTTYC` *a* `PH` *d* `STF (`*c*`)  MSG IP`
`TEST  MISMATCH  ACTUAL  MASK  EXPECTED`
e f g h i

[4] `DGN MTTYC` *a* `ABORTED AT PH` *d* `STMNT` *j b* `[(`*c*`)]  MSG IP`

[5] `DGN MTTYC` *a* `TERMINATED AT PH` *d* `STMNT` *j* `AFTER TEST` *k*

[6] `DGN MTTYC` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the maintenance teletypewriter controller (MTTYC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
NTR — No tests were run.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in the actual value are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2, 3, and 4, if *b* = STF, the unit should be repaired as quickly as possible. Refer to Practice 235-105-220 for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

SEE PROPRIETARY NOTICE ON COVER PAGE

`DO NOT STOP THIS DIAGNOSTIC DURING FLASH MEMORY UPDATE`
`THIS PROCESS SHOULD RUN NO LONGER THAN 15 MINUTES`
`AND MAY RUN ONLY A FEW SECONDS IF NO UPDATE IS REQUIRED`

[8] `DGN MTTYC` *a* `- FLASH MEMORY UPDATE PROCESS COMPLETE`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the maintenance teletypewriter controller (MTTYC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

Format 7 indicates that the Flash update process has started, warning the user against stopping the diagnostic until the Flash update process has completed.

Format 8 indicates that the Flash update process has completed.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
NTR — No tests were run.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in the actual value are of interest to this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

1. FORMAT

This message has two formats.

[1] `DUMP ADDR` *a* `[OFF` *b*`] COMPLETED` *#e*
`ADDRESS (HEX): CONTENTS OF MEMORY (HEX):`
c *d*

[2] `DUMP ADDR` *a* `[OFF` *b*`] STOPPED NGADDR` *#e*

2. REASON FOR OUTPUT

To report the result of executing the `DUMP:ADDR` input message to dump out the contents of an address or address range in main memory.

Format 2 indicates an error was encountered in the indirection addressing chain.

3. VARIABLE FIELD DEFINITIONS

a = Virtual address specified in input message.

b = Offset(s) used on input message line.

c = Address label for line of data.

d = Data as dumped from memory.

e = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 2 is printed, recheck the program listings. If an indirection chain was specified, try breaking the chain into several parts and printing the intermediate addresses.

5. ALARMS

None. This alarm is a manually-requested report.

2. REASON FOR OUTPUT

To display logical volume information for the multi-volume digital audio tape (DAT) loaded in the user-specified tape drive. The logical volume information consists of the backup session number, logical volume number, logical volume name, size, source disk, and date written. The logical volume information will be displayed as a result of executing

either the DUMP:BKTAPE command or the DUMP BKTAPE command poke on the DFC Status Page. If the command was invoked via a command poke, a REPT-DKDIP message will precede the output message.

3. VARIABLE FIELD DEFINITIONS

a = Pathname of the tape special device file.

b = Request status.

ABORTED — The dump failed and aborted .
COMPLETED — The dump completed with no errors.
IN PROGRESS — The dump is processing logical volume headers.
STARTED — The dump started processing logical volume headers.
STOPPED — The dump failed and stopped.

c = Error code output by the DUMP BKTAPE command poke on the DFC Status Page.

f01 — Failed to get ECD information for tape device.
f05 — Special device file is not for a DAT.
f09 — Tape device is not active.
f0d — Failed to allocate data buffer.
f11 — Invalid buffer address.
f15 — entry() call failed.
f19 — Failed to rewind tape.
f1d — Failed to open no-rewind tape device.
f21 — Failed to get tape header information.
f25 — Failed to close no-rewind tape device.
f29 — Failed to rewind tape.
f2d — Failed to get ECD logdev record for tape special device file.
f31 — Failed to get mdct record for tape special device file.
f35 — Invalid partition value for tape special device file.
f39 — Failed to get ucb record for tape device.
f3d — Failed to get tape device driver PID.
f41 — Failed to open rewind tape device.
f45 — Failed to close rewind tape device.
f49 — send_rcv() call failed.
f4d — Failed to open tape device.
f51 — send_rcv() call failed.
f55 — Failed to close tape device.
f59 — send_rcv() call failed.
f5d — Tape header read failed.
f61 — Invalid multi-volume tape.
f65 — Tape header read failed.
f69 — Tape header contains invalid session number.
f6d — Tape header contains invalid volume number.
f71 — Invalid multi-volume tape.
f75 — Sessions are not sequential.
f79 — Volumes are not in ascending order.
f7d — ioqueuem() call failed.
f81 — tio_ack() call failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

f85 — Tape I/O message timed out.

d = System error code number (see the System Error Codes Output Appendix, SYSERR).

e = Internal error code for failure of an equipment configuration database (ECD) access function.

1 — `getdbseg()` failed, could not attach to the ECD.
2 — `lla_iatt()` failed, could not attach to the incore database.
3 — `lla_rdget()` failed, could not get the `ecdorg` record from the ECD.
4 — `lla_get()` failed, could not get the `logdev` record from the ECD.
5 — `lla_rdget()` failed, could not get the `mdct` record from the ECD.
6 — `lla_rdget()` failed, could not get the `ucb` record from the ECD.
10 — `rmovdbseg()` failed, could not remove incore database segments.

f = Error code returned by a failed tape library function (see the Tape Library Error Appendix, TAPE-LIB).

g = Session number (1-9).

h = Logical volume number (0-9).

i = Logical volume name (`TOP`, `AMTEXT`, `AMODD`, `SMTEXT`, `SMODD1`, `SMODD2`, `SMODD3`,`SMODD4`, `SMODD5`, or `SMODD6`).

j = Size, in 512 byte blocks, of the logical volume. NAV (not available) is output if the logical volume is a TOP volume.

k = Name of the source disk(s). NAV (not available) is output if the logical volume is a TOP volume.

l = Date (mm/dd/yy) on which the logical volume was written. NAV (not available) is output if the logical volume is a TOP volume.

m = Total size, in 512 byte blocks, of the data on the DAT. The total size does not include the TOP volume.

n = Length, in meters, of the DAT.

o = Estimated percentage of the DAT that is being used.

4. ACTION TO BE TAKEN

Errors will be accompanied by explanatory text or an error code. Verify that the command that was input is consistent with the `DUMP:BKTAPE` input message manual page. If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report for information only.

6. REFERENCES

OMDB Key(s):

Input Message(s)
DUMP:BKTAPE

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . DUMP-CACHE
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `DUMP CACHE` *a b*

[2] `DUMP CACHE NOT STARTED`
`CONFLICT WITH CURRENT SYSTEM STATUS` *c*

2. REASON FOR OUTPUT

To report the status of a request to dump the contents of cache in the off-line processor.

3. VARIABLE FIELD DEFINITIONS

a = Request status:

`COMPLETED` — The off-line cache was dumped successfully.

`STOPPED` — The cache dump could not be completed because of an error.

b = Reason the cache dump was stopped.

1 — Process maintenance driver (PCPMD) could not open physical memory (`/dev/pmem`).

2 — PCPMD could not set the position of the input stream after opening physical memory.

3 — PCPMD reached an end-of-file (EOF) when it tried to search for information located in physical memory.

4 — PCPMD encountered an error in reading the contents of physical memory.

5 — PCPMD could not set the contents of a register in the off-line processor.

6 — PCPMD failed when it tried to copy data to the memory of the off-line processor.

7 — PCMPD could not execute a program in the off-line processor.

8 — The `DUMP:CACHE` message could not reserve the unit control block (UCB) of the off-line processor.

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Could not access or reserve the UCB record of the mate CU, or the mate CU was not out-of-service.

4. ACTION TO BE TAKEN

If *b* = 1 - 4, the indication is that a software error occurred. Collect all relevant receive-only printer (ROP) data and seek technical assistance.

If *b* = 5 - 7, the problem is most likely with the maintenance channel or the off-line processor. Diagnose the off-line processor.

If *b* = 8, make sure that another process does not have control of the off-line processor (that is, diagnostics or a CU restore) since these reserve the off-line processor's UCB. If it appears that a diagnostic or CU restore was in progress, wait for its completion and try again. If the message still fails in the same manner, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `DUMP FILE ALL {STARTED | IN PROGRESS | COMPLETED}`
a

[2] `DUMP FILE ALL STOPPED`
b

2. REASON FOR OUTPUT

To report the result of executing a `DUMP:F;ALL` input command to dump the contents of an ASCII file.

Format 1 indicates successful execution of the command.

Format 2 indicates failure.

NOTE: `STARTED`, `IN PROGRESS`, and `COMPLETED` messages appear when three or more output segments are printed.

`STARTED` and `COMPLETED` messages appear when two output segments are printed.

A `COMPLETED` message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Contents of the file.

b = Text explaining why the command was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates success. No action is required.

If Format 2 is printed, refer to the input message manual for the correct command format, and correct any command line errors. If the explanatory text indicates that the file cannot be accessed, verify the file's existence using the `OP:STATUS;LISTDIR` command. If the text is not self-explanatory, seek technical assistance.

5. ALARMS

None. This alarm is either a manually-requested report, or an automatically-generated report for information only.

1. FORMAT

This message has two formats.

[1] `DUMP FILE FORMAT {STARTED | IN PROGRESS | COMPLETED}`
a

[2] `DUMP FILE FORMAT STOPPED`
b

2. REASON FOR OUTPUT

To report the execution of a `DUMP:FILE;FORMAT` input message to dump the contents of a file.

Format 1 indicates successful execution of the command.

Format 2 indicates failure.

NOTE: `STARTED`, `IN PROGRESS`, and `COMPLETED` messages appear when three or more output segments are printed.

`STARTED` and `COMPLETED` messages appear when two output segments are printed.

A `COMPLETED` message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Contents of the file in ASCII, decimal, octal, or hexadecimal notation. Default = octal notation. If the dump is in ASCII notation, the following special symbols are used to express nongraphic characters:

\ 0 = null
\ b = backspace
\ f = form-feed
\ n = new-line
\ r = return
\ t = tab

Other nongraphic characters appear as three-digit octal numbers.

b = Pathname specified in the input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Format 1 indicates success; no action needed.

For Format 2, refer to the input message manual for the correct command format, and correct any command line errors. If the explanatory text indicates that the file cannot be accessed, verify the file's existence using the `OP:STATUS;LISTDIR` input message. If the text is not self-explanatory, seek technical assistance.

5. ALARMS

MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `DUMP FILE PARTL {STARTED |IN PROGRESS |COMPLETED}`
a

[2] `DUMP FILE PARTL STOPPED`
b

2. REASON FOR OUTPUT

To print one or more lines of an ASCII file as the result of executing a `DUMP:FILE;PARTL` input message.

NOTE: `STARTED`, `IN PROGRESS` and `COMPLETED` messages appear when three or more output segments are printed.

`STARTED` and `COMPLETED` messages appear when two output segments are printed.

A `COMPLETED` message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Content of specified line(s).

b = Text explaining why the command was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates that the command executed successfully.

Format 2 can be printed due to several errors which the system may encounter. If the explanatory text indicates that the file cannot be accessed, use the `OP:STATUS;LISTDIR` input message to verify the existence of the file. If the explanatory test indicates that there is insufficient disk space to execute the command, use the `OP:STATUS;FREEDISK` input message to verify that there is free space in the file system under which the file being edited resides.

Seek technical assistance if the message is not self-explanatory.

SEE PROPRIETARY NOTICE ON COVER PAGE

MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `DUMP KERN` *a* `[OFF` *b*`] #`*e*
`ADDRESS (HEX): CONTENTS OF MEMORY (HEX):`
c *d*

[2] `DUMP KERN` *a* `[OFF` *b*`] STOPPED NGADDR #`*e*

2. REASON FOR OUTPUT

To report the result of executing a `DUMP:KERN` input message to dump out the contents of an address or address range in the kernel.

Format 2 indicates the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were used.

3. VARIABLE FIELD DEFINITIONS

a = Virtual address specified in input message.

b = Offset(s) used on input command line.

c = Address label for line of data.

d = Data as dumped from memory.

e = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 2 is printed, recheck the program listings. If an indirection chain was specified, try breaking the chain into several parts and printing the intermediate addresses.

5. ALARMS

None. This alarm is a manually-requested report.

Format 1 has OMDB keys of 494 and 514.

Input Message
`DUMP:KERN`

SEE PROPRIETARY NOTICE ON COVER PAGE

Practice 254-341-115 *Generic Access Package (GRASP) Software Subsystem Description 3B20D Processor*

ID . . . . . DUMP-MHD,BLK-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL

1. FORMAT

This message has six formats.

[1] `DUMP MHD` *a* `BLOCK {STARTED | IN PROGRESS}`
`[DATA FOR DISK BLOCK` *d*
e`]`

[2] `DUMP MHD` *a* `BLOCK COMPLETED`

[3] `DUMP MHD` *a* `BLOCK NOT STARTED` *b c*

[4] `DUMP MHD` *a* `BLOCK STOPPED` *b c*

[5] `DUMP MHD` *a* `BLOCK ERROR` *b c*

[6] `DUMP MHD` *a* `BLOCK ABORTED` *b*

2. REASON FOR OUTPUT

To report the status of a request to display the contents of a disk block.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the moving head disk (MHD).

b = Process step or reason code. One of the following:

`f03` — cannot open ECD
`f06` — cannot get UCB by name
`f12` — cannot reserve UCB
`f15` — cannot assign special device file name
`f18` — cannot open special device file name
`f21` — cannot set input/output mode of device file
`f24` — failed to open output file
`f25` — `fseek()` failed on output file
`f27` — `lseek()` to start block failed
`f30` — disk read failed
`f33` — process timed out
`f36` — failed to close special device file
`f39` — failed to release special device file
`f42` — failed to unreserve UCB
`f45` — failed to close ECD
`f48` — terminated externally with signal

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Identifies the disk block which is being dumped.

e = Data contained in the specified disk block. Printed in row major order, hexadecimal notation.

4. ACTION TO BE TAKEN

Noncompletion termination reports which provide an error code usually indicate that a system resource was not available or became unavailable to perform the task. Clear the problem causing the resource limitation and retry the input request.

In some instances, other UNIX® RTR error messages may be printed which may provide information pertaining to the failure encountered.

5. ALARMS

None. This alarm is a manually-requested report.

[5] `DUMP MHD` *a* `BLOCK ERROR` *b c*

[6] `DUMP MHD` *a* `BLOCK ABORTED` *b*

[7] `DUMP MHD` *a* `BLOCK ABORTED` *b*
`ERROR DATA` *f g h i j*

2. REASON FOR OUTPUT

To report the status of a request to display the contents of a disk block.

Format 7 provides additional error information when an explicit SCSI command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

a = Moving head disk (MHD) member number.

b = Process step or reason code.

`f03` — failed to open ECD
`f06` — failed to get UCB by name
`f08` — failed to get UCB of controlling unit
`f0a` — controlling unit is not active
`f12` — failed to reserve UCB
`f15` — failed to assign special device file name
`f18` — failed to open special device file
`f20` — failed to set I/O mode of device file
`f21` — failed to enable message reception
`f22` — starting disk block exceeds disk boundary
`f23` — ending disk block exceeds disk boundary

SEE PROPRIETARY NOTICE ON COVER PAGE

f24 — failed to fopen() output file
f25 — fseek() failed on output file
f27 — lseek() to start block failed
f30 — disk read failed
f33 — process timed out
f36 — failed to close special device file
f39 — failed to release special device file
f42 — failed to unreserve UCB
f45 — failed to close ECD
f48 — terminated externally with signal
f50 — diskinfo() library call failed
f53 — lseek() to "comb" defect table failed
f56 — read of "comb" defect table failed
f60 — failed to get the segment number
f63 — see DKDRV report on the ROP
f69 — SCSI "read capacity" command failed
f70 — message to port failure
f73 — message reception failure

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = Identifies the disk block that is being dumped.

e = Data contained in the specified disk block. Printed in row major order, hexadecimal notation.

f = Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.

AAAA = SCSI job block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, DFC-APPK.

BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, DFC-APPK.

CC = Fill. Not used.

g = First word of extended sense data (ESD). See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 0 of ESD.

BB = Byte 1 of ESD.

CC = Byte 2 of ESD.

DD = Byte 3 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Second word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 4 of ESD.

BB = Byte 5 of ESD.

CC = Byte 6 of ESD.

DD = Byte 7 of ESD.

i = Third word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 8 of ESD.

BB = Byte 9 of ESD.

CC = Byte 10 of ESD.

DD = Byte 11 of ESD.

j = Fourth word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 12 of ESD.

BB = Byte 13 of ESD.

CC = Byte 14 of ESD.

DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports which provide an error code usually indicate that a system resource was not available or became unavailable to perform the task. Clear the problem causing the resource limitation and retry the input request.

In some instances, other UNIX® RTR error messages may be printed which may provide information pertaining to the failure encountered.

If Format 7 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

None. This alarm is a manually-requested report.

SEE PROPRIETARY NOTICE ON COVER PAGE

`[ CORRUPTED (NO FLAG WORD)]`
`[` *n* `TEMPORARY DEFECTS ]`
`[ CYL HEAD CYL HEAD CYL HEAD CYL HEAD`
h i [*h i*] [*h i*] [*h i*]]

2. REASON FOR OUTPUT

To report the execution of a `DUMP:MHD;DEFECT` input message. The output data represents defect management information pertaining to the specified moving head disk.

NOTE: `CORRUPTED (NO FLAG WORD)` output message is not due to corruption of data on the disk; rather, this message is used to indicate that an internal flag used in validating the integrity of the temporary defect table is invalid. No action needs to be taken.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Termination status: `COMPLETED`, `NOT STARTED`, `STOPPED`, `ERROR`, or `ABORTED`.

c = Process step or reason code:

- `f03` — failed to open `/tmp` file
- `f04` — failed to open `specfile`
- `f05` — `fseek` failed on the output file
- `f06` — cannot open equipment configuration database (ECD)
- `f09` — cannot get unit control block (UCB) by name
- `f12` — cannot reserve UCB
- `f15` — cannot assign special device filename
- `f18` — cannot open special device file
- `f21` — cannot set I/O mode of device file
- `f24` — cannot enable message reception
- `f27` — see accompanying DKDRV error report on the receive-only printer (ROP)
- `f30` — disk file controller (DFC) is not in S_ACT state
- `f33` — drive size not supported by defect management
- `f36` — MHD size not recognized
- `f39` — `lseek` to mfgr disk address failed
- `f42` — disk read failed
- `f45` — `lseek` to comb disk address failed
- `f48` — first read of combined defect table failed
- `f51` — `lseek` to comb disk address failed
- `f54` — second read of combined defect table failed
- `f57` — msg to port failure
- `f60` — msg reception failure
- `f63` — process timed out
- `f66` — failed to close special device file
- `f69` — failed to release special device file
- `f72` — failed to unreserve UCB
- `f75` — failed to close ECD

d = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

e = Number of defects on disk pack as specified by manufacturer's defect table.

f = Total number of defects in combined defect table.

g = Maximum number of defects allowed.

h = Cylinder number of defect.

i = Head number of defect.

j = Type of defect:

- `M` — Manufacturer specified.
- `N` — New; found by DFC.

SEE PROPRIETARY NOTICE ON COVER PAGE

k = If *j* is new, number of tests failed.

l = If *j* is new, number of tests run.

m = Sector number of defect.

n = Number of newly-found but not yet tested defects.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is a manually-requested report.

[WARNING: NUMBER OF GROWN DEFECTS EXCEEDS THE LUCENT RECOMMENDATION]
[WARNING: TOTAL NUMBER OF DEFECTS EXCEEDS THE LUCENT RECOMMENDATION]
[WARNING: NUMBER OF DEFECTS ON A CYLINDER EXCEEDS THE LUCENT RECOMMENDATION]

2. REASON FOR OUTPUT

To report the result of executing a DUMP:MHD;DEFECT input message, from either the DUMP:MHD;DEFECT command or from the DUMP:DEFECT poke on the DFSA display page. If the command was invoked via the poke, a REPT-DKDIP message will precede the output message line.

The output data represents defect management information pertaining to the specified moving head disk (MHD). For a small computer system interface (SCSI) MHD, the GROWN defect list is output as the COMBINED defect table. Similarly, the PRIMARY defect list is output as the MANUFACTURER'S defect table. SCSI MHDs do not have the TEMPORARY defect table.

NOTE: The CORRUPTED (NO FLAG WORD) output message is not due to corruption of data on the disk; rather, this message is used to indicate that an internal flag used in validating the integrity of the temporary defect table is invalid. No action needs to be taken.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Termination status: STARTED, IN PROGRESS, NOT STARTED, STOPPED, ERROR, or ABORTED.

c = Process step or reason code.

- f03 — failed to fopen() /tmp file
- f05 — fseek() failed on the output file
- f08 — failed to fopen() specfile
- f0b — failed to open ECD
- f0d — failed to get UCB by name
- f10 — failed to reserve UCB
- f21 — failed to assign special device file name
- f23 — failed to open device file
- f25 — failed to set I/O mode of device file
- f28 — failed to enable message reception
- f2b — see DKDRV report on the ROP
- f2f — DFC is not in S_ACT state
- f33 — drive size not supported by defect management
- f36 — MHD size not recognized
- f39 — lseek() to "mfgr" disk address failed
- f40 — DKDIP virtual address translation failure

SEE PROPRIETARY NOTICE ON COVER PAGE

`f42` — read of "mfgr" defect table failed
`f45` — `lseek()` to "combined" disk address failed
`f46` — DKDIP virtual address translation failure
`f48` — first read of "combined" defect table failed
`f50` — DKDIP virtual address translation failure
`f51` — `lseek()` to "combined" disk address failed
`f54` — second read of "combined" defect table failed
`f57` — see DKDRV report on the ROP
`f5a` — read of the SCSI defect header failed
`f5c` — see DKDRV report on the ROP
`f5e` — read of the SCSI defect list failed
`f61` — failed to get the segment number
`f63` — message to port failure
`f65` — message reception failure
`f68` — process timed out
`f6a` — failed to close special device file
`f6c` — failed to release special device file
`f72` — failed to unreserve UCB
`f75` — failed to close ECD
`f78` — terminated externally with signal
`f82` — see DKDRV report on the ROP
`f84` — read of the SCSI defect header failed
`f86` — see DKDRV report on the ROP
`f88` — read of the SCSI defect list failed
`f92` — message to port failure
`f94` — message reception failure
`f96` — failed to get the segment number
`f98` — see DKDRV report on the ROP
`f99` — SCSI "inquiry" command failed
`f9b` — drive not formatted with 512 bytes per logical block
`f9c` — data overflow - too many block descriptors
`f9e` — data overflow - too many block descriptors
`fa2` — failed to get the segment number
`fa4` — see DKDRV report on the ROP
`fa6` — SCSI "read capacity" command failed
`fb2` — failed to get the segment number
`fb4` — see DKDRV report on the ROP
`fb6` — SCSI "mode sense" command failed
`fc2` — failed to get the segment number
`fc4` — see DKDRV report on the ROP
`fc6` — SCSI "mode sense" command failed
`fc9` — `diskinfo()` library call failed
`fcb` — unknown defect limit type
`fce` — unexpected UCB equipage value

d = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

e = Number of defects on disk drive up to the recommended limit.

For a SCSI disk drive, the total number of defects in a table could exceed the recommended limit. However, no more than the recommended limit of defects will be displayed.

f = Total number of defects in "combined" defect table.

g = Maximum number of defects allowed. This variable field only applies to SMD disk drives.

h = Cylinder number of defect.

i = Head number of defect.

j = Type of defect:

`M` — Manufacturer specified.
`N` — New; found by DFC.

k = If *j* is new, number of tests failed.

l = If *j* is new, number of tests run.

m = Sector number of defect.

n = Number of newly-found but not yet tested defects.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the input request again.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following.

The number of `GROWN` defects should be no more than a recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (`PRIMARY` and `GROWN` defects) should not exceed the Lucent Technologies specification for the disk drive. If the disk has more than the number of defects allowed, the disk drive could become unreliable.

The total number of defects (`PRIMARY` and `GROWN` defects) on a cylinder should not exceed the recommended limit. If the number of defects on a cylinder is larger than the limit, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the system.

SEE PROPRIETARY NOTICE ON COVER PAGE

Lucent Technologies recommends that the SCSI disk drive should be replaced if there is any warning output related to the above recommendations.

5. ALARMS

None. This alarm is a manually-requested report.

[4] `DUMP MHD` *a* `DEFECT TABLE ABORTED` *c*
`ERROR DATA` *o p q r s*

[5] `DUMP MHD` *a* `DEFECT TABLE COMPLETED`
`SCSI DEFECT COUNT CHECK ABORTED` *c*
`ERROR DATA` *o p q r s*

2. REASON FOR OUTPUT

To report the results of executing a `DUMP:MHD;DEFECT` input message, from either the `DUMP:MHD;DEFECT` command or from the `DUMP:DEFECT` poke on the DFSA display page. If the command was invoked via the poke, a `REPT-DKDIP` message will precede the output message.

The output data represents defect management information pertaining to the specified moving head disk (MHD). For a small computer system interface (SCSI) MHD, the `GROWN` defect list is output as the `COMBINED` defect table. Similarly, the `PRIMARY` defect list is output as the `MANUFACTURER'S` defect table.

Formats 4 and 5 provide additional error information when an explicit SCSI command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and input the request again.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following.

The number of GROWN defects on a disk drive should not exceed the recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) on a disk drive should not exceed the recommended limit. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the recommended limit. If the recommended limit is exceeded, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the system.

Lucent Technologies recommends that the SCSI disk drive should be replaced if there is any warning output related to the above recommendations.

If Formats 4 and 5 print, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

None. This alarm is a manually-requested report.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and input the request again.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following.

The number of GROWN defects on a disk drive should not exceed the recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) on a disk drive should not exceed the recommended limit. If the recommended limit is exceeded, the disk drive could become unreliable.

SEE PROPRIETARY NOTICE ON COVER PAGE

The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the recommended limit. If the recommended limit is exceeded, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the system.

Lucent Technologies recommends that the SCSI disk drive should be replaced if there is any warning output related to the above recommendations.

If Formats 4 and 5 print, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

None. This alarm is a manually-requested report.

TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL

1. FORMAT

This messages has eight formats.

[1] `DUMP MHD` *a* `VTOC STARTED`

[2] `DUMP MHD` *a* `VTOC IN PROGRESS`

[3] `DUMP MHD` *a* `VTOC COMPLETED`

[4] `DUMP MHD` *a* `VTOC NOT STARTED` *b c*

[5] `DUMP MHD` *a* `VTOC STOPPED` *b c*

[6] `DUMP MHD` *a* `VTOC ERROR` *b c*

[7] `DUMP MHD` *a* `VTOC ABORTED` *b*

[8] `DUMP MHD` *a* `VTOC SEGMENT` *d* `OF` *e*
`[PTN START END SIZE DESCRIPTION`
f g h i j [+*k*]]

2. REASON FOR OUTPUT

To report the result of executing a `DUMP:MHD` input message with the volume table of contents (VTOC) option. The output data represents the information that is in the `VTOC` of the specified moving head disk (MHD).

3. VARIABLE FIELD DEFINITIONS

a = MHD member number.

b = Process step or reason code. One of the following:

`f03` — cannot open ECD
`f06` — cannot get UCB by name
`f09` — cannot reserve UCB
`f12` — cannot assign special device file name
`f15` — cannot open special device file
`f18` — cannot set I/O mode of the device
`f24` — disk read failed
`f27` — process timed out
`f28` — too many partitions in the disk VTOC
`f29` — no VTOC partition found in disk VTOC
`f30` — failed to close special device file
`f33` — failed to release special device file

SEE PROPRIETARY NOTICE ON COVER PAGE

`f36` — failed to unreserve UCB
`f39` — failed to close ECD
`f42` — terminated externally with signal

c = System error code number. See System Error Code Output Appendix, `SYSERR-APP`.

d = Segment number (32 partitions per segment).

e = Total number of segments.

f = Disk logical partition number.

g = Starting disk block number of the indicated partition.

h = Ending (inclusive) disk block number of the indicated partition.

i = Size, in 512-byte blocks, of the indicated partition.

j = Describes the partition. Unresolved values are printed in hexadecimal and indicate whether the partition is a UNIX® RTR-defined value or an application-defined value.

k = Indicates the modifier(s) applied to the specific partition definition.

4. ACTION TO BE TAKEN

Noncompletion termination reports which provide an error code usually indicate that a system resource was not available or became unavailable to perform the task. Clear the resource limitation problem and input the request again.

In some instances, other UNIX® RTR error messages may be printed which may provide information about the failure.

5. ALARMS

None. This alarm is a manually-requested report.

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

d = Segment number (32 partitions per segment).

e = Total number of segments.

f = Disk logical partition number.

g = Starting disk block number of the indicated partition.

h = Ending (inclusive) disk block number of the indicated partition, or `NA` (not applicable) for the diagnostic partition.

i = Size, in 512-byte blocks, of the indicated partition, or `NA` for the diagnostic partition.

j = Describes the partition. Unresolved values are printed in hexadecimal and indicate whether the partition is a UNIX® RTR-defined value or an application-defined value.

k = Indicates the modifier(s) applied to the specific partition definition.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate that a system resource was not available or became unavailable to perform the task. Clear the resource limitation problem and input the request again.

In some instances, other UNIX® RTR error messages may be printed that may provide information about the failure.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Keys
Formats 1 through 7 have an OMDB key of 248.
Format 8 has an OMDB key of 249.

Output Appendix
SYSERR-APP

Input Message
DUMP:MHD;VTO

Practice 254-341-115 *Generic Access Package (GRASP) Software Subsystem Description 3B20D Processor*

ID . . . . . DUMP-PID
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `DUMP PID` *a* `ADDR` *b* `[OFF` *c*`] COMPLETED` *#g*
`ADDRESS (HEX): CONTENTS OF MEMORY (HEX):`
d *e*

[2] `DUMP PID` *a* `ADDR` *b* `[OFF` *c*`]` *f #g*

2. REASON FOR OUTPUT

To report the result of executing the `DUMP:PID` input message to dump out the contents of an address or address range in main memory.

3. VARIABLE FIELD DEFINITIONS

a = Process ID of the target process.

b = Virtual address specified in input message.

c = Offset(s) used on input command line.

d = Address label for line of data.

e = Data as dumped from memory.

f = Termination status:

`NOT STARTED NGPID` — The `DUMP` was stopped because the specified process does not exist.

`STOPPED NGADDR` — The `DUMP` was stopped because the address specified is not valid for the process; or invalid address values were encountered in the address chain, if offsets were specified.

g = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If *f* is `NOT STARTED NGPID`, the process did not exist at the time the `DUMP` was attempted. If this happens repeatedly with the process IDs used because the process has a short lifetime, consider using the process utility identification (UID) instead of process identification (PID).

SEE PROPRIETARY NOTICE ON COVER PAGE

If *f* is `STOPPED NGADDR`, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the `DUMP` message in the action list.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

`ADDRESS (HEX): CONTENTS OF MEMORY (HEX):`
b *c*

[2] `DUMP PMEM` *a* `STOPPED NGADDR` *#d*

2. REASON FOR OUTPUT

To report the result of executing the `DUMP:PMEM` input message to dump out the contents of a physical address or address range in main memory.

Format 2 indicates the specified address is not valid.

3. VARIABLE FIELD DEFINITIONS

a = Physical address specified in input message.

b = Address label for line of data.

c = Data as dumped from memory.

d = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 2 is printed, verify that the desired address is correct.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Keys
Format 1 has OMDB keys of 494 and 514.

1. FORMAT

This message has three formats.

[1] `DUMP REG` *a* `COMPLETED` *#g*
`REGISTER: CONTENTS:`
b *c*

[2] `DUMP REG` *a* `OFF` *d* `COMPLETED` *#g*
`ADDRESS (HEX): CONTENTS OF MEMORY (HEX):`
e *f*

[3] `DUMP REG` *a* `OFF` *d* `STOPPED NGADDR` *#g*

2. REASON FOR OUTPUT

To report the result of executing a `DUMP:REG` input message to dump the contents of a register or area of main memory.

Format 3 indicates an error was encountered in the indirection addressing chain.

3. VARIABLE FIELD DEFINITIONS

a = Name of register to be dumped.

b = Name of register for line of data.

c = Data dumped from register.

d = Offset(s) used in input command line.

e = Address label for line of data.

f = Data dumped from memory.

g = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 3 is printed, recheck the program listings. Try printing the register contents and break the indirection chain into several parts, printing the intermediate results.

5. ALARMS

None. This alarm is a manually-requested report.

SEE PROPRIETARY NOTICE ON COVER PAGE

6. REFERENCES

OMDB Key
Format 1 has an OMDB key of 510.

`DUMP:REG`

Practice 254-341-115 *Generic Access Package (GRASP) Software Subsystem Description 3B20D Processor*

ID . . . . . DUMP-UID
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `DUMP UID` *a* `ADDR` *b* `[OFF` *c*`] COMPLETED #`*g*
`ADDRESS (HEX): CONTENTS OF MEMORY (HEX):`
d *e*

[2] `DUMP UID` *a* `ADDR` *b* `[OFF`*c*`]` *f* *#g*

2. REASON FOR OUTPUT

To report the result of executing the `DUMP:UID` input message to dump out the contents of an address or address range in main memory.

3. VARIABLE FIELD DEFINITIONS

a = Utility ID of the target process.

b = Virtual address specified in input message.

c = Offset(s) used on input command line.

d = Address label for line of data.

e = Data as dumped from memory.

f = Termination status:

`NOT STARTED NGUID` — The `DUMP` was stopped because no copies of the specified process exist.

`STOPPED NGADDR` — The `DUMP` was stopped because the address specified is not valid for the process, or invalid address values were encountered in address chain, if offsets were specified.

g = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If *f* is `NOT STARTED NGUID`, the process did not exist at the time the `DUMP` was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *f* is `STOPPED NGADDR`, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the `DUMP:UID` message in the action list.

5. ALARMS

None. This alarm is a manually-requested report.

[3] `EX CU` *a* [*b*] `PH` *c* `STF` (*e*) `MSG IP`
`TEST MISMATCH ACTUAL MASK EXPECTED`
f g h i j

[4] `EX CU` *a* [*b*] `ABORTED AT PH` *c* `STMNT` *k d* [(*e*)] `MSG IP`

[5] `EX CU` *a* [*b*] `TERMINATED AT PH` *c* `STMNT` *k* `AFTER TEST` *l*

[6] `EX CU` *a* [*b*] `TASK` *m*
{`MESSAGE STARTED`|`QUEUED`|`ABORTED`}

2. REASON FOR OUTPUT

To report the result of executing an `EX:CU` input message to diagnose the control unit (CU) or one of its subunits in the interactive mode.

Format 1 specifies the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Member number (0 or 1).

b = Unit type and member number of the subunit under the CU which has been diagnosed; for example, CC 0, MASC 0, MASC 1, SAT 0, etc.

c = Phase number.

d = The result of the diagnostic.

- ATP — All tests pass.
- CATP — All tests run were ATP; some were not executed due to the unavailability of a system resource needed to perform the test.
- NTR — No tests were run.
- STF — Some tests fail.

e = If *d* = CATP or NTR, *e* identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if *e* = (00000000 00000018), tests were skipped for reasons 3 and 4.

If *d* = STF, *e* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *e* = (7 00000000 00000018), seven tests failed, plus tests were skipped for reasons 3 and 4. The reasons are as follows:

- Bit 0 — Unused.
- Bit 1 — Unit under test is forced on-line.
- Bit 2 — Sanity timers are disabled.
- Bit 3 — Emergency action interface (EAI) forces on CU, disk, sanity timer are active.
- Bit 4 — Peripheral unit controller is out of service.
- Bit 5 — Helper unit not specified or invalid.
- Bit 6 — Helper unit unavailable.
- Bit 7 — Unit under test is forced off-line.
- Bit 8 — EAI initialization parameter buffer data pending; EAI must be cleared.
- Bit 9 — Helper unit not connected to sub-unit under test.
- Bits 10 — 63 - Unused.

f = Test number of the failing test.

g = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

h = The bits which were actually received from the hardware device.

i = Determines which bits in *h* are included in this test.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = The value which the test expected.

NOTE: For Format 3 the values for *h, i* and *j* may be set to N/A. This means that this data is not available for the specified device.

k = Last statement successfully executed before the diagnostic terminated.

l = Current test number when diagnostic terminated.

m = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *d* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *d* = STF, the unit should be repaired as quickly as possible. See the *Corrective Maintenance* manual for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

[5] `EX DCI` *a* `TERMINATED AT PH` *d* `STMNT` *j* `AFTER TEST` *k*

[6] `EX DCI` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print the results of a diagnostic run on the dual serial channel/computer interconnect (DCI) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
NTR — No tests were executed.
STF — Some tests failed.

c = If *b* = CATP or NTR, *c* identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if *c* = (00000000 00000018), tests were skipped for reasons 3 and 4.

If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reasons are as follows:

Bits 0 - 63 — Unused.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines which bits in *g* are included in this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h* and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *b* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *b* = STF, the unit should be repaired as quickly as possible. See Practice 235-105-220 for the repair procedures.

[6] `EX DFC` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the disk file controller (DFC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

- ATP All tests passed.
- CATP All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
- NTR No tests were executed.
- STF Some tests failed.

c = If *b* = CATP or NTR, *c* identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if *c* = (00000000 00000018), tests were skipped for reasons 3 and 4.

If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reason codes are as follows:

- Bit 0 — Helper unit not specified or invalid.
- Bit 1 — Helper unit cannot be reserved.
- Bit 2 — Helper unit is not out-of-service.
- Bit 3 — Helper unit is not ATP.
- Bit 4 — Helper unit not connected to controller being diagnosed.

NOTE: To interpret CATP bits 32-46, the structure of the system must be understood. All device references are relative to the DFC under test, and may not correspond to "real" unit numbers. The down pointer of the DFC will point to the first SBUS. The side pointer of the first SBUS points to the second SBUS. Similarly, the down pointer of an SBUS points to the first MHD beneath it. The side pointer of an MHD points to the next MHD in the chain. These concepts are displayed graphically on display pages 120 and 122. The leftmost SBUS under a DFC is considered first SBUS, with the rightmost SBUS being second. MHD relative numbering for each SBUS is top-down, with the top MHD being first and the bottom being last. Currently only four MHDs per SBUS are supported.

SEE PROPRIETARY NOTICE ON COVER PAGE

Additional CATP bits for the SCSI-DFC:

Bit	Reason
32	First MHD on first SBUS of DFC did not respond correctly.
33	Second MHD on first SBUS of DFC did not respond correctly.
34	Third MHD on first SBUS of DFC did not respond correctly.
35	Fourth MHD on first SBUS of DFC did not respond correctly.
36	Reserved for fifth MHD on first SBUS of DFC.
37	Reserved for sixth MHD on first SBUS of DFC.
38	Reserved for seventh MHD on first SBUS of DFC.
40	First MHD on second SBUS of DFC did not respond correctly.
41	Second MHD on second SBUS of DFC did not respond correctly.
42	Third MHD on second SBUS of DFC did not respond correctly.
43	Fourth MHD on second SBUS of DFC did not respond correctly.
44	Reserved for fifth MHD on second SBUS of DFC.
45	Reserved for sixth MHD on second SBUS of DFC.
46	Reserved for seventh MHD on second SBUS of DFC.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits that were received from the device.

h = The mask that determines which bits in *g* are of interest to this test.

i = The value that the test expected.

NOTE: For Format 3 the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2, 3, and 4, if *b* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *b* = STF, the unit should be repaired as quickly as possible. See the *Corrective Maintenance* manual for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the input/output processor (IOP) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
NTR — No tests were executed.
STF — Some tests failed.

c = If *b* = CATP or NTR, *c* identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if *c* = (00000000 00000018), tests were skipped for reasons 3 and 4.

If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reasons are as follows:

Bit 0 — Helper unit not specified or invalid.
Bit 1 — Helper unit cannot be reserved.
Bit 2 — Helper unit not out-of-service.
Bit 3 — Helper unit is not ATP.
Bit 4 — Helper unit not connected to controller being diagnosed.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines which bits in *g* are included in this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h* and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If *b* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *b* = STF, the unit should be repaired as quickly as possible. See Practice 235-105-220 for the repair procedures.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21,15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1]
```
EX LDPARM MASC MEM TEST INPUT VALUES
  START ADDRESS = a
  [ERROR: b]
  END ADDRESS = c
  [ERROR: b]
  REFRESH RATE = d MS
  [ERROR: b]
  NUMBER OF FAILURES = e
  [DATA PATTERN = f]
  [ERROR: b]
```

[2]
```
EX LDPARM MASC UPD TEST INPUT VALUES
  START ADDRESS = a
  [ERROR: b]
  END ADDRESS = c
  [ERROR: b]
  REFRESH RATE = d MS
  [ERROR: b]
  NUMBER OF FAILURES = e
  WORDS PER ARRAY TO COPY = g
  [ERROR: b]
  REFRESH DATA PARITY CHECK TIME = h SEC
```

2. REASON FOR OUTPUT

To echo the memory test parameters input manually as part of the control unit (CU) interactive diagnostic mode using the EX:CU input message in conjunction with EX:LDPARM input message. This output comes from main store diagnostic phases 95 or 96.

Format 1 is printed when mainstore controller (MASC) phase 95 is executed. Format 2 is printed when MASC phase 96 is executed.

3. VARIABLE FIELD DEFINITIONS

a = First or lowest address in the address range of memory to be tested, in hexadecimal notation.

b = Error message explaining why previous line was not accepted. One of the following:

`ADDRESS MUST BE GREATER THAN 0`

`ADDRESS MUST BE ON FULLWORD BOUNDARY`

`START ADDRESS GREATER THAN END ADDRESS`

`END ADDRESS TOO LARGE`

`NOT POSSIBLE REFRESH RATE`

`ERROR VALID REFRESH RATES ARE 2, 4, 6, 8, 10, 12, 14, 16, 32, 36, 40, 44, 48, 52, 56, 60` (3B20D)

`ERROR VALID REFRESH RATES ARE 16, 18, 20, 22, 24, 26, 28, 30` (3B21D)

c = Last or highest address in the address range of memory to be tested, in hexadecimal notation.

d = Rate at which the memory is refreshed by the main store controller, in decimal notation.

e = Number of addresses for which failing information is to be collected, in decimal notation.

f = Data to be written into each memory location in the address range under test, in hexadecimal notation. (MASC phase 95.)

g = Words per memory array to copy from the online to the off-line memory, in hexadecimal notation. (MASC phase 96.)

h = Duration of time, in seconds, for which refresh data parity checks are allowed as a mechanism to scan for errors, in decimal notation. (MASC phase 96.)
For 3B21D, the value printed for this variable field is always zero.

4. ACTION TO BE TAKEN

Reenter the memory test parameters using the `EX:CU` and then `EX:LDPARM` input messages if the values are not as desired.

5. ALARMS

None. This alarm is a manually-requested report.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . EX-LOOP
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `EX LOOP` *a* [*b*] `INVALID BEGIN`

[2] `EX LOOP` *a* [*b*] `INVALID END` *d*

[3] `EX LOOP` *a* [*b*] `BETWEEN ST` *c-d*

[4] `EX LOOP REQUEST NOT YET ACTIVE NO ACTION TAKEN`

[5] `EX LOOP REQUEST NOT IN INTERACTIVE MODE NO ACTION TAKEN`

[6] `EX LOOP ILLEGAL REQUEST TYPE NO ACTION TAKEN`

2. REASON FOR OUTPUT

To report the result of executing an `EX:LOOP` interactive diagnostic command as part of an interactive diagnostic procedure.

Format 1 prints if the specified loop start data table statement number cannot be found.

Format 2 prints if the specified loop end data table statement number cannot be found by searching forward in the data table from the loop start statement.

Format 3 prints if a diagnostic program loop has been established as specified in the input command.

Format 4 prints if the unit (and subunit) specified by the interactive diagnostic command is not in the active queue.

Format 5 prints if the unit (and subunit) specified by the interactive diagnostic command is in the active queue but not an interactive request.

Format 6 prints if the unit (and subunit) specified by the interactive diagnostic command could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

a = Unit type and member number of unit under test.

b = Unit type and member number of the subunit under the unit under test.

c = Starting data table statement number.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Ending data table statement number.

4. ACTION TO BE TAKEN

For formats 1 and 2, reenter the input command using a valid start or end statement number.

For format 3, no action is needed.

For formats 4, 5, and 6, reenter the input command after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input command. Use the `OP:DMQ` input command to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the `STOP:DMQ` or `STP:DMQ` input command to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

5. ALARMS

None. This alarm is a manually-requested report.

1. FORMAT

This message has six formats.

[1] `EX MHD` *a* `[COMPLETED]` *b* `[(`*c*`)]`
`{MESSAGE|MSG} {IN PROGRESS|COMPLETE}`

[2] `EX MHD` *a* `PH` *d b* `[(`*c*`)]`
`{MESSAGE IN PROGRESS|MSG IP}`

[3] `EX MHD` *a* `PH` *d* `STF (`*c*`) MSG IP`
`TEST MISMATCH ACTUAL MASK EXPECTED`
e f g h i

[4] `EX MHD` *a* `ABORTED AT PH` *d* `STMNT` *j b* `[(`*c*`)] MSG IP`

[5] `EX MHD` *a* `TERMINATED AT PH` *d* `STMNT` *j* `AFTER TEST` *k*

[6] `EX MHD` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the moving head disk (MHD) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number (0 or 1).

b = The result of the diagnostic.

ATP — All tests passed.
NTR — No tests were executed.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000000), seven tests failed and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines which bits in *g* are included in this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h* and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2, 3, and 4, if *b* = STF, the unit should be repaired as quickly as possible. See the *Corrective Maintenance* manual for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

SEE PROPRIETARY NOTICE ON COVER PAGE

2. REASON FOR OUTPUT

Prints the results of the diagnostic executed on the magnetic tape (MT) in interactive mode.

Format 1 prints at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnostic or RAW data was specified on the diagnostic request.

Format 3 indicates the diagnostic results for an individual failing phase.

Format 4 indicates the diagnostic was stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Member number (0 or 1).

b = The result of the diagnostic.

ATP — All tests passed.
NTR — No tests were executed.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the number of tests skipped. For example, if *c* = (7 00000000 00000000), seven tests failed and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines which bits in *g* are included in this test.

i = The value which the test expected.

NOTE: For format 3, the values for *g*, *h*, and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For formats 2, 3, and 4, if *b* = STF, the unit should be repaired as quickly as possible; seek technical assistance.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the magnetic tape controller (MTC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

- ATP — All tests passed.
- CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
- NTR — No tests were run.
- STF — Some tests failed.

c = If *b* = CATP or NTR, *c* identifies the reasons tests were skipped by their bit position in a 16-digit hexadecimal number. For example, if *c* = (00000000 0000018), tests were skipped for reasons 3 and 4.

If *b* = STF, *c* identifies the number of test failures in addition to the reasons tests were skipped. For example, if *c* = (7 00000000 0000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reason codes are as follows:

- Bit 0 — Helper unit not specified or invalid.
- Bit 1 — Helper unit cannot be reserved.
- Bit 2 — Helper unit not out-of-service.
- Bit 3 — Helper unit is not ATP.
- Bit 4 — Helper unit not connected to controller under test.
- Bit 17 — Helper MT tape not mounted and/or transport door open.
- Bit 18 — Helper MT transport not in on-line mode.
- Bit 19 — Helper MT tape reel has no write enable ring (WER).
- Bit 20 — Helper MT tape too long for diagnostic test tape.
- Bit 21 — Helper MT tape has no header block at BOT or header block indicates not diagnostic test tape.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines which bits in *g* are included in this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h* and *i* may be set to N/A. This means that this data is not available for the specified device.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *b* = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If *b* = STF, the unit should be repaired as quickly as possible. Refer to Practice 235-105-220 for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

ID . . . . . EX-PAUSE
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `EX PAUSE` *a* [*b*] `SUSPENDED AT ST` *c*

[2] `EX PAUSE REQUEST NOT YET ACTIVE NO ACTION TAKEN`

[3] `EX PAUSE REQUEST NOT IN INTERACTIVE MODE NO ACTION TAKEN`

[4] `EX PAUSE ILLEGAL REQUEST TYPE NO ACTION TAKEN`

2. REASON FOR OUTPUT

To report the result of executing an `EX:PAUSE` interactive diagnostic command as part of an interactive diagnostic procedure.

Format 1 prints when the interactive diagnostic is suspended.

Format 2 prints if the unit (and subunit) specified by the interactive diagnostic command is not in the active queue.

Format 3 prints if the unit (and subunit) specified by the interactive diagnostic command is in the active queue but not an interactive request.

Format 4 prints if the unit (and subunit) specified by the interactive diagnostic command could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

a = Unit type and member number of unit under test.

b = Unit type and member number of the subunit under the unit under test.

c = Data table statement number.

4. ACTION TO BE TAKEN

For format 1, after the possible hardware troubleshooting, advance through the data table by issuing the `EX:PAUSE` command again or by issuing the `EX:STEP` command.

For formats 2, 3, and 4, reenter the input command after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input command. Use the `OP:DMQ` input command to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the

SEE PROPRIETARY NOTICE ON COVER PAGE

`STOP:DMQ` or `STP:DMQ` input command to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

[4] `EX STEP ILLEGAL REQUEST TYPE NO ACTION TAKEN`

2. REASON FOR OUTPUT

To report the result of executing an `EX:STEP` interactive diagnostic command as part of an interactive diagnostic procedure.

Format 1 prints when the interactive diagnostic is suspended.

Format 2 prints if the unit (and subunit) specified by the interactive diagnostic command is not in the active queue.

Format 3 prints if the unit (and subunit) specified by the interactive diagnostic command is in the active queue but not an interactive request.

Format 4 prints if the unit (and subunit) specified by the interactive diagnostic command could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

a = Unit type and member number of unit under test.

b = Unit type and member number of the subunit under the unit under test.

c = Data table statement number.

4. ACTION TO BE TAKEN

For format 1, after the possible hardware troubleshooting, advance through the data table by issuing the `EX:STEP` command again or by issuing the `EX:PAUSE` command.

For formats 2, 3, and 4, reenter the input command after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input command. Use the `OP:DMQ` input command to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the

SEE PROPRIETARY NOTICE ON COVER PAGE

`STOP:DMQ` or `STP:DMQ` input command to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

5. ALARMS

None. This alarm is a manually-requested report.

1. FORMAT

This message has three formats.

[1] `EX STOP REQUEST NOT YET ACTIVE NO ACTION TAKEN`

[2] `EX STOP REQUEST NOT IN INTERACTIVE MODE NO ACTION TAKEN`

[3] `EX STOP ILLEGAL REQUEST TYPE NO ACTION TAKEN`

2. REASON FOR OUTPUT

To report the result of executing an `EX:STOP` interactive diagnostic command but the appropriate interactive request could not be found.

Format 1 prints if the unit (and subunit) specified by the interactive diagnostic command is not in the active queue.

Format 2 prints if the unit (and subunit) specified by the interactive diagnostic command is in the active queue but not an interactive request.

Format 3 prints if the unit (and subunit) specified by the interactive diagnostic command could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

For formats 1, 2, and 3, reenter the input command after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input command. Use the `OP:DMQ` input command to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the `STOP:DMQ` or `STP:DMQ` input command to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

5. ALARMS

None. This alarm is a manually-requested report.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `EX TTYC` *a* `[COMPLETED]` *b* `[(`*c*`)]`
`{MESSAGE|MSG} {IN PROGRESS|COMPLETE}`

[2] `EX TTYC` *a* `PH` *d b* `[(`*c*`)] {MESSAGE IN PROGRESS|MSG IP}`

[3] `EX TTYC` *a* `PH` *d* `STF (`*c*`)  MSG IP`
`TEST  MISMATCH  ACTUAL  MASK  EXPECTED`
e f g h i

[4] `EX TTYC` *a* `ABORTED AT PH` *d* `STMNT` *j b* `[(`*c*`)]  MSG IP`

[5] `EX TTYC` *a* `TERMINATED AT PH` *d* `STMNT` *j* `AFTER TEST` *k*

[6] `EX TTYC` *a* `TASK` *l* `{MESSAGE STARTED|QUEUED|ABORTED}`

2. REASON FOR OUTPUT

To print results of a diagnostic run on the teletypewriter controller (TTYC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or `RAW` data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.

ATP — All tests passed.
NTR — No tests were executed.
STF — Some tests failed.

c = If *b* = STF, *c* identifies the number of test failures in addition to the reasons that tests were skipped. For example, if *c* = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A *1* in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines which bits in *g* are included in this test.

i = The value which the test expected.

NOTE: For Format 3 the values for *g*, *h* and *i* may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If *b* = STF, the unit should be repaired as quickly as possible. Refer to Practice 235-105-220 for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . EXC-E,PROC
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `EXC ENVIR PROC` *a* {`STARTED`|`IN PROGRESS`|`COMPLETED`}
b

[2] `EXC ENVIR PROC` *a* `STOPPED`
{`CAN'T EXECUTE PROCESS` *a* |
`ERRNO=`*c* |
`NO CHILD PROCESS`}

2. REASON FOR OUTPUT

To report the execution of a kernel or supervisor process.

Format 1 is printed if the process was run in the foreground.

Format 2 is printed if the process was run in the background.

NOTE: `STARTED`, `IN PROGRESS`, and `COMPLETED` messages appear when three or more output segments are printed.

`STARTED` and `COMPLETED` messages appear when two output segments are printed.

A `COMPLETED` message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Pathname specified in the input command.

b = Result of the process executed.

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Refer to the input message manual for the correct format, and reenter the input message or check the status of the file using the `OP:STATUS;LISTDIR` input message if either of the first two Format 2 messages is printed.

Use the `ALW:FILESYS;ACCESS` input message to make the file executable, if necessary.

Seek technical assistance if the third Format 2 message or any other error message is printed.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

6. REFERENCES

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `EXC ENVIR UPROC {STARTED|IN PROGRESS SEGMENT` *a* `|`
`COMPLETED [SEGMENT` *a*`] |STOPPED}`

[2] `EXC ENVIR UPROC` *a* `STOPPED {[`*b*`] |`
`CANNOT EXEC` *c*`, ERRNO` *d* `|`
`CANNOT CREATE A NEW PROCESS}`

[3] `EXC ENVIR UPROC - PID =` *e*

2. REASON FOR OUTPUT

Format 1 is printed to report the result of executing a user process.

Format 2 is printed to report the reason the process was STOPPED.

Format 3 is printed to give the PID if the process was executed in the background.

NOTE: `STARTED`, `IN PROGRESS`, and `COMPLETED` messages appear when three or more output segments are printed.

`STARTED` and `COMPLETED` messages appear when two output segments are printed.

A `COMPLETED` message appears when only one output segment is printed.

The `STOPPED` message appears when an error occurs in the executed pathname.

The `SEGMENT` information appears with `IN PROGRESS` and optionally with `COMPLETED` messages for segments 2 or greater.

3. VARIABLE FIELD DEFINITIONS

a = The number of segments output.

b = Result of the process executed. (Output will be zero, one, or multiple lines depending on the process executed.)

c = Pathname specified in the input message.

d = System error code. See System Error Codes Output Appendix, SYSERR-APP.

e = User process identification, PID.

4. ACTION TO BE TAKEN

Refer to the input messages manual for the correct format, and reenter the input message or check the status of the file using the OP:STATUS;LISTDIR input message if the can't exec message is printed.

Use the ALW:FILESYS;ACCESS input message to make the file executable, if necessary.

Seek technical assistance if can't create or any other error message appears.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

`OLBSTATE` `LASTATE` `FUNCTION` `LINE`
c *d* *e* *f*

[5] `EXC OFLBOOT` *a*
b [*i* | *k*]

2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

a = Message type.

`ABORTED` — Application request to stop the offline boot procedure; devices moved to the off-line side will be restored.

`COMPLETED` — Indicates off-line side boot has completed.

`INFO` — For information only.

`STOPPED` — Manual request to stop the offline boot procedure. If the RST option was specified, devices moved to the off-line side will be restored.

SEE PROPRIETARY NOTICE ON COVER PAGE

TERMINATED — UNIX® RTR software-initiated termination of the offline boot procedure; devices moved to the off-line side will not be restored.

b = Text Line.

1. A CU IS FORCED

   Printed by EXC:OFLBOOT if either CU 0 or CU 1 is forced on-line.

2. AIM REPORTED CHECKS FAILURE

   AIM pre-oflboot checks have failed.

3. AND NEITHER OOS NOR UCL WAS SPECIFIED

   The specified unit is in the OOS state. For units in this state either the OOS or UCL options must be specified on the command line.

4. BOOT IN PROGRESS

   Indicates the off-line side is booting.

5. BOTH IOP 0 AND IOP 1 CANNOT BE MOVED TO OFFLINE SIDE

   Printed if both IOP 0 and IOP 1 were selected to move to the off-line side.

6. CANNOT ACCESS ECD

   EXC:OFLBOOT encountered problems accessing ECD device information.

7. CANNOT BOOT FROM THIS DEVICE

   It is not possible to boot from a device that is off-line for initialization level 2.

8. CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR *i*

   A message requesting AIM to perform offline boot prechecks cannot be sent to the AIM process. Reason for failure is given in variable *i*.

SEE PROPRIETARY NOTICE ON COVER PAGE

9. CANNOT UPDATE ECD

   The RC/V ECD cannot be updated. The reason is dependent on the function *e* printed:

DFS	Could not reserve a unit's UCB record as part of EXC:OFLBOOT pre-checks.
UNRESERVE	Could not unreserve a UCB record while stopping offline boot. Some units' UCB records may remain reserved.

10. CANNOT VERIFY IF RC/V ECD SESSION IS IN PROGRESS

    The timer for verifying if a disk RC/V ECD session is in progress has expired before the process that checks this responds.

11. CORRUPT ECD UCB RECORD FOR *g h*

    EXC:OFLBOOT encountered inconsistent information about a device from RC/V ECD. For example, EXC:OFLBOOT accessed the RC/V ECD UCB record for a DFC and the device type in the UCB record is not DFC.

12. COULD NOT BUILD TABLE FOR UNKNOWN DEVICE

    Indicates an illegal instruction inside EIH. Offline boot will be terminated.

13. DFC 2 OOS DFC 3 ACT AND UCL WAS NOT SPECIFIED

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If DFC 2 is in the OOS state and DFC 3 is in the ACT state, the UCL option is required. Offline boot will be terminated.

14. DFC 2 OOS DFC 3 OOS AND UCL WAS NOT SPECIFIED

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If both DFC 2 and DFC 3 are in the OOS state, the UCL option is required. Offline boot will be terminated.

15. DFC 3 OOS DFC 2 ACT AND UCL WAS NOT SPECIFIED

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If DFC 3 is in the OOS state and DFC 2 is in the ACT state, the UCL option is required. Offline boot will be terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

16. DIAGNOSTICS IN PROGRESS

    Indicates the specified device's RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

17. EXCEEDED STORAGE CAPACITY FOR STORING DEVICE INFORMATION

    Indicates overflow in internal tables holding device information for offline boot.

18. HAS CORRUPT UNIT NUMBER

    The unit number for the MTTYC is greater than or equal to 2 and this is invalid.

19. HAS DEVICE TYPE ROP

    A UCB record with device type ROP was found whose parent controller was not MTTYC or TTYC.

20. IN DISK INDEPENDENT OPERATION MODE

    Printed if the system is in disk independent operation mode.

21. INITLVL 2 INCOMPATIBLE WITH ANY MHD IN OFL STATE

    Invoking offline boot with initialization level 2 will be rejected if any MHD is in the OFL state. Offline boot will be terminated.

22. MODE MUST BE OLBIDLE TO BOOT OFFLINE

    This message indicates that either offline boot is already in progress or offline boot is not supported.

23. MUST BE ACT OR OOS FOR SPLITTING

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

SEE PROPRIETARY NOTICE ON COVER PAGE

24. `MUST BE ACT FOR INITLEVEL 2`

    The TTY device selected to be the off-line pseudo-ROP is OOS. Also selected was an initialization level 2. Because devices are not automatically restored during this level of initialization, the TTY would have remained OOS in the off-line side after the initialization, that is, there would not have been a pseudo-ROP in the off-line side. This condition cannot be overridden with the OOS or UCL options.

25. `MUST BE STBY FOR INITLEVEL 2`

    Boot level 2 was selected and the off-line CU is not in the STBY state. The incorrect state is given in variable *j*.

26. `NO DISK FORCED`

    Indicates a DFC is not forced.

27. `NO EXC OFLBOOT IN PROGRESS MESSAGE WILL PRINT`

    Printed when all internal timer slots have been used and a new timer cannot be obtained to print the `EXC-OFLBOOT,IN PROGRESS` messages.

28. `NO TIMER SLOTS AVAILABLE`

    Printed when all internal timer slots have been used. Timer slots are freed at this point.

29. `NOT ACTIVE`

    Printed if the specified device is not in the ACT state. The incorrect state is given in variable j.

30. `NOT SPLITTING - DFC 2 UNEQIP`

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

31. `NOT SPLITTING - DFC 3 UNEQIP`

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

SEE PROPRIETARY NOTICE ON COVER PAGE

32. `OFFLINE SIDE BOOT COMPLETE`

    If function *e* is `TIM_EXCCHK`, the on-line side did not receive the results from the post-boot checks in time.

    If the function is `TIM_PRINT,AIM` did not reply to the message to print post-boot or switch checks.

    If the function is `OLBMSGHDLR`, the offline boot sequence completed all its steps.

33. `OLBSTATE` *c* `NOT EXC_LCKECD`

    Printed if offline boot is not in the `EXC_LCKECD` state when `EXC:OFLBOOT` expects it to be. `OLBSTATE` is corrupt or an internal timer was not cleared correctly.

34. `OLBSTATE` *c* `NOT EXC_PRCK`

    Printed if offline boot is not in the `EXC_PRCK` state when `EXC:OFLBOOT` expects it to be. `OLBSTATE` is corrupt or an internal timer was not cleared correctly.

35. `OLBSTATE MUST BE OLBIDLE TO BOOT OFFLINE`

    This message indicates that either an offline boot is already in progress or the value stored in `OLBSTATE` is corrupted.

36. `ONLY ONE BOOT DEVICE`

    Only one boot device is installed. Minimally, both MHD 0 and MHD 1 need to be installed for a system to be considered fully duplex.

37. `SPECIFIED TTY DOES NOT EXIST`

    The TTY device specified in the command line is invalid.

38. `STATE UNACCEPTABLE FOR OFFLINE BOOT`

    The major state of a device is not in the state needed while attempting to boot off-line. The incorrect state is given in variable j.

SEE PROPRIETARY NOTICE ON COVER PAGE

39. `SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS`

    Printed if command line options do not match system status. This message will be output if any of the following conditions are true:

    — required unit is OOS and neither OOS nor UCL was specified

    — specified TTY does not exist

    — specified IOP does not exist

    — both IOP 0 and IOP 1 are selected for moving

    — a primary disk was not forced

    — a CU is forced

    — only one bootable disk is available or one of the bootable disks is not equipped

    — mate CU state is not STBY or OOS

    — if any RC/V ECD UCB record is reserved.

    This list is not exhaustive. Additional information is provided in a previous output message. Refer to it for a description of the problem.

40. `TIME OUT -- AIM OFLBOOT PRECHECKS`

    Printed when the timer for AIM offline boot prechecks expires.

41. `TIME OUT -- CANNOT SPAWN USER PROCESS`

    Printed when a timer expires for creating a process to verify if a disk RC/V ECD session is in progress.

42. `UCL PASSWD FILE CANNOT BE OPENED FOR WRITING`

    See action to be taken.

43. `UCL PASSWD FILE DOES NOT EXIST, SET TO` *k*

    The password file does not exist when the UCL option is used for the first time. A new encrypted password *k* is generated automatically.

44. `UCL PASSWD FILE HAD BAD FORMAT, RESET TO` *k*

    Either the file was empty or its contents was damaged. A new encrypted password *k* is generated automatically.

45. `UCL PASSWD IS INVALID, RESET TO` *k*

The password supplied by the user is incorrect. A new encrypted password *k* is generated automatically.

46. `UNEXPECTED MESSAGE FROM AIM`

    Indicates a message was received unexpectedly from AIM.

47. `UP POINTER IS INVALID`

    Printed when the RC/V ECD UCB record for a device (containing the up pointer) has been corrupted.

48. `WILL BE MOVED TO OFFLINE SIDE`

    Printed when an IOP has not been selected to be moved to the off-line side, but offline boot selected it to be moved. It was selected because one of its TTYs was listed on the command line.

c = Current offline boot state.

d = Previous offline boot state.

e = Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.

f = Line number in the function *e* from which the output message originated. This field is used by UNIX® RTR, in conjunction with field *e*, to diagnose offline boot problems.

g = String giving device type information; CU, DFC, IOP, MHD, TTY, TTYC, and DSCH, for example. Unit names are listed in the Member Numbers Appendix, `MEM-NUM-APPC`, Table C, of this manual.

h = Device number. A value of zero, when used with *g*, could form DFC 0, for example.

i = Reason message could not be sent.

- `0` — Process is not attached to its port or port is invalid.
- `8192` — Process cannot queue more messages.
- `-1` — Cannot allocate system message buffer.

j = Device state.

k = To obtain a legal password for using the UCL option, seek technical assistance, and provide the encrypted password *k*. The value *k* will change every time the UCL option is entered; thus, using the UCL option always requires contacting technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Format 1, no action needs to be taken.

For Formats 2, 3, 4, and 5, the action to be taken depends on text line *b*.

Text line: Action to be Taken:

1. Clear the forced on-line CU and try offline boot again.
2. Clear problem with application; try offline boot again.
3. Either restore the device or add OOS or UCL to the `EXC:OFLBOOT` command line.
4. This message is for information only; no action is needed.
5. Specify only one primary IOP (IOP 0 or IOP 1) in addition to any other IOPs (IOP 2, IOP 3, etc.). Try offline boot again.
6. Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.
7. Restore boot device and try offline boot again. If the device cannot be restored, try offline boot again with initialization level 3 or 4.
8. Seek technical assistance.
9. The action to be taken depends on the function *e* output with the message:

   `DFS` Run RC/V ECD audits. If the audits pass, try offline boot again.

   `UNRESERVE` If diagnostics are not running, then the RC/V ECD UCB record is corrupted; in this case, the UCB record needs to be unreserved manually or through the ECDOWN audit.

10. Try offline boot again.
11. Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.
12. Save the ROP output and seek technical assistance.
13. Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the `EXC:OFLBOOT` input message for more information on UCL.

14. Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the `EXC:OFLBOOT` input message for more information on UCL.

15. Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the `EXC:OFLBOOT` input message for more information on UCL.

16. Wait for diagnostics to complete, fix any problems, and then try offline boot again. If diagnostics are not running, the RC/V ECD UCB record is corrupt. In this case, the UCB needs to be unreserved manually or through the ECDOWN audit.
17. Save the ROP output and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

18. Run audits ECD 1 and ECD 3. If the audits pass, verify RC/V ECD UCB record for this MTTYC; the unit value should be 0 or 1. Try offline boot again.
19. Run audits ECD 1 and ECD 3. If the audits pass, verify RC/V ECD UCB record for this unit. The device type of the ROP controller must be MTTYC or TTYC. Try offline boot again.
20. This message is for information only; no action is needed.
21. Either change the state of affected devices from OFL or specify INITLVL 3 or 4; then try offline boot again.
22. Allow the existing offline boot process to complete or seek technical assistance.
23. This message is for information only; no action is needed.
24. Restore the specified TTY, or select another TTY that is ACT, or do not specify the TTY option, or use initialization level 3 or 4.
25. Change the state of this device to the state needed by `EXC:OFLBOOT`; try offline boot again.
26. Force a DFC; try offline boot again.
27. This message is for information only; no action is needed.
28. This message is for information only; no action is needed.
29. Change the state of this device to the state needed by `EXC:OFLBOOT`; try offline boot again.
30. This message is for information only; no action is needed.
31. This message is for information only; no action is needed.
32. The action to be taken is dependent on the function *e* output with the message:

    `OLBMSGHDLR` — No action is needed.

    `TIM_EXCCHK` — Check OLBLOG files on the off-line side to determine if AIM has a problem. Do NOT start a side switch if it does. Also, recover OLBLOG files and send them to technical assistance. If the message was part of a retrofit side switch, look for correct operation on the new side since AIM was having problems and may not support call origination.

    `TIM_PRINT` — Check AIM's operational status on the on-line side.
33. Seek technical assistance.
34. Seek technical assistance.
35. Allow the existing offline boot process to complete or seek technical assistance.
36. Add another boot disk; try offline boot again.
37. Choose a valid TTY and try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

38. Change the state of this device to the state needed by `EXC:OFLBOOT`; try offline boot again.
39. No action is needed.
40. Try offline boot again.
41. Try offline boot again.
42. The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance to manually construct a valid password file.
43. The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password *k* to obtain a legal password, and try offline boot again.
44. The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password *k* to obtain a legal password, and try offline boot again.
45. The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password *k* to obtain a legal password, and try offline boot again.
46. Seek technical assistance.
47. Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.
48. This message is for information only; no action is needed.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

For a minor alarm, take action as indicated in the report.

ID . . . . . EXC-OFLBOOT-B
GENERIC . . . . . UNIX RTR R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has five formats.

[1] `EXC OFLBOOT` {`STARTED` | `IN PROGRESS` | `ABORTED` | `STOPPED` | `TERMINATED`}

[2] `EXC OFLBOOT` *a*
b
`OLBSTATE` `LASTATE` `FUNCTION` `LINE`
c *d* *e* *f*

[3] `EXC OFLBOOT` *a*
b g h
`OLBSTATE` `LASTATE` `FUNCTION` `LINE`
c *d* *e* *f*

[4] `EXC OFLBOOT` *a*
g h [*j*] *b*
`OLBSTATE` `LASTATE` `FUNCTION` `LINE`
c *d* *e* *f*

[5] `EXC OFLBOOT` *a*
b [*i* | *k*]

2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

a = Message type.

`ABORTED` — Application request to stop the offline boot procedure; devices moved to the off-line side will be restored.

`COMPLETED` — Indicates off-line side boot has completed.

`INFO` — For information only.

`STOPPED` — Manual request to stop the offline boot procedure. If the RST option was specified, devices moved to the off-line side will be restored.

SEE PROPRIETARY NOTICE ON COVER PAGE

TERMINATED — UNIX® RTR software-initiated termination of the offline boot procedure; devices moved to the off-line side will not be restored.

b = Text Line.

1. A CU IS FORCED

   Printed by EXC:OFLBOOT if either CU 0 or CU 1 is forced on-line.

2. AIM REPORTED CHECKS FAILURE

   AIM pre-oflboot checks have failed.

3. AND NEITHER OOS NOR UCL WAS SPECIFIED

   The specified unit is in the OOS state. For units in this state either the OOS or UCL options must be specified on the command line.

4. BOOT IN PROGRESS

   Indicates the off-line side is booting.

5. BOTH IOP 0 AND IOP 1 CANNOT BE MOVED TO OFFLINE SIDE

   Printed if both IOP 0 and IOP 1 were selected to move to the off-line side.

6. CANNOT ACCESS ECD

   EXC:OFLBOOT encountered problems accessing ECD device information.

7. CANNOT BOOT FROM THIS DEVICE

   It is not possible to boot from a device that is off-line for initialization level 2.

8. CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR *i*

   A message requesting AIM to perform offline boot prechecks cannot be sent to the AIM process. Reason for failure is given in variable *i*.

9. CANNOT UPDATE ECD

   The RC/V ECD cannot be updated. The reason is dependent on the function *e* printed:

   DFS — Could not reserve a unit's UCB record as part of EXC:OFLBOOT pre-checks.

SEE PROPRIETARY NOTICE ON COVER PAGE

UNRESERVE — Could not unreserve a UCB record while stopping offline boot. Some units' UCB records may remain reserved.

10. CANNOT VERIFY IF RC/V ECD SESSION IS IN PROGRESS

    The timer for verifying if a disk RC/V ECD session is in progress has expired before the process that checks this responds.

11. CORRUPT ECD UCB RECORD FOR *g h*

    EXC:OFLBOOT encountered inconsistent information about a device from RC/V ECD. For example, EXC:OFLBOOT accessed the RC/V ECD UCB record for a DFC and the device type in the UCB record is not DFC.

12. COULD NOT BUILD TABLE FOR UNKNOWN DEVICE

    Indicates an illegal instruction inside EIH. Offline boot will be terminated.

13. DFC 2 OOS DFC 3 ACT AND UCL WAS NOT SPECIFIED

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If DFC 2 is in the OOS state and DFC 3 is in the ACT state, the UCL option is required. Offline boot will be terminated.

14. DFC 2 OOS DFC 3 OOS AND UCL WAS NOT SPECIFIED

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If both DFC 2 and DFC 3 are in the OOS state, the UCL option is required. Offline boot will be terminated.

15. DFC 3 OOS DFC 2 ACT AND UCL WAS NOT SPECIFIED

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If DFC 3 is in the OOS state and DFC 2 is in the ACT state, the UCL option is required. Offline boot will be terminated.

16. DIAGNOSTICS IN PROGRESS

    Indicates the specified device's RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

SEE PROPRIETARY NOTICE ON COVER PAGE

17. `EXCEEDED STORAGE CAPACITY FOR STORING DEVICE INFORMATION`

    Indicates overflow in internal tables holding device information for offline boot.

18. `HAS CORRUPT UNIT NUMBER`

    The unit number for the MTTYC is greater than or equal to 2 and this is invalid.

19. `HAS DEVICE TYPE ROP`

    A UCB record with device type ROP was found whose parent controller was not MTTYC or TTYC.

20. `IN DISK INDEPENDENT OPERATION MODE`

    Printed if the system is in disk independent operation mode.

21. `INITLVL 2 INCOMPATIBLE WITH ANY MHD IN OFL STATE`

    Invoking offline boot with initialization level 2 will be rejected if any MHD is in the OFL state. Offline boot will be terminated.

22. `MODE MUST BE OLBIDLE TO BOOT OFFLINE`

    This message indicates that either offline boot is already in progress or offline boot is not supported.

23. `MUST BE ACT OR OOS FOR SPLITTING`

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

24. `MUST BE ACT FOR INITLEVEL 2`

    The TTY device selected to be the off-line pseudo-ROP is OOS. Also selected was an initialization level 2. Because devices are not automatically restored during this level of initialization, the TTY would have remained OOS in the off-line side after the initialization, that is, there would not have been a pseudo-ROP in the off-line side. This condition cannot be overridden with the OOS or UCL options.

25. `MUST BE STBY FOR INITLEVEL 2`

    Boot level 2 was selected and the off-line CU is not in the STBY state. The incorrect state is given in variable *j*.

SEE PROPRIETARY NOTICE ON COVER PAGE

26. NO DISK FORCED

    Indicates a DFC is not forced.

27. NO EXC OFLBOOT IN PROGRESS MESSAGE WILL PRINT

    Printed when all internal timer slots have been used and a new timer cannot be obtained to print the EXC-OFLBOOT,IN PROGRESS messages.

28. NO TIMER SLOTS AVAILABLE

    Printed when all internal timer slots have been used. Timer slots are freed at this point.

29. NOT ACTIVE

    Printed if the specified device is not in the ACT state. The incorrect state is given in variable j.

30. NOT SPLITTING - DFC 2 UNEQIP

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

31. NOT SPLITTING - DFC 3 UNEQIP

    When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

32. OFFLINE SIDE BOOT COMPLETED

    The offline side boot sequence completed successfully.

33. OFFLINE SIDE BOOT COMPLETED WITH ERRORS

    The offline side boot sequence completed with errors. A REPT OFLBOOT message was printed to explain the error.

34. OLBSTATE *c* NOT EXC_LCKECD

    Printed if offline boot is not in the EXC_LCKECD state when EXC:OFLBOOT expects it to be. OLBSTATE is corrupt or an internal timer was not cleared correctly.

35. OLBSTATE *c* NOT EXC_PRCK

Printed if offline boot is not in the EXC_PRCK state when EXC:OFLBOOT expects it to be. OLBSTATE is corrupt or an internal timer was not cleared correctly.

36. OLBSTATE MUST BE OLBIDLE TO BOOT OFFLINE

    This message indicates that either an offline boot is already in progress or the value stored in OLBSTATE is corrupted.

37. ONLY ONE BOOT DEVICE

    Only one boot device is installed. Minimally, both MHD 0 and MHD 1 need to be installed for a system to be considered fully duplex.

38. SPECIFIED TTY DOES NOT EXIST

    The TTY device specified in the command line is invalid.

39. STATE UNACCEPTABLE FOR OFFLINE BOOT

    The major state of a device is not in the state needed while attempting to boot off-line. The incorrect state is given in variable j.

40. SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS

    Printed if command line options do not match system status. This message will be output if any of the following conditions are true:

    — required unit is OOS and neither OOS nor UCL was specified

    — specified TTY does not exist

    — specified IOP does not exist

    — both IOP 0 and IOP 1 are selected for moving

    — a primary disk was not forced

    — a CU is forced

    — only one bootable disk is available or one of the bootable disks is not equipped

    — mate CU state is not STBY or OOS

    — if any RC/V ECD UCB record is reserved.

    This list is not exhaustive. Additional information is provided in a previous output message. Refer to it for a description of the problem.

SEE PROPRIETARY NOTICE ON COVER PAGE

41. `TIME OUT -- AIM OFLBOOT PRECHECKS`

    Printed when the timer for AIM offline boot prechecks expires.

42. `TIME OUT -- CANNOT SPAWN USER PROCESS`

    Printed when a timer expires for creating a process to verify if a disk RC/V ECD session is in progress.

43. `UCL PASSWD FILE CANNOT BE OPENED FOR WRITING`

    See action to be taken.

44. `UCL PASSWD FILE DOES NOT EXIST, SET TO` *k*

    The password file does not exist when the UCL option is used for the first time. A new encrypted password *k* is generated automatically.

45. `UCL PASSWD FILE HAD BAD FORMAT, RESET TO` *k*

    Either the file was empty or its contents was damaged. A new encrypted password *k* is generated automatically.

46. `UCL PASSWD IS INVALID, RESET TO` *k*

    The password supplied by the user is incorrect. A new encrypted password *k* is generated automatically.

47. `UNEXPECTED MESSAGE FROM AIM`

    Indicates a message was received unexpectedly from AIM.

48. `UP POINTER IS INVALID`

    Printed when the RC/V ECD UCB record for a device (containing the up pointer) has been corrupted.

49. `WILL BE MOVED TO OFFLINE SIDE`

    Printed when an IOP has not been selected to be moved to the off-line side, but offline boot selected it to be moved. It was selected because one of its TTYs was listed on the command line.

c = Current offline boot state.

d = Previous offline boot state.

e = Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.

f = Line number in the function *e* from which the output message originated. This field is used by UNIX® RTR, in conjunction with field *e*, to diagnose offline boot problems.

g = String giving device type information; CU, DFC, IOP, MHD, TTY, TTYC, and DSCH, for example. Unit names are listed in the Member Numbers Appendix, `MEM-NUM-APPC`, Table C, of this manual.

h = Device number. A value of zero, when used with *g*, could form DFC 0, for example.

i = Reason message could not be sent.

`0` — Process is not attached to its port or port is invalid.

`8192` — Process cannot queue more messages.

`-1` — Cannot allocate system message buffer.

j = Device state.

k = To obtain a legal password for using the UCL option, seek technical assistance, and provide the encrypted password *k*. The value *k* will change every time the UCL option is entered; thus, using the UCL option always requires contacting technical assistance.

4. ACTION TO BE TAKEN

For Format 1, no action needs to be taken.

For Formats 2, 3, 4, and 5, the action to be taken depends on text line *b*.

Text line: Action to be Taken:

1. Clear the forced on-line CU and try offline boot again.
2. Clear problem with application; try offline boot again.
3. Either restore the device or add OOS or UCL to the `EXC:OFLBOOT` command line.
4. This message is for information only; no action is needed.
5. Specify only one primary IOP (IOP 0 or IOP 1) in addition to any other IOPs (IOP 2, IOP 3, etc.). Try offline boot again.
6. Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.
7. Restore boot device and try offline boot again. If the device cannot be restored, try offline boot again with initialization level 3 or 4.
8. Seek technical assistance.
9. The action to be taken depends on the function *e* output with the message:

`DFS`	Run RC/V ECD audits. If the audits pass, try offline boot again.
`UNRESERVE`	If diagnostics are not running, then the RC/V ECD UCB record is corrupted; in this case, the UCB record needs to be unreserved manually or through the ECDOWN audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

10. Try offline boot again.
11. Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.
12. Save the ROP output and seek technical assistance.
13. Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the `EXC:OFLBOOT` input message for more information on UCL.

14. Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the `EXC:OFLBOOT` input message for more information on UCL.

15. Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the `EXC:OFLBOOT` input message for more information on UCL.

16. Wait for diagnostics to complete, fix any problems, and then try offline boot again. If diagnostics are not running, the RC/V ECD UCB record is corrupt. In this case, the UCB needs to be unreserved manually or through the ECDOWN audit.
17. Save the ROP output and seek technical assistance.
18. Run audits ECD 1 and ECD 3. If the audits pass, verify RC/V ECD UCB record for this MTTYC; the unit value should be 0 or 1. Try offline boot again.
19. Run audits ECD 1 and ECD 3. If the audits pass, verify RC/V ECD UCB record for this unit. The device type of the ROP controller must be MTTYC or TTYC. Try offline boot again.
20. This message is for information only; no action is needed.
21. Either change the state of affected devices from OFL or specify INITLVL 3 or 4; then try offline boot again.
22. Allow the existing offline boot process to complete or seek technical assistance.
23. This message is for information only; no action is needed.
24. Restore the specified TTY, or select another TTY that is ACT, or do not specify the TTY option, or use initialization level 3 or 4.
25. Change the state of this device to the state needed by `EXC:OFLBOOT`; try offline boot again.
26. Force a DFC; try offline boot again.
27. This message is for information only; no action is needed.
28. This message is for information only; no action is needed.
29. Change the state of this device to the state needed by `EXC:OFLBOOT`; try offline boot again.
30. This message is for information only; no action is needed.

SEE PROPRIETARY NOTICE ON COVER PAGE

31. This message is for information only; no action is needed.
32. This message is for information only; no action is needed
33. See associated REPT:OFLBOOT message for explanation of error. Do NOT start a side switch without first seeking technical assistance.
34. Seek technical assistance.
35. Seek technical assistance.
36. Allow the existing offline boot process to complete or seek technical assistance.
37. Add another boot disk; try offline boot again.
38. Choose a valid TTY and try offline boot again.
39. Change the state of this device to the state needed by `EXC:OFLBOOT`; try offline boot again.
40. No action is needed.
41. Try offline boot again.
42. Try offline boot again.
43. The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance to manually construct a valid password file.
44. The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password *k* to obtain a legal password, and try offline boot again.
45. The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password *k* to obtain a legal password, and try offline boot again.
46. The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password *k* to obtain a legal password, and try offline boot again.
47. Seek technical assistance.
48. Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.
49. This message is for information only; no action is needed.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

For a minor alarm, take action as indicated in the report.

SEE PROPRIETARY NOTICE ON COVER PAGE

MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `IN FILE APND COMPLETED`
a

[2] `IN FILE APND STOPPED`
b

2. REASON FOR OUTPUT

To report the result of executing an `IN:FILE;APND` input message to read and append text to a specified line of a file.

3. VARIABLE FIELD DEFINITIONS

a = The lines above and below the line appended.

b = Text explaining why the command was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates that the command executed successfully.

Format 2 can be printed due to several errors which the system may encounter. If the explanatory text indicates that the file cannot be accessed, use the `OP:STATUS;LISTDIR` input message to verify the existence of the file. If the explanatory text indicates that there is insufficient disk space to execute the command, use the `OP:STATUS;FREEDISK` input message to verify that there is free space in the file system under which the file being edited resides.

Seek technical assistance if the message is not self-explanatory.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `IN FILESYS DIR COMPLETED`

[2] `IN FILESYS DIR STOPPED`
`{CANNOT ACCESS` *a* `|`
`CANNOT MAKE DIRECTORY` *a* `|`
`CANNOT LINK` *a* `|`
`CANNOT CHANGE OWNER` *a*`}`

2. REASON FOR OUTPUT

To report the result of executing an `IN:FILESYS;DIR` input message to create a directory.

3. VARIABLE FIELD DEFINITIONS

a = Pathname specified in the message.

4. ACTION TO BE TAKEN

If `cannot access` prints, the pathname is not valid. If `cannot make directory` prints, there is a directory with that name. Use the `OP:STATUS;LISTDIR` input message to verify the situation.

The `cannot link` and `cannot change owner` messages are system-related errors. Seek technical assistance if either of these two messages is printed.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

6. REFERENCES

OMDB Key
Formats 1 and 2 have an OMDB key of 282.

Manual 5D5-105-210 *Routine Operations and Maintenance*

ID . . . . . IN-REM
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `IN REMOTE WAITING`

[2]
```
IN REMOTE IN PROGRESS
FILES RECEIVED: a IN PROGRESS
ELAPSED TIME b SPACE REMAINING c [IN PROGRESS]
INODES REMAINING d [IN PROGRESS]
[e ERROR f [IN PROGRESS]]
[CREAT ERRNO = g]
```

2. REASON FOR OUTPUT

Format 1 reports that the file-receive process is waiting for a session connect message from a remote sending site.

Format 2 reports totals for files successfully and unsuccessfully received from the Software Change Administration and Notification System (SCANS-2).

3. VARIABLE FIELD DEFINITIONS

a = Number of successfully received files.

b = Elapsed time in the form hours:minutes.

c = Number of blocks (512 bytes per block) remaining in the base directory on the receiving machine.

d = Number of inodes remaining in the base directory on the receiving machine.

e = Pathname of a file issued by the sending end which was not received by the file-receive process.

f = Error code specifying the reason why the file was not received by the file-receive process.

- 01 — Insufficient space on disk to store the file.
- 02 — File length exceeds the maximum length permitted (2,500,000 bytes).
- 03 — The pathname being processed matches that of a file already on disk.
- 04 — Could not create incoming file on disk.
- 05 — File transmission was interrupted.
- 06 — The system command `mkdir()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

g = If the system command `creat()` failed (*f* = 4), then *g* is the value of errno set by `creat()`. For errno definitions, see the Appendix System Error.

4. ACTION TO BE TAKEN

Seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
IN REMOTE ERROR a[b][, ERRNO = c]
[INVALID TRANSACTION ID: d]
[NO TRANSACTION ID]
[READ FAILED]
```

2. REASON FOR OUTPUT

To report the termination of the file-receive process due to an error that is unrelated to the actual transmission of files. This message may occur either before, during, or after the transmission of files. "inremote" refers to the process created when `IN:REMOTE;START` is entered.

3. VARIABLE FIELD DEFINITIONS

a = One of the following codes indicating the reason for termination:

- 01 — The file-receive process could not be executed.
- 02 — A bad argument was passed to the file-receive process.
- 03 — Time limit to establish the dial-up link has expired.
- 04 — Non-positive number of blocks was specified on the command line.
- 05 — Failed to connect to system port.
- 06 — Failed `stat` call on base directory.
- 07 — Failed `ustat` call on base directory.
- 08 — Insufficient disk space in base directory.
- 09 — Failed to read connect message, or received invalid connect message from the remote sending system. This message may be followed by a message indicating that `READ FAILED`, `NO TRANSACTION ID` was sent, or an `INVALID TRANSACTION ID` was sent. The latter will include the invalid ID which was sent, as noted below.
- 10 — An error occurred in the printing of file-receive output messages.
- 11 — An `IN:REMOTE;START` request was denied because a file-receive process already exists. Try the request again later.
- 12 — An `IN:REMOTE;REPT` or `IN:REMOTE;STOP` request failed because a message could not be sent to inremote or file-receive process.
- 13 — An `IN:REMOTE;REPT` or `IN:REMOTE;STOP` request failed because a message could not be sent to file-receive process or inremote.

SEE PROPRIETARY NOTICE ON COVER PAGE

14 — Could not enable reception of messages.
15 — Could not send message from file-receive process to inremote.
16 — Bad message received by inremote.
17 — Bad message received by file-receive process.
18 — Unable to open software change and notification system (SCANS) data link.
19 — Unable to open equipment configuration database (ECD).
20 — Unable to get unit control block (UCB) record for SDL0.

b = Error code indicating an ECD access problem or database inconsistencies. The following error numbers may be printed if *a* = 18.

100 — SDL is not active
101 — no unit name listed as active in mdct record
102 — `stat()` failed
103 — `lla_rdget()` failed
104 — `lla_get()` failed
105 — `lla_iatt()` failed
106 — `getdbseg()` failed

c = The system error number. See the system error code output appendix, SYSERR. The system error number prints if *a* = 1, 5, 6, 7, 10, 14, or 15.

d = The invalid transaction ID received by the file-receive process.

4. ACTION TO BE TAKEN

Seek technical assistance. If required, cancel broadcast warning message (BWM) order and reorder later.

5. ALARMS

None. This alarm is a manually-requested report.

IN-REM,STOP
```

ID . . . . . IN-REM,INIT
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
IN REMOTE INITIALIZED IP
TRANSACTION ID: a TIME: bb:bb
```

2. REASON FOR OUTPUT

To report initialization of the software change administration and notification system (SCANS-2) interface and to provide a transaction ID to be used when ordering broadcast warning messages (BWMs) from SCANS-2 within the next 24 hours.

3. VARIABLE FIELD DEFINITIONS

a = A transaction ID, from one to ten decimal digits and uppercase letters. This ID is supplied to SCANS-2 when BWMs are ordered. It is valid only for the next dial-in transmission of files, at which time SCANS-2 must present the transaction ID. If the ID time limit (24 hours) expires, the caller presents an invalid ID, or no ID, an `IN-REMOTE,ERROR` output message will be displayed.

b = The time at which a 24-hour timer began, in the form hours:minutes.

4. ACTION TO BE TAKEN

Provide the transaction ID to SCANS-2 when ordering the next delivery of BWMs. The order must be placed and SCANS-2 must dial in to the computer within 24 hours of the appearance of this message.

5. ALARMS

None.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
IN REMOTE STOPPED a
[FILES MAY BE LOST]
```

2. REASON FOR OUTPUT

To report the reason for termination of the file receiving process.

3. VARIABLE FIELD DEFINITIONS

a = One of the following codes indicating the reason for termination.

0 — Successful completion of the file transfer session.
1 — Time limit to receive messages from the remote system has expired.
2 — Unable to resynchronize messages with the remote sender.
3 — Unable to resynchronize files with the remote sender.
4 — Bad file sequence number.
5 — Insufficient disk space to store incoming files.
6 — Too many files interrupted.
7 — An internal error occurred in the process.
8 — The file receive process was terminated in response to the `IN:REM;STOP` input message.
9 — An I/O error occurred in writing a file to disk.
10 — The remote sender aborted transmission.
11 — The file receive process terminated for an unknown reason. This message is followed by the `FILES MAY BE LOST` output message indicating that the file receive session died in an unknown state.
12 — A bad disconnect message was received from the sender.
13 — The system command `mkdir()` failed.

4. ACTION TO BE TAKEN

Verify that all files have been received. If *a* = 11 - this message may be ignored if preceded by an `IN-REM,STOPPED` or `IN-REM,ERROR` output message.

5. ALARMS

None. This alarm is a manually-requested report.

MESSAGE CLASS . . MAINT

1. FORMAT

```
IN XFER  - a
     b  [c]
```

2. REASON FOR OUTPUT

To report the current state of the file transfer system, in response to an `IN:XFER` command.

3. VARIABLE FIELD DEFINITIONS

a = Status of file transfer system.

`COMPLETED`	= The file transfer session has ended.
`IN PROGRESS`	= The file transfer session is running.

b = Additional status information.

`DATA LINK ERRORS`	= The file transfer session was stopped due to errors from the data link.
`MANUALLY TERMINATED`	= The file transfer session was stopped by an `IN:XFER STOP` command.
`NO ERRORS`	= The file transfer session was stopped by the normal end of the session with a computer.
`NO PASSWORD`	= A session was attempted from the remote end, but the `IN:XFER START` command was not entered.
`PASSWORD-NO GOOD`	= The file transfer session was stopped because an incorrect password was entered at the remote end.
`RECEIVING`	= A session is in progress and is currently receiving the file *c*.
`RUNNING SHELL`	= A session is in progress and is currently executing shell commands.
`SENDING`	= A session is in progress and is currently sending the file *c*.
`WAITING`	= A session is in progress and is currently waiting for a support computer to respond.

c = Filename.

4. ACTION TO BE TAKEN

Inform the support person who requested the execution of `IN:XFER` of this output.

SEE PROPRIETARY NOTICE ON COVER PAGE

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has five formats.

[1] `INH DMQ COMPLETED`

[2] `INH DMQ CANNOT INHIBIT A MANUAL SOURCE` *a*

[3] `INH DMQ SOURCE ALL IS ALREADY INHIBITED`

[4] `INH DMQ TOO MANY ACTIVE INHIBITS`

[5] `INH DMQ CANNOT LCALL INHTIMER PROCESS` *a*
`FOR INHIBIT ERRNO =` *b*

2. REASON FOR OUTPUT

Format 1 reports maintenance input request administrator (MIRA) has completed a request to inhibit a source of automatic maintenance requests.

Format 2 indicates MIRA does not inhibit manual source of maintenance requests - *a*.

Format 3 indicates source `ALL` is already inhibited.

Format 4 reports there are too many active inhibits. Cannot inhibit any more.

Format 5 reports MIRA could not start inhibit timer for automatic maintenance request source a.

3. VARIABLE FIELD DEFINITIONS

a = Three-character name of the source specified in the `INH:DMQ` input message. `ALL` indicates all automatic maintenance requests are inhibited.

b = System error number returned for the failing system call. See System Error Codes Output Appendix, `SYSERR-APP`.

4. ACTION TO BE TAKEN

Use the `OP:DMQ` input message to determine which maintenance sources are inhibited.

For Formats 1 and 3, no action is required.

For Format 2, check syntax of source - *a*.

For Format 4, use ALW:DMQ to allow some of the inhibited sources and retry message.

For Format 5, retry the input message. If retry is unsuccessful, an operating system function call is failing; seek technical assistance to clear the trouble.

5. ALARMS

None. This alarm is a manually-requested report.

This message has three formats.

[1] `INH EAIINT` *a* `COMPLETED`

[2] `INH EAIINT` *a* `COMPLETED WITH` *c*

[3] `INH EAIINT` *a* `ABORTED` *b*

2. REASON FOR OUTPUT

To indicate the result of a request to inhibit emergency action interface (EAI) error interrupts on a specified 3B21D computer control unit (CU), or on both 3B21D computer CUs.

NOTE: The 3B20D computer CUs do not have EAI error interrupts.

Format 1 indicates successful completion.

Format 2 indicates successful completion with a message port problem.

Format 3 indicates an error.

3. VARIABLE FIELD DEFINITIONS

a = One of the following: CU 0, CU 1, or CU 0 and CU 1.

b = One of the following error codes:

`50` — message could not be sent to a driver or real time status (RTS) report
`51` — equipment configuration data base (ECD) access function completed unsuccessfully
`52` — error in message communication
`53` — error internal to the inhibit administrator

c = One of the following port problems:

`AN INVALID SYSTEM PORT SPECIFIED`
`AN INVALID SYSTEM PORT SPECIFIED FOR AIM` (application integrity monitor)
`NO PROCESS ATTACHED TO THE SPECIFIED PORT`
`NO PROCESS ATTACHED TO THE AIM PORT`

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Format 1, no action is necessary.

For Format 2, seek technical assistance.

For Format 3, use the `OP:ERRCHK` input message to learn the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

5. ALARMS

None. This report is either a manually-requested report or an automatically-generated report for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . INH-ERRINT-B
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has five formats.

[1] `INH ERRINT COMPLETED`

[2] `INH ERRINT COMPLETED WITH` *b*

[3] `INH ERRINT ABORTED` *a*

[4]
```
INH ERRINT NOT STARTED
INVALID ID FIELD - INPUT ERROR
```

[5]
```
ALW ERRINT NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS - UNEQUIPPED UNIT
```

2. REASON FOR OUTPUT

To indicate the result of a request to inhibit error interrupts on a particular hardware unit/complex, or on all hardware units.

Format 1 indicates successful completion.

Format 2 indicates successful completion with a message port problem.

Format 3 indicates an error.

Format 4 indicates an error in the identification field of the input. Possibly, the unit name and number specified cannot be found in the data base.

Format 5 indicates unit name and number specified was found in the data base, but is unequipped.

3. VARIABLE FIELD DEFINITIONS

a = One of the following error codes:

- `50` — A message could not be sent to a driver or real time status (RTS) report.
- `51` — An equipment configuration data base (ECD) access function completed unsuccessfully.
- `52` — An error in message communication.
- `53` — An error internal to the inhibit administrator.

SEE PROPRIETARY NOTICE ON COVER PAGE

b = One of the following port problems:

```
AN INVALID SYSTEM PORT SPECIFIED
AN INVALID SYSTEM PORT SPECIFIED FOR AIM
 (application integrity monitor)
NO PROCESS ATTACHED TO THE SPECIFIED PORT
NO PROCESS ATTACHED TO THE AIM PORT
```

4. ACTION TO BE TAKEN

For Formats 1, 4, and 5, no action is necessary.

For Format 2, seek technical assistance.

For Format 3, use the OP:ERRCHK input message to learn the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

5. ALARMS

None. This report is either a manually-requested report or is automatically generated for information only.

6. REFERENCES

1. FORMAT

This message has three formats.

[1] `INH ERRSRC COMPLETED`

[2] `INH ERRSRC ABORTED` *a*

[3] `INH ERRSRC NOT STARTED`
`INVALID ID FIELD`

2. REASON FOR OUTPUT

To indicate the result of a request to inhibit the processing of errors under a control unit (CU) pseudo-node.

3. VARIABLE FIELD DEFINITIONS

a = One of the following error codes.

50 — A message could not be sent to a driver or real time status report (RTS).

51 — An equipment configuration data base (ECD) access function completed unsuccessfully.

52 — An error in message communication.

53 — An error internal to the inhibit administrator.

55 — An invalid system port was specified.

56 — No process is attached to the specified port.

4. ACTION TO BE TAKEN

If an error was reported, use the `OP:ERRCHK` input message to find out the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a technical representative.

5. ALARMS

None. This is either a manually-requested report or is automatically generated for information only.

1. FORMAT

This message has two formats.

[1] `INH FILESYS UMOUNT COMPLETED`

[2] `INH FILESYS UMOUNT STOPPED`
a

2. REASON FOR OUTPUT

To report the result of executing an `INH:FILESYS;UMOUNT` input message to unmount a previously mounted file system.

Format 1 indicates that the action was completed.

Format 2 indicates that the action was terminated.

3. VARIABLE FIELD DEFINITIONS

a = Description of the error encountered.

4. ACTION TO BE TAKEN

Format 1 indicates success, and requires no action.

Format 2 indicates the command has failed. The explanatory text will indicate the error encountered. Refer to the input message manual for the correct format and reenter the command, or check the status of the file using the `OP:STATUS;LISTDIR` input message.

Seek technical assistance if any other error message is printed.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

ID . . . . . INH-REX
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `INH REX COMPLETED`

[2]
```
INH REX NOT STARTED
{CONFLICT WITH CURRENT SYSTEM STATUS
|RETRY LATER }
```

2. REASON FOR OUTPUT

To report the termination status of the `INH:REX` input message.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

For Format 1, no action is needed.

For Format 2, `CONFLICT WITH CURRENT SYSTEM STATUS` indicates that temporary routine exercise (REX) inhibits are not available for the unit specified, or all the units specified due to active permanent REX inhibit(s). Use the `OP:REXINH` input message with the `PERM` option to determine the current permanent REX inhibits.

`RETRY LATER` indicates that the database manager or a database record could not be opened; try again at a later time. If this persists, seek technical assistance.

5. ALARMS

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . INH-SCSD
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `INH SCSD UNIT` *a* `PT` *b*[*bbbbbbb*] *f*

[2] `INH SCSD GRPN` *c* `DUPID` *d* `PT` *e*[*eeeee*] *f*

[3]
```
INH SCSD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
```

2. REASON FOR OUTPUT

To indicate whether a scan point was disabled as a result of executing an `INH:SCSD` input message. This prevents the reporting of a scan point's transitions.

Format 1 is used when a scan point is identified by physical location.

Format 2 is used when a scan point is identified by logical address.

Format 3 indicates the scanner and signal distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

a = Member number of scanner and signal distributor (SCSD) unit.

b = Physical scan point number on an SCSD (0-47).

c = Name of the logical group.

d = Duplex group ID (0 or 1).

e = Number of a point within a logical group.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = Termination status:

`FAILED` — Action could not be completed by SCSD administrator.

Possible reasons for failure are:

— SCSD unit number is invalid.

— Point number is invalid for the logical group.

— Logical group name is invalid and either the SCSD unit is out-of-service (OOS) or is in an inactive state to the SCSD administrator.

`COMPLETED` — Action completed.

4. ACTION TO BE TAKEN

Issue the `OP:OOS` input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter recent change and verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

ID . . . . . INH-UMEM
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`INH UMEM` *a* `WAS` *b* `NOW` *c* *#d*

2. REASON FOR OUTPUT

To report that the transfer trace entered the `STOPPED` state either as the result of an `INH:UMEM` input message or the `STOP FULL` directive of the `INIT:UMEM` input message. The two cases can be distinguished by the 'priority of action' field which will be either `M` or `A`, respectively.

3. VARIABLE FIELD DEFINITIONS

a = Status of the operation.

- `COMPLETED` — The trace has stopped monitoring the flow of execution.
- `NOT STARTED` — The operation was ignored because the trace was not running.
- `STOPPED UCERR` — The utility circuit either does not respond or does not match the circuit present when the trace was defined.

b = State of the trace before the operation was attempted.

- `DUMPED` — The trace was not running and its data had already been dumped.
- `NEW` — The trace was not running and did not have data.
- `RUNNING` — The trace was collecting data.
- `STOPPED` — The trace was not running and did have data.
- `UNDEF` — No trace was defined.

c = State of the trace after the operation was attempted.

- `DUMPED` — The trace is not running and its data had already been dumped.
- `NEW` — The trace is not running and does not contain data.
- `STOPPED` — The trace is stopped and does contain data.
- `UNDEF` — No trace is defined.

d = Generic access package (GRASP) execution sequence number.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If *a* is `STOPPED UCERR`, check the utility circuit hardware. After it is fixed, use the `INIT:UC` input message to reinitialize the circuit.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`INH UTIL` *a #b*

2. REASON FOR OUTPUT

To indicate the disposition of an `INH:UTIL` input message or report generic access package (GRASP) dynamic time overload.

3. VARIABLE FIELD DEFINITIONS

a = Termination status.

`COMPLETED` — The action associated with breakpoints will not be executed when the breakpoint conditions occur.

`COMPLETED EAI` — All defined breakpoints were inhibited by a request from application integrity monitor (AIM).

`COMPLETED OVERLOAD` — All defined breakpoints were automatically inhibited because of GRASP overload (due to breakpoints or trace processing). This message will appear when an overload condition occurs, even if no breakpoints are currently defined.

`STOPPED UCERR` — The operation was completed successfully for software breakpoints but the utility circuit either does not respond or does not match the circuit present when the hardware breakpoints were defined.

b = GRASP execution sequence number.

4. ACTION TO BE TAKEN

If *a* is `COMPLETED OVERLOAD`, re-enable selected breakpoints and clear the others, or increase the dynamic time limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* is `STOPPED UCERR`, check the utility circuit hardware. After it is fixed, use the `INIT:UC` input message to reinitialize the circuit.

         TRACK/CYL/HD/SC
          [e  f g h]
```

2. REASON FOR OUTPUT

To report the result of executing an `INIT:MHD` input message. See the ACTION TO BE TAKEN section for the explanation of why and when each output message format will be used.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the moving head disk (MHD) drive.

b = Process step or reason code.

- f03 — failed to fopen `/tmp file`
- f04 — `fseek` failed on the output file
- f06 — cannot open equipment configuration database (ECD)
- f09 — cannot get UCB by name
- f12 — cannot reserve UCB
- f15 — cannot assign special device file name
- f18 — cannot open special device file
- f21 — cannot set I/O mode of device file
- f24 — cannot enable message reception
- f27 — see DFCDRV error report
- f30 — DFC is not in S_ACT store
- f33 — MHD size not recognized
- f36 — see DFCDRV error report
- f39 — see DFCDRV error report
- f42 — DFC RAM read failed

SEE PROPRIETARY NOTICE ON COVER PAGE

f45 — `vfy` data overwritten - repeat input request starting from track number
f48 — `lseek` to "combined" defect table failed
f51 — first read of defect table failed
f54 — `lseek` to "combined" defect table failed
f57 — second read of defect table failed
f60 — message to port failure
f63 — message reception failure
f66 — process timed out
f69 — failed to close special device file
f72 — failed to release special device file
f75 — failed to unreserve UCB
f78 — failed to close ECD
f81 — terminated externally with signal number

c = System error code. See System Error Codes Output Appendix, SYSERR-APP.

d = Number of failures (bad sectors) found during the verify step.

e = Relative track number of the indicated bad sector. The track number is relative to the beginning of the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management.

f = Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management.

g = Physical head number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management.

h = Sector number in use when the failure occurred. It is a relative number 0 to 31.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

A termination report that specifies a verification failure indicates that format information on the MHD disk pack could not be read or is incorrect and could not be corrected. This MHD and disk pack should NOT be used until the problem is corrected. The HEAD and TRACK information is output to provide data in helping to determine if the problem is in the MHD (head alignment) or in the disk pack (bad surface).

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

This alarm is either a manually-requested report or an automatically-generated report for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

```

2. REASON FOR OUTPUT

To report the status of a request to format a moving head disk (MHD).

If the format process was invoked via the `INIT MHD` poke on the disk file storage access (DFSA) display page during disk independent operation (DIOP) mode, a `REPT-DKDIP` message will precede the output message line.

3. VARIABLE FIELD DEFINITIONS

a = MHD member number.

b = Process step or reason code.

f01 — failed to `fopen() /tmp` file
f03 — `fseek()` failed on the output file
f06 — failed to open ECD
f09 — failed to get UCB by name

SEE PROPRIETARY NOTICE ON COVER PAGE

f0a — `TRACK` or `BLOCK` or `NEW` are not valid for small computer system interface (SCSI) MHD
f0c — `TRACK` is not valid for SCSI MHD
f0e — single block format not allowed for SCSI disk
f12 — `BLOCK` is not valid for storage module device (SMD) MHD
f18 — failed to reserve UCB
f1b — failed to assign special device file name
f1d — failed to open device file
f21 — failed to set I/O mode of device file
f24 — failed to enable message reception
f27 — see DKDRV report on the ROP
f30 — DFC is not in S_ACT state
f33 — MHD size not recognized
f36 — see DKDRV report on the ROP
f37 — DKDIP virtual address translation failure
f39 — see DKDRV report on the ROP
f42 — DFC RAM read failed
f45 — verify data overwritten - repeat input request starting from track number
f46 — start block greater than LBA
f47 — see DKDRV report on the ROP
f48 — DKDIP virtual address translation failure
f49 — see DKDRV report on the ROP
f4c — read of the DFC head UPT failed
f4e — see DKDRV report on the ROP
f52 — read of the DFC firmware UPT failed
f55 — failed to get UCB of the MHD's SBUS by RID
f58 — see DKDRV report on the ROP
f5b — read of the verify failure data failed
f5e — invalid verify data
f63 — `lseek()` to "combined" defect table failed
f64 — DKDIP virtual address translation failure
f66 — first read of defect table failed
f69 — `lseek()` to "combined" defect table failed
f6a — DKDIP virtual address translation failure
f6c — second read of defect table failed
f6e — message to port failure
f71 — message reception failure
f72 — manual abort requested
f73 — manual abort requested
f74 — process timed out
f78 — failed to close special device file
f7c — failed to release special device file
f7f — failed to unreserve UCB
f83 — failed to close ECD
f86 — terminated externally with signal
f94 — see DKDRV report on the ROP
f99 — message to port failure
f9c — message reception failure
f9f — see DKDRV report on the ROP

SEE PROPRIETARY NOTICE ON COVER PAGE

fa1 — failed to get the segment number
fa5 — SCSI "inquiry" command failed
fa9 — failed to get the segment number
fb1 — SCSI "mode sense" command failed
fb2 — data overflow - too many block descriptors
fb5 — failed to get the segment number
fb9 — SCSI "mode select" command failed
fc1 — see DKDRV report on the ROP
fc6 — failed to get the segment number
fc9 — SCSI "read capacity" command failed

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = Number of failures (bad sectors for SMD MHD or bad blocks for SCSI MHD) found during the verify step.

e = Relative track number of the indicated bad sector. The track number is relative to the beginning of the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management. This variable field only applies to an SMD MHD.

f = Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

g = Physical head number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

h = Sector number in use when the failure occurred. It is a relative number from 0 to 31. This variable field only applies to an SMD MHD.

i = Logical disk block number of the bad disk block found on the SCSI disk drive during the verify stage.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the resource limitation problem and input the request again.

A termination report that specifies a verification failure means that the indicated disk or sectors or blocks had uncorrectable data errors or that the format information contained in the sector headers was not as expected. This MHD and disk pack should NOT be used until the problem is corrected. If the pack is an SMD drive, the HEAD and TRACK information is output to provide data in helping to determine if the problem is in the MHD (head alignment) or in the disk pack (bad surface). If the disk is an SCSI drive, the BLOCK information is output for possible use by the SCSI embedded controller to reassign to a good disk block.
A termination report specifying completion indicates that all directives of the input request

SEE PROPRIETARY NOTICE ON COVER PAGE

were done and no failures were encountered.

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

[3] `INIT MHD` *a* `EARLY TERM VFY FAILED` *d*
`BLOCKS BLOCKS BLOCKS BLOCKS`
i [*i*] [*i*] [*i*]

[4] `INIT MHD` *a* `ABORTED` *b*
`ERROR DATA` *j k l m n*

2. REASON FOR OUTPUT

To report the status of a request to format a moving head disk (MHD).

This report may be invoked by either executing an `INIT:MHD` input message or by poking `INIT MHD`.

If the format process was invoked via the `INIT MHD` poke on the DFSA display page during disk independent operation (DIOP) mode, a `REPT-DKDIP` message will precede the output message.

Format 4 provides additional error information when an explicit small computer system interface (SCSI) command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

a = MHD member number.

b = Process step or reason code.

f01 — failed to `fopen() /tmp` file

fc6 — failed to get the segment number
fc9 — SCSI "read capacity" command failed
ffe — aborted due to phase 1

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = Number of failures (bad sectors for SMD MHD or bad blocks for SCSI MHD) found during the verify step.

e = Relative track number of the indicated bad sector. The track number is relative to the beginning of the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management. This variable field only applies to an SMD MHD.

f = Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

g = Physical head number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

h = Sector number in use when the failure occurred. It is a relative number from 0 to 31. This variable field only applies to an SMD MHD.

i = Logical disk block number of the bad disk block found on the SCSI disk driver during the verify operation.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Command completion word. The command completion word is eight hexadecimal digits in the form AAAABBCC.

AAAA = SCSI job block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, DFC-APPK.

BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, DFC-APPK.

CC = Fill. Not used.

k = First word of extended sense data (ESD). See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits in the form AABBCCDD.

AA = Byte 0 of ESD.

BB = Byte 1 of ESD.

CC = Byte 2 of ESD.

DD = Byte 3 of ESD.

l = Second word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits in the form AABBCCDD.

AA = Byte 4 of ESD.

BB = Byte 5 of ESD.

CC = Byte 6 of ESD.

DD = Byte 7 of ESD.

m = Third word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits in the form AABBCCDD.

AA = Byte 8 of ESD.

BB = Byte 9 of ESD.

CC = Byte 10 of ESD.

DD = Byte 11 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

n = Fourth word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits in the form AABBCCDD.

AA = Byte 12 of ESD.

BB = Byte 13 of ESD.

CC = Byte 14 of ESD.

DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

A termination report specifying a verification failure indicates that format information on the disk media could not be read, or is incorrect and could not be corrected. This disk media should not be used until the problem is corrected. For an SMD MHD, the HEAD and TRACK information is output to help determine if the problem is with the MHD (head alignment) or in the disk media (bad surface).

If Format 4 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report for information only.

There is a manual alarm for OMDB keys 147 and 666, and an information alarm for OMDB key 148.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

There is a major alarm for OMDB keys 146, 149, and 569.

SEE PROPRIETARY NOTICE ON COVER PAGE

MESSAGE CLASS . . MAINT

1. FORMAT

`LOAD ADDR` *a* [`,OFF` *b*] *c #d*

2. REASON FOR OUTPUT

To report the completion status of a `LOAD` input message.

3. VARIABLE FIELD DEFINITIONS

a = Virtual address, in hexadecimal notation (destination of the load).

b = Offset information from input message.

c = Termination report.

- `COMPLETED` — The `LOAD` operation has been successfully completed.
- `STOPPED NGADDR` — The `LOAD` message was stopped because the address specified is not valid.
- `STOPPED NGLOAD` — The `LOAD` message was stopped because some other error occurred.
- `STOPPED NGPROT` — The `LOAD` operation was stopped because the destination address does not have write permission granted.

d = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If *c* is `STOPPED NGADDR`, recheck the program listings.

If *c* is `STOPPED NGPROT`, recheck the destination to verify that it indicates a writable area. To change program text, use the `LOAD:UPNM` input message.

5. ALARMS

None. This alarm is a manually-requested report.

ID . . . . . LOAD-DFC,PUMP-C
GENERIC . . . . . UNIX RTR R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL

1. FORMAT

This message has six formats.

[1] `LOAD DFC` *a* `PUMP [CHECKSUM | FU] NOT STARTED` *b c*

[2] `LOAD DFC` *a* `PUMP [CHECKSUM | FU] STARTED`

[3] `LOAD DFC` *a* `PUMP [CHECKSUM | FU] STOPPED` *b c*

[4] `LOAD DFC` *a* `PUMP [CHECKSUM | FU] ERROR` *b c*

[5] `LOAD DFC` *a* `PUMP [CHECKSUM | FU] ABORTED` *b*

[6] `LOAD DFC` *a* `PUMP [CHECKSUM | FU] COMPLETED` *d*

2. REASON FOR OUTPUT

To report the result of executing a `LOAD:DFC;PUMP` input command.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the disk file controller (DFC).

b = Process step or reason code:

f03 — failed to open the ECD
f06 — failed to get UCB by name
f07 — DFC is not an SCSI device
f09 — failed to open the pump file
f0a — pump file is zero length (bytes) in size
f0c — failed to allocate buffer
f0e — failed to read the pump file header
f13 — failed to reserve the UCB
f16 — failed to assign special device file name for DFC
f19 — failed to open special device file for DFC
f1b — failed to enable message reception
f1d — see DKDRV report on the ROP
f1f — DFC is not active
f22 — see DKDRV report on the ROP
f25 — failed to close special device file
f28 — failed to re-open special device file for DFC
f2a — DFC auto pump failed
f2c — failed to allocate a segment for buffer
f2e — DFC pump failed

SEE PROPRIETARY NOTICE ON COVER PAGE

f31 — failed to notify DKDRV of the pump procedure completion
f34 — process timed out
f37 — failed to close special device file
f3a — failed to release special device file
f3c — failed to unreserve UCB
f3e — failed to close ECD
f3f — failed to close the pump file
f41 — read of the pump file failed
f44 — message to port failure
f47 — message reception failure
f4c — terminated externally with signal
f4e — invalid magic number in pump file header
f51 — invalid pump file header
f54 — unused portion of the pump file header is not zero

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = There are two formats for this field:

VALID PUMPCODE — pumpcode has passed the hashsum check

INVALID PUMPCODE — pumpcode failed the hashsum check

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried. The pump failure can also be caused by the incompatibility between the pumpcode and firmware. The pump can also fail due to a corrupted pumpfile. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

None. This alarm is a manually-requested report.

Output Message
LOAD-DFC,PUMP

ID . . . . . LOAD-MHD-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`LOAD MHD` *a* `FROM TD` *b c* [*d*]
[*e*]

2. REASON FOR OUTPUT

To report the status of a request to load a disk from tape during disk independent operation (DIOP) mode in response to the `LOAD MHD` poke on the DFSA display page.

3. VARIABLE FIELD DEFINITIONS

a = MHD member number to be loaded.

b = Pathname used to access the tape unit.

c = Status of request:

`STARTED`	— Poke parameters accepted.
`IN PROGRESS`	— Message indicating normal progress.
`STOPPED`	— Process stopped by a poke request.
`ABORTED`	— Process aborted due to error.
`ERROR`	— Process aborted due to tape error.
`MOUNT NEXT TAPE`	— Directive to mount next tape.
`COMPLETED`	— Process completed successfully.

If *c* = `ABORTED`,

d = One of the following error codes.

f00 — invalid option, abort the command in progress
f03 — `entry()` function call failed
f06 — ECD access failed
f09 — failed to open the disk unit
f12 — invalid `segsize` or buffer address
f15 — failed to open the tape device
f18 — header read failed
f21 — header check failed
f24 — wrong tape mounted
f27 — tape is out of sequence
f30 — tape sequence ID is incorrect
f33 — tape sequence ID is incorrect
f36 — boot flags do not match
f39 — tape sequence ID is incorrect
f42 — GENERIC and DB tapes not made with same generic

SEE PROPRIETARY NOTICE ON COVER PAGE

f45 — first tape read failed
f48 — first disk seek failed
f51 — first disk seek failed
f54 — second tape read failed
f57 — second disk seek failed
f60 — second disk write failed
f63 — tape block size invalid
f66 — header read failed
f69 — header check failed
f72 — tape close failed
f75 — trashed header on the tape
f78 — internal error
f81 — mount tape timeout

If *c* = ERROR,

e = One of the following messages:

REPT HEADER HASH SUM CHECK FAILED
The calculated header hash sum on the tape does not match the recorded header hash sum on the tape.

REPT DATA HASH SUM CHECK FAILED
The calculated data hash sum on the tape does not match the recorded data hash sum on the tape.

4. ACTION TO BE TAKEN

A hash sum check message indicates that data on the tape is corrupted. Verify the integrity of the tape and/or the tape unit. Correct any problems and repeat the input request.

5. ALARMS

None. This alarm is a manually-requested report.

`f45` — first tape read failed
`f48` — first disk seek failed
`f51` — first disk write failed
`f54` — second tape read failed
`f57` — second disk seek failed
`f60` — second disk write failed
`f63` — tape block size invalid
`f66` — read of tape header failed
`f69` — tape header check failed
`f72` — tape close failed
`f75` — tape header is inconsistent
`f81` — mount tape timeout
`f85` — `opcltape()` called with invalid flag
`f89` — `ioqueuem()` call failed
`f8d` — `waitack()` call failed
`f91` — failed to open tape device
`f95` — failed to close tape device
`f99` — `ioqueuem()` call failed
`f9d` — `waitack()` call failed
`fa1` — tape header read failed
`fa5` — read of tape header exceeded retry count
`fa9` — bufsize or tpblksize invalid
`fad` — `ioqueuem()` call failed
`fb1` — `waitack()` call failed
`fb5` — data read failed
`fb9` — read of tape exceeded retry count
`fbd` — `readtape()` tpblocks problem
`fc1` — tape I/O message timed out
`fc5` — failed to close tape device
`fc9` — failed to close disk device
`fcc` — invalid common generic tape syncword
`fcd` — tape syncword invalid for 3B21D platform
`fce` — tape syncword invalid for 3B20D platform

SEE PROPRIETARY NOTICE ON COVER PAGE

`fcf` — invalid ecdorg model field
`fd1` — header hash sum check failed
`fd5` — data hash sum check failed
`fd9` — failed to get tape logdev record
`fdd` — failed to get tape MDCT record
`fe1` — failed to get tape UCB record
`fe5` — failed to get tape device driver PID
`fe9` — failed to get MHD UCB record by name
`ffe` — aborted due to phase 1

4. ACTION TO BE TAKEN

A hash sum check message indicates that data on the tape is corrupted. Verify the integrity of the tape and/or the tape unit. Correct any problems and repeat the input request.

5. ALARMS

None. This alarm is a manually-requested report.

`fb5` — data read failed
`fb9` — read of tape exceeded retry count

SEE PROPRIETARY NOTICE ON COVER PAGE

`fbd` — `readtape()` tpblocks problem
`fc1` — tape I/O message timed out
`fc3` — failed to close tape device
`fc5` — failed to close disk device
`fc7` — failed to open rewind tape device
`fc9` — failed to close rewind tape device
`fca` — tape header session number does not match command line parameter
`fcb` — tape header volume number does not match command line parameter
`fcc` — invalid common generic tape syncword
`fcd` — tape syncword invalid for 3B21D platform
`fce` — tape syncword invalid for 3B20D platform
`fcf` — invalid ecdorg model field
`fd1` — header hash sum check failed
`fd5` — data hash sum check failed
`fd9` — failed to get tape logdev record
`fdd` — failed to get tape MDCT record
`fde` — invalid partition value for tape special device file
`fe1` — failed to get tape UCB record
`fe5` — failed to get tape device driver PID
`fe9` — failed to get MHD UCB record by name
`fea` — failed to open the tape device
`feb` — read of tape header failed
`fec` — invalid multi-volume tape
`fed` — failed to close no-rewind tape device
`fee` — failed to open rewind tape device
`fef` — failed to close rewind tape device
`ff0` — failed to open no-rewind tape device
`ff1` — failed to close no-rewind tape device
`ff2` — valid logical volume did not precede EOD
`ff3` — specified logical volume not found on tape
`ff4` — specified logical volume not found on tape
`ff5` — specified session not found on tape
`ff6` — read of tape header failed
`ff7` — invalid multi-volume tape
`ff8` — sessions are not sequential
`ff9` — volumes are not in ascending order
`ffa` — specified logical volume not found on tape
`ffb` — specified logical volume not found on tape
`ffc` — failed to close no-rewind tape device
`ffe` — aborted due to phase 1

e = Multi-volume Digital Audio Tape (DAT) session number.

f = Multi-volume Digital Audio Tape (DAT) volume number.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

[5] `LOAD MHD` *a* `DEFECT TABLE COMPLETED` *d*

2. REASON FOR OUTPUT

To report the result of executing a `LOAD:MHD;DEFECT` input message.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the moving head disk (MHD).

b = Process step or reason code.

f03 — failed to open input file
f06 — cannot open equipment configuration database (ECD)
f09 — cannot get unit control block (UCB) of unit by name
f12 — cannot reserve UCB
f15 — cannot assign special device file name
f18 — cannot open special device file
f21 — cannot set input/output mode of device file
f24 — cannot enable message reception
f27 — see accompanying disk driver (DKDRV) error report on the receive-only printer (ROP)
f30 — disk file controller (DFC) is not in S_ACT state
f33 — drive size not supported by defect management
f36 — MHD size not recognized
f37 — read of defect spec file not correct
f39 — `lseek` to mfgr disk address failed
f42 — disk write failed
f45 — too many defects specified
f48 — incorrect defect spec file format
f51 — cylinder number out of range
f54 — head number out of range
f57 — sector number out of range
f60 — defects not sorted in ascending order by head

SEE PROPRIETARY NOTICE ON COVER PAGE

f63 — defects not sorted in ascending order by cylinder
f66 — message to port failure
f69 — message reception failure
f72 — process timed out
f75 — failed to close special device file
f78 — failed to release special device file
f81 — failed to unreserve UCB of unit
f84 — failed to close ECD

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = Number of defect written.

4. ACTION TO BE TAKEN

A termination report that specifies noncompletion provides an error code that usually indicates a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

None. This alarm is a manually-requested report.

`[WARNING: NUMBER OF DEFECTS ON A CYLINDER EXCEEDS THE LUCENT RECOMMENDATION ]`

2. REASON FOR OUTPUT

To report the result of executing a `LOAD:MHD;DEFECT` input message.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Process step or reason code.

f03 — failed to `fopen()` input file
f06 — failed to open ECD
f09 — failed to get UCB by name
f12 — failed to reserve UCB
f15 — failed to assign special device file name
f18 — failed to open special device file
f21 — failed to set I/O mode of device file
f24 — failed to enable message reception
f26 — clear of media access error counter failed
f27 — see DKDRV report on the ROP

SEE PROPRIETARY NOTICE ON COVER PAGE

f30 — DFC is not in S_ACT state
f33 — drive size not supported by defect management
f36 — MHD size not recognized
f39 — `lseek()` to "mfgr" disk address failed
f42 — disk write failed
f44 — clear of MHD media access error counter failed
f46 — too many defect blocks specified
f48 — incorrect defect spec file format
f4a — block number not sorted in ascending order
f4b — block number is out of range
f4c — failed to get the segment number
f53 — see DKDRV report on ROP
f56 — Small computer system interface (SCSI) "reassign block" command failed
f59 — too many defects specified
f6c — incorrect defect spec file format
f6e — cylinder number out of range
f71 — head number out of range
f73 — sector number out of range
f76 — head number not sorted in ascending order
f79 — cylinder number not sorted in ascending order
f82 — message to port failure
f85 — message reception failure
f88 — process timed out
f8c — failed to close special device file
f8e — failed to release special device file
f91 — failed to unreserve UCB
f93 — failed to close ECD
f96 — terminated externally with signal
f99 — see DKDRV report on ROP
f9c — read of the SCSI defect header failed
f9f — see DKDRV report on ROP
fa2 — read of the SCSI defect list failed
fa5 — failed to get the segment number
fa8 — message to port failure
fab — message reception failure
fae — failed to get the segment number
fb1 — see DKDRV report on the ROP
fb3 — SCSI "inquiry" command failed
fb9 — drive not formatted with 512 bytes per logical block
fba — data overflow - too many block descriptors
fbd — data overflow - too many block descriptors
fc2 — failed to get the segment number
fc4 — see DKDRV report on the ROP
fc6 — SCSI "read capacity" command failed
fc9 — failed to get the segment number
fcb — see DKDRV report on the ROP
fce — SCSI "mode sense" command failed
fd2 — failed to get the segment number
fd4 — see DKDRV report on the ROP

SEE PROPRIETARY NOTICE ON COVER PAGE

fd6 — SCSI "mode sense" command failed
fd9 — `diskinfo()` library call failed
fdb — unknown defect limit type
fde — unexpected UCB equipage value

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

d = Number of defect written.

4. ACTION TO BE TAKEN

A termination report that specifies noncompletion provides an error code that usually indicates a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following.

The number of `GROWN` defects should be no more than a recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (`PRIMARY` and `GROWN` defects) should not exceed the Lucent Technologies specification for the disk drive. If the disk has more than the number of defects allowed, the disk drive could become unreliable.

The total number of defects (`PRIMARY` and `GROWN` defects) on a cylinder should not exceed the recommended limit. If the number of defects on a cylinder is larger than the limit, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the 3B20D or 3B21D system.

Lucent Technologies recommends that the SCSI disk should be replaced if there is any warning output related to the above recommendations.

NOTE: For a SCSI disk, after the new defect blocks are loaded, all the previous information about the bad blocks (defects) becomes invalid. For example, bad logical block number 3 is not physically the same block after being loaded; in fact, it is now a good block number 3. Therefore, only a new defect(s) detected since the previous `LOAD:MHD;DEFECT` command should be included in the specfile used for loading new defects into the `GROWN` defect list.

5. ALARMS

None. This alarm is a manually-requested report.

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = Number of defects written.

e = Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.

AAAA = SCSI job block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, DFC-APPK.

BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, DFC-APPK.

CC = Fill. Not used.

f = First word of extended sense data (ESD). See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 0 of ESD.

BB = Byte 1 of ESD.

CC = Byte 2 of ESD.

DD = Byte 3 of ESD.

g = Second word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 4 of ESD.

BB = Byte 5 of ESD.

CC = Byte 6 of ESD.

DD = Byte 7 of ESD.

h = Third word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 8 of ESD.

BB = Byte 9 of ESD.

CC = Byte 10 of ESD.

DD = Byte 11 of ESD.

i = Fourth word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 12 of ESD.

BB = Byte 13 of ESD.

CC = Byte 14 of ESD.

DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

A termination report that specifies noncompletion provides an error code that usually indicates a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following.

The number of GROWN defects should be no more than a recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) should not exceed the Lucent Technologies specification for the disk drive. If the disk has more than the number of defects allowed, the disk drive could become unreliable.

SEE PROPRIETARY NOTICE ON COVER PAGE

The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the recommended limit. If the number of defects on a cylinder is larger than the limit, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the 3B20D or 3B21D system.

Lucent Technologies recommends that the SCSI disk should be replaced if there is any warning output related to the above recommendations.

NOTE: For SCSI disk, after new defect blocks are loaded, all the previous information about bad blocks (defects) becomes invalid. For example, bad logical block number 3 is not physically the same block after being loaded; in fact, it is now a good block number 3. Therefore, only a new defect (or defects) detected since the previous LOAD:MHD;DEFECT command should be included in the specfile used for loading new defects into the GROWN defect list.

If Format 7 or Format 8 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

None. This alarm is a manually-requested report.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

A termination report that specifies noncompletion provides an error code that usually indicates a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following.

The number of GROWN defects should be no more than a recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) should not exceed the Lucent Technologies specification for the disk drive. If the disk has more than the number of defects allowed, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the recommended limit. If the number of defects on a cylinder is larger than the limit, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the 3B20D or 3B21D system.

SEE PROPRIETARY NOTICE ON COVER PAGE

Lucent Technologies recommends that the SCSI disk should be replaced if there is any warning output related to the above recommendations.

NOTE: For SCSI disk, after new defect blocks are loaded, all the previous information about bad blocks (defects) becomes invalid. For example, bad logical block number 3 is not physically the same block after being loaded; in fact, it is now a good block number 3. Therefore, only a new defect (or defects) detected since the previous `LOAD:MHD;DEFECT` command should be included in the specfile used for loading new defects into the `GROWN` defect list.

If Format 7 or Format 8 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

None. This alarm is a manually-requested report.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

A termination report that specifies noncompletion provides an error code that usually indicates a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following.

The number of GROWN defects should be no more than a recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) should not exceed the Lucent Technologies specification for the disk drive. If the disk has more than the number of defects allowed, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the recommended limit. If the number of defects on a cylinder is larger than the limit, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the 3B20D or 3B21D system.

SEE PROPRIETARY NOTICE ON COVER PAGE

Lucent Technologies recommends that the SCSI disk should be replaced if there is any warning output related to the above recommendations.

NOTE: For SCSI disk, after new defect blocks are loaded, all the previous information about bad blocks (defects) becomes invalid. For example, bad logical block number 3 is not physically the same block after being loaded; in fact, it is now a good block number 3. Therefore, only a new defect (or defects) detected since the previous `LOAD:MHD;DEFECT` command should be included in the specfile used for loading new defects into the `GROWN` defect list.

If Format 7 or Format 8 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

None. This alarm is a manually-requested report.

Output Appendix
SYSERR-APP

Input Message
LOAD:MHD;FIRMWARE

ID . . . . . LOAD-PMEM
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
LOAD PMEM a #b
ADDRESS (HEX) OLD VALUE (HEX) <- NEW VALUE (HEX)
 [c    d            <-   e]
```

2. REASON FOR OUTPUT

To report the completion status of a LOAD input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination report:

- COMPLETED — The LOAD operation has been successfully completed.
- STOPPED NGADDR — The LOAD message was stopped because the address specified is not valid.
- STOPPED NGLOAD — The LOAD message was stopped because some other error occurred.
- STOPPED NGPROT — The LOAD operation was stopped because the destination address does not have write permission granted.

b = Generic access package (GRASP) execution sequence number.

c = Address of word of physical memory that was modified.

d = Original value of specified word of physical memory.

e = New value of specified word of physical memory.

4. ACTION TO BE TAKEN

If *a* is STOPPED NGADDR, recheck the program listings.

If *a* is STOPPED NGPROT, recheck the destination to verify that it indicates a writable area. To change program text, use the LOAD:UPNM input message.

5. ALARMS

ID . . . . . OP-ABD
GENERIC . . . . . UNIX RTR 21.27 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1]
```
OP ABD STOPPED
{HARDWARE PLATFORM NOT VALID FOR ALTERNATE BOOT DISK |
ALTERNATE BOOT DISK FEATURE UNAVAILABLE |
CANNOT CREATE BOOTDISKCHK PROCESS |
CANNOT SEND MESSAGE TO BOOTDISKCHK PROCESS |
DID NOT RECEIVE MESSAGE FROM BOOTDISKCHK PROCESS |
CANNOT GET ECD DATA SEGMENTS |
CANNOT ATTACH TO ECD DATA SEGMENTS |
CANNOT GET ECDORG RID |
NO UCB RID FOUND FOR DEVICE WITHIN THE ECD |
CANNOT CREATE DATA FILE FOR REPORT |
DID NOT RECEIVE USER EVENT FROM BOOTDISKCHK PROCESS |
BOOTDISKCHK PROCESS TERMINATED WITH EXIT VALUE a}
```

[2]
```
OP ABD IN PROGRESS
```

[3]
```
OP ABD COMPLETED
MHD  STATUS  REASON  DATE
 b      c      [d [e]]   [f]
```

2. REASON FOR OUTPUT

To display a list of available Alternate Boot Disk units and specify whether or not the unit may be used as a boot disk. If a unit is determined to be a valid boot disk, the date of the last update to the disk will be output if applicable. Otherwise, a special code will be output to explain why the unit cannot be used as a boot disk or why a determination could not be made.

NOTE: Only data from the primary partitions is used to determine if a unit is a valid boot disk. No checking is done on the backup partitions.

3. VARIABLE FIELD DEFINITIONS

a = Exit value of */unixutil/disk/bootdiskchk* process. See Bootdiskchk Codes Appendix, BOOTDISKCHK-APP, Exit Codes.

b = Unit number. See Input/Output Member Numbers Appendix, MEM-NUM-APPC, Table C.

c = Boot status.

- YES — The unit is bootable from its primary partitions.
- NO — The unit is not bootable from its primary partitions.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = A code to indicate why the unit was not marked as a valid boot disk. See Bootdiskchk Codes Appendix, BOOTDISKCHK-APP, Result Codes.

e = System error code number. See System Error Codes Output Appendix, APP-SYSERR.

f = Date when the boot disk was last updated.

4. ACTION TO BE TAKEN

If the description of the error is not self-explanatory, seek technical assistance.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report for information only.

6. REFERENCES

2. REASON FOR OUTPUT

This report contains device information specific to hardware units on communities requested via the OP:ACT input message. The format is consistent with related maintenance commands.

The exit status of this report is indicated by either the successful COMPLETED message, or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Unit names are listed in the Member Numbers Appendix, MEM-NUM-APPC, Table C.

b = Unit number. See Member Numbers Appendix, MEM-NUM-APPC, Table C.

c = Subunit name, if *a* = CU. CU subunit names are listed in the Member Numbers Appendix, MEM-NUM-APPD, Table D.

d = Subunit number. See Member Numbers Appendix, MEM-NUM-APPC, Table C.

e = The current maintenance state of the unit is indicated by the following identifiers.

ACT — Active units.
OOS — Out-of-service units.
STBY — Standby units.
GROW — Units being grown.
UNAV — Unavailable units.
INIT — Initializing units.
OFL — Off-line units.
UNEQIP — Unequipped units.

f = This field indicates the current inhibit status of the associated error source. The inhibit status may either be inhibited or allowed and is represented by INH and ALW respectively.

g = The results of the last diagnostic on the unit is indicated by the following identifiers.

ATP — All tests pass.
STF — Some test failing.
NTR — No tests run.
CATP — Conditional all tests pass.
ABT — Aborted diagnostics.

h = Error number.

9 — Cannot attach to plant measurement library.
11 — Cannot open equipment configuration database (ECD) sequence.
12 — Cannot sequence unit control blocks (UCBs).

i = Retry the command later for the following reasons.

```
CANNOT SEQUENCE DATABASE
CANNOT CREATE FILE IN /tmp
CANNOT GET DATABASE RECORD ID
```

j = Temporary output file name.

k = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

This alarm is either a manually-requested report or is automatically-generated. Action may or may not be required.

1. FORMAT

This message has four formats.

[1]
```
OP AUD a
ROUTINE AUDIT SCHEDULING IS b
AUDIT    AUDIT     AUDIT  MODE   INSTANCE    INS  MODE RTN
NAME   MBR    RID   INH   PERM  RID   NAME   INH  ACT  SCH BLK
 c    d    e   f   ghij  k   l    m   n   o  p
```

[2]
```
OP AUD ABORTED ECD INTERFACE ERROR q [AUDIT RID r]
```

[3]
```
OP AUD ABORTED CANNOT OPEN OUTPUT FILE s
```

[4]
```
OP AUD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS t
RETRY LATER u
```

2. REASON FOR OUTPUT

Format 1 prints the status of the audits controlled by the system integrity monitor (SIM).

Format 2 reports an equipment configuration data base (ECD) database interface error.

Format 3 reports an error when trying to create a temporary output file.

Format 4 reports the termination status of the `OP:AUD` input message.

3. VARIABLE FIELD DEFINITIONS

a = Output message status. One of the following.

`COMPLETED`	— Final or only message segment.
`COMPLETED`	— No audit records in ECD.
`IN PROGRESS`	— Second or subsequent message segment.
`STARTED`	— First of several message segments.

b = Master audit inhibit status for all audits controlled by SIM. One of the following.

`ALLOWED` - Not inhibited.
`AUTOMATICALLY INHIBITED`
`IN UNKNOWN STATE`
`MANUALLY INHIBITED`

c = Audit name. This field is blank for all instances after the first.

d = Member number. This field is blank for all instances after the first.

e = Record identification (RID) of the audit record from the ECD. This field is blank for all instances after the first.

f = Source of the inhibit: blank if the audit is not inhibited. This field is blank for all instances after the first. One of the following.

AUTO — Automatic action.
MAN — Manual request.
??? — Unrecognized reason.

If the inhibit source is enclosed by parentheses, it indicates that the inhibit state for the audit is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permission fields). This inhibit will not cause the audit to appear in the REPT-AUDSTAT report.

g = R if routine mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

h = M if manual mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

i = S if software mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

j = D if demand mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

k = Record identifier (RID) of the instance record from ECD.

l = Instance name. This field may be blank.

m = Inhibit state of a given instance of the audit; blank if the audit is not inhibited. One of the following.

AUTO — Automatic action.
MAN — Manual request.
??? — Unrecognized reason.

If the inhibit state is enclosed by parentheses, it indicates that the inhibit state for the instance is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permissions fields). This inhibit will not cause the audit to appear in the REPT-AUDSTAT report.

n = Mode in which the given instance of the audit is running or blank if the instance is not running. One of the following.

DEM — Part of a recovery sequence.
MAN — Manually requested.
RTN — Routine scheduling.
SFT — Software request.
??? — Unrecognized mode.

SEE PROPRIETARY NOTICE ON COVER PAGE

o = Scheduling frequency of the audit.

A through H — Frequency group of audit.
T — Timed audit.
(blank) — Audit is neither timed nor routine.

p =

Y — This instance of the audit is blocked.
(blank) — This instance of the audit is not blocked.

If Y is enclosed in parentheses, it indicates that the audit is blocked, but the block has no meaning because the audit is not permitted to run in any mode (see description for mode permission fields). This block will not cause the audit to appear in the REPT-AUDSTAT report.

q = ECD interface error number.

10 — cannot open audit record sequence
11 — cannot sequence through audit records
12 — cannot get audit record
20 — cannot open audit instance record sequence
21 — cannot sequence through instance records

r = Audit record RID.

s = Name of temporary file.

t = Explanation of error. See Audit Appendix C, AUD-APPC.

u = Explanation of error. See Audit Appendix D, AUD-APPD.

NOTE: See Audit Appendixes A and B, AUD-APPA and AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

Use the ALW:AUD input message to allow audits which should be allowed. Use the INH:AUD input message to inhibit audits which should be inhibited. Use the STOP:AUD or STP:AUD input message to stop audits which should be stopped.

5. ALARMS

None. This automatically-generated report is for information only.

2. REASON FOR OUTPUT

Format 1 prints the status of the audits controlled by the system integrity monitor (SIM).

Format 2 reports an equipment configuration database (ECD) data base interface error.

Format 3 reports an error when trying to create a temporary output file.

Format 4 reports an error when writing to a temporary output file.

Format 5 reports the termination status of the `OP:AUD` input message.

3. VARIABLE FIELD DEFINITIONS

a = Output message status. One of the following.

`STARTED` — First of several message segments.

`IN PROGRESS` — Second or subsequent message segment.

`COMPLETED` — Final or only message segment.

`COMPLETED NO AUDIT RECORDS IN ECD` — Explains the lack of meaningful output. In the case of executing

OP:AUD;RUN, it means that no audits were running. In all other cases, it means that there are no audit records in the ECD.

b = Master audit inhibit status for all audits controlled by SIM. One of the following.

ALLOWED - Not inhibited.
AUTOMATICALLY INHIBITED
IN UNKNOWN STATE
MANUALLY INHIBITED

c = Audit name. This field is blank for all instances after the first.

d = Member number. This field is blank for all instances after the first.

e = Record identification (RID) of the audit record from the ECD. This field is blank for all instances after the first.

f = Source of the inhibit: blank if the audit is not inhibited. This field is blank for all instances after the first. One of the following.

AUTO — Automatic action.
MAN — Manual request.
??? — Unrecognized reason.

If the inhibit source is enclosed by parentheses, it indicates that the inhibit state for the audit is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permission fields). This inhibit will not cause the audit to appear in the REPT-AUDSTAT report.

g = R if routine mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

h = M if manual mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

i = S if software mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

j = D if demand mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

k = RID of the instance record from ECD.

l = Instance name. This field may be blank.

m = Inhibit state of a given instance of the audit; blank if the audit is not inhibited. One of the following.

AUTO — Automatic action.
MAN — Manual request.
??? — Unrecognized reason.

If the inhibit state is enclosed by parentheses, it indicates that the inhibit state for the instance is set. However, the inhibit has no

meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permissions fields). This inhibit will not cause the audit to appear in the REPT-AUDSTAT report.

n = Mode in which the given instance of the audit is running, or blank if the instance is not running. One of the following:.

DEM — Part of a recovery sequence.
MAN — Manually requested.
RTN — Routine scheduling.
SFT — Software request.
??? — Unrecognized mode.

o = Scheduling frequency of the audit.

A through H — Frequency group of audit.
T — Timed audit.
(blank) — Audit is neither timed nor routine.

p =

Y — This instance of the audit is blocked.

(blank) — This instance of the audit is not blocked.

If Y is enclosed in parentheses, it indicates that the audit is blocked, but the block has no meaning because the audit is not permitted to run in any mode (see description for mode permission fields). This block will not cause the audit to appear in the REPT-AUDSTAT report.

q = ECD interface error number.

10 — cannot open audit record sequence
11 — cannot sequence through audit records
12 — cannot get audit record
20 — cannot open audit instance record sequence
21 — cannot sequence through instance records

r = Audit record RID.

s = Name of temporary file.

t = Explanation of error. See Audit Appendix C, AUD-APPC.

u = Explanation of error. See Audit Appendix D, AUD-APPD.

NOTE: See Audit Appendixes A and B, AUD-APPA and AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

Use the ALW:AUD input message to allow audits which should be allowed. Use the INH:AUD input message to inhibit audits which should be inhibited. Use the STOP:AUD or STP:AUD input message to stop audits which should be stopped.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

2. REASON FOR OUTPUT

Format 1 prints the status of the audits controlled by the system integrity monitor (SIM).

Format 2 reports an equipment configuration data base (ECD) data base interface error.

Format 3 reports an error when trying to create a temporary output file.

Format 4 reports an error when writing to a temporary output file.

Format 5 reports an error when unable to create a uniquely named temporary file.

Format 6 reports the termination status of the `OP:AUD` input message.

3. VARIABLE FIELD DEFINITIONS

a = Output message status. One of the following:

`STARTED` — First of several message segments.

IN PROGRESS — Second or subsequent message segment.

COMPLETED — Final or only message segment.

```
COMPLETED NO AUDIT RECORDS IN ECD
COMPLETED NO AUDITS RUNNING
```

b = Master audit inhibit status for all audits controlled by SIM. One of the following.

```
ALLOWED - Not inhibited.
AUTOMATICALLY INHIBITED
IN UNKNOWN STATE
MANUALLY INHIBITED
```

c = Audit name. This field is blank for all instances after the first.

d = Member number. This field is blank for all instances after the first.

e = Record identification (RID) of the audit record from the ECD. This field is blank for all instances after the first.

f = Source of the inhibit; blank if the audit is not inhibited. This field is blank for all instances after the first. One of the following:

AUTO — Automatic action.
MAN — Manual request.
??? — Unrecognized reason.

If the inhibit source is enclosed by parentheses, it indicates that the inhibit state for the audit is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permission fields). This inhibit will not cause the audit to appear in the REPT-AUDSTAT report.

g = R if routine mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

h = M if manual mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

i = S if software mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

j = D if demand mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.

k = RID of the instance record from ECD.

l = Instance name. This field may be blank.

m = Inhibit state of a given instance of the audit; blank if the audit is not inhibited. One of the following.

AUTO — Automatic action.
MAN — Manual request.
??? — Unrecognized reason.

SEE PROPRIETARY NOTICE ON COVER PAGE

If the inhibit state is enclosed by parentheses, it indicates that the inhibit state for the instance is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permissions fields). This inhibit will not cause the audit to appear in the REPT-AUDSTAT report.

n = Mode in which the given instance of the audit is running, or blank if the instance is not running. One of the following.

DEM — Part of a recovery sequence.
MAN — Manually requested.
RTN — Routine scheduling.
SFT — Software request.
??? — Unrecognized mode.

o = Scheduling frequency of the audit.

A through H — Frequency group of audit.
T — Timed audit.
(blank) — Audit is neither timed nor routine.

p = Y — This instance of the audit is blocked.

(blank) — this instance of the audit is not blocked.

If Y is enclosed in parentheses, it indicates that the audit is blocked, but the block has no meaning because the audit is not permitted to run in any mode (see description for mode permission fields). This block will not cause the audit to appear in the REPT-AUDSTAT report.

q = ECD interface error number.

10 — cannot open audit record sequence
11 — cannot sequence through audit records
12 — cannot get audit record
20 — cannot open audit instance record sequence
21 — cannot sequence through instance records

r = Audit RID.

s = Name of temporary file.

t = Explanation of error. See Audit Appendix C, AUD-APPC.

u = Explanation of error. See Audit Appendix D, AUD-APPD.

NOTE: See Audit Appendixes A and B, AUD-APPA and AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If Formats 1, 2, or 6 prints, use the ALW:AUD input message to allow audits which should be allowed. Use the INH:AUD input message to inhibit audits which should be inhibited. Use the STOP:AUD or STP:AUD input message to stop audits which should be stopped.

Format 3 indicates all of the inodes of the tmp file system are being used. Clean up unused files in the tmp file system using CLR:FILESYS;FILE.

Format 4 indicates all tmp file system space has been used. Clean up unused files in the tmp file system using CLR:FILESYS;FILE.

Format 5 indicates system resources do not permit the running of this command at this time; retry later. If command continues to fail, seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1]
```
OP AUDERR a
 AUDIT                          ERRORS          ERROR    ERROR
NAME    MBR   INSTANCE     FOUND CORRECTED    CAT      COUNT
 b      c     d      e     f     g      h
```

[2] `OP AUDERR ABORTED ECD INTERFACE ERROR` *i* [`AUDIT RID` *j*]

[3] `OP AUDERR ABORTED CANNOT OPEN OUTPUT FILE` *k*

[4]
```
OP AUDERR NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS l
RETRY LATER m
```

2. REASON FOR OUTPUT

Format 1 prints the status of the audits controlled by the system integrity monitor (SIM).

Format 2 reports an equipment configuration database (ECD) interface error.

Format 3 reports an error when creating a temporary output file.

Format 4 reports the termination status of `OP:AUDERR` input message.

3. VARIABLE FIELD DEFINITIONS

a = Output message status:

`COMPLETED`	— Last or only segment of message.
`COMPLETED`	— No audit records in ECD.
`IN PROGRESS`	— Intermediate segment(s) of message.
`STARTED`	— First segment of message.

b = Name of the audit. This field is blank for all instances after the first.

c = Member number of the audit. This field is blank for all instances after the first.

d = Instance name which may be blank.

e = Total errors found by audit since the last bootstrap. This will be blank for all error categories after the first.

f = Total errors corrected by the audit since the last bootstrap. This will be blank for all error categories after the first.

SEE PROPRIETARY NOTICE ON COVER PAGE

g = Error category (0-5).

The error categories used by an audit are specified in its equipment configuration database ECD record. Each error category represents a different level of severity and type of recovery action. For examples, look at any of the audits and their associated Audit Error Table in the *System Maintenance Manual*.

h = Error count of the category.

i = ECD interface error number:

10 — cannot open audit record sequence
11 — cannot sequence through audit records
12 — cannot get audit record
20 — cannot open audit instance record sequence
21 — cannot sequence through instance records

j = Associated audit record RID.

k = Name of temporary file.

l = Explanation of error. See Audit Appendix C, AUD-APPC.

m = Explanation of error. See Audit Appendix D, AUD-APPD.

NOTE: See Audit Appendixes A and B, AUD-APPA and AUD-APPB, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

```

2. REASON FOR OUTPUT

Format 1 prints the status of the audits controlled by the system integrity monitor (SIM).

Format 2 reports an equipment configuration database (ECD) interface error.

Format 3 reports an error when creating a temporary output file.

Format 4 reports an error when writing to a temporary output file.

Format 5 reports the termination status of `OP:AUDERR` input message.

3. VARIABLE FIELD DEFINITIONS

a = Output message status.

- `COMPLETED` — Last or only segment of message.
- `COMPLETED` — No audit records in ECD.
- `IN PROGRESS` — Intermediate segment(s) of message.
- `STARTED` — First segment of message.

b = Name of the audit. This field is blank for all instances after the first.

c = Member number of the audit. This field is blank for all instances after the first.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Instance name which may be blank.

e = Total errors found by audit since the last bootstrap. This will be blank for all error categories after the first.

f = Total errors corrected by the audit since the last bootstrap. This will be blank for all error categories after the first.

g = Error category (0-5).

The error categories used by an audit are specified in its equipment configuration database ECD record. Each error category represents a different level of severity and type of recovery action. For examples, look at any of the audits and their associated Audit Error Table in the *System Maintenance Manual*.

[5] `OP AUDERR ABORTED CANNOT CREATE TEMPORARY FILE`

[6]
```
OP AUDERR NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS l
RETRY LATER m
```

2. REASON FOR OUTPUT

Format 1 prints the status of the audits controlled by the system integrity monitor (SIM).

Format 2 reports an equipment configuration database (ECD) interface error.

Format 3 reports an error when creating a temporary output file.

Format 4 reports an error when writing to a temporary output file.

Format 5 reports an error when unable to create a uniquely named temporary file.

Format 6 reports the termination status of `OP:AUDERR` input message.

3. VARIABLE FIELD DEFINITIONS

a = Output message status.

`STARTED` — first segment of message

`IN PROGRESS` — intermediate segment(s) of message

`COMPLETED` — last or only segment of message

`COMPLETED NO AUDIT RECORDS IN ECD`

b = Name of the audit. This field is blank for all instances after the first.

c = Member number of the audit. This field is blank for all instances after the first.

d = Instance name which may be blank.

e = Total errors found by audit since the last bootstrap. This will be blank for all error categories after the first.

f = Total errors corrected by the audit since the last bootstrap. This will be blank for all error categories after the first.

g = Error category (0-5). The error categories used by an audit are specified in its equipment configuration database ECD record. Each error category represents a different level of severity and type of recovery action. For examples, look at any of the audits and their associated Audit Error Table in the *System Maintenance Manual*.

h = Error count of the category.

i = ECD interface error number.

`10` — cannot open audit record sequence
`11` — cannot sequence through audit records
`12` — cannot get audit record
`20` — cannot open audit instance record sequence
`21` — Cannot sequence through instance records.

j = Associated audit record identification (RID).

k = Name of temporary file.

l = Explanation of error. See Audit Appendix C, `AUD-APPC`.

m = Explanation of error. See Audit Appendix D, `AUD-APPD`.

NOTE: See Audit Appendixes A and B, `AUD-APPA` and `AUD-APPB`, for assorted parsing errors when the IM catalog is not active.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If Formats 1, 2, or 6 prints, use the `ALW:AUD` input message to allow audits which should be allowed. Use `INH:AUD` input message to inhibit audits which should be inhibited. Use the `STOP:AUD` or `STP:AUD` input message to stop audits which should be stopped.

Format 3 indicates all of the inodes of the tmp file system are being used. Clean up unused files in the tmp file system using input message `CLR:FILESYS;FILE`.

Format 4 indicates all tmp file system space has been used. Clean up unused files in the tmp file system using input message `CLR:FILESYS;FILE`.

Format 5 indicates system resources do not permit the running of this command at this time; retry later. If command continues to fail, seek technical assistance.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report for information only.

```

2. REASON FOR OUTPUT

To give device information specific to hardware units on communities requested via the OP:CFGSTAT input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Unit names are listed in Member Numbers Appendix, MEM-NUM-APPC, Table C.

b = Unit number. See Member Numbers Appendix, MEM-NUM-APPC, Table C.

c = Subunit name, if *a* = CU. Control unit (CU) subunit names are listed in Member Numbers Appendix, MEM-NUM-APPC, Table C.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Subunit number. See the Member Numbers Appendix, MEM-NUM-APPC, Table C.

e = The current maintenance state of the unit is indicated by the following identifiers.

ACT — Active units.
GROW — Units being grown.
INIT — Initializing units.
OFL — Off-line units.
OOS — Out-of-service units.
STBY — Standby units.
UNAV — Unavailable units.
UNEQIP — Unequipped units.

f = Current inhibit status of the associated error source.

ALW — Allowed.
INH — Inhibited.

g = The results of the last diagnostic on the unit is indicated by the following identifiers.

ABT — Aborted diagnostics.
ATP — All tests passed.
CATP — Conditional all tests passed.
NTR — No tests were run.
STF — Some tests failed.

h = Error number.

9 — cannot attach to plant measurement library
11 — cannot open equipment configuration database (ECD) sequence
12 — cannot sequence unit control blocks (UCBs)

i = Retry the message later for one of the following reasons.

```
CANNOT SEQUENCE DATABASE
CANNOT CREATE FILE IN /tmp
CANNOT GET DATABASE RECORD ID
```

j = Temporary output file name.

k = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated. Action may or may not be required.

MESSAGE CLASS . . VAR

1. FORMAT

This message has two formats.

[1] `OP` *a b* `INFO` *c d [e]*

[2] `OP` *a b* `INFO`

```
Iop #  Pcslot   State   PackCode  Version  # Devices
-----  ------  -------  --------  -------  ---------
  f      g        h        i         j        k
 U_Name   Unit #  Port #   State   Logical Name
--------  ------  ------  -------  ------------------
   l        m       n        o         p
```

.
.
.

2. REASON FOR OUTPUT

To report the result of executing an `OP:[MTTYC,TTYC,HSDC,SDLC] a;INFO` input message.

3. VARIABLE FIELD DEFINITIONS

a = Device name.

b = Device member number.

c = Message State.

`NOT STARTED`

`STOPPED`

`ERROR`

`ABORT`

d = Process step or Error Code.

f01 — Failed to enable message reception.
f03 — Failed to open ECD.
f06 — Failed to get UCB by name.
f07 — Failed to get up UCB.
f08 — Failed to get down UCB.
f09 — Failed to get the side UCB.
f0a — UCB is not an IOP.

SEE PROPRIETARY NOTICE ON COVER PAGE

f0b — UCB is not a MTTYC, TTYC, HSDC or SDLC.
f0c — UCB is not a MTTY, ROP, SCC, TTY, HSD or SDL.
f0d — There is no controller for the device.
f0e — There is no IOP for the controller.
f10 — Failed to send message to I/O driver.
f11 — Failed to unreserve UCB.
f12 — Failed to receive ack. from I/O driver.
f13 — Failed to close ECD.
f14 — Failed to reserve UCB.
f15 — A message to driver has been lost, time out.
f16 — Terminated externally with signal.

e = System error code (set by libC functions, defined in sys/errno.h).

f = Unit number of IOP for the controller.

g = Slot number of controller in IOP.

h = Major State of controller.

i = Pack code.

j = Version number of controller. If the version number is 0x----, the version number was not accessible from the controller.

k = Number of devices used in controller.

l = Unit name of device.

m = Unit number of device.

n = Port number of device in controller.

o = Major State of device under controller.

p = The logical name from the logdev record associated with the device. If the logical name cannot be obtained, an error message is displayed.

0x01 — No mdct points to ucb.
0x02 — No logdev points to mdct.
0x03 — Unable to attach ecd segments.
0x04 — Unable to connect to ecd.
0x05 — Unable to read ecdorg record.
0x06 — Unable to open sequence to read mdct records.
0x07 — Error reading mdct record.
0x08 — Unable to open sequence to read logdev records.
0x09 — Error reading logdev record.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated IOP is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the

SEE PROPRIETARY NOTICE ON COVER PAGE

requested task. Clear the problem causing the resource limitation and try the request again.

5. ALARMS

None. This is a manually-requested report.

```

2. REASON FOR OUTPUT

To report the result of executing an `OP:[MTTY,ROP,SCC,TTY,HSD,SDL] a;INFO` input message.

3. VARIABLE FIELD DEFINITIONS

a = Device name.

b = Device member number.

c = Message State.

`NOT STARTED`

`STOPPED`

`ERROR`

`ABORT`

d = Process step or Error Code.

f01 — Failed to enable message reception.
f03 — Failed to open ECD.
f06 — Failed to get UCB by name.
f07 — Failed to get up UCB.
f08 — Failed to get down UCB.
f09 — Failed to get the side UCB.
f0a — UCB is not an IOP.
f0b — UCB is not a MTTYC, TTYC, HSDC or SDLC.
f0c — UCB is not a MTTY, ROP, SCC, TTY, HSD or SDL.
f0d — There is no controller for the device.

SEE PROPRIETARY NOTICE ON COVER PAGE

f0e — There is no IOP for the controller.
f10 — Failed to send message to I/O driver.
f11 — Failed to unreserve UCB.
f12 — Failed to receive ack. from I/O driver.
f13 — Failed to close ECD.
f14 — Failed to reserve UCB.
f15 — A message to driver has been lost, time out.
f16 — Terminated externally with signal.

e = System error code (set by libC functions, defined in sys/errno.h).

f = Name and unit number of controller for the device.

g = Pack code.

h = Port number.

i = Major States.

j = The logical name from the logdev record associated with the device. If the logical name cannot be obtained, an error message is displayed.

0x01 — No mdct points to ucb.
0x02 — No logdev points to mdct.
0x03 — Unable to attach ecd segments.
0x04 — Unable to connect to ecd.
0x05 — Unable to read ecdorg record.
0x06 — Unable to open sequence to read mdct records.
0x07 — Error reading mdct record.
0x08 — Unable to open sequence to read logdev records.
0x09 — Error reading logdev record.

k = Data Terminal Ready.

\- — the data was not accessible from the controller.
0 — the signal was not asserted.
1 — the signal was asserted.

l = Data Carrier Detect.

\- — the data was not accessible from the controller.
0 — the signal was not asserted.
1 — the signal was asserted.

m = Data Set Ready.

\- — the data was not accessible from the controller.
0 — the signal was not asserted.
1 — the signal was asserted.

n = Clear To Send.

\- — the data was not accessible from the controller.
0 — the signal was not asserted.
1 — the signal was asserted.

o = Ready To Send.

SEE PROPRIETARY NOTICE ON COVER PAGE

- — the data was not accessible from the controller.
0 — the signal was not asserted.
1 — the signal was asserted.

p = The physical level one layer attached to the device.

----- — the data was not accessible from the controller.
RS232 — interface is being used.
V.36 — interface is being used.
RS449 — interface is being used.
R232E — tn74 emulation mode with a RS232 interface is being used.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated IOP is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

5. ALARMS

None. This is a manually-requested report.

2. REASON FOR OUTPUT

To report the result of executing an `OP:DFC;INFO` input message.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the disk file controller (DFC).

b = Process step or reason code:

- `f03` — failed to open `/tmp/MHDINFO`*xxxxxx* output file
- `f06` — failed to open equipment configuration database (ECD)
- `f07` — failed to get next unit control block (UCB)
- `f09` — failed to get UCB by name
- `f13` — failed to assign special device file name for moving head disk (MHD)
- `f15` — failed to assign special device file name for DFC
- `f16` — failed to open special device file for MHD
- `f18` — failed to open special device file for DFC
- `f19` — failed to get UCB of DFC
- `f21` — failed to set input/output mode of device file
- `f24` — failed to enable message reception

SEE PROPRIETARY NOTICE ON COVER PAGE

`f27` — see accompanying disk driver (DKDRV) error report on the receive-only printer (ROP)
`f28` — see accompanying DKDRV error report on the ROP
`f29` — see accompanying DKDRV error report on the ROP
`f30` — failed to close special device file of unit
`f31` — failed to close special device file of unit
`f32` — failed to close special device file of unit
`f39` — failed to close ECD
`f40` — failed to release special device file of unit
`f41` — failed to release special device file of unit
`f42` — failed to release special device file of unit
`f48` — message reception failure
`f51` — message to port failure
`f54` — message reception failure
`f57` — process timed out
`f60` — failed to release UCB of unit for DFC
`f61` — failed to release UCB of unit
`f62` — failed to release UCB of unit

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

d = DFC microcode version.

— `NOT AVAILABLE`
— *e.f.g - h*

e = Version of `DFC MICROCODE`.
f = Issue of `DFC MICROCODE`.
g = Point issue of `DFC MICROCODE`.
h = Laboratory Design Issue (LDI) of `DFC MICROCODE`.

i = Unit number.

j = Device ID (drive ID plug number).

k = Physical port.

— The DFC physical port connection number is displayed if the `DFC MICROCODE VERSION` is 3.2.0 or later.
— `NA` (not available) indicates an earlier `DFC MICROCODE VERSION`, or the DFC was unavailable.

`NA` is also output if the unit is reserved.

l = Major status of unit.

m = Equipage (drive type), in megabytes.

160MB
300MB
340MB
675MB

— NA DFC was unavailable.

NA is also output if the unit is reserved.

n = Number of tracks on the disk drive.

Value — decimal number of disk tracks
NA — DFC was unavailable

NA is also output if the unit is reserved.

o = Validity of the VTOC.

VALID — VTOC has a valid VTOC entry
INVALID — could not find a valid VTOC entry
UNRDBLE — read error while trying to read VTOC
NA — could not reserve unit - VTOC not read

p = Usability.

YES
NO — disk data integrity is unknown

q = Unit reserved.

YES — unit is reserved for maintenance activity
NO — unit is not reserved

r = Unit essential.

Value — hexadecimal value of the essential field of the unit's UCB

s = Unit's mate.

Unit — name and number of duplex mate
SMPLX — unit has no mate

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

SEE PROPRIETARY NOTICE ON COVER PAGE

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If the unit is reserved, however, certain fields will contain information that is not available. For more complete information, try the command again after the unit is released.

Format 5 is the result of when the DFC or any of its associated units is reserved.

5. ALARMS

None. This alarm is a manually-requested report.

2. REASON FOR OUTPUT

To report the result of executing an `OP:DFC;INFO` input message.

Format 5 is output when all of the subunits of the disk file controller (DFC) are unequipped.

Format 6 is used to output data for a SMD DFC.

Format 7 is used to output data for a small computer system interface (SCSI) DFC equipped with only one SCSI bus (SBUS).

Format 8 is used to output data for a SCSI DFC equipped with more than one SBUS.

3. VARIABLE FIELD DEFINITIONS

a = DFC member number.

b = Process step or reason code.

`f01` — failed to enable message reception
`f03` — failed to open ECD
`f06` — failed to get UCB by name
`f09` — failed to get UCB of SBUS
`f0c` — failed to get UCB of DFC
`f0e` — failed to get UCB of DFC
`f11` — failed to assign SDF name for DFC
`f14` — failed to open SDF for DFC
`f17` — see DKDRV report on the ROP
`f1a` — failed to close special device file
`f1c` — failed to release special device file
`f1f` — failed to unreserve DFC UCB
`f23` — failed to get next UCB
`f26` — failed to assign SDF name for MHD
`f29` — failed to open SDF for MHD
`f2c` — failed to set I/O mode of device file

SEE PROPRIETARY NOTICE ON COVER PAGE

`f2f` — see DKDRV report on the ROP
`f33` — see DKDRV report on the ROP
`f36` — failed to close MHD SDF
`f37` — failed to release MHD SDF
`f38` — failed to unreserve MHD UCB
`f3e` — message to port failure
`f43` — message reception failure
`f46` — process timed out
`f49` — failed to close special device file
`f4c` — failed to release special device file
`f4f` — failed to unreserve UCB
`f53` — failed to close ECD
`f56` — terminated externally with signal

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

d = DFC firmware/pumpcode version.

`A.B.C` — `D`

`A` = Version of `DFC FIRMWARE/PUMPCODE`.

`B` = Issue of `DFC FIRMWARE/PUMPCODE`.

`C` = Point issue of `DFC FIRMWARE/PUMPCODE`.

`D` = Laboratory Design Issue (LDI) of `DFC FIRMWARE/PUMPCODE`.

`NAV` — The firmware or pumpcode versions are not available, or cannot be determined.

`NAP` — The pumpcode version is not applicable for SMD DFCs.

e = Unit number.

f = Device ID (drive ID number).

g = Physical port.

The physical port number is where the SMD MHD is connected to the DFC.

data — Physical port number.

`NAV` — The DFC is not available, or the DFC is reserved, or the SMD DFC firmware/pumpcode version is earlier than 3.2.0.

`NAP` — Not applicable for SCSI disks.

h = Major status of unit.

i = Number of tracks on the disk drive.

data — Decimal number of disk tracks.

NAV — DFC is not available, or the unit is reserved.

NAP — Not applicable for SCSI disks.

j = Validity of the volume table of contents (VTOC).

VALID — VTOC has a valid VTOC entry.

INVALID — Could not find a valid VTOC entry.

UNRDBLE — Read error while trying to read VTOC.

NAV — Could not reserve unit - VTOC not read.

k = Usability.

YES — Disk is considered usable.

NO — Disk data integrity is unknown.

l = Unit reserved.

YES — Unit is reserved for maintenance activity.

NO — Unit is not reserved.

m = Unit essential.

data — Hexadecimal value of the essential field of the unit's UCB.

n = Unit's mate.

Unit — Name and unit number of duplex mate.

SMPLX — Unit has no mate.

o = Equipage size based on the physical drive.

For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

NAV — The DFC is not active, or the SCSI MHD is inaccessible, or the unit is reserved.

p = Equipage size based on the UCB equipage value.

The drive size is determined by reading the equipage value in the UCB record for the unit.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

NAV — The DFC is not active, or the unit is reserved.

q = Equipage size based on the VTOC.

The drive size is derived from the maximum capacity of the unit's VTOC.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

NAV — The DFC is not active, or the unit is reserved, or the unit is inaccessible.

r = Sizes compatible.

YES — DRIVE, UCB, and VTOC equipage sizes are compatible.

NO — DRIVE, UCB, and VTOC equipage sizes are not compatible.

NAV — At least one of the equipage sizes are not available.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size.

SEE PROPRIETARY NOTICE ON COVER PAGE

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the LUCENT RTR-supported disk drives are as follows:

Drive	Formatted Capacity
160MB	133MB
300MB	253MB
322MB	322MB
340MB	277MB
600MB	604MB
1000MB	1000MB

s = Product identification.

NAP — Not applicable for SMD disks.

NAV — The DFC is not active, or the unit is reserved, or the SCSI MHD is inaccessible.

data — Alphanumeric data representing the product identification of a SCSI disk.

t = SBUS unit number if the DFC is a SCSI device.

Unit Number — Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

u = SCSI HA bus identification number: either 0 or 1.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated DFC is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For Formats 6, 7, and 8, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, contact the next level of technical assistance.

5. ALARMS

This alarm is a manually-requested report.

6. REFERENCES

OMDB Keys

f2f — device size not recognized
f33 — see DKDRV report on the ROP
f36 — failed to close special device file
f37 — failed to release special device file
f38 — failed to unreserve device UCB
f3e — message to port failure
f43 — message reception failure
f46 — process timed out
f49 — failed to close special device file
f4c — failed to release special device file
f4f — failed to unreserve UCB
f53 — failed to close ECD
f56 — terminated externally with signal

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = DFC firmware/pumpcode version.

NAP — The pumpcode version is not applicable for SMD DFCs.

NAV — The firmware or pumpcode versions are not available, or cannot be determined.

A.B.C — D

A = Version of DFC FIRMWARE/PUMPCODE.

B = Issue of DFC FIRMWARE/PUMPCODE.

C = Point issue of DFC FIRMWARE/PUMPCODE.

D = Laboratory Design Issue (LDI) of DFC FIRMWARE/PUMPCODE.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Unit name and member number.

f = Device type.

g = Device ID (drive ID number).

h = Physical port where the SMD disk drive is connected to the DFC.

NAV — The DFC is not available,
or the DFC is reserved,
or the SMD DFC firmware/pumpcode version is earlier than 3.2.0.

data — Physical port number.

i = Major status of unit.

j = Number of tracks on the SMD disk drive.

NAV — DFC is not available, or the unit is reserved.

data — Decimal number of disk tracks.

k = Validity of the volume table of contents (VTOC).

VALID — VTOC has a valid VTOC entry.

INVALID — Could not find a valid VTOC entry.

UNRDBLE — Read error while trying to read VTOC.

NAV — Could not reserve unit - VTOC not read.

NAP — Not applicable for this device.

l = Usability.

YES — Disk is considered usable.

NO — Disk data integrity is unknown.

NAP — Not applicable for this device.

m = Unit reserved.

YES — Unit is reserved for maintenance activity.

NO — Unit is not reserved.

n = Unit essential.

NAP — Not applicable for this device.

data — Hexadecimal value of the essential field of the unit's UCB.

o = Unit's mate.

NAP — Not applicable for this device.

SMPLX — Unit has no mate.

data — Unit name and member number of duplex mate.

p = Equipage size based on the physical disk drive.

For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

NAV — The DFC is not active, or the SCSI device is inaccessible, or the unit is reserved.

NAP — Not applicable for this device.

q = Equipage size based on the UCB equipage value.

The disk drive size is determined by reading the equipage value in the UCB record for the unit.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

NAV — The DFC is not active, or the unit is reserved.

NAP — Not applicable for this device.

r = Equipage size based on the VTOC.

The drive size is derived from the maximum capacity of the unit's VTOC.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

SEE PROPRIETARY NOTICE ON COVER PAGE

NAV — The DFC is not active,
or the unit is reserved,
or the unit is inaccessible.

NAP — Not applicable for this device.

s = Sizes compatible.

YES — DRIVE, UCB, and VTOC equipage sizes are compatible.

NO — DRIVE, UCB, and VTOC equipage sizes are not compatible.

NAV — At least one of the equipage sizes are not available.

NAP — Not applicable for this device.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size.

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the LUCENT RTR-supported disk drives are as follows:

Drive	Formatted Capacity
160MB	133MB
300MB	253MB
322MB	322MB
340MB	277MB
600MB	604MB
1000MB	1000MB

t = Product identification.

NAP — Not applicable for this device.

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the product identification of a SCSI device.

u = Revision level.

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the revision level of the firmware in a SCSI device.

v = Serial number.

NAP — Not applicable for this device.

SEE PROPRIETARY NOTICE ON COVER PAGE

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the serial number of a SCSI device.

w = SBUS unit number if the DFC is a SCSI device.

Unit Number — Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

x = SCSI HA bus identification number: either 0 or 1.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated DFC is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For Formats 6, 7, and 8, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, contact the next level of technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

2. REASON FOR OUTPUT

To report the result of executing an `OP:DFC;INFO` input message.

Format 5 is output when all of the subunits of the disk file controller (DFC) are unequipped.

Format 6 is used to output data for a storage module drive (SMD) DFC.

Format 7 is used to output data for a small computer system interface (SCSI) DFC equipped with only one SCSI bus (SBUS).

Format 8 is used to output data for a SCSI DFC equipped with more than one SBUS.

3. VARIABLE FIELD DEFINITIONS

a = DFC member number.

b = Process step or reason code.

f01 — failed to enable message reception
f03 — failed to open ECD
f06 — failed to get UCB by name
f08 — failed to get top UCB
f0a — top UCB is not a DFC
f0c — unknown DFC type
f0e — failed to get UCB of SBUS
f11 — failed to assign special device file name for DFC
f14 — failed to open special device file for DFC
f17 — see DKDRV report on the ROP
f1a — failed to close special device file
f1c — failed to release special device file
f1f — failed to unreserve DFC UCB
f23 — failed to get next UCB
f26 — failed to assign special device file name
f29 — failed to open special device file
f2c — failed to set I/O mode of device file
f2f — device size not recognized
f33 — see DKDRV report on the ROP
f36 — failed to close special device file
f37 — failed to release special device file
f38 — failed to unreserve device UCB
f3e — message to port failure
f43 — message reception failure
f46 — process timed out
f49 — failed to close special device file
f4c — failed to release special device file
f4f — failed to unreserve UCB
f53 — failed to close ECD
f56 — terminated externally with signal

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = DFC firmware/pumpcode version.

NAP — The pumpcode version is not applicable for SMD DFCs.

NAV — The firmware or pumpcode versions are not available, or cannot be determined.

A.B.C — D

A = Version of DFC FIRMWARE/PUMPCODE.

B = Issue of DFC FIRMWARE/PUMPCODE.

C = Point issue of DFC FIRMWARE/PUMPCODE.

D = Laboratory Design Issue (LDI) of DFC FIRMWARE/PUMPCODE.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Unit name and member number.

f = Device type.

g = Device ID (drive ID number).

h = Physical port where the SMD disk drive is connected to the DFC.

NAV — The DFC is not available,
or the DFC is reserved,
or the SMD DFC firmware/pumpcode version is earlier than 3.2.0.

data — Physical port number.

i = Major status of unit.

j = Number of tracks on the SMD disk drive.

NAV — DFC is not available, or the unit is reserved.

data — Decimal number of disk tracks.

k = Validity of the volume table of contents (VTOC).

VALID — VTOC has a valid VTOC entry.

INVALID — Could not find a valid VTOC entry.

UNRDBLE — Read error while trying to read VTOC.

NAV — Could not reserve unit - VTOC not read.

NAP — Not applicable for this device.

l = Usability.

YES — Disk is considered usable.

NO — Disk data integrity is unknown.

NAP — Not applicable for this device.

m = Unit reserved.

YES — Unit is reserved for maintenance activity.

NO — Unit is not reserved.

n = Unit essential.

NAP — Not applicable for this device.

data — Hexadecimal value of the essential field of the unit's UCB.

o = Unit's mate.

NAP — Not applicable for this device.

SMPLX — Unit has no mate.

data — Unit name and member number of duplex mate.

p = Equipage size based on the physical disk drive.

SEE PROPRIETARY NOTICE ON COVER PAGE

For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

2000MB — (SCSI disk drive)

NAV — The DFC is not active, or the SCSI device is inaccessible, or the unit is reserved.

NAP — Not applicable for this device.

q = Equipage size based on the UCB equipage value.

The disk drive size is determined by reading the equipage value in the UCB record for the unit.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

2000MB — (SCSI disk drive)

NAV — The DFC is not active, or the unit is reserved.

NAP — Not applicable for this device.

r = Equipage size based on the VTOC.

The drive size is derived from the maximum capacity of the unit's VTOC.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

SEE PROPRIETARY NOTICE ON COVER PAGE

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

2000MB — (SCSI disk drive)

NAV — The DFC is not active,
or the unit is reserved,
or the unit is inaccessible.

NAP — Not applicable for this device.

s = Sizes compatible.

YES — DRIVE, UCB, and VTOC equipage sizes are compatible.

NO — DRIVE, UCB, and VTOC equipage sizes are not compatible.

NAV — At least one of the equipage sizes are not available.

NAP — Not applicable for this device.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size.

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the LUCENT RTR-supported disk drives are as follows:

Drive	Formatted Capacity
160MB	133MB
300MB	253MB
322MB	322MB
340MB	277MB
600MB	604MB
1000MB	1000MB
2000MB	2000MB

t = Product identification.

NAP — Not applicable for this device.

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the product identification of a SCSI device.

u = Revision level.

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the revision level of the

firmware in a SCSI device.

v = Serial number.

NAP — Not applicable for this device.

NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

data — Alphanumeric data representing the serial number of a SCSI device.

w = SBUS unit number if the DFC is a SCSI device.

Unit Number — Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

x = SCSI HA bus identification number: either 0 or 1.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated DFC is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For Formats 6, 7, and 8, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, contact the next level of technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

```

[19] `OP DFCELOG COMPLETED`

2. REASON FOR OUTPUT

Formats 2 through 5 report that an equipment configuration database (ECD) database call failed.

Format 6 reports that the moving head disk (MHD) `idplug` does not match with the `idplug` in the ECD records.

Formats 7 through 13 report that the user control string (UCS) portion of the `DFCELOG` entry is corrupted.

Formats 14, 15, and 16 report that the text portion of the `DFCELOG` entry is corrupted.

Formats 17, 18, and 19 report and format the `REPT-DFCE` entries in the disk driver logfile. See `REPT-DFCE` output manual page for the displayed codes.

3. VARIABLE FIELD DEFINITIONS

a = Name of the disk driver logfile.

b = MHD number.

c = Number of the segment being printed.

d = Time stamp.

4. ACTION TO BE TAKEN

If Format 1 is printed, check to see if the logfile exists under `/etc/log`.

The contents of the corrupted logfile must be SAVED on paper and/or tape for later reference. The corrupted logfile should be removed by using the `CLR:FILESYS;FILE` input message, and terminate the spooler output process (SOP) for the logfile.

NOTE: Depending on the severity of the corruption, the message may or may not continue processing.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

LLLLLLLL	-	Extended sense data 4

[22] OP DFCELOG COMPLETED

2. REASON FOR OUTPUT

Formats 2 through 6 report that an equipment configuration database (ECD) database call failed.

Format 7 reports that the SMD moving head disk (MHD) id plug number does not match with the id plug number in the ECD records.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 8 reports that the SCSI MHD id switch number does not match with the id switch number in the ECD records.

Formats 9 through 15 report that the user control string (UCS) portion of the DFCELOG entry is corrupted.

Formats 16 through 19 report that the text portion of the DFCELOG entry is corrupted.

Formats 20, 21, and 22 report and format the enhanced information report (EIR) entries in the disk driver logfile.
See REPT-DFCE and REPT-DFCI output messages for the displayed codes.

3. VARIABLE FIELD DEFINITIONS

a = Name of the disk driver logfile.

b = MHD number.

c = Number of the segment being generated.

d = Time stamp.

For SCSI DFC report:

A — Command completion word. aabbcdee

- a — Completion code. See output DFC Appendix B, DFC-APPB, Tables 1 and 2.
- b — Number of blocks read on short failure of read command.
- c — Device ID number.
- d — Autonomous completion code. See output DFC Appendix B, DFC-APPB, Table 3.
- e — Job ID number.

C — Firmware version.

a.bb.cc — ddef
- a — Version of DFC firmware.
- b — Issue of DFC firmware.
- c — Point issue of DFC firmware.
- def — Laboratory design issue (LDI).

D — Pumpcode version.

a.bb.cc — ddef
- a — Version of DFC pumpcode.
- b — Issue of DFC pumpcode.
- c — Point issue of DFC pumpcode.
- def — LDI.

If the SCSI DFC is running without pumpcode, the pumpcode version has the following format:

FFFFFFFF

4. ACTION TO BE TAKEN

If Format 1 is printed, check to see if the logfile exists under `/etc/log`.

The contents of the corrupted logfile must be SAVED on paper and/or tape for later reference. The corrupted logfile should be removed by using the `CLR:FILESYS;FILE` input message, and terminate the spooler output process (SOP) for the logfile.

NOTE: Depending on the severity of the corruption, the message may or may not continue processing.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

d

For storage module drive (SMD) disk file controller (DFC) report:

AAAA	-	Data flags.
BBBB	-	Drive table status word 0.
CCCC	-	Drive table status word 1.
DDDD	-	Id plug number.
EEEE	-	Completion codes.
FFFF	-	Enhanced codes.
GGGG	-	Disk status register.
HHHH	-	Starting cylinder of current job.
IIII	-	Starting head of current job.
JJJJ	-	Starting sector of current job.
KKKK	-	Number of sectors in current job.
LLLL	-	Current cylinder.
MMMM	-	Current head.
NNNN	-	Current sector.

For small computer system interface (SCSI) DFC report:

AAAAAAAA	-	Command completion word
BBBBBBBB	-	Device status word
C.CC.CC - CCCC	-	Firmware version
D.DD.DD - DDDD	-	Pumpcode version
EEEE	-	Enhanced completion code
FF	-	SCSI job block status byte
GG	-	Firmware/Driver communication register
HHHHHHHH	-	Host adapter status register
IIIIIIII	-	BIC status register
JJJJJJJJ	-	Routine exerciser failure block number
KKKKKKKK	-	Failed command word 1
KKKKKKKK	-	Failed command word 2
KKKKKKKK	-	Failed command word 3
KKKKKKKK	-	Failed command word 4
LLLLLLLL	-	Extended sense data 1
LLLLLLLL	-	Extended sense data 2
LLLLLLLL	-	Extended sense data 3
LLLLLLLL	-	Extended sense data 4

[22] OP DFCELOG COMPLETED

2. REASON FOR OUTPUT

Formats 2 through 6 report that an equipment configuration database (ECD) call failed.

Format 7 reports that the SMD moving head disk (MHD) ID plug number does not match the ID plug number in the ECD records.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 8 reports that the ID switch number on the SCSI device does not match the ID switch number in the ECD records.

Formats 9 through 15 report that the user control string (UCS) portion of the DFCELOG entry is corrupted.

Formats 16 through 19 report that the text portion of the DFCELOG entry is corrupted.

Formats 20, 21, and 22 report and format the enhanced information report (EIR) entries in the disk driver logfile.
See REPT-DFCE and REPT-DFCI output messages for the displayed codes.

3. VARIABLE FIELD DEFINITIONS

a = Name of the disk driver logfile.

b = MHD or SCSI MT member number.

c = Number of the segment being generated.

d = Time stamp.

For SCSI DFC report:

A — Command completion word.
aabbcdee

a — Completion code. See output DFC Appendix B, DFC-APPB, Tables 1 and 2.
b — Number of blocks read on short failure of read command.
c — Device ID number.
d — Autonomous completion code. See output DFC Appendix B, DFC-APPB, Table 3.
e — Job ID number.

C — Firmware version.

a.bb.cc — ddef
a — Version of DFC firmware.
b — Issue of DFC firmware.
c — Point issue of DFC firmware.
def — Laboratory design issue (LDI).

D — Pumpcode version.

a.bb.cc — ddef
a — Version of DFC pumpcode.
b — Issue of DFC pumpcode.
c — Point issue of DFC pumpcode.
def — LDI.

If the SCSI DFC is running without pumpcode, the pumpcode version has the following format:

FFFFFFFF

4. ACTION TO BE TAKEN

If Format 1 is printed, check to see if the logfile exists under `/etc/log`.

The contents of the corrupted logfile must be SAVED on paper and/or tape for later reference. The corrupted logfile should be removed by using the `CLR:FILESYS;FILE` input message, and terminate the spooler output process (SOP) for the logfile.

NOTE: Depending on the severity of the corruption, the message may or may not continue processing.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

ID . . . . . OP-DMQ
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
OP DMQ

REQUEST ACTIVE
  [DIAGNOSTIC EXECUTION SUSPENDED DURING RECOVERY]
a    b c  d
SOURCE = e     PRIORITY = f
STATUS = g

REQUEST WAITING

a    b c  d
SOURCE = e     PRIORITY = f
STATUS = g

 INHIBIT SOURCES

   h

OP DMQ COMPLETED
```

2. REASON FOR OUTPUT

To report the status of the maintenance input request administrator (MIRA) request queue in response to the OP:DMQ input message.

If the statement DIAGNOSTIC EXECUTION SUSPENDED DURING RECOVERY appears under REQUEST ACTING, a previous initialization has suspended all diagnostic requests. See the ALW:DMQ input message.

For additional, application-specific information about format or field values, refer to appropriate, application-specific documentation.

3. VARIABLE FIELD DEFINITIONS

a = Task number assigned to the request by MIRA. This is the TASK number used in the STOP:DMQ or STP:DMQ input message.

b = Request type: DGN, DMQ, RST, or RMV.

c = Requested unit; for example, CU 0 CC 0.

d = Request parameters.

SEE PROPRIETARY NOTICE ON COVER PAGE

The request parameters indicate the beginning and ending phase numbers requested. If no phase numbers were specified in the input message, beginning phase (BPH) is shown as 1 and ending phase (EPH) is shown as 100.

e = Request source

ADP — Automatic diagnostic process
MAN — Manual
PSM — Power switch monitor
REX — Routine exerciser
ARR — Automatic ring recovery

f = Request priority.

g = Request status

ABORTING
ACTIVE
EMPTY
WAITING

h = Source identification of the inhibited requests.

4. ACTION TO BE TAKEN

Issue the STOP:DMQ or STP:DMQ input message to remove any unwanted requests from the queue. Issue the appropriate maintenance request command (DGN, DMQ, RMV, RST) to add a desired request to the queue.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

MESSAGE CLASS . . SIM

1. FORMAT

This message has four formats.

[1]
```
OP EMERSTAT COMPLETED
EMERGENCY DUMP PARTITION IS EMPTY
```

[2]
```
OP EMERSTAT COMPLETED
EMERGENCY DUMP PARTITION IS FULL
TIME OF EMERGENCY DUMP: a b c d e
BOOT DEVICE LOADED = f
g BYTES OF MAIN MEMORY WERE DUMPED
FROM THE FOLLOWING SEGMENTS:
  ADDRESS      LENGTH
 X'hhhhhhhh X'iiiiiii
```

[3]
```
OP EMERSTAT COMPLETED
{FOPEN|FREAD|FSEEK|REWIND} OF PANIC DUMP PARTITION FAILED: ERRNO = j
```

[4]
```
OP EMERSTAT COMPLETED
PDMPFULL FLAG IN LOW CORE IS NOT SET
TIME OF LAST DUMP: k
```

2. REASON FOR OUTPUT

To report the status of the emergency dump partition in response to an `OP:EMERSTAT` input message.

3. VARIABLE FIELD DEFINITIONS

a = Day of the week.

b = Month of the year.

c = Day of the month.

d = Time of day.

e = Year.

f = Unit number of the disk the dump was written on.

`0` — MHD 0.

`1` — MHD 1.

NOTE: If a disk restoral has been performed, the data reside on both disks.

SEE PROPRIETARY NOTICE ON COVER PAGE

g = Total number of bytes written into the emergency dump partition on MHD *f*.

h = For each segment, bits 30 and 31 represent status information, and the remaining bits represent the physical address.

If set, bit 30 indicates that all data was dumped; bit 31 indicates the segment was accessed.

i = Number of bytes written from address *h*.

j = Error number.

k = ASCII string indicating time and date when last panic dump occurred.

4. ACTION TO BE TAKEN

For Formats 1 and 3, no action is required.

For Format 2, use the `COPY:TAPE;EMERDMP` input message to copy the data to magnetic tape, and the `CLR:EMERDMP` input message to clear the emergency dump partition status flag. Send the tape and this printout to a technical assistance center for analysis.

For Format 4, use the `COPY:TAPE;EMERDUMP` input message to copy the data to magnetic tape. Send the tape and this output message to a technical assistance center for analysis.

5. ALARMS

None. This alarm is a manually-requested report.

ID . . . . . OP-ERRCHK-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1]
```
OP ERRCHK MESSAGE STARTED
a
b
c
d
e
```

[2]
```
OP ERRCHK IN PROGRESS
  SUMMARY OF INHIBITED UNITS
    f   g   h   i
OP ERRCHK COMPLETED
```

[3]
```
OP ERRCHK ABORTED  f
```

[4]
```
OP ERRCHK NOT STARTED
INVALID ID FIELD
```

2. REASON FOR OUTPUT

To indicate the inhibit status of all computer error conditions that may be optionally inhibited or allowed. There are currently four error conditions of this type: 1) hardware checks identified by HDWCHK, 2) software checks identified by SFTCHK, 3) error interrupts identified by ERRINT, and 4) control unit (CU) pseudo-nodes identified by ERRSRC. The report lists each error condition and its associated inhibit state. In the case of inhibited error interrupts, a supplemental report is output which then lists all units that are inhibited. Information specific to each device is output in a format consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful ABORTED message.

3. VARIABLE FIELD DEFINITIONS

a = This field indicates the existence or non-existence of computer error sources. This field will contain ACTIVE INHIBITS if any error source inhibits are active. Otherwise, it will contain NO INHIBITS.

b = HDWCHK if the computer hardware checks are inhibited.

c = SFTCHK if the computer software checks are inhibited.

d = ERRSRC if the computer CU pseudo-nodes are inhibited.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = ERRINT if the computer error interrupts are inhibited.

f = Unit name. This name may indicate the complex name in a two-level identification, such as CU, may indicate a specific hardware unit, such as teletypewriter (TTY).

g = Unit number that specifically identifies a complex type or hardware unit.

h = Indicates a subunit name that must always be identified with a two-level name, such as CU O MASC O.

i = Subunit number that specifically identifies a unit described by a two-level name.

j = One of the following error codes.

- 50 — A message could not be sent to a driver or real time status report (RTS).
- 51 — An equipment configuration database (ECD) access function completed unsuccessfully.
- 52 — An error in message communication.
- 53 — An error internal to the inhibit administrator.
- 54 — Temporary output file could not be opened.
- 55 — An invalid system port was specified.
- 56 — No process is attached to the specified port.

4. ACTION TO BE TAKEN

All error codes associated with this activity are significant. Seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

[*f*]
[*g*]

[2] `OP ERRCHK MESSAGE IN PROGRESS`
`SUMMARY OF INHIBITED UNITS`
h i j k
`OP ERRCHK COMPLETED`

[3] `OP ERRCHK ABORTED` *l*

[4] `OP ERRCHK NOT STARTED`
`INVALID ID FIELD`

2. REASON FOR OUTPUT

To indicate the inhibit status of all computer error conditions that may be optionally inhibited or allowed. The error conditions of this type are: 1) hardware checks identified by HDWCHK, 2) software checks identified by SFTCHK, 3) error interrupts identified by ERRINT, 4) control unit (CU) pseudo-nodes identified by ERRSRC, 5) emergency action interface (EAI) error interrupts from CU 0 identified by EAIINT CU 0, and 6) EAI error interrupts from CU 1 identified by EAIINT CU 1.

NOTE: The 3B20D computer CUs do not have EAI error interrupts.

The report lists each error condition and its associated inhibit state. In the case of inhibited error interrupts (ERRINT), a supplemental report is output which then lists all units that are inhibited. Information specific to each device is output in a format consistent with related maintenance messages.

The exit status of this report is indicated by either the successful `COMPLETED` message or the unsuccessful `ABORTED` message.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = This field indicates the existence or non-existence of error source inhibits. This field contains ACTIVE INHIBITS if any error source inhibits are active. Otherwise, it contains NO INHIBITS.

b = HDWCHK if the hardware checks are inhibited.

c = SFTCHK if the software checks are inhibited.

d = ERRSRC if the CU pseudo- nodes are inhibited.

e = ERRINT if the error interrupts are inhibited.

f = EAIINT CU 0 if the EAI error interrupts are inhibited on CU 0.

g = EAIINT CU 1 if the EAI error interrupts are inhibited on CU 1.

h = Unit name. This name may indicate the complex name in a two-level identification, such as CU, or can simply indicate a specific hardware unit, such as teletypewriter (TTY).

i = Unit number that specifically identifies a complex type or hardware unit.

j = Indicates a subunit name that must always be identified with a two-level name, such as CU O MASC O.

k = Subunit number that specifically identifies a unit described by a two-level name.

l = One of the following error codes:

`50` — message could not be sent to a driver or real time status report (RTS)
`51` — equipment configuration database (ECD) access function completed unsuccessfully
`52` — error in message communication
`53` — error internal to the inhibit administrator
`54` — Temporary output file could not be opened
`55` — invalid system port was specified
`56` — no process is attached to the specified port

4. ACTION TO BE TAKEN

All error codes associated with this activity are significant. Seek technical assistance.

5. ALARMS

For formats 1 and 2, none. This report is automatically generated. Action may or may not be required.

For format 3, none. This automatically-generated report is for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `OP FNAME` *a*

b `NAME`

c d

[2] `OP FNAME NOT STARTED`
`RETRY LATER` *e*

2. REASON FOR OUTPUT

To print the full pathnames of files containing given block or i-node numbers.

3. VARIABLE FIELD DEFINITIONS

a = Output message status.

`COMPLETED` — Last or only segment of message.
`IN PROGRESS` — Intermediate segment(s) of message.
`STARTED` — First segment of message.

b = Search type:

`BLOCK` — The check for matches was made on block numbers.
`INODE` — The check for matches was made on i-nodes.

c = Inode or first block number on which the match occurred.

d = Full path name on which the match occurred.

e = Explanation of error. See OP-FNAME Output Appendix, `OP-FNAME-APP`.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is either a manually-requested report or is an automatically-generated report for information only.

1. FORMAT

This message has five formats.

[1] `OP FNAME` *a*
b `NAME`
c d

[2] `OP FNAME ABORTED CANNOT OPEN OUTPUT FILE` *e*

[3] `OP FNAME ABORTED CANNOT WRITE OUTPUT FILE` *e*

[4] `OP FNAME ABORTED CANNOT CREATE TEMPORARY FILE`

[5] `OP FNAME NOT STARTED`
`RETRY LATER` *f*

2. REASON FOR OUTPUT

Format 1 prints the full path names of files.

Format 2 reports an error when trying to create a temporary output file.

Format 3 reports an error when writing to a temporary output file.

Format 4 reports an error when unable to create a uniquely-named, temporary file.

Format 5 reports an aborted `OP:FNAME` command with an explanation.

3. VARIABLE FIELD DEFINITIONS

a = Output message status.

`STARTED` — First segment of message.
`IN PROGRESS` — Intermediate segment(s) of message.
`COMPLETED` — Last or only segment of message.

b = Search type.

`INODE` — The check for matches was made on i-nodes.
`BLOCK` — The check for matches was made on block numbers.

c = Inode or first block number on which the match occurred.

d = Full path name on which the match occurred.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Name of temporary file.

f = Explanation of error. See OP-FNAME Output Appendix, `OP-FNAME-APP`.

4. ACTION TO BE TAKEN

If Format 1 prints, no action is needed.

Format 2 indicates all of the inodes of the `tmp` file system are being used. Clean up unused files in the `tmp` file system using input message `CLR:FILESYS;FILE`.

Format 3 indicates all `tmp` file system space has been used. Clean up unused files in the `tmp` file system using input message `CLR:FILESYS;FILE`.

Format 4 indicates system resources do not permit the running of this command at this time; try again later. If the command continues to fail, seek technical assistance.

If Format 5 prints, action is dependent upon the error given.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report for information only.

NOTE: Two of these formats may appear in succession with `OP GEN READLOG` printed only once.

2. REASON FOR OUTPUT

To print the contents of the system update event log.

Format 1 indicates that output of the system update event log has been completed.

Format 2 indicates that output of the system update event log has been stopped due to error. The error is identified.

Format 3 displays the `FIRST` log entry, including the number of entries in the log.

Format 4 displays a `BEGIN` log entry indicating that an identified system update process began the update method in use, the mode of execution and the process ID (PID) of the update process, and the date and time that the entry was made.

Format 5 displays a `BEGIN` log entry for an `ENTER` process, which includes all the information in Format 4 as well as the pathname of the input file (normally a magnetic-tape device), the pathname of each volume table of contents (VTOC) on each disk pair being updated, the unit number of the disk file controller (DFC) for each new-generic disk (if one was specified), and the tape sequence options used to update the specified disks. Also included is the pathname of the equipment configuration database (ECD) which will be accessed in the new generic, the partition in which this ECD will reside, the pathname of the system update log in the new generic, and the partition in which this log will reside. Also included is the PID of the update process, and the date and time of the log entry.

Format 6 displays a `DISK` entry for the backup partition (BKPRT) update method indicating the type of update process that began updating a disk pair, the name of the VTOC on this disk pair, the PID of the update process, and the date and time that the entry was made.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7 displays a disconnect (DISK) entry for the off-line disk (OFLDISK) update method indicating the type of process that began updating a disk, the disk that was to contain (or contained) the new generic, and its mate, the disk that contained the old generic. Also included is the PID of the update process, and the date and time of the log entry.

Format 8 displays a `WRITE` entry indicating that an ENTER process began to update a partition, which partition was being updated, and its backup partition (if one exists). Also, the PID of the update process and the date and time of the log entry are included.

Format 9 displays a `TAPE` entry indicating that an `ENTER` process was ready to read a tape, the sequence number of the tape expected, the system generation (SG)-database ID (time stamp) expected from the tape, the generic-version number expected from the tape, and an indication of whether the tape is in the first or second sequence for the disk-pair. Also included is the process ID of the update process, and the date and time of the log entry.

Format 10 displays an `APPLHOOK` entry indicating the type of update process that initiated application-dependent processing, the PID of the update process, and the date and time of the log entry.

Format 11 displays an `UPDATE` entry indicating that the `ENTER` process is updating the backup partitions, the PID of the update process, the backup partition number being updated, and the date and time of the log entry.

Format 12 displays a `CONTINUE` entry indicating the type of update process that restarted execution, the PID of the update process, and the date and time of the log entry.

Format 13 displays an `END` entry indicating that the execution of an update process ended (and the process type), whether the system was booted on primary or backup root, `appdmert` or `dmert` (the latter is `MIN_CONFIG` on the EAI), and for the off-line disk method the boot disk (moving head disk [MHD] 0 or 1). Also included are whether the process completed successfully or failed, the error code, an error number set by a UNIX® system call or DMERT interface function, the PID of the update process, and the date and time of the log entry.

Formats 14 and 15 indicate that an error was made when entering the input message.

NOTE: The log is normally emptied when a `COMMIT` or `RESTORE` process succeeds.

3. VARIABLE FIELD DEFINITIONS

a = Error code for failing process, or the reason the process stopped; 0 implies success. The error code is output at the time the process is run. See the System Error Codes Appendix, `SYSERR-APP`.

b = Number of event entries in the system update log.

c = Process ID associated with the log entry.

d = Date stamp; indicates when the log entry was made.

e = Pathname of the input file, as specified in the `UPD:GEN;ENTER` input message.

f = Destination VTOC pathname(s) for subsequent write entries.

g = Sequence options used for the specified destinations.

h = Pathname of the ECD to be accessed in the new generic.

i = Partition number of the partition in which the ECD will reside.

j = Pathname of the system update log in the old generic.

k = Partition number of the partition in which the system update log of the old generic resided.

l = Pathname of the system update log in the new generic.

m = Partition number of the partition in which the system update log will reside.

n = Number, in order of updating, of the disk pair being updated.

o = Member number of the disk containing the new generic; associated with subsequent write entries (off-line disk method only).

p = Member number of the duplexed disk containing the old generic; mate for MHD *a* (off-line disk method only).

q = Partition number of the partition written.

r = Partition number of the partition paired with *a*, if one exists; 0 implies that no backup to *a* exists.

s = Sequence number of the tape.

t = SG database unique ID (time stamp).

u = Generic and version number of the new generic.

v = Backup partition number being updated.

w = Error number set by a failed UNIX® system call or DMERT interface function (which usually results in process failure); 0 implies success of all system calls (some DMERT functions set this number to non-zero values even on success).

x = Internal error code generated by a system update process. See the System Update Error Codes Appendix, `SUPR-APP`.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is a manually-requested report.

SEE PROPRIETARY NOTICE ON COVER PAGE

```

[7]
```
OP GROW RETRY LATER i
```

[8]
```
OP GROW WRITE TO j
FAILED ON KEY #k
```

2. REASON FOR OUTPUT

To give device information specific to computer hardware units on communities requested via the OP:GROW input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Computer unit names are listed in the Member Numbers Appendix, Table C, MEM-NUM-APPC.

b = Unit number. See the Member Numbers Appendix, Table C, MEM-NUM-APPC.

c = Subunit name, if *a* = CU. Computer CU subunit names are listed in the Member Numbers Appendix, Table D, MEM-NUM-APPD.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Subunit number. See the Member Numbers Appendix, Table C, MEM-NUM-APPC.

e = The current maintenance state of the unit is indicated by the following identifiers:

ACT — Active units
GROW — Units being grown
INIT — Initializing units
OFL — Offline units
OOS — Out-of-service units
STBY — Standby units
UNAV — Unavailable units
UNEQIP — Unequipped units

f = Indicates the current inhibit status of the associated error source:

ALW — Allowed
INH — Inhibited

g = Results of the last diagnostic on the unit:

ABT — Aborted diagnostics
ATP — All tests passed
CATP — Conditional all tests passed
NTR — No tests were run
STF — Some tests failed

h = Error number.

9 — cannot attach to plant measurement library
11 — cannot open equipment configuration database (ECD) sequence
12 — cannot sequence unit control blocks (UCBs)

i = Retry the command later for the following reasons.

```
CANNOT SEQUENCE DATABASE
CANNOT CREATE FILE IN /tmp
CANNOT GET DATABASE RECORD ID
```

j = Temporary output file name.

k = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

This alarm is either a manually-requested report or is automatically-generated. Action may or may not be required.

SEE PROPRIETARY NOTICE ON COVER PAGE

2. REASON FOR OUTPUT

To give device information specific to computer hardware units on communities requested via the OP:INIT input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Computer unit names are listed in the Member Numbers Appendix, Table C, MEM-NUM-APPC.

b = Unit number. See the Member Numbers Appendix, Table C, MEM-NUM-APPC.

c = Subunit name, if *a* = CU. Computer CU subunit names are listed in the Member Numbers Appendix, Table C, MEM-NUM-APPC.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Subunit number. See the Member Numbers Appendix, Table C, MEM-NUM-APPC.

e = The current maintenance state of the unit is indicated by the following identifiers.

ACT — Active units
GROW — Units being grown
INIT — Initializing units
OFL — Offline units
OOS — Out-of-service units
STBY — Standby units
UNAV — Unavailable units
UNEQIP — Unequipped units

f = Indicates the current inhibit status of the associated error source

ALW — Allowed
INH — Inhibited

g = Results of the last diagnostic on the unit.

ABT — Aborted diagnostics
ATP — All tests passed
CATP — Conditional all tests passed
NTR — No tests were run

ID . . . . . OP-IODRV
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1]
```
OP IODRV   MSG STARTED
 LVL
  a
 ID
  b
 CLASS
  c
 MSGSAVE
  ON|OFF
OP IODRV COMPLETED
```

[2]
```
OP IODRV NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS  d
```

[3]
```
OP IODRV ABORTED
```

[4]
```
OP IODRV ATTRIBUTE FILE UPDATED
```

2. REASON FOR OUTPUT

Format 1 prints the status of the current options set in the input/output processor (IOP) driver. These options are as requested in the `OP:IODRV` input message.

Format 4 indicates that the attribute file for the IOP driver messages was inconsistent with the IOP driver and has been updated to the current settings.

3. VARIABLE FIELD DEFINITIONS

a	=	Severity levels set.
b	=	Handler identifications set.
c	=	Classes set.
d	=	Process not initiated.
`ON`	=	Messages are being saved in the `IODRVLOG` log file.
`OFF`	=	Messages are not being saved in the `IODRVLOG` log file.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 221.
Formats 3 and 4 have an OMDB key of 161.

Input Messages
`CLR:IODRV`
`OP:IODRV`
`SET:IODRV`

Output Messages
`CLR-IODRV`
`SET-IODRV`

ID . . . . . OP-IOP,INFO
GENERIC . . . . . UNIX RTR R21.27 and later
TYPE . . . . . Output
MESSAGE CLASS . . VAR

1. FORMAT

This message has two formats.

[1] `OP IOP` *a* `INFO` *b c [d]*

[2] `OP IOP` *a* `INFO`

U_Name	Unit #	U_mv	State	PackCode	Versions	Ver_From
e	f	g	h	i	j	k

.
.
.

2. REASON FOR OUTPUT

To report the result of executing an `OP:IOP a;INFO` input message.

3. VARIABLE FIELD DEFINITIONS

a = IOP member number.

b = Message State.

`NOT STARTED`

`STOPPED`

`ERROR`

`ABORT`

c = Process step or Error Code.

f01 — Failed to enable message reception.
f03 — Failed to open ECD.
f06 — Failed to get UCB by name.
f08 — Failed to get down UCB.
f09 — Failed to get the side UCB.
f0a — Top UCB is not a IOP.
f10 — Failed to send message to I/O driver.
f11 — Failed to unreserve UCB.
f12 — Failed to receive ack. from I/O driver.
f13 — Failed to close ECD.
f14 — Failed to reserve UCB.
f15 — A message to driver has been lost, time out.
f16 — Terminated externally with signal.

SEE PROPRIETARY NOTICE ON COVER PAGE

f20 — Failed to get UCBL.
f21 — Failed to get PTA (page table address).
f23 — Failed to assign a dma slot.
f24 — Failed to queue a job.
f25 — Failed to define a task with an ucblp as the idcode, function timreq1 failed.
f27 — IO is BUSY.
f28 — Time out when access RAM.

d = System error code (set by libC functions, defined in sys/errno.h).

e = IOP unit name.

f = Unit number.

g = MV number.

h = Major States.

i = Pack code.

j = RAM code version.

k = RAM code version is read from.

`ECD` — Version is read from ECD.

`RAM` — Version is read from RAM.

`Number` — Error Code (same as the c field above).

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated IOP is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

5. ALARMS

None. This alarm is a manually-requested report.

SEE PROPRIETARY NOTICE ON COVER PAGE

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 766.
Format 2 has an OMDB key of 767.

Output Appendix
SYSERR-APP

Input Messages
OP:IOP;INFO

ID . . . . . OP-LOG-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . UTIL

1. FORMAT

This message has four formats.

[1] `OP LOG` *a b* `CORRUPT SEGMENT AT` *c*
g

[2] `OP LOG` *a* `FILE` *d* `CANNOT OPEN TEMPORARY FILE`

[3] `OP LOG` *a* `CANNOT OPEN LOGFILE`

[4] `OP LOG` *a* {`STARTED`|`IN PROGRESS`|`COMPLETED`} `SEGMENT` *e*
f
g

2. REASON FOR OUTPUT

Formats 1, 2, and 3 report that an error occurred when executing the `OP:LOG` input message.

3. VARIABLE FIELD DEFINITIONS

a = Name of the logfile.

b = Pathname of the file in which corruption was discovered.

c = Position, expressed in characters, in file where corruption was discovered.

d = Name of temporary file.

e = Number of output segment.

f = Time stamp.

g = Message text from the logfile entry.

4. ACTION TO BE TAKEN

If Format 1 prints, the contents of the corrupt log file must be SAVED on paper and/or tape for later reference. The corrupt logfile entries should be cleaned up by using the `DEL:LOG` input message on the logfile without any selection criteria.

If Format 2 prints, check the `/tmp` file system to see if all the space is used up.

If Format 3 prints, check to see if the log file exists under the pathname specified in the device record.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

6. REFERENCES

OMDB Keys
Formats 1, 2, and 3 have an OMDB key of 277.
Format 4 has an OMDB key of 279.

Input Messages
`DEL:LOG`
`OP:LOG`

ID . . . . . OP-LOG-B
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . UTIL

1. FORMAT

This message has 10 formats.

[1] `OP LOG` *a* *b* `CORRUPT SEGMENT AT` *c*
[*g*]

[2] `OP LOG` *a* `FILE` *d* `CANNOT OPEN TEMPORARY FILE`

[3] `OP LOG` *a* `CANNOT OPEN LOGFILE`

[4] `OP LOG` *a* {`STARTED`|`IN PROGRESS`|`COMPLETED`} `SEGMENT` *e*
f
[*g*]

[5] `OP LOG` *a* `OUTPUT FILE EXISTS` *h*

[6] `OP LOG` *a* `CANNOT CREATE OUTPUT FILE` *h*

[7] `OP LOG` *a* `OUTPUT DIRECTORY DOES NOT EXIST` *i*

[8] `OP LOG` *a* `OUTPUT DIRECTORY IS NOT WRITABLE` *i*

[9] `OP LOG` *a* `PASSED BAD PARM TYPE TO FILE FUNCTION`

[10] `OP LOG` *a* `STOPPED` *j*

2. REASON FOR OUTPUT

Formats 1, 2, 3, and 5 indicate that an error occurred when executing the `OP:LOG` input message.

Formats 6, 7, and 8 indicate a system error preventing creation of the file.

Format 9 indicates that the process is using invalid data in the message structure.

Formats 4 and 10 indicate the process status.

3. VARIABLE FIELD DEFINITIONS

a = Name of the logfile.

b = Pathname of the file in which corruption was discovered.

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Position, expressed in characters, in file where corruption was discovered.

d = Name of temporary file.

e = Number of output segment.

f = Time stamp.

g = Message text from the logfile entry. If the output file parameter has been requested, this will not appear.

h = Name of the output file to be created in `/fmt`

i = Name of the directory where the output file will be created

j = The `STOPPED` reason code

`40` — cannot open temporary file
`201` — given output file name is too long
`202` — implied output file path name is too long
`203` — given output file is formatted incorrectly
`208` — given input file name is too long
`211` — cannot create temporary file
`212` — cannot write temporary file

4. ACTION TO BE TAKEN

If Format 1 prints, the contents of the corrupt logfile must be SAVED on paper and/or tape for later reference. The corrupt logfile entries should be cleaned up by using the `DEL:LOG` input message on the logfile without any selection criteria.

If Format 2 prints, check the `/tmp` file system to see if all the space is used up.

If Format 3 prints, check to see if the logfile exists under the pathname specified in the device record.

If Format 5 prints, retry the command with a file name that is 14 characters or less and contains no slashes (/) to denote a sub-directory.

If Format 6 prints, check to see if there are i-nodes available on the file system partition in which that directory resides. If i-nodes are available, contact technical support for further assistance.

If Format 7 or 8 prints, check to see if the identified directory exists and has write permission.

If Format 9 prints, contact technical support for further assistance.

If Format 10 prints, check `SPLLOG` for `CSOP` error messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is either a manually-requested report, or an automatically-generated report for information only.

6. REFERENCES

OMDB Keys
Formats 1, 2, and 3 have an OMDB key of 277.
Format 4 has an OMDB key of 279.
Formats 5 through 10 have an OMDB key of 276.

Input Messages
`DEL:LOG`
`OP:LOG`

ID . . . . . OP-MEMERRS-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has five formats.

[1]
```
OP MEMERRS {IN PROGRESS | COMPLETED}
DATE      TIME  CU MASC MY/OTH TYPE SLOT DEV UNCORR/CORR
mm/dd/yy  hh mm  a    b      c    d    e   f       g
ACCESS ERRASRC
   h        i
   [j]
```

[2]
```
OP MEMERRS CANNOT OPEN NEW TEMP FILE
```

[3]
```
OP MEMERRS NO MEMLOG FILES
```

[4]
```
OP MEMERRS NOT STARTED
```

[5]
```
OP MEMERRS COMPLETED
NO MEMLOG ENTRIES MATCH THE SPECIFIED DATE
```

2. REASON FOR OUTPUT

To report a table of interpreted memory errors from MEMLOG.

Format 3 indicates there are no memory errors stored in the log files.

3. VARIABLE FIELD DEFINITIONS

NOTE: When a variable has no value, a dash("-") is printed in its place.

mm/dd/yy = Date that the memory error occurred. Listed in the form of month / day / year.

hh mm = Time of day of the memory error. Listed in the form of hour and minute.

a = Control unit (CU) number of the faulty unit.

b = Main store controller of the faulty unit.

c = Indicates where the error occurred.

MY — My store
OTH — Other store

d = Type of memory error that occurred.

Error A — An "or" over several circuit checks resulted in error detection.

Error B — An attempt was made to access an unequipped memory array or module.

Error C — The Hamming check circuitry detected a multi-bit uncorrectable error during a system access of memory.

Error D — A system or refresh access of memory detected an error.

e = Slot number of the faulty data. This number is relative to the CU.

f = Hexadecimal code identifier for memory devices.

This value is only reported on an error D and is used to locate the faulty chip on the array board. The form of this identifier is `nnss` where `ss` is the side (A, B, 1A, 1B, 2A, 2B) of the memory device.

g = Indicates whether the detected error was correctable or uncorrectable.

h = Indicates whether the error was detected during system or refresh access.

i = The error A interrupt source formed from an "or" of several check circuits internal to the memory controller. The error A source is only output if an error A has occurred.

j = An optional warning or abort message of the form:

```
SLOT NUMBERS ARE INVALID
```

4. ACTION TO BE TAKEN

If the abort message appears, remove any files in directory `tmp` of the form `MEMERRS-`*`XXXXXX`* and try the message again.

If the warning message that the slot numbers are invalid appears, the slot numbers in the table cannot be trusted. This message indicates that the equipment configuration database (ECD) cannot be properly accessed; seek technical assistance to rectify this problem. Also, all equipment is assumed to be the same as in CU 0 and only MASC 0 and MASC 1 are allowed for any CU.

If question marks (?) appear at any place, the data being read is invalid. Output will resume at the next valid entry.

Format 3 is not an error condition. It requires no action.

5. ALARMS

None. This alarm is a manually-requested report.

SEE PROPRIETARY NOTICE ON COVER PAGE

```

[6]
```
OP MEMERRS CANNOT RETRIEVE MEMLOG RECORD FROM ECD
```

[7]
```
OP MEMERRS COMPLETED
NO MEMLOG ENTRIES MATCH THE SPECIFIED DATE
```

2. REASON FOR OUTPUT

To report a table of interpreted memory errors from MEMLOG.

Format 3 indicates the information message stating that there are no memory errors stored in the log files.

3. VARIABLE FIELD DEFINITIONS

NOTE: When a variable has no value, a dash("-") is printed in its place.

mm/dd/yy = Date that the memory error occurred. Listed in the form of month / day / year.

hh mm = Time of day of the memory error. Listed in the form of hour and minute.

a = Control unit (CU) number of the faulty unit.

b = Main store controller of the faulty unit.

c = Indicates where the error occurred.

MY — My store.
OTH — Other store.

d = Type of memory error that occurred.

Error A — An "or" over several circuit checks resulted in error detection.

Error B — An attempt was made to access an unequipped memory array or module.

Error C — The Hamming check circuitry detected a multi-bit uncorrectable error during a system access of memory.

Error D — A system or refresh access of memory detected an error.

e = Slot number of the faulty data. This number is relative to the CU.

f = Hexadecimal code identifier for memory devices.

This value is only reported on an error D and is used to locate the faulty chip on the array board. The form of this identifier is `nnss` where `ss` is the side (A, B, 1A, 1B, 2A, 2B) of the memory device.

g = Indicates whether the detected error was correctable or uncorrectable.

h = Indicates whether the error was detected during system or refresh access.

i = The error A interrupt source formed from an "or" of several check circuits internal to the memory controller. The error A source is only output if an error A has occurred.

j = An optional warning or abort message of the form:

```
SLOT NUMBERS ARE INVALID
```

4. ACTION TO BE TAKEN

If the abort message appears, remove any files in directory `tmp` of the form `MEMERRS-`*`XXXXXX`* and retry the message.

If the warning message that the slot numbers are invalid appears, the slot numbers in the table cannot be trusted. This message indicates that the equipment configuration database (ECD) cannot be properly accessed; seek technical assistance to rectify this problem. Also, all equipment is assumed to be the same as in CU 0 and only MASC 0 and MASC 1 are allowed for any CU.

If question marks (?) appear at any place, the data being read is invalid. Output will resume at the next valid entry.

[9] `OP MEMERRS CANNOT CLOSE TEMPORARY FILE` *k*

2. REASON FOR OUTPUT

To report a table of interpreted 3B20D CU memory errors from `MEMLOG`. 3B21D CU memory errors are not interpreted because there is only one memory board in each CU.

Format 3 indicates the information message stating that there are no memory errors stored in the log files.

Format 4 indicates that memory error interpretation was requested on 3B21D CU memory errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

NOTE: When a variable has no value, a dash("-") is printed in its place.

mm/dd/yy = Date that the memory error occurred. Listed in the form of month / day / year.

hh mm = Time of day of the memory error. Listed in the form of hour and minute.

a = Control unit (CU) number of the faulty unit.

b = Main store controller of the faulty unit.

c = Indicates where the error occurred.

`MY` — My store.
`OTH` — Other store.

d = Type of memory error that occurred.

Error A — An "or" over several circuit checks resulted in error detection.

Error B — An attempt was made to access an unequipped memory array or module.

Error C — The Hamming check circuitry detected a multi-bit uncorrectable error during a system access of memory.

Error D — A system or refresh access of memory detected an error.

e = Slot number of the faulty data. This number is relative to the CU.

f = Hexadecimal code identifier for memory devices.

This value is only reported on an error D and is used to locate the faulty chip on the array board. The form of this identifier is `nnss` where `ss` is the side (A, B, 1A, 1B, 2A, 2B) of the memory device.

g = Indicates whether the detected error was correctable or uncorrectable.

h = Indicates whether the error was detected during system or refresh access.

i = The error A interrupt source formed from an "or" of several check circuits internal to the memory controller. The error A source is only output if an error A has occurred.

j = An optional warning or abort message of the form:

```
SLOT NUMBERS ARE INVALID
```

k = The name of the temporary file.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If the abort message appears, remove any files in directory `tmp` of the form `MEMERRS-`*`XXXXXX`* and retry the message.

If the warning message that the slot numbers are invalid appears, the slot numbers in the table cannot be trusted. This message indicates that the equipment configuration database (ECD) cannot be properly accessed; seek technical assistance to rectify this problem. Also, all equipment is assumed to be the same as in CU 0 and only MASC 0 and MASC 1 are allowed for any CU.

If question marks (?) appear at any place, the data being read is invalid. Output will resume at the next valid entry.

Format 3 is not an error condition. It requires no action.

5. ALARMS

None. This alarm is a manually-requested report.

`MHD` *j k l m n o p q r s t*

2. REASON FOR OUTPUT

To report the result of executing an `OP:MHD;INFO` input message.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the moving head disk (MHD) drive.

b = Process step or reason code.

f06 — failed to open equipment configuration database (ECD)
f07 — failed to get next unit control block (UCB)
f09 — failed to get UCB by name
f13 — failed to assign special device file name for MHD
f15 — failed to assign special device file name for disk file controller (DFC)
f16 — failed to open special device file for MHD
f18 — failed to open special device file for DFC
f19 — failed to get UCB of DFC
f21 — failed to set input/output mode of device file
f24 — failed to enable message reception
f27 — see accompanying disk driver (DKDRV) error report on the receive-only printer (ROP)
f28 — see accompanying DKDRV error report on the ROP
f29 — see accompanying DKDRV error report on the ROP
f30 — failed to close special device file of unit
f31 — failed to close special device file of unit
f32 — failed to close special device file of unit
f39 — failed to close ECD

SEE PROPRIETARY NOTICE ON COVER PAGE

f40 — failed to release special device file of unit
f41 — failed to release special device file of unit
f42 — failed to release special device file of unit
f51 — message to port failure
f54 — message reception failure
f57 — process timed out
f60 — failed to release UCB of unit for DFC
f61 — failed to release UCB of unit
f62 — failed to release UCB of unit
f66 — terminated externally with signal

c = System error code number. See the System Error Codes Output Appendix, SYSERR-APP.

d = Unit number controller.

e = DFC microcode version.

— NOT AVAILABLE
— *f.g.h - i*

f = Version of DFC MICROCODE.
g = Issue of DFC MICROCODE.
h = Point issue of DFC MICROCODE.
i = Laboratory design issue (LDI) of DFC MICROCODE.

j = Unit number.

k = Device ID (drive ID plug number).

l = Physical port.

— The DFC physical port connection number is displayed if DFC MICROCODE VERSION is 3.2.0 or later.
— NA (not available) indicates an earlier DFC MICROCODE VERSION or the DFC was unavailable.
— NA is also output if the unit is reserved.

m = Major status of unit.

n = Equipment (drive type), in megabytes.

— 160MB
— 300MB
— 340MB
— 675MB
— NA - DFC was unavailable.
— NA is also output if the unit is reserved.

o = Number of tracks on disk drive.

— Value - decimal number of the disk tracks.
— NA - DFC was unavailable.
— NA is also output if the unit is reserved.

SEE PROPRIETARY NOTICE ON COVER PAGE

p = Validity of the volume table of contents (VTOC).

`INVALID` — There is no valid entry for the VTOC.
`UNRDBLE` — The command encountered an error while trying to read the VTOC.
`VALID` — VTOC has a valid entry for the VTOC.
`NA` — Could not reserve unit; VTOC not read.

q = Usability.

`YES` — The unit is usable.
`NO` — The unit is not usable.

r = Unit reserved.

`YES` — The unit is reserved for maintenance activity.
`NO` — The unit is not reserved for maintenance activity.

s = Unit essential.

Value — hexadecimal value of the essential field of the unit's UCB.

t = Unit's mate.

Unit — Unit name and number of duplex mate.
`SMPLX` — The unit has no mate.

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If the unit is reserved, however, certain fields will contain information that is not available. For more complete information, try the command again after the unit is released.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Keys
Formats 1 through 4 have an OMDB key of 153.
Format 5 has an OMDB key of 151.

2. REASON FOR OUTPUT

To report the result of executing an `OP:MHD;INFO` input message.

Format 5 is used to output data for an storage module device (SMD) moving head disk (MHD).

Format 6 is used to output data for a small computer system interface (SCSI) MHD.

3. VARIABLE FIELD DEFINITIONS

a = MHD member number.

b = Process step or reason code.

f01 — failed to enable message reception
f03 — failed to open ECD
f06 — failed to get UCB by name
f09 — failed to get UCB of SBUS
f0c — failed to get UCB of DFC
f0e — failed to get UCB of DFC

f4f — failed to unreserve UCB
f53 — failed to close ECD
f56 — terminated externally with signal

c = System error code number. See the System Error Codes Output Appendix, SYSERR-APP.

d = Unit number of controller.

e = DFC firmware/pumpcode version.

A.B.C — D

A = Version of DFC FIRMWARE/PUMPCODE.

B = Issue of DFC FIRMWARE/PUMPCODE.

C = Point issue of DFC FIRMWARE/PUMPCODE.

D = Laboratory design issue (LDI) of DFC FIRMWARE/PUMPCODE.

NAV — The firmware or pumpcode versions are not available, or cannot be determined.

NAP — The pumpcode version is not applicable for SMD DFCs.

f = Unit number.

g = Device ID (drive ID number).

h = Physical port.

The physical port number is where the SMD MHD is connected to the DFC.

data — Physical port number.

NAV — The DFC is not available,
or the DFC is reserved,
or the SMD DFC firmware/pumpcode version is earlier than 3.2.0.

NAP — Not applicable for SCSI disks.

i = Major status of unit.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Number of tracks on the disk drive.

data — Decimal number of disk tracks.

NAV — DFC is not available, or the unit is reserved.

NAP — Not applicable for SCSI disks.

o = Validity of the volume table of contents (VTOC).

VALID — VTOC has a valid VTOC entry.

INVALID — Could not find a valid VTOC entry.

UNRDBLE — Read error while trying to read VTOC.

NAV — Could not reserve unit - VTOC not read.

l = Usability.

YES — Disk is considered usable.

NO — Disk data integrity is unknown.

m = Unit reserved.

YES — Unit is reserved for maintenance activity.

NO — Unit is not reserved.

n = Unit essential.

data — Hexadecimal value of the essential field of the unit's UCB.

o = Unit's mate.

Unit — Name and unit number of duplex mate.

SMPLX — Unit has no mate.

p = Equipage size based on the physical drive.

For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

NAV — The DFC is not active,
or the SCSI MHD is inaccessible,
or the unit is reserved.

SEE PROPRIETARY NOTICE ON COVER PAGE

q = Equipage size based on the UCB equipage value.

The drive size is determined by reading the equipage value in the UCB record for the unit.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

NAV — The DFC is not active, or the unit is reserved.

r = Equipage size based on the VTOC.

The drive size is derived from the maximum capacity of the unit's VTOC.

160MB — (SMD disk drive)

300MB — (SMD disk drive)

322MB — (SCSI disk drive)

340MB — (SMD disk drive)

600MB — (SCSI disk drive)

1000MB — (SCSI disk drive)

NAV — The DFC is not active, or the unit is reserved, or the unit is inaccessible.

s = Sizes compatible.

YES — DRIVE, UCB, and VTOC equipage sizes are compatible.

NO — DRIVE, UCB, and VTOC equipage sizes are not compatible.

NAV — At least one of the equipage sizes are not available.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size.

SEE PROPRIETARY NOTICE ON COVER PAGE

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the LUCENT RTR-supported disk drives are as follows:

Drive	Formatted Capacity
160MB	133MB
300MB	253MB
322MB	322MB
340MB	277MB
600MB	604MB
1000MB	1000MB

t = Product identification.

NAP — Not applicable for SMD disks.

NAV — The DFC is not active,
or the unit is reserved,
or the SCSI MHD is inaccessible.

data — Alphanumeric data representing the product identification of a SCSI disk.

u = SBUS unit number if the DFC is a SCSI device.

Unit Number — Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

v = SCSI HA bus identification number, either 0 or 1.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For Formats 5 and 6, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, contact the next level of technical assistance.

5. ALARMS

This alarm is a manually-requested report.

c = System error code number. See the System Error Codes Output Appendix, SYSERR-APP.

d = Member number of controller.

e = DFC firmware/pumpcode version.

A.B.C — D

A = Version of DFC FIRMWARE/PUMPCODE.

B = Issue of DFC FIRMWARE/PUMPCODE.

C = Point issue of DFC FIRMWARE/PUMPCODE.

D = Laboratory design issue (LDI) of DFC FIRMWARE/PUMPCODE.

NAP — The pumpcode version is not applicable for SMD DFCs.

NAV — The firmware or pumpcode versions are not available, or cannot be determined.

f = Unit number.

g = Device type.

h = Device ID (drive ID number).

i = Physical port where the SMD disk is connected to the DFC.

NAV — The DFC is not available,
or the DFC is reserved,
or the SMD DFC firmware/pumpcode version is earlier than 3.2.0.

data — Physical port number.

j = Major status of unit.

k = Number of tracks on the SMD disk drive.

NAV — DFC is not available, or the unit is reserved.

data — Decimal number of disk tracks.

l = Validity of the volume table of contents (VTOC).

VALID — VTOC has a valid VTOC entry.

INVALID — Could not find a valid VTOC entry.

UNRDBLE — Read error while trying to read VTOC.

NAV — Could not reserve unit - VTOC not read.

m = Usability.

YES — Disk is considered usable.

NO — Disk data integrity is unknown.

n = Unit reserved.

YES — Unit is reserved for maintenance activity.

NO — Unit is not reserved.

o = Unit essential.

data — Hexadecimal value of the essential field of the unit's UCB.

p = Unit's mate.

SMPLX — Unit has no mate.

data — Unit name and member number of duplex mate.

SEE PROPRIETARY NOTICE ON COVER PAGE

q = Equipage size based on the physical drive.

For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record.

160MB — (SMD disk drive)
300MB — (SMD disk drive)
322MB — (SCSI disk drive)
340MB — (SMD disk drive)
600MB — (SCSI disk drive)
1000MB — (SCSI disk drive)
NAV — The DFC is not active,
or the SCSI device is inaccessible,
or the unit is reserved.

r = Equipage size based on the UCB equipage value.

The drive size is determined by reading the equipage value in the UCB record for the unit.

160MB — (SMD disk drive)
300MB — (SMD disk drive)
322MB — (SCSI disk drive)
340MB — (SMD disk drive)
600MB — (SCSI disk drive)
1000MB — (SCSI disk drive)
NAV — The DFC is not active,
or the unit is reserved.

s = Equipage size based on the VTOC.

The drive size is derived from the maximum capacity of the unit's VTOC.

160MB — (SMD disk drive)
300MB — (SMD disk drive)
322MB — (SCSI disk drive)
340MB — (SMD disk drive)
600MB — (SCSI disk drive)
1000MB — (SCSI disk drive)
NAV — The DFC is not active,
or the unit is reserved,
or the unit is inaccessible.

SEE PROPRIETARY NOTICE ON COVER PAGE

t = Sizes compatible.

YES — DRIVE, UCB, and VTOC equipage sizes are compatible.

NO — DRIVE, UCB, and VTOC equipage sizes are not compatible.

NAV — At least one of the equipage sizes are not available.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size.

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the LUCENT RTR-supported disk drives are as follows:

Drive	Formatted Capacity
160MB	133MB
300MB	253MB
322MB	322MB
340MB	277MB
600MB	604MB
1000MB	1000MB

u = Product identification.

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the product identification of a SCSI device.

v = Revision level.

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the revision level of the firmware in a SCSI device.

w = Serial number.

NAP — Not applicable for this device.

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the serial number of a SCSI device.

SEE PROPRIETARY NOTICE ON COVER PAGE

x = SBUS unit number if the DFC is a SCSI device.

Unit Number — Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

y = SCSI HA bus identification number: either 0 or 1.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For Formats 5 and 6, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, contact the next level of technical assistance.

2. REASON FOR OUTPUT

To report the result of executing an `OP:MHD;INFO` input message.

Format 5 is used to output data for an storage module device (SMD) moving head disk (MHD).

Format 6 is used to output data for a small computer system interface (SCSI) MHD.

3. VARIABLE FIELD DEFINITIONS

a = MHD member number.

b = Process step or reason code.

f01 — failed to enable message reception
f03 — failed to open ECD
f06 — failed to get UCB by name
f08 — failed to get top UCB
f0a — top UCB is not a DFC
f0c — unknown DFC type
f0e — failed to get UCB of SBUS

SEE PROPRIETARY NOTICE ON COVER PAGE

f11 — failed to assign special device file name for DFC
f14 — failed to open special device file for DFC
f17 — see DKDRV report on the ROP
f1a — failed to close special device file
f1c — failed to release special device file
f1f — failed to unreserve DFC UCB
f23 — failed to get next UCB
f26 — failed to assign special device file name
f29 — failed to open special device file
f2c — failed to set I/O mode of device file
f2f — device size not recognized
f33 — see DKDRV report on the ROP
f36 — failed to close special device file
f37 — failed to release special device file
f38 — failed to unreserve device UCB
f3e — message to port failure
f43 — message reception failure
f46 — process timed out
f49 — failed to close special device file
f4c — failed to release special device file
f4f — failed to unreserve UCB
f53 — failed to close ECD
f56 — terminated externally with signal

c = System error code number. See the System Error Codes Output Appendix, SYSERR-APP.

d = Member number of controller.

e = DFC firmware/pumpcode version.

A.B.C — D

A = Version of DFC FIRMWARE/PUMPCODE.

B = Issue of DFC FIRMWARE/PUMPCODE.

C = Point issue of DFC FIRMWARE/PUMPCODE.

D = Laboratory design issue (LDI) of DFC FIRMWARE/PUMPCODE.

NAP — The pumpcode version is not applicable for SMD DFCs.

NAV — The firmware or pumpcode versions are not available, or cannot be determined.

f = Unit number.

g = Device type.

h = Device ID (drive ID number).

i = Physical port where the SMD disk is connected to the DFC.

NAV — The DFC is not available,
or the DFC is reserved,
or the SMD DFC firmware/pumpcode version is earlier than 3.2.0.

data — Physical port number.

j = Major status of unit.

k = Number of tracks on the SMD disk drive.

NAV — DFC is not available, or the unit is reserved.

data — Decimal number of disk tracks.

l = Validity of the volume table of contents (VTOC).

VALID — VTOC has a valid VTOC entry.

INVALID — Could not find a valid VTOC entry.

UNRDBLE — Read error while trying to read VTOC.

NAV — Could not reserve unit - VTOC not read.

m = Usability.

YES — Disk is considered usable.

NO — Disk data integrity is unknown.

n = Unit reserved.

YES — Unit is reserved for maintenance activity.

NO — Unit is not reserved.

o = Unit essential.

data — Hexadecimal value of the essential field of the unit's UCB.

p = Unit's mate.

SMPLX — Unit has no mate.

data — Unit name and member number of duplex mate.

SEE PROPRIETARY NOTICE ON COVER PAGE

q = Equipage size based on the physical drive.

For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record.

160MB — (SMD disk drive)
300MB — (SMD disk drive)
322MB — (SCSI disk drive)
340MB — (SMD disk drive)
600MB — (SCSI disk drive)
1000MB — (SCSI disk drive)
2000MB — (SCSI disk drive)
NAV — The DFC is not active,
or the SCSI device is inaccessible,
or the unit is reserved.

r = Equipage size based on the UCB equipage value.

The drive size is determined by reading the equipage value in the UCB record for the unit.

160MB — (SMD disk drive)
300MB — (SMD disk drive)
322MB — (SCSI disk drive)
340MB — (SMD disk drive)
600MB — (SCSI disk drive)
1000MB — (SCSI disk drive)
2000MB — (SCSI disk drive)
NAV — The DFC is not active,
or the unit is reserved.

s = Equipage size based on the VTOC.

The drive size is derived from the maximum capacity of the unit's VTOC.

160MB — (SMD disk drive)
300MB — (SMD disk drive)
322MB — (SCSI disk drive)
340MB — (SMD disk drive)
600MB — (SCSI disk drive)
1000MB — (SCSI disk drive)
2000MB — (SCSI disk drive)
NAV — The DFC is not active,
or the unit is reserved,
or the unit is inaccessible.

SEE PROPRIETARY NOTICE ON COVER PAGE

t = Sizes compatible.

YES — DRIVE, UCB, and VTOC equipage sizes are compatible.

NO — DRIVE, UCB, and VTOC equipage sizes are not compatible.

NAV — At least one of the equipage sizes are not available.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size.

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the LUCENT RTR-supported disk drives are as follows:

Drive	Formatted Capacity
160MB	133MB
300MB	253MB
322MB	322MB
340MB	277MB
600MB	604MB
1000MB	1000MB
2000MB	2000MB

u = Product identification.

NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

data — Alphanumeric data representing the product identification of a SCSI device.

v = Revision level.

NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

data — Alphanumeric data representing the revision level of the firmware in a SCSI device.

w = Serial number.

NAP — Not applicable for this device.

NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

data — Alphanumeric data representing the serial number of a SCSI device.

SEE PROPRIETARY NOTICE ON COVER PAGE

x = SBUS unit number if the DFC is a SCSI device.

Unit Number — Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

y = SCSI HA bus identification number: either 0 or 1.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For Formats 5 and 6, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, contact the next level of technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

- `f4f` — failed to unreserve UCB
- `f53` — failed to close ECD
- `f56` — terminated externally with signal

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = Member number of controller.

e = Major status of unit.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = DFC firmware / pumpcode version.

NAV — The firmware or pumpcode versions are not available, or cannot be determined.

A.B.C — D

A = Version of DFC FIRMWARE/PUMPCODE.
B = Issue of DFC FIRMWARE/PUMPCODE.
C = Point issue of DFC FIRMWARE/PUMPCODE.
D = Laboratory design issue (LDI) of DFC FIRMWARE/PUMPCODE.

g = SBUS unit number.

Unit Number — Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

h = SCSI HA bus identification number, either 0 or 1.

i = Unit number.

j = Device type.

k = Device ID (drive ID number).

l = Unit reserved.

YES — Unit is reserved for maintenance activity.

NO — Unit is not reserved.

m = Product identification.

NAP — Not applicable for this device.

n = Revision level.

NAV — The DFC or the SBUS is not active,
or the unit is reserved,
or the SCSI device is inaccessible.

data — Alphanumeric data representing the revision level of the firmware in an SCSI device.

o = Serial number.

NAP — Not applicable for this device.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

5. ALARMS

None. This alarm is a manually-requested report.

[8]
```
OP OFL WRITE TO j
FAILED ON KEY #k
```

2. REASON FOR OUTPUT

To give device information specific to computer hardware units on communities requested via the OP:OFL input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Computer unit names are listed in the Member Numbers Appendix, Table C, MEM-NUM-APPC.

b = Unit number. See the Member Numbers Appendix, Table C MEM-NUM-APPC.

c = Subunit name, if *a* = CU. Computer CU subunit names are listed in Member Numbers Appendix, Table D MEM-NUM-APPD.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Subunit number. See the Member Numbers Appendix, Table C MEM-NUM-APPC.

e = The current maintenance state of the unit is indicated by the following identifiers.

ACT — Active units.
GROW — Units being grown.
INIT — Initializing units.
OFL — Offline units.
OOS — Out-of-service units.
STBY — Standby units.
UNAV — Unavailable units.
UNEQIP — Unequipped units.

f = Indicates the current inhibit status of the associated error source.

ALW — Allowed.
INH — Inhibited.

g = Results of the last diagnostic on the unit.

ABT — Aborted diagnostics.
ATP — All tests passed.
CATP — Conditional all tests passed.
NTR — No tests were run.
STF — Some test failed.

h = Error number.

9 — cannot attach to plant measurement library
11 — cannot open equipment configuration database (ECD) sequence
12 — cannot sequence unit control blocks (UCBs)

i = Retry the command later for the following reasons.

```
CANNOT SEQUENCE DATABASE
CANNOT CREATE FILE IN /tmp
CANNOT GET DATABASE RECORD ID
```

j = Temporary output file name.

k = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated. Action may or may not be required.

GENERIC . . . . . UNIX RTR R1.5, R6.4, and R21.3
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has eight formats.

[1] `OP OMDB COMPLETED`

[2]
```
OP OMDB NO DATABASE ENTRY FOUND FOR THE
FOLLOWING KEYS:
  b
```

[3]
```
OP OMDB FAILED
UNABLE TO ACCESS /cft/spl/omdb
```

[4] `OP OMDB FAILED`

[5]
```
OP OMDB ABORTED
UNABLE TO CREATE TEMP FILE
```

[6]
```
OP OMDB a
KEY    MSG_CLASS   ALARM   TEXT
c      d     e     f
```

[7]
```
OP OMDB ABORTED
UNABLE TO SEND REQUEST TO CSOP
```

[8]
```
OP OMDB NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS g
```

2. REASON FOR OUTPUT

To report the result of executing an `OP:OMDB` input message.

3. VARIABLE FIELD DEFINITIONS

a = `DISK` for OMDB disk file or `ACT` for active OMDB.

b = List of message keys for which the `OP:OMDB` failed.

c = Message key that was requested. There will be one line in the report for each key requested.

d = Numeric value of the message class associated with the message for the message key in *c*.

e = Alarm level (`CRIT, MAJ, MIN, MAN, ACT, INFO, VAR`) associated with the message for the message key in *c*.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = Up to 40 characters of the text associated with the message for the message key in *c*. The text shown in this report may include "%" characters. These characters indicate that variable data will be passed by the requesting process when this message is to be formatted and spooled.

g = Further explanation of error: `SYNTAX ERROR, INVALID OMDB COPY, INVALID KEY, TOO MANY KEYS`.

4. ACTION TO BE TAKEN

Format 1 indicates success.

For format 2, verify that the key(s) was entered correctly.

For format 3, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the `OP:STATUS;LISTDIR` command for `/cft/spl/omdb`.

For format 4, verify that the OMDB disk file (`/cft/spl/omdb`) is there. If the file is there, run the `ACTV:OMDB` command. If that does not solve the problem, attempt a craft initialization. If the file is not on the disk, restore the file and then run `ACTV:OMDB`.

Format 5 indicates a possible file system problem, such as lack of available disk space.

Format 6 indicates successful execution of the command.

For format 7, verify that the craft output spooler (CSOP) is running.

For format 8, verify that the input message was entered correctly.

5. ALARMS

None. This alarm is a manually-requested report.

ID . . . . . OP-PMCR-A
GENERIC . . . . . UNIX RTR R1.5, R6.4 and R21.3
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`OP PMCR ERROR` *a*[`,ERRNO =` *b*]

2. REASON FOR OUTPUT

To report errors encountered during the execution of the processes which comprise the plant measurements common report (PMCR) capability.

3. VARIABLE FIELD DEFINITIONS

a = Four-digit error code. This code consists of a one-digit number which indicates the PMCR process in which the error was detected, a two-digit number which indicates the error type, and a one-digit number which shows the location of the error within the specific process. The last digit is necessary for field support and is only used by developers. Therefore, all possible values and their meanings are not documented.

Process values (first digit) are as follows:

`1` — PMCR craft interface
`2` — PMCR manager
`3` — PMCR collector
`4` — PMCR report generator

Error-type values (second and third digits) are as follows:

`00` — user is not allowed to request scheduled report
This message comes from PMCR craft interface as `ERROR` 1001.
`01` — could not connect to system port
`02` — could not send or receive message
`03` — failed `plib` call
`04` — failed `pl_init` call
`05` — failed `pl_attrec` call
`06` — failed `pl_update` call
`07` — failed `pl_read` call
`08` — failed `lla_iatt` call
`09` — failed `lla_irel` call
`10` — failed `lla_rdget` call
`11` — failed `lla_opensq` call
`12` — failed `lla_nextseq` call
`13` — could not execute PMCR collector or PMCR report generator
`14` — could not get ECD segments
`15` — could not get reporting office name from ECD

SEE PROPRIETARY NOTICE ON COVER PAGE

16 — Computation of maintenance usage time for the specified unit resulted in a time greater than 86,400 seconds (one day), or in a negative value.
17 — bad arguments received by PMCR report generator
18 — spool error during output of report
19 — No data has been collected to output a retained/demand report. Requesting a daily retained report should not be attempted until after a scheduled daily report has been generated. Requesting an hourly retained report should not be attempted until after a scheduled hourly report has been generated. Demand reports should not be attempted until at least one hour after a valid scheduled daily report has been generated.
22 — PMDB initialization time reset to current time
23 — start time reset to 0
24 — start time reset to current time
25 — change reason for start time and reset start time to 0
26 — start time reset to top unit start time
27 — change reason for start time to top unit reason and reset start time to top unit start time
28 — hour limit exceeded - time reset to one hour
29 — negative time count time reset to 0
30 — day limit exceeded - time reset to one day
31 — The current value (for example, alarm count) is less than count recorded from previous hour, or previous count was invalid.
32 — open of `/etc/log/pmcrlog` file failed
33 — could not execute pmdbcopy
34 — Unrecognized UCB status
35 — failed `malloc` call.
36 — failed `lla_gtrid` call.
37 — Plant Measurements audit record deleted.

SEE PROPRIETARY NOTICE ON COVER PAGE

38 — Bad arguments supplied to pmcrman via the "PMCRMAN" ULARP form. There should be no more than two arguments to pmcrman. The arguments should be a number (0-23) indicating the time the daily reports should be generated and/or "NEF". "NEF" is used by 5E International which uses the eaiopt fields differently than expected.

Process location value (fourth digit). Possible values and meanings are not documented because this digit is necessary for field support and is only used by developers.

b = Error code returned by the failing function call.

If *a* = x01x, x02x, x03x, x13x, x14x, x15x, x16x, x181, or x182, see the System Error Codes Output Appendix, SYSERR-APP.

If *a* = x04x, x05x, x06x, or x07x, *b* is the plant measurements error code number.

If *a* = x17x or x183, *b* is the value of the bad arguments passed to the function or process.

If *a* = x34x, *b* is the invalid UCB status.

If *a* = x37x, *b* is the deleted audit record.

If *a* = x08x, x09x, x10x, x11x, x12x, x19x, x35x, x36x, x37x, or x38x *b* does not specify an error code.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For error messages 22 through 31, see `/etc/log/pmcrlog` for record name information. These error messages indicate that the count or time for the unit may not be valid. Since these errors are corrected by pmcrman, they are for information only and require no further action. Some of these errors may be seen at boot time or after stopping off line boot (OFLBOOT).

The log file (`/etc/log/pmcrlog`) is reset each time a scheduled report runs.

For all other errors, the table below shows the action to be taken based on error code *a*. In all instances, seek technical assistance if the error persists.

Table 1. Error Codes

If *a* =	Action To Be Taken
x00x	Request output of scheduled reports to be turned on by using `OP:PMCR;TYPE STAT` command. Then scheduled hourly reports will be printed at the end of the hour, and daily at the end of the day.
x01x	Check port 27, using the `OP:STATUS;PORTS` input message, to see if another process has control of the port.
x02x	Check that the correct `OP:PMCR` input message was entered. Request output of scheduled reports to be turned on by using `OP:PMCR`.
x03x - x07x	Check the usability of the plant measurements database.
x08x - x12x	Check the usability of the ECD.
x13x	Check the usability of the PMCR processes.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

If *a* =	Action To Be Taken
x14x - x15x	Check the usability of the ECD.
x16x	Check system clock versus last clean report.
x17x	Check that the correct `OP:PMCR` input message was entered.
x18x - x19x	No action can be taken.
x32x	Check that the `/etc/log/` *directory* has read/write/search permission, that the `etc/log/pmcrlog` file (if it exists) has write permission, and that free blocks and i-nodes are available on the file system.
x33x	Check that the `/prc/pmdbcopy` file exists and is executable.
x34x - x35x	Seek technical assistance if the error persists.
x36x	Check the usability of the ECD.
x37x	No action to be taken.
x38x	Check the "PMCRMAN" ULARP form to ensure the arguments are correct. Seek technical assistance if necessary.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

[1] `OP PMCR ERROR` *a*`[,ERRNO =` *b*`]`

[2] `OP PMCR INFO` *a*

2. REASON FOR OUTPUT

To report errors encountered during the execution of the processes which comprise the plant measurements common report (PMCR) capability.

3. VARIABLE FIELD DEFINITIONS

a = Four-digit error code. This code consists of a one-digit number which indicates the PMCR process in which the error was detected, a two-digit number which indicates the error type, and a one-digit number which shows the location of the error within the specific process. The last digit is necessary for field support and is only used by developers. Therefore, all possible values and their meanings are not documented.

Process values (first digit) are as follows:

`1` — PMCR craft interface
`2` — PMCR manager
`3` — PMCR collector
`4` — PMCR report generator

Error-type values (second and third digits) are as follows:

`00` — user is not allowed to request scheduled report
This message comes from PMCR craft interface as `ERROR` 1001.
`01` — could not connect to system port
`02` — could not send or receive message
`03` — failed `plib` call
`04` — failed `pl_init` call
`05` — failed `pl_attrec` call

SEE PROPRIETARY NOTICE ON COVER PAGE

06 — failed `pl_update` call
07 — failed `pl_read` call
08 — failed `lla_iatt` call
09 — failed `lla_irel` call
10 — failed `lla_rdget` call
11 — failed `lla_opensq` call
12 — failed `lla_nextseq` call
13 — could not execute PMCR collector or PMCR report generator
14 — could not get ECD segments
15 — could not get reporting office name from ECD
16 — Computation of maintenance usage time for the specified unit resulted in a time greater than 86,400 seconds (one day), or in a negative value.
17 — bad arguments received by PMCR report generator
18 — spool error during output of report
19 — No data has been collected to output a retained/demand report. Requesting a daily retained report should not be attempted until after a scheduled daily report has been generated. Requesting an hourly retained report should not be attempted until after a scheduled hourly report has been generated. Demand reports should not be attempted until at least one hour after a valid scheduled daily report has been generated.
22 — PMDB initialization time reset to current time
23 — start time reset to 0
24 — start time reset to current time
25 — change reason for start time and reset start time to 0
26 — start time reset to top unit start time
27 — change reason for start time to top unit reason and reset start time to top unit start time
28 — hour limit exceeded - time reset to one hour
29 — negative time count time reset to 0
30 — day limit exceeded - time reset to one day
31 — The current value (for example, alarm count) is less than count recorded from previous hour, or previous count was invalid.
32 — open of `/etc/log/pmcrlog` file failed
33 — could not execute pmdbcopy
34 — Unrecognized UCB status
35 — failed `malloc` call.
36 — failed `lla_gtrid` call.
37 — Plant Measurements audit record deleted.

SEE PROPRIETARY NOTICE ON COVER PAGE

38 — Bad arguments supplied to pmcrman via the "PMCRMAN" ULARP form. There should be no more than two arguments to pmcrman. The arguments should be a number (0-23) indicating the time the daily reports should be generated and/or "NEF". "NEF" is used by 5E International which uses the eaiopt fields differently than expected.

Process location value (fourth digit). Possible values and meanings are not documented because this digit is necessary for field support and is only used by developers.

b = Error code returned by the failing function call.

If *a* = x01x, x02x, x03x, x13x, x14x, x15x, x16x, x181, or x182, see the System Error Codes Output Appendix, SYSERR-APP.

If *a* = x04x, x05x, x06x, or x07x, *b* is the plant measurements error code number.

If *a* = x17x or x183, *b* is the value of the bad arguments passed to the function or process.

If *a* = x34x, *b* is the invalid UCB status.

If *a* = x37x, *b* is the deleted audit record.

If *a* = x08x, x09x, x10x, x11x, x12x, x19x, x35x, x36x, x37x, or x38x *b* does not specify an error code.

4. ACTION TO BE TAKEN

For error messages 22 through 31, see `/etc/log/pmcrlog` for record name information. These error messages indicate that the count or time for the unit may not be valid. Since these errors are corrected by pmcrman, they are for information only and require no further action. Some of these errors may be seen at boot time or after stopping off line boot (OFLBOOT).

The log file (`/etc/log/pmcrlog`) is reset each time a scheduled report runs.

For all other errors, the table below shows the action to be taken based on error code *a*. In all instances, seek technical assistance if the error persists.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes

If *a* =	Action To Be Taken
x00x	Request output of scheduled reports to be turned on by using `OP:PMCR;TYPE STAT` command. Then scheduled hourly reports will be printed at the end of the hour, and daily at the end of the day.
x01x	Check port 27, using the `OP:STATUS;PORTS` input message, to see if another process has control of the port.
x02x	Check that the correct `OP:PMCR` input message was entered. Request output of scheduled reports to be turned on by using `OP:PMCR`.
x03x - x07x	Check the usability of the plant measurements database.
x08x - x12x	Check the usability of the ECD.
x13x	Check the usability of the PMCR processes.
x14x - x15x	Check the usability of the ECD.
x16x	Check system clock versus last clean report.
x17x	Check that the correct `OP:PMCR` input message was entered.
x18x - x19x	No action can be taken.
x32x	Check that the `/etc/log/` *directory* has read/write/search permission, that the `etc/log/pmcrlog` file (if it exists) has write permission, and that free blocks and i-nodes are available on the file system.
x33x	Check that the `/prc/pmdbcopy` file exists and is executable.
x34x - x35x	Seek technical assistance if the error persists.

Table 1. Error Codes *(continued)*

If *a* =	Action To Be Taken
x36x	Check the usability of the ECD.
x37x	No action to be taken.
x38x	Check the "PMCRMAN" ULARP form to ensure the arguments are correct. Seek technical assistance if necessary.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

6. REFERENCES

OMDB Key

ID . . . . . OP-REXINH-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . XUNIT,MAINT

1. FORMAT

This message has five formats.

[1] `OP REXINH` *a*
b `REX INHIBITED UNITS`[:]
c d

[2] `OP REXINH CANNOT OPEN` *e*

[3] `OP REXINH NOT STARTED`
`INVALID DATA FIELD`

[4] `OP REXINH NOT STARTED`
`RETRY LATER`

[5] `OP REXINH CANNOT WRITE TO` *e*
`WITH MESSAGE FROM KEY #` *f*

2. REASON FOR OUTPUT

Format 1 is printed in response to an `OP:REXINH` input message. This message reports the hardware communities for which routine exercises are currently inhibited. The `INH:REX` input message inhibits routine exercises from hardware communities. The `INH:DMQ` input message can inhibit honoring routine exercise process maintenance requests. DMQ inhibits may be verified by using the `OP:DMQ` input message.

Format 2 could not open temporary file used for sending report data to CSOP - no report is generated.

3. VARIABLE FIELD DEFINITIONS

a = `COMPLETED` if entire report has been processed. The last lines of the report follow the `COMPLETED` message. `IN PROGRESS` if the report has not yet been completed.

b = `NO` if no `REX` inhibited hardware communities are found in the ECD. If this field is `NO`, then the optional colon at the end of the text is not generated. If `REX` inhibited hardware communities are found in the ECD, then this field is empty and the optional colon is generated followed by a list of the `REX` inhibited hardware communities.

c = Unit name.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Unit number.

e = Temporary output file name.

f = Key associated with write failure.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is either a manually-requested report, or an automatically-generated report that is for information only.

. .
`[REX INHIBITED IN DMQ |`
`REX DMQ STATUS NOT AVAILABLE]`

[2] `OP REXINH CANNOT OPEN` *e*

[3] `OP REXINH NOT STARTED`
`INVALID DATA FIELD`

[4] `OP REXINH NOT STARTED`
`RETRY LATER`

[5] `OP REXINH CANNOT WRITE TO` *e*
`WITH MESSAGE FROM KEY #` *f*

2. REASON FOR OUTPUT

Format 1 is printed in response to an `OP:REXINH` input message. This message reports either the temporary routine exercise inhibits or the permanent routine exercise inhibits if the `PERM` option was specified on the input message. The `INH:REX` input message temporarily inhibits routine exercises from hardware communities. The `INH:DMQ` input message can temporarily inhibit honoring routine exercise process maintenance requests. This message reports if routine exercises are inhibited in the DMQ or if the DMQ cannot be accessed as part of temporary routine exercise inhibits. DMQ inhibits may be verified by using the `OP:DMQ` input message. Permanent routine exercise inhibits are established for hardware communities by a field in the ECD.

Format 2 could not open temporary file used for sending report data to CSOP - no report is generated.

3. VARIABLE FIELD DEFINITIONS

a = `COMPLETED` if entire report has been processed. The last lines of the report follow the `COMPLETED` message. `IN PROGRESS` if the report has not yet been completed.

SEE PROPRIETARY NOTICE ON COVER PAGE

b = This field is empty if there are temporary REX inhibited hardware communities or REX is inhibited in the DMQ, followed by a list of the temporary REX inhibits. NO if there are no temporary REX inhibited hardware communities and REX is not inhibited in the DMQ.

When the PERM option is specified on the OP:REXINH input message: PERMANENT if there are permanent REX inhibited hardware communities, followed by a list of the permanent REX inhibited hardware communities. NO PERMANENT if there are no permanent REX inhibited hardware communities.

c = Unit name.

d = Unit number.

e = Temporary output file name.

f = Key associated with write failure.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is either a manually-requested report, or an automatically-generated report that is for information only.

ID . . . . . OP-SCSD
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `OP SCSD UNIT` *a*
`INHIBIT:` *ccccccccc ccccccccc ccccccccc ccccccccc ccccccccc ccccccccc*
`SCAN PT:` *ddddddddd ddddddddd ddddddddd ddddddddd ddddddddd ddddddddd*
`OP SCSD UNIT` *a b*

[2] `OP SCSD GRPN` *e*
`DUPID` *f*
`INHIBIT:` [*ccc*]
`SCAN PT:` [*ddd*]
`OP SCSD GRPN` *e b*

[3] `OP SCSD NOT STARTED`
`CONFLICT WITH CURRENT SYSTEM STATUS`

2. REASON FOR OUTPUT

To indicate the state and the inhibit status of the scan points on a scanner and signal distributor (SCSD) unit.

Format 1 is used to display the entire SCSD scan map for a unit.

Format 2 is used to display the scan state for a particular logical group.

Format 3 indicates the SCSD administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

a = Member number of SCSD unit.

b = Termination status.

FAILED — Action could not be completed by SCSD administrator.

Possible reasons for failure are:

— SCSD unit number is invalid.

— Point number is invalid for the logical group.

— Logical group name is invalid and either the SCSD unit is out-of-service (OOS) or is in an inactive state to the SCSD administrator.

SEE PROPRIETARY NOTICE ON COVER PAGE

COMPLETED — Action completed.

c = Inhibit status. (Scan points are numbered 0 - 47 starting from the left) One of the following.

0 — Scan point is not inhibited.
1 — Scan point is inhibited.

d = Scan point status. (Scan points are numbered 0 - 47 starting from the left) One of the following.

0 — Scan point is clear (open).
1 — Scan point is set (closed).

e = Logical group name.

f = Duplex group ID (0 or 1).

4. ACTION TO BE TAKEN

Issue the OP:OOS input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter recent change and verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

1. FORMAT

This message has four formats.

[1] `OP STATUS DISKUSE COMPLETED`
a b

[2] `OP STATUS DISKUSE STOPPED`
c `DOES NOT EXIST`

[3] `OP STATUS DISKUSE STOPPED`
`TOTAL OR EACH MUST BE SPECIFIED`
`IF FN IS A FILE`

[4] `OP STATUS DISKUSE STOPPED`
d

2. REASON FOR OUTPUT

To report the result of executing an `OP:STATUS;DISKUSE` input message.

3. VARIABLE FIELD DEFINITIONS

a = The total number of blocks in the directory or file is printed. Block size is 512 bytes.

b = Pathname of file specified in the input message.

c = Pathname of the directory which does not exist.

d = Text explaining why the command was stopped.

4. ACTION TO BE TAKEN

Use the `OP:STATUS;LISTDIR` input message to check the status of the file if `bad status` is printed. (This message implies that the file does not exist.)

Use the `CLR:FILESYS;FILE` input message to remove some files or the `COPY:FILESYS;FILE` input message to copy some files to another directory if `Huge directory` is printed.

Seek technical assistance if a `cannot open` or `cannot read` message is printed.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `OP STATUS FREEDISK {STARTED | IN PROGRESS | COMPLETED}`
a b c `BLOCKS` *d* `I-NODES`

[2] `OP STATUS FREEDISK STOPPED`
`cannot open` *e* `|`
`cannot stat` *e* `|`
e `not a block device |`
e `not a file system`

2. REASON FOR OUTPUT

To respond to the `OP:STATUS;FREEDISK` input message to print out the number of free blocks and free i-nodes available for on-line file system.

Format 1 prints when the input message is being executed or is successfully completed.

Format 2 prints when the input message is stopped by an error condition.

NOTE: `STARTED`, `IN PROGRESS` and `COMPLETED` messages appear when three or more output segments are printed.

`STARTED` and `COMPLETED` messages appear when two output segments are printed.

A `COMPLETED` message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Mounted directory name.

b = Device name.

c = Number of free blocks.

d = Number of free inodes.

e = Pathname specified in the input message.

4. ACTION TO BE TAKEN

Refer to the *Input Messages Manual* for the correct format and reenter the message or check the status of the file using the `OP:STATUS;LISTDIR` input message if `cannot open` printed.

Seek technical assistance if `cannot stat` or any other error message is printed.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

b = Size in blocks.

c = Type of file. One of the following:

`d` — Directory
`b` — Block
`c` — Character
`p` — FIFO
`-` — Ordinary

d = Permissions. (For example, `RWX` = read, write and execute.)

e = Number of links.

f = Owner.

g = Size, specified in bytes.

h = Current modification time.

i = Filename.

j = Pathname specified in the input command.

4. ACTION TO BE TAKEN

Refer to the *Input Message Manual* for the correct format and reenter the command if `not found` is printed.

Seek technical assistance if any other error message is printed.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `OP STATUS PORTS {STARTED|IN PROGRESS|COMPLETED}`
`port` *a* `owner by` *b*

[2] `OP STATUS PORTS STOPPED`

2. REASON FOR OUTPUT

To respond to an `OP:STATUS;PORTS` input message to output the status of each connected port.

NOTE: `STARTED`, `IN PROGRESS` and `COMPLETED` messages appear when three or more output segments are printed.

`STARTED` and `COMPLETED` messages appear when two output segments are printed.

A `COMPLETED` message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Port number.

b = Process identification (ID) of the process connected to the port.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

warning: can't stat /dmrt/kprc |
read error /dev/kmem |
bad read |
read error
internal error |
bad input line: badline |
internal table exhausted
```

2. REASON FOR OUTPUT

To output the status of one or more active processes.

Format 1 prints when ALL or ALLTERMS was specified in the input message.

Format 2 prints when ALLKERNS was specified in the input message.

Format 3 prints when PATH was specified in the input command.

SEE PROPRIETARY NOTICE ON COVER PAGE

NOTE: `STARTED`, `IN PROGRESS` and `COMPLETED` messages appear when three or more output segments are printed.

`STARTED` and `COMPLETED` messages appear when two output segments are printed.

A `COMPLETED` message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Process status flags (in hexadecimal notation).

b = Current priority of the process (in decimal notation).

c = Time spent in the kernel in milliseconds (in decimal notation).

d = Time spent in kernel processes in milliseconds (in decimal notation).

e = Time spent in supervisor processes in milliseconds (in decimal notation).

f = Last character of the control channel (terminal) of the process (alphabetical).

g = Process number of the process (in decimal notation).

h = Utility identification (ID) as given in the specification file for the process.

i = Size (in bytes) of the process (in decimal notation).

j = Bit pattern on which the process is sleeping (in hexadecimal notation).

k = Command line used to invoke the process, including any arguments passed to the process. This is in alphabetical sequence.

l = Execution level for the process (in decimal notation).

m = Real-time clock value for a single or repetitive timeout (in hexadecimal notation).

n = Time interval (in milliseconds) between timeouts for repetitive timeouts (in decimal notation).

o = Process event-flag word (in hexadecimal notation).

p = Process control channel (in hexadecimal notation).

q = Address of the process control block (PCB) segment descriptor entry (in hexadecimal notation).

r = Dispatcher control table index for the process (in decimal notation).

s = Name of the controller or device.

t = Process number of the parent process (in decimal notation).

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Seek technical assistance if format 4 or other error message prints.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

6. REFERENCES

1. FORMAT

This message has two formats.

[1] `OP STATUS SUM COMPLETED`
a b c

[2] `OP STATUS SUM STOPPED`
`Cannot open` *c* | `Read error on` *c*

2. REASON FOR OUTPUT

To output the result of executing the `OP:STATUS;SUM` input command to calculate the checksum and to report the number of blocks in a file.

3. VARIABLE FIELD DEFINITIONS

a = 16-bit checksum of a file (in decimal notation).

b = Number of blocks in a file (in decimal notation).

c = Pathname of the file specified in the input command.

4. ACTION TO BE TAKEN

Refer to the input message manual for the correct format and reenter the command, or check the status of the file using the `OP:STATUS;LISTDIR` input message if `can't open` is printed.

Seek technical assistance if `read error` is printed.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

[8]
```
OP STBY WRITE TO j
FAILED ON KEY #k
```

2. REASON FOR OUTPUT

To give device information specific to computer hardware units on communities requested via the OP:STBY input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Computer unit names are listed in the Member Numbers Appendix, MEM-NUM-APPC, Table C.

b = Unit number. See the Member Numbers Appendix, MEM-NUM-APPC, Table C.

c = Subunit name, if *a* = control unit (CU). Computer CU subunit names are listed in the Member Numbers Appendix, MEM-NUM-APPD, Table D.

d = Subunit number. See the Member Numbers Appendix, MEM-NUM-APPC, Table C.

e = The current maintenance state of the unit is indicated by the following identifiers.

ACT — Active units.
GROW — Units being grown.
INIT — Initializing units.
OFL — Offline units.
OOS — Out-of-service units.
STBY — Standby units.
UNAV — Unavailable units.
UNEQIP — Unequipped units.

f = Unit status.

ALW — Allowed.
INH — Inhibited.

g = Results of the last diagnostic on the unit.

ABT — Aborted diagnostics.
ATP — All tests passed.
CATP — Conditional all tests passed.
NTR — No tests were run.
STF — Some tests failed.

h = Error number.

9 — cannot attach to plant measurement library
11 — cannot open equipment configuration database (ECD) sequence
12 — cannot sequence unit control blocks (UCBs)

i = Retry the command later for the following reasons.

```
CANNOT SEQUENCE DATABASE
CANNOT CREATE FILE IN /tmp
CANNOT GET DATABASE RECORD ID
```

j = Temporary output file name.

k = Key associated with write failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

This alarm is either a manually-requested report or is automatically-generated. Action may or may not be required.

1. FORMAT

This message has two formats.

[1] `OP ULARP COMMAND STARTED`
a b c

[2] `OP ULARP` {`COMPLETED`|`ABORTED`}

2. REASON FOR OUTPUT

To print the status of one or all run commands.

3. VARIABLE FIELD DEFINITIONS

a = Name of the equipment configuration database (ECD) record for the run command.

b = Status of the run command.

`COMPLETED` — Run command has successfully executed. Any numeric value indicates the run command failed.

`FORK_FAIL` — User level automatic restart process's (ULARP's) attempt to fork a process to execute the run command failed.

`NON_EXEC` — Run command was not executed.

c = Date and time status field last changed.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This automatically-generated report is for information only.

This message has two formats.

[1] `OP ULARP EXECSEQ` *a* `STARTED`
`SEQ NUM NAME TYPE BOOTPRM RID/UID DELAY WAIT`
b c d e f g h

[2] `OP ULARP` {`COMPLETED`|`ABORTED`}

2. REASON FOR OUTPUT

To print the order of execution of child processes and run commands.

3. VARIABLE FIELD DEFINITIONS

a = Procedure.

`BOOT` — Bootstrap.

`CFTINIT` — Craft initialization.

b = Sequence number.

c = Name of equipment configuration database (ECD) record for child process or run command.

d = Child process or run command.

`P` — Child process.

`C` — Run command.

e = `BOOTPRM`. Two-digit hexadecimal number which is output as part of a processor recovery message (PRM) resulting from the creation of each child process.

f = Record identification (ID) in the case of a run command, or utility ID in the case of a child process.

g = Delay timing field (in seconds).

h = Wait-for-completion flag for run commands (`YES` or `NO`).

4. ACTION TO BE TAKEN

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

This message has two formats.

[1] `OP ULARP PROCESS STARTED`
`NAME PID STATUS LAST CHANGED RST CNT RST TIME`
a b c d e f

[2] `OP ULARP` {`COMPLETED`|`ABORTED`}

2. REASON FOR OUTPUT

To print the status of one or all user level automatic restart process (ULARP) child processes.

3. VARIABLE FIELD DEFINITIONS

a = Name of equipment configuration database (ECD) record for a ULARP child process.

b = Process ID.

c = One of the following statuses.

`CFTTERM` — Craft initialization is in progress.

`EXECFAIL` — ULARP failed to execute the process.

`FORKFAIL` — ULARP's attempt to fork the process failed.

`NONEXEC` — Process was not executed.

`RUNNING` — Process is running.

`UFATAL` — Process terminated because of a fatal error.

Any numeric value indicates that the process terminated and was not restarted by `ULARP`. The value is the exit status that was returned to `ULARP` the last time the process terminated.

d = Date and time status field last changed.

e = Restart count, if non-zero.

f = Date and time `ULARP` started counting restarts if *e* is non-zero.

```

[6]
```
OP UMEM NOT STARTED
INVALID ID FIELD GENERAL SYNTAX ERROR
```

[7]
```
OP UMEM NOT STARTED
RETRY LATER THE SYSTEM IS IN AN OVERLOAD CONDITION
```

2. REASON FOR OUTPUT

To report the disposition of an `OP:UMEM` input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination status.

- `COMPLETED` — The data has been dumped to the file as indicated.
- `STOPPED UCERR` — The utility circuit either does not respond or does not match the circuit present when the trace was defined.

b = Number of lines written to the file.

c = Name of the file to which the output was written.

d = Circuit type from which the information was taken.

e,h = Generic access package (GRASP) execution sequence number.

f = `CREATE`, `OPEN`, or `READ`. Indicates which file operation failed.

g = `DIAGNOSTICS` or `TRACE INFORMATION`. Indicates for which file operation failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

The file into which the information was written should be removed after it has been examined.

If *a* is `STOPPED UCERR`, check the utility circuit hardware. After it is fixed, use initiative to reinitialize the circuit.

5. ALARMS

None. This alarm is a manually-requested report.

DCYCLE = c          DEATH DELAY = d

{NO FLAGS DEFINED |
BPTNUM  UID X'  PID   ADDR X'   L  MODE   (IMP) STATE
 e   f   g    h   i  j  (k)  l }
{NO TRACE DEFINED |

TRACE   UID X'  PID   ADDR X'   L  STORE  (IMP) STATE
 m   n    o    p   q  r  (s)  t }
#u
```

[2]
```
OP UTIL NOT STARTED
INVALID ACTION FIELD INVALID KEYWORD
```

[3]
```
OP UTIL NOT STARTED
RETRY LATER THE SYSTEM IS IN AN OVERLOAD CONDITION
```

2. REASON FOR OUTPUT

To print a summary status report of the generic access package (GRASP) state in response to an `OP:UTIL` input message. The effective values of the dynamic and static thresholds, defined breakpoints and their attributes, and the transfer trace attributes are printed.

3. VARIABLE FIELD DEFINITIONS

a = Threshold value of dynamic real time usage at which GRASP will take overload recovery. Expressed as a percentage.

b = Threshold value of real time allowed for an individual breakpoint. Breakpoints which exceed this limit will be rejected. Expressed in milliseconds.

c = Interval of time over which GRASP real time usage is accumulated. Expressed in milliseconds.

d = Length of time of debugging inactivity through which GRASP will wait before terminating itself. Expressed in minutes.

e = Breakpoint number.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = Utility ID (UID) of the process in which the breakpoint is planted. The value is enclosed in parentheses if the breakpoint definition specified a process ID (PID) instead of a utility ID.

g = PID of the process in which the breakpoint is planted. The value is enclosed in parentheses if the breakpoint definition specified a utility ID instead of a process ID. The field will be blank if no suitable process has been found.

h = Address of the breakpoint.

i = Length of the match interval. Execution breakpoints indicate 1 byte.

j = Breakpoint condition as specified in the `WHEN` input message.

k = Implementation of the breakpoint. Software implemented breakpoints are not marked. Hardware implemented breakpoints are marked with an `H`. In addition, the range matcher is marked with an asterisk (*) and the hardware execution matcher is marked with a pound sign (#).

l = Breakpoint state: `ENABLED` or `DISABLED`.

m = Stop condition of the trace; one of the following.

`CIRCULAR` — The trace will run indefinitely, replacing the oldest data with the newest.
`STOP FULL` — The trace will stop when the memory fills up.

n = Utility ID to which the trace is restricted. The value will be enclosed in parentheses if the `INIT:UMEM` message specified a process ID. Will be blank if no restriction was given.

o = Process ID to which the trace is restricted. Will be blank if no PID restriction was given.

p = Beginning address to which the trace is restricted.

q = Length of the address interval to which the trace is restricted.

r = Storage mode: `UID` or `TRANSFER`.

s = Implementation of the trace. Indicates which matcher is used with `H*` for the range matcher and `H#` for the execution matcher.

t = Trace state.

`DUMPED` — The trace is not running and its data has already been dumped.
`NEW` — The trace is not running and does not contain data.
`RUNNING` — The trace is collecting data.
`STOPPED` — The trace is not running but does contain data.

u = GRASP execution sequence number range. Other GRASP operations have higher priority than `OP:UTIL`, some may occur during `OP:UTIL` formatting.

2. REASON FOR OUTPUT

To print a summary status report of the generic access package (GRASP). This is in response to an `OP:UTIL` input message. The effective values of the dynamic and static thresholds, defined breakpoints and their attributes, and the transfer trace attributes are printed.

3. VARIABLE FIELD DEFINITIONS

a = Threshold value of dynamic real time usage at which GRASP will take overload recovery. Expressed as a percentage.

c = Interval of time over which GRASP real time usage is accumulated. Expressed in milliseconds.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Length of time of debugging inactivity through which GRASP will wait before terminating itself. Expressed in minutes.

e = Breakpoint number.

f = Utility ID (UID) of the process in which the breakpoint is planted. The value is enclosed in parentheses if the breakpoint definition specified a process ID instead of a utility ID.

g = Process ID (PID) of the process in which the breakpoint is planted. The value is enclosed in parentheses if the breakpoint definition specified a utility ID instead of a process ID. The field will be blank if no suitable process has been found.

h = Address of the breakpoint.

i = Length of the match interval. Execution breakpoints indicate one byte.

j = Breakpoint condition as specified in the `WHEN` input message.

k = Implementation of the breakpoint. Software implemented breakpoints are not marked. Hardware implemented breakpoints are marked with an `H`. In addition, the range matcher is marked with an asterisk (*) and the hardware execution matcher is marked with a pound sign (#).

l = Breakpoint state includes one of the following: `ENABLED` or `DISABLED`.

m = Stop condition of the trace - includes one of the following.

`STOP FULL` — The trace will stop when the memory fills up.
`CIRC` — The trace will run indefinitely, replacing the oldest data with the newest.

n = Utility ID to which the trace is restricted. The value will be enclosed in parentheses if the `INIT:UMEM` message specified a process ID. If no restriction was given, will be blank.

o = Process ID to which the trace is restricted. If no PID restriction was given, will be blank.

p = Beginning address to which the trace is restricted.

q = Length of the address interval to which the trace is restricted.

r = Storage mode: `UID`, `TRANS`, `DATA`, `DTRANS`, `FPARAM`, or `DFPAR`.

s = Implementation of the trace. Indicates which matcher is used with `H*` for the range matcher and `H` for the execution matcher.

SEE PROPRIETARY NOTICE ON COVER PAGE

t = Trace state:

`NEW` — The trace is not running and does not contain data.
`RUNNING` — The trace is collecting data.
`STOPPED` — The trace is not running but does contain data.
`DUMPED` — The trace is not running and its data has already been dumped.

u = GRASP execution sequence number range. Other GRASP operations have higher priority then `OP:UTIL`, some may occur during `OP:UTIL` formatting.

OP VERSION [MISMATCH]  a  [PART b [COMPLETED]]
   PARTITION       VERSION          BWM
   c                d                 e
                    .
                    .
                    .
   [DISK CONFIGURATION: f]
```

2. REASON FOR OUTPUT

To respond to the input message OP:VERSION.

3. VARIABLE FIELD DEFINITIONS

COMPLETED = Final part of multipart message.

MISMATCH = The generic versions and/or software-update levels do not match.

PART = Indicates multipart message.

a = Version and level to which date partitions were set.

b = Message part number.

c = Partition name. The pseudo-partition ECD refers to the 'systype' and 'genid' items from the 'eaiopt' form in the equipment configuration database (ECD).

d = Generic version of this partition.

e = Software-update level of this partition. The ECD partition does not have a software-update level.

f = Office disk configuration.

UPD:VERSION
```

Output Message(s):

```
UPD:VERSION
```

ID . . . . . ORD-SCSD
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `ORD SCSD UNIT` *a* `PT` *b*[*bbbbbbb*] *f g*

[2] `ORD SCSD GRPN` *c* `DUPID` *d* `PT` *e*[*eeeee*] *f g*

[3]
```
ORD SCSD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
```

2. REASON FOR OUTPUT

To indicate the result of a distribute operation requested by an `ORD:SCSD` input message. The operations are: set, clear, flash for eight seconds, and flash continuously.

Format 1 is used when a distribute point is identified by physical location.

Format 2 is used when a distribute point is identified by logical address.

Format 3 indicates the scanner and signal distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

a = Member number of SCSD unit.

b = Physical scan point number on an SCSD (0-31).

c = Name of the logical group.

d = Duplex group ID (0 or 1).

e = Number of a point within a logical group.

f = Distribute operation.

`RELEASE` — Clear.
`OPERATE` — Set.
`STEP` — Flash for eight seconds, which it terminates in the cleared state.
`REPEAT` — Flash continuously.

SEE PROPRIETARY NOTICE ON COVER PAGE

g = Termination status.

`FAILED` — Action could not be completed by SCSD administrator.

Possible reasons for failure are:

— SCSD unit number is invalid.

— Point number is invalid for the logical group. If more than one point number is specified, at least one of them is invalid. Operation will complete for all valid point numbers if there are no other errors.

— Logical group name is invalid and either the SCSD unit is out-of-service (OOS) or is in an inactive state to the SCSD administrator.

`COMPLETED` — Action completed.

4. ACTION TO BE TAKEN

Issue the `OP:OOS` input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter recent change and verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

[7] PRM_*a b*6*de* 7*qr uss nnn ooo hi jk lm*

2. REASON FOR OUTPUT

To report the completion status of each computer process during processor recovery. The report is called a Processor Recovery Message (PRM). See the *UNIX® RTR Operating System Processor Recovery Messages Guide* for detail on specific PRMs printed on the ROP.

Successful execution produces a success PRM. If a process encounters a failure, a failure PRM is produced to indicate which process failed, the reason for the failure, and, in some cases, the failing data.

Format 1 is printed for all processes except the disk driver. Formats 2 - 7 are disk driver failure PRMs.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the control unit (CU) which output the PRM (0 or 1).

b = Type of PRM.

E — Success.

F — Failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Major step or process that output PRM.

0 — Microboot.

1 — Little Boot and load disk from tape.

2 — PINIT.

3 — Big Boot.

4 — KBOOT.

5 — EIH.

6 — Disk Driver.

7 — IOP Driver.

8 — File Manager.

9 — UNIX® RTR Processes: kernel, scheduler, memory manager, capabilities manager, or utilities manager.

A — Process Manager.

B — System Integrity Monitor (SIM).

C — SIM recovery complete.

D-E — Not used by UNIX® RTR. Could be an application process. See application documentation.

d = UNIX® RTR level of initialization.

e = Application level of initialization.

f = Two-digit code for function within major step.

g = 10 digits of failure data or other information.

h = Emergency action interface (EAI) status digit bits numbered right to left as follows.

3 — Power up.

2 — Central control (CC) run.

1 — CC active.

0 — EAI all seems well (ASW).

i = EAI status digit, bits numbered right to left as follows.

3 — New PRM.
2 — Maintenance reset function (MRF) start.
1 — Pulse point 23.
0 — Pulse point 22.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = EAI status digit, bits numbered right to left as follows.

3 — IPB received.
2 — EAI enabled.
1 — Primary disk.
0 — Secondary disk.

k = EAI status digit, bits numbered right to left as follows.

3 — CC forced on.
2 — CC forced off.
1 — Timer disable.
0 — CC MRF.

l = Current status of inhibits, bits numbered right to left as follows.

3 — Hardware checks are inhibited.
2 — UNIX® RTR error interrupts are inhibited.
1 — Cache is bypassed (inhibited).
0 — Software checks are inhibited (SIM inhibited).

m = Configuration control options, bits numbered right to left as follows.

3 — Backup root file system being used.
2 — Minimum configuration being used.
1 — Unused.
0 — Unused.

4. ACTION TO BE TAKEN

Refer to the *Processor Recovery Message Guide* for detailed information. If additional information is required, contact the product engineering control center.

ID . . . . . RCV-MENU
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . RC

1. FORMAT

`RCV MENU` *a b* [*c*][`ERRNO` *d*]

2. REASON FOR OUTPUT

To specify the termination status of an `RCV:MENU` input message.

3. VARIABLE FIELD DEFINITIONS

a = Name of first ID field of corresponding input message.

b = Termination status.

`ABORTED` — Error.
`COMPLETED` — Successful completion.

If *b* = `ABORTED`:

c = One of the following messages.

`CANNOT CREATE ERROR FILE` — Recent change activity unable to create a log file for errors; permissions may be inappropriate or file space may be insufficient.

`CANNOT EXEC` — Unknown recent change activity in second data field or permissions inappropriate.

`CANNOT WAIT` — MENU finds system call failure.

`DATA SUBFIELD` *num* `INCORRECT` — Parameters to recent change activity incorrect; *num* is an integer starting from one, indicating which parameter is not understood.

`CANNOT DETERMINE DEFAULT VALUES` — Special error return from `RCV` indicating failure to determine default mask directory.

`FORK FAILED` — `MENU` finds system call failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

INTERNAL ERROR	— Recent change activity encountered an internal error; error message logged to error file named for the activity.
ODIN FORM CHECK FAILED FOR BATCH	— Special error return from RCV3B to indicate a failure in batch mode.
OUT OF MEMORY	— MENU cannot find main memory for setup.
CANNOT GETTRAP STDIN	— System call failed.
CANNOT REOPEN STREAM	— Library call failed.
CANNOT GETTRAP	— System call failed.
CANNOT SETTRAP	— System call failed.
CANNOT REOPEN TERMINAL	— Library call failed.
SETTRAP STDIN FAILED	— System call failed.
CLOSE FAILED	— System call failed.
DUP FAILED	— System call failed.
FCLOSE FAILED	— Library call failed.
PIPE FAILED	— System call failed.
READ FAILED	— System call failed.
WRITE FAILED	— System call failed.

d = Error number after system call failure. See System Error Codes Output Appendix, SYSERR-APP.

4. ACTION TO BE TAKEN

Check the input messages manual and the output messages manual version of the message to see if an error log file exists.

If INTERNAL ERROR is printed, examine the error log file. If an error log file does not exist, check the ROP.

Seek assistance to restore the system to sanity if any other system-related or library-related message is printed.

Refer to input messages manual and reenter the correct input format for any other error messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . RCVRY-HSDC
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`RCVRY HSDC` *a b* [*c*]

2. REASON FOR OUTPUT

To report the outcome of a high-speed synchronous datalink controller (HSDC) recovery attempt. The HSDC, initially in the active state, changes to the recovery state when the first error is detected. It remains in this state until the recovery is either successful or the unit is removed from service because of a high error count.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Termination status:

`ABORTED` — An error occurred: recovery failed.

`COMPLETED` — Recovery was successful.

c = Additional error information. See IOP Appendix F, `IOP-APPF`.

4. ACTION TO BE TAKEN

If the unit is ultimately removed from service (because of a high error count), run diagnostics and repair the unit.

5. ALARMS

None.

ID . . . . . REPT-ADP-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats

[1] `REPT ADP AUTORST FAILURE FOR` *a b* [*c*] [*d*]

[2] `REPT ADP MAJOR ALARM AUTORST FAILURE FOR` *a b* [*c*] [*d*]

[3] `REPT ADP MINOR ALARM AUTORST FAILURE FOR` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

The automatic diagnostic process (ADP) after fault branch was unable to restore a suspected faulty hardware unit, and ADP will no longer attempt to diagnose or restore the hardware unit or community.

Format 1 is output to report that the suspected faulty hardware unit or community has exceeded its error threshold.

Format 2 is output when the hardware unit or community is essential.

Format 3 is output when the hardware unit or community is a unit or community whose top unit is an input/output processor (IOP).

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Subunit name.

d = Subunit number.

4. ACTION TO BE TAKEN

For Format 1, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

For Formats 2 and 3, if the hardware unit or community actually failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

The maintenance input request administration (MIRA) process might not start or complete ADP's restore requests for one of the following reasons (use the `OP:DMQ` input message to check the deferred maintenance queue [DMQ]):

— The `DMQ` already has a restore request for the hardware unit, community, or top unit. MIRA canceled ADP's restore request as a duplicate.

SEE PROPRIETARY NOTICE ON COVER PAGE

— Request source ADP is inhibited in the DMQ. Determine why ADP was inhibited and, if practical, use the ALW:DMQ input message to remove the inhibit.

— An initialization interval is in the progress. MIRA aborted tasks in the active queue. Tasks in the waiting queue are started at the end of the initialization interval. ADP may generate another restore request.

— ADP's internal request timer may have expired if there is a large number of manual requests and/or there is a high system load. ADP's request might still be in the DMQ. MIRA defers ADP requests in favor of manual requests, and part of the active queue is for manual requests only.

Request a restore on the hardware unit or community if the hardware unit, community, or top unit does not have a restore request in the queue. No further action is required if the restore is successful.

5. ALARMS

None.

ID . . . . . REPT-ADP-B
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `REPT ADP AUTORST FAILURE FOR` *a b* [*c*] [*d*]

[2] `REPT ADP MAJOR ALARM AUTORST FAILURE FOR` *a b* [*c*] [*d*]

[3] `REPT ADP MINOR ALARM AUTORST FAILURE FOR` *a b* [*c*] [*d*]

[4] `REPT ADP NO AUTORST, UNIT IS MAN RMV FOR` *a b* [*c*] [*d*]

[5] `REPT ADP NO AUTORST, UNIT IS FLT RMV FOR` *a b* [*c*] [*d*]

[6] `REPT ADP NO AUTORST, UNIT IS NOT OOS FOR` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

The automatic diagnostic process (ADP) after fault branch was unable to restore a suspected faulty hardware unit, and ADP will no longer attempt to diagnose or restore the hardware unit or community.

Format 1 is output to report that the suspected faulty hardware unit or community has exceeded its error threshold.

Format 2 is output when the hardware unit or community is essential.

Format 3 is output when the hardware unit or community is a unit or community whose top unit is an input/output processor (IOP).

Format 4 is output to report that the unit will not be automatically restored because it was manually removed.

Format 5 is output to report that the unit will not be automatically restored because it was fault removed.

Format 6 is output to report that the unit will not be automatically restored because it was not out of service.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Subunit name.

d = Subunit number.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For format 1, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

For formats 2 and 3, if the hardware unit or community failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

The maintenance input request administration (MIRA) process might not start or complete ADP's restore requests for one of the following reasons (use the `OP:DMQ` input message to check the deferred maintenance queue [DMQ]):

— The DMQ already has a restore request for the hardware unit, community, or top unit. MIRA canceled ADP's restore request as a duplicate.

— Request source ADP is inhibited in the DMQ. Determine why ADP was inhibited and, if practical, use the `ALW:DMQ` input message to remove the inhibit.

— An initialization interval is in the progress. MIRA aborted tasks in the active queue. Tasks in the waiting queue are started at the end of the initialization interval. ADP may generate another restore request.

— ADP's internal request timer may have expired if there is a large number of manual requests and/or there is a high system load. ADP's request might still be in the DMQ. MIRA defers ADP requests in favor of manual requests, and part of the active queue is for manual requests only.

Request a restore on the hardware unit or community if the hardware unit, community, or top unit does not have a restore request in the queue. No further action is required if the restore is successful.

For format 4, if the hardware unit should be restored, then restore the unit manually.

For format 5, if the hardware unit should be restored, determine what is wrong with the unit using diagnostics, correct the problem, and manually restore the unit.

For format 6, if the hardware unit is not active and not OOS, and if the hardware unit should be restored, then move the unit to OOS using RC/V UCB and manually restore the unit.

5. ALARMS

There is no alarm for an automatically-generated report that is for information only.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

ID . . . . . REPT-ADP,AUT
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT ADP AUTORST THRESHOLD EXCEEDED FOR` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

To report that the specified faulty hardware unit or community of units has exceeded its error threshold. The automatic diagnostic process (ADP) will no longer attempt to diagnose or restore the unit or community of units. The maximum number of restorations allowed is found in the max_restorable field in the ucbdyn form in the ECD.

NOTE: The ucbdyn form is a review-only form.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Subunit name.

d = Subunit number.

4. ACTION TO BE TAKEN

Manual diagnosis and restoration of the unit is required. This can be accomplished by using the `RST` input message for a restoration on a specified unit with or without running diagnostics. The `DGN` input command will run diagnostics on the specified unit with no restoration.

5. ALARMS

None. This automatically-generated report is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT ADP INHIBIT ACTIVE` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

To report that the automatic diagnostic process (ADP) attempted to diagnose and restore the specified hardware unit or community but was inhibited from doing so by the diagnostics subsystem (MIRA).

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Subunit name.

d = Subunit number.

4. ACTION TO BE TAKEN

Manual action is required to diagnose, repair, and restore the unit to service. Diagnostic inhibit status can be determined via the `OP:DMQ` input message. The diagnostic inhibit on ADP can be allowed via the `ALW:DMQ` input message.

5. ALARMS

None. This automatically-generated report is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT ADP INTERFACE ERROR` *a* [*b*][*c*][*d*][*e*]

2. REASON FOR OUTPUT

To report that the automatic diagnostic process (ADP) has encountered a problem interfacing with another part of the UNIX® RTR system while attempting to restore a hardware unit or community of units.

3. VARIABLE FIELD DEFINITIONS

a = One of the following error codes:

1 — `ADP` could not open the equipment configuration data base (ECD).

2 — `ADP` could not obtain a unit control block (UCB).

3 — `ADP` could not set a value in a UCB.

4 — `ADP` could not enable messages.

5 — `ADP` could not send a message to the port that is assigned to the maintenance input request administrator (MIRA).

6 — `MIRA` could not execute a request that was sent to it by `ADP`.

7 — `ADP` could not retrieve an IOP peripheral controller (IOP PC) UCB.

b = Unit name.

c = Unit number.

d = Subunit name.

e = Subunit number.

4. ACTION TO BE TAKEN

For error code 6, use the `OP:DMQ` input message to determine the status of the `MIRA` process. If automatic diagnostics are inhibited in `MIRA`, the `ALW:DMQ` input message may be used to remove the inhibit. If the problem persists, obtain technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-ADPAB-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT ADPAB MAJOR ALARM RESTORE FAILURE`
`FOR` *a b* [*c*] [*d*]

[2] `REPT ADPAB MAJOR ALARM RESTORE FAILURE`
`FOR` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

The automatic diagnostic process (ADP) After Boot (AB) branch was unable to restore a hardware unit left out of service (OOS) after a bootstrap. ADPAB will no longer attempt to diagnose or restore the hardware unit or community.

Format 1 is output when the hardware unit or community is essential.

Format 2 is output when the hardware unit or community is a unit or community whose top unit is an input/output processor (IOP).

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Subunit name.

d = Subunit number.

4. ACTION TO BE TAKEN

If the hardware unit or community actually failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

The maintenance input request administration (MIRA) process might not start or complete ADPAB's restore requests for one of the following reasons (use the `OP:DMQ` input message to check the deferred maintenance queue [DMQ]):

— The DMQ already has a restore request for the hardware unit, community, or top unit. MIRA canceled ADP's restore request as a duplicate.

— Request source ADP is inhibited in the DMQ. Determine why ADP was inhibited and, if practical, use the `ALW:DMQ` input message to remove the inhibit.

— An initialization interval is in the progress. MIRA aborted tasks in the active queue. Tasks in the waiting queue are started at the end of the initialization interval. ADP may generate another restore request.

SEE PROPRIETARY NOTICE ON COVER PAGE

— ADP's internal request timer may have expired if there is a large number of manual requests and/or there is a high system load. ADP's request might still be in the DMQ. MIRA defers ADP requests in favor of manual requests, and part of the active queue is for manual requests only.

Request a restore on the hardware unit or community if the hardware unit, community, or top unit does not have a restore request in the queue. No further action is required if the restore is successful.

5. ALARMS

None.

ID . . . . . REPT-ADPAB-B
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `REPT ADPAB MAJOR ALARM RESTORE FAILURE`
`FOR` *a b* [*c*] [*d*]

[2] `REPT ADPAB MINOR ALARM RESTORE FAILURE`
`FOR` *a b* [*c*] [*d*]

[3] `REPT ADPAB - COMMAND LINE ERROR`

2. REASON FOR OUTPUT

The automatic diagnostic process (ADP) after boot (AB) branch was unable to restore a hardware unit left out of service (OOS) after a bootstrap. ADPAB will no longer attempt to diagnose or restore the hardware unit or community.

Format 1 is output when the hardware unit or community is essential.

Format 2 is output when the hardware unit or community is a unit or community whose top unit is an input/output processor (IOP).

Format 3 is output when there is an error with the wait time option is used to invoke adp.ab. The -w option is used when the application wants to extend the wait time before restoring the Units after an initialization without extending the initialization interval. If an other option is used then an error will occur. The range of the wait time is between 0 and 3600 seconds. If the option is under 0 seconds, the wait time will be set to 0 and this message will be output. If the option is over 3600 seconds, then the wait time will be set to 3600 seconds and this message will be output.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Subunit name.

d = Subunit number.

4. ACTION TO BE TAKEN

If the hardware unit or community actually failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

SEE PROPRIETARY NOTICE ON COVER PAGE

The maintenance input request administration (MIRA) process might not start or complete ADPAB's restore requests for one of the following reasons (use the OP:DMQ input message to check the deferred maintenance queue (DMQ)):

— The DMQ already has a restore request for the hardware unit, community, or top unit. MIRA canceled ADP's restore request as a duplicate.

— Request source ADP is inhibited in the DMQ. Determine why ADP was inhibited and, if practical, use the ALW:DMQ input message to remove the inhibit.

— An initialization interval is in the progress. MIRA aborted tasks in the active queue. Tasks in the waiting queue are started at the end of the initialization interval. ADP may generate another restore request.

— ADP's internal request timer may have expired if there is a large number of manual requests and/or there is a high system load. ADP's request might still be in the DMQ. MIRA defers ADP requests in favor of manual requests, and part of the active queue is for manual requests only.

Request a restore on the hardware unit or community if the hardware unit, community, or top unit does not have a restore request in the queue. No further action is required if the restore is successful.

For format 3 examine the ULARP record in the ecd that is used to create adp and correct the command line. If the -w option is used then it must include a value in the range of 0 o 3600.

5. ALARMS

None.

ID . . . . . REPT-ANALY,TLP
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has nine formats.

[1] `REPT ANALY TLP NULL PACK LIST`

[2] `REPT ANALY TLP CANNOT FIND PACK LOCATION` *a*

[3] `REPT ANALY TLP UNABLE TO OPEN TLDB` *b*

[4] `REPT ANALY TLP UNABLE TO READ HEADER FROM DATABASE` *b*

[5] `REPT ANALY TLP ILLEGAL ARGUMENT` *c*

[6] `REPT ANALY TLP CONNSEG FAILED ERRNO` *d*

[7] `REPT ANALY TLP CANNOT OPEN INPUT FILE` *e*

[8] `REPT ANALY TLP CANNOT OPEN DIRECTORY ../datatbl/tlp/misc`

[9] `REPT ANALY TLP NO KEYS SET FOR INPUT TO TLP`

2. REASON FOR OUTPUT

To report error conditions encountered by a trouble locating process (TLP).

Format 1 is printed when a search of the trouble location database (TLDB) found no suspected faulty circuit packs. The fault signature from first failing phase is substantially different from fault signatures in the trouble location database file.

Format 2 is printed when a circuit-pack location cannot be found by the TLP.

Format 3 is printed when the `TLP` search program cannot open the trouble-locating database file associated with the diagnostic phase that failed.

Format 4 is printed when the trouble-locating database could be opened, but the header information was not there.

Format 5 is printed when the diagnostic monitor (DIAMON) passes an illegal argument to `TLP`.

Format 6 is printed when `TLP` cannot connect to the diagnostic control block segment.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7 is printed when TLP cannot open the file created by the diagnostic control process, which contains the diagnostic fault signatures.

Format 8 is printed when the directory /diag/datatbl/tlp/misc cannot be opened. This directory contains the pack location file for each subunit.

Format 9 is printed when a diagnostic failure did not set any TLP keys and consequently sent a null signature to TLP.

3. VARIABLE FIELD DEFINITIONS

a = Pack number.

b = Pathname that specifies the filename of the TLDB.

c = Illegal argument passed by DIAMON to TLP.

d = Error code returned by the operating system call connseg. See the System Error Codes Output Appendix, SYSERR-APP.

e = Name of TLP file containing the diagnostic fault signatures.

4. ACTION TO BE TAKEN

Retry the request to determine if the condition is repeatable. If it is, perform the actions below appropriate for each output message format. If that fails to clear the problem, seek technical assistance.

For Formats 1, 2, 5, 6, and 7, check trouble location process file /diag/dgnc/tlp, and restore from backup file system.

Also, for Formats 5, 6, and 7, check diagnostic monitor process file /diag/dgnc/ppdiamon, and restore from backup file system.

In addition, for Format 2, check pack location file, and restore from backup file system. Pack location files are in /diag/datatbl/tlp/misc and are named p.*unit_number_number*. For example, p.cu.0_10 and p.dfc.21_22.

For Formats 1, 3, and 4, check TLDB file, and restore from backup file system. TLDB files are in directory /diag/datatbl/tlp/*unit*[*c*|*e*|*s*|*v*|*x*] and are named *unitphase*.db. For example: /diag/databl/tlp/dmac/dca10.db (see the *unit/subunit* UCB mv value and the tldb lines in the /diag/util/cu|pu/*unit* file for the TLDB directory).

For Formats 1 and 9, check the diagnostic data table file and offline main store file; if these are missing or corrupted, restore them from backup file system. Data table files are in directories under /diag/datatbl (see the *unit/subunit* UCB mv value and the dgn lines in the *unit/subunit* util file under /diag/util for the dpt file name, then the dpt file under /diag/dtp for the data table file names). Offline main store files are in directories under /diag/offcode/mas (see excofl statements in the diagnostic listing file to identify the offline main store files - executed).

For Format 8, verify that the directory and files exist and have correct permissions. Restore directory and files from backup file system, if necessary.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

6. REFERENCES

OMDB Keys
Formats 1, 8, and 9 have an OMDB key of 21.

GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1]
```
REPT AUDSTAT a
ROUTINE AUDIT SCHEDULING IS b
INHIBITED AND/OR BLOCKED AUDITS:
 AUDIT    AUDIT INSTANCES INHIBITED/BLOCKED
NAME    MBR  INH  NAME                 INH BLK
c    d  e  f          g  h
```

[2]
```
REPT AUDSTAT COMPLETED
ROUTINE AUDIT SCHEDULING IS b
NO INHIBITED OR BLOCKED AUDITS
```

[3]
```
REPT AUDSTAT ABORTED
ECD INTERFACE ERROR i [AUDIT RID j]
```

[4]
```
REPT AUDSTAT ABORTED
CANNOT OPEN OUTPUT FILE k
```

2. REASON FOR OUTPUT

Formats 1 and 2 print the status of audits controlled by the system integrity monitor (SIM). Inhibited audits whose mode permissions prevent them from executing in routine or software request modes will not appear in the output message, unless the blocking state causes the audit to appear. In this case, the inhibit source will be enclosed in parentheses.

Blocked audits whose mode permissions prevent them from executing in any mode will not appear in the output message.

Format 3 reports an equipment configuration database (ECD) interface error.

Format 4 reports an error when creating a temporary file.

3. VARIABLE FIELD DEFINITIONS

a = Output message status.

- `COMPLETED` — Last or only segment of message.
- `IN PROGRESS` — Intermediate segment(s) of message.
- `STARTED` — First segment of message.

b = Master audit inhibit status for all audits controlled by SIM. One of the following.

ALLOWED - Not inhibited.

AUTOMATICALLY INHIBITED

IN UNKNOWN STATE

MANUALLY INHIBITED

c = Audit name. This field is blank for all instances after the first.

d = Member number. This field is blank for all instances after the first.

e = Inhibit state of the audit.

MAN — Manual request.

AUTO — Automatic action.

??? — Unrecognized reason.

If the audit is not inhibited, this field is blank. This field is also blank for all instances after the first.

f = Instance name. This field may be blank.

g = Inhibit state of a given instance of the audit blank if the audit is not inhibited.

MAN — Manual request.

AUTO — Automatic request.

??? — Unrecognized reason.

h = Y if this instance of the audit is blocked. This field is blank if this instance of the audit is not blocked.

i = ECD interface error number.

10 — Cannot open audit record sequence.

11 — Cannot sequence through audit records.

20 — Cannot open audit instance record sequence.

21 — Cannot sequence through instance records.

30 — Cannot open audit instance record sequence.

31 — Cannot sequence through instance records.

j = Associated audit record ID (RID).

k = Name of temporary file.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Use the OP:AUD input message to obtain additional status on the audits. Use the ALW:AUD input message to allow audits which are to be allowed.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report for information only.

INHIBITED AND/OR BLOCKED AUDITS:
 AUDIT    AUDIT INSTANCES INHIBITED/BLOCKED
NAME    MBR  INH  NAME                 INH BLK
c    d   e   f        g   h
```

[2]
```
REPT AUDSTAT COMPLETED
ROUTINE AUDIT SCHEDULING IS b
NO INHIBITED OR BLOCKED AUDITS
```

[3]
```
REPT AUDSTAT ABORTED
ECD INTERFACE ERROR i [AUDIT RID j]
```

[4]
```
REPT AUDSTAT ABORTED
CANNOT OPEN OUTPUT FILE k
```

[5]
```
REPT AUDSTAT ABORTED  CANNOT WRITE OUTPUT FILE k
```

2. REASON FOR OUTPUT

Formats 1 and 2 print the status of audits controlled by the system integrity monitor (SIM). Inhibited audits whose mode permissions prevent them from executing in routine or software request modes will not appear in the output message, unless the blocking state causes the audit to appear. In this case, the inhibit source will be enclosed in parentheses.

Blocked audits whose mode permissions prevent them from executing in any mode will not appear in the output message.

Format 3 reports an equipment configuration database (ECD) interface error.

Format 4 reports an error when creating a temporary file.

Format 5 reports an error when writing to a temporary output file.

3. VARIABLE FIELD DEFINITIONS

a = Output message status.

- `COMPLETED` — Last or only segment of message.
- `IN PROGRESS` — Intermediate segment(s) of message.
- `STARTED` — First segment of message.

SEE PROPRIETARY NOTICE ON COVER PAGE

b = Master audit inhibit status for all audits controlled by SIM. One of the following.

ALLOWED - Not inhibited.

AUTOMATICALLY INHIBITED

IN UNKNOWN STATE

MANUALLY INHIBITED

c = Audit name. This field is blank for all instances after the first.

d = Member number. This field is blank for all instances after the first.

e = Inhibit state of the audit.

MAN — Manual request.

AUTO — Automatic action.

??? — Unrecognized reason.

If the audit is not inhibited, this field is blank. This field is also blank for all instances after the first.

f = Instance name. This field may be blank.

g = Inhibit state of a given instance of the audit blank if the audit is not inhibited.

MAN — Manual request.

AUTO — Automatic request.

??? — Unrecognized reason.

h = Y if this instance of the audit is blocked. This field is blank if this instance of the audit is not blocked.

i = ECD interface error number.

10 — Cannot open audit record sequence.

11 — Cannot sequence through audit records.

20 — Cannot open audit instance record sequence.

21 — Cannot sequence through instance records.

30 — Cannot open audit instance record sequence.

31 — Cannot sequence through instance records.

j = Associated audit record ID (RID).

k = Name of temporary file.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Use the OP:AUD input message to obtain additional status on the audits. Use the ALW:AUD input message to allow audits which are to be allowed.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report for information only.

1. FORMAT

This message has six formats.

[1]
```
REPT AUDSTAT a
ROUTINE AUDIT SCHEDULING IS b
INHIBITED AND/OR BLOCKED AUDITS:
 AUDIT    AUDIT INSTANCES INHIBITED/BLOCKED
NAME    MBR  INH  NAME                 INH BLK
c    d   e  f        g   h
```

[2]
```
REPT AUDSTAT COMPLETED
ROUTINE AUDIT SCHEDULING IS b
```

[3] `REPT AUDSTAT ABORTED ECD INTERFACE ERROR i [AUDIT RID j]`

[4] `REPT AUDSTAT ABORTED CANNOT OPEN OUTPUT FILE k`

[5] `REPT AUDSTAT ABORTED CANNOT WRITE OUTPUT FILE k`

[6] `REPT AUDSTAT ABORTED CANNOT CREATE TEMPORARY FILE`

2. REASON FOR OUTPUT

Formats 1 and 2 print the status of audits controlled by the system integrity monitor (SIM). Inhibited audits whose mode permissions prevent them from executing in routine or software request modes will not appear in the output message, unless the blocking state causes the audit to appear. In this case, the inhibit source will be enclosed in parentheses.

Blocked audits whose mode permissions prevent them from executing in any mode will not appear in the output message.

Format 3 reports an equipment configuration database (ECD) interface error.

Format 4 reports an error when creating a temporary file.

Format 5 reports an error when writing to a temporary output file.

Format 6 reports an error when unable to create a uniquely named temporary file.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Output message status.

STARTED — First segment of message.

IN PROGRESS — Intermediate segment(s) of message.

COMPLETED — Last or only segment of message.

b = Master audit inhibit status for all audits controlled by SIM. One of the following.

ALLOWED - Not inhibited.

AUTOMATICALLY INHIBITED

IN UNKNOWN STATE

MANUALLY INHIBITED

c = Audit name. This field is blank for all instances after the first.

d = Member number. This field is blank for all instances after the first.

e = Inhibit state of the audit.

MAN — Manual request.

AUTO — Automatic action.

??? — Unrecognized reason.

If the audit is not inhibited, this field is blank. This field is also blank for all instances after the first.

f = Instance name. This field may be blank.

g = Inhibit state of a given instance of the audit blank if the audit is not inhibited.

MAN — Manual request.

AUTO — Automatic request.

??? — Unrecognized reason.

h = Y if this instance of the audit is blocked. This field is blank if this instance of the audit is not blocked.

i = ECD interface error number.

10 — cannot open audit record sequence.
11 — cannot sequence through audit records
20 — cannot open audit instance record sequence
21 — cannot sequence through instance records
30 — cannot open audit instance record sequence
31 — cannot sequence through instance records

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Associated audit record identification (RID).

k = Name of temporary file.

4. ACTION TO BE TAKEN

If Formats 1, 2, or 3 prints, use the `OP:AUD` input message to obtain additional status on the audits. Use the `ALW:AUD` input message to allow audits which are to be allowed.

Format 4 indicates all the inodes of the tmp file system are being used. Clean up unused files in the tmp file system using `CLR:FILESYS;FILE`.

Format 5 indicates all tmp file system space has been used. Clean up unused files in the tmp file system using `CLR:FILESYS;FILE`.

Format 6 indicates system resources do not permit the running of this command at this time; retry later. If command continues to fail, see technical assistance.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report for information only.

 8: kkkkkkkk   9: kkkkkkkk   A: kkkkkkkk   B: kkkkkkkk
 C: kkkkkkkk   D: kkkkkkkk   E: kkkkkkkk   F: kkkkkkkk
UTILITY ID: lllllll       PROCESS NUMBER: mmmmmmmm

REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

To indicate software fault; an instruction executed with wrong address (for example, full-word instruction executed with half-word address).

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in the form `mm/dd/yy hh:mm:ss`.

g = The program address at the time of initialization (in hexadecimal). For software-requested initializations, this is the address of the `PHASE OST` and NOT the address where the problem was detected.

h = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode, that is, kernel mode, kernel process, supervisor process, or user process. See the *System Maintenance Manual*, Appendix P.

i = The contents of the primary segment base register (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

j = The contents of the secondary segment base register (in hexadecimal).

k = The contents of the 16 general purpose registers (in hexadecimal).

R9: argument pointer
RA: frame pointer
RB: stack pointer

l = Process utility ID (in hexadecimal). See the *System Maintenance Manual* Process / Problem Table.

m = Process number (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the CU interrupt.

4. ACTION TO BE TAKEN

Forward the software log entry information to the technical assistance organization.

5. ALARMS

None.

OST ARGUMENTS:
ARG1: llllllll  ARG2: llllllll  ARG3: llllllll  ARG4: llllllll
ARG5: llllllll  ARG6: llllllll  ARG7: llllllll
REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

The kernel has determined that a process has attempted an operating system trap (OST) with a bad argument.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report.

b = Control unit (CU) member number.

c = Time in the form `mm/dd/yy hh:mm:ss`.

d = The program address at the time of error interrupt (in hexadecimal). For software-requested initializations this is the address of the `PHASE OST` and NOT the address where the problem was detected.

e = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode, that is, kernel mode, kernel process, supervisor process, or user process. See the *System Maintenance Manual*, Appendix P.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = The contents of the primary segment base register (in hexadecimal).

g = The contents of the secondary segment base register (in hexadecimal).

h = The contents of the 16 general purpose registers (in hexadecimal).

R9: argument pointer
RA: frame pointer
RB: stack pointer

i = Process utility ID (in hexadecimal). See the *System Maintenance Manual* Process / Problem Table.

j = Process number (in hexadecimal).

k = OST code (in hexadecimal).

l = OST arguments (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time the error interrupt.

4. ACTION TO BE TAKEN

Save the read-only printer (ROP) output, note the UID of the process that was reported and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

5. ALARMS

None.

6. REFERENCES

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . REPT-BAD,PRTY-DIO
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . EIH

1. FORMAT

```
REPT BAD PARITY ON DIO BUS X'a
ONLINE CU: b
FAULTY UNIT: c d
TIME OF ERROR: e
DMA ADDRESS:  fffffffff  DMA STATUS REGISTER:  gggggggg
h
CHANNEL ADDRESS: iiiiiiii CHANNEL STATUS REGISTER: jjjjjjjj
DMA RAM:  kkkkkkkk  llllllll  mmmmmmmm  nnnnnnnn
DMA STORE DATA REGISTER:  oooooooo  DMA INCREMENTOR:  pppppppp
DMA BUFFER REGISTER:  qqqqqqqq
REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

The direct memory access controller (DMAC) received bad parity from the named CHANNEL ADDRESS device on data destined for the main memory during a direct memory access (DMA) transfer.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in the form mm/dd/yy hh:mm:ss.

f = Input/output address of the DMA DMAC encountering the fault (in hexadecimal).

g = DMA status register (in hexadecimal). See the *System Maintenance Manual*, Appendixes C and D.

h = For Model 1:

DMA CHANNEL STATUS REGISTER: *xxxxxxxx*

For Model 2:

CHANNEL DATA REGISTER: *yyyyyyyy*

i = Input/output address of the channel that caused the problem (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Status of the DMA channel (in hexadecimal). This is the dual serial channel register (DSCH). See the *System Maintenance Manual*, Appendix E.

k = First word entry in the DMA RAM for the device that failed (in hexadecimal).

l = Second word entry in the DMA RAM for the device that failed (in hexadecimal).

m = Third word entry in the DMA RAM for the device that failed (in hexadecimal).

n = Fourth word entry in the DMA RAM for the device that failed (in hexadecimal).

o = The contents of the DMA store data register (in hexadecimal).

p = The contents of the DMA incrementor (in hexadecimal).

q = The contents of the DMA buffer register (in hexadecimal).

x = Status of the channel under the DMAC that encountered the fault (in hexadecimal). See the *System Maintenance Manual*, Appendix B.

y = Contents of the faulted channels data register (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Run diagnostics on the indicated unit.

5. ALARMS

None.

DMA BUFFER REGISTER:  nnnnnnnn
o
REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

The direct memory access (DMA) controller (DMAC) detected bad parity on its internal bus. This can be caused by a DMAC failure or a request from a device that has not had its DMAC RAM block initialized.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in the form `mm/dd/yy hh:mm:ss`.

f = Input/output address of the DMAC encountering the fault (in hexadecimal).

g = The contents of the DMA status register (in hexadecimal). See the *System Maintenance Manual*, Appendixes C and D.

h = First word entry in the DMA RAM for the device that failed (in hexadecimal).

i = Second word entry in the DMA RAM for the device that failed (in hexadecimal).

j = Third word entry in the DMA RAM for the device that failed (in hexadecimal).

k = Fourth word entry in the DMA RAM for the device that failed (in hexadecimal).

l = Internal DMAC register contents (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

m = Internal DMAC register contents (in hexadecimal).

n = Internal DMAC register contents (in hexadecimal).

o = For Model 1:

```
CHANNEL DATA REGISTER:    xxxxxxxx
```

For Model 2:

a blank line

x = Contents of the faulted channels data register (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

d = Member number.

e = Time in the form `mm/dd/yy hh:mm:ss`.

g = The program address at the time of error interrupt (in hexadecimal). For software-requested initializations, this is the address of the `PHASE OST` and NOT the address where the problem was detected.

h = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode, that is, kernel mode, kernel process, supervisor process, or user process. See the *System Maintenance Manual*, Appendix P.

i = The contents of the primary segment base register (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

j = The contents of the secondary segment base register (in hexadecimal).

k = The contents of the 16 general purpose registers (in hexadecimal).

R9: argument pointer
RA: frame pointer
RB: stack pointer

l = Process utility ID (in hexadecimal). See the *System Maintenance Manual*, Process / Problem Table.

m = Process number (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time the error interrupt.

4. ACTION TO BE TAKEN

Run diagnostics on the indicated unit.

5. ALARMS

None.

```
REPT CCIO - DATA PARITY FAILURE X'a
ONLINE CU: b
FAULTY UNIT: c d
TIME OF ERROR: e
DMA ADDRESS:  ffffffff  DMA STATUS REGISTER:  gggggggg
DMA RAM:  hhhhhhhh  iiiiiiii  jjjjjjjj  kkkkkkkk
DMA STORE DATA REGISTER:  lllllllll  DMA INCREMENTOR:  mmmmmmmm
DMA BUFFER REGISTER:  nnnnnnnn

REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

A command received by the direct memory access controller (DMAC) on a processor input/output (PIO) operation had bad parity.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in the form `mm/dd/yy hh:mm:ss`.

f = Input/output address of the DMAC encountering the fault (in hexadecimal).

g = Direct memory access (DMA) status register (in hexadecimal). See the *System Maintenance Manual*, Appendixes C and D.

h = First word entry in the DMA RAM for the device that failed (in hexadecimal).

i = Second word entry in the DMA RAM for the device that failed (in hexadecimal).

j = Third word entry in the DMA RAM for the device that failed (in hexadecimal).

k = Fourth word entry in the DMA RAM for the device that failed (in hexadecimal).

l = The contents of the internal DMAC register (in hexadecimal).

ID REPT-CD,CIA0
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `REPT C/D CIA CANNOT OPEN DEVICE` *a*

[2] `REPT C/D CIA CANNOT GET PROCESS ID OF DAP`

[3] `REPT C/D CIA CANNOT SEND A MESSAGE TO DAP`

2. REASON FOR OUTPUT

Format 1 informs the user that the current state of the switching control center (SCC) links indicates that the equipment configuration database (ECD) must be updated in order for the SCC to become active.

Formats 2 and 3 indicate that the critical indicators administrator (CIA) could not communicate with the display administration process (DAP).

3. VARIABLE FIELD DEFINITIONS

a = Device filename.

4. ACTION TO BE TAKEN

Format 1 prints when the status of the SCC links in the ECD is something other than `ACT`, `STBY`, `OOS` or `INIT`. If the SCC is not needed, use recent change/verify (RC/V) to delete the `ULARP` record for CIA to prohibit `ULARP` from trying to restart the CIA process. If the SCC link is needed, follow growth procedures to activate the link.

If Format 2 or Format 3 is output, seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-CD,ERROR-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has five formats.

[1] `REPT C/D ERROR 1` *a* [`PID` *b*] [*c*]

[2] `REPT C/D ERROR 2` *c d* [*e*]

[3] `REPT C/D ERROR 3` *f g*

[4] `REPT C/D ERROR 4` *h i* [`ERRNO` *j*] [*k*]

[5] `REPT C/D ERROR 5 1 DAP EXITING RECEIVED SIGNAL` *l*

2. REASON FOR OUTPUT

To inform the user that control/display (C/D) detected an exceptional condition while trying to process a message or poke request from the maintenance cathode ray terminal (CRT).

For Format 1, error types 1, 2, and 3 indicate severe problems in which the display administration process (DAP) died upon initialization and will have been restarted by `ULARP`. Error types 4, 5, 6, and 7 can be ignored unless persistent; if persistent, seek technical assistance.

Format 2 indicates that DAP is overloaded with outstanding writes. This may indicate an `IODRV` or system overload, or that more requests for change to displays are arriving than DAP can handle.

For Format 3, error types 1, 2, and 4 indicate that DAP could not allocate memory or process the `transtab` file, and that a default translation table will be used. Error type 3 indicates that `tty` information is missing for a particular terminal, and that DAP is using default information for the terminal.

For Format 4, error type 1 indicates that DAP could not open the translation table, and that a default is being used. Error type 2 indicates that DAP incurred a write error, and data for a terminal has been lost. Error types 9, 10, 11, and 13 indicate an error while attempting to attach a device. Error type 12 indicates that a problem occurred in finding or updating an indicator for a page. Error type 14 indicates that DAP was unable to request new memory to buffer output destined for a terminal, and that data has been lost.

Format 5 occurs when DAP dies from a signal, and can indicate a problem that should be noted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

Format 1

a = Error type.

1 — unable to attach to C/D port
2 — cannot enable message reception
3 — unable to get shared segment or fork/exec critical indicator administrator (CIA)
4 — invalid C/D administrative request received
5 — unable to send DAP status to application
6 — unable to send message to page owner
7 — invalid C/D poke operation request received

b = Process ID of the process which sent the bad message.

c = `APPLICATION NOTIFICATION FAILURE`.

Format 2

c = Error type.

2 — Write error

d = `DAP LOCAL DEVICE I/O BUFFER OVERFLOW` *e*

`DAP PROCESS I/O BUFFER OVERFLOW`

e = Device ID.

Format 3

f = Error type.

1 — file format error
2 — file read failure
3 — `gettrap` returned no data
4 — memory request failure

`If` *f* = 3:

g = Device ID.

If *f* = `1` or `2`:

g = File name.

Format 4

g = CANNOT ALLOCATE MEMORY FOR PAGE INITIALIZATION.

h = Error type.

NOTE: Although previously valid, error codes 3 through 8 are now obsolete.

1 — file open error.
2 — write error.
9 — attach settrap error
10 — attach gettrap error
11 — attach incore ECD error
12 — indicator operation error
13 — retrieve incore ECD device record error
14 — error when attempting to allocate memory

If *h* = 1:

i = File name.

If *h* = 14:

i = DAPMALLOC FAILED DATA LOST FOR DEVICE

k = Device ID.

Else:

i = Device ID.

j = System error code. See the System Error Codes Appendix, SYSERR-APP.

Format 5

l = Signal received.

4. ACTION TO BE TAKEN

For Format 1, error types 1, 2, and 3 indicate severe problems in which DAP died upon initialization, and will have been restarted by ULARP. Error types 4, 5, 6, and 7 can be ignored unless persistent; if persistent, seek technical assistance.

For Format 4, error types 9, 10, 11, and 13 indicate an error while attempting to attach a device. The terminal should be power cycled for these conditions. If the problem persists, seek technical assistance.

For Format 2 through 5, except where previously noted for Format 4, if the message is intermittent, take no action. If the message persists for a local terminal, power cycle the terminal. If it persists for a removed terminal, terminate and re-establish the terminal's connections.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

SYSERR-APP

ID . . . . . REPT-CD,GETTY-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `REPT C/D GETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT`

[2] `REPT C/D GETTY UNABLE TO ACCESS ECD FOR` *a*

[3] `REPT C/D GETTY FAILED TO OPEN DEVICE` *a* `FOR WRITING`

[4] `REPT C/D GETTY UNABLE TO COMMUNICATE WITH DAP PORT` *b*

[5] `REPT C/D GETTY FOR DEVICE` *a* `FAILED TO CREATE` *c*

[6] `REPT C/D GETTY PATHNAME NOT IN THE ECD FOR` *a*

2. REASON FOR OUTPUT

To inform the user that the `CDGETTY` process has encountered an error while trying to process initialization information for control/display (C/D) devices following terminal restores. The messages may appear on the originating device, or the receive-only printer (ROP).

3. VARIABLE FIELD DEFINITIONS

a = Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as `/dev/cda`, then *a* is the device ID.

b = Port ID.

c = Pathname of the process to be created.

4. ACTION TO BE TAKEN

Format 1 indicates that the UNIX® process `/prc/init` is not setting the proper environment for `getty`. Seek technical assistance.

Format 2 indicates that either it could not attach to the incore database or it failed to get the required record; the `getty` record, for example. Seek technical assistance.

Format 3 indicates that it cannot open the acknowledgment channel for the listed device. Seek technical assistance.

Format 4 indicates that the DAP process is not connected to its port. Seek technical assistance to verify that the DAP process is currently running.

Formats 5 and 6 indicate that they could not execute the shell listed in the `getty` record. Verify the correctness of the `getty` record in the incore database and seek technical assistance.

2. REASON FOR OUTPUT

To report errors detected by poker associated with control/display (C/D) devices.

Formats 1, 9, and 11 indicate errors in setting up or diverting output to a secondary reader (for example, RCV/ECD).

Formats 2, 4 through 8, 12, and 13 indicate poker initialization errors.

Format 10 indicates an error with sending poke input to DAP from a dialogue terminal.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Failure return from `write()`.

b = Signal number.

c = File name.

d = Port number.

e = Device ID which is a single character (lower case letter) suffix representing a control/display device. For example, if a logical device is defined as `/dev/cda`, then *a* is the device ID.

f = System error numbers. See the System Error Codes Output Appendix, SYSERR-APP.

4. ACTION TO BE TAKEN

For Formats 1, 2, 5, and 7 through 11, an operating system function call is failing; seek technical assistance.

For Format 3, if DAP is running, execute menu 807 from the C/D update page to restart the poker. If DAP is not running, seek technical assistance.

For Format 4, seek technical assistance to verify correctness of `ttopt` form for this device.

For Format 6, seek technical assistance to verify correctness of pagename field found in the `getty` form for this device. If correct, take no action; message was the result of a request to display an uninitialized page at time of request.

For Format 12, seek technical assistance to verify correctness of channel ID field found in the `logdev` form for this device.

For Format 13, if CSOP is running, display page 103 and execute menu 807 to restart the poker. If CSOP is not running, seek technical assistance.

5. ALARMS

None. These automatically-generated reports are for information only.

[13] `REPT C/D STARTER ARGUMENT ERROR`

[14] `REPT C/D STARTER ALREADY RUNNING ON TERMINAL` *j*

[15] `REPT C/D STARTER ERROR EXIT` *g* `ERRNO` *f*

2. REASON FOR OUTPUT

To report the control / display (C / D) starter process encountered an error while attempting to set up the device for a secondary input read process; for example, recent change and verify (RCV).

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Input file name.

b = Output file name.

c = Pathname of secondary input read process.

d = Poker process ID.

e = Display administration process (DAP) port number.

f = System error number. See the System Error Codes Output Appendix, SYSERR.

g = Child's exit status.

h = Signal that terminated the child.

i = File name.

j = Device id.

4. ACTION TO BE TAKEN

For Formats 1, 2, 5, and 8 through 13, re-enter the menu and try to restart the STARTER process. If this fails again, seek technical assistance.

For Formats 3 and 4, if the message is printed for a local terminal, power cycle the terminal. If the message is printed for a remote terminal, terminate and re-establish the terminal's connection.

For Format 6, if system initialization is in progress, wait and re-enter the menu later to restart the STARTER process. If system initialization is not in progress, mount the /tmp filesystem or seek technical assistance.

Formats 7 and 15 indicate the child process of STARTER terminated abnormally. Re-enter the menu to restart the STARTER process.

Format 14 indicates that an active child process is running on the named terminal. Use the PF3 key to resume communication with that process.

5. ALARMS

None. This automatically-generated report is for information only.

f = System error number. See the System Error Codes Output Appendix, SYSERR.

g = Signal that terminated the child.

h = Device ID which is a single character (lower-case letter) suffix representing a control display device. For example, if a logical device is defined as `/dev/cd`*a*, then *a* is the device ID.

4. ACTION TO BE TAKEN

For Formats 1 and 2, if the message is printed for a local terminal, power cycle the terminal. If the message is printed for a remote terminal, terminate and re-establish the terminal's connection.

For Format 3, if the system initialization is in progress, wait and re-enter the menu later to re-start the STARTER process. If system initialization is not in progress, mount the `/tmp` filesystem, or seek technical assistance.

Format 4 indicates the child process of STARTER terminated abnormally. Re-enter the menu to re-start the STARTER process.

For Formats 5 through 10, re-enter the menu to try to re-start the STARTER process. If this fails again, seek technical assistance.

Format 11 indicates that an active child process is running on the named terminal. Use the PF3 key to resume communication with that process.

5. ALARMS

None. This automatically-generated report is for information only.

[10] `REPT C/D STARTER ARGUMENT ERROR`

[11] `REPT C/D STARTER ALREADY RUNNING ON TERMINAL` *h*

2. REASON FOR OUTPUT

To report the control / display (C / D) starter process encountered an error while attempting to set up the device for a secondary input read process; for example, recent change and verify (RCV).

3. VARIABLE FIELD DEFINITIONS

a = File name.

b = Child exit status.

c = Pathname of secondary input read process.

d = Poker process ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Display administration process (DAP) port number.

f = System error number. See the System Error Codes Output Appendix, SYSERR.

g = Signal that terminated the child.

h = Device ID which is a single character (lower-case letter) suffix representing a control display device. For example, if a logical device is defined as `/dev/cd`*a*, then *a* is the device ID.

4. ACTION TO BE TAKEN

For Formats 1 and 2, if the message is printed for a local terminal, power cycle the terminal. If the message is printed for a remote terminal, terminate and re-establish the terminal's connection.

For Format 3, if the system initialization is in progress, wait and re-enter the menu later to re-start the STARTER process. If system initialization is not in progress, mount the `/tmp` filesystem, or seek technical assistance.

Format 4 indicates the child process of STARTER terminated abnormally. If STATUS is specified, then refer to documentation for the child process. If SIGNAL is specified, then seek technical assistance.

For Formats 5 through 10, re-enter the menu to try to re-start the STARTER process. If this fails again, seek technical assistance.

Format 11 indicates that an active child process is running on the named terminal. Use the PF3 key to resume communication with that process.

5. ALARMS

None. This automatically-generated report is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has 13 formats.

[1] `REPT CFT LIB UNABLE TO OPEN AUTHORITY GROUPS FILE`

[2] `REPT CFT LIB AUTHORITY GROUPS FILE READ ERROR`

[3] `REPT CFT LIB AUTHORITY GROUPS FILE TOO MANY GROUPS`

[4] `REPT CFT LIB UNABLE TO OPEN AUTHORITY FILE`

[5] `REPT CFT LIB AUTHORITY FILE READ ERROR`

[6] `REPT CFT LIB UNABLE TO RETRIEVE DATE FORMAT FROM ECD`

[7] `REPT CFT LIB ILLEGAL DATE FORMAT IN ECD`

[8] `REPT CFT LIB UNABLE TO RETRIEVE IM FOR ECHO`

[9] `REPT CFT LIB CANNOT ACCESS ECD PDS ASSUMED`

[10] `REPT CFT LIB IA01 RMOVSEG FAILED ERRNO` *a*

[11] `REPT CFT LIB GETSEG FAILED ERRNO` *a*

[12] `REPT CFT LIB UNABLE TO PLACE INPUT MESSAGE IN ENVIRONMENT`

[13] `REPT CFT LIB CANNOT ACCESS ECD AUTHDEF RECORDS`

2. REASON FOR OUTPUT

To report a craft library (CFT LIB) related occurrence or error.

Format 1 indicates that the craft library could not access the file that contains the currently valid input message authority groups.

Format 2 indicates that the craft library encountered a read error when attempting to read the input message authority groups file.

Format 3 indicates that an error has been detected in the input message authority groups file. This can occur if there are too many authority groups specified (more than the defined maximum, currently 64) or if the wrong file is read.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 4 indicates that the craft library could not access the file that contains the current assignments of authority groups to persons and terminals.

Format 5 indicates that the craft library encountered a read error when attempting to read the authority assignment file.

Format 6 indicates that the craft library could not retrieve the date format from the `eaiopt` record in the equipment configuration database (ECD).

Format 7 prints when the craft library detects an error in the layout of the date found in the `eaiopt` record in the ECD. The layout must include the desired position of the month (`m`), day (`d`), and year (`y`) with optional separators (for example, ":" or "-"). Some example layouts include: `m:d:y` and `d-m-y`.

Format 8 prints when the craft library is unable to retrieve an input message string from the calling process' environment.

Format 9 prints when the craft library is either unable to attach to the ECD or unable to read the `splrinfo` record in the ECD to determine whether the system is in PDS or MML mode. PDS mode is assumed.

Format 10 indicates that the craft library failed to remove the incore ECD data segment(s) from its address space.

Format 11 indicates that the craft library failed to add the incore ECD data segment(s) to its address space.

Format 12 indicates that the craft library failed to put the input message into the client process environment.

Format 13 indicates that the craft library failed in an attempt to attach to the ECD. As a result, the authority definition (`authdef`) records are not in effect.

3. VARIABLE FIELD DEFINITIONS

a = System error number. See the System Error Codes output appendix, SYSERR.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is a manually-requested report.

If a minor alarm occurs, take action as indicated in the report.

SEE PROPRIETARY NOTICE ON COVER PAGE

[13] `REPT CFT LIB CLEARING SEMAPHORE`

2. REASON FOR OUTPUT

To report a craft library (CFT LIB) related occurrence or error.

Format 1 indicates that the craft library could not access the file that contains the currently valid input message authority groups.

Format 2 indicates that the craft library encountered a read error when attempting to read the input message authority groups file.

Format 3 indicates that an error has been detected in the input message authority groups file. This can occur if there are too many authority groups specified (more than the defined maximum, currently 91) or if the wrong file is read.

Format 4 indicates that the craft library could not access the file that contains the current assignments of authority groups to persons and terminals.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5 indicates that the craft library encountered a read error when attempting to read the authority assignment file.

Format 6 indicates that the craft library could not retrieve the date format from the `eaiopt` record in the equipment configuration database (ECD).

Format 7 prints when the craft library detects an error in the layout of the date found in the `eaiopt` record in the ECD. The layout must include the desired position of the month (`m`), day (`d`), and year (`y`) with optional separators (for example... ":", "-"). Some example layouts include: `m:d:y` and `d-m-y`.

Format 8 prints when the craft library is unable to retrieve an input message string from the calling process' environment.

Format 9 prints when the craft library is either unable to attach to the ECD or unable to read the `splrinfo` record in the ECD to determine whether the system is in PDS or MML mode. PDS mode will be assumed.

Format 10 indicates that the craft library failed to remove the incore ECD data segment(s) from its address space.

Format 11 indicates that the craft library failed to add the incore ECD data segment(s) to its address space.

Format 12 indicates that the craft library failed to put the input message into the client process environment.

Format 13 indicates that the craft library is releasing a locked semaphore.

3. VARIABLE FIELD DEFINITIONS

a = Reason for failure to obtain date format from the ECD.

- 1 = Could not attach ECD segment to process.
- 2 = Failure attaching to database.
- 3 = Could not get ECD origin.
- 4 = Could not get UCB record.
- 5 = Could not get IOPT record.
- 6 = Could not get EAIOPT record.
- 7 = Failure releasing database.
- 8 = Could not remove ECD segment from process.

b = System error number. See the System Error Codes Output Appendix, `SYSERR-APP`.

4. ACTION TO BE TAKEN

For Formats 1 through 12, no action is needed.

For Format 13, check the `/cdmp` directory for a dump file of the process that had the semaphore locked. If a file is present, save the file for future analysis.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is a manually-requested report.

If a minor alarm occurs, take action as indicated in the report.

6. REFERENCES

OMDB Keys
Formats 1 through 5, 8, and 10 through 13 have an OMDB key of 290.

ID . . . . . REPT-CFTSHL
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has 13 formats.

[1] `REPT CFTSHL TERMINAL IN SERVICE *** f`
`CAPABILITY MODE / g`

[2] `REPT CFTSHL EOF ENCOUNTERED`

[3] `REPT CFTSHL UNABLE TO READ LINE a OF .pname file`
`INSTALL A .pname FILE in DIRECTORY i AND`
`SHELL WILL RECOVER`

[4] `REPT CFTSHL CANNOT CHANGE DIRECTORY TO b`

[5] `REPT CFTSHL SETGID TO c FAILED`

[6] `REPT CFTSHL SETUID TO d FAILED`

[7] `REPT CFTSHL CANNOT CREATE e AS ALTERNATE SHELL`

[8] `REPT CFTSHL INTERRUPT RECEIVED`

[9] `REPT CFTSHL INVALID ENVIRONMENT ARGUMENT PASSED`
`TO ALTERNATE SHELL`

[10] `REPT CFTSHL UNABLE TO READ LINE a OF .pname FILE FOR`
`ALTERNATE SHELL AND ENVIRONMENT ARGUMENT MISSING`

[11] `REPT CFTSHL CANNOT CREATE SEGMENT FOR INPUT AND OUTPUT`

[12] `REPT CFTSHL ON MTTY WILL USE DEFAULT .PNAME FILE`

[13] `REPT CFTSHL CRAFT SHELL IS IN LIMP CAPABILITY MODE`

2. REASON FOR OUTPUT

To report a CFTSHL-related occurrence or error. The messages may appear on the input (requesting) terminal, the receive-only printer (ROP), or both depending on the mode (terminal reading/background execution) of the CFTSHL. Some messages may be appended to an input command.

Format 1 indicates the CFTSHL is ready to accept input.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 2 indicates the CFTSHL has been terminated.

Format 3 indicates a command has requested a change to an environment that does not exist in the .pname file. (This format is for LUCENT use only.)

Format 4 indicates a request to change an execution directory as a result of an environment change has not been honored. (This format is for LUCENT use only; occurs when cd command to variable *b* fails.)

Format 5 indicates an attempt to set the group ID for the CFTSHL failed. (This format is for LUCENT use only.)

Format 6 indicates an attempt to set the user ID of the CFTSHL failed. (This format is for LUCENT use only.)

Format 7 indicates the failure of an alternate shell process creation. (This format is for LUCENT use only.)

Format 8 prints as a result of encountering an interrupt. This interrupt usually occurs as a result of depressing the BREAK key.

Format 9 prints when CFTSHL is executed from another process (shell) and an improper environment is passed as argument two.

Format 10 prints when an alternate CFTSHL is invoked and the request environment cannot be read from the .pname file.

Format 11 prints when CFTSHL fails to allocate a memory segment for I/O buffer using RTR system call makeseg().

Format 12 prints when a CFTSHL is invoked for a maintenance terminal and the .pname file cannot be found in the current working directory. The CFTSHL will then use a default .pname file.

Format 13 indicates that the CFTSHL cannot attach to the *Input Message Catalog*.

3. VARIABLE FIELD DEFINITIONS

EOF = End of file.

a = Label of line.

b = Name of the requested directory.

c = Name of the requested group ID.

d = Name of the requested user ID.

e = Pathname of the alternate shell process.

f = CFTSHL capability mode: LIMP, PART or FULL.

g = Input message syntax: PDS or MML.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Format 3 the command or the `.pname` file is in error and must be corrected. For all other formats, escalate through appropriate channels.

5. ALARMS

None for Formats 1, 2, and 4 through 7. These reports are automatically generated for information only.

Action alarm for Formats 3, 9, and 10. Take action as indicated in the report.

Manual alarm for Format 8. This report is a result of manual input.

Minor alarm for Formats 11 and 13. Take action as indicated in the report.

Critical alarm for Format 12. Take immediate action as indicated in the report. Seek technical assistance if needed.

6. REFERENCES

OMDB Keys
Formats 11 and 13 have an OMDB key of 299.
Format 12 has an OMDB key of 298.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . REPT-CONFIG
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT CONFIG FAULT TYPE` *a* `UNIT =` *b* `PID =` *c* `ASSERT =` *d*

[2] `REPT CONFIG FAULT TYPE` *a* `INACCESSIBLE RID =` *e* `PID =` *c*
`ASSERT =` *d*

2. REASON FOR OUTPUT

To report a fault condition in the configuration (`CONFIG`) library.

Format 1 is printed whenever the name of the unit can be determined. If not, Format 2 is printed.

3. VARIABLE FIELD DEFINITIONS

a = One or more fault types.

- `AMB` — could not allocate a message buffer
- `CI` — `CONFIG` internal failure
- `EA` — equipment configuration database (ECD) access problem
- `ED` — ECD data invalid
- `FSM` — could not fault a process or send a message to a process
- `IA` — possible invalid argument
- `PA` — plant measurements database access problem
- `PS` — unit in protected state

b = Name and number of unit.

c = Process number of the process which called the `CONFIG` function.

d = Identification number (ASSERT number) of the fault in `CONFIG`.

e = Record ID (RID) of the unit control block (UCB) record in the ECD of the unit.

4. ACTION TO BE TAKEN

Consider bootstrapping for fault types `EA`, `ED`, and `PA`. Fault types `AMB` and `FSM` suggest that the system is in overload. In all cases, save a copy of the output message and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 447.
Format 2 has an OMDB key of 418.

ID . . . . . REPT-CONFIG,REC
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT CONFIG RECONFIGURATION TYPE` *a* `UNIT` *b* `PID =` *c*

2. REASON FOR OUTPUT

To report a successfully executed reconfiguration requested by `CONFIG` when the indicated unit has exceeded an error threshold and cannot be removed or replaced.

3. VARIABLE FIELD DEFINITIONS

a = Reconfiguration type (or action).
SWCU - softswitch

b = Name and number of the unit causing reconfiguration.

c = Process ID of the process calling `CONFIG`.

4. ACTION TO BE TAKEN

The softswitch will eliminate the errors associated with the indicated unit only if the error sources are in the direct memory access (DMA) or the dial serial channel (DSCH) subunits of the now standby control unit (CU), or in the duplex dual serial bus selector (DDSBS) of the unit. If this is the case repair the appropriate DMA, DSCH, or DDSBS.

5. ALARMS

For a minor alarm, take action as indicated in the report.

[53] REPT CSOP OUTPUT ERROR *m j k c* NO ENTRY

[54] REPT CSOP CREATE *b l*

2. REASON FOR OUTPUT

To report errors detected by the spooler during initialization.

Format 1 prints if a class is defined that contains no output devices.

Format 2 prints if port 1 is not free. The coordinator of spooler output processor (CSOP) process will attempt to kill the process that is attached to port 1 and connect itself.

Format 4 prints if CSOP does not have enough memory to store the definition of an output device.

Format 5 prints when CSOP does not have enough memory to store the definition of a class.

Format 11 prints when CSOP is unable to queue incoming messages; therefore, messages will be lost. When Formats 21 through 26 print, CSOP messages may then appear in primitive mode.

Formats 31 through 54 will appear only in the spooler log, not on the receive-only printer (ROP).

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Name of CSOP's error file.

b = Process ID of SOP.

c = DEVICE or CLASS.

d = Name of an output device or class.

e = Spooler output class.

f = File.

g = Reason a device could not be added to CSOP's device table.

h = Number of messages.

i = SOP path.

j = System error number.

k = Job ID.

l = SOP completion code.

m = String containing additional information.

4. ALARMS

[50] REPT CSOP UNABLE TO RETRIEVE EAI OPTIONS FROM ECD

[51] REPT CSOP UNABLE TO RETRIEVE SPOOLER INFORMATION FROM ECD

[52] REPT CSOP UNKNOWN TTY--SOP EXIT CODE *f* PID *c*

[53] REPT CSOP UNABLE TO ALLOCATE WORK Q FOR *a*

[54] REPT CSOP UNABLE TO CREATE NAMED WORK Q SEGMENT

[55] REPT CSOP STORE ERROR INMSG MGRERR=*m*

[56] REPT CSOP STORE ERROR UFILE MGRERR=*m*

2. REASON FOR OUTPUT

To report errors detected by the spooler during initialization.

When formats having no key value are printed, other output messages may then appear in primitive mode.

Format 1 prints if the ECD contains inconsistent device definitions.

Formats 2, 15, and 19 print if the coordinator of spooler output processor (CSOP) cannot access the plant measurements database.

Format 5 prints if there is an inconsistency in the ECD device definition. Either the terminal should be a dialogue device and is not, or the SOP should be temporary and is not.

Format 11 prints if CSOP is unable to create a dialogue shell.

Format 18 prints if CSOP cannot send a message to SOP *c*.

Format 20 prints when CSOP creates a new spooler output process.

Format 21 prints when a device record is deleted in the ECD.

Formats 22 and 25 are printed when CSOP is unable to create a new spooler output process.

Format 23 prints if CSOP is unable to print to the ROP.

Format 24 prints if CSOP is unable to remove a file.

Formats 26, 39, 40, and 52 indicate a SOP work-queue error. For Format 40, the locations and addresses of the message headers print.

Formats 28, 55, and 56 print when CSOP is unable to queue incoming messages; therefore, messages will be lost.

Format 31 prints when a new device record is defined in the ECD.

Format 32 prints if a class is defined that contains no output devices.

Format 33 prints when there was no entry in the work queue for *a*.

Formats 34 and 37 print when a dialogue shell is terminated.

Format 35 prints if port 1 is not free. CSOP will attempt to kill the process that is attached to port 1 and connect itself.

Format 37 prints when the ECD record for a device or class is changed.

Format 38 prints when a dialogue shell is created.

Format 42, 43, and 49 indicate ECD record problems.

Format 45 prints if CSOP cannot get enough memory to store the definition of an output device.

Format 46 prints when CSOP does not have enough memory to store the definition of a class.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 47 prints if CSOP was unable to attach to the ECD. If this appears before CSOP initializes the master work queue, the message will go to the spooler log until CSOP is restarted.

Formats 47, 50, and 51 indicate ECD access and/or update errors.

3. VARIABLE FIELD DEFINITIONS

a = Name of an output device or class.

b = Reason a device could not be added to CSOP's device table.

c = Process ID of SOP.

d = String containing additional information.

e = File.

f = System error number.

g = Completion code.

h = Job ID.

i = Path name.

j = Segment name.

k = Name of CSOP's error file.

l = Spooler output class.

m = Error number assigned by CSOP.

4. ACTION TO BE TAKEN

For messages appearing on the ROP, in the event of a fatal fault, CSOP will be restarted, thus clearing the problem. No action should be taken unless the message is repeated. In that case, seek technical assistance to restore system sanity.

Messages written to the spooler log are informational only and no action is necessary.

5. ALARMS

None. This automatically-generated report is for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

6. REFERENCES

OMDB Keys

Format 1 has an OMDB key of 599.
Formats 2, 11, 15, 19, 21, 22, 24, 25, 31, 32, 34, 36, 37, 42, 43, and 47 through 51 have an OMDB key of 201.
Formats 3 through 10, 12, 13, 14, 16, 17, 27 through 30, 35, 45, 46, 47, and 53 through 56 do not have OMDB keys. These are output messages that cannot be formatted and spooled due to the state of the system at the time of printing.
Format 18 has an OMDB key of 203.
Format 20 has an OMDB key of 176.
Formats 23, 26, 39, and 52 have an OMDB key of 202.

2. REASON FOR OUTPUT

To report errors detected by the spooler during initialization.

When formats having no key value are printed, other output messages may then appear in primitive mode.

Format 1 is printed if the equipment configuration database (ECD) contains inconsistent device definitions.

Formats 2 and 9 are printed if the ACKDB failed to initialize from disk, or could not be added to the invoking process' address space.

Formats 3, 16, and 21 are printed if coordinator of spooler output processes (CSOP) cannot access the plant measurements database.

Formats 4, 5, 7 through 10, 13, 14, 15, 17, and 18 are printed if errors occur while trying to read an OMDB into memory.

Format 6 is printed if there is an inconsistency in the ECD device definition. Either the terminal should be a dialogue device and is not, or the SOP should be temporary and is not.

Format 11 is printed if CSOP fails to save the stack in preparation for handling a phase 1.

Format 12 is printed if CSOP is unable to create a dialogue shell.

Format 19 is printed if CSOP cannot remove the output file associated with Format 21.

Format 20 is printed if CSOP cannot send a message to SOP *c*.

Formats 22 and 27 are printed if CSOP cannot open or write the output file.

Format 23 is printed when CSOP creates a new spooler output process.

Format 24 is printed when a device record is deleted in the ECD.

Formats 25 and 29 are printed when CSOP is unable to create a new spooler output process.

Format 26 is printed if CSOP is unable to print to the ROP.

Format 28 is printed if CSOP is unable to remove a file.

Format 29 is printed if CSOP is unable to fork a SOP process.

Formats 30, 43, 44, and 59 indicate a SOP work queue error. In the case of 43, the locations and addresses of the message headers are printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 31 is printed if memory cannot be allocated for CSOP's master work queue. This is a fatal error since no messages can be stored internally for later output.

Formats 32, 45 and 46 are printed when CSOP is unable to queue incoming messages; therefore, messages will be lost.

Format 33 is printed when the overload condition has been cleared.

Format 34 is printed if CSOP is unable to enable the reception of messages.

Format 35 is printed when a new device record is defined in the ECD.

Format 36 is printed if a class is defined that contains no output devices.

Format 37 is printed when there was no entry in the work queue for a.

Formats 38 and 41 are printed when a dialogue shell is terminated.

Format 39 is printed if port 1 is not free. CSOP will attempt to kill the process that is attached to port 1 and connect itself.

Format 40 is printed when the ECD record for a device or class is changed.

Format 42 is printed when a dialogue shell is created.

Format 47 is printed if the queue size for a device changed and it is not large enough to hold all the current outstanding messages.

Format 48, 49, and 57 indicate ECD record problems.

Format 50 is printed if CSOP cannot get enough memory to store the definition of an output device.

Format 51 is printed when CSOP does not have enough memory to store the definition of a class.

Format 52 is printed if CSOP is unable to allocate memory for the work queue associated with a particular SOP.

Format 53 is printed if CSOP was unable to attach to the ECD. If this appears before CSOP initializes the master work queue, the message will go to the spooler log until CSOP is restarted.

Formats 53, 57, and 58 indicate ECD access and / or update errors.

Format 54 is printed when the common segment to exchange work queue information between CSOP and SIP cannot be created.

Format 55 is printed when CSOP is unable to allocate space to store information about a new tty entry.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 56 is printed when a tty entry is requested to be removed from CSOP's internal tty list, and CSOP cannot find an entry for the specified device or class.

Format 59 is printed by CSOP when it is cleaning up after a dead SOP if it cannot find a tty entry associated with the SOP.

Format 60 is printed when CSOP finds that the output file is not empty. This is done to ensure that existing files are not destroyed or inappropriately changed.

Formats 61 and 62 indicate that a state change has occurred in the system; output is redirected to the spooler log. Format 61 indicates that the system is in the SIMPLEX mode, and Format 62 indicates that the system is in DUPLEX mode.

Format 63 indicates that CSOP has run out of common segment space. This space is used to store output messages that are being formatted or formatted messages that have not yet been output.

Format 64 indicates that CSOP cannot retrieve the name of a file from its common segment. CSOP needs the filename so that the file can be removed (unlinked).

3. VARIABLE FIELD DEFINITIONS

a = Name of an output device or class.

b = Reason a device could not be added to CSOP's device table.

c = Process identification (ID) of SOP.

d = String containing additional information.

e = File name.

f = System error number.

g = Completion code.

h = Job ID.

i = Path name.

j = Segment name.

k = Spooler output class.

l = Error number assigned by CSOP.

m = Maximum number of active OMDB segments.

n = String identifying where data is stored. "NO TEXT" indicates there is no data stored.

o = Address in CSOP's common segment.

4. ACTION TO BE TAKEN

For messages appearing on the receive-only printer (ROP), in the event of a fatal fault, CSOP will be restarted, thus clearing the problem. No action should be taken unless the message is repeated. If the message is repeated, seek technical assistance to restore system sanity.

Messages written to the spooler log are informational only and no action should be taken.

If Format 19 is printed, the file should be removed manually.

If Format 60 is printed, determine the input command that specified this output file and retry that command with a different filename option.

If Format 64 is printed, if /tmp space is limited, check for files of the form "/tmp/OM*" and remove any of these that do not have a time stamp within the last 6 hours.

5. ALARMS

None. This automatically-generated report is for information only.

2. REASON FOR OUTPUT

To report errors detected by the spooler during initialization.

When formats having no key value are printed, other output messages may then appear in primitive mode.

Format 1 is printed if the equipment configuration database (ECD) contains inconsistent device definitions.

Formats 2 and 9 are printed if the ACKDB failed to initialize from disk, or could not be added to the invoking process' address space.

Formats 3, 16, and 21 are printed if coordinator of spooler output processes (CSOP) cannot access the plant measurements database.

Formats 4, 5, 7 through 10, 13, 14, 15, 17, and 18 are printed if errors occur while trying to read an OMDB into memory.

Format 6 is printed if there is an inconsistency in the ECD device definition. Either the terminal should be a dialogue device and is not, or the SOP should be temporary and is not.

Format 11 is printed if CSOP fails to save the stack in preparation for handling a phase 1.

Format 12 is printed if CSOP is unable to create a dialogue shell.

Format 19 is printed if CSOP cannot remove the output file associated with Format 21.

Format 20 is printed if CSOP cannot send a message to SOP *c*.

Formats 22 and 27 are printed if CSOP cannot open or write the output file.

Format 23 is printed when CSOP creates a new spooler output process.

Format 24 is printed when a device record is deleted in the ECD.

Formats 25 and 29 are printed when CSOP is unable to create a new spooler output process.

Format 26 is printed if CSOP is unable to print to the ROP.

Format 28 is printed if CSOP is unable to remove a file.

Format 29 is printed if CSOP is unable to fork a SOP process.

SEE PROPRIETARY NOTICE ON COVER PAGE

Formats 30, 43, 44, and 59 indicate a SOP work queue error. In the case of 43, the locations and addresses of the message headers are printed.

Format 31 is printed if memory cannot be allocated for CSOP's master work queue. This is a fatal error since no messages can be stored internally for later output.

Formats 32, 45 and 46 are printed when CSOP is unable to queue incoming messages; therefore, messages will be lost.

Format 33 is printed when the overload condition has been cleared.

Format 34 is printed if CSOP is unable to enable the reception of messages.

Format 35 is printed when a new device record is defined in the ECD.

Format 36 is printed if a class is defined that contains no output devices.

Format 37 is printed when there was no entry in the work queue for a.

Formats 38 and 41 are printed when a dialogue shell is terminated.

Format 39 is printed if port 1 is not free. CSOP will attempt to kill the process that is attached to port 1 and connect itself.

Format 40 is printed when the ECD record for a device or class is changed.

Format 42 is printed when a dialogue shell is created.

Format 47 is printed if the queue size for a device changed and it is not large enough to hold all the current outstanding messages.

Format 48, 49, and 57 indicate ECD record problems.

Format 50 is printed if CSOP cannot get enough memory to store the definition of an output device.

Format 51 is printed when CSOP does not have enough memory to store the definition of a class.

Format 52 is printed if CSOP is unable to allocate memory for the work queue associated with a particular SOP.

Format 53 is printed if CSOP was unable to attach to the ECD. If this appears before CSOP initializes the master work queue, the message will go to the spooler log until CSOP is restarted.

Formats 53, 57, and 58 indicate ECD access and/or update errors.

Format 54 is printed when the common segment to exchange work queue information between CSOP and SIP cannot be created.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 55 is printed when CSOP is unable to allocate space to store information about a new tty entry.

Format 56 is printed when a tty entry is requested to be removed from CSOP's internal tty list, and CSOP cannot find an entry for the specified device or class.

Format 59 is printed by CSOP when it is cleaning up after a dead SOP if it cannot find a tty entry associated with the SOP.

Format 60 is printed when CSOP finds that the output file is not empty. This is done to ensure that existing files are not destroyed or inappropriately changed.

Formats 61 and 62 indicate that a state change has occurred in the system; output is redirected to the spooler log. Format 61 indicates that the system is in the SIMPLEX mode, and Format 62 indicates that the system is in DUPLEX mode.

Format 63 indicates that CSOP has run out of common segment space. This space is used to store output messages that are being formatted or formatted messages that have not yet been output.

Format 64 indicates that CSOP cannot retrieve the name of a file from its common segment. CSOP needs the filename so that the file can be removed.

3. VARIABLE FIELD DEFINITIONS

a = Name of an output device or class.

b = Reason a device could not be added to CSOP's device table.

c = Process identification (ID) of SOP.

d = String containing additional information.

e = File name.

f = System error number.

g = Completion code.

h = Job ID.

i = Path name.

j = Segment name.

k = Spooler output class.

l = Error number assigned by CSOP.

m = Maximum number of active OMDB segments.

n = String identifying where data is stored. "NO TEXT" indicates there is no data stored.

o = Address in CSOP's common segment.

p = Utility ID.

q = OMDB key of the report.

4. ACTION TO BE TAKEN

For messages appearing on the receive-only printer (ROP), in the event of a fatal fault, CSOP will be restarted, thus clearing the problem. No action should be taken unless the message is repeated. If the message is repeated, seek technical assistance to restore system sanity.

Messages written to the spooler log are informational only and no action should be taken.

If Format 19 is printed, the file should be removed manually.

If Format 60 is printed, determine the input command that specified this output file and retry that command with a different filename option.

If Format 64 is printed, if /tmp space is limited, check for files of the form "/tmp/OM*" and remove any of these that do not have a time stamp within the last 6 hours. Note: there is one report of format 64 for each file to be removed.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 599.
Formats 2, 4 through 11, 13, 14, 15, 17, 18, 31 through 34,
39, 45, 46, 50 through 54 and 63 do not have OMDB keys.
These are output messages that cannot be formatted and
spooled due to the state of the system at the time of printing.
Formats 3, 12, 16, 21, 23, 24, 25, 28, 29, 35, 36, 38, 40,
41, 47, 49, and 55 through 58, 61 and 62 have an OMDB key of 201.
Formats 19, 22, 26, 27, 30, 44, 59, and 60 have an OMDB key of 202.
Format 20 has an OMDB key of 203.
Format 37 has an OMDB key of 204.
Format 42 has an OMDB key of 205.
Format 43 has an OMDB key of 206.
Format 64 has an OMDB key of 745.

 FIELD SIZE ERROR
 KEY:  a PID:  b UTILITY ID:  c
```

2. REASON FOR OUTPUT

To report that an error has occurred during the formatting of a format-and-spool request.

3. VARIABLE FIELD DEFINITIONS

a = The key that was requested.

b = The process ID of the requesting process.

c = The utility ID of the requesting process.

All variables for `REPT-CSOP,FORMATTING` messages are taken from the information passed by the requesting (client) process.

4. ACTION TO BE TAKEN

Formats 1 through 5 indicate a problem in requesting process code. Seek technical assistance.

Format 6 indicates that `CSOP` is unable to store the formatted text. `CSOP` will attempt to store the text in a file in `/tmp` if `CSOP`'s common segment is full. This message indicates that the attempted use of a file failed.

Formats 7 and 8 indicate a software problem with the output message database (OMDB). Seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
Formats 1 through 8 have an OMDB key of 11.

2. REASON FOR OUTPUT

To report that an error has occurred during the formatting of a format-and-spool request.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = The key that was requested.

b = The process ID of the requesting process.

c = The utility ID of the requesting process.

All variables for `REPT-CSOP,FORMATTING` messages are taken from the information passed by the requesting (client) process.

4. ACTION TO BE TAKEN

Formats 1 through 5 indicate a problem in requesting process code. Seek technical assistance.

Format 6 indicates that `CSOP` is unable to store the formatted text. `CSOP` will attempt to store the text in a file in `/tmp` if `CSOP`'s common segment is full. This message indicates that the attempted use of a file failed.

Format 7 indicates a software problem with the output message database (OMDB). Seek technical assistance.

Format 8 indicates a software error in the language passed to `CSOP`. Currently, there are two valid values, English and National, with English as the default. Seek technical assistance to resolve.

Format 9 indicates a failure in `CSOP` to allocate memory while processing the output message. This indicates that memory resources are temporarily unavailable resulting in the loss of the requested output message.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
Formats 1 through 9 have an OMDB key of 11.

ID . . . . . REPT-CSOP,IN
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT CSOP IN SERVICE
 OMDB SEGMENTS:
TOTAL      ACTIVE
 a     b
```

2. REASON FOR OUTPUT

To report initialization of the coordinator of spooler output processor (CSOP) process.

3. VARIABLE FIELD DEFINITIONS

a = Total number of segments that the output message database (OMDB) requires.

b = Number of segments that are active (incore).

NOTE: The number of segments is variable depending on the current state of the system and the equipment configuration database (ECD) setup. When the system is in DUPLEX mode, the number of active segments will be determined from the splrinfo record information in the ECD. When the system is in SIMPLEX mode, the number of active segments will be the total number of output buffer segments required by the OMDB.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
This message has an OMDB key of 0.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . REPT-CSOP,PRIM
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT CSOP PRIMITIVE MODE FOR KEY` *a*
`0`*xbbbb: xxxxxxxx* [*xxxxxxxx xxxxxxxx xxxxxxxx*]

2. REASON FOR OUTPUT

To report that the output message database (OMDB) cannot be accessed and therefore a message cannot be formatted. Variables passed by the requesting process are given in the form of a hexadecimal dump.

3. VARIABLE FIELD DEFINITIONS

a = The key that is requested.

bbbb = The offset of the first byte of the line.

xxxxxxxx = A hexadecimal dump of one memory word. (Due to limits of the primitive mode buffer, this may not be a complete dump of all variables.)

4. ACTION TO BE TAKEN

Primitive mode indicates a problem in accessing the incore OMDB. Examine the current status of the file `/cft/spl/omdb` and disk availability. If the file exists and the disk is `ACTIVE`, execute the `ACTV:OMDB` message. If this is not successful, the problem may be insufficient memory available to bring the OMDB incore; contact the next level of technical support.

NOTE: A cross reference file, `omdb.xref`, located on development support processors, is needed to translate the hexadecimal dump. Support personnel should refer to the *UNIX® RTR Programmer's Manual*, Volume 2, for instructions on translating hexadecimal OMDB dumps.

5. ALARMS

None.

1. FORMAT

This message has three formats.

[1] `REPT CU` *a b*

[2] `REPT CU` *a* `ERROR INTERRUPT` *c d*

[3] `REPT CU` *a* `MAINTENANCE INTERRUPT` *d*

2. REASON FOR OUTPUT

To indicate the status of the specified control unit (CU).

Format 1 is printed as the result of a change in the major state of the CU, while Formats 2 and 3 indicate that an error interrupt has occurred.

3. VARIABLE FIELD DEFINITIONS

a = Member number (0 or 1).

b = Major state:

- `ACTIVE` — Processor is on-line and not in a recovery state.
- `INITIALIZING` — Processor has undergone an initialization, and the initialization interval has not elapsed.
- `OUT OF SERVICE` — Processor is available for use, but its memory is not up-to-date.
- `STANDBY` — Processor is updated and available for use.
- `UNAVAILABLE` — Processor is unavailable under any circumstance (for example, forced off-line).

c = Interrupt type, in hexadecimal notation.

- `2` — Emergency action interface (EAI) error
- `8` — Noncorrectable parity failure in main store (my store C)
- `0B` — Invalid maintenance channel order
- `0C` — Other store controller error (other store A)
- `0D` — Other store refresh or correctable parity failure (other store D)
- `0E` — Other store noncorrectable memory failure (other store C)
- `0F` — Other store timeout

SEE PROPRIETARY NOTICE ON COVER PAGE

10 — Channel error
11 — IO response error
12 — IO addressing error
13 — Parity divert error
14 — Refresh or correctable parity memory failure (my store D)
15 — Protection violation
16 — Virtual address out of range (VLMM only)
17 — Out-of-range memory reference
18 — Out-of-range memory reference (other store)
19 — Privilege violation
1A — Bad alignment on memory reference
1B — Illegal operand
1C — Illegal instruction
1D — Illegal stack switch
1E — No interrupt source set when microcode interrupt handler entered
20 — Direct memory access (DMA) detected fatal hardware fault in on-line main store
21 — DMA detected out-of-range memory reference
22 — DMA detected noncorrectable parity failure in main store
25 — DMA error: bad parity on direct I/O bus (DIO)
26 — DMA error: bad parity on read
27 — DMA error: DMA random access memory (RAM) parity failure
28 — DMA error: DMA incrementer parity failure
29 — DMA error: DIO ready failure
2A — DMA error: DIO all seems well failure
2B — DMA error: DIO acknowledge failure
2C — DMA error: central control input output (CCIO) data parity failure
2D — DMA error: CCIO message failure
2E — DMA error: DMA read only message (ROM) sequencer parity failure
2F — DMA error: Address error
30 — DMA error: Channel request error
32 — Processor error interrupt but no bits are set in error registers
33 — Bad operating system trap (OST) detected by the kernel

d = If supplemental data is gathered for this error, it will be placed in the appropriate log file. This identification flag can be used to find the entry in the log file.

For format 2, the error data will be in either the ERLOG or MEMLOG log file. The log file name is given in the action to be taken for each interrupt type.

For format 3, the entry is always in the PMLOG file.

Items can be extracted from a log file using the OP:LOG input message, where ERLOG or MEMLOG is the log file being searched and the keyword (KW) argument is *d* the sequence number given above.

4. ACTION TO BE TAKEN

If a Format 2 message is output, follow the appropriate instructions for the specified interrupt type as given in the following table.

Table A
Interrupt Action Table

Interrupt Type	Action
2	This interrupt occurs only on 3B21D machines. It indicates that an error has occurred on the on-line CC EAI circuitry. Analyze the accompanying REPT-ERSLOT output message and take appropriate action as stated in the REPT-ERSLOT output manual pages.
8	This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board. Run all of the phases of the main store controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.
0B	If this is an isolated failure, no action is required. If repeated failures occur, the maintenance channel may have a fault. Check the cabling and run diagnostics. The error entry is in ERLOG.
0C	This error may implicate the store controller or a store array. Calculate the faulty store array and run diagnostics as for interrupt type 8. If there is no fault, restore the unit to service.
0D	This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board. Run all of the phases of the main store controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table A
Interrupt Action Table (*continued*)

Interrupt Type	Action
0E	This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board. Run all of the phases of the main store controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.
0F	Check the update cables and run diagnostics on the off-line main store and update circuits. The error data is in ERLOG.
10	Get the channel number and channel address from the corresponding entry in ERLOG. If the address corresponds to a 3x6 code, but the channel is unequipped, the data base may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the data base. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.
11	Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as follows: channel address = (hardware status register & If the address corresponds to a 3x6 code, but the channel is unequipped, the database may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the data base. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table A
Interrupt Action Table (*continued*)

Interrupt Type	Action
12	Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as follows: channel address = (hardware status register & If the address corresponds to a 3x6 code, but the channel is unequipped, the data base may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the data base. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.
13	Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as follows: channel address = (hardware status register & If the address corresponds to a 3x6 code, but the channel is unequipped, the data base may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the data base. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.
14	This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board. Run all of the phases of the main store controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.
15	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, program address (PA) and program status word (PSW), should be reported according to local procedures, including the error log data.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table A
Interrupt Action Table (*continued*)

Interrupt Type	Action
16	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
17	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
18	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
19	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
1A	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
1C	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
1D	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
1E	If repeated failures occur, run diagnostics on the processor encountering the fault. The error data is recorded in ERLOG.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table A
Interrupt Action Table (*continued*)

Interrupt Type	Action
20	This error can occur only if hardware checks are blocked. The corresponding ERLOG entry contains the direct memory access (DMA) store data register. This can be used to determine the bad memory location. Diagnose the main store if there are multiple errors of this type.
21	This is a software error that was detected by the DMA and is a fatal DMA error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
22	This error typically implicates a memory array board detected by the DMA and is a fatal DMA error. The error data is recorded in ERLOG. This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board. Run all of the phases of the main store controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.
25	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
26	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
27	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
28	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table A
Interrupt Action Table (*continued*)

Interrupt Type	Action
29	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
2A	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
2B	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
2C	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
2D	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
2E	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
2F	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
30	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table A
Interrupt Action Table (*continued*)

Interrupt Type	Action
32	If this problem persists, diagnose the faulty CU. This can be an improperly wired interrupt source register. The error data is recorded in ERLOG.
33	The kernel has detected a bad operating system trap. Identification of the offending process is possible by examining the ERLOG log file or the corresponding error data printed on the receive-only printer (ROP).

For format 3 errors, refer to the *System Maintenance Manual* for analysis of maintenance interrupt data. The analysis is done similarly to the post mortem analysis with the following additions:

1. The source will always be software or hardware.
2. For software sources, the utility ID and panic code determine the cause.
3. For hardware sources, examine the MICROCODE SAVE STATE for
   a. Stop and switch errors in the error register.
   b. A one (1) in bits 6 or 7 of the timer register (TMR), indicating the sanity timer fired.
   c. A micro-interrupt error with either the interrupts blocked (system status register [SSR]) or the execution at level 15 (PSW).

Any hardware error implicates the sanity of the faulty CU while, in general, software errors are caused by program malfunctions. However, any recurring error on one CU implicates that CU. Run diagnostics, including demand phases, if necessary.

5. ALARMS

For a minor alarm, take action as indicated in the report.

6. REFERENCES

1. FORMAT

This message has three formats.

[1] `REPT CU` *a b*

[2] `REPT CU` *a* `ERROR INTERRUPT` *c d*

[3] `REPT CU` *a* `MAINTENANCE INTERRUPT` *d*

2. REASON FOR OUTPUT

To indicate the status of the specified control unit (CU).

Format 1 is printed as the result of a change in the major state of the CU, while Formats 2 and 3 indicate that an error interrupt has occurred.

3. VARIABLE FIELD DEFINITIONS

a = Member number (0 or 1).

b = Major state:

`ACTIVE` — Processor is on-line and not in a recovery state.

`INITIALIZING` — Processor has undergone an initialization, and the initialization interval has not elapsed.

`OUT OF SERVICE` — Processor is available for use, but its memory is not up-to-date.

`REMOVED` — Processor state has been changed to OUT OF SERVICE or UNAVAILABLE.

`STANDBY` — Processor is updated and available for use.

`UNAVAILABLE` — Processor is unavailable under any circumstance (for example, forced off-line).

c = Interrupt type, in hexadecimal notation.

`2` — Emergency action interface (EAI) error
`8` — Noncorrectable parity failure in main store (my store C)
`0B` — Invalid maintenance channel order
`0C` — Other store controller error (other store A)
`0D` — Other store refresh or correctable parity failure (other store D)

SEE PROPRIETARY NOTICE ON COVER PAGE

0E — Other store noncorrectable memory failure (other store C)
0F — Other store timeout
10 — Channel error
11 — IO response error
12 — IO addressing error
13 — Parity divert error
14 — Refresh or correctable parity memory failure (my store D)
15 — Protection violation
16 — Virtual address out of range (VLMM only)

Interrupt Action Table (*continued*)

Interrupt Type	Action
0E	This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board. Run all of the phases of the main store controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.
0F	Check the update cables and run diagnostics on the off-line main store and update circuits. The error data is in ERLOG.
10	Get the channel number and channel address from the corresponding entry in ERLOG. If the address corresponds to a 3x6 code, but the channel is unequipped, the data base may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the data base. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.
11	Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as follows: channel address = (hardware status register & If the address corresponds to a 3x6 code, but the channel is unequipped, the database may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the data base. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.

Interrupt Type	Action
12	Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as follows: channel address = (hardware status register & If the address corresponds to a 3x6 code, but the channel is unequipped, the data base may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the data base. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.
13	Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as follows: channel address = (hardware status register & If the address corresponds to a 3x6 code, but the channel is unequipped, the data base may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the data base. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.
14	This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board. Run all of the phases of the main store controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.
15	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, program address (PA) and program status word (PSW), should be reported according to local procedures, including the error log data.

SEE PROPRIETARY NOTICE ON COVER PAGE

Interrupt Action Table (*continued*)

Interrupt Type	Action
16	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
17	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
18	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
19	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
1A	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
1C	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
1D	This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
1E	If repeated failures occur, run diagnostics on the processor encountering the fault. The error data is recorded in ERLOG.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table A
Interrupt Action Table (*continued*)

Interrupt Type	Action
20	This error can occur only if hardware checks are blocked. The corresponding ERLOG entry contains the direct memory access (DMA) store data register. This can be used to determine the bad memory location. Diagnose the main store if there are multiple errors of this type.
21	This is a software error that was detected by the DMA and is a fatal DMA error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
22	This error typically implicates a memory array board detected by the DMA and is a fatal DMA error. The error data is recorded in ERLOG. This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board. Run all of the phases of the main store controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.
25	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
26	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
27	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
28	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.

Interrupt Type	Action
29	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
2A	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
2B	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
2C	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
2D	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
2E	This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
2F	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
30	This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table A
Interrupt Action Table (*continued*)

Interrupt Type	Action
32	If this problem persists, diagnose the faulty CU. This can be an improperly wired interrupt source register. The error data is recorded in ERLOG.
33	The kernel has detected a bad operating system trap. Identification of the offending process is possible by examining the ERLOG log file or the corresponding error data printed on the receive-only printer (ROP).

For format 3 errors, refer to the *System Maintenance Manual* for analysis of maintenance interrupt data. The analysis is done similarly to the post mortem analysis with the following additions:

1. The source will always be software or hardware.
2. For software sources, the utility ID and panic code determine the cause.
3. For hardware sources, examine the MICROCODE SAVE STATE for
   a. Stop and switch errors in the error register.
   b. A one (1) in bits 6 or 7 of the timer register (TMR), indicating the sanity timer fired.
   c. A micro-interrupt error with either the interrupts blocked (system status register [SSR]) or the execution at level 15 (PSW).

Any hardware error implicates the sanity of the faulty CU while, in general, software errors are caused by program malfunctions. However, any recurring error on one CU implicates that CU. Run diagnostics, including demand phases, if necessary.

5. ALARMS

For a minor alarm, take action as indicated in the report.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . REPT-CURSTRMV
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has eight formats.

[1] `REPT CURSTRMV FAULT TYPE` *a* `UNIT =` *b* `ASSERT =` *c*

[2] `REPT CURSTRMV FAULT TYPE` *a* `UNIT =` *b*
`MICROSTORE PUMP FAILED`

[3] `REPT CURSTRMV FAULT TYPE` *a* `UNIT =` *b*
`PHYSICAL MEMORY PUMP FAILED`

[4] `REPT CURSTRMV FAULT TYPE` *a* `UNIT =` *b*
`UPDATE FAILED IN MEMORY BLOCK` *d*

[5] `REPT CURSTRMV FAULT TYPE` *a* `INACCESSIBLE RID =` *e*
`ASSERT =` *c*

[6] `REPT CURSTRMV FAULT TYPE` *a* `CHECKSUM FAILED IN SLOT` *f*
`ASSERT =` *c*

[7] `REPT CURSTRMV CU RESTORE CONTINUING,DIAGNOSTIC`
`FAILURE IN NON-CRITICAL UNIT`

[8] `REPT CURSTRMV FAULT TYPE` *a* `UNIT =` *b*
`OOS CU FORCED OFFLINE`

2. REASON FOR OUTPUT

To report a fault condition in the control unit restore or remove (CURSTRMV) process.

Format 5 prints when the name of the unit cannot be determined in response to manual and automatic `RMV` or `RST` request.

3. VARIABLE FIELD DEFINITIONS

a = One or more of the following fault types.

`BOOT` — Bootfile access problem.

`CURS` — `CURSTRMV` internal failure.

`ECDA` — Equipment configuration data base (ECD) access problem.

SEE PROPRIETARY NOTICE ON COVER PAGE

ECDD — ECD data invalid.

EEIH — Processor control process error interrupt handler (PCPEIH) error.

EMEM — Memory size from ECD different from equipped memory size.

EMM — EMM straps do not match on both control units (CU).

EPCP — Processor control process maintenance driver (PCPMD) error.

IARG — Invalid argument.

MPF — Microstore pump failed.

OPCP — Cannot open process control process maintenance driver (PCPMD).

OSPL — Cannot open spooler.

PMPF — Physical memory pump failed.

RSTCOD — Restore code access problem.

RTS — Could not send message to RTS.

UCOD — Could not load micro code.

UF — Update failed.

VTOC — Volume table of contents (VTOC) access problem.

FOFL — Problem with the system status register (SSR) forced off-line bit.

b = Name and number of unit.

c = Identification number (ASSERT number) of the fault in the CURSTRMV process. Useful only to RTR development seeking to resolve the problem.

d = Starting address of the memory block.

e = Record ID (RID) of the unit control block (UCB) record in the ECD.

f = Microstore slot number of failing checksum.

4. ACTION TO BE TAKEN

Messages referring to a microstore pump failure, a physical memory pump failure, or an update failure generally indicate hardware problems with the off-line CU. If the message indicates the off-line CU is forced, clear the force from the emergency action interface (EAI) page on the maintenance terminal. For the EMM type message, make sure the EMM straps are either *on* or *off* on both CUs. For other cases, save a copy of the output message and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-DCI-A
GENERIC . . . . . UNIX RTR R21.3, R21.15 thru R21.30
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has twelve formats.

[1] `REPT DCIDRV INFO CODE` *a b c*

[2] `REPT DCIDRV ERROR CODE` *a b c*

[3] `REPT` *d e* `ERROR CODE` *a b c*

[4] `REPT` *d e* `ERROR COMPLETION CODE` *f*

[5] `REPT` *d e* `ERROR -` *g* `STATUS` *h*

[6] `REPT` *d e* `FAULT CODE` *i j*

[7] `REPT` *d e* `UNIDENTIFIED RESPONSE WD1=`*k*

[8] `REPT` *d e* `ERROR STATUS` *l* `MASK` *m* `EXP` *n*

[9] `REPT` *d e* `INFO CODE` *a b c*

[10] `REPT` *d e* `AUTONOMOUS RESPONSE` *o*

[11] `REPT` *d e* `CHANNEL` *p q* `CODE` *a b c*

[12] `REPT DCIDRV RECEIVED UNKNOWN RCV MESSAGE` *r e s*

2. REASON FOR OUTPUT

To specify the error condition detected by the Dual Serial Channel Interconnect (DCI) driver.

3. VARIABLE FIELD DEFINITIONS

a = An error code or information code number. For the meaning of error or information code, see appendix DCI-APPA.

b = Supplemental data for previous REPT-DCIDRV message.

c = Supplemental data for previous REPT-DCIDRV message.

d = DCI unit name

e = DCI unit number

f = One word completion report. It contains information like command completion code, job ID (DMA job number), size of data.

g = Can be either CHAN, DBS or BIC Register. For more information, see *h*.

h = Supplemental data for the previous message.

if the value of *g* is CHAN, see output DCI appendix C, DCI-APPC.

if the value of *g* is DBS, see output DCI appendix D, DCI-APPD.

if the value of *g* is BIC REGISTER, see output DCI appendix E, DCI-APPE.

i = Fault code, in hexadecimal notation. See output DCI appendix H, DFC-APPH.

j = In case of software faults in *i*, it contains the program address where fault occurred.

k = One word completion report. It contains information like command completion code, job ID (DMA job number), size of data.

l = BIC status in hexadecimal notation. See output appendix E, DCI-APPE.

m = Mask.

n = Expected value of *l after being masked with m*.

o = Autonomous response special completion code. See output appendix, DCI-APPB.

p = Channel number on which error occurred.

q = Can be either INFO on the channel or an ERROR on channel.

r = The unit_name of the device which received unknown message.

s = The number of message in hexadecimal notation.

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

5. ALARMS

None. This automatically-generated report is for information only.

2. REASON FOR OUTPUT

To specify the error condition detected by the Dual Serial Channel Interconnect (DCI) driver.

3. VARIABLE FIELD DEFINITIONS

a = An error code or information code number. For the meaning of error or information code, see appendix DCI-APPA.

b = Supplemental data for previous REPT-DCIDRV message.

c = Supplemental data for previous REPT-DCIDRV message.

d = DCI unit name

e = DCI unit number

f = One word completion report. It contains information like command completion code, job ID (DMA job number), size of data.

g = Can be either CHAN, DBS or BIC Register. For more information, see *h*.

h = Supplemental data for the previous message.

if the value of *g* is CHAN, see output DCI appendix C, DCI-APPC.

if the value of *g* is DBS, see output DCI appendix D, DCI-APPD.

if the value of *g* is BIC REGISTER, see output DCI appendix E, DCI-APPE.

i = Fault code, in hexadecimal notation. See output DCI appendix H, DFC-APPH.

j = In case of software faults in *i*, it contains the program address where fault occurred.

k = One word completion report. It contains information like command completion code, job ID (DMA job number), size of data.

l = BIC status in hexadecimal notation. See output appendix E, DCI-APPE.

m = Mask.

n = Expected value of *l after being masked with m*.

o = Autonomous response special completion code. See output appendix, DCI-APPB.

p = Channel number on which error occurred.

q = Can be either INFO on the channel or an ERROR on channel.

r = The unit_name of the device which received unknown message.

s = The number of message in hexadecimal notation.

t = The beginning of the time range indicator.

u = The end of the time range indicator.

v = The maximum job response time to be printed.

w = The segment number of this report (1, 2 or 3.)

x = The largest segment number of this report (1, 2, or 3.)

SEE PROPRIETARY NOTICE ON COVER PAGE

R = Starting time value.

S = Ending time value+8

A = The number of job timeouts received in the one second time period RR to RR+1 seconds.

B = The number of job timeouts received in the one second time period RR+1 to RR+2 seconds.

C = The number of job timeouts received in the one second time period RR+2 to RR+3 seconds.

D = The number of job timeouts received in the one second time period RR+3 to RR+4 seconds.

E = The number of job timeouts received in the one second time period RR+4 to RR+5 seconds.

F = The number of job timeouts received in the one second time period RR+5 to RR+6 seconds.

G = The number of job timeouts received in the one second time period RR+6 to RR+7 seconds.

H = The number of job timeouts received in the one second time period RR+7 to RR+8 seconds.

I = The number of job timeouts received in the one second time period RR+8 to RR+9 seconds.

J = The number of job timeouts received in the one second time period RR+9 to RR+10 seconds.

K = The number of job timeouts received in the one second time period RR+10 to RR+11 seconds.

L = The number of job timeouts received in the one second time period RR+11 to RR+12 seconds.

M = The number of job timeouts received in the one second time period RR+12 to RR+13 seconds.

N = The number of job timeouts received in the one second time period RR+13 to RR+14 seconds.

O = The number of job timeouts received in the one second time period RR+14 to RR+15 seconds.

P = The number of job timeouts received in the one second time period RR+15 to RR+16 seconds.

The format 13 report consists of up to three segments of data giving a frequency table of job response times in intervals of one second. Each output segment consists of three lines. The first line gives the time range of the job response times for that segment in fields *t* through *u*, the maximum job response time recorded (*v*), the current segment number (*w*) and the last segment to be printed (*x*). The next two lines give the frequency distribution. The beginning of the line (RR or SS) is the time value in seconds corresponding to the first

entry in the line. The next eight numbers (AAAAA-HHHHH or IIIII-PPPPP) are the frequency of job responses occuring in consecutive time intervals one second apart.

An sample output is shown below in Examples 1 and 2. In Example 1, line 1 indicates that DCI 1 had some job responses between 0 and 16 (15+1) seconds, with a maximum reported response time between 21 and 22 seconds and that this is the first of two segments that will be reported. Line 2 shows the job responses received between 0-8 seconds; it indicates that there were 16 job responses received between 0 and 1 second and one response received between 4 and 5 seconds. Line 3 shows the job responses received between 8-16 seconds; it indicates that there was one job response received between 13 and 14 seconds.

In Example 2, line 1 indicates that DCI 1 had some job responses between 16 and 32 (31+1) seconds, with a maximum reported response time between 21 and 22 seconds and that this is the second of two segments that will be reported. Line 2 shows the job responses received between 16-24 seconds; it indicates that there was one job response received between 21 and 22 seconds. Line 3 shows the job responses received between 24-32 seconds; there were no job responses received in this period.

Example 1
=========

```
   REPT DCI 1 JOB RESP TIMES  0-15 MAX 21 SEGMENT 1 OF 2
 0:   16    0    0    0    1    0    0    0
 8:    0    0    0    0    0    1    0    0
```

Example 2
=========

```
   REPT DCI 1 JOB RESP TIMES 16-31 MAX 21 SEGMENT 2 OF 2
16:    0    0    0    0    0    1    0    0
24:    0    0    0    0    0    0    0    0
```

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

Format 13 is produced when the DCI/VDCI unit *e* has exceeded the threshold for heartbeat timeouts and will be removed from service, or if the DCI driver receives a signal E_USR6. When it receives the E_USR6 signal, it also clears the accumulated job response times after printing the table. The format 13 report provides data about the the distribution of DCI/VDCI job response times which is used for determining the network performance and delay characteristics and diagnose network problems. These data can be used to guide the setting of appropriate heartbeat timeout ECD parameters to prevent DCI/VDCI timeouts in consultation with Customer Technical Support.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

GENERIC . . . . . UNIX RTR R21.17 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

REPT DCIDIP ERROR a [b]

2. REASON FOR OUTPUT

To report an error condition encountered by the DCIDIP process.

3. VARIABLE FIELD DEFINITIONS

a = Process step or reason.

`f00` — sendw() failed to send message to DAP
`f06` — received invalid message type
`f0c` — failed to open the ECD
`f12` — failed to attach the ECD
`f18` — failed to get MDCT record for physical TTY
`f1e` — MDCT rid for physical TTY not known
`f24` — failed to get UCB record
`f2a` — UCB rid for physical TTY not known
`f30` — no RID in message from DCI driver
`f36` — failed to get UCB record
`f3c` — unit not supported by DCIDIP
`f42` — out of range DCI unit number
`f48` — failed to get DCIOPT record
`f4e` — invalid UCB RID for DCI
`f4f` — failed to get Adjunct UCB record
`f54` — invalid UCB RID for physical TTY
`f6a` — no data in poke message
`f70` — too many arguments in poke message
`f76` — poke number is not supported
`f7c` — option not supported by remove TTY
`f82` — invalid option for restore TTY
`f88` — failed to execute craft shell

b = System error code number. See System Error Codes Appendix.

4. ACTION TO BE TAKEN

This message indicates that the DCIDIP process encountered an error condition either during initialization or when processing a clients request. If the error condition persists, contact the next level of technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

This alarm is an automatically-generated report for information only.

TYPE . . . . . Output
MESSAGE CLASS . . VAR, DSKSYS

1. FORMAT

`REPT DEGROWTH` *a b c* [*d*]

2. REASON FOR OUTPUT

To indicate that a unit has been dynamically degrown by a user.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = `COMPLETED`.

= `FAILED`.

= `IN PROGRESS`.

If *c* = `FAILED`:

d = The reason for failure. For an input/output processor (IOP) unit, refer to output IOP Appendix J, `IOP-APPJ` for an explanation of the error code. For a disk file controller (DFC) unit, refer to output DFC Appendix A, `DFC-APPA` for an explanation of the error code.

4. ACTION TO BE TAKEN

No action is needed if *c* indicates `COMPLETED` or `IN PROGRESS`. If *c* is `FAILED` then check the error code to determine action.

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-DFC-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . DSKSYS

1. FORMAT

This message has ten formats.

[1] `REPT DFC` *a* `ERROR COMPL CODE` *b* `MHD STATUS` *c*

[2] `REPT DFC` *a* `ERROR MHD STATUS` *c*

[3] `REPT DFC` *a* `ERROR CHAN STATUS` *d*

[4] `REPT DFC` *a* `ERROR DBS STATUS` *e*

[5] `REPT DFC` *a* `ERROR BIC STATUS` *f*

[6] `REPT DFC` *a* `ERROR STATUS` *g* `MASK` *h* `EXP` *i*

[7] `REPT DFC` *a* `ERROR DATA` *j*

[8] `REPT DFC` *a* `FAULT CODE` *k*

[9] `REPT DFC` *a* `UNIDENTIFIED RESPONSE WD1=` *l* `WD2=` *m*

[10] `REPT DFC` *a* `AUTONOMOUS RESPONSE` *n*

2. REASON FOR OUTPUT

To specify the error condition detected by the disk file controller (DFC).

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Command completion status word in hexadecimal notation. The completion word is eight hexadecimal digits of the form *rrsstuvv*.

rr = Command completion code. See Tables 1 and 2 in output DFC Appendix B, `DFC-APPB`.

ss = Number of disk blocks read or written.

t = Device ID number.

u = Special completion code; valid only when *vv* is 00. See Table 3 in output DFC Appendix B, `DFC-APPB`.

vv = DMA job number (job ID).

c = MHD status, in hexadecimal notation. See output DFC Appendix C, `DFC-APPC`.

d = Channel status, in hexadecimal notation. See output DFC Appendix D, `DFC-APPD`.

e = Bus selector status, in hexadecimal notation. See output DFC Appendix E, `DFC-APPE`.

f = BIC status, in hexadecimal notation. See output DFC Appendix F, `DFC-APPF`.

g = BIC status, in hexadecimal notation. See output DFC Appendix F, `DFC-APPF`.

h = Mask.

i = Expected value of *g* after being masked with *h*.

j = Supplemental data for previous `REPT-DKDRV` message.

k = Fault code, in hexadecimal notation. See output DFC Appendix I, `DFC-APPI`.

l = First word of an unidentifiable completion report. This would normally be the command completion word.

m = Second word of an unidentifiable completion report. This would normally be the MHD status word.

n = Autonomous response special completion code (eight hexadecimal digits). The explanation of the hexadecimal digits is the same as the command completion code described above for variable *b*. The *u* hexadecimal digit provides the reason for the autonomous response. See Table 3 in output DFC Appendix B, `DFC-APPB`.

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

5. ALARMS

None. This automatically-generated report is for information only.

To specify the error condition detected by the disk file controller (DFC).

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Command completion status word in hexadecimal notation. The completion word is eight hexadecimal digits of the form *rrsstuvv*.

- *rr* = Command completion code. See Tables 1 and 2 in output DFC Appendix B, DFC-APPB.
- *ss* = Number of disk blocks read or written.
- *t* = Device ID number.
- *u* = Special completion code; valid only when *vv* is 00. See Table 3 in output DFC Appendix B, DFC-APPB.
- *vv* = DMA job number (job ID).

c = MHD status, in hexadecimal notation. See output DFC Appendix C, DFC-APPC.

d = Channel status, in hexadecimal notation. See output DFC Appendix D, DFC-APPD.

e = Bus selector status, in hexadecimal notation. See output DFC Appendix E, DFC-APPE.

f = BIC status, in hexadecimal notation. See output DFC Appendix F, DFC-APPF.

g = BIC status, in hexadecimal notation. See output DFC Appendix F, DFC-APPF.

h = Mask.

i = Expected value of *g* after being masked with *h*.

j = Supplemental data for previous REPT-DKDRV message.

k = Fault code, in hexadecimal notation. See output DFC Appendix I, DFC-APPI.

l = First word of an unidentifiable completion report. This would normally be the command completion word.

m = Second word of an unidentifiable completion report. This would normally be the MHD status word.

n = Autonomous response special completion code (eight hexadecimal digits). The explanation of the hexadecimal digits is the same as the command completion code described above for variable *b*. The *u* hexadecimal digit provides the reason for the autonomous response. See Table 3 in output DFC Appendix B, DFC-APPB.

o = The SCSI host adapter (HA) shadow register status, in hexadecimal notation. See output DFC Appendix P, DFC-APPP.

SEE PROPRIETARY NOTICE ON COVER PAGE

p = Information code. See output DFC Appendix A, DFC-APPA.

q = DMA job ID number.

w = Job ID in use indicator. Y indicates valid job ID.

x = Message buffer indicator. Y indicates a message buffer was found and fields *y* through *cc* are from the message buffer. N indicates a message buffer was not found and fields *y* through *cc* are not valid.

y = Process ID of the process requesting I/O.

z = Utility ID of the process requesting I/O.

aa = Page table address of I/O memory segment provided by the client.

bb = Offset into the memory segment.

cc = Number of bytes requested by the client for I/O transfer.

dd = Page table address of I/O memory segment used by the driver.

ee = Number of bytes used by the driver for I/O transfer.

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

5. ALARMS

None. This automatically-generated report is for information only.

`JOB_BCNT` *y* `JOB_PA` *z*

2. REASON FOR OUTPUT

To specify the error condition detected by the disk file controller (DFC).

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Command completion status word in hexadecimal notation. The completion word is eight hexadecimal digits of the form: `rrsstuvv`.

`rr` = Command completion code. See Tables 1 and 2 in DFC Appendix B, `DFC-APPB`.

`ss` = Number of blocks read or written.

`t` = Device identification (ID) number.

`u` = Special completion code; valid only when `vv` is 00. See Table 3 in DFC Appendix B, `DFC-APPB`.

`vv` = DMA job number (job id).

c = Device status, in hexadecimal notation. See DFC Appendix C, `DFC-APPC`.

d = Channel status, in hexadecimal notation. See DFC Appendix D, `DFC-APPD`.

e = Bus selector status, in hexadecimal notation. See DFC Appendix E, `DFC-APPE`.

f = BIC status, in hexadecimal notation. See DFC Appendix F, `DFC-APPF`.

g = BIC status, in hexadecimal notation. See DFC Appendix F, `DFC-APPF`.

h = Mask.

i = Expected value of *g* after being masked with *h*.

j = Supplemental data for previous `REPT-DKDRV` output message.

k = Fault code, in hexadecimal notation. See DFC Appendix I, `DFC-APPI`.

l = First word of an unidentifiable completion report. This would normally be the command completion word.

m = Second word of an unidentifiable completion report. This would normally be the device status word.

n = Autonomous response special completion code (eight hexadecimal digits). The explanation of the hexadecimal digits is the same as the command completion code described above for variable *b*. The *u* hexadecimal digit provides the reason for the autonomous response. See Table 3 in DFC Appendix B, `DFC-APPB`.

o = The small computer system interface (SCSI) host adapter (HA) shadow register status, in hexadecimal notation. See DFC Appendix P, `DFC-APPP`.

SEE PROPRIETARY NOTICE ON COVER PAGE

p = Information code. See DFC Appendix A, DFC-APPA.

q = DMA job ID number.

r = Job ID in use indicator. Y indicates valid job ID.

s = Message buffer indicator. Y indicates a message buffer was found and fields t through z are from the message buffer. N indicates a message buffer was not found and fields t through z are not valid.

t = Process ID of the process requesting I/O.

u = Utility ID of the process requesting I/O.

v = Page table address of I/O memory segment provided by the client.

w = Offset into the memory segment.

x = Number of bytes requested by the client for I/O transfer.

y = Page table address of I/O memory segment used by the driver.

z = Number of bytes used by the driver for I/O transfer.

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

5. ALARMS

There is no alarm for an automatically-generated report that is for information only.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Practice 254-301-215 *Disk File Controller Description and Theory of Operation 3B20D Model 1 Computer*

Practice 254-301-216 *SCSI Disk File Controller Description and Theory of Operation*

ID . . . . . REPT-DFC,PUMP
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . DSKSYS

1. FORMAT

This message has seven formats.

[1] `REPT DFC` *a* `AUTO PUMP NOT STARTED`

[2] `REPT DFC` *a* `AUTO PUMP STARTED`

[3] `REPT DFC` *a* `AUTO PUMP IN PROGRESS`

[4] `REPT DFC` *a* `AUTO PUMP ABORTED`

[5] `REPT DFC` *a* `AUTO PUMP COMPLETED`

[6] `REPT DFC` *a* `AUTO PUMP INHIBITED`

[7] `REPT DFC` *a* `PUMPCODE REMOVED`

2. REASON FOR OUTPUT

To report the result of disk driver (DKDRV) automatically downloading the pumpcode to the disk file controller (DFC) or the removal of the pumpcode from the small computer system interface host adapter (SCSI HA).

3. VARIABLE FIELD DEFINITIONS

a = Member number of the DFC.

4. ACTION TO BE TAKEN

If a termination report specifies that the pump could not be completed, see DKDRV's error messages to determine the reason for the failure. If the problem is caused by the resource limitation, the limitation should be cleared so that the pump can be successfully completed. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Format 6 indicates that the DKDRV will not try to initiate any more pumpcode downloading on this DFC. The DFC pump must be manually requested.

Format 7 indicates that the pumpcode has been removed from the SCSI HA and the SCSI DFC is running with the operational firmware. This occurs, because the SCSI DFC has operational problem(s) with the running pumpcode. The pumpcode residing on disk should be verified and redownloaded manually.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT DFCE` *a*
`AAAABBBB CCCCDDDD EEEEEEEE GGGGHHHH IIIIJJJJ KKKKLLLL MMMMNNNN`

[2] `REPT DFCE` *a* `DATA` *b-c* `X'` *d*

2. REASON FOR OUTPUT

To print the enhanced information report (EIR) provided by the disk file controller (DFC).

Format 1 prints when the short form of the EIR is requested.

Format 2 prints when the long form of the EIR is requested.

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Segment number of error report.

c = Number of segments of information report.

d = Sequence number for this report.

NOTE: For values of *b*, `X` means unused, or not applicable.

Format 1 (EIR short form):

A — Data flags.

Bit field definitions for dflags word are as follows.

`X'8000` — defect table in memory flag (1-in, 0-out)
`X'4000` — REX allowed flag (1-alw, 0-inh)
`X'2000` — drive in-service indicator (1-out, 0-in)
`X'1000` — optimization bit (1-on)
`X'0800` — uncorrectable data error
`X'0400` — defect management update write job

B — Drive table status word 0.

Bit field definitions for `dtstat` word 0 are as follows.

X'8000 — disk access required flag
X'4000 — seek only command flag
X'2000 — non-disk access command present flag
X'1000 — defect table setup only - no disk access
X'0800 — seek required flag
X'0400 — call to dtsetp required
X'0200 — seek pending flag
X'0100 — do not enter defect management if set (for dgn)
X'0080 — no work

C — Drive table status word 1.

Bit field definitions for dtstat word 1 are as follows.

X'8000 — go indication flag
X'4000 — not used
X'2000 — DMA operation completed successfully
X'1000 — DMA operation detected error
X'0800 — marker read flag
X'0400 — boot request active flag
X'0200 — segment break flag
X'0100 — enable segment breaks
X'0080 — 0-read, boot, verify 1-write, init
X'0040 — verify command flag
X'0020 — init command flag
X'0010 — no marker read-wait for index flag
X'0008 — DMA required flag
X'0004 — address mismatch flag (read only)
X'0004 — write gate off flag (write only)
X'0002 — skip defect management check
X'0001 — first sector flag for read

D — ID plug number.

E — Completion and enhanced error codes.

This field consists of three subfields: the command completion code, the error code status flag, and the internal DFC error code.

The meaning of command completion code subfield value is found in one of two command completion code lists. The list to reference is determined by the value in the error code status flag subfield. If the error code status flag value indicates an autonomous response, then reference the autonomous completion code list; otherwise, reference the non-autonomous completion code list.

The completion and enhanced error code field is eight hexadecimal digits of the form aaaabccc.

aaaa — Command completion code.

Values for autonomous completion codes are as follows.

X'0000 — instrumentation data
X'0100 — diagnostic failure
X'0200 — MHD exerciser failure
X'0300 — sysgen response
X'0400 — boot complete response
X'0500 — DFC idle response
X'0600 — illegal command / parameters
X'0700 — high temperature
X'0800 — not used

Values for non-autonomous completion codes are as follows.

X'0000 — successful completion code
X'0400 — verify completed - errors detected, however
X'8100 — PIC RAM boundary error
X'8300 — seek error on disk
X'8500 — no index detected on disk
X'8900 — MHD status error
X'8B00 — uncorrectable data error
X'8D00 — disk boundary overflow
X'8F00 — head-sector mismatch error
X'9100 — wrong disk selected
X'9300 — no disk selected
X'9500 — head positioning error
X'9700 — head selection error
X'9900 — BIC parity error
X'9B00 — BIC-PIC soft error
X'9D00 — PIC error
X'9F00 — DMA setup overwrite
X'A100 — early EOT from DMA
X'A300 — no EOT from DMA
X'A700 — PSDI FIFO parity error
X'A900 — PSDI FIFO underflow error
X'AB00 — PSDI FIFO overflow error
X'AD00 — PSDI acknowledge failure
X'AF00 — extra data in PSDI FIFO
X'B100 — disk data buffer error
X'B300 — main store address error
X'B500 — disk time out error
X'B700 — DMA time out error
X'BB00 — uncorrectable data error in MFGR defect table
X'BD00 — defect table overflow
X'BF00 — command for defective disk
X'C100 — unable to create our defect table on the disk
X'C300 — manufacturer specified more than the maximum number of defects allowed
X'C500 — uncorrectable data error on area that is guaranteed to be error free
X'C700 — invalid data in defect table

SEE PROPRIETARY NOTICE ON COVER PAGE

X'C900 — invalid data in RAM
X'CB00 — invalid MFGR defect table
X'CD00 — uncorrectable data error in defect table
X'CF00 — unable to read defect table
X'E100 — bad version information in pump file
X'E500 — pump timeout
X'D100 — unable to read MFGR's defect table
X'D300 — unable to write defect table on the disk
X'D500 — ramreg has incorrect value
X'D700 — uncorrectable data error and read TEMP list failed
X'D900 — uncorrectable data error and TEMP list overflow
X'DA00 — uncorrectable data error and the attempt to write the TEMP list failed

b — Error code status flag.

X'0 — instrumentation data has not been saved
X'4 — instrumentation data has been saved
X'8 — autonomous response
X'C — autonomous response with instrumentation data saved

ccc — Internal DFC error code.

X'001 — REX verify not inserted
X'002 — DGN drive number out of range
X'003 — defect table read not inserted
X'004 — read not inserted
X'005 — seek not inserted
X'006 — verify not inserted
X'007 — write not inserted
X'008 — DFC online when DGN requested
X'009 — MHD online when DGN requested
X'00A — run on board over run
X'00B — invalid DGN command pointer
X'00C — invalid system requested DGN command
X'00D — invalid routine exercise command
X'00E — invalid DGN command type
X'00F — no subroutine requested by diagnostic
X'010 — invalid put response table pointer
X'011 — putrsp in wrong state
X'012 — RAM board failure
X'013 — no response from RAM board
X'014 — invalid divide masks detected by axlate
X'015 — invalid current state for putrsp
X'016 — invalid return code from oncyldp
X'017 — invalid return code from skcylnd
X'018 — invalid return code from skcylnd
X'019 — invalid return code from skcylnd
X'01A — invalid data in DTSTAT0
X'01B — invalid return code from skcylnd

SEE PROPRIETARY NOTICE ON COVER PAGE

X'01C — invalid input to dtsetp
X'01D — schdlr detected invalid DFC state
X'01E — error detected by dtsetp
X'01F — read RAM boundary error
X'020 — write RAM boundary error
X'021 — attempt to cmsmhd when dfc offline
X'022 — attempt to cmsmhd to online-unit not ready
X'023 — select drive in priority sel/rel failed
X'024 — unit not ready - priority release
X'025 — unclearable fault - priority release
X'026 — defect table not in memory (dfctmg)
X'027 — disk maximum address exceeded - axlate
X'028 — no end code in RAM defect table (dfctmg)
X'029 — bad cylinder translation (dfctmg)
X'02A — bad sector for MFGR head (dmngmt)
X'02B — bad sector for TEMP head (dmngmt)
X'02C — bad head for copy request (dmngmt)
X'02D — bad dtstat0 options (dmngmt)
X'02E — update defect table write failed (dmngmt)
X'02F — TEMP defect table write failed (dmngmt)
X'030 — not defect management job (dmngmt)
X'031 — no defects for this drive (cpyupd)
X'032 — max head exceeded in MFGR table (cpyupd)
X'033 — max cylinder exceeded in MFGR table (cpyupd)
X'034 — max sector exceeded in MFGR table (cpyupd)
X'035 — no end code for MFGR defect table (cpyupd)
X'036 — bad defects order in MFGR table (cpyupd)
X'037 — no end code for TEMP defect table (cpytmp)
X'039 — bad TEMP defect table start code (cpytmp)
X'03B — no end code for COMB defect table (prcdfj)
X'03C — defect hash code does not match (prcdfj)
X'03D — bad COMB defect table start code (prcdfj)
X'03E — read defect table failed (drdchk)
X'03F — bad version information in pump data
X'050 — missing routine
X'051 — time-out no sector/index intr in 600us
X'052 — on-cylinder could not select disk
X'053 — on-cylinder detected seek time-out
X'054 — maximum cylinder number exceeded
X'055 — cylinder mismatch (expected != read)
X'056 — head/sector mismatch (expected != read)
X'057 — physical address not updated in time
X'058 — PSDI FIFO time-out (first address word)
X'059 — PSDI FIFO time-out (second address word)
X'05A — PSDI FIFO time-out (reading data)
X'05B — PSDI status error during read
X'05C — read gate turn off time out
X'05D — data buffer pointer error (diff > size)
X'05E — missed an ECC interrupt
X'05F — uncorrectable data error

SEE PROPRIETARY NOTICE ON COVER PAGE

X'060 — ECC / Addr buffer full
X'061 — address update done too late (during write)
X'062 — data buffer pointer error (diff > size)
X'063 — no disk acknowledgment received
X'064 — multiple disk responded (first select)
X'065 — wrong or multiple disks responded
X'066 — can't clear drive fault
X'067 — seek error in disk status set
X'068 — seek did not start
X'069 — PSDI did not start during a read
X'06A — PSDI did not start during a write
X'06B — seek time-out (detected by skcylnd)
X'06C — sector / index interrupt time-out (read)
X'06D — sector / index interrupt time-out (write)
X'06E — seek error on new cylinder
X'06F — index time out on new cylinder
X'070 — PSDI FIFO error during write
X'071 — PSDI FIFO unload time before head select
X'072 — job start sector / index interrupt time out
X'073 — time-out waiting for ECC (new cylinder)
X'074 — time-out waiting for write to go off
X'075 — uncorrectable data error during verify
X'076 — address mismatch failure during verify
X'077 — disk access job aborted due to DMA error
X'078 — seek error detected by select routine
X'079 — drive fault during write operation

G — Disk status register and flags.

This field consists of two subfields: the status flags and the disk status register of the form aabb.

aa = Status flags.

Bit field definitions are as follows.

X'01 — multiple drives responded
X'02 — wrong drive responded
X'04 — no drive responded
X'08 — cannot clear drive fault
X'10 — seek error set when drive was selected
X'20 — cannot make selected drive "ready"
X'40 — fatal error during drive select
X'80 — some kind of drive select error occurred

bb = Disk status register.

Bit field definitions are as follows.

X'01 — heads have not been loaded
X'02 — on cylinder
X'04 — unit ready

SEE PROPRIETARY NOTICE ON COVER PAGE

X'08 — high temperature warning
X'10 — seek error
X'20 — fault flag
X'40 — sector mark flag
X'80 — index mark flag

If the disk status register subfield contains the value FF, then the disk status register subfield should be ignored.

H — Starting cylinder of current job.

I — Starting head of current job.

J — Starting sector of current job.

K — Number of sectors in current job.

L — Current cylinder.

M — Current head.

N — Current sector.

Format 2 (EIR long form):

Where *b* = 1, this printout follows.

```
xxxxxxxx AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB
BBBBBBBB CCCCDDDD EFGGxxxx HHHHIIII IIIIIIII IIIIIIII IIIIxxxx xxxxxxxx
```

A — Current DFC related command.

B — Previous DFC related command.

C — DFC copy of response queue load pointer.

D — Version number of the DFC firmware.

Layout of version words are as follows.

4 bits — DFC generic number.
6 bits — DFC issue number.
6 bits — DFC point issue number.

E — Tens digit of DFC EDI.

F — Units digit of DFC EDI.

G — ASCII letter of DFC EDI.

H — DFC code (FFFO).

I — Internal list pointers.

Where *b* = 2, this printout follows:

```
AAAABBBB xxxxxxxx xxxxxxxx CCCCxxxx DDDDDDDD xxxxxxxx EEEEFFFF FFFFFFFF
FFFFxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
```

SEE PROPRIETARY NOTICE ON COVER PAGE

A — Current DFC state.

Values the cstate may assume are as follows.

X'0001 — initial state after a reset
X'0002 — firmware initialization state
X'0004 — normal operating state in the asynchronous mode
X'0008 — normal operating state in the synchronous mode
X'0010 — sleep state in the synchronous mode
X'0020 — sleep state in the asynchronous mode
X'0040 — job completion state in the initl mode
X'0080 — job completion state in the synchronous mode
X'0100 — job failure state in the asynchronous mode
X'FE00 — invalid state mask

B — Data flags.

Bit field definitions for dflags word are as follows.

X'8000 — defect table in memory flag (1-in, 0-out)
X'4000 — REX allowed flag (1-alw, 0-inh)
X'2000 — drive in-service indicator (1-out, 0-in)
X'1000 — optimization bit (1-on)
X'0800 — uncorrectable data error
X'0400 — defect management update write job

C — Pointer to drive table of currently active drive.

D — Completion and enhanced error codes.

This field consists of three subfields: the command completion code, the error code status flag, and the internal DFC error code.

The meaning of the command completion code subfield value is found in one of two command completion code lists. The list to reference is determined by the value in the error code status flag subfield. If the error code status flag value indicates an autonomous response, then reference the autonomous completion code list; otherwise, reference the non-autonomous completion code list.

The completion and enhanced error code field is eight hexadecimal digits of the form aaaabccc.

aaaa = Command completion code.

Values for autonomous completion codes are as follows.

X'0000 — instrumentation data
X'0100 — diagnostic failure
X'0200 — MHD exerciser failure
X'0300 — sysgen response
X'0400 — boot complete response

SEE PROPRIETARY NOTICE ON COVER PAGE

X'0500 — DFC idle response
X'0600 — illegal command / parameters
X'0700 — high temperature
X'0800 — not used

Values for non-autonomous completion codes are as follows.

X'0000 — successful completion code
X'0400 — verify completed - error detected, however
X'8100 — PIC RAM boundary error
X'8300 — seek error on disk
X'8500 — no index detected on disk
X'8900 — MHD status error
X'8B00 — uncorrectable data error
X'8D00 — disk boundary overflow
X'8F00 — head-sector mismatch error
X'9100 — wrong disk selected
X'9300 — no disk selected
X'9500 — head positioning error
X'9700 — head selection error
X'9900 — BIC parity error
X'9B00 — BIC-PIC soft error
X'9D00 — PIC error
X'9F00 — DMA setup overwrite
X'A100 — early EOT from DMA
X'A300 — no EOT from DMA
X'A700 — PSDI FIFO parity error
X'A900 — PSDI FIFO underflow error
X'AB00 — PSDI FIFO overflow error
X'AD00 — PSDI acknowledge failure
X'AF00 — extra data in PSDI FIFO
X'B100 — disk data buffer error
X'B300 — main store address error
X'B500 — disk time out error
X'B700 — DMA time out error
X'BB00 — uncorrectable data error in MFGR defect table
X'BD00 — defect table overflow
X'BF00 — command for defective disk
X'C100 — unable to create our defect table on the disk
X'C300 — manufacturer specified more than the maximum number of defects allowed
X'C500 — uncorrectable data error on area that is guaranteed to be error free
X'C700 — invalid data in defect table
X'C900 — invalid data in RAM
X'CB00 — invalid MFGR defect table
X'CD00 — uncorrectable data error in defect table
X'CF00 — unable to read defect table
X'E100 — bad version information in pump file
X'E500 — pump timeout
X'D100 — unable to read MFGR's defect table

SEE PROPRIETARY NOTICE ON COVER PAGE

X'D300 — unable to write defect table on the disk
X'D500 — ramreg has incorrect value
X'D700 — uncorrectable data error and read TEMP list failed
X'D900 — uncorrectable data error and TEMP list overflow
X'DA00 — uncorrectable data error and the attempt to write the TEMP list failed

b = Error code status flag.

X'0 — instrumentation data has not been saved
X'4 — instrumentation data has been saved
X'8 — autonomous response
X'C — autonomous response with instrumentation data saved

ccc = Internal DFC error code.

X'001 — REX verify not inserted
X'002 — DGN drive number out of range
X'003 — defect table read not inserted
X'004 — read not inserted
X'005 — seek not inserted
X'006 — verify not inserted
X'007 — write not inserted
X'008 — DFC online when DGN requested
X'009 — MHD online when DGN requested
X'00A — run on board over run
X'00B — invalid DGN command pointer
X'00C — invalid system requested DGN command
X'00D — invalid routine exercise command
X'00E — invalid DGN command type
X'00F — no subroutine requested by diagnostic
X'010 — invalid put response table pointer
X'011 — putrsp in wrong state
X'012 — RAM board failure
X'013 — no response from RAM board
X'014 — invalid divide masks detected by axlate
X'015 — invalid current state for putrsp
X'016 — invalid return code from oncyldp
X'017 — invalid return code from skcylnd
X'018 — invalid return code from skcylnd
X'019 — invalid return code from skcylnd
X'01A — invalid data in DTSTATO
X'01B — invalid return code from skcylnd
X'01C — invalid input to dtsetp
X'01D — schdlr detected invalid DFC state
X'01E — error detected by dtsetp
X'01F — read RAM boundary error
X'020 — write RAM boundary error
X'021 — attempt to cmsmhd when dfc offline
X'022 — attempt to cmsmhd to online-unit not ready

SEE PROPRIETARY NOTICE ON COVER PAGE

X'023 — select drive in priority sel / rel failed
X'024 — unit not ready - priority release
X'025 — unclearable fault - priority release
X'026 — defect table not in memory (dfctmg)
X'027 — disk maximum address exceeded - axlate
X'028 — no end code in RAM defect table (dfctmg)
X'029 — bad cylinder translation (dfctmg)
X'02A — bad sector for MFGR head (dmngmt)
X'02B — bad sector for TEMP head (dmngmt)
X'02C — bad head for copy request (dmngmt)
X'02D — bad dtstat0 options (dmngmt)
X'02E — update defect table write failed (dmngmt)
X'02F — TEMP defect table write failed (dmngmt)
X'030 — not defect management job (dmngmt)
X'031 — no defects for this drive (cpyupd)
X'032 — max head exceeded in MFGR table (cpyupd)
X'033 — max cylinder exceeded in MFGR table (cpyupd)
X'034 — max sector exceeded in MFGR table (cpyupd)
X'035 — no end code for MFGR defect table (cpyupd)
X'036 — bad defects order in MFGR table (cpyupd)
X'037 — no end code for TEMP defect table (cpytmp)
X'039 — bad TEMP defect table start code (cpytmp)
X'03B — no end code for COMB defect table (prcdfj)
X'03C — defect hash code does not match (prcdfj)
X'03D — bad COMB defect table start code (prcdfj)
X'03E — read defect table failed (drdchk)
X'03F — bad version information in pump data
X'050 — missing routine
X'051 — time-out no sector / index intr in 600us
X'052 — on-cylinder could not select disk
X'053 — on-cylinder detected seek time-out
X'054 — maximum cylinder number exceeded
X'055 — cylinder mismatch (expected != read)
X'056 — head / sector mismatch (expected != read)
X'057 — physical address not updated in time
X'058 — PSDI FIFO time-out (first address word)
X'059 — PSDI FIFO time-out (second address word)
X'05A — PSDI FIFO time-out (reading data)
X'05B — PSDI status error during read
X'05C — read gate turn off time out
X'05D — data buffer pointer error (diff > size)
X'05E — missed an ECC interrupt
X'05F — uncorrectable data error
X'060 — eCC / Addr buffer full
X'061 — address update done too late (during write)
X'062 — data buffer pointer error (diff > size)
X'063 — no disk acknowledgment received
X'064 — multiple disk responded (first select)
X'065 — wrong or multiple disks responded
X'066 — can't clear drive fault

SEE PROPRIETARY NOTICE ON COVER PAGE

X'067 — seek error in disk status set
X'068 — seek did not start
X'069 — PSDI did not start during a read
X'06A — PSDI did not start during a write
X'06B — seek time-out (detected by skcylnd)
X'06C — sector/index interrupt time-out (read)
X'06D — sector/index interrupt time-out (write)
X'06E — seek error on new cylinder
X'06F — index time out on new cylinder
X'070 — PSDI FIFO error during write
X'071 — PSDI FIFO unload time before head select
X'072 — job start sector/index interrupt time out
X'073 — time-out waiting for ECC (new cylinder)
X'074 — time-out waiting for write to go off
X'075 — uncorrectable data error during verify
X'076 — address mismatch failure during verify
X'077 — disk access job aborted due to DMA error
X'078 — seek error detected by select routine
X'079 — drive fault during write operation

E — Size of disk data buffer (16-bit words).

F — Initialization pattern.

Where *b* = 3 or 4, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
```

A — Routine trace buffer (for developer use only).

Where *b* = 5, this printout follows:

```
AAAABBBB CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC DDDDDDDD DDDDDDDD DDDDDDDD
DDDDDDDD EEEEFFFF GGGGGGGG HHHHIIII IIIIIIII IIIIIIII IIIIxxxx JJJJKKKK
```

A — Drive table status word 0.

Bit field definitions for dtstat word 0 are as follows.

X'8000 — disk access required flag
X'4000 — seek only command flag
X'2000 — non-disk access command present flag
X'1000 — defect table setup only - no disk access
X'0800 — seek required flag
X'0400 — call to dtsetp required
X'0200 — seek pending flag
X'0100 — do not enter defect mangement if set (for dgn)
X'0080 — no work

B — Drive table status word 1.

Bit field definitions for dtstat word 1 are as follows.

X'8000 — go indication flag
X'4000 — not used
X'2000 — DMA operation completed successfully
X'1000 — DMA operation detected error
X'0800 — marker read flag
X'0400 — boot request active flag
X'0200 — segment break flag
X'0100 — enable segment breaks
X'0080 — 0-read, boot, verify 1-write, init
X'0040 — verify command flag
X'0020 — init command flag
X'0010 — no marker read-wait for index flag
X'0008 — DMA required flag
X'0004 — address mismatch flag (read only)
X'0004 — write gate off flag (write only)
X'0002 — skip defect management check
X'0001 — first sector flag for read

C — Current drive table command.

D — Previous drive table command.

E — Number of cylinders on this drive.

F — Number of tracks per cylinder.

G — Division masks for converting block number to cylinder, head, and sector.

H — Drive number.

I — Internal list pointers.

J — Maximum number of readable cylinders.

K — Maximum number of verifiable cylinders.

Where b = 6, this printout follows:

```
AAAABBBB CCCCDDDD EEEExxxx xxxxFFFF GGGGGGGG IIIIxxxx xxxxxxxx xxxxxxxx
xxxxxxxx JJJJKKKK LLLLMMMM xxxxNNNN OOOOPPPP xxxxxxxx xxxxxxxx xxxxxxxx
```

A — Port number associated with this drive.

B — Data flags.

Bit field definitions for dflags word are as follows.

X'8000 — defect table in memory flag (1-in, 0-out)
X'4000 — REX allowed flag (1-alw, 0-inh)
X'2000 — drive in-service indicator (1-out, 0-in)
X'1000 — optimization bit (1-on)
X'0800 — uncorrectable data error
X'0400 — defect management update write job

SEE PROPRIETARY NOTICE ON COVER PAGE

C — Current direction of heads.

D — Next cylinder for routine exercises.

E — Next head for routine exercises.

F — Pointer to initialization pattern.

G — Completion and enhanced error codes.

See the "completion and enhanced error codes" field described in segment 2 of this report for a description of this field and the completion code values.

I — Disk status register and flags.

This field consists of two subfields: the status flags and the disk status register of the form aabb.

aa = Status flags.

Bit field definitions are as follows.

X'01 — multiple drives responded
X'02 — wrong drive responded
X'04 — no drive responded
X'08 — cannot clear drive fault
X'10 — seek error set when drive was selected
X'20 — cannot make selected drive "ready"
X'40 — fatal error during drive select
X'80 — some kind of drive select error occurred

bb = Disk status register.

Bit field definitions are as follows.

X'01 — heads have not been loaded
X'02 — on cylinder
X'04 — unit ready
X'08 — high temperature warning
X'10 — seek error
X'20 — fault flag
X'40 — sector mark flag
X'80 — index mark flag

If the disk status register subfield contains the value FF, then the disk status register subfield should be ignored.

J — Starting cylinder of current job.

K — Starting head of current job.

L — Starting sector of current job.

M — Number of sectors in current job.

N — Current cylinder.

O — Current head.

P — Current sector.

Where *b* = 7 or 9, this printout follows.

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
```

A — ECC buffer.

NOTE: There may be from 1 to 16 fields in segment 9.

Where *b* = 8, this printout follows.

```
xxxxAAAA BBBBCCCC DDDDEEFF GGGGHHHH IIIIJJJJ KKKKLLLL DDDDEEFF GGGGHHHH
IIIIJJJJ KKKKLLLL DDDDEEFF GGGGHHHH IIIIJJJJ KKKKLLLL DDDDEEFF GGGGHHHH
```

A, B, C — Pointers into ECC table.

D — Cylinder from disk.

E — Track from disk.

F — Sector from disk.

G — Expected cylinder.

H — Expected track.

I — Expected sector.

J — Block.

K — Word.

L — Correction code.

4. ACTION TO BE TAKEN

This report provides supplemental data associated with a response returned to the computer. The messages printed on the receive-only printer (ROP) around the report should be checked to determine the significance of the report.

A two-segment report is generated after a SYSGEN command has been received from the computer and before the response for the SYSGEN command is returned to the computer. All of the data in this particular report should be ignored.

5. ALARMS

None. This automatically-generated report is for information only.

To print the additional information provided by the disk file controller (DFC).

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Segment number of information report.

c = Number of segments of information report.

d = Sequence number for this report.

Where *b* = 1, this printout follows:

```
AAAAAAAA BBBBBBBB CCCCCCCC DDDDDDDD EEEEFGHH IIIIIIII JJJJJJJJ KKKKKKKK
LLLLLLLL LLLLLLLL LLLLLLLL LLLLLLLL MMMMMMMM MMMMMMMM MMMMMMMM MMMMMMMM
```

A Command completion word:
aabbcdee

- a Completion code. See output DFC Appendix B, DFC-APPB, Tables 1 and 2.
- b Number of blocks read / written on short failure of read / write command.
- c Bus / device ID number of the device associated with the activity identified by this response. If the activity references the host adapter (HA), this field is not used by the DFC.
- d Autonomous completion code. See output DFC Appendix B, DFC-APPB, Table 3.
- e Job ID number.

B Moving head disk (MHD) status word. See output DFC Appendix C, DFC-APPC.

C Operational firmware version. See output DFC Appendix O, DFC-APPO.

D Pumpcode version. See output DFC Appendix O, DFC-APPO.

E Enhanced completion code. See output DFC Appendix B, DFC-APPB, Table 4.

F SCSI bus 0 enabled status and HA ID number:
abbb

SEE PROPRIETARY NOTICE ON COVER PAGE

a — SCSI bus enabled:

0 — Bus is not enabled.
1 — Bus is enabled.

b — HA ID number.

G SCSI bus 1 status and HA ID number:
abbb

a — SCSI bus enabled:

0 — Bus is not enabled.
1 — Bus is enabled.

b — HA ID number.

H Firmware/driver communications register. See output DFC Appendix B, DFC-APPB, Table 5.

I HA status register. See output DFC Appendix N, DFC-APPN.

J Bus interface controller (BIC) status register. See output DFC Appendix F, DFC-APPF.

K Routine exerciser failing block number.

L Failing command received from the computer. See output DFC Appendix M, DFC-APPM.

M Previous command received from the computer. See output DFC Appendix M, DFC-APPM. This information may not be useful when pumpcode is running.

Where *b* = 2, this printout follows:

```
AABBCCDD EEEEEEEE FFFFFFFF GGGGGGGG GGGGGGGG GGGGGGGG GGGGGGGG HHHHHHHH
HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH
```

A Device number.

B Other device number.

C Job type pending. See output DFC Appendix B, DFC-APPB, Table 6.

D Device maintenance mode.

0 — Device is ONLINE.
1 — Device is OFFLINE.

E Last logical block address of the device.

F Target controller's logical block size in bytes.

G Extended sense data. See output DFC Appendix J, DFC-APPJ.

H Inquiry data. See output DFC Appendix L, DFC-APPL.

SEE PROPRIETARY NOTICE ON COVER PAGE

AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A Second SJB structure. See output DFC Appendix K, DFC-APPK.

B Second SCSI command. See Notes at the end of this section.

B Location of the routine exerciser on the device in logical blocks.

Where *b* = 10, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB BBBBBBBB
```

A Third SJB structure. See output DFC Appendix K, DFC-APPK.

B Command received from the computer.

Where *b* = 11, this printout follows:

```
AAAAAAAA BBBBBBBB CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC
CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC
```

A Device busy condition at time of job termination:

0 — Device was not in a busy condition.
1 — Device was in a busy condition.

B Timer ID associated with busy condition.

C Reserved for future use.

NOTE: There are normally one, five, or nine segments of data output.

The task entry data does not contain any information which can be used by the craft. The information is useful to the developer/maintainer of the firmware/pumpcode. The information may be useful to the Technical Assistance centers.

SEE PROPRIETARY NOTICE ON COVER PAGE

The SCSI commands do not contain any information which can be used by the craft. The information is useful to the developer/maintainer of the firmware/pumpcode. The information may be useful to the Technical Assistance centers. The detailed explanation of this data is in the *LUCENT Small Computer Computer System Interface (SCSI) Definition.*

4. ACTION TO BE TAKEN

An information report provides additional information about a condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

5. ALARMS

None.

MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT DFCI` *a*
`AAAAAAAA BBBBBBBB CCCCCCCC DDDDDDDD EEEEFFGG HHHHHHHH IIIIIIII JJJJJJJJ`
`KKKKKKKK KKKKKKKK KKKKKKKK KKKKKKKK LLLLLLLL LLLLLLLL LLLLLLLL LLLLLLLL`

[2] `REPT DFCI` *a* `DATA` *b-c* `X'` *d*

2. REASON FOR OUTPUT

To print the enhanced information report (EIR) provided by the small computer system interface (SCSI) disk file controller (DFC).

Format 1 prints when the short form of the EIR is requested.

Format 2 prints when the long form of the EIR is requested.

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Segment number of information report.

c = Number of segments of information report.

d = Sequence number for this report.

Format 1 (EIR short form):

A — Command completion word.

The completion word is eight hexadecimal digits of the form aabbcdee.

aa = Completion code. See output DFC Appendix B, DFC-APPB, Tables 1 and 2.

bb = Number of blocks read / written on short failure of read / write command.

c = Bus / Device ID number of the device associated with the activity identified by this response. If the activity references the host adapter (HA), this field is not used by the DFC.

d = Autonomous completion code. See output DFC Appendix B, DFC-APPB, Table 3.

NOTE: d is only valid when ee is zero.

ee = Job ID number.

SEE PROPRIETARY NOTICE ON COVER PAGE

B — MHD status word. See output DFC Appendix C, DFC-APPC.

C — Operational firmware version. See output DFC Appendix O, DFC-APPO.

D — Pumpcode version. See output DFC Appendix O, DFC-APPO.

E — Enhanced completion code. See output DFC Appendix B, DFC-APPB, Table 4.

F — SCSI bus enabled status and HA ID number. It is comprised of 4 bits of the form abbb.

a = SCSI bus enabled status.

0 — Bus is not enabled.

1 — Bus is enabled.

bbb = HA ID number.

G — Firmware/Driver communications register. See output DFC Appendix B, DFC-APPB, Table 5.

H — HA status register. See output DFC Appendix N, DFC-APPN.

I — BIC status register. See output DFC Appendix F, DFC-APPF.

J — Previous command received from the computer. See output DFC Appendix M, DFC-APPM. This information may not be useful when pumpcode is running.

K — Failing command received from the computer. See output DFC Appendix M, DFC-APPM.

L — Extended sense data. See output DFC Appendix J, DFC-APPJ.

Format 2 (EIR long form):

Where *b* = 1, this printout follows:

```
AAAAAAAA BBBBBBBB CCCCCCCC DDDDDDDD EEEEFGHH IIIIIIII JJJJJJJJ KKKKKKKK
LLLLLLLL LLLLLLLL LLLLLLLL LLLLLLLL MMMMMMMM MMMMMMMM MMMMMMMM MMMMMMMM
```

A — Command completion word:

The completion word is eight hexadecimal digits of the form aabbcdee.

aa = Completion code. See output DFC Appendix B, DFC-APPB, Tables 1 and 2.

bb = Number of blocks read/written on short failure of read/write command.

c = Bus/Device ID number of the device associated with the activity identified by this response. If the activity references the HA, this field is not used by the DFC.

d = Autonomous completion code. See output DFC Appendix B, DFC-APPB, Table 3.

NOTE: d is only valid when ee is zero.

ee = Job ID number.

B — MHD status word. See output DFC Appendix C, DFC-APPC.

C — Operational firmware version. See output DFC Appendix O, DFC-APPO.

D — Pumpcode version. See output DFC Appendix O, DFC-APPO.

E — Enhanced completion code. See output DFC Appendix B, DFC-APPB, Table 4.

F — SCSI bus 0 enabled status and HA ID number. It is comprised of 4 bits of the form abbb.

a = SCSI bus enabled status.

0 — Bus is not enabled.
1 — Bus is enabled.

bbb = HA ID number.

G — SCSI bus 1 enabled status and HA ID number: It is comprised of 4 bits of the form abbb.

a = SCSI bus enabled status.

0 — Bus is not enabled.
1 — Bus is enabled.

bbb = HA ID number.

H — Firmware/driver communications register. See output DFC Appendix B, DFC-APPB, Table 5.

I — HA status register. See output DFC Appendix N, DFC-APPN.

J — BIC status register. See output DFC Appendix F, DFC-APPF.

K — Routine exerciser failing block number.

L — Failing command received from the computer. See output DFC Appendix M, DFC-APPM.

M — Previous command received from the computer. See output DFC Appendix M, DFC-APPM. This information may not be useful when pumpcode is running.

Where *b* = 2, this printout follows:

```
AABBCCDD EEEEEEEE FFFFFFFF GGGGGGGG GGGGGGGG GGGGGGGG GGGGGGGG HHHHHHHH
HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH
```

A — Device number.

B — Other device number.

C — Job type pending. See output DFC Appendix B, DFC-APPB, Table 6.

D — Device maintenance mode.

0 — Device is ONLINE.
1 — Device is OFFLINE.

E — Last logical block address of the device.

F — Target controller's logical block size in bytes.

G — Extended sense data. See output DFC Appendix J, DFC-APPJ.

H — Inquiry data. See output DFC Appendix L, DFC-APPL.

Where *b* = 3, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A — First SCSI job block (SJB) structure. See output DFC Appendix K, DFC-APPK.

B — SCSI command (see **NOTES** at the end of this section).

C — Retry count.

Where *b* = 4, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A — Second SJB structure. See output DFC Appendix K, DFC-APPK.

B — Second SCSI command (see **NOTES** at the end of this section).

C — Location of the routine exerciser on the device in logical blocks.

Where *b* = 5, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB BBBBBBBB
```

A — Third SJB structure. See output DFC Appendix K, DFC-APPK.

B — Command received from the computer. See output DFC Appendix M, DFC-APPM.

Where *b* = 6, this printout follows:

```
AAAAAAAA BBBBBBBB CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC
CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC
```

A — Device busy condition at time of job termination.

0 — Device was not in a busy condition.
1 — Device was in a busy condition.

B — Timer ID associated with busy condition.

C — Reserved for future use.

Where *b* = 7, this printout follows:

```
AABBCCDD EEEEEEEE FFFFFFFF GGGGGGGG GGGGGGGG GGGGGGGG GGGGGGGG HHHHHHHH
HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH
```

A — Device number.

B — Other device number.

SEE PROPRIETARY NOTICE ON COVER PAGE

C — Job type pending. See output DFC Appendix B, DFC-APPB, Table 6.

D — Device maintenance mode.

0 — Device is ONLINE.
1 — Device is OFFLINE.

E — Last logical block address of the device.

F — Target controller's logical block size in bytes.

G — Inquiry data. See output DFC Appendix L, DFC-APPL.

H — Extended sense data. See output DFC Appendix J, DFC-APPJ.

Where *b* = 8, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A — First SJB structure. See output DFC Appendix K, DFC-APPK.

B — SCSI command (see **NOTES** at the end of this section).

C — Retry count.

Where *b* = 9, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A — Second SJB structure. See output DFC Appendix K, DFC-APPK.

B — Second SCSI command (see **NOTES** at the end of this section).

C — Location of the routine exerciser on the device in logical blocks.

Where *b* = 10, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB BBBBBBBB
```

A — Third SJB structure. See output DFC Appendix K, DFC-APPK.

B — Command received from the computer. See output DFC Appendix M, DFC-APPM.

Where *b* = 11, this printout follows:

```
AAAAAAAA BBBBBBBB CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC
CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC CCCCCCCC
```

A — Device busy condition at time of job termination.

0 — Device was not in a busy condition.
1 — Device was in a busy condition.

B — Timer ID associated with busy condition.

C — Reserved for future use.

NOTE: There are normally 1, 6, or 11 segments of data output.

SEE PROPRIETARY NOTICE ON COVER PAGE

The task entry data does not contain any information that is helpful to a user. The information is useful to the developer/maintainer of the firmware/pumpcode. The information may be useful to the Technical Assistance centers.

The SCSI commands do not contain any information that is helpful to a user. The information is useful to the developer/maintainer of the firmware/pumpcode. The information may be useful to the Technical Assistance centers. The detailed explanation of this data is in the *LUCENT Small Computer System Interface (SCSI) Definition*.

4. ACTION TO BE TAKEN

An information report provides additional information about a condition that could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages that provide useful data may be output.

5. ALARMS

None. This automatically-generated report is for information only.

2. REASON FOR OUTPUT

To print the enhanced information report (EIR) provided by the small computer system interface (SCSI) disk file controller (DFC).

Format 1 prints when the short form of the EIR is requested.

Format 2 prints when the long form of the EIR is requested.

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Segment number of information report.

c = Number of segments of information report.

d = Sequence number for this report.

Format 1 (EIR short form):

A — Command completion word.

The completion word is eight hexadecimal digits of the form aabbcdee.

aa = Completion code (see DFC Appendix B, DFC-APPB, Tables 1 and 2).

bb = Number of blocks read / written on short failure of read / write command.

c = Bus / Device ID number of the device associated with the activity identified by this response. If the activity references the Host Adapter (HA), this field is not used by the DFC.

d = Autonomous completion code (see DFC Appendix B, DFC-APPB, Table 3).

NOTE: d is only valid when ee is zero.

ee = Job ID number.

B — Device status word (see DFC Appendix C, DFC-APPC).

C — Operational firmware version (see DFC Appendix O, DFC-APPO).

D — Pumpcode version (see DFC Appendix O, DFC-APPO).

E — Enhanced completion code (see DFC Appendix B, DFC-APPB, Table 4).

F — Target controller command status byte.

0x00 — Good.
0x02 — Check condition.
0x04 — Condition met.
0x08 — Busy.
0x10 — Intermediate.
0x14 — Intermediate - condition met.
0x18 — Reservation conflict.
0x22 — Command terminated.
0x28 — Queue full.
0xFF — Status not available.

G — Firmware/Driver communications register (see DFC Appendix B, DFC-APPB, Table 5).

H — HA status register (see DFC Appendix N, DFC-APPN).

I — BIC status register (see DFC Appendix F, DFC-APPF).

J — Previous command received from the 3B (see DFC Appendix M, DFC-APPM). This information may not be useful when pumpcode is running.

K — Failing command received from the 3B (see DFC Appendix M, DFC-APPM).

L — Extended sense data (see DFC Appendix J, DFC-APPJ).

Format 2 (EIR long form):

Where *b* = 1, this printout follows:

```
AAAAAAAA BBBBBBBB CCCCCCCC DDDDDDDD EEEEFGHH IIIIIIII JJJJJJJJ KKKKKKKK
LLLLLLLL LLLLLLLL LLLLLLLL LLLLLLLL MMMMMMMM MMMMMMMM MMMMMMMM MMMMMMMM
```

A — Command completion word:

The completion word is eight hexadecimal digits of the form aabbcdee.

aa = Completion code (see DFC Appendix B, DFC-APPB, Tables 1 and 2).

bb = Number of blocks read/written on short failure of read/write command.

c = Bus/Device ID number of the device associated with the activity identified by this response. If the activity references the HA, this field is not used by the DFC.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Autonomous completion code (see DFC Appendix B, DFC-APPB, Table 3).

NOTE: d is only valid when ee is zero.

ee = Job ID number.

B — Device status word (see DFC Appendix C, DFC-APPC).

C — Operational firmware version (see DFC Appendix O, DFC-APPO).

D — Pumpcode version (see DFC Appendix O, DFC-APPO).

E — Enhanced completion code (see DFC Appendix B, DFC-APPB, Table 4).

F — SCSI bus A enabled status and HA ID number. It is comprised of 4 bits of the form abbb.

a = SCSI bus enabled status.

0 — Bus is not enabled.
1 — Bus is enabled.

bbb = HA ID number.

G — SCSI bus B enabled status and HA ID number. It is comprised of 4 bits of the form abbb.

a = SCSI bus enabled status.

0 — Bus is not enabled.
1 — Bus is enabled.

bbb = HA ID number.

H — Firmware/Driver communications register (see DFC Appendix B, DFC-APPB, Table 5).

I — HA status register (see DFC Appendix N, DFC-APPN).

J — BIC status register (see DFC Appendix F, DFC-APPF).

K — Routine exerciser failing block number.

L — Failing command received from the 3B (see DFC Appendix M, DFC-APPM).

M — Previous command received from the 3B (see DFC Appendix M, DFC-APPM). This information may not be useful when pumpcode is running.

Where *b* = 2, this printout follows:

```
AABBCCDD EEEEEEEE FFFFFFFF GGGGGGGG GGGGGGGG GGGGGGGG GGGGGGGG HHHHHHHH
HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH
```

A — Device number.

B — Other device number.

C — Job type pending (see DFC Appendix B, DFC-APPB, Table 6).

SEE PROPRIETARY NOTICE ON COVER PAGE

D — Device maintenance mode.

0 — Device is ONLINE.
1 — Device is OFFLINE.

E — Last logical block address of the device.

F — Target controller's logical block size in bytes.

G — Extended sense data (see DFC Appendix J, DFC-APPJ).

H — Inquiry data (see DFC Appendix L, DFC-APPL).

Where *b* = 3, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A — First SCSI job block (SJB) structure (see DFC Appendix K, DFC-APPK).

B — SCSI command (see **NOTES** at the end of this section).

C — Retry count.

Where *b* = 4, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A — Second SJB structure (see DFC Appendix K, DFC-APPK).

B — Second SCSI command (see **NOTES** at the end of this section).

C — Location of the routine exerciser on the device in logical blocks.

Where *b* = 5, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB BBBBBBBB
```

A — Third SJB structure (see DFC Appendix K, DFC-APPK).

B — Command received from the 3B (see DFC Appendix M, DFC-APPM).

Where *b* = 6, this printout follows:

```
AAAAAAAA BBBBBBBB CCCCCCCC DDDDDDDD EEEEEEEE EEEEEEEE FFFFFFFF FFFFFFFF
FFFFFFFF FFFFFFFF FFFFFFFF FFFFFFFF FFFFFFFF GGGGGGGG GGGGGGGG GGGGGGGG
```

A — Device busy condition at time of job termination.

0 — Device was not in a busy condition.
1 — Device was in a busy condition.

B — Timer ID associated with busy condition.

C — Host Adapter data buffer address.

D — Slow job function pointer.

SEE PROPRIETARY NOTICE ON COVER PAGE

E — Sequential Access Device record information.

F — Data transfer control information.

G — Reserved for future use.

Where *b* = 7, this printout follows:

```
AABBCCDD EEEEEEEE FFFFFFFF GGGGGGGG GGGGGGGG GGGGGGGG GGGGGGGG HHHHHHHH
HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH HHHHHHHH
```

A — Device number.

B — Other device number.

C — Job type pending (see DFC Appendix B, DFC-APPB, Table 6).

D — Device maintenance mode.

0 — Device is ONLINE.
1 — Device is OFFLINE.

E — Last logical block address of the device.

F — Target controller's logical block size in bytes.

G — Extended sense data (see DFC Appendix J, DFC-APPJ).

H — Inquiry data (see DFC Appendix L, DFC-APPL).

Where *b* = 8, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A — First SJB structure (see DFC Appendix K, DFC-APPK).

B — SCSI command (see **NOTES** at the end of this section).

C — Retry count.

Where *b* = 9, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB CCCCCCCC
```

A — Second SJB structure (see DFC Appendix K, DFC-APPK).

B — Second SCSI command (see **NOTES** at the end of this section).

C — Location of the routine exerciser on the device in logical blocks.

Where *b* = 10, this printout follows:

```
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA BBBBBBBB BBBBBBBB BBBBBBBB BBBBBBBB
```

A — Third SJB structure (see DFC Appendix K, DFC-APPK).

B — Command received from the 3B (see DFC Appendix M, DFC-APPM).

Where *b* = 11, this printout follows:

```
AAAAAAAA BBBBBBBB CCCCCCCC DDDDDDDD EEEEEEEE EEEEEEEE FFFFFFFF FFFFFFFF
FFFFFFFF FFFFFFFF FFFFFFFF FFFFFFFF FFFFFFFF GGGGGGGG GGGGGGGG GGGGGGGG
```

A — Device busy condition at time of job termination.

0 — Device was not in a busy condition.
1 — Device was in a busy condition.

B — Timer ID associated with busy condition.

C — Host Adapter data buffer address.

D — Slow job function pointer.

E — Sequential Access Device record information.

F — Data transfer control information.

G — Reserved for future use.

NOTES: There are normally 1, 6, or 11 segments of data output.

The task entry data does not contain any information that is helpful to a user. The information is useful to the developer/maintainer of the firmware/pumpcode. The information may be useful to the Technical Assistance centers.

The SCSI commands do not contain any information that is helpful to a user. The information is useful to the developer/maintainer of the firmware/pumpcode. The information may be useful to the Technical Assistance centers. The detailed explanation of this data is in the *LUCENT Small Computer System Interface (SCSI) Definition.*

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

An information report provides additional information about a condition that could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages that provide useful data may be output.

5. ALARMS

None. This automatically-generated report is for information only.

 PSW  = u HSR = v SSR  = x ER   = w
[WARNING: THE OFFLINE CU HAS INITIALIZED ]
```

2. REASON FOR OUTPUT

To report an error encountered by the control unit (CU) diagnostic programs. Critical registers are displayed for error codes marked.

SEE PROPRIETARY NOTICE ON COVER PAGE

If the message `WARNING: READ PROBLEMS - SOME REGISTERS MAY BE INCORRECT` appears, maintenance channel failures were encountered while reading some of the offline CU registers. Although the registers involved are not indicated, registers containing all zeroes are particularly suspect.

If the message `WARNING: THE OFFLINE CU HAS INITIALIZED` appears, the ten temporary registers indicated under the variable *s* field will contain a snapshot taken at the time of the reset (maintenance reset function).

3. VARIABLE FIELD DEFINITIONS

a = Error code, in hexadecimal notation. See the table description in this message.

b = Index into PCP table.

c = Error number returned from process control process maintenance driver (PCPMD). See System Error Codes Output Appendix, `SYSERR-APP`.

d = Left half of instruction to PCPMD, in hexadecimal notation.

e = Right half of instruction to PCPMD, in hexadecimal notation.

f = Online maintenance channel status, in hexadecimal notation.

g = Offline maintenance channel status, in hexadecimal notation.

h = Last test executed.

i = Data table address.

j = Data table statement number.

k = Task routine index.

l = Maintenance channel buffer.

m = Maintenance channel status.

n = Bidirectional gating bus.

o = Microstore data register high half.

p = Microstore data register low half.

q = Microstore address register.

r = Microstore address stack first entry.

s = Microstore address stack second entry.

t = Microstore address stack third entry.

u = Processor status word.

v = Hardware status register.

w = Error register.

x = System status register.

SEE PROPRIETARY NOTICE ON COVER PAGE

y = Destination bus.

z = Source bus.

aa = Bidirectional gating register.

bb = Pulse point register.

cc = Ones register.

dd = Channel data register.

ee = Interrupt mask.

ff = Interrupt source register.

gg = Real time counter.

hh = Timers register.

ii = Store address register.

jj = Present address register.

kk = Store control register.

ll = Address translation buffer.

mm = Store data register.

nn = Store instruction register.

oo = Instruction buffer.

pp = Halfword multiplexor.

qq = General registers (0-15).

rr = Firmware registers (0-15).

ss = Temporary registers (0-15):

`T0` — Store address register.
`T1` — System status register.
`T2` — Processor status word.
`T3` — Store control register.
`T4` — Error register.
`T5` — Pulse point register.
`T6` — Hardware status register.
`T7` — Store data register.
`T10` — Real time counter.
`T11` — Timers register.

4. ACTION TO BE TAKEN

An explanation of the error encountered and the appropriate action to be taken are shown in the following table. Critical registers are displayed for error codes marked with an asterisk (*).

Table 1. Error Codes

a =	Explanation	Action to be Taken
41	The test count specified at the end of the phase does not agree with number of tests actually executed.	Either an errant transfer was taken during the execution of the phase or the phase data table has been mutilated. Rerun the phase. If the problem remains, the data table file may be corrupted; seek technical assistance.
*42	Offline diagnostic microcode timed out.	A specified time limit is set for running microcode to prevent infinite loops. Problems could be due to the microstore not being loaded properly, an offline maintenance reset function (MRF) occurred, or the microcode got stuck in an infinite loop. Usually a retry will correct any microcode timeout problem. If the central control (CC) diagnostic was not run before the abort occurred, running it might find the problem.
*43	There is an error in a setarg command at the indicated data table location in the phase where the abort occurred.	The number of arguments passed to the offline main store routine does not match the number declared in the setarg command. Rerun the phase. If the problem remains, the indicated data table file may be corrupted; seek technical assistance.
*44	Offline main store code execution timed out.	The calling phase sets a specified time limit in which this offline code should execute. Problems can occur if the halt bit was not set when the code finished executing, or if hardware problems prevent running offline code, or a MRF occurred in the offline CU. If the CC and main store diagnostic was not run previous to where the abort occurred, running them might find the problem. If any other offline main store code ran successfully, the offline code file on the disk might be bad. Rerun the phase. If the problem remains, the indicated data table file may be corrupted; seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
*45	The verify failed after a pump to the offline microstore by the mcexec data table command.	After the microcode pump is completed, the code is pumped back to the online for verification. This error means the returned file did not match the file sent. Problem could be in microstore or in the communication between online and offline processors. If the CC diagnostic was not run previous to where the abort occurred, running it might find the problem.
46	The object file specified in an excofl data table command could not be opened for reading or it is not the proper type of file for running offline main store code. Also, file I/O function (`lseek`) might not have been able to seek to the desired location in the object file.	This can be due to mutilation of the specified object file. Rerun the phase. If the problem remains, the indicated object file may be corrupted; seek technical assistance.
*47	Offline main store object file could not be copied from online processor to offline processor.	The maintenance driver library function pcpyto is used to do the copy. The online or offline maintenance channel could be faulty. The PCPMD error code, which appears under the heading DRIVER DATA, could help determine the cause of the problem.
*48	Could not set stack register or argument register in offline CU for offline main store execution.	Failure to connect to the equipment configuration database (ECD), unit control block (UCB) record ID points to the online control unit (CU), or CU was not OUT OF SERVICE. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
*49	Cannot setup stack argument count and program counter or address pointer in offline main store.	Some of the things to look for are as follows: The offline CU was not OUT OF SERVICE, the pointer to the UCB is not valid or does not point to a CU UCB in the ECD database, the UCB record ID was pointing to the online processor, or the maintenance channel did not execute the expected number of bytes. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed. Also, run CC diagnostic phases 1 through 4 to verify communication between the online and offline maintenance channels.
*4A	The test routine loaded in the offline main store did not execute properly.	The PCPMD function pexecothr is used to start execution. The pointer passed to it from cudiagc was not recognized as a valid pointer or did not point to a CU UCB in the ECD. Retry the maintenance request. If the problem remains, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed. The file may be corrupted; seek technical assistance.
*4B	The test routine loaded in the online microstore and/or mainstore did not execute properly.	The PCPMD function pexeconl is used to start online execution. Retry the maintenance request, and if the problem remains, use the number printed in ERRNO to look up the source of the problem in the System Error Codes Output Appendix, SYSERR-APP.
4C	The equipment configuration database (ECD) manager could not be opened for a special unit control block request.	Verify that file /dev/ecd exists.
4D	Illegal helper unit requested.	Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
4E	The member version or equipage fields of the ECD for the main store are incorrect.	Use the RCV command to examine the UCD for the mainstore being diagnosed. Verify that there is 1 equipage bit set (starting at bit 0) for each memory array equipped. Also, verify that the low order nibble (4-bits) of the MV field has one of the following values: (1 - TN07; 3 - TN14; 4 - TN28; 5 - TN56; 6 - TN2012) and bit 5 of the MV field should be: (0 - UN39, UN40; 1 - UN59).
4F	Could not setup UCB for maintenance driver access. Appears only when the host is a UNIX® RTR machine.	Function psetup failed to pass a pointer to the top of the UCB to PCPMD. Use RCV to verify ECD is consistent and up to date for the control unit under test.
50	An invalid parameter was input when running diagnostics using the interactive mode of operation.	The interactive mode is used for main store phase 95. Three types of input errors could cause this problem. (1) The starting address is larger than the ending address. (2) The starting address is larger than the highest possible address. (3) The refresh rate is invalid. The valid refresh rates are from 2 to 16 milliseconds in steps of 2 and 32 to 60 milliseconds in steps of 4. See EX command in the *Input Message Manual.*
52	The special ECDMAN function (ursvucb) could not reserve the specified UCB.	Check that the u_admin field of the UCB is *1* (not reserved). If it is reserved, see the REPT-MIRA output message (reason 2). If it is not reserved, rerunning the diagnostic should clear the problem.
53	Cannot release a previously reserved unit control block (UCB) via the special ECDMAN function urelucb.	Display the contents of the UCB for the unit being diagnosed. If the u_admin variable is a *0*, the UCB is still reserved. See the REPT-MIRA output message (reason 2). If it is not reserved, rerunning the diagnostic should clear the problem.
54	Cannot find unit control block (UCB) for helper unit.	The getucb function could not find the UCB for helper unit. Verify that the helper unit was specified correctly in the input command. Use RCV to verify that helper unit UCB exists and is correct. If the problem remains, the data table file may be corrupted; seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
56	Illegal instruction signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
57	Bus error signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
58	Segment violation signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
59	Error on system call signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
5A	The ECD Manager failed to fill in the special device file path name.	Use the RCV command to verify that the special device file exist in the LOGDEV.
5B	Could not open the special device file used to talk with the hardware.	The ECD manager must be reinitialized. This ECD function is used only in peripheral (IOP or DFC) units where the unique field in the UCB is ON. Other units may still be diagnosed in the face of this problem.
5C	The ECD manager failed to release a special device file used for communication with the peripheral hardware.	If the special device file was already released, a retry of the request should correct the problem. A second abort means the ECD manager has an internal software problem that can only be corrected by restoring the ECD manager.
61	The control unit diagnostic controller failed to open processor control process maintenance driver (PCPMD).	Verify that file /dev/cu exists.
*62	A write to the diagnostic driver (PCPMD) has failed.	The function endblk in cudiagc sends a buffer of maintenance channel commands to the offline maintenance channel via the PCPMD function pexmch. pexmch has failed. The PCPMD error

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
		code, that appears under the heading DRIVER DATA, will indicate the cause of the problem. Run CC diagnostic phases 1 through 4 to verify operation of the maintenance channel.
63	This code is an indication to the diagnostic monitor that a phase of the diagnostic completed normally.	This is not an error code and will not cause an abort.
64	Could not open data table file or micro code program file.	Verify the existence of the file being opened. If the statement (S) is zero, a data table file could not be opened. The name of the file (relative to directory `/diag/dgnc`) is specified in the (P+1)th line in the file `/diag/dpt/cu/<file>` where P = the phase that aborted, file is selected by the dgn line(s) in /diag/util/cu/<unit> and possibly the "mv" field of the UCB, and unit = the name of the unit being diagnosed. If the index (I) is 17 or 2a, the name of the file is `/diag/offcode/mic/<file>.u` where file = the file name specified at statement S in the listing of the phase which aborted.
65	The diagnostic control buffer could not be shared by cudiagc from the diagnostic monitor.	The `connseg` system call has failed. The ERRNO item will indicated the system error reason.
66	The diagnostic control program has encountered an invalid index or argument in a data table.	Rerun the phase. If the problem remains, the data table file for the indicated phase may be corrupted; seek technical assistance.
67	The diagnostic control program was spawned by the diagnostic monitor with the wrong number of arguments.	Rerun the diagnostic.
68	The diagnostic control program could not setup the spooler control string for buffered output to the TTY from which the diagnostic request was input.	Rerun the diagnostic. If the problem remains, reinitialize the craft interface (key 15 on the emergency action interface (EAI) page at the maintenance terminal).

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
69	The histogram format print file for the main store diagnostic failed to be opened.	This file should be located in the directory /diag/dgnc under the name dgnff. Verify that this file does exist and has read permission.
6A	An illegal option was input while running diagnostics in the interactive mode (that is, EX command).	Verify that the input command syntax is correct. See the EX command in the *Input Message Manual*.
*6B	Offline register could not be read back to online processor.	This is probably due to a maintenance channel error. Rerun the diagnostic. If the problem remains, run CC diagnostic phases 1 through 4 to test the maintenance channel.
6C	Cannot open file for trouble location process.	The problem could be that there is not enough file space in /tmp. Rerun the diagnostic.
*6D	The offline control unit (CU) has reset via the maintenance reset function (MRF).	Examine the error register to determine if a hardware error occurred and, if so, its cause. The MSA, MSA1, MSA2 and MSA3 registers form a push-down stack with MSA at the top. The highest register that does not contain 0 or 2b is the microstore address being executed when the MRF occurred. The program address (PA) contains the mainstore address being executed when the MRF occurred.
6E	The datatbl file contains instructions which are not supported on this hardware platform.	Verify that the umodel field in the unit's top-level UCB record is correct. Otherwise, the datatbl file is incorrect or the wrong datatbl file is being invoked. Seek technical assistance to correct these problems.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

ONLINE CU CRITICAL REGISTERS
PSW  = u HSR = v SSR  = x ER   = w
[WARNING: THE OFFLINE CU HAS INITIALIZED ]
```

2. REASON FOR OUTPUT

To report an error encountered by the control unit (CU) diagnostic programs. Critical registers are displayed for error codes marked.

If the message WARNING: READ PROBLEMS - SOME REGISTERS MAY BE INCORRECT appears, maintenance channel failures were encountered while reading some of the offline CU registers. Although the registers involved are not indicated, registers containing all zeroes are particularly suspect.

If the message WARNING: THE OFFLINE CU HAS INITIALIZED appears, the ten temporary registers indicated under the variable *s* field will contain a snapshot taken at the time of the reset (maintenance reset function).

3. VARIABLE FIELD DEFINITIONS

a = Error code, in hexadecimal notation. See the table description in this message.

b = Index into PCP table.

c = Error number returned from process control process maintenance driver (PCPMD). See System Error Codes Output Appendix, SYSERR-APP.

d = Left half of instruction to PCPMD, in hexadecimal notation.

e = Right half of instruction to PCPMD, in hexadecimal notation.

f = Online maintenance channel status, in hexadecimal notation.

g = Offline maintenance channel status, in hexadecimal notation.

h = Last test executed.

i = Data table address.

j = Data table statement number.

k = Task routine index.

l = Maintenance channel buffer.

m = Maintenance channel status.

n = Bidirectional gating bus.

o = Microstore data register high half.

p = Microstore data register low half.

q = Microstore address register.

r = Microstore address stack entry.

SEE PROPRIETARY NOTICE ON COVER PAGE

u = Processor status word.

v = Hardware status register.

w = Error register.

x = System status register.

y = Destination bus.

z = Source bus.

aa = Bidirectional gating register.

bb = Pulse point register.

cc = Ones register.

dd = Channel data register.

ee = Interrupt mask.

ff = Interrupt source register.

gg = Real time counter.

hh = Timers register.

ii = Store address register.

jj = Present address register.

kk = Store control register.

ll = Address translation buffer.

mm = Store data register.

nn = Store instruction register.

oo = Instruction buffer.

pp = Halfword multiplexor.

qq = General registers (0-15).

rr = Firmware registers (0-15).

ss = Temporary registers (0-15):

`T0` — Store address register.
`T1` — System status register.
`T2` — Processor status word.
`T3` — Store control register.
`T4` — Error register.
`T5` — Pulse point register.
`T6` — Hardware status register.
`T7` — Store data register.
`T10` — Real time counter.
`T11` — Timers register.

tt = Main Memory registers:

MCMD — MCERT MC Command Register
MSTAT — MCERT MC Status Register
MADD — MCERT MC Error Address Register
MER — MCERT MC Error Flags Register
DCMD — MCERT DP Command Register
DSTAT — MCERT DP Status Register
MDAT — MCERT DP Error Data Register
MMR — Main Memory Register
BNK0 — MCERT MC Bank Address Register 0
BNK1 — MCERT MC Bank Address Register 1
BNK2 — MCERT MC Bank Address Register 2
BNK3 — MCERT MC Bank Address Register 3
BNK4 — MCERT MC Bank Address Register 4
BNK5 — MCERT MC Bank Address Register 5
BNK6 — MCERT MC Bank Address Register 6
BNK7 — MCERT MC Bank Address Register 7

uu = Cache registers:

CRA — Cache Error Register A
CRB — Cache Error Register B
CRC — Cache Error Register C
CRD — Cache Error Register D
CRE — Cache Error Register E
CRG — Cache Status Register G
CTAG — Cache Tag Trap Register
CST — Cache Status Word

4. ACTION TO BE TAKEN

An explanation of the error encountered and the appropriate action to be taken are shown in the following table. Critical registers are displayed for error codes marked with an asterisk (*).

Table 1. Error Codes

a =	Explanation	Action to be Taken
41	The test count specified at the end of the phase does not agree with number of tests actually executed.	Either an errant transfer was taken during the execution of the phase or the phase data table has been mutilated. Rerun the phase. If the problem remains, the data table file may be corrupted; seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
*42	Offline diagnostic microcode timed out.	A specified time limit is set for running microcode to prevent infinite loops. Problems could be due to the microstore not being loaded properly, an offline maintenance reset function (MRF) occurred, or the microcode got stuck in an infinite loop. Usually a retry will correct any microcode timeout problem. If the central control (CC) diagnostic was not run before the abort occurred, running it might find the problem.
*43	There is an error in a setarg command at the indicated data table location in the phase where the abort occurred.	The number of arguments passed to the offline main store routine does not match the number declared in the setarg command. Rerun the phase. If the problem remains, the indicated data table file may be corrupted; seek technical assistance.
*44	Offline main store code execution timed out.	The calling phase sets a specified time limit in which this offline code should execute. Problems can occur if the halt bit was not set when the code finished executing, or if hardware problems prevent running offline code, or a MRF occurred in the offline CU. If the CC and main store diagnostic was not run previous to where the abort occurred, running them might find the problem. If any other offline main store code ran successfully, the offline code file on the disk might be bad. Rerun the phase. If the problem remains, the indicated data table file may be corrupted; seek technical assistance.
*45	The verify failed after a pump to the offline microstore by the mcexec data table command.	After the microcode pump is completed, the code is pumped back to the online for verification. This error means the returned file did not match the file sent. Problem could be in microstore or in the communication between online and offline processors. If the CC diagnostic was not run previous to where the abort occurred, running it might find the problem.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
46	The object file specified in an excofl data table command could not be opened for reading or it is not the proper type of file for running offline main store code. Also, file I/O function (`lseek`) might not have been able to seek to the desired location in the object file.	This can be due to mutilation of the specified object file. Rerun the phase. If the problem remains, the indicated object file may be corrupted; seek technical assistance.
*47	Offline main store object file could not be copied from online processor to offline processor.	The maintenance driver library function pcpyto is used to do the copy. The online or offline maintenance channel could be faulty. The PCPMD error code, which appears under the heading DRIVER DATA, could help determine the cause of the problem.
*48	Could not set stack register or argument register in offline CU for offline main store execution.	Failure to connect to the equipment configuration database (ECD), unit control block (UCB) record ID points to the online control unit (CU), or CU was not OUT OF SERVICE. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed.
*49	Cannot setup stack argument count and program counter or address pointer in offline main store.	Some of the things to look for are as follows: The offline CU was not OUT OF SERVICE, the pointer to the UCB is not valid or does not point to a CU UCB in the ECD database, the UCB record ID was pointing to the online processor, or the maintenance channel did not execute the expected number of bytes. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed. Also, run CC diagnostic phases 1 through 4 to verify communication between the online and offline maintenance channels.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
*4A	The test routine loaded in the offline main store did not execute properly.	The PCPMD function pexecothr is used to start execution. The pointer passed to it from cudiagc was not recognized as a valid pointer or did not point to a CU UCB in the ECD. Retry the maintenance request. If the problem remains, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed. The file may be corrupted; seek technical assistance.
*4B	The test routine loaded in the online microstore and/or mainstore did not execute properly.	The PCPMD function pexeconl is used to start online execution. Retry the maintenance request, and if the problem remains, use the number printed in ERRNO to look up the source of the problem in the System Error Codes Output Appendix, SYSERR-APP.
4C	The equipment configuration database (ECD) manager could not be opened for a special unit control block request.	Verify that file /dev/ecd exists.
4D	Illegal helper unit requested.	Not used.
4E	The member version or equipage fields of the ECD for the main store are incorrect.	Use the RCV command to examine the UCD for the mainstore being diagnosed. Verify that there is 1 equipage bit set (starting at bit 0) for each memory array equipped. Also, verify that the low order nibble (4-bits) of the MV field has one of the following values: (1 - TN07; 3 - TN14; 4 - TN28; 5 - TN56; 6 - TN2012) and bit 5 of the MV field should be: (0 - UN39, UN40; 1 - UN59).
4F	Could not setup UCB for maintenance driver access. Appears only when the host is a UNIX® RTR machine.	Function psetup failed to pass a pointer to the top of the UCB to PCPMD. Use RCV to verify ECD is consistent and up to date for the control unit under test.

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
50	An invalid parameter was input when running diagnostics using the interactive mode of operation.	The interactive mode is used for main store phase 95. Three types of input errors could cause this problem. (1) The starting address is larger than the ending address. (2) The starting address is larger than the highest possible address. (3) The refresh rate is invalid. The valid refresh rates are from 2 to 16 milliseconds in steps of 2 and 32 to 60 milliseconds in steps of 4. See EX command in the Input Message Manual.
52	The special ECDMAN function (ursvucb) could not reserve the specified UCB.	Check that the u_admin field of the UCB is *1* (not reserved). If it is reserved, see the REPT-MIRA output message (reason 2). If it is not reserved, rerunning the diagnostic should clear the problem.
53	Cannot release a previously reserved unit control block (UCB) via the special ECDMAN function urelucb.	Display the contents of the UCB for the unit being diagnosed. If the u_admin variable is a *0*, the UCB is still reserved. See the REPT-MIRA output message (reason 2). If it is not reserved, rerunning the diagnostic should clear the problem.
54	Cannot find unit control block (UCB) for helper unit.	The getucb function could not find the UCB for helper unit. Verify that the helper unit was specified correctly in the input command. Use RCV to verify that helper unit UCB exists and is correct. If the problem remains, the data table file may be corrupted; seek technical assistance.
56	Illegal instruction signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
57	Bus error signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
58	Segment violation signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
59	Error on system call signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
5A	The ECD Manager failed to fill in the special device file path name.	Use the RCV command to verify that the special device file exist in the LOGDEV.
5B	Could not open the special device file used to talk with the hardware.	The ECD manager must be reinitialized. This ECD function is used only in peripheral (IOP or DFC) units where the unique field in the UCB is ON. Other units may still be diagnosed in the face of this problem.
5C	The ECD manager failed to release a special device file used for communication with the peripheral hardware.	If the special device file was already released, a retry of the request should correct the problem. A second abort means the ECD manager has an internal software problem that can only be corrected by restoring the ECD manager.
61	The control unit diagnostic controller failed to open processor control process maintenance driver (PCPMD).	Verify that file /dev/cu exists.
*62	A write to the diagnostic driver (PCPMD) has failed.	The function endblk in cudiagc sends a buffer of maintenance channel commands to the offline maintenance channel via the PCPMD function pexmch. pexmch has failed. The PCPMD error code, that appears under the heading DRIVER DATA, will indicate the cause of the problem. Run CC diagnostic phases 1 through 4 to verify operation of the maintenance channel.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
63	This code is an indication to the diagnostic monitor that a phase of the diagnostic completed normally.	This is not an error code and will not cause an abort.
64	Could not open data table file or micro code program file.	Verify the existence of the file being opened. If the statement (S) is zero, a data table file could not be opened. The name of the file (relative to directory `/diag/dgnc`) is specified in the (P+1)th line in the file `/diag/dpt/cu/<file>` where P = the phase that aborted, file is selected by the "dgn" line(s) in `/diag/util/cu/<unit>` and possibly the "mv" field of the UCB, and `unit` = the name of the unit being diagnosed. If the index (I) is 17 or 2a, the name of the file is `/diag/offcode/mic/<file>.u` where `file` = the file name specified at statement S in the listing of the phase which aborted.
65	The diagnostic control buffer could not be shared by cudiagc from the diagnostic monitor.	The `connseg` system call has failed. The ERRNO item will indicated the system error reason.
66	The diagnostic control program has encountered an invalid index or argument in a data table.	Rerun the phase. If the problem remains, the data table file for the indicated phase may be corrupted; seek technical assistance.
67	The diagnostic control program was spawned by the diagnostic monitor with the wrong number of arguments.	Rerun the diagnostic.
68	The diagnostic control program could not setup the spooler control string for buffered output to the TTY from which the diagnostic request was input.	Rerun the diagnostic. If the problem remains, reinitialize the craft interface (key 15 on the emergency action interface (EAI) page at the maintenance terminal).

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
69	The histogram format print file for the main store diagnostic failed to be opened.	This file should be located in the directory /diag/dgnc under the name dgnff. Verify that this file does exist and has read permission.
6A	An illegal option was input while running diagnostics in the interactive mode (that is, EX command).	Verify that the input command syntax is correct. See the EX command in the input message manual.
*6B	Offline register could not be read back to online processor.	This is probably due to a maintenance channel error. Rerun the diagnostic. If the problem remains, run CC diagnostic phases 1 through 4 to test the maintenance channel.
6C	Cannot open file for trouble location process.	The problem could be that there is not enough file space in /tmp. Rerun the diagnostic.
*6D	The offline control unit (CU) has reset via the maintenance reset function (MRF).	Examine the error register to determine if a hardware error occurred and, if so, its cause. The MSA, MSA1, MSA2 and MSA3 registers form a push-down stack with MSA at the top. The highest register that does not contain 0 or 2b is the microstore address being executed when the MRF occurred. The program address (PA) contains the mainstore address being executed when the MRF occurred.
6E	The datatbl file contains instructions which are not supported on this hardware platform.	Verify that the umodel field in the unit's top-level UCB record is correct. Otherwise, the datatbl file is incorrect or the wrong datatbl file is being invoked. Seek technical assistance to correct these problems.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

```

2. REASON FOR OUTPUT

To report an error encountered by the control unit (CU) diagnostic programs. Critical registers are displayed for error codes marked.

If the message WARNING: READ PROBLEMS - SOME REGISTERS MAY BE INCORRECT appears, maintenance channel failures were encountered while reading some of the offline CU registers. Although the registers involved are not indicated, registers containing all zeroes are particularly suspect.

If the message WARNING: THE OFFLINE CU HAS INITIALIZED appears, the ten temporary registers indicated under the variable *s* field will contain a snapshot taken at the time of the reset (maintenance reset function).

3. VARIABLE FIELD DEFINITIONS

a = Error code, in hexadecimal notation. See the table description in this message.

b = Index into PCP table.

c = Error number returned from process control process maintenance driver (PCPMD). See System Error Codes Output Appendix, SYSERR-APP.

d = Left half of instruction to PCPMD, in hexadecimal notation.

e = Right half of instruction to PCPMD, in hexadecimal notation.

f = Online maintenance channel status, in hexadecimal notation.

g = Offline maintenance channel status, in hexadecimal notation.

h = Last test executed.

i = Data table address.

j = Data table statement number.

k = Task routine index.

l = Maintenance channel buffer.

m = Maintenance channel status.

n = Bidirectional gating bus.

o = Microstore data register high half.

p = Microstore data register low half.

q = Microstore address register.

r = Microstore address stack entry.

SEE PROPRIETARY NOTICE ON COVER PAGE

u = Processor status word.

v = Hardware status register.

w = Error register.

x = System status register.

y = Destination bus.

z = Source bus.

aa = Bidirectional gating register.

bb = Pulse point register.

cc = Ones register.

dd = Channel data register.

ee = Interrupt mask.

ff = Interrupt source register.

gg = Real time counter.

hh = Timers register.

ii = Store address register.

jj = Present address register.

kk = Store control register.

ll = Address translation buffer.

mm = Store data register.

nn = Store instruction register.

oo = Instruction buffer.

pp = Halfword multiplexor.

qq = General registers (0-15).

rr = Firmware registers (0-15).

ss = Temporary registers (0-15):

`T0` — Store address register.
`T1` — System status register.
`T2` — Processor status word.
`T3` — Store control register.
`T4` — Error register.
`T5` — Pulse point register.
`T6` — Hardware status register.
`T7` — Store data register.
`T10` — Real time counter.
`T11` — Timers register.

tt = Main Memory registers:

MCMD — MCERT MC Command Register
MSTAT — MCERT MC Status Register
MADD — MCERT MC Error Address Register
MER — MCERT MC Error Flags Register
DCMD — MCERT DP Command Register
DSTAT — MCERT DP Status Register
MDAT — MCERT DP Error Data Register
MMR — Main Memory Register
BNK0 — MCERT MC Bank Address Register 0
BNK1 — MCERT MC Bank Address Register 1
BNK2 — MCERT MC Bank Address Register 2
BNK3 — MCERT MC Bank Address Register 3
BNK4 — MCERT MC Bank Address Register 4
BNK5 — MCERT MC Bank Address Register 5
BNK6 — MCERT MC Bank Address Register 6
BNK7 — MCERT MC Bank Address Register 7

uu = Cache registers:

CRA — Cache Error Register A
CRB — Cache Error Register B
CRC — Cache Error Register C
CRD — Cache Error Register D
CRE — Cache Error Register E
CRF — Cache Error Register F
CRG — Cache Status Register G

4. ACTION TO BE TAKEN

An explanation of the error encountered and the appropriate action to be taken are shown in the following table. Critical registers are displayed for error codes marked with an asterisk (*).

Table 1. Error Codes

a =	Explanation	Action to be Taken
41	The test count specified at the end of the phase does not agree with number of tests actually executed.	Either an errant transfer was taken during the execution of the phase or the phase data table has been mutilated. Rerun the phase. If the problem remains, the data table file may be corrupted; seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
*42	Offline diagnostic microcode timed out.	A specified time limit is set for running microcode to prevent infinite loops. Problems could be due to the microstore not being loaded properly, an offline maintenance reset function (MRF) occurred, or the microcode got stuck in an infinite loop. Usually a retry will correct any microcode timeout problem. If the central control (CC) diagnostic was not run before the abort occurred, running it might find the problem.
*43	There is an error in a setarg command at the indicated data table location in the phase where the abort occurred.	The number of arguments passed to the offline main store routine does not match the number declared in the setarg command. Rerun the phase. If the problem remains, the indicated data table file may be corrupted; seek technical assistance.
*44	Offline main store code execution timed out.	The calling phase sets a specified time limit in which this offline code should execute. Problems can occur if the halt bit was not set when the code finished executing, or if hardware problems prevent running offline code, or a MRF occurred in the offline CU. If the CC and main store diagnostic was not run previous to where the abort occurred, running them might find the problem. If any other offline main store code ran successfully, the offline code file on the disk might be bad. Rerun the phase. If the problem remains, the indicated data table file may be corrupted; seek technical assistance.
*45	The verify failed after a pump to the offline microstore by the mcexec data table command.	After the microcode pump is completed, the code is pumped back to the online for verification. This error means the returned file did not match the file sent. Problem could be in microstore or in the communication between online and offline processors. If the CC diagnostic was not run previous to where the abort occurred, running it might find the problem.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
46	The object file specified in an excofl data table command could not be opened for reading or it is not the proper type of file for running offline main store code. Also, file I/O function (`lseek`) might not have been able to seek to the desired location in the object file.	This can be due to mutilation of the specified object file. Rerun the phase. If the problem remains, the indicated object file may be corrupted; seek technical assistance.
*47	Offline main store object file could not be copied from online processor to offline processor.	The maintenance driver library function pcpyto is used to do the copy. The online or offline maintenance channel could be faulty. The PCPMD error code, which appears under the heading DRIVER DATA, could help determine the cause of the problem.
*48	Could not set stack register or argument register in offline CU for offline main store execution.	Failure to connect to the equipment configuration database (ECD), unit control block (UCB) record ID points to the online control unit (CU), or CU was not OUT OF SERVICE. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed.
*49	Cannot setup stack argument count and program counter or address pointer in offline main store.	Some of the things to look for are as follows: The offline CU was not OUT OF SERVICE, the pointer to the UCB is not valid or does not point to a CU UCB in the ECD database, the UCB record ID was pointing to the online processor, or the maintenance channel did not execute the expected number of bytes. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed. Also, run CC diagnostic phases 1 through 4 to verify communication between the online and offline maintenance channels.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
*4A	The test routine loaded in the offline main store did not execute properly.	The PCPMD function pexecothr is used to start execution. The pointer passed to it from cudiagc was not recognized as a valid pointer or did not point to a CU UCB in the ECD. Retry the maintenance request. If the problem remains, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed. The file may be corrupted; seek technical assistance.
*4B	The test routine loaded in the online microstore and/or mainstore did not execute properly.	The PCPMD function pexeconl is used to start online execution. Retry the maintenance request, and if the problem remains, use the number printed in ERRNO to look up the source of the problem in the System Error Codes Output Appendix, SYSERR-APP.
4C	The equipment configuration database (ECD) manager could not be opened for a special unit control block request.	Verify that file /dev/ecd exists.
4D	Illegal helper unit requested.	Not used.
4E	The member version or equipage fields of the ECD for the main store are incorrect.	Use the RCV command to examine the UCD for the mainstore being diagnosed. Verify that there is 1 equipage bit set (starting at bit 0) for each memory array equipped. Also, verify that the low order nibble (4-bits) of the MV field has one of the following values: (1 - TN07; 3 - TN14; 4 - TN28; 5 - TN56; 6 - TN2012) and bit 5 of the MV field should be: (0 - UN39, UN40; 1 - UN59).
4F	Could not setup UCB for maintenance driver access. Appears only when the host is a UNIX® RTR machine.	Function psetup failed to pass a pointer to the top of the UCB to PCPMD. Use RCV to verify ECD is consistent and up to date for the control unit under test.

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
50	An invalid parameter was input when running diagnostics using the interactive mode of operation.	The interactive mode is used for main store phase 95. Three types of input errors could cause this problem. (1) The starting address is larger than the ending address. (2) The starting address is larger than the highest possible address. (3) The refresh rate is invalid. The valid refresh rates are from 2 to 16 milliseconds in steps of 2 and 32 to 60 milliseconds in steps of 4. See EX command in the Input Message Manual.
52	The special ECDMAN function (ursvucb) could not reserve the specified UCB.	Check that the u_admin field of the UCB is *1* (not reserved). If it is reserved, see the REPT-MIRA output message (reason 2). If it is not reserved, rerunning the diagnostic should clear the problem.
53	Cannot release a previously reserved unit control block (UCB) via the special ECDMAN function urelucb.	Display the contents of the UCB for the unit being diagnosed. If the u_admin variable is a *0*, the UCB is still reserved. See the REPT-MIRA output message (reason 2). If it is not reserved, rerunning the diagnostic should clear the problem.
54	Cannot find unit control block (UCB) for helper unit.	The getucb function could not find the UCB for helper unit. Verify that the helper unit was specified correctly in the input command. Use RCV to verify that helper unit UCB exists and is correct. If the problem remains, the data table file may be corrupted; seek technical assistance.
56	Illegal instruction signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
57	Bus error signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
58	Segment violation signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
59	Error on system call signal received from operating system.	Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file /diag/dgnc/cudiagc may be corrupted; seek technical assistance.
5A	The ECD Manager failed to fill in the special device file path name.	Use the RCV command to verify that the special device file exist in the LOGDEV.
5B	Could not open the special device file used to talk with the hardware.	The ECD manager must be reinitialized. This ECD function is used only in peripheral (IOP or DFC) units where the unique field in the UCB is ON. Other units may still be diagnosed in the face of this problem.
5C	The ECD manager failed to release a special device file used for communication with the peripheral hardware.	If the special device file was already released, a retry of the request should correct the problem. A second abort means the ECD manager has an internal software problem that can only be corrected by restoring the ECD manager.
61	The control unit diagnostic controller failed to open processor control process maintenance driver (PCPMD).	Verify that file /dev/cu exists.
*62	A write to the diagnostic driver (PCPMD) has failed.	The function endblk in cudiagc sends a buffer of maintenance channel commands to the offline maintenance channel via the PCPMD function pexmch. pexmch has failed. The PCPMD error code, that appears under the heading DRIVER DATA, will indicate the cause of the problem. Run CC diagnostic phases 1 through 4 to verify operation of the maintenance channel.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
63	This code is an indication to the diagnostic monitor that a phase of the diagnostic completed normally.	This is not an error code and will not cause an abort.
64	Could not open data table file or micro code program file.	Verify the existence of the file being opened. If the statement (S) is zero, a data table file could not be opened. The name of the file (relative to directory `/diag/dgnc`) is specified in the (P+1)th line in the file `/diag/dpt/cu/<file>` where P = the phase that aborted, file is selected by the "dgn" line(s) in `/diag/util/cu/<unit>` and possibly the "mv" field of the UCB, and `unit` = the name of the unit being diagnosed. If the index (I) is 17 or 2a, the name of the file is `/diag/offcode/mic/<file>.u` where `file` = the file name specified at statement S in the listing of the phase which aborted.
65	The diagnostic control buffer could not be shared by cudiagc from the diagnostic monitor.	The `connseg` system call has failed. The ERRNO item will indicated the system error reason.
66	The diagnostic control program has encountered an invalid index or argument in a data table.	Rerun the phase. If the problem remains, the data table file for the indicated phase may be corrupted; seek technical assistance.
67	The diagnostic control program was spawned by the diagnostic monitor with the wrong number of arguments.	Rerun the diagnostic.
68	The diagnostic control program could not setup the spooler control string for buffered output to the TTY from which the diagnostic request was input.	Rerun the diagnostic. If the problem remains, reinitialize the craft interface (key 15 on the emergency action interface (EAI) page at the maintenance terminal).

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
69	The histogram format print file for the main store diagnostic failed to be opened.	This file should be located in the directory /diag/dgnc under the name dgnff. Verify that this file does exist and has read permission.
6A	An illegal option was input while running diagnostics in the interactive mode (that is, EX command).	Verify that the input command syntax is correct. See the EX command in the input message manual.
*6B	Offline register could not be read back to online processor.	This is probably due to a maintenance channel error. Rerun the diagnostic. If the problem remains, run CC diagnostic phases 1 through 4 to test the maintenance channel.
6C	Cannot open file for trouble location process.	The problem could be that there is not enough file space in /tmp. Rerun the diagnostic.
*6D	The offline control unit (CU) has reset via the maintenance reset function (MRF).	Examine the error register to determine if a hardware error occurred and, if so, its cause. The MSA, MSA1, MSA2 and MSA3 registers form a push-down stack with MSA at the top. The highest register that does not contain 0 or 2b is the microstore address being executed when the MRF occurred. The program address (PA) contains the mainstore address being executed when the MRF occurred.
6E	The datatbl file contains instructions which are not supported on this hardware platform.	Verify that the umodel field in the unit's top-level UCB record is correct. Otherwise, the datatbl file is incorrect or the wrong datatbl file is being invoked. Seek technical assistance to correct these problems.

```

[3]
```
REPT DGN AUDIT a
R = b
LEXEC DATA
D = o errno = p
PHASE DATA
T = i A = j S = k I = l
```

2. REASON FOR OUTPUT

Each of the formats has a separate purpose.

Format 1 is used to report a peripheral driver error encountered by the peripheral diagnostic programs.

Format 2 is used to report a peripheral diagnostic error encountered by the peripheral diagnostic programs.

Format 3 is used to report a LEXEC function failure encountered by the peripheral diagnostic programs.

3. VARIABLE FIELD DEFINITIONS

a = Diagnostic reporting the error for the disk file controller (DFC), input/output processor (IOP), and dual serial channel/computer interconnect (DCI).

SEE PROPRIETARY NOTICE ON COVER PAGE

b = Reason for audit, in hexadecimal notation.

- 41 — open special device file failed
  For SMD MHDs with UCB `device_id` field = 0 (first MHD on DFC, usually MHD 0 or 1), MHD type read from DFC backplane may not agree with MHD UCB equipage field or may not be read correctly by DFC TN65 or UN64 board.
- 42 — SETIO failed
- 43 — `makeseg` failed
- 44 — `sendpw` failed
- 45 — read PC pump file failed
- 46 — driver operation failed
- 47 — open PC pump file failed
- 48 — `msgenab` failure
- 49 — `msgdisab` failure
- 4A — open processor control process maintenance driver (PCPMD) failed
- 4B — write to PCPMD failed
- 4C — `excofl` timed out
- 4D — open ECD manager failed
- 4E — function `ugucbn` failed
- 4F — peripheral interface controller (PIC) microstore size not in UCB
- 50 — receive wait failed
- 51 — `LEXEC` function failed
- 52 — `e_host` of UCB not initialized
- 53 — `lseek` function failure
- 54 — drive size not 5 or 19 tracks
- 55 — `makeseg` failed for disk read / write buffer
- 56 — write / read segment too small
- 57 — function `ugetucb` failed
- 58 — DFC not active
- 59 — IOP not active
- 61 — SCSI bus not active
- 62 — incorrect flash ram file count
- 63 — feature not supported
- 64 — cannot open data table file or micro program file
- 65 — cannot share DCB from DIAMON
- 66 — error in the data table
- 67 — invalid number of parameters from DIAMON
- 68 — open spooler failed
- 69 — invalid equipage field value
- 6A — invalid interactive mode command
- 6C — open `tlpfile` failed
- 6D — signal - illegal instruction
- 6E — signal - bus error
- 6F — signal - segment violation
- 70 — signal - software termination
- 71 — function ugnxtucb failed
- 72 — illegal device type for DFC

SEE PROPRIETARY NOTICE ON COVER PAGE

73 — function ucbrsrv failed
74 — function ugsdf failed
75 — function diskinfo failed
77 — specified file not accessible
78 — could not create output file
79 — flash ram data file wrong size
7A — could not write output file

i = Last test executed, in decimal notation.

j = Data table address, in hexadecimal notation.

k = Data table statement number, in decimal notation.

l = Task routine index, in hexadecimal notation.

m = Peripheral driver information/error code, in hexadecimal notation. For DFC and DCI diagnostics, dkdrv interfaces with diagc. For IOP diagnostics, the maintenance handler interfaces with diagc. The DFC information/error codes are in output DFC Appendix A, DFC-APPA. The IOP error codes (from the maintenance handler) are in output IOP Appendix G, IOP-APPG. The DCI information/error codes are in output DCI Appendix A, DCI-APPA.

n = Error code, in decimal notation, returned on a failing system call or ECD function call. See System Error Codes Output Appendix, SYSERR-APP.

o = Error code, in decimal notation, returned by LEXEC function call. See the System Error Codes Output Appendix, SYSERR-APP.

p = Error code, in decimal notation, from a PCPMD (the CU maintenance driver) function call. See the System Error Codes Output Appendix, SYSERR-APP.

4. ACTION TO BE TAKEN

If the reason for audit is 58, 59, or 61, restore the appropriate unit. If the reason for audit is 6A, check the syntax of the command. For all other reasons or if audit continues, seek technical assistance.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

SEE PROPRIETARY NOTICE ON COVER PAGE

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . REPT-DIAMON
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT DIAMON  ERROR = a ERRNO = b
```

2. REASON FOR OUTPUT

To report that the diagnostic monitor (DIAMON) has aborted one or more diagnostic control processes due to an error condition.

For additional, application-specific information about format or field values, refer to appropriate, application-specific documentation.

3. VARIABLE FIELD DEFINITIONS

a = Error code, in hexadecimal notation. See the table description in this message.

b = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

A system error code of zero means that no system error was reported.

4. ACTION TO BE TAKEN

An explanation of the error encountered and the appropriate action to be taken are shown in the following table.

Table 1. Error Codes

a =	Explanation	Action to be Taken
41	A manual request to terminate the maintenance request was entered at the maintenance terminal (MCRT).	Rerun the maintenance request.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
42	The diagnostic monitor could not send an event to the diagnostic controller.	The UNIX® system call sendev believes the diagnostic controller process does not exist. Check that this process exists in the directory `/diag/dgnc` under the name `cudiagc` for a control unit diagnostic, `dfdiag` for a DFC or MHD diagnostic, or `iodiag` for a DUIC, IOP, MTC, MTTYC, SCSDC, SDLC, or TTYC diagnostic. Verify line one of the DPT file identifies a valid diagc process. The DPT file is `/diag/dpt/<type>/<unit>` where `unit` = the unit type specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore files from the backup file system.
43	Could not find Trouble Location Process (TLP) pathname in the util file.	A TLP file should be specified in the file `/diag/util/ cu/unit_name` for a control unit diagnostic or `/diag/util/ pu/unit_name` for a peripheral unit diagnostic. For an example of a util file, refer to error code `5A`. Restore file from backup file system.
44	UNIX® system call (`lcall`) could not find the Trouble Location Process, or there is no execute permission on the file.	Verify that the file `/diag/dgnc/tlp` exists and has execute permission. Restore file from backup file system.
45	The diagnostic monitor failed to receive a message from the remove process.	Errors may occur if the remove process has not enabled message reception, or the requested type or size is invalid. Retry the request.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
46	The diagnostic monitor could not create a segment of memory to be shared with the diagnostic controller.	The problem could be insufficient swap space or address space in the user's address space for the segment. Retry the diagnostic until enough user space is free to create a segment.
47	The messages queue, maintained by the operating system, was not available for diagnostic usage.	Too many messages are being input at this time for the operating system to handle. Retry the request until the message queue frees up.
48	The input message from the Maintenance Input Request Administrator via the operating system to the diagnostic monitor failed.	Retry the request.
49	The diagnostic monitor could not set up the spooler control string for buffered output to the TTY that originated the request.	If the input came from the maintenance TTY (MCRT), the problem may be correctable by initializing the craft interface (EAI page, key 15).
4A	The diagnostic monitor format file for the maintenance output process has an invalid spooler tag.	Retry the request. If the problem remains, the file `/diag/dgnc/fmat` has been mutilated and must be restored from a backup file system.
4B	An error occurred when trying to open the Equipment Configuration Database (ECD).	Verify that file `/dev/ecd` exists.
4C	The input request had valid syntax, but one or more fields were found to be incorrect.	Check the input command for correctness. Perhaps a nonexistent unit type or phase number was specified. Retry the request. Refer to the *Input Message Manual* for a description of the maintenance commands.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	**Explanation**	**Action to be Taken**
4D	DIAMON could not find the location of the remove process in the diagnostic utility file.	An RMV file should be specified in the file /diag/util/cu/unit_name for a control unit diagnostic or /diag/util/pu/unit_name for a peripheral unit diagnostic. For an example of a util file, refer to error code 5A. Restore file from backup file system.
4E	Could not find the location of the restore process in the diagnostic utility file.	An RST file should be specified in the file /diag/util/cu/unit_name for a control unit diagnostic or /diag/util/pu/unit_name for a peripheral unit diagnostic. For an example of a util file, refer to error code 5A. Restore file from backup file system.
4F	Failed to spawn the process for removing a unit from service.	The file was either not found or it did not have execute permission. To verify the remove process for a control unit diagnostic, use the OP:STATUS:LISTDIR command with the filename /unixutil/cu/curstrmv. For a peripheral unit diagnostic, the same command with the file name /diag/dgnc/iormv or /diag/dgnc/dfrmv will verify the remove process. If the remove process exists and has execute permission, the system might be out of space. Retry the request until the system process space frees up.
50	Failed to spawn the process for restoring a unit to service.	The file was either not found, or it did not have execute permission. Refer to error code 4F for the action to be taken since the restore and remove use the same process.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
51	An invalid return value was received from the remove process.	Retry the request.
52	An invalid return value was received from the restore process.	Retry the request.
53	The remove process failed to receive a message.	The remove process did not enable message reception, the type specified is not valid, or most likely, the remove process has an excessive amount of messages outstanding on its queue. Retry the request.
54	The restore process failed to receive a message.	The restore process did not enable message reception, the type specified is not valid, or most likely, the restore process has an excessive amount of messages outstanding on its queue. Retry the request.
55	An illegal maintenance input request was received from the maintenance input administrator.	Check the input command for correctness. Retry the request. Refer to the *Input Message Manual* for a description of the maintenance commands.
56	The unit requested to be restored is not a restorable unit.	Check the input command for correctness. Retry the request. If the unit is being falsely taken as unrestorable, use the RCV command to update the `u_restorable` field in the Unit Control Block (UCB) for the unit from OFF to ON.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
57	The utility file for the remove, restore, diagnose, or trouble location process could not be opened.	Verify the utility file exists with read permission. The file is named `/diag/util/ <type>/<unit>` where `unit` = the unit specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore file from backup file system.
58	The unit control block could not be released by the ECD manager.	Either the UCB was not reserved, or an error occurred when trying to release it. Retry the request.
59	The result of the diagnostic could not be sent from DIAMON to MIRA.	Errors can occur if MIRA did not enable message reception, an invalid message was sent, or MIRA has an excessive amount of messages outstanding on its queue. Retry the request.

5A	The tag in the utility file for the remove, restore, diagnose, or the trouble location process could not be found.	Examine the utility file for the unit specified in the input request. It should look like the following example of the Central Control utility file:
		`dgn :../dpt/cu/cc`
		`rst :/unixutil/cu/curstrmv`
		`rmv :/unixutil/cu/curstrmv`
		`tlp :tlp`
		The file named `/diag/util/ <type>/<unit>` where `unit` = the unit specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore file from backup file system.

Table 1. Error Codes *(continued)*

a =	**Explanation**	**Action to be Taken**
62	Error in the request message. The repeat counter has a value greater than 0 but the RPT option was not specified.	This is a warning; the phase will run, but not in repeat mode. Identify the process sending the request. Retry the request manually.
63	A death of child signal was received by the diagnostic monitor, but the diagnostic monitor could not determine which child process was active.	This error indicates an internal problem in the diagnostic monitor. Retry the request.
64	A death of child signal was received for the diagc process indicating an exec failure.	The `diagc` process could not be executed. Retry the request. If the error continues to occur, restore the `diagc` process from the backup file system. The `diagc` processes are found in the directory `/diag/dgnc`. The names of the `diagc` processes are `cudiagc` (for CU diagnostics) `dfdiag` (for DFC diagnostics) and `iodiag` (for IOP diagnostics). Verify line one of the DPT file identifies a valid `diagc` process. The DPT file is `/diag/dpt/<type>/<unit>` where `unit` = the unit type specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore files from the backup file system.
65	A death of child signal was received by the diagnostic monitor; however, no child process was being monitored.	Retry the request.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	**Explanation**	**Action to be Taken**
66	Incorrect version specification in utility file.	Examine the multiple version lines of the appropriate utility file for incorrect version number representations like octal 8 (08). Also, verify that each tag has a multiple version line that has a value that is less than or equal to the MV in the UCB for that subunit. Multiple version utility file lines look like: `tlp :0x0:tlp`
67	Could not remove specified unit or subunit. Error return received from remove process.	Verify correctness of input unit specification. For example: CU 0, CC 0 is not valid. Further information can be obtained from remove process output messages.
68	Could not restore specified unit or subunit.	Verify correctness of input unit specification. For example: CU 0, CC 0 is not valid. Further information can be obtained from restore process output messages.
69	No Trouble Location Process (TLP) process exists for the unit requested.	Do not use the TLP option for this unit.
6A	No diagnostic exists for the unit requested.	Do not use the `DGN` or `EX` commands with this unit.
6B	The ECD manager failed to write the `u_util` field in the UCB.	Use the RCV command to verify that the `u_util` field in the UCB for the unit specified in the input request is of the form `cu/<unit>` or `pu/<unit>`.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
6C	The ECD manager failed to release a special device file used for communication with the peripheral hardware.	If the special device file was already released, a retry of the request should correct the problem. A second abort means the ECD manager has an internal software problem that can only be corrected by restoring the ECD manager.
6D	Diagnostic monitor could not open the format file for the maintenance output process.	Verify the file `/diag/dgnc/fmat` exists with read permission.
6E	Could not open the diagnostic phase table (DPT) file for the requested unit.	Verify the DPT file exists with read permission. The file is named `/diag/dpt/ <type>/<unit>` where `unit` = the unit specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore file from backup file system.
6F	DIAMON failed to open the ECD manager.	Verify that file `/dev/ecd` exists.
70	The Unit Control Block for the unit under test was not found.	An invalid equipment ID was entered in the input request, or a ECD problem exists. Check the input command for correctness. Retry the request. Refer to the input messages manual for a description of the maintenance commands. Verify the database correctness using the recent change and verify command `RCV:MENU;BROWSE`.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
71	Could not get the next unit control block in the diagnostic hierarchy from the ECD manager.	Verify the database correctness using the recent change and verify command RCV:MENU;BROWSE.
72	The diagnostic phase table (DPT) file could not be read.	Verify the DPT file exists with read permission. The file is named /diag/dpt/ <type>/<unit> where unit = the unit specified in the input request; type = cu if the unit is within a CU, or pu if the unit is within an IOP or DFC.
73	The diagnostic monitor could not spawn the diagnostic control process (DIAGC) for the unit specified in the input request.	Verify the DIAGC file exists with the execute permission. The file is named /diag/dgnc/<name> where name = cudiagc if the unit is within a CU, iodiag if the unit is within an IOP, or dfdiag if the unit is within a DFC. Restore file from backup file system. The system may be at its process limit. Retry the request when the system process space frees up.
74	An illegal phase number was specified in the diagnostic input request.	Check the input request for correctness. Retry the request. Refer to the input messages manual for a description of the maintenance commands. Verify the DPT file has active phases. The DPT file is /diag/dpt/<type>/<unit> where unit = the unit type specified in the input request; type = cu if the unit is within a CU, or pu if the unit is within an IOP or DFC. Restore file from the backup file system.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	**Explanation**	**Action to be Taken**
75	The UCB for the unit to be diagnosed is already reserved by another maintenance client not under the control of MIRA, or a previous maintenance request failed to release the UCB.	Refer to the *Output Message Manual* entry `REPT-MIRA`.
76	Could not open special device file used to talk with hardware.	The ECD manager must be reinitialized. This ECD function is used only in peripheral (IOP or DFC) units where the unique field in the UCB is ON. Other units may still be diagnosed in the face of this problem.
77	An invalid message was sent from the Maintenance Input Request Administrator or the Diagnostic Controller.	Retry the request.
78	The diagnostic monitor was sent an invalid type of request.	Retry the request.
79	The diagnostic controller returned an invalid result after a diagnostic phase completed.	Retry the request.
7A	The diagnostic controller returned an invalid result after a unit diagnostic completed.	Retry the request.
7B	A request to the ECD manager to update the minor device state has failed.	Seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1. Error Codes *(continued)*

a =	Explanation	Action to be Taken
7C	The user has attempted to execute diagnostics on an IOP tape device. This is valid for only DFC tape devices.	The unit name or number is incorrect. If the tape device is an IOP sub-device the MTC should be diagnosed. If the tape device is a DFC sub-device the unit number is incorrect. Correct the input command and retry the request.
7D	The user has attempted to diagnose CSU or SAT. These units are part of the CC on this hardware platform.	Use the DGN:CU input message to diagnose the CC.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

1. FORMAT

```
REPT DIO - ACKNOWLEDGE FAILURE X'a
ONLINE CU: b
FAULTY UNIT: c d
TIME OF ERROR: e
DMA ADDRESS:  fffffffff  DMA STATUS REGISTER:  gggggggg
h
CHANNEL ADDRESS: iiiiiiii CHANNEL STATUS REGISTER: jjjjjjjj
DMA RAM:  kkkkkkkk  llllllll  mmmmmmmm  nnnnnnnn
DMA STORE DATA REGISTER:  oooooooo  DMA INCREMENTOR:  pppppppp
DMA BUFFER REGISTER:  qqqqqqqq
REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

Either more than one or no channel responded to the direct memory access controller (DMAC).

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in form `mm/dd/yy hh:mm:ss`.

f = Input/output address of the direct memory access controller (DMAC) encountering the fault (in hexadecimal).

g = Direct memory access (DMA) status register (in hexadecimal). See *System Maintenance Manual*, Appendixes C and D.

h = For Model 1:

`DMA CHANNEL STATUS REGISTER:` *xxxxxxxx*

For Model 2:

`CHANNEL DATA REGISTER:` *yyyyyyyy*

i = Input/output address of the channel the DMA believed caused the problem (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Status of the DMA channel (in hexadecimal). This is the dual serial channel register (DSCH). See *System Maintenance Manual*, Appendix E.

k = First word entry in the DMA RAM for the device that failed (in hexadecimal).

l = Second word entry in the DMA RAM for the device that failed (in hexadecimal).

m = Third word entry in the DMA RAM for the device that failed (in hexadecimal).

n = Fourth word entry in the DMA RAM for the device that failed (in hexadecimal).

o = The contents of the DMA store data register (in hexadecimal).

p = The contents of the DMA incrementor (in hexadecimal).

q = The contents of the DMA buffer register (in hexadecimal).

x = Status of the channel under the DMAC that encountered the fault (in hexadecimal). See *System Maintenance Manual*, Appendix B.

y = Contents of the faulted channels data register (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time the error interrupt.

4. ACTION TO BE TAKEN

Run diagnostics on the indicated unit.

5. ALARMS

None.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has seven formats.

[1] `REPT DIOP DIOPNKILL UNSWAP FAILURE` *a*

[2] `REPT DIOP DIOPNKILL SWAP FAILURE` *a*

[3] `REPT DIOP SIMPLEX UNSWAP FAILURE` *a*
`REPT DIOP SIMPLEX PROCESSING FAILURE`

[4] `REPT DIOP SIMPLEX PROCESSING COMPLETED`

[5] `REPT DIOP DUPLEX SWAP FAILURE` *a*

[6] `REPT DIOP DUPLEX PROCESSING COMPLETED`

[7] `REPT DIOP ALL NONESSENTIAL IMS PROCESSES TERMINATED`

2. REASON FOR OUTPUT

Format 1 reports that a process has requested that it be made disk independent operation (DIOP) essential while the computer disks are simplex, but the kernel cannot swap it in or make it nonswappable.

Format 2 reports that a process has requested that it be made disk independent operation nonessential, but the kernel cannot make it swappable.

Format 3 reports a swappable disk independent operation essential process cannot be made nonswappable in the computer disk simplex mode.

Format 4 reports the successful execution of the disk simplex operation. All swappable disk simplex essential processes have been swapped in and made nonswappable.

Format 5 reports that while attempting to re-enter computer disk duplex operation, a process that was made nonswappable because it was disk independent operation essential cannot be made swappable.

Format 6 reports that computer disk duplex operation has been restored. All processes that were made nonswappable because of administrative module (AM) disk simplex operation have been made swappable.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7 reports that the switch has been placed in the DIOP mode. All nonessential interprocess message switch (IMS) processes have been terminated. This message is reported every 15 minutes as long as IMS is in the DIOP mode.

3. VARIABLE FIELD DEFINITIONS

a = pcode portion of the process's utility ID.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, and 5, report the failure message to a technical support person.

For Formats 4 and 6, no action is necessary.

For Format 7, an IMS level 3 or level 4 initialization is required to bring the IMS out of the DIOP mode and restore its full capabilities.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
Formats 1 through 7 have an OMDB key of 334.

ID . . . . . REPT-DKDIP-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL,MAINT

1. FORMAT

This message has four formats.

[1] `REPT DKDIP MESSAGE`
`REPT DKDIP CANNOT OPEN ECD`

[2] `REPT DKDIP MESSAGE`
`REPT DKDIP CANNOT ATTACH TO THE ECD`

[3] `REPT DKDIP MESSAGE`
`REPT DKDIP IS RESTARTED AFTER PHASE 1`

[4] `REPT DKDIP MESSAGE`
a

2. REASON FOR OUTPUT

For Formats 1, 2, and 4 report the result of executing a command using a poke number on the data file system access (DFSA) display page during `DISK INDEPENDENT OPERATION`.

For Format 3 reports that `DKDIP` was restarted after a Phase 1 initialization.

3. VARIABLE FIELD DEFINITIONS

a = Reference to another output message in the *Output Manual.*

4. ACTION TO BE TAKEN

For Formats 1, 2, and 3, take no action. The output messages that relate to the Equipment Configuration Database (ECD) only occur during the start-up sequence of the `DKDIP` process.

For Format 4, appropriate actions can be found under the appropriate output message pages in the output manual. The output messages that relate to the ECD only occur during the start-up sequence of the `DKDIP` process.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

SEE PROPRIETARY NOTICE ON COVER PAGE

2. REASON FOR OUTPUT

Formats 1 and 2 report that the `DKDIP` process could not open the equipment configuration database (ECD) or could not attach to the ECD.

Format 3 reports that the `DKDIP` process was restarted after a Phase 1 initialization.

Format 4 reports the status of a poke request invoked from the DFSA display page during disk independent operation (DIOP).

3. VARIABLE FIELD DEFINITIONS

a = Reference to another output message in the *Output Manual.*

4. ACTION TO BE TAKEN

Formats 1 and 2 relate to the ECD and are printed only during the start-up sequence of the DKDIP process. Contact the next level of technical assistance.

Format 3 requires no action.

Format 4 appropriate actions can be found under the appropriate output message pages in the *Output Manual.*

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

This message has two formats.

[1] `REPT DKDIP MESSAGE`
`REPT DKDIP ERROR` *a* [*b*]

[2] `REPT DKDIP MESSAGE`
c

2. REASON FOR OUTPUT

Format 1 reports an error condition encountered by the `DKDIP` process.

Format 2 reports the status of a poke request invoked from the DFSA display page during disk independent operation (DIOP).

3. VARIABLE FIELD DEFINITIONS

a = Process step or reason.

- `d04` — DKDIP was restarted due to phase 1
- `d18` — received invalid message type - message ignored
- `d22` — failed to get DAP's PID
- `d30` — failed to open the ECD
- `d34` — failed to attach to the ECD
- `d38` — failed to initialize ackdb segment
- `d50` — failed to get UCB record by RID
- `d60` — failed to get UCB record by RID
- `d63` — UCB returned is not a DFC UCB
- `d66` — invalid DFC UCB model field
- `d67` — performance updates stopped because of message overload
- `d68` — sendw() failed to send message to DAP
- `d70` — virtual address translation failure
- `d80` — failed to get UCB record by RID
- `d83` — invalid DFC sub-device type
- `d86` — failed to get UCB record by RID
- `d89` — invalid peripheral device type

b = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

c = Reference to another output message in the *Output Manual.*

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Format 1 is printed when the DKDIP process encounters an error condition either during initialization or when processing a client request. If the error condition persists, contact the next level of technical assistance.

For format 2, appropriate actions can be found under the appropriate output message pages in the *Output Manual.*

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . REPT-DKDRV-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . DSKSYS

1. FORMAT

This message has seven formats.

[1] `REPT DKDRV INFO DATA` *a*

[2] `REPT DKDRV ERROR CODE` *a*

[3] `REPT DKDRV WARNING CODE` *a*

[4] `REPT DKDRV ERROR DATA` *b*

[5] `REPT DKDRV RECEIVED UNKNOWN RCV MESSAGE` *c d e*

[6] `REPT DKDRV WARNING, MHD` *d* `PARTITION` *f* `IS WRITE RESTRICTED, VIOLATING PID` *g*

[7] `REPT DKDRV WARNING, MHD` *d* `EXCEEDS LONG TERM FAILURE THRESHOLD`

2. REASON FOR OUTPUT

Formats 1, 2, and 3 report a disk file controller (DFC) or disk driver (DKDRV) related error condition.

Format 4 is used to provide additional data for a preceding `REPT-DKDRV` message. For technical assistance organization use only.

Format 5 reports the DKDRV received notification from RCV that the ECD has changed, but the change type is not recognized.

Format 6 reports the process identifier (PID) of the violating process that tries to access the write-restricted partition.

Format 7 is output when a disk exceeds the failure threshold. Action may be necessary to prevent a system outage.

3. VARIABLE FIELD DEFINITIONS

a = DKDRV information code. See the output DFC Appendix A, `DFC-APPA`.

b = Supplemental data for previous `REPT-DKDRV` message.

c = Unit name.

d = Unit number.

e = RCV operation code.

f = Partition number.

g = PID of the violating process.

4. ACTION TO BE TAKEN

For Formats 1, 2, and 3, look up the reason for the information code or data in the output DFC Appendix A, DFC-APPA. If hardware is implicated, replace the faulty hardware using standard maintenance procedures. If a software or data malfunction is indicated, then try to correct the problem if possible.

For Formats 4, 5, and 6, save the receive-only printer (ROP) output, then contact your technical assistance organization.

For Format 7, see the *System Maintenance Manual*, handling disk media access errors section.

5. ALARMS

None. This automatically-generated report is for information only.

1. FORMAT

This message has five formats.

[1] `REPT DKDRV INFO CODE` *a*

[2] `REPT DKDRV ERROR DATA` *b*

[3] `REPT DKDRV RECEIVED UNKNOWN RCV MESSAGE` *c d e*

[4] `REPT DKDRV WARNING, MHD` *d* `PARTITION` *f* `IS WRITE RESTRICTED, VIOLATING PID` *g*

[5] `REPT DKDRV WARNING, MHD` *d* `EXCEEDS LONG TERM FAILURE THRESHOLD`

2. REASON FOR OUTPUT

Format 1 reports a disk file controller (DFC) or disk driver (DKDRV) related error condition.

Format 2 is used to provide additional data for a preceding `REPT-DKDRV` message. For technical assistance organization use only.

Format 3 reports the DKDRV received notification from RCV that the ECD has changed, but the change type is not recognized.

Format 4 reports the process identifier (PID) of the violating process that tries to access the write-restricted partition.

Format 5 is output when the disk exceeds the failure threshold. Action may be necessary to prevent a system outage.

3. VARIABLE FIELD DEFINITIONS

a = DKDRV information code. See the output DFC Appendix A, `DFC-APPA`.

b = Supplemental data for previous `REPT-DKDRV` message.

c = Unit name.

d = Unit number.

e = RCV operation code.

f = Partition number.

g = PID of the violating process.

4. ACTION TO BE TAKEN

If Format 1 prints, look up the reason for the information code or data in the output DFC Appendix A, DFC-APPA. If hardware is implicated, replace the faulty hardware using standard maintenance procedures. If a software or data malfunction is indicated, then try to correct the problem, if possible.

If Formats 2, 3, or 4 print, save the receive-only printer (ROP) output, then contact your technical assistance organization.

If Format 5 prints, see the *System Maintenance Manual*, handling disk media access errors section.

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-DLGGETTY
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has seven formats.

[1] `REPT DLGGETTY UNABLE TO ACCESS ECD FOR` *a*

[2] `REPT DLGGETTY CANNOT READ GETTY RECORD FOR` *a*

[3] `REPT DLGGETTY UNABLE TO CHANGE DIRECTORY TO` *b*

[4] `REPT DLGGETTY FAILED TO EXECUTE` *c*

[5] `REPT DLGGETTY FAILED TO OPEN` *d*

[6] `REPT DLGGETTY CHANID FOUND IN LOGDEV RECORD` *a*

[7] `REPT DLGGETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT`

2. REASON FOR OUTPUT

To report that the `DLGGETTY` process has encountered an error while trying to process initialization information for a device. The message will appear on the originating device only.

3. VARIABLE FIELD DEFINITIONS

a = Teletypewriter (TTY) device against which the `dlggetty` is executing.

b = The directory which the dlggetty could not access.

c = Pathname of the process to be executed.

d = Special device file which could not be opened.

4. ACTION TO BE TAKEN

If format 1 or 2 is printed, verify that the getty record in the equipment configuration database (ECD) for the indicated TTY device is correct.

If format 3 is printed, verify that the directory indicated in the getty record exists.

If format 4 is printed, verify that the process which could not be executed exists and is executable.

SEE PROPRIETARY NOTICE ON COVER PAGE

If format 5, 6, or 7 is printed, or the errors persist after taking actions indicated above, seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

[17] `REPT DLGSHL DEVICE` *a* `NO SOP-CSOP COMMUNICATION POSSIBLE`

[18] `REPT DLGSHL DEVICE` *a* `UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT`

[19] `REPT DLGSHL DEVICE` *a* `EOF ENCOUNTERED`

[20] `REPT DLGSHL TERMINAL IN SERVICE *** ` *b* `CAPABILITY MODE / ` *c*

[21] `REPT DLGSHL UNABLE TO READ LINE` *d* `OF .pname FILE`

[22] `REPT DLGSHL CANNOT CHANGE DIRECTORY TO` *e*

[23] `REPT DLGSHL SETGID TO` *f* `FAILED`

[24] `REPT DLGSHL SETUID TO` *g* `FAILED`

[25] `REPT DLGSHL UNABLE TO ACCESS SPLRINFO FORM`

[26] `REPT DLGSHL CRAFT SHELL IS IN LIMP CAPABILITY MODE`

[27] `REPT DLGSHL ON MTTY WILL USE DEFAULT .PNAME FILE`

2. REASON FOR OUTPUT

To report a dialogue shell (DLGSHL) related occurrence or error.

Format 1 indicates that the DLGSHL cannot receive messages.

Format 2 indicates that the DLGSHL cannot create or open a segment.

Format 3 indicates that a call to `setio()` failed.

Format 4 indicates that the DLGSHL cannot open the specified device.

Format 5 indicates that the DLGSHL cannot read from the specified device.

Format 6 indicates that the DLGSHL cannot write to the specified device.

Format 7 is printed when the DLGSHL encounters an unknown error, such as an illegal enumeration value.

Format 8 is printed when the synchronous DLGSHL fails to fork the character special device interface process (CSDIP).

Format 9 is printed when the synchronous DLGSHL fails to execute the CSDIP.

Format 10 indicates that a call to `gettrap()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 11 indicates that a call to `settrap()` failed.

Format 12 indicates that a call to `statio()` failed.

Format 13 indicates that the CSDIP process on the specified device has died.

Format 14 indicates that the DLGSHL cannot access the equipment configuration database (ECD).

Format 15 indicates that the DLGSHL cannot access information relating to terminal and personal authority.

Format 16 indicates that the DLGSHL cannot retrieve information relating to input message authority groups.

Format 17 indicates that communication between the coordinator of spooler output processes (CSOP) and the DLGSHL spooler output function (SOF) have been corrupted.

Format 18 is printed when the DLGSHL cannot retrieve the LCHAN environment variable.

Format 19 indicates that the DLGSHL has been terminated.

Format 20 indicates that the DLGSHL has been initiated. A dialogue request character must be typed and, possibly, a password entered before the DLGSHL is ready to accept input messages (see the *System Maintenance Manual*).

Format 21 indicates that a message has requested a change to an environment that does not exist in the `.pname` file (see the *System Maintenance Manual*).

Format 22 indicates that a request to change an execution directory as a result of an environment change has not been honored.

Format 23 indicates that an attempt to change the group ID of the DLGSHL failed. This usually occurs as a result of attempts to change the environment.

Format 24 indicates that an attempt to change the user ID of the DLGSHL failed. This usually occurs as a result of attempts to change the environment.

Format 25 indicates that the DLGSHL cannot access the `splrinfo` record in the ECD.

Format 26 indicates that the DLGSHL cannot attach to the *Input Message Catalog*.

Format 27 indicates that the DLGSHL attached to the maintenance teletypewriter (MTTY) cannot read the `.pname` file and will, therefore, use a default `.pname` file containing the following: `0:..../cmds1:/cft/shl/cmds`.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Device name.

b = DLGSHL capability mode: LIMP, PART or FULL.

c = Input message syntax: PDS or MML.

d = Label of line.

e = Name of the requested directory.

f = Name of the requested group ID.

g = Name of the requested user ID.

4. ACTION TO BE TAKEN

For Format 21, either the message or the `.pname` file is in error and must be corrected.

5. ALARMS

None. This automatically-generated report is for information only.

Critical alarm. Take immediate action as indicated in the report. Seek technical assistance if needed.

Minor alarm. Take action as indicated in the report.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT DMQ INHIBIT` *a* `ACTIVE`
`[,REMAINING TIME` *b* `MIN.]`

[2] `REPT DMQ ATTEMPT TO DISABLE INHIBIT` *a* `FAILED`

2. REASON FOR OUTPUT

Format 1 reports inhibited maintenance request sources. The source may have been disallowed for an infinite time span, or a finite time span.

Format 2 reports that inhibited maintenance request source *a* reached the end of its inhibited time, but the clear of the inhibit failed.

3. VARIABLE FIELD DEFINITIONS

a = Source of maintenance requests; for example, automatic diagnostic process (ADP).

b = Time, in minutes, left until requests will be allowed from source *a*.

4. ACTION TO BE TAKEN

Format 1 requires no action.

For Format 2, use the `ALW:DMQ` input message to manually allow the inhibited request source *a*. Seek technical assistance for the cause of the problem.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

6. REFERENCES

OMDB Keys
Format 1 has OMDB keys of 92 and 93.
Format 2 has an OMDB key of 92.

Output Message
ALW-DMQ

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . REPT-DUI
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MAIPR . . . . . MAINT,

1. FORMAT

This message has three formats.

[1] `REPT DUI` *a* {`ERROR` *b* [`COMPL CODE` *c*] |
`UNIDENTIFIED RESPONSE WD1=`*d* `WD2=`*e*}

[2] `REPT DUI` *a* `STARTED`

[3] `REPT DUI` *a* `STOPPED`

2. REASON FOR OUTPUT

Format 1 reports a direct user interface (DUI) subdevice-related software or hardware error.

Format 2 reports that the DUI has changed state from STBY to ACT. A DUI will change to ACT state when the level 2 connection is established, and the data link is in information transfer state.

Format 3 reports that the DUI has changed state from ACT to STBY. A DUI will change to STBY state when the level 2 connection is terminated, and the level 1 connection remains established.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies, in hexadecimal notation, the point within the input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

c = Hardware error type. See output IOP Appendix A, `IOP-APPA`.

d = First word of an unidentified completion report.

e = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Formats 2 and 3 are informational messages and indicate that the DUI has changed states. No action is necessary.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

Format 1 has no alarm; it is an automatically-generated report for information only.

Formats 2 and 3 have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

1. FORMAT

This message has two formats.

[1] `REPT DUIC` *a* {`ERROR` *b* [`COMPL CODE` *c*] |
`UNIDENTIFIED RESPONSE WD1=`*d* `WD2=`*e*}

[2] `REPT DUIC` *a* `CODE VERSION X'`*f*

2. REASON FOR OUTPUT

Format 1 reports a direct user interface controller (DUIC) related software or hardware error.

Format 2 is output during the restoral of the unit.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies point within input/output processor driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. See output IOP Appendix F, `IOP-APPF`.

c = Hardware error error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

d = First word of an unidentifiable completion report.

e = Second word of an unidentifiable completion report.

f = Peripheral controller pump code version.

4. ACTION TO BE TAKEN

These error messages indicate error conditions that could cause the removal of a unit. Any removed unit must be repaired and restored to service. No action is necessary for the message in format 2 unless the controller and/or its subdevices are not acting normal, or could not be restored. Contact the service organization with the code version which was used.

5. ALARMS

None.

1. FORMAT

This message has six formats.

[1] `REPT EAI SANITY TIMERS ARE INHIBITED`

[2]
```
REPT EAI BACKUP ROOT SELECTED ON EAI PAGE
            CURRENTLY RUNNING IN ROOT
            PLEASE REMOVE THIS SELECTION
            UNLESS PREPARING TO BOOT BACKUP ROOT
```

[3]
```
REPT EAI MINIMUM CONFIGURATION SELECTED ON EAI PAGE
            CURRENTLY RUNNING IN FULL CONFIGURATION
            PLEASE REMOVE THIS SELECTION
            UNLESS PREPARING TO BOOT MINIMUM CONFIGURATION
```

[4]
```
REPT EAI ROOT SELECTED ON EAI PAGE
            CURRENTLY RUNNING IN BACKUP ROOT
            PLEASE REMOVE THIS SELECTION
            UNLESS PREPARING TO BOOT ROOT
```

[5]
```
REPT EAI ** WARNING ** a ON CU b
c
d
e
```

[6] `REPT EAI APPLICATION PARAMETER f IS SET`

2. REASON FOR OUTPUT

Format 1 reports that the sanity timers are inhibited.

****WARNING****

The system's ability to recover from errors is reduced when the sanity timers are inhibited. The sanity timers are not inhibited in normal operation.

Formats 2, 3, and 4 report that the root, backup root, or minimum configuration is selected and the system is not currently running in that mode. To avoid inadvertently booting the system in the wrong mode, these selections should only be made just prior to booting the system.

Format 5 applies only for the 3B21D machines. Format 5 has four messages. The messages are output as a result of either inhibiting emergency action interface (EAI) hardware error reporting via a craft command, or inhibiting EAI hardware error interrupt due to excessive errors.

```
REPT EAI ** WARNING ** EAI ERROR THRESHOLD EXCEEDED ON CU b.
         ** WARNING ** ATTEMPTED SOFT SWITCH FAILED.
         ** WARNING ** EAI ERROR REPORTING INHIBITTED.
         ** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.
```

This indicates that the error threshold was exceeded on the on-line central controller (CC) EAI hardware and an attempt to switch to the other CC failed.

```
REPT EAI ** WARNING ** EAI ERROR THRESHOLD EXCEEDED ON CU b.
         ** WARNING ** SOFT SWITCH COMPLETED.
         ** WARNING ** EAI ERROR REPORTING INHIBITTED.
         ** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.
```

This indicates that the error threshold was exceeded on the off-line CC EAI hardware. The machine has switched to the currently-active processor due to the error.

```
REPT EAI ** WARNING ** EAI ERROR INTERRUPT INHIBITTED ON CU b.
         ** WARNING ** USE ALW:EAIINT COMMAND TO ENABLE THE INTERRUPT.
```

This indicates that EAI error reporting has been inhibited by a software command.

```
REPT EAI ** WARNING ** EAI ERROR REPORTING INHIBITTED FOR OVER 24 HOURS ON CU b.
         ** WARNING ** AUTOMATICALLY ENABLING EAI ERROR REPORTING.
```

This indicates that the EAI error reporting has been inhibited by a software command for more than 24 hours. Fault recovery software within the system is automatically enabling this error reporting.

Format 6 reports that an application parameter has been entered, but not followed by a manual initialization. To avoid inadvertently performing a manual initialization with an unknown application parameter set, application parameters should only be input just prior to a manual initialization.

3. VARIABLE FIELD DEFINITIONS

a = A string defining one of three possible error types:

```
** WARNING ** EAI ERROR THRESHOLD EXCEEDED ON CU b.
** WARNING ** EAI ERROR INTERRUPT INHIBITTED ON CU b.
** WARNING ** EAI ERROR REPORTING INHIBITTED FOR OVER 24 HOURS ON CU b.
```

b = CU member number.

c = A string defining one of four possible error types:

```
** WARNING ** ATTEMPTED SOFT SWITCH FAILED.
** WARNING ** SOFT SWITCH COMPLETED.
** WARNING ** USE ALW:EAIINT COMMAND TO ENABLE THE INTERRUPT.
** WARNING ** AUTOMATICALLY ENABLING EAI ERROR REPORTING.
```

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Blank line or a string defining one of two possible error types:

```
** WARNING ** EAI ERROR REPORTING INHIBITTED.
** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.
```

e = Blank line or the following string.

```
** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.
```

f = Application parameter that is currently set.

4. ACTION TO BE TAKEN

For Format 1, remove the inhibit sanity timer selection on the EAI page of the maintenance terminal.

For Formats 2, 3, and 4, remove the root, backup root, or minimum configuration selection on the EAI page of the maintenance terminal.

For Format 5, do the following.

1. For the Type 1 message, restore the other CU and switch to that CU. Run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG and ROP output, to the next level of support.
2. For the Type 2 message, run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG and ROP output, to the next level of support.
3. For the Type 3 message, re-enable reporting of the EAI hardware errors.
4. The Type 4 message is for information only, and no action is needed.

For Format 6, clear the application parameter, using poke 43 (Clr Appl Param) or poke 14 (CLR EAI).

5. ALARMS

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

         MHD = j STATUS = k [X'l]
         DIFFERS FROM CURRENT DUPLEXED BOOT DISK PAIR
         PLEASE REMOVE THIS SELECTION UNLESS PREPARING TO BOOT
```

2. REASON FOR OUTPUT

Format 1 reports that the sanity timers are inhibited.

Formats 2, 3, and 4 report that the root, backup root, or minimum configuration is selected and the system is not currently running in that mode. To avoid inadvertently booting the system in the wrong mode, these selections should only be made just prior to booting the system.

Format 5 applies only for the 3B21D machines. Format 5 has four messages. The messages are output as a result of either inhibiting emergency action interface (EAI) hardware error reporting via a craft command, or inhibiting EAI hardware error interrupt due to excessive errors.

```
REPT EAI ** WARNING ** EAI ERROR THRESHOLD EXCEEDED ON CU b.
         ** WARNING ** ATTEMPTED SOFT SWITCH FAILED.
         ** WARNING ** EAI ERROR REPORTING INHIBITTED.
         ** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.
```

This indicates that the error threshold was exceeded on the on-line central controller (CC) EAI hardware and an attempt to switch to the other CC failed.

```
REPT EAI ** WARNING ** EAI ERROR THRESHOLD EXCEEDED ON CU b.
         ** WARNING ** SOFT SWITCH COMPLETED.
         ** WARNING ** EAI ERROR REPORTING INHIBITTED.
         ** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.
```

This indicates that the error threshold was exceeded on the off-line CC EAI hardware. The machine has switched to the currently-active processor due to the error.

```
REPT EAI ** WARNING ** EAI ERROR INTERRUPT INHIBITTED ON CU b.
         ** WARNING ** USE ALW:EAIINT COMMAND TO ENABLE THE INTERRUPT.
```

This indicates that EAI error reporting has been inhibited by a software command.

```
REPT EAI ** WARNING ** EAI ERROR REPORTING INHIBITTED FOR OVER 24 HOURS ON CU a.
         ** WARNING ** AUTOMATICALLY ENABLING EAI ERROR REPORTING.
```

This indicates that the EAI error reporting has been inhibited by a software command for more than 24 hours. Fault recovery software within the system is automatically enabling this error reporting.

Format 6 reports that an application parameter has been entered, but not followed by a manual initialization. To avoid inadvertently performing a manual initialization with an unknown application parameter set, application parameters should only be input just prior to a manual initialization.

Format 7 reports EAI off-normal selections. One or more fields are displayed whenever an

SEE PROPRIETARY NOTICE ON COVER PAGE

off-normal condition is detected. This message can only be displayed when the hardware platform is configured with the Recovery from Alternate Boot Disk Feature.

Format 8 reports an inconsistency between the MTTYC 0 and MTTYC 1 hardware or firmware. This message can only be displayed when the hardware platform is configured with the Recovery from Alternate Boot Disk Feature.

Formats 9 and 10 can can only be displayed when the hardware platform is configured with the Recovery from Alternate Boot Disk Feature. These output messages report the status of selected MHDs **following** any change to the EAI page's Boot MHDs selection (Pokes 28 and 29) or following the successful execution of the CFR:DUPLEXDISKS command. These messages are periodically displayed until both selected disks are **BOOTABLE** and both selected disks are the same as the currently duplexed (mated) pair.

3. VARIABLE FIELD DEFINITIONS

a = A string defining one of three possible error types:

```
** WARNING ** EAI ERROR THRESHOLD EXCEEDED ON CU b.
** WARNING ** EAI ERROR INTERRUPT INHIBITTED ON CU b.
** WARNING ** EAI ERROR REPORTING INHIBITTED FOR OVER 24 HOURS ON CU b.
```

b = CU member number.

c = A string defining one of four possible error types:

```
** WARNING ** ATTEMPTED SOFT SWITCH FAILED.
** WARNING ** SOFT SWITCH COMPLETED.
** WARNING ** USE ALW:EAIINT COMMAND TO ENABLE THE INTERRUPT.
** WARNING ** AUTOMATICALLY ENABLING EAI ERROR REPORTING.
```

d = Blank line or a string defining one of two possible error types:

```
** WARNING ** EAI ERROR REPORTING INHIBITTED.
** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.
```

e = Blank line or the following string.

```
** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.
```

f = Application parameter that is currently set.

g = Off-normal selection displaying one or more of the following types:

CU FORCED ONLINE
Indicates that a CU is forced on-line. View the EAI screen to determine which CU is selected.

PRI / SEC DISK
Either the Primary or Secondary Disk has been selected. View the EAI screen to determine which option has been selected.

BACKUP ROOT SELECTION IS SET
The Backup Root option has been selected while running in ROOT.

BACKUP ROOT SELECTION IS CLR
The Backup Root option has been cleared while running in BROOT

MIN CONFIG
The Min Config option has been selected.

INHIBIT SANITY TIMER
The Inhibit Sanity Timer option has been selected.

INH HDWCHK
The Inhibit Hardware Check option has been selected.

INH SFTCHK
The Inhibit Software Check option has been selected.

INH ERRCHK
The Inhibit Error Check option has been selected.

INH CACHE
The Inhibit Cache option has been selected.

APPL PARAM
An Application Parameter has been entered on the EAI.

ALT BOOT DEV
An Alternate Boot Device has been selected. View the EAI screen to determine the boot device.

h = Equipage status of the MTTYC boards provided by the IO Driver to PCPAUD and an audit of the in-core ECD MTTY UCB equipage field.

The equipage status word is eight hexadecimal digits of the form `aabbcccc`

`aa` = Equipage value for MTTYC 0

`bb` = Equipage value for MTTYC 1.

`cccc` = Bitfield with the following definitions:

0001 The Recovery from Alternate Boot Disk (ABD) feature is available

0002 System is operating with an ABD selected

0004 One MTTYC does not have ABD; the other MTTYC does have ABD

i = MHD unit number.
See Input/Output Member Numbers Appendix, `MEM-NUM-APPC`, Table C.

j = MHD unit number.
See Input/Output Member Numbers Appendix, `MEM-NUM-APPC`, Table C.

k = MHD status.

BOOTABLE
The MHD can be used as a boot disk.

RESERVED
The MHD is currently reserved by a system level process. This situation can occur when a maintenance action is in progress, for example, when an MHD is being restored.

SEE PROPRIETARY NOTICE ON COVER PAGE

NOT BOOTABLE
The MHD is not bootable. Variable *l* provides additional information.

UNKNOWN
The status of the MHD could not be obtained. Check the ROP (Read-only printer) for error output messages that may help resolve the reason for this status occurring.

l = Error code when Variable *k* is **NOT BOOTABLE**.
The error code indicates why the unit was not marked as a valid boot disk. See Bootdiskchk Codes Appendix, `BOOTDISKCHK-APP`, Result Codes.

4. ACTION TO BE TAKEN

For Format 1, remove the inhibit sanity timer selection on the EAI page of the maintenance terminal.

For Formats 2, 3, and 4, remove the root, backup root, or minimum configuration selection on the EAI page of the maintenance terminal.

For Format 5, do the following.

1. For the Type 1 message, restore the other CU and switch to that CU. Run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG and ROP output, to the next level of support.
2. For the Type 2 message, run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG and ROP output, to the next level of support.
3. For the Type 3 message, re-enable reporting of the EAI hardware errors.
4. The Type 4 message is for information only, and no action is needed.

For Format 6, clear the application parameter, using poke 43 (Clr Appl Param) or poke 14 (CLR EAI).

For Format 7, no action is necessary. This is an informational output message that displays one or more off-normal conditions into a single message.

For Format 8, MTTYC 0 and MTTYC 1 should be consistent in terms of the type of hardware circuit packs and the flash memory downloaded on the circuit packs. Determine which circuit pack is causing the inconsistency and either replace it with an MTTYC that supports the Recovery from Alternate Boot Disk feature; or, if the circuit pack is the same type, execute diagnostics to download the flash memory. If the ECD contains an invalid equipage value, correct the ECD record.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 9, take action based on the description of the error. If one of the disks is **NOT BOOTABLE**, it is essential to make that disk **BOOTABLE** again. If the description of the error is not self-explanatory, seek technical assistance.

For Format 10, re-boot the system so that the selected boot disks become the duplexed (mated) pair, **or on the EAI page**, enter the appropriate Boot MHD pokes so that the selected values are the same as the duplexed (mated) pair. To determine the duplexed pair, check the RTR 102 page or the MHD status page, then use the 28 or 29 EAI poke to correct the boot disk selection. In this latter case, it is not necessary to re-boot. For example, if MHD 0 and MHD 15 are the currently active disks (the duplexed pair) and the output message is reporting status for MHD 0 and MHD 1, on the EAI page, enter a '28', then '15', then 'y'.

5. ALARMS

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `REPT ERRPORT OPEN FAILURE ERRNO` *a*

[2] `REPT ERRPORT READ FAILURE ERRNO` *a*

[3] `REPT ERRPORT` *b* `MESSAGES LOST`

[4] `REPT ERRPORT PREPHASE MESSAGE`

2. REASON FOR OUTPUT

Format 1 reports that the computer error logging process (`errport`) is not able to open its special file `/dev/errport`.

Format 2 reports that the computer `errport` has encountered an error in its special file `/dev/errport`.

Format 3 reports that the computer `errport` has received output messages after its internal queue was full. These messages have been lost.

Format 4 reports that a message existed in the low core first-in, first-out (FIFO) queue before the computer phased.

3. VARIABLE FIELD DEFINITIONS

a = File access error code. See System Error Codes Output Appendix, `SYSERR-APP`.

b = Number of messages lost.

4. ACTION TO BE TAKEN

For Formats 1 and 2, check the status of the file and seek immediate technical assistance. (`/dev/errport` should be present; it should be a FIFO special file and have read and write permissions.)

For Formats 3 and 4, no action is necessary.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To report error interrupts handled by the error interrupt handler (EIH) that are not associated with the main memory. Among the errors handled are input/output errors, direct memory access (DMA) errors, other control unit (CU) hardware errors, and software errors.

Format 1 indicates that the kernel determined that a process attempted an operating system trap (OST) with a bad argument.

Format 2 indicates that a faulty unit encountered a fatal error condition. The channel status and channel address are provided in the report.

Format 3 has six error types.

1. `MY STORE A DURING DMA`
   This error type indicates the DMA controller (DMAC) encountered a fatal main memory problem during DMA transfer. See the *System Maintenance Manual*, ERROR REGISTER DESCRIPTION section, error bit 6.
2. `MY STORE B DURING DMA`
   A device attempted to access a location in memory that is not physically equipped. See the *System Maintenance Manual*, ERROR REGISTER DESCRIPTION section, error bit 23.
3. `BAD PARITY ON DMA READ`
   The DMAC detected bad parity on its internal bus. This can be caused by a DMAC failure, or a request from a device that has not had its DMAC RAM block initialized.
4. `DMA RAM PARITY FAILURE`
   A parity error occurred on the DMAC internal RAM.
5. `CCIO - DATA PARITY FAILURE`
   A command received by the DMAC on a processor input/output (PIO) operation had bad parity.
6. `DMA - ROM PARITY FAILURE`
   A parity error was detected in the DMAC ROM.

Format 4 has six error types.

1. `BAD PARITY ON DIO BUS`
   The DMAC received bad parity from named CHANNEL ADDRESS device on data destined for the main memory during a DMA transfer.
2. `DIO - READY FAILURE`
   The named channel did not return a READY signal to the DMAC.
3. `DMA - ASW FAILURE`
   The named channel did not return all-seems-well (ASW) to the DMAC.
4. `DIO - ACKNOWLEDGE FAILURE`
   Either more than one or no channel responded to the DMAC.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. DMA - ADDRESS ERROR
   During the virtual to physical address translation, the DMAC found that the requested input/output access was not permitted to physical memory, or, during the data transfer, the data would have been written beyond the end of a segment.
6. DMA - CHANNEL REQUEST ERROR
   A device made a request with an invalid DMA RAM entry.

Format 5 has eleven error types.

1. PARITY DIVERT ERROR
   The named unit returned a word with bad parity.
2. PROTECTION VIOLATION
   A program tried to execute from a segment that did not have execute permission, or tried to write into a segment that did not have write permission.
3. OUT OF RANGE MEMORY REFERENCE
   A program tried to access unequipped memory.
4. OUT OF RANGE MEMORY REFERENCE (OTHER STORE)
   The off-line main memory considered the address to be out of range while the on-line memory did not. This usually indicates a problem with the off-line memory.
5. PRIVILEGED INSTRUCTION VIOLATION
   The program tried to execute one of the special instructions without a corresponding privilege bit set in the PSW.
6. BAD ALIGNMENT ON MEMORY REFERENCE
   This indicates software fault - the instruction executed with the wrong address (for example, a full-word instruction executed with a half-word address).
7. ILLEGAL OPERAND
   One of the operands specified in an instruction is invalid for the opcode.
8. ILLEGAL INSTRUCTION
   The data in the instruction buffer did not correspond to a valid instruction.
9. ILLEGAL STACK SWITCH
   The program attempted to switch to a private stack while running on a private stack, or attempted to switch to the kernel stack while it was already running on the kernel stack.
10. CCIO - COMMAND FAILURE
    A second programmed input/output order was sent to the DMAC before the first one was completed.
11. VIRTUAL ADDRESS OUT OF RANGE
    Microcode has determined that a virtual address is not mappable in a process's address space.

Format 6 has two error types.

1. 3/6 MAIN CHANNEL IO RESPONSE ERROR
   More than one device responded to an input/output address. See the *System Maintenance Manual*, ERROR REGISTER DESCRIPTION section, error bit 17.

SEE PROPRIETARY NOTICE ON COVER PAGE

2. `3/6 MAIN CHANNEL ADDRESS SEQUENCING ERROR`
   Either an illegal 3-out-of-6 (3/6) code on the CCIO bus, or more than one input/output pulse point was active in the command to the channel. See the *System Maintenance Manual*, ERROR REGISTER DESCRIPTION section, error bit 18.

Format 7 has three error types.

1. `PINV - PAGE INVALID`
   A process attempted to access a page that is not in its page table.
2. `SIND - SEGMENT INDEX TOO LARGE`
   Microcode detected a segment index too large for the segment being accessed.
3. `SINV - SEGMENT INVALID`
   A process attempted to access a segment that is not in its segment table.

Format 8 indicates that the maintenance channel is faulty, or a maintenance channel order has been sent to a processor that is not disabled or marked off-line.

Format 9 indicates the off-line CU memory controller has not responded to a memory access.

Format 10 indicates EIH was dispatched to handle an error, but no error bit in the error registers was set.

Format 11 indicates an error type which EIH does not recognize occurred.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = CU member number.

c = The date in the form `mm/dd/yy`, month/day/year.

d = The time in the form `hh:mm:ss`, hours:minutes:seconds.

e = The program address at the time of error interrupt (in hexadecimal). For software requested initializations, this is the address of the phase OST and not the address where the problem was detected.

f = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode - the kernel mode, kernel process, supervisor process, or user process. See the *System Maintenance Manual*, Appendix P.

g = The contents of the primary segment base register (in hexadecimal).

h = The contents of the secondary segment base register (in hexadecimal).

i = The contents, in hexadecimal, of the 16 general-purpose registers.

`R9:` argument pointer
`RA:` frame pointer
`RB:` stack pointer

j = Process utility ID (in hexadecimal). See the *System Maintenance*

Manual, Process / Problem Table.

k = Process number (in hexadecimal).

l = OST code (in hexadecimal).

m = OST arguments (in hexadecimal).

n = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

o = Unit name.

p = Member number.

q = The input / output address, in hexadecimal, of the channel that caused the problem.

r = The contents, in hexadecimal, of the dual serial channel (DSCH) channel status register. See the *System Maintenance Manual*, Appendix E.

s = The input / output address, in hexadecimal, of the DMAC that encountered the fault.

t = The contents, in hexadecimal, of the DMA status register. See the *System Maintenance Manual*, Appendixes C and D.

u = First word entry in the DMA RAM for the device that failed (in hexadecimal).

v = Second word entry in the DMA RAM for the device that failed (in hexadecimal).

w = Third word entry in the DMA RAM for the device that failed (in hexadecimal).

x = Fourth word entry in the DMA RAM for the device that failed (in hexadecimal).

y = Internal DMAC register contents (in hexadecimal). This data represents the last data word either written or read from main store.

z = Internal DMAC register contents (in hexadecimal). This data represents the value of the DMA incrementor which is a counter used by the DMAC to increment the physical address, map address, and the transfer count during the store operation.

a[1] = Internal DMAC register contents (in hexadecimal). This register is used as a scratch register by microcode during the virtual to physical translation in a DMA access.

b[1] = Contents of the channel data register (CDR), also known as the CCIO bus data register (in hexadecimal).

c[1] = Contents of the hardware status register (in hexadecimal).

d[1] = On-line maintenance channel status (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

e^1 = Community name.

f^1 = Community number.

g^1 = The invalid error interrupt type.

h^1 = The contents of the error register (ER) (in hexadecimal). See the *System Maintenance Manual*, Appendix F.

i^1 = The contents of the microinterrupt error register (UER) (in hexadecimal). See the *System Maintenance Manual*, Appendix N.

j^1 = The contents of the UER1 (in hexadecimal). See the *System Maintenance Manual*, Appendix O.

k^1 = The invalid error number.

l^1 = A string defining one of six possible error types:

```
MY STORE DURING DMA
MY STORE DURING DMA
BAD PARITY ON DMA READ
DMA RAM PARITY FAILURE
CCIO - DATA PARITY FAILURE
DMA - ROM PARITY FAILURE
```

m^1 = A string defining one of six possible error types:

```
BAD PARITY ON DIO BUS
DIO - READY FAILURE
DMA - ASW FAILURE
DIO - ACKNOWLEDGE FAILURE
DMA - ADDRESS ERROR
DMA - CHANNEL REQUEST ERROR
```

n^1 = For Model 1:

DMA CHANNEL STATUS REGISTER: $o^1o^1o^1o^1o^1o^1o^1o^1$

For Model 2:

CHANNEL DATA REGISTER: $p^1p^1p^1p^1p^1p^1p^1p^1$

o^1 = Status, in hexadecimal, of the channel under the DMAC that encountered the fault. See the *System Maintenance Manual*, Appendix B.

p^1 = The contents, in hexadecimal, of the faulted channels data register.

SEE PROPRIETARY NOTICE ON COVER PAGE

q^1 = A string defining one of eleven possible error types:

```
PARITY DIVERT ERROR
PROTECTION VIOLATION
OUT OF RANGE MEMORY REFERENCE
OUT OF RANGE MEMORY REFERENCE (OTHER STORE)
PRIVILEGED INSTRUCTION VIOLATION
BAD ALIGNMENT ON MEMORY REFERENCE
ILLEGAL OPERAND
ILLEGAL INSTRUCTION
ILLEGAL STACK SWITCH
CCIO - COMMAND FAILURE
VIRTUAL ADDRESS OUT OF RANGE
```

r^1 = A string defining one of two possible error types:

```
3/6 MAIN CHANNEL IO RESPONSE ERROR
3/6 MAIN CHANNEL ADDRESS SEQUENCING ERROR
```

s^1 = A string defining one of three possible error types:

```
PINV - PAGE INVALID X'a
SIND - SEGMENT INDEX TOO LARGE X'a
SINV - SEGMENT INVALID X'a
```

4. ACTION TO BE TAKEN

For Format 1, save the ROP output, note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 2, examine the DSCH channel status register layout to determine the error type, and run diagnostics on the unit.

For Formats 3 and 4, for all six error types, run diagnostics on the indicated unit.

For Format 5, for error types `PARITY DIVERT ERROR` and `CCIO - COMMAND FAILURE`, run diagnostics on the indicated unit.
For error types `PROTECTION VIOLATION`, `OUT OF RANGE MEMORY REFERENCE`, `PRIVILEGED INSTRUCTION VIOLATION`, `BAD ALIGNMENT ON MEMORY REFERENCE`, `ILLEGAL OPERAND`, `ILLEGAL INSTRUCTION` and `LLEGAL STACK SWITCH`, forward the software log entry information from `ERRLOG` to the next level of support.
For error type `OUT OF RANGE MEMORY REFERENCE (OTHER STORE)`, check the fuses in the off-line memory and replace as needed. Run diagnostics on the off-line memory.

For error type `VIRTUAL ADDRESS OUT OF RANGE`, save the information from output, note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 6, run diagnostics on the processor encountering the fault.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 7, save the information from output, note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 8, if the error occurs more than once in 24 hours, run diagnostics on the off-line processor. If no problem is found, switch processors and run diagnostics on the off-line processor.

For Format 9, check the update cables on both processors and run diagnostics on the off-line processor.

For Format 10, run diagnostics on the CU in which the error occurred and forward the information from ERRLOG and ROP output to the next level of support.

For Format 11, if possible, switch processors so that the faulty CU can be diagnosed. Forward the diagnostic results and the information from ERRLOG to the next level of support.

5. ALARMS

None. This automatically-generated report is for information only.

2. REASON FOR OUTPUT

To report error interrupts handled by the error interrupt handler (EIH) that are not associated with the main memory. Among the errors handled are input/output errors, direct memory access (DMA) errors, other control unit (CU) hardware errors, and software errors.

Format 1 indicates that the kernel determined that a process attempted an operating system trap (OST) with a bad argument.

Format 2 indicates that a faulty unit encountered a fatal error condition. The channel status and channel address are provided in the report.

Format 3 has six error types.

1. MY STORE A DURING DMA
   This error type indicates the DMA controller (DMAC) encountered a fatal main memory problem during DMA transfer. See the *System Maintenance Manual,* Register Layouts section of the Error Analysis chapter, Error Register error bit 6.

2. `MY STORE B DURING DMA`
   A device attempted to access a location in memory that is not physically equipped. See the *System Maintenance Manual*, Register Layouts section of the Error Analysis chapter, Error Register error bit 23.
3. `BAD PARITY ON DMA READ`
   The DMAC detected bad parity on its internal bus. This can be caused by a DMAC failure, or a request from a device that has not had its DMAC RAM block initialized.
4. `DMA RAM PARITY FAILURE`
   A parity error occurred on the DMAC internal RAM.
5. `CCIO - DATA PARITY FAILURE`
   A command received by the DMAC on a processor input/output (PIO) operation had bad parity.
6. `DMA - ROM PARITY FAILURE`
   A parity error was detected in the DMAC ROM.

Format 4 has six error types.

1. `BAD PARITY ON DIO BUS`
   The DMAC received bad parity from named CHANNEL ADDRESS device on data destined for the main memory during a DMA transfer.
2. `DIO - READY FAILURE`
   The named channel did not return a READY signal to the DMAC.
3. `DMA - ASW FAILURE`
   The named channel did not return all-seems-well (ASW) to the DMAC.
4. `DIO - ACKNOWLEDGE FAILURE`
   Either more than one or no channel responded to the DMAC.
5. `DMA - ADDRESS ERROR`
   During the virtual to physical address translation, the DMAC found that the requested input/output access was not permitted to physical memory, or, during the data transfer, the data would have been written beyond the end of a segment.
6. `DMA - CHANNEL REQUEST ERROR`
   A device made a request with an invalid DMA RAM entry.

Format 5 has eleven error types.

1. `PARITY DIVERT ERROR`
   The named unit returned a word with bad parity.
2. `PROTECTION VIOLATION`
   A program tried to execute from a segment that did not have execute permission, or tried to write into a segment that did not have write permission.
3. `OUT OF RANGE MEMORY REFERENCE`
   A program tried to access unequipped memory.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. OUT OF RANGE MEMORY REFERENCE (OTHER STORE)
   The off-line main memory considered the address to be out of range while the on-line memory did not. This usually indicates a problem with the off-line memory.
5. PRIVILEGED INSTRUCTION VIOLATION
   The program tried to execute one of the special instructions without a corresponding privilege bit set in the PSW.
6. BAD ALIGNMENT ON MEMORY REFERENCE
   This indicates software fault - the instruction executed with the wrong address (for example, a full-word instruction executed with a half-word address).
7. ILLEGAL OPERAND
   One of the operands specified in an instruction is invalid for the opcode.
8. ILLEGAL INSTRUCTION
   The data in the instruction buffer did not correspond to a valid instruction.
9. ILLEGAL STACK SWITCH
   The program attempted to switch to a private stack while it was running on a private stack, or attempted to switch to the kernel stack while it was already running on the kernel stack.
10. CCIO - COMMAND FAILURE
    A second programmed input/output order was sent to the DMAC before the first one was completed.
11. VIRTUAL ADDRESS OUT OF RANGE
    Microcode has determined that a virtual address is not mappable in a process's address space.

Format 6 has two error types.

1. 3/6 MAIN CHANNEL IO RESPONSE ERROR
   More than one device responded to an input/output address. See the *System Maintenance Manual,* Register Layouts section of the Error Analysis chapter, Error Register error bit 17.
2. 3/6 MAIN CHANNEL ADDRESS SEQUENCING ERROR
