   Either an illegal 3-out-of-6 (3/6) code on the CCIO bus, or more than one input/output pulse point was active in the command to the channel. See the *System Maintenance Manual,* Register Layouts section of the Error Analysis chapter, Error Register error bit 18.

Format 7 has three error types.

1. PINV - PAGE INVALID
   A process attempted to access a page that is not in its page table.
2. SIND - SEGMENT INDEX TOO LARGE
   Microcode detected a segment index too large for the segment being accessed.
3. SINV - SEGMENT INVALID
   A process attempted to access a segment that is not in its segment table.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 8 indicates that the maintenance channel is faulty, or a maintenance channel order has been sent to a processor that is not disabled or marked off-line.

Format 9 indicates the off-line CU memory controller has not responded to a memory access.

Format 10 indicates EIH was dispatched to handle an error, but no error bit in the error registers was set.

Format 11 indicates an error type which EIH does not recognize occurred.

Format 12 indicates that a non-correctable parity error has occurred during a DMA read of a memory location on the currently running CU.

Format 13 is for 3B21D machine only and indicates that a non-correctable parity error has occurred during a DMA read of a memory location on the currently running CU.

Format 14 indicates that an error has occurred because the memory controller of the mate processor had a store error A condition. This error occurs in the off-line CU, but is detected by the on-line CU.

Format 15 is for 3B21D machine only and indicates that an error has occurred because the memory controller of the mate processor had a store error A condition. This error occurs in the off-line CU, but is detected by the on-line CU.

Format 16 has four error types.

1. The `REPT NONCORRECTABLE PARITY ERROR ON MEMORY REFERENCE` indicates noncorrectable memory parity failure in the on-line CU.
2. The `OTHER STORE REFRESH PARITY ERROR` indicates a correctable parity error (other store D) in the mate processor. This type of error can only occur if the mate processor is in the standby state.
3. The `REPT OTHER STORE READ PARITY ERROR` indicates a noncorrectable memory error (`other store C`) in the mate processor. This type of error can only occur if the mate processor is in the standby state.
4. A `REPT MEMORY PARITY FAILURE` indicates a correctable memory failure occurred in the on-line processor (`my store D`).

Format 17 is for the 3B21D machine only. It is issued for the same reason as Format 16.

Format 18 is for the 3B21D machine only. This indicates that an error has occurred in the CC EAI hardware.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = CU member number.

SEE PROPRIETARY NOTICE ON COVER PAGE

c = The date in the form `mm/dd/yy`, month / day / year.

d = The time in the form `hh:mm:ss`, hours:minutes:seconds.

e = The program address at the time of error interrupt (in hexadecimal). For software-requested initializations, this is the address of the phase OST and not the address where the problem was detected.

f = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode - the kernel mode, kernel process, supervisor process, or user process. See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

g = The contents of the primary segment base register (in hexadecimal).

h = The contents of the secondary segment base register (in hexadecimal).

i = The contents, in hexadecimal, of the 16 general-purpose registers.

`R9:` argument pointer
`RA:` frame pointer
`RB:` stack pointer

j = Process utility ID (in hexadecimal). See the Error Analysis chapter of the *System Maintenance Manual,* Process / Problem Table.

k = Process number (in hexadecimal).

l = OST code (in hexadecimal).

m = OST arguments (in hexadecimal).

n = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

o = Unit name.

p = Member number.

q = The input / output address, in hexadecimal, of the channel that caused the problem.

r = The contents, in hexadecimal, of the dual serial channel (DSCH) channel status register. See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

s = The input / output address, in hexadecimal, of the DMAC that encountered the fault.

SEE PROPRIETARY NOTICE ON COVER PAGE

t = The contents, in hexadecimal, of the DMA status register. See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

u = First word entry in the DMA RAM for the device that failed (in hexadecimal).

v = Second word entry in the DMA RAM for the device that failed (in hexadecimal).

w = Third word entry in the DMA RAM for the device that failed (in hexadecimal).

x = Fourth word entry in the DMA RAM for the device that failed (in hexadecimal).

y = Internal DMAC register contents (in hexadecimal). This data represents the last data word either written or read from main store.

z = Internal DMAC register contents (in hexadecimal). This data represents the value of the DMA incrementor which is a counter used by the DMAC to increment the physical address, map address, and the transfer count during the store operation.

a^1 = Internal DMAC register contents (in hexadecimal). This register is used as a scratch register by microcode during the virtual to physical translation in a DMA access.

b^1 = Contents of the channel data register (CDR), also known as the CCIO bus data register (in hexadecimal).

c^1 = Contents of the hardware status register (in hexadecimal).

d^1 = On-line maintenance channel master status (in hexadecimal).

e^1 = Community name.

f^1 = Community number.

g^1 = The invalid error interrupt type.

h^1 = The contents of the error register (ER) (in hexadecimal). See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

i^1 = The contents of the microinterrupt error register (UER) (in hexadecimal). See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

j^1 = The contents of the UER1 (in hexadecimal). See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

k^1 = The invalid error number.

SEE PROPRIETARY NOTICE ON COVER PAGE

l^1 = A string defining one of six possible error types:

```
MY STORE A DURING DMA
MY STORE B DURING DMA
BAD PARITY ON DMA READ
DMA RAM PARITY FAILURE
CCIO - DATA PARITY FAILURE
DMA - ROM PARITY FAILURE
```

m^1 = A string defining one of six possible error types:

```
BAD PARITY ON DIO BUS
DIO - READY FAILURE
DMA - ASW FAILURE
DIO - ACKNOWLEDGE FAILURE
DMA - ADDRESS ERROR
DMA - CHANNEL REQUEST ERROR
```

n^1 = For Model 1:

DMA CHANNEL STATUS REGISTER: $o^1o^1o^1o^1o^1o^1o^1o^1$

For Model 2:

CHANNEL DATA REGISTER: $p^1p^1p^1p^1p^1p^1p^1p^1$

o^1 = Status, in hexadecimal, of the channel under the DMAC that encountered the fault. See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

p^1 = The contents, in hexadecimal, of the faulted channels data register.

q^1 = A string defining one of eleven possible error types:

```
PARITY DIVERT ERROR
PROTECTION VIOLATION
OUT OF RANGE MEMORY REFERENCE
OUT OF RANGE MEMORY REFERENCE (OTHER STORE)
PRIVILEGED INSTRUCTION VIOLATION
BAD ALIGNMENT ON MEMORY REFERENCE
ILLEGAL OPERAND
ILLEGAL INSTRUCTION
ILLEGAL STACK SWITCH
CCIO - COMMAND FAILURE
VIRTUAL ADDRESS OUT OF RANGE
```

r^1 = A string defining one of two possible error types:

```
3/6 MAIN CHANNEL IO RESPONSE ERROR
3/6 MAIN CHANNEL ADDRESS SEQUENCING ERROR
```

SEE PROPRIETARY NOTICE ON COVER PAGE

s[1] = A string defining one of three possible error types:

```
PINV - PAGE INVALID X'a
SIND - SEGMENT INDEX TOO LARGE X'a
SINV - SEGMENT INVALID X'a
```

t[1] = Internal DMAC register contents (in hexadecimal). This register contains the last main store memory accessed by DMA for either a read or a write.

u[1] = Internal DMAC register contents (in hexadecimal). This register contains the data being passed between the DMAC and the channels.

v[1] = Internal DMAC register contents (in hexadecimal). This register contains the current channel mask setup.

w[1] = For 3B21D:

On-line maintenance channel slave status (in hexadecimal).

For 3B20D:

This field is meaningless. It is set to 0xffffffff.

x[1] = On-line maintenance channel buffer (in hexadecimal).

y[1] = For 3B21D:

On-line maintenance channel slave command (in hexadecimal).

For 3B20D:

This field is meaningless. It is set to 0xffffffff.

z[1] = For 3B21D:

Off-line maintenance channel master status (in hexadecimal).

For 3B20D:

This field is meaningless. It is set to 0xffffffff.

a[2] = Off-line maintenance channel slave status (in hexadecimal).

b[2] = Off-line maintenance channel buffer (in hexadecimal).

c[2] = If bit 27 of the main store controller 0 trapped address register (TAR0) is set, TAR0 contains the address, in hexadecimal, where the fault occurred.

d[2] = The contents, in hexadecimal, of the main store controller 0 error register 1 (ER01). See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

e[2] = The contents, in hexadecimal, of the main store controller 0 error register 2 (ER02). See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

SEE PROPRIETARY NOTICE ON COVER PAGE

f^2 = The contents, in hexadecimal, of the main store controller 1 trapped address register (TAR1).

g^2 = The contents, in hexadecimal, of the main store controller 1 error register 1 (ER11). See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

h^2 = The contents, in hexadecimal, of the main store controller 1 error register 2 (ER12). See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual.*

i^2 = Error data (in hexadecimal).

j^2 = Physical memory address (in hexadecimal).

k^2 = The contents of the MCERT error address register. This is the address where the error occurred.

l^2 = The contents of the MCERT error register. This register has all the relevant information that caused an error B.

m^2 = The contents of the MCERT status register. This indicates the banks that are present, the size of each bank and the result of the march test.

n^2 = The contents of the MCERT command register.

o^2 = The contents of the MCERT strobe shape register. This register encodes the timing requirements for various operations in the MCERT circuit.

p^2 = The contents of the MCERT main memory register. This register has all the relevant error information.

q^2 = The contents of the data path MCERT error data register. This register contains the data when the error occurred.

r^2 = The contents of the data path MCERT status register. This register contains information that caused the error A, C, or D.

s^2 = The contents of the MCERT data path command register. This register contains application specific information.

t^2 = The bank number, in hexadecimal, corresponding to the physical memory address. A value of 0xFF is invalid. This indicates an error in accessing the MCERT (memory controller for the 3B21D machine).

u^2 = Contents of the EAI error register. This indicates the actual error on the EAI hardware.

SEE PROPRIETARY NOTICE ON COVER PAGE

y^2 = For Model 1:

CHANNEL DATA REGISTER: $p^1p^1p^1p^1p^1p^1p^1p^1$

For Model 2:

a blank line.

z^2 = A string defining one of four possible error types:

```
NONCORRECTABLE PARITY ERROR ON MEMORY REFERENCE
OTHER STORE REFRESH PARITY ERROR
OTHER STORE READ PARITY ERROR
MEMORY PARITY FAILURE
```

4. ACTION TO BE TAKEN

For Format 1, save the ROP output, note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 2, examine the DSCH channel status register layout to determine the error type, and run diagnostics on the unit.

For Formats 3 and 4, for all six error types, run diagnostics on the indicated unit.

For Format 5, for error types PARITY DIVERT ERROR and CCIO - COMMAND FAILURE, run diagnostics on the indicated unit.

For error types PROTECTION VIOLATION, OUT OF RANGE MEMORY REFERENCE, PRIVILEGED INSTRUCTION VIOLATION, BAD ALIGNMENT ON MEMORY REFERENCE, ILLEGAL OPERAND, ILLEGAL INSTRUCTION and ILLEGAL STACK SWITCH, forward the software log entry information from ERLOG to the next level of support.

For error type OUT OF RANGE MEMORY REFERENCE (OTHER STORE), check the fuses in the off-line memory and replace as needed. Run diagnostics on the off-line memory.

For error type VIRTUAL ADDRESS OUT OF RANGE, save the information from ERLOG output, note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 6, run diagnostics on the processor encountering the fault.

For Format 7, save the information from ERLOG output, note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 8, if the error occurs more than once in 24 hours, run diagnostics on the off-line processor. If no problem is found, switch processors and run diagnostics on the off-line processor.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 9, check the update cables on both processors and run diagnostics on the off-line processor.

For Format 10, run diagnostics on the CU in which the error occurred and forward the information from ERLOG and ROP output to the next level of support.

For Format 11, if possible, switch processors so that the faulty CU can be diagnosed. Forward the diagnostic results and the information from ERLOG to the next level of support.

For Formats 12 and 13, if the processor switched as a result of the error, run diagnostics on the processor encountering the fault.

For Formats 14 and 15, diagnose the fault unit and forward the diagnostic results and the information from ERLOG to the next level of support.

For Formats 16 and 17, if the error occurred on the off-line CU, check the update cable on both the processors. In all cases, run diagnostics on the faulty processor.

NOTE: To run CU diagnostics, the CU that is being diagnosed should be out of service and the other CU active.

Format 18 indicates a fault in the EAI hardware of the CC pack.

Some classes of EAI faults will cause hard failures for which there is no automatic recovery of the EAI. An example of this type of error is a stuck microprocessor address/data bit which will cause indeterminate code execution and block internal recovery. Invalid error register contents reported in the error log (e.g. 00) is an indication that the EAI hardware has detected a fault but is not able to perform fault recovery functions for the EAI. As a result of this hard fault, RTR fault recovery code will not be able to access the EAI hardware, including the EAI error register. The main symptom of this problem is that the EAI hardware routinely report errors even after automatic recovery. When this type of error occurs and if the CUs are in ACT/STBY state, a CU switch will occur and the machine will continue to run on the non-faulty CU (a CU switch will NOT occur if the CUs are in ACT/OOS state). Also, all other system functions should continue as normal.

In any case ensure that the machine is running on the other (non-faulty) CU and run diagnostics on the faulty CU. If the diagnostics fail, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG and ROP output to the next level of support.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

If a major alarm occurs (Format 18), it may not be service affecting, but take immediate action as indicated in the report.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `REPT FAN INHIBITS CLEARED` *a b*

[2] `REPT FAN INHIBITS NOT CLEARED` *a b*

[3] `REPT FAN INHIBIT TIMER HAS EXPIRED` *a b*

2. REASON FOR OUTPUT

To report on fan alarm scan points.

Format 1 indicates that the fan alarm scan points are no longer inhibited. This is a result of a 30-minute inhibit timer expiring.

Format 2 reports that the power switch monitor (PSM) failed to remove scan point inhibits.

Format 3 reports that the inhibit timer has expired and PSM is taking action to allow the points.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

4. ACTION TO BE TAKEN

If inhibits could not be cleared, information from the `REPT-PSM` output message will indicate the reason for the failure. Maintenance on the fan units may be required.

5. ALARMS

Formats 1, 2, and 3 are automatically-generated reports and are for information only.

Format 2 can also have a major alarm level for multiple fan failures, or a minor alarm level for single fan failures.

For a major alarm, failure may not be service affecting, but take immediate action as indicated in the report.

For a minor alarm, take action as indicated in the report.

SEE PROPRIETARY NOTICE ON COVER PAGE

6. REFERENCES

OMDB Keys
Formats 1, 2, and 3 have an OMDB key of 137.
Format 2 also has OMDB keys of 135 (major alarm) and 136 (minor alarm).

Output Message

GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has eight formats.

[1] `REPT FAN INHIBITS CLEARED` *a b*

[2] `REPT FAN INHIBITS NOT CLEARED` *a b*

[3] `REPT FAN INHIBIT TIMER HAS EXPIRED` *a b*

[4] `REPT FAN INHIBITS CLEARED` *c* `CABINET`

[5] `REPT FAN INHIBITS NOT CLEARED` *c* `CABINET`

[6] `REPT FAN INHIBIT TIMER HAS EXPIRED` *c* `CABINET`

[7] `REPT FAN ALARM` *c* `CABINET`

[8] `REPT FAN ALARM CLEARED` *c* `CABINET`

2. REASON FOR OUTPUT

To report on fan alarm scan points.

Formats 1 and 4 indicate that the fan alarm scan points are no longer inhibited. This is a result of a 30-minute inhibit timer expiring.

Formats 2 and 5 report that the power switch monitor (PSM) failed to remove scan point inhibits.

Formats 3 and 6 report that the inhibit timer has expired and the the PSM is taking action to allow the points.

Format 7 reports a scan point transition which indicates a fan alarm in one of the cabinets of the 3B21D computer.

Format 8 reports a scan point transition which indicates the fan alarm in one of the cabinets of the 3B21D computer was cleared.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Basic or growth cabinet.

4. ACTION TO BE TAKEN

For Formats 1 through 6, if inhibits could not be cleared, information from the REPT-PSM output message will indicate the reason for the failure. Maintenance on the fan units may be required.

For Format 7, determine if the fan units in the indicated cabinet of the 3B21D computer need to be repaired. If all fan units are operational, then fan alarm is the result of the fan circuitry experiencing excessive heat. This causes the fan to run at high speeds. Seek technical assistance if needed.

For Format 8, no action is needed.

5. ALARMS

Formats 1 through 6 and 8 are automatically-generated reports and are for information only.

Format 2 can also have a major alarm level for multiple fan failures, or a minor alarm level for single fan failures.

Format 5 can also have a critical alarm level for fan alarms within the basic cabinet of the 3B21D computer, or a major alarm level for fan alarms within the growth cabinet of the 3B21D computer.

Format 7 has a critical alarm level for fan alarms within the basic cabinet of the 3B21D computer, or a major alarm level for fan alarms within the growth cabinet of the 3B21D computer.

For a critical alarm, take immediate action to clear the problem. Seek technical assistance if needed.

For a major alarm, the problem may not be service affecting, but take immediate action as indicated in the report.

For a minor alarm, take action as indicated in the report.

1. FORMAT

`REPT FIELD MAINT` *a*

2. REASON FOR OUTPUT

To report that a poked input message from a field maintenance command page has failed.

3. VARIABLE FIELD DEFINITIONS

a = Reason for failure.

`DISPLAY PAGE FAILED` - A request for the display administration process to display the input page failed.

`INPUT BUFFER LIMIT EXCEEDED` - `Fmctrl` could not store all of the input message line in the command buffer.

`INPUT TEXT EXECUTION FAILED` - Failure to communicate with the craft shell when passing the input message for processing.

`MESSAGE NOT RECEIVED` - An attempt to update the screen via sending a message string to the display administration process has failed.

`UNABLE TO SEND MESSAGE TO DAP` - An attempt to communicate with the display administration process failed.

`UNKNOWN INDICATOR` - The input message was not found in the `fmctrl` command table.

4. ACTION TO BE TAKEN

If the error does not involve the display administration process, retry the command. If the error does involve display administration process (DAP), restart DAP. If this does not correct the problem, seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

`WARNING` — File system is in danger of overflowing, possibly within two hours.
`CRITICAL` — File system is completely full.

b = File system name.

4. ACTION TO BE TAKEN

Manual action may be required to remove data from the file system named. In order to remove data safely, the user must know which files in the file system are permanent and which are temporary. Refer to the application's specific document for file system maintenance and trouble-clearing procedures.

After the files are removed, the amount of free space in the file system can be displayed by using the UNIX® command `df`, or the craft command `OP:STATUS;FREEDISK`. If the free space is still low, or if the file system overflow condition continues, it is likely that some active processes have opens on files in the file system. The removal of files will not take effect until all opens to the file are closed.

The processes with active opens can be identified by using the UNIX® command `umount`, or the Craft command `INH:FILESYS;UMOUNT`. The `umount` command will fail to unmount if there are open files in the file system. The processes with active opens may have to be terminated to remove the overflow condition, but discretion is advised. In case of uncertainty, the next level of support personnel should be consulted.

In particular, when an overflow condition is reported for `/dev/tmp`, it is recommended that a corrective measure be taken to clear the overflow condition. A shortage in `/dev/tmp` free space may result in loss or mutilation of ROP messages, or other unforeseen malfunctions in the system.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT FMGR a TABLE b FAIL
ERROR = c DATA X'd
```

2. REASON FOR OUTPUT

To report an alteration or a failed attempt to alter the size of file manager (FMGR) tables.

3. VARIABLE FIELD DEFINITIONS

a = Name of FMGR table:

- CAPABILITY - Capability table.
- FILE - File table.
- INODE - Inode table.

b = Action taken on FMGR table:

- GROWTH - Increase in size.
- DEGROWTH - Decrease in size.

c = Reason FMGR was unable to grow:

1 - System is currently in disk independent operation (DIOP).

2 - Insufficient time since last unsuccessful growth attempt.

3 - Resource is already at its maximum size.

4 - Cannot allocate a message buffer for message to the memory manager.

5 - Cannot allocate additional memory.

6 - Cannot send the message to the memory manager.

7 - Another task is growing the resource.

d = If non-zero, status indicates why memory menager cannot allocate additional memory.

4. ACTION TO BE TAKEN

If GROWTH failure, reduce system load. If DEGROWTH failure, FMGR will deallocate as needed at a later time.

SEE PROPRIETARY NOTICE ON COVER PAGE

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT FMGR DIR SW FAILED:
INODE a OPEN BY PID b ON c
```

2. REASON FOR OUTPUT

To report that a directory switch request failed because of a busy inode.

3. VARIABLE FIELD DEFINITIONS

a = The busy inode number.

b = The process ID of the process that has the inode open.

c = The name of the file system that contains the inode.

4. ACTION TO BE TAKEN

Kill the process(es) that has the inode open and try the switch again. Repeat until all processes that have inodes open in the directory structure have been killed. If the switch still does not succeed, report the problem to UNIX® RTR system support.

5. ALARMS

None. This automatically-generated report is for information only.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT FMGR ECD` *a* `PID=`*b* `UID=`*c d*

2. REASON FOR OUTPUT

To report that the file manager attempted to access an equipment configuration database (ECD) record defining a special device file. In the attempt, something malfunctioned.

3. VARIABLE FIELD DEFINITIONS

a = `RETURN-XX`. The `lla` access function failed, returning `xx`. This would normally indicate that the special device file is not in the database.

= `BAD-PERM`. One or more of the file permissions exceeded the value of seven.

= `BAD-DCN`. The major device number is invalid for the specified driver type.

= `BAD-DRIVER`. The driver type is undefined.

= `BAD-FIFO`. The partition number exceeded the maximum allowed for a fifo device.

b = Process ID of the process that sent the message to the `FMGR`.

c = Utility ID of the process that sent the message to the `FMGR`.

d = Fully qualified pathname for which the ECD access occurred.

4. ACTION TO BE TAKEN

The driver required information normally extracted from the ECD will instead be used as specified in the special device file contained in the file system. If the special device file information (the `mdct-rid`, partition, and dcn) is inappropriate, then the ECD must be corrected.

5. ALARMS

None. This automatically-generated report is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT FMGR` *a* `IN FILE SYSTEM` *b*

2. REASON FOR OUTPUT

To report that space for a file system could not be allocated during falloc() or writetape() (POSSIBLE CORRUPTION), or that static data in the root file system incore super block was corrupted but has been recovered (SUPER BLOCK RECOVERED).

3. VARIABLE FIELD DEFINITIONS

a = Reason for FMGR FILSYS output message:

`POSSIBLE CORRUPTION` - Build of a file system's bitmap failed (during falloc() or writetape()), and file system may be corrupted.

`FMGR INCORE SUPER BLOCK RECOVERED` - Static data in root file system incore super block was corrupted but has been recovered.

b = The name of the file system.

4. ACTION TO BE TAKEN

For POSSIBLE CORRUPTION, run file system audits. For FMGR INCORE SUPER BLOCK RECOVERED, file system audit has been requested; examine output when audit completes. If condition persists, report audit results and name of file system to next level of technical support.

5. ALARMS

None.

REPT FMGR MOUNT FAILED:
PROCESS PID=a,UID=b,HAS OPEN MOUNT POINT=c
```

2. REASON FOR OUTPUT

To report that mount failed and print the pid and uid of the process which has the mount point open.

3. VARIABLE FIELD DEFINITIONS

a = The pid of the process which has the mount point open.

b = The uid of the process which has the mount point open.

c = The name of the mount point.

4. ACTION TO BE TAKEN

Kill the processes which have the mount point open and retry the mount. If the mount still does not succeed, report the problem to UNIX® RTR System Support.

5. ALARMS

None. This automatically-generated report is for information only.

1. FORMAT

`REPT FMGR NONTASK FAULT` *a* `ADDR` *b*

2. REASON FOR OUTPUT

To report that a file manager fault has occurred that was not within a task.

3. VARIABLE FIELD DEFINITIONS

a = Fault code. See DFC Appendix I, `DFC-APPI`.

b = Program address at which the fault occurred.

4. ACTION TO BE TAKEN

The fault has been resolved by the file manager and no further action should be necessary. Should this condition become chronic, the problem should be referred to UNIX® RTR System Support.

5. ALARMS

None. This automatically-generated report is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT FMGR:` *a* `TABLE OVERLOAD` *b*`, COUNT =` *c*

2. REASON FOR OUTPUT

To report that one of the file manager tables is approaching an overload condition or to report that the overload condition has been cleared.

3. VARIABLE FIELD DEFINITIONS

a = Name of file manager internal table.

`INODE` - Inode table.

`FILE` - File table.

`CAP` - Capability table.

b = Indicates severity of overload.

`WARNING` - Most table entries have been allocated, still a few free entries.

`CRITICAL` - Very close to complete exhaustion.

`CLEARED` - A number of table entries have been freed since last warning/critical report.

c = Number of table entries in use.

4. ACTION TO BE TAKEN

No action is necessary. `AUD:FMGR;2`, `AUD:FMGR;4`, or `AUD:FMGR;5` could be taken to ensure correctness of the use count of the inode, file, or capability table.

5. ALARMS

None.

MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT FMGR PROCESS KILLED BY UNCONDITIONAL MOUNT
PID=a, UID=b, MOUNT POINT=c
```

2. REASON FOR OUTPUT

To report that the FMGR has terminated a process due to an unconditional mount request.

If the FMGR is requested to mount a file system unconditionally, all non-kernel processes that have the mount point open (for example, a process with the mount point at its current working directory) will be terminated.

3. VARIABLE FIELD DEFINITIONS

a = Process ID of the terminated process.

b = Utility ID of the terminated process.

c = Mount point of the unconditional mount request.

4. ACTION TO BE TAKEN

Important system processes should restart automatically, so no direct action is required of the craft. Save the receive-only printer (ROP) output and seek technical assistance to determine why it was necessary to terminate the indicated process.

5. ALARMS

None. This automatically-generated report is for information only.

`REPT FMGR TASK STATUS` *a*`, PID=`*b* `TYPE=`*c* `ADDR=`*d*

2. REASON FOR OUTPUT

To report that a file manager task has been prematurely terminated.

3. VARIABLE FIELD DEFINITIONS

a = Reason for task termination:

`FAULT` - Task was running when a file manager fault occurred.

`PHASE1` - Task was running when a phase level 1 occurred.

`TIMEOUT` - Task execution time exceeded limit.

b = Process ID of the process that requested the task: in decimal.

c = Type of message (from `head/mstyp.h`) that initiated the task: in decimal.

d = Address of resource that a timed out task was waiting for: in hexadecimal.

4. ACTION TO BE TAKEN

An error condition has been resolved by the file manager. No further action is necessary.

```
REPT FMGR UNMOUNT FAILED:
PROCESS a HAS OPEN FOR INODE b FOR c
```

2. REASON FOR OUTPUT

To report that an unmount request failed because the file system is busy, and to specify which processes have locks on files in the file system to be unmounted.

3. VARIABLE FIELD DEFINITIONS

a = The process ID of the process which has the inode open.

b = The busy inode number.

c = The name of the file system.

4. ACTION TO BE TAKEN

Support processes such as recent change, audits and measurements may be killed. Kill the processes that have the inodes open and try the unmount again. Some processes affect call processing and should never be killed. If the unmount still does not succeed, report the problem to the next level of technical support and/or contact technical support for assistance in determining which processes may be killed.

This message has two formats.

[1] `REPT FMGR` *a* `UNMOUNTED DUE TO DISK REMOVAL`

[2] `REPT FMGR UNMOUNT FAILED:`
`PROCESS` *b* `HAS OPEN FOR INODE` *c* `FOR` *d*

2. REASON FOR OUTPUT

Format 1 reports that the file manager has unmounted the named file system due to disk removal (by fault or request).

Format 2 reports that an unmount request failed because the file system is busy, and to specify which processes have locks on files in the file system to be unmounted.

3. VARIABLE FIELD DEFINITIONS

a = The name of the file system unmounted.

b = The process ID of the process which has the inode open.

c = The busy inode number.

d = The name of the file system.

4. ACTION TO BE TAKEN

For Format 1, no action needs to be taken.

For Format 2, support processes such as recent change, audits and measurements may be killed. Kill the processes that have the inodes open and try the unmount again. Some processes affect call processing and should never be killed. If the unmount still does not succeed, report the problem to the next level of technical support and / or contact technical support for assistance in determining which processes may be killed.

5. ALARMS

Formats 1 and 2 are automatically-generated reports and are for information only.

1. FORMAT

This message has two formats.

[1] `REPT FUSE ALARM` *a* `CABINET`

[2] `REPT FUSE ALARM CLEARED` *a* `CABINET`

2. REASON FOR OUTPUT

To report on fuse alarm scan points.

Format 1 reports a scan point transition which indicates a fuse alarm in one of the cabinets of the 3B21D computer.

Format 2 reports a scan point transition which indicates a fuse alarm was cleared in one of the cabinets of the 3B21D computer.

3. VARIABLE FIELD DEFINITIONS

a = Basic or growth cabinet.

4. ACTION TO BE TAKEN

For Format 1, determine if any of the fuses, within the indicated cabinet of the 3B21D computer, need to be repaired.

For Format 2, no action is needed.

5. ALARMS

Format 1 has a major alarm. The problem may not be service affecting, but take immediate action as indicated in the report.

Format 2 is an automatically-generated report and is for information only.

[8] `REPT GRASP NOT STARTED`
`RETRY LATER` *f*

2. REASON FOR OUTPUT

To report on generic access package (GRASP) conditions of a general or emergency nature.

3. VARIABLE FIELD DEFINITIONS

a = Condition reported:

`DATA BUF` — GRASP dump data is affected.
`DYNAMIC` — The status of the dynamic timer is changing.
`FLDOP` — There are other field operation processes with which GRASP cannot coexist. GRASP cannot proceed.

SEE PROPRIETARY NOTICE ON COVER PAGE

MESSAGE BUF — GRASP completion messages are affected.
STATIC — The status of the static timer is changing.
UC — The utility circuit is affected.

b = Status:

ABORT — GRASP is being terminated. Do not issue further messages immediately. No further message expected.
FULL — The trace was stopped as requested in the INIT:UMEM input message. Trace memory is full.
LOST — The timer override has been lost and the default will take effect with the next debugging session.
OVFL — More data is being produced than can be printed. The oldest data is overwritten with the newest data.
RESET — The default value of the timer is in effect. BREAKPOINT CLEARED BYSYSTEM DIRECTIVE #G*e*, where *e* indicates the generic access package (GRASP) sequence number associated with the breakpoint removed.
UNAV — The facility in *a* is not available.

c = WAS RUNNING NOW STOPPED. Indicates that the trace was stopped. Printed only if *a* = UMEM and *b* = FULL.

d,f,i = Numeric identifier (one or more decimal digits) for the breakpoint affected.

e = Generic Access Package (GRASP) execution sequence number.

g = Utility ID (UID) of the target process as specified in Practice 254-341-115.

h = Process ID (PID) of the target process.

j = Firing number (one or more decimal digit) of breakpoint.

k = RANGE ERROR (DTIME) or (STIME)
RANGE ERROR (UNTIL)

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

Practice 254-341-115 *Generic Access Package (GRASP) and Enhanced Generic Access Package (EGRASP) Software Subsystem Description*

ID . . . . . REPT-GROWTH
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . VAR,DSKSYS

1. FORMAT

`REPT GROWTH` *a b c* [*d*]

2. REASON FOR OUTPUT

To report when a unit is grown. This could be either due to normal initialization or due to a craft person dynamically growing a unit.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = `COMPLETED`, `IN PROGRESS`, or `FAILED`.

d = Reason for failure.

d is printed only if *c* = `FAILED`.

For an Input/Output Processor (IOP) unit, refer to IOP Appendix J, `IOP-APPJ` for an explanation of the error code.

4. ACTION TO BE TAKEN

No action is needed if *c* indicates `COMPLETED` or `IN PROGRESS`.

If *c* is `FAILED` and the unit name is an IOP or an IOP subunit, check the error code to determine action.

If *c* is `FAILED` and the unit name is a DFC or a DFC subunit, see accompanying `REPT-DKDRV` report on the ROP for the error/info code. Refer to DFC Appendix A, `DFC-APPA` for an explanation of the error/info code.

5. ALARMS

None. This automatically-generated report is for information only.

Output Message
REPT-DKDRV

ID . . . . . REPT-HSD
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAIPR,SPERR,MAINT

1. FORMAT

This message has four formats.

[1] `REPT HSD` *a* {`ERROR` *b* [*c*] [`COMPL CODE` *d*] |
`UNIDENTIFIED RESPONSE WD1=`*e* `WD2=`*f*}

[2] `REPT HSD` *a* `WARNING LAST LINK IN DUPLEX LINK GROUP BEING REMOVED`

[3] `REPT HSD` *a* `STARTED`

[4] `REPT HSD` *a* `STOPPED`

2. REASON FOR OUTPUT

Format 1 reports a high speed synchronous data (HSD) link related software or hardware error.

Format 2 reports the last available link in a duplex link group is being removed from service.

Format 3 reports that the HSD has changed state from STBY to ACT. An HSD will change to ACT state when the level 2 connection is established, and the data link is in information transfer state.

Format 4 reports that the HSD has changed state from ACT to STBY. An HSD will change to STBY state when the level 2 connection is terminated, and the level 1 connection remains established.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies, in hexadecimal notation, the point within the IOP driver (IODRV) where a software or hardware error was detected. See IOP Appendix F, `IOP-APPF`.

c = Character string giving more information about the error identified in *b* above. Refer to IOP Appendix F, `IOP-APPF` for additional explanation.

d = Hardware error type, in hexadecimal notation. See IOP Appendix A, `IOP-APPA`.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = First word of an unidentified completion report.

f = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

For Format 2, removal of the last available link in a duplex link group indicates that no data transmission can take place over the link facility. One of the links in the group should be repaired and then restored to service.

Formats 3 and 4 are informational messages and indicate that the HSD has changed states. No action is necessary.

5. ALARMS

Format 1 has no alarm. The automatically-generated report is for information only.

Format 2 has a major alarm. A major alarm may not be service affecting, but take immediate action as indicated in the report.

Formats 3 and 4 have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

6. REFERENCES

OMDB Key(s)
Format 1 has an OMDB key of 208.
Format 2 has an OMDB key of 590.
Formats 3 and 4 have an OMDB key of 308.

1. FORMAT

[1] `REPT HSDC` *a* {`ERROR` *b* [`COMPL CODE` *c*] |
`UNIDENTIFIED RESPONSE WD1=`*d* `WD2=`*e*}

[2] `REPT HSDC` *a* `CODE VERSION X'`*f*

[3] `REPT HSDC` *a* `FLASH RAM VERSION X'`*g*

2. REASON FOR OUTPUT

Format 1 reports a high-speed synchronous data link controller (HSDC) related software or hardware error.

Format 2 is output during the restoration of the unit.

Format 3 is requested by diagnostics and output prior to the update of flash RAM on the unit.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies the point, in hexadecimal notation, within IODRV (IOP driver) where a software or hardware error was detected. See IOP Appendix F, `IOP-APPF`.

c = Hardware error type, in hexadecimal notation. See IOP Appendix A, `IOP-APPA`.

d = First word of an unidentifiable completion report.

e = Second word of an unidentifiable completion report.

f = Peripheral controller pump code version number.

g = Peripheral controller flash RAM version number.

4. ACTION TO BE TAKEN

Format 1 is an error message that indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Formats 2 and 3, no action is necessary unless the controller and/or its subdevices are not acting normal, or cannot be restored. Contact the service organization with the code version number and/or flash RAM version number that was used.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-INHADM
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has five formats.

[1] `REPT INHADM UNABLE TO MAINTAIN INHIBITS`

[2] `REPT INHADM FAULTED FCODE` *a*

[3] `REPT INHADM UNABLE TO SEND INHIBIT MESSAGE TO DRIVER` *b*

[4] `REPT INHADM CANNOT GET UCB RECORD`

[5] `REPT INHADM MINOR ALARM FROM INHIBIT ADMINISTRATOR`

2. REASON FOR OUTPUT

For Format 1, to report that the inhibit administrator process attempted to maintain consistency of the error interrupt inhibits between the emergency action interface (EAI) and the unit control blocks (UCBs) in the equipment configuration database (ECD) during an initialization, but failed to access the ECD or could not send a message to a driver. The error interrupt inhibit options selected by the EAI must be propagated to the ECD on any initialization to ensure consistency.

For Format 2, the inhibit administrator received the fault *a*.

For Format 3, the inhibit administrator does not inhibit a device directly, it sends a message to the corresponding driver. This error indicates that the "queuemn" system call failed when sending to the driver with process id (PID) *a*.

For Format 4, an ECD access function (either `lla_opensq` or `lla_nextseq`) failed when accessing a UCB record.

For Format 5, inhibiting hardware checks, software checks, and error interrupts can prevent the system from recovering automatically from hardware or software faults. This error is printed when any of the checks are inhibited as a warning to the user.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Fault code received by INHADM. See the Fault Code Appendix, FAULT-CODE-APP.

b = PID of driver.

4. ACTION TO BE TAKEN

For Formats 1-4, run ECD audits. If there are no errors in the ECD, then seek technical assistance. For format 5, no action is required.

5. ALARMS

None. This automatically-generated report is for information only.

Minor alarm. Take action as indicated in the report.

`REPT INHIBIT SCAN POINT` *a* `ON SCSD` *b*

2. REASON FOR OUTPUT

To report that the scanner and signal distributor administrator (SCSDA) has detected a scan point which is chattering (greater than four transistors a second).

3. VARIABLE FIELD DEFINITIONS

a = Physical scan point number.

b = Member number.

4. ACTION TO BE TAKEN

This message indicates that a scan point is changing state continually. This could cause a message buffer overload for the clients of the SCSDA monitoring that point. This scan point should be investigated to determine why it is changing state frequently.

5. ALARMS

Minor alarm. Take action as indicated in the report.

6. REFERENCES

None.

```
REPT INIT DEVICE STATUS
a b c
```

2. REASON FOR OUTPUT

To report initial device states obtained from the equipment configuration database (ECD) by the real time status report program.

3. VARIABLE FIELD DEFINITIONS

This message is printed as a table with multiple lines containing the following items.

a = Hardware unit name:

- CSU - Cache store unit
- CU - Control unit
- DFC - Disk file controller
- EAI - Emergency action interface
- IOP - Input/output processor
- MHD - Moving head disk
- MTTY - Maintenance teletypewriter
- MTTYC - Maintenance teletypewriter controller
- ROP - Receive only printer
- SCC - Switching control center

b = Unit number in decimal notation.

c = Unit status:

```
ACTIVE
GROWTH IN PROGRESS
INITIALIZING
OFF LINE
OUT OF SERVICE
STANDBY
UNAVAILABLE
UNEQUIPPED
```

4. ACTION TO BE TAKEN

TYPE . . . . . Output
MESSAGE CLASS . . VAR

1. FORMAT

`REPT IODRV ERR X'ld50000` *a b c d e f g*

2. REASON FOR OUTPUT

To report an input/output processor (IOP) related software error.

3. VARIABLE FIELD DEFINITIONS

a = Single character for device type. See the *Processor Recovery Message Guide*, Appendix D.

b = Real time stamp in eight alphanumericals.

c = Single character for the unit number in hexadecimal.

d = Alphanumerical location code indicating calling function:

1	— ioccerror
2	— cserror
3	— sserror
4	— dserror
7	— pcnotequip
8	— pcommoff
a	— prtfault
10-13	— kfault
15	— procfmsg
16	— callphase
17	— iopfatal
18	— iop1fatal
19	— feaioprm
20	— seaioprm

e = If field *d i 1* is 4 or 7, then this field contains a four-digit (hexadecimal) error code. Error codes are defined in IOP Appendix F, IOP-APPF.

If field *d* is 8, then this field contains a four-digit (hexadecimal) code of 2400. This indicates that the PC community is powered down.

If field *d* is a, 10 - 13, or 15, then this field contains a one- or two-digit (hexadecimal) fault code. Fault codes are defined in IOP Appendix E, IOP-APPE.

SEE PROPRIETARY NOTICE ON COVER PAGE

If field *d* is 16, then this field contains a single-digit panic code. Panic codes are defined as follows:

1 - Encountered a fault while handling a fault.

2 - Excessive S/W faults.

3 - Excessive unrecoverable errors while processing a fault.

4 - Excessive unrecoverable errors while processing a fault where the IOPs were affected but not implicated.

If field *d* is 17 - 20, this field contains a two-digit (hexadecimal) code that represents the function within a major step. This is the same code that would be found in digits 4 and 5 of the PRM, function within a major step (also known as PRM number), had the PRM been issued. The meanings of these codes can be found in the *Process Recovery Messages Guide* by finding the IOP Driver PRM (digit 1 is a 7) with the indicated function-within-a-major-step, and reading the PRM description.

f = Additional error code for debugging in hex.

g = Additional error code for debugging in hex.

4. ACTION TO BE TAKEN

An error report is indicative of an error condition which could result in the removal of a unit. Units that are removed should be repaired and restored to service.

5. ALARMS

None. This automatically-generated report is for information only.

1. FORMAT

```
REPT IODRV ERROR a [b]
```

2. REASON FOR OUTPUT

To report an input/output processor (IOP) related software error.

3. VARIABLE FIELD DEFINITIONS

a = Location code in hexadecimal indicating the fault source. Refer to IOP Appendix F, IOP-APPF for more information.

b = Character string giving more information about the error. Refer to IOP Appendix F, IOP-APPF for more explanation.

4. ACTION TO BE TAKEN

An error report is indicative of an error condition which could result in the removal of a unit. Units that are removed should be repaired and restored to service.

5. ALARMS

None. This automatically-generated report is for information only.

```
REPT IODRV FAULT CODE a [b] [VIRTUAL ADDRESS c]
```

2. REASON FOR OUTPUT

To report an input/output processor (IOP)-related software error.

3. VARIABLE FIELD DEFINITIONS

a = Input/output driver (IODRV) fault code. See IOP Appendix E, IOP-APPE.

b = Sequence number for stack back trace of d5 fault code (bad OST). The most recent function called will be listed first.

c = Virtual address within IODRV where fault occurred, if IODRV was running at the time. If this message is a d5 fault stack back trace, the address is the program address from the stack.

4. ACTION TO BE TAKEN

An error report is indicative of an error condition which could result in the removal of a unit. Units that are removed should be repaired and restored to service.

1. FORMAT

This message has ten formats.

[1] `REPT IOP` *a* `ERROR` *b* [*q*]

[2] `REPT IOP` *a* `ERROR` *b* `COMPL CODE` *c*

[3] `REPT IOP` *a* `ERROR` *b* `CHAN STATUS` *d*

[4] `REPT IOP` *a* `ERROR` *b* `BIC STATUS` *e*

[5] `REPT IOP` *a* `ERROR` *b* `DBS STATUS` *f*

[6] `REPT IOP` *a* `NOT EQUIPPED` *g h* `SLOT` *i*

[7] `REPT IOP` *a* `PC COMMUNITY` *j* `POWER REMOVED`

[8] `REPT IOP` *a* `UNIDENTIFIED RESPONSE  WD1=`*k* `WD2=`*l*

[9] `REPT IOP` *a* `CODE VERSION` *m*

[10] `REPT IOP` *a* `MEM ALLOC` *n* `MEM USED` *p*

2. REASON FOR OUTPUT

To report an input/output processor (IOP)-related software or hardware error, or the occurrence of an abnormal IOP-related event.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies the point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. See IOP Appendix F, `IOP-APPF`.

c = Hardware error type, in hexadecimal notation. See IOP Appendix A, `IOP-APPA`.

d = Returned channel status, in hexadecimal notation. See IOP Appendix B, `IOP-APPB`.

e = Returned bus interface controller (BIC) status, in hexadecimal notation. See IOP Appendix C, `IOP-APPC`.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = Returned duplex bus selector (DBS) status, in hexadecimal notation. See IOP Appendix D, `IOP-APPD`.

g = Unit name of missing PC.

h = Member number of missing PC.

i = Pack position of missing PC (0-15).

j = Identifies PC community that is powered down (0-3).

k = First word of an unidentifiable completion report.

l = Second word of an unidentifiable completion report.

m = Version number of code that exists in the device.

n = Number of bytes received.

p = Number of bytes requested.

q = Character string giving more information about the error.

4. ACTION TO BE TAKEN

With the exception of Formats 6 and 7, the error messages indicate error conditions that could cause the removal of a unit. Any removed unit should be repaired and restored to service. Formats 6 and 7 indicate improper manual operations.

5. ALARMS

None.

1. FORMAT

`REPT IORMVRST ERROR` *a b*

2. REASON FOR OUTPUT

To report an error condition in the `IORMVRST` user process.

3. VARIABLE FIELD DEFINITIONS

a = Function call failure type:

`1` - Message enable.
`2` - Receive wait.
`3` - Send to port.

b = Error code returned by the failing function call.

4. ACTION TO BE TAKEN

An operating system function call is failing; seek technical assistance to clear the trouble.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

1. FORMAT

`REPT KAUDPRC FAULT CODE` *a* [`AUDIT` *b c*]

2. REASON FOR OUTPUT

To report that the kernel audit process was faulted.

3. VARIABLE FIELD DEFINITIONS

a = Fault code, in hexadecimal notation.

b = Name of audit running when fault occurred, if an audit was running.

`MMGR` — Memory manager audits.

c = Audit member. One of the following:

`1` — Segment descriptor table (SDT) audit.
`2` — Page table (PGT) audit.
`3` — Page descriptor table (PDT) audit.
`4` — Segment release audit.
`5` — Segment unlock audit.

`MSGBUF` — Message buffer audits.

c = Audit member. One of the following:

`1` — Message queue audit.
`2` — Message extender audit.

`PROAD` — Process administration audits.

c = Audit member. Is the following:

`1` — Process creation and termination audits.

4. ACTION TO BE TAKEN

Report the occurrence of the message if an audit is identified in the message.

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-KLLA
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has 14 formats.

[1] `REPT KLLA TASK STATUS - `*a*`, PID=`*b*` TYPE=`*c*` ADDR=`*d*

[2] `REPT KLLA NON-TASK FAULT `*e*` ADDR `*f*

[3] `REPT KLLA STOP AND FLUSH IN PROGRESS FOR `*g*

[4] `REPT KLLA RECOVERY FAILED, RELEASED DATABASE `*g*

[5] `REPT KLLA NO PROCESS ATTACHED, RELEASE DATABASE `*g*

[6] `REPT KLLA {ADD|GROW|FREE} SEGMENT ERROR = `*h*` INDEX = `*j*

[7] `REPT KLLA UNSHARE SEGMENT FAILED INDEX = `*j*

[8] `REPT KLLA MEMORY LOCK CLEARED`

[9] `REPT KLLA LOCK CLEARED ON `*g*

[10] `REPT KLLA BAD MESSAGE QUEUE REPAIRED FOR `*g*

[11] `REPT KLLA UPDATE MAP OVERLOAD FOR `*g*

[12] `REPT KLLA FILENAME TOO LONG `*k*

[13] `REPT KLLA LLA ERROR CODES `*m*

[14] `REPT KLLA LLA DATA SEGMENT ERROR`

2. REASON FOR OUTPUT

To report status or error conditions in the process `/prc/klla`.

Format 1 - Report that a task was faulted or timed out.

Format 2 - Report that `/prc/klla` faulted while not in a task.

Format 3 - Report that a database is in a stop and flush mode. Output approximately every five minutes while the stop and flush is in effect.

Format 4 - Report that an attempt to recover from a fault has failed and that the database is being related.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5 - Report that no living process remains attached to a database and therefore the database is being released.

Format 6 - Report an error in adding or freeing dynamic memory.

Format 7 - Report that a shared segment cannot by unshared.

Format 8 - Report that a memory lock that was stuck has been cleared.

Format 9 - Report that a lock on a database that was stuck has been cleared.

Format 10 - Report that bad links were found in the message queue for a database and the queue has been repaired.

Format 11 - Report that the capacity of the update map for a database has been exceeded.

Format 12 - Reports an attempt to build a database file name that would contain more than fourteen characters.

Format 13 - Report internal LLA errors.

Format 14 - Reports internal KLLA error in administering the LLA library data segment associated with a task.

3. VARIABLE FIELD DEFINITIONS

a = Reason for terminating the task, PHASE 1, FAULT or TIMEOUT.

b = Process number of the process requesting the task.

c = Type of request being serviced.

d = If *a* is PHASE 1 or FAULT, the address at which the task was faulted with the fault code in the first two hex digits. If a is TIMEOUT, the task sleep address.

e = Fault code.

f = Address in /prc/klla at which fault occurred.

g = Name of the database.

h = Error code returned by the memory manager.

j = Segment index of the affected segment.

k = Name of the file.

m = A string of mnemonic LLA error codes separated by comas.

4. ACTION TO BE TAKEN

Formats 1 and 2 are for RTR developers. Frequent appearance of these messages should be reported to UNIX® RTR support.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3 is for information only; no action is necessary.

Formats 4 and 5 indicate further KLLA access to that database will be denied until a new attach request is made. No action is necessary.

Format 6 means the following messages indicate a failure to allocate memory for the database environment because of a shortage of memory resources:

```
REPT KLLA ADD SEGMENT ERROR = X'ef
REPT KLLA ADD SEGMENT ERROR = X'ed
REPT KLLA GROW SEGMENT ERROR = X'fb
```

Retry the attach request when the memory shortage is cleared.

Any other SEGMENT ERROR message is an indication of a failure in KLLA's management of dynamic memory. Report this error to UNIX® RTR support.

Format 7 is a failure in KLLA's management of shared memory. Report this error to UNIX® RTR support.

Formats 8, 9, and 10 report errors found and repaired by internal audits of KLLA's structures. They are useful for explaining a possible slowdown or deadlock in KLLA processing. Frequent appearance of these messages should be reported to UNIX® RTR support.

Format 11 warns that the capacity of the updated map structure has been exceeded. If this error occurs frequently, pass this information to the UNIX® RTR support organization.

Format 13 contains useful debugging information for UNIX® RTR developers.

Format 14 reports a failure to set up the proper addressing for a task. The task involved will eventually be torn down with a timeout. Frequent appearance of this message should be reported to UNIX® RTR support.

5. ALARMS

REPT LIBC ARGUMENTS TO FUNC *a* UTID: *b*
c

2. REASON FOR OUTPUT

To report arguments to the faulting function and to the function that called the faulting function.

3. VARIABLE FIELD DEFINITIONS

a = Address of the faulting instruction or the caller of the faulting function. This will identify the function to which these arguments refer.

b = Utility ID of the process that faulted.

c = List of arguments to the function (maximum of 14) from the stack.

4. ACTION TO BE TAKEN

This is a supplementary message to REPT-LIBC,FAULT. No separate action is required if actions are taken for REPT-LIBC,FAULT message.

2. REASON FOR OUTPUT

To report that a UNIX® process was overlaying itself with another image and an unexpected error occurred.

Format 1 is printed when a new segment could not be added to the address space.

Format 2 is printed when a new segment could not be allocated.

Format 3 is printed when the process attributes could not be changed.

Format 4 is printed when the process class could not be set.

Format 5 is printed when `chgpcb` failed when setting the profiling address. For UNIX® RTR R6 and later, `MAXSEG` error occurs when the `chgpcb ost` fails to change the segment list size when executing a child with a different number of segments than the parent. `PCBSIZE` error occurs when the pcb could not be grown or shrunk for the new process identified in `FNAME`.

Format 6 is printed when a shared library file header contained bad data.

Format 7 is printed when a shared library file could not be read.

Format 8 is printed when a shared library file could not be opened.

Format 9 is printed when the new process image's file contained invalid shared library data.

Format 10 is printed when a segment name template could not be obtained for a shared library file.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 11 is printed when a segment index in the file header was invalid.

Format 12 is printed when a segment overlay in the process being executed.

Format 13 is printed when the PCB data in the file header was invalid.

Format 14 is printed when a segment image could not be read from a file.

Format 15 is printed when a segment number for a new segment could not be found.

Format 16 is printed when the stack data in the file header was invalid.

Format 17 is printed when a temporary segment could not be added to the address space.

Format 18 is printed when a temporary segment could not be allocated.

3. VARIABLE FIELD DEFINITIONS

a = Process name from the process control block (PCB). For some cases, this may be NULL.

b = Process number.

c = Utility ID.

d = Name of the file in which the error happened. In some cases, the name will have the utility ID as a prefix.

e = Segment number of the one that could not be attached.

f = Size of the requested segment.

g = Name of the requested segment.

h = Static or dynamic priority indicator.

i = Priority requested.

j = Time slice requested.

k = Shared library bits.

l = Shared library bits.

m = Class requested.

n = Name of the shared library.

o = System error code. See System Error Codes Output Appendix, SYSERR-APP.

p = Invalid path data.

q = File's invalid segment descriptor.

r = Profiling address, or the new segment list size, of the new PCB size.

s = Magic number in file header.

t = Magic number in a.out header.

u = Number of segment maps.

SEE PROPRIETARY NOTICE ON COVER PAGE

v = Segment index of bad segment in pfile.

4. ACTION TO BE TAKEN

File an operational trouble report accompanied by the message. Many conditions indicate a file whose data have been damaged.

5. ALARMS

None. This automatically-generated report is for information only.

Output Appendix
SYSERR-APP

ID . . . . . REPT-LIBC,FL-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT LIBC FAULT IN a FLTCODE b PA c
  PNAME:d PID:e UTID:f
```

2. REASON FOR OUTPUT

To report that a UNIX® process caused a software fault that made it terminate.

3. VARIABLE FIELD DEFINITIONS

a = A general indicator of what caused the fault:

`LIB` - The UNIX® portion of the library.

`USER` - The process itself.

b = Fault number. See Fault Code Appendix, `FAULT-CODE-APP`.

c = Program address at which the fault occurred. In some cases, this value may point to the next instruction.

d = Process name from the process control block (PCB).

e = Process number.

f = Utility ID.

4. ACTION TO BE TAKEN

File an operational trouble report accompanied by the output message. In some cases, a file is created in `/cdmp` that contains an image of the process when it terminates. The file's name will be the same as variable field *d* in the output message.

If variable fields *a* = `USER` and *b* = `0xe1` (`H'e1`), a phase 1 has occurred, and the currently running supervisor or UNIX® process (indicated by variable field *d*) is killed by sending it a phase fault (`0xe1`). This is part of the phase 1 recovery process, and the process is reporting that it has received a fault. The postmortem should be analyzed to determine the cause of the phase 1. If bit 31 of the process status word (PSW) in the postmortem is `0xa1` and the process indicated in variable field *d* was dumped into `/cdmp`, then save the core dump for analysis.

5. ALARMS

None. This automatically-generated report is for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT LIBC FAULT IN a FLTCODE b PA c
  PNAME:d PID:e UTID:f
```

2. REASON FOR OUTPUT

To report that a UNIX® process caused a software fault that made it terminate.

3. VARIABLE FIELD DEFINITIONS

a = A general indicator of what caused the fault:

- `LIB` - The UNIX® portion of the library.
- `USER` - The process itself.
- `SBTRACE` - The stack back trace execution.

b = Fault number. See LIBC Fault Number Appendix, `LIBC-FAULT-NUM-APP`.

c = Program address at which the fault occurred. In some cases, this value may point to the next instruction.

d = Process name from the process control block (PCB).

e = Process number.

f = Utility ID of the process that faulted.

4. ACTION TO BE TAKEN

File an operational trouble report accompanied by `REPT-LIBC,FAULT`, `REPT-LIBC,PROGRAM`, `REPT-LIBC,SAVE`, and `REPT-LIBC,ARGU` output messages. In some cases, a file is created in /cdmp that contains an image of the process when it terminates. The file's name will be the same as variable field *d* in the output message.

If variable fields *a* = `USER` and *b* = `0xe1` (`H'e1`), a phase 1 has occurred, and the currently running supervisor or UNIX® process (indicated by variable field *d*) is killed by sending it a phase fault (`0xe1`). This is part of the phase 1 recovery process, and the process is reporting that it has received a fault. The postmortem should be analyzed to determine the cause of the phase 1. If bit 31 of the process status word (PSW) in the postmortem is `0xa1` and the process indicated in variable field *d* was dumped into `/cdmp`, then save the core dump for analysis.

[5] `REPT LIBC ERROR FORK PFORK2 FAILED`
`PNAME:`*a* `PID:`*b* `UTID:`*c*

2. REASON FOR OUTPUT

To report that an error prevented a UNIX® process from creating a new process with the fork system call.

Format 1 is printed when the process could not duplicate all segments of its address space.

Format 2 is printed when the process could not add the new process control block (PCB) segment to its address space.

Format 3 is printed when the process could not create a copy of its PCB segment.

Formats 4 and 5 are printed if the new process could not be created because of other system limitations. This condition may be temporary.

3. VARIABLE FIELD DEFINITIONS

a = Process name from the PCB.

b = Process number.

c = Utility ID.

d = Return value from an unsuccessful request.

4. ACTION TO BE TAKEN

If the condition persists, file an operational trouble report accompanied with the output message.

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-MAXINTVL
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT MAXINTVL` *a*

2. REASON FOR OUTPUT

To report the utility id of a process which requested a time-out exceeding the maximum allowable value.

3. VARIABLE FIELD DEFINITIONS

a = Utility id of process requesting time-out.

4. ACTION TO BE TAKEN

The timeout request, by default, will succeed unless failure is requested via the `(s)maxintvl` call. The process may use the `(s)maxintvl` call to eliminate the message.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
There is an MDB key of 333.

ID . . . . . REPT-MBD
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT MBD  DATA 1-1`
`00000000`

[2] `REPT MBD  DATA` *a-b*
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA
AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA AAAAAAAA

2. REASON FOR OUTPUT

To print system message buffer data when the disk driver message buffer contains invalid data.

Format 1 prints when the disk driver message buffer pointer is NULL.

Format 2 prints when a critical field in the disk driver message buffer is considered to be invalid.

The message buffer dump (MBD) will always contain the disk driver message buffer that is considered invalid. If it exists, message buffer data preceding the disk driver message buffer will also be printed.

The maximum amount of data printed is the size of the largest message buffer plus the size of the smallest message buffer followed by the disk driver message buffer. The boundaries between message buffers contained in the dump are determined by interpreting the data.

3. VARIABLE FIELD DEFINITIONS

a = Current print segment number.

b = Total number of print segments in this report.

A = Message buffer data in hexadecimal notation.

4. ACTION TO BE TAKEN

Save a copy of the receive-only printer (ROP) and contact your technical support organization.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

None.

ID . . . . . REPT-MEMORY,PRTY
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MEMF

1. FORMAT

```
REPT MEMORY PARITY FAILURE  X'a
ONLINE CU: b
FAULTY UNIT: c d
TIME OF ERROR: e
MAIN STORE CONTROLLER 0
TRAPPED ADDRESS REGISTER:  hhhhhhhh
ERROR REGISTER 1:  iiiiiiii
ERROR REGISTER 2:  jjjjjjjj
MAIN STORE CONTROLLER 1 (MAY NOT BE CONFIGURED)
TRAPPED ADDRESS REGISTER: kkkkkkkk
ERROR REGISTER 1:  llllllll
ERROR REGISTER 2:  mmmmmmmm
ERROR DATA:  nnnnnnnn
PHYSICAL MEMORY ADDRESS:  oooooooo
REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

A correctable memory failure occurred in the online processor (my store D).

3. VARIABLE FIELD DEFINITIONS

a = Sequence hexadecimal number associating this report with previous `REPT-CU` (see its parameter *d*).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in form `mm/dd/yy hh:mm:ss`.

h = If bit 27 of the Main store controller 0 trapped address register (TAR0) is set, TAR0 contains the address where the fault occurred (in hexadecimal).

i = The contents of the main store controller (MASC) 0 error register 1 (ER01) (in hexadecimal). See the *System Maintenance Manual*, Appendix F.

j = The contents of the MASC 0 error register 2 (ER02) (in hexadecimal). See the *System Maintenance Manual*, Appendix F.

k = The contents of the MASC 1 trapped address register (TAR1) (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

l = The contents of the MASC 1 error register 1 (ER11) (in hexadecimal). See the *System Maintenance Manual*, Appendix F.

m = The contents of the MASC 1 error register 2 (ER12) (in hexadecimal). See the *System Maintenance Manual*, Appendix F.

n = Error data (in hexadecimal).

o = Physical memory address (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time the error interrupt.

4. ACTION TO BE TAKEN

If the processor encountering the fault is out of service, run diagnostics on it.

5. ALARMS

None. This automatically-generated report is for information only.

[5] `REPT MHD` *a* `ERROR BIC STATUS` *f*

[6] `REPT MHD` *a* `ERROR STATUS` *g* `MASK` *h* `EXP` *i*

[7] `REPT MHD` *a* `ERROR DATA` *j*

[8] `REPT MHD` *a* `FAULT CODE` *k*

[9] `REPT MHD` *a* `UNIDENTIFIED RESPONSE WD1=`*l* `WD2=`*m*

[10] `REPT MHD` *a* `AUTONOMOUS RESPONSE` *n*

2. REASON FOR OUTPUT

To specify the error condition detected on the moving head disk (MHD).

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Command completion status word in hexadecimal notation. The completion word is eight hexadecimal digits of the form: *rrsstuvv*.

rr = Command completion code. See Tables 1 and 2 in DFC Appendix B, `DFC-APPB`.

ss = Number of disk blocks read or written.

t = Device ID number.

u = Special completion code; valid only when *vv* is 00. See Table 3 in DFC Appendix B, `DFC-APPB`.

vv = DMA job number (job id).

c = MHD Status, in hexadecimal notation. See DFC Appendix C, DFC-APPC.

d = Channel status, in hexadecimal notation. See DFC Appendix D, DFC-APPD.

e = Bus selector status, in hexadecimal notation. See DFC Appendix E, DFC-APPE.

f = BIC status, in hexadecimal notation. See DFC Appendix F, DFC-APPF.

g = BIC status, in hexadecimal notation. See DFC Appendix F, DFC-APPF.

h = Mask.

i = Expected value of *g* after being masked with *h*.

j = Supplemental data for previous REPT-DKDRV message.

k = Fault code, in hexadecimal notation. See DFC Appendix I, DFC-APPI.

l = First word of an unidentifiable completion report. This would normally be the command completion word.

m = Second word of an unidentifiable completion report. This would normally be the MHD status word.

n = Autonomous response special completion code (eight hexadecimal digits). The explanation of the hexadecimal digits is the same as the command completion code described above for variable *b*. The *u* hexadecimal digit provides the reason for the autonomous response. See Table 3 in DFC Appendix B, DFC-APPB.

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages may be output which provide useful data.

5. ALARMS

None. This automatically-generated report is for information only.

[12] `REPT MHD` *a* `INFO CODE` *p*

[13] `REPT MHD` *a* `SJR DATA` *q r s t u*

2. REASON FOR OUTPUT

To specify the error condition detected on the moving head disk (MHD).

Format 13 provides small computer system interface (SCSI) job response (SJR) information when an explicit SCSI command, built by the disk file controller (DFC). driver, fails. The SJR data is necessary to determine the exact cause of the error condition.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b = Command completion status word in hexadecimal notation. The completion word is eight hexadecimal digits of the form: `rrsstuvv`.

`rr` = Command completion code. See Tables 1 and 2 in DFC Output Appendix B, `DFC-APPB`.

`ss` = Number of disk blocks read or written.

`t` = Device ID number.

`u` = Special completion code; valid only when `vv` is 00. See Table 3 in DFC Output Appendix B, `DFC-APPB`.

`vv` = DMA job number (job ID).

c = Device status, in hexadecimal notation. See DFC Output Appendix C, `DFC-APPC`.

d = Channel status, in hexadecimal notation. See DFC Output Appendix D, `DFC-APPD`.

e = Bus selector status, in hexadecimal notation. See DFC Output Appendix E, `DFC-APPE`.

f = BIC status, in hexadecimal notation. See DFC Output Appendix F, `DFC-APPF`.

g = BIC status, in hexadecimal notation. See DFC Output Appendix F, `DFC-APPF`.

h = Mask.

i = Expected value of *g* after being masked with *h*.

j = Supplemental data for previous `REPT-DKDRV` message.

k = Fault code, in hexadecimal notation. See DFC Output Appendix I, `DFC-APPI`.

l = First word of an unidentifiable completion report. This would normally be the command completion word.

m = Second word of an unidentifiable completion report. This would normally be the device status word.

n = Autonomous response special completion code (eight hexadecimal digits). The explanation of the hexadecimal digits is the same as the command completion code described above for variable *b*. The *u* hexadecimal digit provides the reason for the autonomous response. See Table 3 in DFC Output Appendix B, `DFC-APPB`.

o = The SCSI host adapter (HA) shadow register status, in hexadecimal notation. See DFC Output Appendix P, `DFC-APPP`.

p = Information code. See DFC Output Appendix A, `DFC-APPA`.

SEE PROPRIETARY NOTICE ON COVER PAGE

q = Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.

AAAA = SCSI job block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, DFC-APPK.

BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, DFC-APPK.

CC = Fill. Not used.

r = First word of extended sense data (ESD). See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 0 of ESD.

BB = Byte 1 of ESD.

CC = Byte 2 of ESD.

DD = Byte 3 of ESD.

s = Second word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 4 of ESD.

BB = Byte 5 of ESD.

CC = Byte 6 of ESD.

DD = Byte 7 of ESD.

t = Third word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 8 of ESD.

BB = Byte 9 of ESD.

CC = Byte 10 of ESD.

DD = Byte 11 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

u = Fourth word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 12 of ESD.

BB = Byte 13 of ESD.

CC = Byte 14 of ESD.

DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages may be output which provide useful data.

If Format 13 prints, the SCSI drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

There is no alarm for an automatically-generated report that is for information only.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Practice 254-301-216 *CSI Disk File Controller Description and Theory of Operation*

ID . . . . . REPT-MIRA
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has 21 formats.

[1] `REPT MIRA QUEUE FULL - RETRY LATER`

[2] `REPT MIRA ERROR` *a c d* [*e f*] `RETRY FAILED`

[3] `REPT MIRA FAILED TO  CHANGE PRIORITY ERRNO =` *b*

[4] `REPT MIRA ECD OPEN FAILED ERRNO =` *b*

[5] `REPT MIRA ECDMAN FAILED TO GET TOP UCB RECORD ERRNO =` *b*

[6] `REPT MIRA NO UCB FOR EQUIPMENT ID =` *c d* [*e f*]

[7] `REPT MIRA CANNOT LCALL` *g*

[8] `REPT MIRA NOTHING TO STOP NO UNITS QUEUED`

[9] `REPT MIRA CANNOT RECEIVE MESSAGE`

[10] `REPT MIRA UNIDENTIFIABLE MESSAGE RECEIVED`

[11] `REPT MIRA NULL MESSAGE RECEIVED`

[12] `REPT MIRA CANNOT SEND MESSAGE TO` *g* `ERRNO =` *b*

[13] `REPT MIRA PORT CONNECTION FAILURE`

[14] `REPT MIRA INVALID UNIT ID IN DIAGNOSTIC ABORT REQUEST`
c d [*e f*]

[15] `REPT MIRA INVALID MESSAGE COMMAND RECEIVED`

[16] `REPT MIRA` *a c d* [*e f*] `ABORT REQUESTED REASON` *h*

[17] `REPT MIRA DIAGNOSTICS ARE NOT IN THE SUSPENDED STATE`

[18] `REPT MIRA ILLEGAL REQUEST FOR` *c d* [*e f*]

[19] `REPT MIRA NO UNITS QUEUED OF THAT TYPE`

[20] `REPT MIRA INVALID UNIT ID IN INTERACTIVE REQUEST EX` *a c d* [*e f*]

[21] `REPT MIRA CANNOT RESERVE UNITS FOR` *a c d* [*e f*]

2. REASON FOR OUTPUT

To report one of the following conditions encountered by the maintenance input request administrator (MIRA).

Format 1 indicates that all slots in the MIRA queue are taken.

Formats 2 and 21 indicate that the unit control block (UCB) for the unit is reserved.

Format 3 indicates that MIRA could not change to a different UNIX® priority.

Format 4 indicates that MIRA could not to open the equipment configuration database (ECD) manager.

Format 5 indicates that the ECD manager failed to locate the top UCB for the request.

Format 6 indicates that the UCB for the requested unit was not found by the ECD manager.

Format 7 indicates that MIRA could not create a child process.

Format 8 indicates that a `STOP` command has been received but there are no units queued.

Format 9 indicates that MIRA could not enable message reception.

Format 10 indicates that the message tag is invalid.

Format 11 indicates that an error in the message reception occurred.

Format 12 indicates that MIRA could not send a message to a process.

Format 13 indicates that MIRA could not connect to port 2.

Format 14 indicates that the UCB for the unit ID in a diagnostic abort was not found by the ECD manager.

Format 15 indicates that MIRA could not execute the command in a message.

Format 16 indicates that an abort of an active diagnostic has been initiated by MIRA.

Format 17 indicates that the input message `ALW:DMQ;RUN` was entered while normal execution of diagnostics was allowed.

Format 18 indicates that the unit cannot be diagnosed or restored because it is a software device.

Format 19 indicates that there is no unit queued of the type requested in the `STOP` message.

Format 20 indicates that the UCB for the unit ID in the `EX` request was not matched, no action was taken.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a = Type of input request.

b = System error number. See System Error Codes Appendix, `SYSERR-APP`.

c = Unit name.

d = Unit number.

e = Subunit name.

f = Subunit number.

g = Name of process in directory `/diag/dgnc`.

h = Reason code for the diagnostic abort:

`0` - `STOP:DMQ` or `STP:DMQ` command entered.
`1` - Abort request received from the DMERT fault recovery process.
`2` - Software diagnostic abort request was received.
`3` - Operating system signal received by MIRA.
`4` - Timeout message received from diagnostic timer (dgntimer) process.

4. ACTION TO BE TAKEN

For Format 1, wait until a slot is available (see `OP:DMQ` input message) or remove a request from the queue. See `STOP:DMQ` or `STP:DMQ` input message. If problem persists, seek technical assistance.

For Formats 2 and 21, one of the following actions should be taken in the order given. If the problem persists, do the next action on the list.

SEE PROPRIETARY NOTICE ON COVER PAGE

Step	Procedure
1	Wait until the UCB is no longer reserved. The unit specified in the diagnostic request may be in use by another process. Both `INIT:MHD` (initialize moving head disk) and `UPD:GEN` (generic update) reserve units. Verify that these processes are not active. Retry the maintenance request.
2	Enter `RMV:unit a!` where unit is the unit name and a is the unit number from the original maintenance request. Retry the maintenance request.
3	Enter `AUD:ECDOWN 1!` to run the ECD audit. Retry the maintenance request.
4	Enter: `OP:STATUS:PROCESS,ALL!` Record the identifications for all processes named "ppdiamon," "cudiagc," "iodiag," and "dfdiag." Enter `STOP:EXC:ANY,PID a!` to kill these processes. Enter `AUD:ECDOWN 1!` to run the ECD audit. Try the maintenance request again.
5	Repeat Step 4 using the following commands: Enter: `STOP:EXC;USER,PID a,SIG 9!`, This generates a kill that cannot be caught or ignored. Use of this command will result in the need to reinitialize ularp. `INIT:ULARP` will restart all monitored processes.
6	If problems persist, seek technical assistance.

For Format 3, MIRA can change its priority if it is spawned with a command line parameter of *prty=x*, where -39≤x≤39. MIRA's priority then becomes default priority minus *6x*. When *x* is negative, the priority increases. When *x* is positive, the priority decreases. In no case will MIRA's priority rise above 191 or go below zero. MIRA's command line can be found in the file /etc/ularpfile. The typical error causing this output will be an out-of-range command line *prty* value.

For Format 4, verify that the file /dev/ecd exists and the access permissions are correct.

For Formats 5 and 6, verify that a valid unit name was entered on the input request. Examine the UCB of the unit requested for correctness, using the recent change and verify command RCV:M;BROWSE.

For Format 7, verify that process *g* exists in the directory /diag/dgnc and is executable. This failure also occurs if insufficient swap space exists.

For Format 8, 12, 14, 16, 17, 18, and 20, no action is required.

For Formats 9 and 13, no action is required. MIRA will terminate and be restarted by ULARP.

For Formats 10, 11, 15, and 19, if a manual input command preceded this message, retry the input command.

5. ALARMS

This alarm is either a manually-requested report or is automatically-generated. Action may or may not be required.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . REPT-MKDSK
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1]
```
REPT MKDSK PLEASE MOUNT NEXT TAPE IN SEQUENCE
REMEMBER TO PLACE TAPE DRIVE ONLINE
TO RESTART TYPE MKSTART
```

[2]
```
REPT MKDSK STILL WAITING FOR NEXT TAPE IN SEQUENCE
REMEMBER TO PLACE TAPE DRIVE ONLINE
TO RESTART TYPE MKSTART
```

2. REASON FOR OUTPUT

Format 1 is output when another tape should be mounted when multiple tapes are being read.

Format 2 reports that mkdsk has not terminated, and the next tape should be mounted.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

Mount the next tape in the sequence. If the user waits more than five minutes to mount the next tape, the process will terminate and must be restarted.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

ID REPT-MMGR001
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT MMGR001 BAD DKDRV STAT` *a*

2. REASON FOR OUTPUT

To report that the memory manager has received an acknowledgement message with an invalid response field from the disk driver. Legal responses are: success, failure, retry or bad message. The memory manager, not sure of how to proceed, will retry the input/output request.

3. VARIABLE FIELD DEFINITIONS

a = Offending status code, in decimal notation.

4. ACTION TO BE TAKEN

There is apparently a software coding error. Unless the condition causing the unusual return clears spontaneously, recovery in the field is remote. Submit an operational trouble report accompanied by the printout of this message.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

ID REPT-MMGR002
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT MMGR002 EXCESSIVE RETRIES FOR I/O SWAP
  SEGID a RETRIED b TIMES
```

2. REASON FOR OUTPUT

To report that the disk driver has returned a message status of 'retry' an unexpectedly large number of times. This message is repeated every 20 times a retry message is received until the Input/Output request is satisfied.

3. VARIABLE FIELD DEFINITIONS

a = Segment ID of the segment being swapped. (This might be useful in debugging.)

b = Number of times this was retried.

4. ACTION TO BE TAKEN

There is trouble in the disk driver. The swapping function of memory management is probably not working while this condition continues. Diagnose the moving head disk.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

Practice 254-301-210 *Moving Head Disk Drive General Description 3B20D Processor*

SEE PROPRIETARY NOTICE ON COVER PAGE

ID REPT-MMGR003-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT MMGR003 ADD MEMORY FAILED  AVAIL MEM a PAGES
ATTEMPTED TO ATTACH b PAGES
[MUST REGEN SYSTEM TO ADD MORE MEMORY |
 EXTENDED MEMORY NOT ENABLED.  AVAIL MEM AT MAX. ]
```

2. REASON FOR OUTPUT

Reports that a request to make some added memory available for system use failed. Recent change / verify had requested that the memory manager make some added memory available for system use.

3. VARIABLE FIELD DEFINITIONS

a = Amount of usable memory, in pages. One page = 2048 bytes.

b = Number of pages that recent change / verify attempted to make available for system use.

4. ACTION TO BE TAKEN

If recent change / verify attempts to increase the memory size beyond the maximum memory size specified during system generation, (variable *a* should equal the system generation specified maximum memory size), then the memory manager will attempt to add *a* pages. To increase this size, the system must be `resysgened`, and the computer rebooted to use the additional memory. However, if this is not desirable, then the system can be left to run with the original amount of memory.

If recent change / verify attempts to add memory beyond the physical size of memory (*b* is greater than 32768 pages), the attempt will fail. This indicates a faulty recent change / verify request.

If *b* is less than or equal to *a*, then a request was made to add memory with the memory size being equal to the old size or smaller. This could be caused by an error when entering recent change / verify commands.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
There is an OMDB key of 330.

SEE PROPRIETARY NOTICE ON COVER PAGE

Input Message

```
UPD:BLDBOOT
```

ID REPT-MMGR003-B
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT MMGR003 ADD [EXTENDED] MEMORY FAILED. AVAILABLE MEMORY = a PAGES
ATTEMPTED TO GROW MEMORY TO b PAGES
[MUST REGEN SYSTEM TO ADD MEMORY]
```

2. REASON FOR OUTPUT

To report that a request to make some added memory available for system use failed. Recent change / verify had requested that the memory manager make some added memory available for system use.

3. VARIABLE FIELD DEFINITIONS

a = Amount of usable memory, in pages. One page = 2048 bytes.

b = Number of pages that recent change / verify attempted to make available for system use.

4. ACTION TO BE TAKEN

If recent change / verify attempts to increase the memory size beyond the maximum memory size specified during system generation, the memory manager will attempt to grow memory to *a* pages (variable *a* should equal the system generation specified maximum memory size). To increase this size, the system must be resysgened, and the computer rebooted to use the additional memory. However, if this is not desirable, then the system can be left to run with the original amount of memory.

If recent change / verify attempts to add memory beyond the physical size of memory the attempt will fail. For VLMM the physical size of memory is 32768 pages; for EMM it is 16384; otherwise, it is 8192. Variable *b* is greater than 32768 pages, and indicates a faulty recent change / verify request.

If *b* is less than or equal to *a*, then a request was made to add memory with the memory size being equal to the old size or smaller. This could be caused by an error when entering recent change / verify commands.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
The OMDB key for this message is 330.

Input Message

```
UPD:BLDBOOT
```

ID REPT-MMGR004
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT MMGR004 SWAP SPACE REQUEST FAILED
  AVAIL BLKS = b REQUESTED BLKS = a
```

2. REASON FOR OUTPUT

Swap disk space is allocated to new segments as they are created, and each segment must get contiguous blocks on the disk. This raises the possibility of fragmentation. That is, there might be enough free space for any given segment, but no single set of contiguous free blocks is large enough by itself. Instead of denying a space request immediately, the Memory Manager will attempt to re-arrange the disk space of existing segments. This can be done reasonably cheaply for all segments that happen to be in main memory at the time.

This message is produced when such a compaction has been done. However, the request that triggered the compaction could NOT be satisfied, even after the compaction.

3. VARIABLE FIELD DEFINITIONS

a = The size, in 512-byte disk blocks, of the failing request.

b = The size, in 512-byte disk blocks, of the largest free contiguous extent ("hole") after compaction.

4. ACTION TO BE TAKEN

If this message occurs, a request for swap space has been denied. This implies that some process was unable to function properly. Possible urgent action to be taken includes:

1. Request a more effective but more expensive compaction using the `AUD:MMGR` input message. This may be postponed until a time when the load is lighter.
2. If the message persists, more disk space may be required. This entails a regeneration of the system, and a re-boot.

NOTE: The automatic compaction will not be attempted, and this message will not appear, if the system is in a state of absolute swap disk overload (output message `REPT-SIMCHK 602 A6` has appeared).

5. ALARMS

None. This automatically-generated report is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT MOP CANNOT UNMOUNT DEVICE` *a* `ERROR =` *b*

2. REASON FOR OUTPUT

To report that the process mop is unable to unmount the off-line partition mounted as device *a* due to error *b*.

3. VARIABLE FIELD DEFINITIONS

a = Name of device.

b = Error code:
See System Error Codes Output Appendix, `SYSERR-APP`.

4. ACTION TO BE TAKEN

If mop is unable to unmount device *a* because a file on the device is open (busy), close the file and mop will unmount device *a* approximately two minutes after most recent `REPT` time.

If mop is unable to unmount the device due to an input/output error, kill the current mop process before executing a format [2] mop message as documented in *3B20D Computer Commands*.

5. ALARMS

Major alarm. May not be service affecting, but take immediate action as indicated in the report.

[14] `REPT MT` *a* `INFO CODE` *r*

[15] `REPT MT` *a* `SJR DATA` *s t u v w*

2. REASON FOR OUTPUT

To report a magnetic-tape (MT) related software or hardware error.

Format 15 provides small computer system interface (SCSI) job response (SJR) information when an explicit SCSI command, built by the disk file controller (DFC). driver, fails. The SJR data is necessary to determine the exact cause of the error condition.

SEE PROPRIETARY NOTICE ON COVER PAGE

Formats 1 and 2 are output exclusively by the input output processor (IOP) tape device driver. Format 3 is common and may be output by both the drivers. Formats 4 through 15 are output exclusively by the SCSI DFC driver.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. See IOP Output Appendix F, `IOP-APPF`.

c = Hardware error type, in hexadecimal notation. See IOP Output Appendix A, `IOP-APPA`.

d = First word of an unidentifiable completion report.

e = Second word of an unidentifiable completion report.

f = Command completion status word. The completion word is eight hexadecimal digits of the form: `rrsstuvv`.

- `rr` = Command completion code. See Tables 1 and 2 in DFC Output Appendix B, `DFC-APPB`.
- `ss` = Number of blocks read or written.
- `t` = Device ID number.
- `u` = Special completion code; valid only when `vv` is 00. See Table 3 in DFC Output Appendix B, `DFC-APPB`.
- `vv` = DMA job number (job ID).

g = Device status, in hexadecimal notation. See DFC Output Appendix C, `DFC-APPC`.

h = Channel status, in hexadecimal notation. See DFC Output Appendix D, `DFC-APPD`.

i = Bus selector status, in hexadecimal notation. See DFC Output Appendix E, `DFC-APPE`.

j = BIC status, in hexadecimal notation. See DFC Output Appendix F, `DFC-APPF`.

k = BIC status, in hexadecimal notation. See DFC Output Appendix F, `DFC-APPF`.

l = Mask.

m = Expected value of *k* after being masked with *l*.

n = Supplemental data for the previous `REPT-DKDRV` message.

o = Fault code, in hexadecimal notation. See DFC Output Appendix I, `DFC-APPI`.

SEE PROPRIETARY NOTICE ON COVER PAGE

p = Autonomous response special completion code (eight hexadecimal digits). The explanation of the hexadecimal digits is the same as the command completion code described for variable *f*. The *u* hexadecimal digit provides the reason for the autonomous response. See Table 3 in DFC Output Appendix B, DFC-APPB.

q = The SCSI host adapter (HA) shadow register status, in hexadecimal notation. See DFC Output Appendix P, DFC-APPP.

r = Information code. See DFC Output Appendix A, DFC-APPA.

s = Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.

- AAAA = SCSI job block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, DFC-APPK.
- BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, DFC-APPK.
- CC = Fill. Not used.

t = First word of extended sense data (ESD). See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

- AA = Byte 0 of ESD.
- BB = Byte 1 of ESD.
- CC = Byte 2 of ESD.
- DD = Byte 3 of ESD.

u = Second word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

- AA = Byte 4 of ESD.
- BB = Byte 5 of ESD.
- CC = Byte 6 of ESD.
- DD = Byte 7 of ESD.

v = Third word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

- AA = Byte 8 of ESD.
- BB = Byte 9 of ESD.
- CC = Byte 10 of ESD.
- DD = Byte 11 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

w = Fourth word of ESD. See DFC Output Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 12 of ESD.

BB = Byte 13 of ESD.

CC = Byte 14 of ESD.

DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

These error messages indicate error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

If Format 15 prints, the SCSI drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

There is no alarm for an automatically-generated report that is for information only.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

1. FORMAT

This message has two formats.

[1] `REPT MTC` *a*{`ERROR` *b*[`COMPL CODE` *c*]|
`UNIDENTIFIED RESPONSE WD1=`*d* `WD2=`*e*}

[2] `REPT MTC` *a* `CODE VERSION X'`*f*

2. REASON FOR OUTPUT

Format 1 reports a magnetic-tape-controller (MTC) related software or hardware error.

Format 2 is output during the restoral of the unit.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. See output IOP Appendix F, `IOP-APPF`.

c = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

d = First word of an unidentifiable completion report.

e = Second word of an unidentifiable completion report.

f = Peripheral controller pump code version.

4. ACTION TO BE TAKEN

These error messages indicate error conditions that could cause the removal of a unit. Any removed unit must be repaired and restored to service. No action is necessary for the message in Format 2 unless the controller and/or its subdevices are not acting normally or could not be restored. Contact the service organization with the code version which was used.

5. ALARMS

None.

ID . . . . . REPT-MTTY
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT, MAIPR

1. FORMAT

This message has three formats.

[1] `REPT MTTY` *a* {`ERROR` *b* [*c*] [`COMPLETED CODE` *d*] |
`UNIDENTIFIED RESPONSE WD1=`*e* `WD2=`*f*}

[2] `REPT MTTY` *a* `STARTED`

[3] `REPT MTTY` *a* `STOPPED`

2. REASON FOR OUTPUT

Format 1 reports a maintenance teletypewriter (MTTY) related software or hardware error.

Format 2 reports that the MTTY has changed state from STBY to ACT. An MTTY will change to ACT state when DTR is ON.

Format 3 reports that the MTTY has changed state from ACT to STBY. An MTTY will change to STBY state when DTR is OFF.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies, in hexadecimal notation, the point within the input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

c = Character string giving more information about the error identified in *b* above. Refer to IOP Appendix F, `IOP-APPF` for additional explanation.

d = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

e = First word of an unidentified completion report.

f = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit must be repaired and then restored to service.

Formats 2 and 3 are informational messages and indicate that the MTTY has changed

states. These messages will be output when the currently active MTTY changes state to STBY, and the currently STBY MTTY changes state to ACT. An active MTTY will change state to STBY when powered off, and a standby MTTY will change state to ACT when powered up. No action is necessary.

5. ALARMS

Format 1 has no alarm. The automatically-generated report is for information only.

Formats 2 and 3 have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

[3] `REPT MTTYC` *a* `FLASH RAM VERSION X'`*g*

2. REASON FOR OUTPUT

Format 1 reports a maintenance teletypewriter controller (MTTYC) related software or hardware error.

Format 2 is output during unit restoration.

Format 3 is requested by diagnostics and output prior to the update of flash RAM on the unit.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies the point, in hexadecimal notation, within input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

c = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPF`.

d = First word of an unidentifiable completion report.

e = Second word of an unidentifiable completion report.

f = Peripheral controller pump code version number.

g = Peripheral controller flash RAM version number.

4. ACTION TO BE TAKEN

Format 1 is an error message that indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Formats 2 and 3, no action is necessary unless the controller and/or its subdevices are not acting normal, or cannot be restored. Contact the service organization with the code version number and/or flash RAM version number that was used.

DMA STORE DATA REGISTER:  llllllll  DMA INCREMENTOR:  mmmmmmmm
DMA BUFFER REGISTER:  nnnnnnnn
o
REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

Indicates the direct memory access (DMA) controller (DMAC) encountered a fatal main memory problem during DMA transfer. See the *System Maintenance Manual*, ERROR REGISTER DESCRIPTION section, Error Bit 6.)

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in form `mm/dd/yy hh:mm:ss`.

f = Input/output address of the DMAC encountering the fault (in hexadecimal).

g = The contents of the DMA status register (in hexadecimal). See *System Maintenance Manual*, Appendixes C and D.

h = First word entry in the DMA RAM for the device that failed (in hexadecimal).

i = Second word entry in the DMA RAM for the device that failed (in hexadecimal).

j = Third word entry in the DMA RAM for the device that failed (in hexadecimal).

k = Fourth word entry in the DMA RAM for the device that failed (in hexadecimal).

l = Internal DMAC register contents (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

m = Internal DMAC register contents (in hexadecimal).

n = Internal DMAC register contents (in hexadecimal).

o = For Model 1:

`CHANNEL DATA REGISTER:` *xxxxxxxx*

For Model 2:

a blank line

x = Contents of the faulted channels data register (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Run diagnostics on the indicated unit.

ERROR REGISTER 1:  llllllll
ERROR REGISTER 2:  mmmmmmmm
ERROR DATA:  nnnnnnnn
PHYSICAL MEMORY ADDRESS: oooooooo
p
REAL TIME CLOCK: rrrrrrrr
```

2. REASON FOR OUTPUT

A non-correctable parity error has occurred during a direct memory access (DMA) read of a memory location on the currently running control unit (CU).

3. VARIABLE FIELD DEFINITIONS

a = The sequence number, in hexadecimal, of the report.

b = Active CU number.

c = Unit name.

d = Member number.

e = Time in form `mm/dd/yy hh:mm:ss`.

f = Input/output address, in hexadecimal, of the DMA controller (DMAC) encountering the fault.

g = The contents, in hexadecimal, of the DMA status register. See the *System Maintenance Manual*, Appendixes C and D.

h = If bit 27 of the main store controller 0 trapped address register (TAR0) is set, TAR0 contains the address, in hexadecimal, where the fault occurred.

i = The contents, in hexadecimal, of the main store controller 0 error register 1 (ER01). See the *System Maintenance Manual*, Appendix F.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = The contents, in hexadecimal, of the main store controller 0 error register 2 (ER02). See the *System Maintenance Manual*, Appendix F.

k = The contents, in hexadecimal, of the main store controller 1 trapped address register (TAR1).

l = The contents, in hexadecimal, of the main store controller 1 error register 1 (ER11). See the *System Maintenance Manual*, Appendix F.

m = The contents, in hexadecimal, of the main store controller 1 error register 2 (ER12). See the *System Maintenance Manual*, Appendix F.

n = Error data (in hexadecimal).

o = Physical memory address (in hexadecimal).

p = For Model 1:

```
CHANNEL DATA REGISTER:    qqqqqqqq
```

For Model 2:

a blank line

q = The contents, in hexadecimal, of the faulted channels data register.

r = Value, in milliseconds and hexadecimal, of the real time clock (RTC) at the time of the error interrupt.

4. ACTION TO BE TAKEN

If the processors switched as a result of the error, run diagnostics on the processor encountering the fault.

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-OFFLINE-A
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 thru R21.33
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT OFFLINE BOOT IN PROGRESS`

[2] `REPT OFFLINE BOOT {ABORTED | STOPPED | TERMINATED}`

2. REASON FOR OUTPUT

These messages are output to report information about the execution of the offline boot feature.

Format 1 is printed every 5 minutes, after the off-line side has booted successfully, to indicate that the system is still in offline boot and therefore, is still logically split.

Format 2 is printed after the off-line side has booted successfully and offline boot is being stopped. Whether devices moved to the off-line side are restored or not depends on the abort type:

`ABORTED` — Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.

`STOPPED` — Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.

`TERMINATED` — UNIX® RTR software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. For a minor alarm, take action as indicated in the report.

ID . . . . . REPT-OFFLINE-B
GENERIC . . . . . UNIX RTR R21.35 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT OFFLINE BOOT IN PROGRESS` *a*

[2] `REPT OFFLINE BOOT` {`ABORTED` | `STOPPED` | `TERMINATED`}

2. REASON FOR OUTPUT

These messages are output to report information about the execution of the offline boot feature.

Format 1 is printed every 5 minutes, after the off-line side has booted successfully, to indicate that the system is still in offline boot and therefore, is still logically split.

Format 2 is printed after the off-line side has booted successfully and offline boot is being stopped. Whether devices moved to the off-line side are restored or not depends on the abort type:

`ABORTED` — Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.

`STOPPED` — Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.

`TERMINATED` — UNIX® RTR software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

3. VARIABLE FIELD DEFINITIONS

a = Offline side boot completion status. If this part of the message is not printed, a side-switch was performed and the initial offline side boot completion status is no longer valid. Otherwise, the following text will be printed, respectively, when the offline side boot completes without errors and with non-fatal errors:

```
- OFFLINE SIDE BOOT COMPLETED

- OFFLINE SIDE BOOT COMPLETED WITH ERRORS
```

4. ACTION TO BE TAKEN

For Format 1, in the case where non-fatal errors occurred, the ROP should be examined for additional messages associated with the offline boot. Any action to be taken is based on these messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. For a minor alarm, take action as indicated in the report.

2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

a = Message type.

- ABORTED — Application request to stop the offline boot procedure; devices moved to the off-line side will be restored.
- COMPLETED — Indicates off-line side boot has completed.
- INFO — For information only.
- STOPPED — Manual request to stop the offline boot procedure. If the RST option was specified, devices moved to the off-line side will be restored.
- TERMINATED — UNIX® RTR software-initiated termination of the offline boot procedure; devices moved to the off-line side will not be restored.

b = Text line.

1. ABORT DENIED DURING SWITCH

   Application-initiated aborts are ignored while SW:OFLBOOT is running.

2. ADP IS NOT RUNNING, CANNOT RESTORE *g h*

   Automatic diagnostic process (ADP) is not running, so the automatic restore of the specified unit will not be done.

3. AIM PRINTING OF PRE-CHECKS OR POST-CHECKS TIMED OUT

   Offline boot did not receive results of activities before the timers expired.

4. AIM REPORTED FAILURE TO REDUPLEX

   AIM reported failure to put the system back to its state previous to the off-line boot.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. AIM REPORTED FAILURE TO SPLIT

   AIM reported failure to split in preparation for booting off-line.

6. AIM REPORTED FAILURE TO TURN CALL PROCESSING OFF

   AIM reported call origination could not be turned off in preparation for side switching. If retrofit was not specified, SW:OFLBOOT will fail.

7. AIM REPORTED FAILURE TO TURN CALL PROCESSING ON

   AIM reported call origination could not be turned on.

8. AIM REPORTED PRE-CONFIGURATION FAILURES

   AIM reported pre-configuration errors in preparation for booting off-line.

9. CANNOT ACCESS A DIAGNOSTIC/MAINTENANCE SPECIAL DEVICE FILE

   There were problems in obtaining a special device file; therefore, a DFC cannot be removed. Offline boot will be terminated.

10. CANNOT ACCESS ECD

    Device information cannot be accessed from the RC/V ECD while booting off-line or side switching. Depending on the function *e* printed, there are different consequences:

CHECK_OOS	Cannot get a UCB record to verify that the unit has indeed been removed as part of RTR offline boot pre-configuration. Offline boot will be automatically terminated.
CHG_DFC	Cannot get a DFC UCB or a DFC sub-unit UCB record before moving it to the OOS state as part of stopping the offline boot. The DFC or its sub-unit will remain in the GROW state.
CHG_IOPS	Cannot get an IOP UCB or an IOP sub-unit UCB record before moving it to the OOS state as part of stopping the offline boot. The IOP or its sub-unit will remain in the GROW state.
DEGROW_DFC	Cannot get a DFC UCB record before unequipping it. The DFC will remain in the OOS state. Offline boot will be automatically terminated.

DEGROW_IOP	Cannot get an IOP UCB record before unequipping it. The IOP will remain in the OOS state. Offline boot will be automatically terminated.
EQUIP_CU	Cannot get CU UCB when equipping the CU community as part of stopping the offline boot. The complete CU community or some of its sub-units will remain in the UNEQIP state.
GROW_DFC	Cannot get a DFC UCB or a DFC sub-unit UCB record before equipping it as part of stopping the offline boot. The DFC or its sub-unit will remain in the UNEQIP state.
GROW_IOPS	Cannot get an IOP UCB or an IOP sub-unit UCB record before moving it to the OOS state as part of stopping the offline boot. The IOP or its sub-unit will remain in the UNEQIP state.
OLBCONTROL	Cannot get CU UCB record before removing the CU community. Offline boot will be automatically terminated.
RMV_DFC	Cannot get a DFC UCB record before removing it. Offline boot will be automatically terminated.
RMV_IOPS	Cannot get an IOP UCB record before removing it. If more than one IOP was specified in the EXC_OFLBOOT command line, then one or more IOPs may have been moved to the OOS state and remain that way even though offline boot has been automatically terminated. This is because one or more messages to remove IOP may have already been dispatched to the IODRV before this failure occurred.
RSTFCN	Cannot get a CU UCB record before sending ADP a message to restore the CU as part of stopping offline boot. The CU will remain in the OOS state.
RST_DFC	Cannot get a DFC UCB record before sending ADP a message to restore the DFC as part of stopping offline boot. The DFC will remain in the OOS state.

SEE PROPRIETARY NOTICE ON COVER PAGE

RST_IOPS	Cannot get an IOP UCB record before sending ADP a message to restore it as part of stopping offline boot. If more than one IOP was specified in the EXC:OFLBOOT command line, then one or more IOPs may have been restored despite this failure. This is because one or more messages to ADP may have already been dispatched.
TIM_UNIT	Cannot get an IOP UCB record or an IOP sub-unit UCB record to report that the IODRV timed out when growing this device. The unknown device will remain in the UNEQIP or GROW state.
UNRESERVE	Cannot get a UCB record while stopping offline boot. Some units' records may remain reserved.

11. CANNOT CLOSE SPECIAL DEVICE FILE

    DKDRV could not close a special device file. Consequently, its internal tables are corrupt and indicate a DFC is undergoing maintenance forever.

12. CANNOT COPY MEMORY AREA FROM OFFLINE CU TO ONLINE CU

    Information cannot be transferred either from the on-line CU to the off-line side or vice versa.

13. CANNOT COPY MEMORY AREA FROM ONLINE CU TO OFFLINE CU

    Information cannot be transferred either from the on-line CU to the off-line side or vice versa.

14. CANNOT CREATE VFYDISKECD PROCESS

    The process that checks to see if a disk ECD RC/V session is in progress cannot be created.

15. CANNOT DETERMINE ACT IOP FOR MTTY OR ROP

    Either the system is missing its MTTY or ROP or the RC/V ECD is corrupt. Offline boot cannot be guaranteed under these conditions.

16. CANNOT DETERMINE IF OFFLINE SIDE IS RUNNING

    The on-line CU cannot determine if the off-line CU is running or not. Before the on-line CU tries to access the off-line CU for a memory copy, it needs to know whether the off-line CU is

running. This is done by reading the off-line CU SSR through a series of MCH instructions. These instructions failed, which indicates problems with the MCH. This condition sometimes results in automatic termination of offline boot.

17. `CANNOT GROW` *g h*

    Prints if a device cannot be grown.

18. `CANNOT OUTPUT POST MORTEM, REASON` *v*

    EIH could not output the post-mortem for reason *v*.

19. `CANNOT PORT SWITCH MTTY`

    A message could not be sent to the IODRV to port switch an MTTY or ROP device.

20. `CANNOT PORT SWITCH MTTY OR ROP`

    The IODRV did not respond to the port switch message in the allotted time frame. When the timer expired, EIH checked the MTTY and ROP devices and found that they had not been port switched.

21. `CANNOT PORT SWITCH ROP`

    A message could not be sent to the IODRV to port switch an MTTY or ROP device.

22. `CANNOT READ OFFLINE CU SSR`

    The on-line CU cannot determine if the off-line CU is running. Periodically, the on-line CU checks the off-line CU's SSR to know whether the off-line CU is running or not. This is done by reading the off-line CU SSR through a series of MCH instructions. The instructions failed which indicates problems with the MCH. This condition will result in the automatic termination of offline boot.

23. `CANNOT RECONFIGURE CU COMMUNITY`

    Devices could not be reconfigured due to RC/V ECD access or update failures. Another possibility is that the device was properly reconfigured, but a message could not be sent to RTS to update the display pages information.

24. `CANNOT RELEASE AN MDCT RECORD`

    While trying to release an MDCT RC/V ECD record of type diagnostic that is associated with the disk community, the RC/V ECD could not be accessed or updated.

SEE PROPRIETARY NOTICE ON COVER PAGE

25. `CANNOT REMOVE DFC`

    Units could not be removed in preparation for booting off-line.

26. `CANNOT REMOVE IOP`

    Units could not be removed in preparation for booting off-line.

27. `CANNOT RESET SANITY TIMERS`

    Sanity timers cannot be reset or cleared.

28. `CANNOT RESTORE TO ORIGINAL STATE` *g h*

    Devices could not be reconfigured due to RC/V ECD access or update failures. Another possibility is that the device was properly reconfigured, but a message could not be sent to RTS to update the display pages information.

29. `CANNOT RESTORE` *g h*

    A message could not be sent to ADP to unconditionally restore a CU, DFC, or IOP community.

30. `CANNOT SEND DEGROWTH MESSAGE TO IODRV`

    Degrowth requests cannot be sent to IODRV in preparation for booting off-line.

31. `CANNOT SEND GROWTH MESSAGE TO DKDRV`

    Growth requests cannot be sent to DKDRV in order to reduplex the system.

32. `CANNOT SEND GROWTH MESSAGE TO IODRV`

    Growth requests cannot be sent to IODRV in order to reduplex the system.

33. `CANNOT SEND IOCLOSE MESSAGE TO DKDRV`

    A message cannot be sent to DKDRV requesting it to close a special device file. If the message prints twice, it means DKDRV will not have a chance to close a special device file. Consequently, its internal tables are corrupt and indicate a DFC is undergoing maintenance forever.

34. `CANNOT SEND IOOPEN MESSAGE TO DKDRV`

    Message cannot be sent to DKDRV. Usually the reason is that a message buffer cannot be allocated for the message.

35. `CANNOT SEND MESSAGE TO PMPRC`

    Message cannot be sent to PMPRC. Usually the reason is that a message buffer cannot be allocated for the message.

36. `CANNOT SEND MESSAGE TO USER PROCESS, PID` *i*

    Message cannot be sent to a user process identified by its process ID. Usually the reason is that a message buffer cannot be allocated for the message.

37. `CANNOT SEND OLBCPOFF MESSAGE TO AIM ERROR` *o*

    Message requesting AIM to turn call origination off failed. Reason for the failure is given in variable *o*.

38. `CANNOT SEND OLBCPON MESSAGE TO AIM ERROR` *o*

    EIH could not send a message to AIM of activity OLBCPON. This message is serious; the system does not have call origination. Reason for the failure is given in variable *o*.

39. `CANNOT SEND OLBDUPLEX MESSAGE TO AIM ERROR` *o*

    Message requesting AIM to reduplex failed. Reason for the failure is given in variable *o*.

40. `CANNOT SEND OLBPOSTSW MESSAGE TO AIM ERROR` *o*

    Message requesting AIM to take post-switch actions failed. Reason for the failure is given in variable *o*.

41. `CANNOT SEND OLBPRECFG MESSAGE TO AIM ERROR` *o*

    Message requesting AIM to pre-configure for an offline boot failed. Reason for the failure is given in variable *o*.

42. `CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR` *o*

    Message requesting AIM to perform offline boot pre-checks failed. Reason for the failure is given in variable *o*.

43. `CANNOT SEND OLBPRINT MESSAGE TO AIM ERROR` *o*

    Message requesting AIM to print the results of a previous check failed. Reason for the failure is given in variable *o*.

SEE PROPRIETARY NOTICE ON COVER PAGE

44. `CANNOT SEND OLBSPLIT MESSAGE TO AIM ERROR` *o*

    Message requesting AIM to unequip application hardware RC/V ECD UCBs failed. Reason for the failure is given in variable *o*.

45. `CANNOT SEND REC_UPDATE MESSAGE TO DKDRV`

    Message cannot be sent to DKDRV to update its disk display pages. Usually the reason is that a message buffer cannot be allocated for the message.

46. `CANNOT SEND UNTRMV MESSAGE TO DKDRV`

    DFC remove request cannot be sent to DKDRV in preparation for booting off-line.

47. `CANNOT SEND UNTRMV MESSAGE TO IODRV`

    IOP remove request cannot be sent to IODRV in preparation for booting off-line.

48. `CANNOT SEND UNTRST MESSAGE TO IODRV`

    EIH could not send a message during a side switch to restore an MTTY, ROP, or SCC device.

49. `CANNOT UNEQIP DEVICES`

    CU community devices cannot be unequipped.

50. `CANNOT UNEQIP` *g h*

    DFC and IOP devices and their sub-units cannot be unequipped.

51. `CANNOT UPDATE ECD`

    The RC/V ECD cannot be updated. The reason is dependent on the function *e* printed:

`DFS`	Could not reserve a unit's UCB record as part of `EXC:OFLBOOT` pre-checks.
`UNRESERVE`	Could not unreserve a UCB record while stopping offline boot. Some units' UCB records may remain reserved.

52. `CC_OTHA IN THE ON-LINE`

    A level 1 interrupt has occurred. The other CC hardware has reported a store hardware fault error (ER12). See the *System Maintenance Manual* for more information on ER12. Offline boot will be terminated because of faulty hardware.

53. CC_OTHC IN THE ON_LINE

    A level 1 interrupt has occurred. The other CC hardware has reported a read parity fault hardware error (ER14). See the *System Maintenance Manual* for more information on ER14. Offline boot will be terminated because of faulty hardware.

54. CC_OTHD IN THE ON-LINE

    A level 1 interrupt has occurred. The other CC hardware has reported a refresh parity fault hardware error (ER13). See the *System Maintenance Manual* for more information on ER13. Offline boot will be terminated because of faulty hardware.

55. CC_OTHTO IN THE ON-LINE

    A level 1 interrupt has occurred. The other CC hardware has reported a store time-out hardware error (ER15). See the *System Maintenance Manual* for more information on ER15. Offline boot will be terminated because of faulty hardware.

56. CHANGED DISK FORCES

    The DFC that is now forced on-line is not the same DFC that was forced on-line when the offline boot procedure was started. Offline boot will be terminated.

57. CORRUPT TIMER SLOT

    EIH found that the timer slot did not correspond to the ongoing action. Because EIH cannot use the corrupt time value from the slot, it uses a best guess of the time value instead.

58. CORRUPT VALUE FOR ABORT TIMER

    The offline boot stop sequence can be started when EIH is performing an action that:

    — does not need a timer to monitor it (NOTIMER)

    — needs a timer to monitor it, but the timer has not been started (NEEDTIMER)

    — needs a timer to monitor it and the timer has been started (RUNNING).

    This information (NOTIMER, NEEDTIMER, or RUNNING) has been found to be inconsistent or corrupted in comparison with the ongoing action. EIH will assume the worst case (a timer is RUNNING) and continue with the stop sequence. This assumption may result in this text line printing several times.

59. `COULD NOT PORT SWITCH`

    The IODRV returned a port switch request message with a failure code.

60. `COULD NOT TELL SIM TO BLOCK ECD 1 AUDITS`

    The EIH process could not tell the SIM process to block the ECD 1 audits.

61. `COULD NOT TELL SIM TO BLOCK ECD 3 AUDITS`

    The EIH process could not tell the SIM process to block the ECD 3 audits.

62. `COULD NOT TELL SIM TO BLOCK ECD 2 (APPECD) AUDITS`

    The EIH process could not tell the SIM process to block the ECD 2 (appecd) audits.

63. `COULD NOT TELL SIM TO BLOCK ECD 2 (ECD) AUDITS`

    The EIH process could not tell the SIM process to block the ECD 2 (ecd) audits.

64. `COULD NOT TELL SIM TO UNBLOCK ECD 1 AUDITS`

    The EIH process could not tell the SIM process to unblock the ECD 1 audits.

65. `COULD NOT TELL SIM TO UNBLOCK ECD 3 AUDITS`

    The EIH process could not tell the SIM process to unblock the ECD 3 audits.

66. `COULD NOT TELL SIM TO UNBLOCK ECD 2 (APPECD) AUDITS`

    The EIH process could not tell the SIM process to unblock the ECD 2 (appecd) audits.

67. `COULD NOT TELL SIM TO UNBLOCK ECD 2 (ECD) AUDITS`

    The EIH process could not tell the SIM process to unblock the ECD 2 (ecd) audits.

68. `DFC PRECHECKS FAILED`

    DFC-related checks failed. Offline boot will be terminated.

69. `DISK RC/V ECD SESSION IN PROGRESS`

    A disk RC/V ECD session is in progress. Offline boot will be terminated.

70. DKDRV HAS NOT CLOSED SPECIAL DEVICE FILE FOR *g h*

    Indicates that RTR pre-configuration has not completed because the DKDRV has not closed a file used in removing the specified device.

71. ILLEGAL SW OFLBOOT COMMAND

    A side switch was requested outside of offline boot (that is, offline boot is not running).

72. INCORRECT OLBSTATE *c*

    When EIH was processing a system initialization fault, it found that it had to resume offline boot activities. However, the state information was corrupt. Hence, EIH will not be able to resume the offline boot.

73. INTERNAL DFC NUMBER CORRUPT

    Indicates corruption of EIH's internal offline boot data.

74. INTERNAL DFC TABLE CORRUPT

    Indicates corruption of EIH's internal offline boot data.

75. INTERNAL ERROR, BAD OLBSTATE *c* SEEK TECHNICAL ASSISTANCE

    An illegal instruction in EIH was found during the offline boot procedure.

76. INTERNAL INITLEVEL CORRUPT

    A system wide initialization (FLT_SINIT) was processed by EIH. EIH found it had to resume offline boot activities, but could not because the specified initialization level (2) might use a corrupt RC/V ECD. Offline boot will be terminated.

77. INTERNAL IOP TABLE CORRUPT

    Indicates corruption of EIH's internal offline boot data.

78. INTERNAL LOGIC ERROR

    Indicates a logic error has been encountered. Offline boot will be terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

79. `INTERNAL UNITS TABLE CORRUPT`

    EIH used an RC/V ECD RID stored internally to read a RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it pointed to the incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.

80. `INVALID MESSAGE RECEIVED`

    Invalid message was received from the process identified by its process ID.

81. `INVALID MESSAGE RECEIVED FROM AIM, ACTIVITY` *j*

    Invalid message was received from AIM.

82. `INVALID MESSAGE RECEIVED FROM IODRV, TYPE` *k*

    Invalid message was received from IODRV.

83. `INVALID OLBSTATUS FOR MESSAGE RECEIVED FROM AIM, ACTIVITY` *j*

    The activity carried out by AIM is inconsistent with the current OLBSTATE.

84. `LAST OLBSTATE` *d* `INVALID`

    During the stop offline boot sequence, state information used to determine how much work needs to be done was found to be corrupt. The stop sequence will assume the highest level of work is needed and continue.

85. `LAST OLBSTATE` *d* `INVALID FOR ABORT`

    During the stop offline boot sequence, state information used to determine how much work needs to be done was found to be corrupt. The stop sequence will assume the highest level of work is needed and continue.

86. `LATE MESSAGE RECEIVED`

    A message was received too late from the process identified by its process ID.

87. `LOW CORE AMODE CORRUPT`

    Indicates corruption of low core.

88. `LOW CORE IOPMASK CORRUPT`

    EIH cannot interpret the contents of the lowcore IOPMASK value because the contents of lowcore ORIGSIDE is corrupt.

SEE PROPRIETARY NOTICE ON COVER PAGE

89. `LOW CORE ORIGSIDE CORRUPT`

    Indicates corruption of low core.

90. `MEMORY COPY FAILED`

    A memory-to-memory copy failed because either the off-line CU never halted to allow the copy or there was a `CC_OTHC` or `CC_OTHTO` fault.

91. `MESSAGE FROM PMPRC TOO LATE -- DISCARDING`

    Message was received out of time from PMPRC. EIH took a default action, which could include terminating the offline boot procedure.

92. `MESSAGE FROM DKDRV TOO LATE -- DISCARDING`

    Message was received out of time from DKDRV. EIH took a default action, which could include terminating the offline boot procedure.

93. `MESSAGE FROM VFYDISKECD TOO LATE -- DISCARDING`

    Message was received out of time from the VFYDISKECD process. EIH took a default action, which could include terminating the offline boot procedure.

94. `MESSAGE FROM AIM TOO LATE -- DISCARDING`

    Message was received out of time from AIM. EIH took a default action, which could include terminating the offline boot procedure.

95. `MTTY OR ROP NOT ACTIVE FOR ONLINE SIDE`

    MTTY, or ROP, or both are not active for the on-line CU. Offline boot is not supported without an MTTY and a ROP. Offline boot will be terminated.

96. `MUST BE ACT TO REMOVE`

    A device is in the wrong state to remove. The incorrect state is given in variable *p* which immediately precedes this text line.

97. `MUST BE IN ACT OR INIT STATE TO DEGROW`

    A device is in the ACT or INIT states when it should be in a state valid for the degrowth operation (OOS state). The incorrect state is given in variable *p* which immediately precedes this text line.

98. `MUST BE IN ACT OR INIT STATE TO REMOVE`

    A device is in the wrong state to remove. The incorrect state is given in variable *p* which immediately precedes this text line.

99. `MUST BE OOS TO RESTORE`

    A device is not in the state that the offline boot procedure expects it to be. The incorrect state is given in variable *p* which immediately precedes this text line.

100. `NO DISK FORCED`

    There is no DFC forced on-line.

101. `NO TIMER SLOTS AVAILABLE`

    Indicates internal timer slots are all used up. Timer slots are freed at this point and the "no timer slots available" message is printed.

102. `NOT ALL UNITS ARE OOS`

    Indicates not all units are OOS. Before offline boot moves a device to the off-line side, it first puts the device in the OOS state. One or more of the devices that are to be moved to the off-line side are not in the OOS state. Offline boot will be terminated.

103. `NOT IN GROW STATE`

    During the stop offline boot process, a unit has been found that is not in the correct state to allow it to be reconfigured back into service, or the unit in question has already been moved (not by offline boot) to some other unexpected state. In either case, the reconfiguration sequence is not followed for this device. The incorrect state is given in variable *p* which immediately precedes this text line.

104. `NOT IN UNEQIP STATE`

    A device is not in the state that the offline boot procedure expects it to be. The incorrect state is given in variable *p* which immediately precedes this text line.

105. `NOT OOS`

    EIH is expecting all the devices going to the off-line side to be in the OOS state. However, it has found that one or more of these devices are not in the OOS state. Offline boot will be terminated. The incorrect state is given in variable *p* which immediately precedes this text line.

106. `OFFLINE AIM REPORTED CHECKS FAILURE`

     AIM reported pre-check errors.

107. `OFFLINE BOOT TIMED OUT`

     The timer set for booting off-line has expired. Another timer will be set with the original timeout value and offline boot will continue until manually stopped or off-line AIM writes the completion word in low core.

108. `OFFLINE CU NOT RUNNING`

     Output by the on-line CU, this message indicates that the off-line CU is not running. Offline boot will be terminated.

109. `OFFLINE LOW CORE BOOT STATUS IS CORRUPT`

     The periodic monitor that checks whether AIM has written the boot completion word in the off-line low core found the contents of the word corrupt. It will assume that the boot is not done.

110. `OFFLINE RTR CHECKS FAILED ERROR` *q*

     UNIX® RTR encountered pre-check errors. Error is given in variable *q*.

111. `OFFLINE RTR-AIM COMMUNICATION FAILED`

     Indicates EIH could not send a message to AIM in the off-line side or that AIM did not reply on time.

112. `OFFLINE SIDE DID NOT COMPLETE THE LBOOT STEP`

     If failure PRMs are present, they will indicate that the disk unit (MHD 0 or MHD 1) used to boot the offline side is bad. Examples of corruption are a bad or non-existent VTOC or junk in the LBOOT partition. If failure PRMs are not present, there may be a problem with the MCH or the CU complex.

113. `OLBABORT EVENT RECEIVED -- ABORTING`

     Indicates EIH has received an abort event; procedures to stop the offline boot have begun. Procedures will attempt to restore units.

114. `OLBCONFIG EVENT RECEIVED -- ABORTING`

     Indicates EIH has received an abort event because an essential device like an SCC or MHD is not active nor unequipped; procedures to stop the offline boot have begun. Procedures will attempt to restore units.

SEE PROPRIETARY NOTICE ON COVER PAGE

115. `OLBSTATE` *c* `EXPECTED EXC_BOOT OR SW_PRCHK`

    A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

116. `OLBSTATE` *c* `NOT EXC_AIMECD`

    A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

117. `OLBSTATE` *c* `NOT EXC_CFGAIM`

    A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

118. `OLBSTATE` *c* `NOT EXC_POSTSW`

    A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

119. `OLBSTATE` *c* `NOT EXC_RMV`

    A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

120. `OLBSTATE` *c* `NOT STOP_IOPS`

    A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

121. `PORT SWITCH NOT DONE`

    The IODRV returned a port switch request message with a success code. However, when EIH verified this against the ECD, it found that the devices had not really been port switched.

122. `RC/V ECD SESSION IN PROGRESS`

    An incore RC/V ECD session is in progress. Offline boot will be terminated.

123. `RESTORE OF MTTY,ROP,SCC AND/OR SCSDC FAILED AFTER SIDE SWITCH`

    During a side-switch, EIH received a message from the IODRV saying that it could not restore an MTTY, ROP, SCC, or SCSDC device.

SEE PROPRIETARY NOTICE ON COVER PAGE

124. `RETROFIT NOT SPECIFIED -- REDUPLEXING`

    Call origination could not be turned on in the new on-line side during a side switch. Since the RETROFIT option was not specified, offline boot will be terminated immediately.

125. `RETROFIT SPECIFIED -- CONTINUING`

    Call origination could not be turned on in the new on-line side during a side switch. Since the RETROFIT option was specified, the side switch will continue its normal sequence. Notice, however, there is no call origination going on.

126. `SANITY TIMER NOT CLEARED`

    The off-line sanity timer cannot be cleared.

127. `SIM COULD NOT BLOCK` *r s t* `AUDITS REASON` *u*

    SIM reported to EIH that it could not block the requested audits. The requested audit name is *r* with member number *s* and the audit instance name is *t*. The reason is explained by the code *u*.

128. `SIM COULD NOT UNBLOCK` *r s t* `AUDITS REASON` *u*

    SIM reported to EIH that it could not unblock the requested audits. The requested audit name is *r* with member number *s* and the audit instance name is *t*. The reason is explained by the code *u*.

129. `SOME TERMINAL(S) UNDER OFF-LINE IOP MAY BE LOCKED`

    Some IOP assigned to the off-line side will not have all its subdevices equipped, and as a consequence, some terminal in the office, if any, will appear to be locked, i. e., the information displayed is out-dated, and no input is accepted.

130. `STOP DENIED DURING SWITCH`

    Offline boot cannot be stopped manually or through application requests during a side switch.

131. `SWITCH CALL PROCESSING OFF FAILED`

    AIM reported call origination could not be turned off in preparation for side switching. If retrofit was not specified, `SW:OFLBOOT` will fail.

132. `SWITCH CALL PROCESSING ON FAILED`

    AIM reported call origination could not be turned on.

SEE PROPRIETARY NOTICE ON COVER PAGE

133. `SWITCH POSTSW FAILED`

    AIM reported post-switch work failed. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

134. `SWITCH POSTSW TIMED OUT`

    AIM post-switch work timed out. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

135. `SWITCH PRE-CHECK ONLY COMPLETED`

    The pre-check only option was specified in the application message requesting the side switch (that is, not a manual request to side switch).

136. `SWITCH TERMINATED`

    The side switch was terminated. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

137. `SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS`

    Command line options do not match system status. This message will be output if any of the following conditions are true:

    — required unit is OOS and neither OOS nor UCL was specified

    — specified TTY does not exist

    — specified IOP does not exist

    — both IOP 0 and IOP 1 are selected for moving to the off-line side

    — a primary disk was not forced

    — a CU is forced

    — only one bootable disk is available or one of the bootable disks is not equipped

    — mate CU state is not STBY or OOS

    — if any RC/V ECD UCB record is reserved.

    This list is not exhaustive. Another output message has been output prior to this output message describing the problem.

138. TIME OUT - AIM POST-BOOT CHECKS

    EIH did not receive results of activities before timers expired. Either the on-line side or the off-line side timer to receive the results from the off-line AIM post-boot checks has expired. These post-boot results will not be available.

139. TIME OUT - AIM PRECONFIGURATION

    EIH did not receive results of activities before timers expired.

140. TIME OUT - CANNOT REMOVE EITHER CU, DFC AND/OR IOP

    EIH did not receive all the successful removal confirmation messages when the timer expired. It verified against the RC/V ECD that not all of the units were in the OOS state as expected.

141. TIME OUT DUPLEX ECD: AIM REPORTED *x*, RTR REPORTED *y*

    This message always results in continuing the STOP sequence in progress to the point where IOPs are duplexed and then to the end part of the STOP. Although AIM is involved in the STOP sequence, it did not cause the timeout. Therefore, the AIM duplex completion value *x* is printed for information purposes only. If *x* is NOTHING, AIM had not finished its duplexing at the moment the timeout occurred. If *x* is SUCCESS, AIM had successfully finished its STOP sequence. If *x* is FAILURE, AIM reported errors during its STOP sequence. This timeout was caused by RTR problems when growing DFC units. A value of NOTHING for *y* means RTR did not complete or report to EIH the status of the grow operations for the DFC units involved in the STOP sequence. A value of FAILURE for *y* means RTR failed to complete the grow operations for the DFCs units involved in the STOP sequence. A value of SUCCESS for *y* means RTR indicated a successful grow of the DFC units involved in a side switch; a logic error happened.

142. TIME OUT FOR RECEIVING RESULTS OF POST-BOOT CHECKS

    EIH did not receive results of activities before timers expired. Either the on-line side or the off-line side timer to receive the results from the off-line AIM post-boot checks has expired. These post-boot results will not be available.

143. TIME OUT RTR GROW: AIM REPORTED *x*, RTR REPORTED *y*

    This message always results in termination of the oflboot procedure. AIM is not involved in the side switch growth of units, hence, the value of *x* is always NOTHING; otherwise, a logic error happened. A value of NOTHING for *y* means RTR did not complete or did not report to EIH the status of the grow operations for the MTTY, ROP, SCC, and SCSDCs units involved in a side switch. A value of FAILURE for *y* means RTR failed to complete the grow operations for the MTTY, ROP, SCC, and SCSDCs units involved in a side switch. A value of SUCCESS for *y* means RTR indicated a successful grow of the units involved in a side switch; a logic error happened.

144. TIME OUT SPLIT ECD: AIM REPORTED *x*, RTR REPORTED *y*

    This message always results in termination of the oflboot procedure. A value of NOTHING for *x* or *y* means AIM or RTR or both did not complete or did not report to EIH the status of the split operation. A value of FAILURE for *x* or *y* means AIM or RTR or both failed to complete the split operation. A value of SUCCESS for *x* or *y* means AIM or RTR or both indicated a successful split of its units. Notice that, if both are SUCCESS, a logic error happened.

145. TIME OUT WHEN GROWING *g h*

    EIH did not receive the result of growing an IOP unit or sub-unit. The specified unit and its sub-units if any will be left in the UNEQIP state.

146. TRYING TO WRITE INVALID BOOTSTATUS TO LOW CORE

    EIH is trying to write an invalid value to low core.

147. TRYING TO WRITE INVALID IOPMASK TO LOW CORE

    EIH is trying to write an invalid value to low core.

148. TRYING TO WRITE INVALID IOPSUBUNIT TO LOW CORE

    EIH is trying to write an invalid value to low core.

149. TRYING TO WRITE INVALID MODE TO LOW CORE

    EIH is trying to write an invalid value to low core.

150. `TRYING TO WRITE INVALID MODIFIEDECD TO LOW CORE`

     EIH is trying to write an invalid value to low core.

151. `TRYING TO WRITE INVALID OFLTTY TO LOW CORE`

     EIH is trying to write an invalid value to low core.

152. `TRYING TO WRITE INVALID OLBACK TO LOW CORE`

     EIH is trying to write an invalid value to low core.

153. `TRYING TO WRITE INVALID OLBDFC TO LOW CORE`

     EIH is trying to write an invalid value to low core.

154. `TRYING TO WRITE INVALID OLBTRACE TO LOW CORE`

     EIH is trying to write an invalid value to low core.

155. `TRYING TO WRITE INVALID OLBUCL TO LOW CORE`

     EIH is trying to write an invalid value to low core.

156. `TRYING TO WRITE INVALID ORIGSIDE TO LOW CORE`

     EIH is trying to write an invalid value to low core.

157. `TRYING TO WRITE INVALID VALUE TO LOW CORE`

     EIH is trying to write an invalid value to low core.

158. `UNEXPECTED MESSAGE FROM AIM`

     EIH received a message from AIM (type OFLBOOT) whose activity was OLBPRECHK. However, EIH's internal state information (OLBSTATE) was inconsistent with the value specified in lowcore MODE for the specified activity (OLBPRECHK). This situation indicates either an illegal message was received from AIM or that a message buffer was overwritten and corrupted. EIH will drop this message and not take action on it.

159. `UNEXPECTED MESSAGE RECEIVED FROM`

     EIH received a message it cannot identify. The process ID and message type are provided to help identify the message.

160. UNIT REMOVAL FAILURE

During a side switch, the following devices are removed from the on-line side: MTTY, ROP, SCC, and SCSDs. The IODRV returned a message stating that one or more of these devices could not be moved to the OOS state. The side switch will continue. Furthermore, to prevent the IODRV from stealing these devices from the new on-line side, their RC/V ECD UCB records will be unequipped and messages will be sent to the IODRV to move them to the DEGROW state.

c = Current offline boot state.

d = Previous offline boot state.

e = Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.

f = Line number in the function *f* from which the output message originated. This field is used by UNIX® RTR, in conjunction with fields *c*, *d*, and *e*, to diagnose offline boot problems.

g = String giving device type information; CU, DFC, IOP, MHD, TTY, TTYC, and DSCH, for example. Unit names are listed in the Member Number Appendix, MEM-NUM-APPC, Table C, of this manual.

h = Device number. A value of zero, which used with *g*, could form DFC 0, for example.

i = Process identification number.

j = Activity defined in message sent from the AIM process.

k = Message type in message sent from the IODRV, AIM, or any other unknown process.

l = Memory location where the invalid value *n* is being written.

m = Invalid value that is being written to low core.

n = RID of the RC/V ECD UCB record for the unit that cannot be removed.

o = Reason message could not be sent.

0	process is not attached to its port or port is invalid
8192	process cannot queue more messages
-1	cannot allocate system message buffer

p = Device state.

q = Pre-check errors.

`1` Offline side is running in minimum configuration mode. System must be in full configuration mode for a side switch.

`2` Internal DFC table corrupt. Indicates corruption of EIH's internal offline boot data.

`3` Cannot get a DFC UCB record to get information for running pre-checks.

`4` An offline side DFC or DFC sub-unit is in the INIT state.

`5` Corrupt ECD UCB record for a DFC or DFC sub-unit. The device is in the STBY state which is not supported for DFC communities.

`6` An offline side DFC or DFC sub-unit either has a non-supported essential field or it is an essential or no_man_rmv device that is not active. For the latter, it could be UNAV, OFL, OOS, or GROW.

`7` Corrupt ECD UCB record for a DFC or DFC sub-unit. The device has an unsupported major state field in its UCB.

`10` Low core IOPMASK corrupt. EIH cannot interpret the contents of the low core IOPMASK value because the contents of low core ORIGSIDE is corrupt.

`11` No IOP in the off-line side. Indicates that IOP 0 and IOP 1 are both on the on-line side. The switch will fail because it will not have a MTTY or ROP on the other side.

`12` No IOP in the off-line side. Indicates that IOP 0 and IOP 1 are both on the on-line side. The switch will fail because it will not have a MTTY or ROP on the other side.

`13` Low core ORIGSIDE corrupt. Indicates corruption of low core.

`14` Internal IOP table corrupt. Indicates corruption of EIH's internal offline boot data.

`15` Cannot get IOP 0 or 1 UCB record to get information for running pre-checks.

`16` Internal units table corrupt. EIH used an RC/V ECD RID stored internally to read a RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it pointed to the incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.

SEE PROPRIETARY NOTICE ON COVER PAGE

17 Not ACT. The IOP is not in the ACT state.

18 Diagnostics running. Indicates the specified IOP, 0 or 1, RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

19 The off-line side is running in full disk independent operation (DIOP) mode. The offline boot procedure cannot side switch to an impaired side.

20 Cannot get MTTYC 0 or 1 UCB record to get information for running pre-checks.

21 Internal units table corrupt. EIH used an RC/V ECD RID stored internally to read a MTTY controller RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it pointed to the incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.

22 Not ACT. MTTYC 0 or 1 is not in the ACT state.

23 Diagnostics running. Indicates MTTYC 0 or 1 RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

r = Audit name, such as ECD.

s = Audit member number, such as 1, 2, or 3.

t = Audit instance, such as "ecd" or "appecd".

u = Possible errors codes returned by SIM to the EIH request to block or unblock an ECD audit:

3 audit system initialization in progress

4 audit system initialization failed

5 access to audit record in the ECD failed

9 requested audit instance is blocked

19 invalid audit specified

20 invalid audit instance specified

30 request resulted in no change

SEE PROPRIETARY NOTICE ON COVER PAGE

v = Possible reason codes why EIH could not output a post-mortem report:

`10` cannot copy post-mortem slots from off-line CU - the on-line CU is holding information in its slots

`11` RMF is not running

`12` cannot copy off-line post-mortem slots

w = RID of the RC/V ECD UCB record for the unit that cannot be restored automatically.

x = `NOTHING`, `SUCCESS`, or `FAILURE`

y = `NOTHING`, `SUCCESS`, or `FAILURE`

4. ACTION TO BE TAKEN

Text Line: Action to be Taken:

1. Indicates AIM tried to abort the offline boot while `SW:OFLBOOT` was executing.
2. Restore the unit manually.
3. This message is for information only; no action is needed.
4. Wait for offline boot to terminate. Some application devices may be in an incorrect state. If so, issue a `STOP:OFLBOOT;RST` command within 1 hour. Once the hour is passed, manual actions will be required to restore the application devices to their original states.
5. Wait for offline boot to terminate, clear the problem with the application, and try offline boot again.
6. If retrofit was not specified, offline boot will be terminated on the current on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.
7. If retrofit was not specified, offline boot will be terminated on the new on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.
8. Wait for offline boot to terminate, then try offline boot again.
9. Wait for offline boot to terminate, then try offline boot again.
10. Wait for offline boot to be terminated, then run RC/V ECD audits.
11. Seek technical assistance.
12. Wait for offline boot to terminate, then try offline boot again.
13. Wait for offline boot to terminate, then try offline boot again.
14. Wait for offline boot to terminate, then try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

15. If there is no active MTTY or ROP, restore them and try offline boot again. Otherwise, RC/V ECD is corrupt and RC/V ECD audits must be run. If the audits pass, try offline boot again.
16. If the message did not result in an automatic termination of offline boot, manually stop the procedure. Once offline boot is stopped, run the CU diagnostics, phases 1 through 4, 11, and 62; if successful, try offline boot again.
17. Manual recovery is needed to restore the device to its pre-offline boot state.
18. If the reported reason was 10 or 12, the problem is either that the output slot is being used by a higher priority message or that EIH is unable to complete copy. In either case, no action is needed. A reason of 11 indicates that the recovery message formatter (RMF) process is not running; seek technical assistance.
19. Indicates there were errors in port switching a device. Check device state and restore if needed.
20. Manual recovery is needed to restore the device to its pre-offline boot state.
21. Manual recovery is needed to restore the device to its pre-offline boot state.
22. Wait for offline boot to terminate, then run the CU diagnostics, phases 1 through 4, 11, and 63, to check the maintenance channel. If these particular phases do not reveal anything then run the complete CU diagnostics before trying offline boot again.
23. Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
24. A scarce system resource (a MDCT record of type diagnostic) has been lost. To recover it, run the ECDOWN audit or manually unreserve the RC/V ECD MDCT record.
25. Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
26. Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
27. This message is for information only; no action is needed.
28. Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
29. Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
30. Wait for offline boot to terminate, then try offline boot again.
31. Manual recovery is needed to restore the device to its pre-offline boot state.
32. Manual recovery is needed to restore the device to its pre-offline boot state.

SEE PROPRIETARY NOTICE ON COVER PAGE

33. This message can occur twice. The first time this message occurs, ignore it; no action is needed. The second time this message prints, seek technical assistance.
34. Wait for offline boot to terminate, then try offline boot again.
35. Wait for offline boot to terminate, then try offline boot again.
36. This message is for information only; no action is needed.
37. If retrofit was not specified, the system will remain in offline boot. The side switch may be retried, if desired. If retrofit was specified, the side switch will continue; no action is needed.
38. If retrofit was not specified, offline boot will be terminated on the new on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.
39. Application recovery must be carried out manually.
40. Seek technical assistance.
41. Wait for offline boot to terminate, then try offline boot again.
42. The action to be taken depends on the function *e* output with the message:

`HDL_OLB_OPCODE`	The off-line side EIH could not ask AIM to perform post-boot checks. No action is needed.
`OLBCONTROL`	The off-line side EIH could not ask AIM to perform side switch pre-checks; try the side switch again.

43. This message is for information only; no action is needed.
44. Wait for offline boot to terminate, then try offline boot again.
45. DKDRV did not have a chance to update its disk display pages. Restart the DKDIP process to have the pages show the correct information.
46. Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
47. Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
48. Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
49. Check to see why the device cannot be unequipped, resolve the problem, and try offline boot again.
50. Check to see why the device cannot be unequipped, resolve the problem, and try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

51. The action to be taken depends on the function *e* output with the message:

`DFS`	Run RC/V ECD audits. If the audits pass, try offline boot again.
`UNRESERVE`	If diagnostics are not running, then the RC/V ECD UCB record is corrupted; in which case, the UCB record needs to be unreserved manually or through the ECDOWN audit.

52. Seek technical assistance to run diagnostics.
53. Seek technical assistance to run diagnostics.
54. Seek technical assistance to run diagnostics.
55. Seek technical assistance to run diagnostics.
56. Wait for offline boot to terminate, force a DFC, and try again to boot off-line.
57. Notify technical assistance about this occurrence. No other action needs to be taken for `STOP:OFLBOOT` to complete.
58. Notify technical assistance about this occurrence. No other action needs to be taken for `STOP:OFLBOOT` to complete.
59. Indicates there were errors in port switching a device. Check device state and restore if needed.
60. This message is for information only; no action is needed.
61. This message is for information only; no action is needed.
62. This message is for information only; no action is needed.
63. This message is for information only; no action is needed.
64. Save the ROP output and report this incident to technical assistance.

NOTE: The audits will automatically be unblocked in six hours.

65. Save the ROP output and report this incident to technical assistance.

NOTE: The audits will automatically be unblocked in six hours.

66. Save the ROP output and report this incident to technical assistance.

NOTE: The audits will automatically be unblocked in six hours.

67. Save the ROP output and report this incident to technical assistance.

NOTE: The audits will automatically be unblocked in six hours.

68. Investigate the cause of the pre-check error, resolve the problem indicated, and try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

69. Wait for the RC/V ECD session to complete, then try offline boot again.

70. This message is for information only; no action is needed.

71. If an offline boot was underway, then the low core value of MODE has been corrupted; seek technical assistance. Otherwise, boot off-line and then side switch.

72. A manual `STOP:OFLBOOT` will be necessary because offline boot will not continue. Depending on the amount of state information corrupted, the `STOP:OFLBOOT` may result in cascading error messages; the stop process will complete, however.

73. The action to be taken depends on the function *e* output with this message:

    `DEGROW_DFC, RMV_DFC` - Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.

    `CHG_DFC` The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.

    `RST_DFC` The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.

74. The action to be taken depends on the function *e* output with this message:

    `DEGROW_DFC, RMV_DFC` - Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.

    `CHG_DFC` The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.

    `RST_DFC` The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.

75. Seek technical assistance.

76. Wait for offline boot to be terminated, restore the CU community, and try offline boot again.

77. The action to be taken depends on the function *e* output with this message:

    `DEGROW_IOPS, RMV_IOPS` - Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.

    `GROW_IOPS` The device will remain in the UNEQIP state. If this was not its original state, wait for offline boot to be terminated, then manually grow the device community and restore it to service.

    `RST_IOPS` The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.

78. Save the ROP output and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

79. The action to be taken depends on the function *e* output with this message:

    CHECK_OOS, DEGROW_DFC, DEGROW_IOPS, RMV_DFC, RMV_IOPS - Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.

    CHG_DFC — The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.

    EQUIP_CU, GROW_DFC, GROW_IOPS - The device will remain in the UNEQIP state. If this was not its original state, wait for offline boot to be terminated, then manually grow the device community and restore it to service.

    RST_DFC — The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.

    SWPRECHECK — The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete.

80. Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.

81. Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.

82. Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.

83. Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.

84. No action is needed.

85. Seek technical assistance.

86. This message is for information only; no action is needed.

87. Save the ROP output and seek technical assistance.

88. If OLBSTATE is EXC_ONLECD, wait for offline boot to be terminated, then try it again.

    If the function *e* is SWPRECHECK, the side switch will not succeed. To retry to side switch, first, stop offline boot manually; second, start another offline boot; and third, try the side switch again after offline boot completes.

    Otherwise, this is happening during the offline boot stop sequence. Some DFCs or IOPs belonging to the off-line side will remain in the UNEQIP, GROW, or OOS state. If these were not the original states, manually move the devices to their original states.

SEE PROPRIETARY NOTICE ON COVER PAGE

89. If OLBSTATE is EXC_ONLECD, wait for offline boot to be terminated, then try it again.

    If the function *e* is SWPRECHECK, the side switch will not succeed. To retry to side switch, first, stop offline boot manually; second, start another offline boot; and third, try the side switch again after offline boot completes.

    Otherwise, this is happening during the offline boot stop sequence. Some DFCs or IOPs belonging to the off-line side will remain in the UNEQIP, GROW, or OOS state. If these were not the original states, manually move the devices to their original states.

90. This message is for information only; no action is needed.

91. This message is for information only; no action is needed.

92. This message is for information only; no action is needed.

93. This message is for information only; no action is needed.

94. This message is for information only; no action is needed.

95. Check the status of the MTTY and ROP, restore the device that is not in the ACT state, and try offline boot again.

96. Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

97. This message should read CANNOT BE IN ACT OR INIT STATE TO DEGROW. Stop offline boot manually, change the state of the device, and try offline boot again.

98. Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

99. Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

100. If printed while executing EXC:OFLBOOT, wait for offline boot to terminate, force a DFC, and try again to boot off-line. If this message is printed as part of SW:OFLBOOT, wait for the side switch to fail, force the DFCs as they were at the beginning of the offline boot, and try to side switch again.

101. This message is for information only; no action is needed.

102. Wait for offline boot to be terminated. Check on why the DFC and all the IOPs to be moved to the off-line side are not in the OOS state. Resolve the problem, and then try offline boot again.

103. After the offline boot process is terminated, check whether this device requires manual action to be brought back to its original state.

104. No action is needed.

105. Wait for offline boot to be terminated. Then, check the states of the devices that were going to the off-line side. If any device is not in the OOS state, investigate why. After resolving any problem, try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

106. If post-boot checks failed, no action is needed. If side switch pre-checks failed, investigate what caused the pre-check error, resolve the problem, and try the side switch again.

107. Either manually stop offline boot or let it run until it completes. If this message is seen twice or more, offline boot may not complete and manually stopping it is recommended.

108. Check the on-line CU to see why it terminated. There may be some information in the off-line side post-mortem dump if one was output as part of the offline boot termination. If nothing is determined, try offline boot again after the termination is complete.

109. If the failure is part of a side switch, the side switch will be aborted if the RETROFIT option was not specified. If the RETROFIT option was specified, the system will be booted on the side targeted for switching and offline boot will terminate.

NOTE: If the reason for failure indicates bad hardware, it is recommended to stop the oflboot procedure and reschedule it when the hardware has been repaired.

110. The action to be taken depends on the value of *q*:

    `1` To side switch, stop oflboot and execute `EXC:OFLBOOT` without specifying the MINCONFIG option. When this second offline boot completes, try the side switch again.

    `2` Seek technical assistance.

    `3` The error is in the off-line side ECD which cannot be audited; seek technical assistance.

    `4` Wait for the INIT operation to complete and run `SW:OFLBOOT` again.

    `5` The error is in the off-line side ECD which cannot be audited; seek technical assistance.

    `6` If the error is an invalid essential field then it is in the off-line side ECD which cannot be audited; seek technical assistance. ESSENTIAL or NOMANRMV devices in GROW and OFL will fail the switch always; stop offline boot manually and seek technical assistance. ESSENTIAL or NOMANRMV devices in UNAV and OOS should be restored, then run `SW:OFLBOOT` again. If the restore operations fail the switch will always fail; stop offline boot manually and seek technical assistance.

    `7` The error is in the off-line side ECD which cannot be audited; seek technical assistance.

    `10` Seek technical assistance.

    `11` Stop offline boot; wait for it to terminate. Try oflboot with IOP 0 or IOP 1 specified. Wait for the off-line side to be booted, then try `SW:OFLBOOT` again.

    `12` Stop offline boot; wait for it to terminate. Try oflboot with IOP 0 or IOP 1 specified. Wait for the off-line side to be booted, then try `SW:OFLBOOT` again.

SEE PROPRIETARY NOTICE ON COVER PAGE

13 Seek technical assistance.

14 Seek technical assistance.

15 The error is in the off-line side ECD which cannot be audited; seek technical assistance.

16 Seek technical assistance.

17 Restore the IOP and run `SW:OFLBOOT` again.

18 Run `SW:OFLBOOT` again after diagnostics complete.

19 Stop oflboot, repair the equipment that caused the off-line side to go into DIOP and execute `EXC:OFLBOOT`. When this second offline boot completes, try the side switch again.

20 The error is in the off-line side ECD which cannot be audited; seek technical assistance.

21 If there is no active MTTY controller, restore it and try offline boot again. Otherwise, RC/V ECD is corrupt and RC/V ECD audits must be run. If the audits pass, try offline boot again.

22 Restore the MTTY controller and run `SW:OFLBOOT` again.

23 Run `SW:OFLBOOT` again after MTTY controller diagnostics complete.

111. Check OLBLOG files on the off-line side to determine if AIM has a problem. Do NOT start a side switch if it does. Also, recover OLBLOG files and send them to technical assistance. If the message was part of a retrofit side switch, watch for correct operation on the new on-line side as AIM was having problems and it may not support call origination.

112. Wait for offline boot to terminate. If a disk is bad do not boot from it, booting from a corrupted disk can cause an outage; seek technical assistance. If the CU or MCH appears to be the problem, then run the CU diagnostics, phases 1 through 4, 11, and 63, to check the maintenance channel. If these particular phases do not reveal anything, then run the complete CU diagnostics before trying offline boot again.

113. No action is needed.

114. Restore or unequip the affected essential device before trying offline boot again.

115. Save the ROP output and notify technical assistance of this occurrence.

116. Save the ROP output and notify technical assistance of this occurrence.

117. Save the ROP output and notify technical assistance of this occurrence.

118. Save the ROP output and notify technical assistance of this occurrence.

119. Save the ROP output and notify technical assistance of this occurrence.

SEE PROPRIETARY NOTICE ON COVER PAGE

120. Save the ROP output and notify technical assistance of this occurrence.

121. Indicates there were errors in port switching a device. Check device state and restore if needed.

122. Wait for the RC/V ECD session to complete, then try offline boot again.

123. Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

124. Indicates offline boot has encountered fatal errors and the RETROFIT option was not specified, so offline boot is terminated and the system is immediately reduplexed. When offline boot has terminated, perform whatever manual recovery steps are needed to re-establish call origination.

125. If function *e* is `TIM_CPON`, call origination is down. Wait for the side switch to finish, manually stop offline boot, and then take whatever actions are needed to re-establish call origination.

126. This message is for information only; no action is needed.

127. This message is for information only; no action is needed.

128. Save the ROP output and report this incident to technical assistance.

NOTE: The audits will automatically be unblocked in six hours.

129. No action is needed.

130. Wait until the side switch is finished, try `STOP:OFLBOOT` again on the new on-line side.

131. If retrofit was not specified, the system will remain in offline boot. The side switch may be retried, if desired. If retrofit was specified, the side switch will continue; no action is needed.

132. Check OLBLOG files on the off-line side to determine if AIM has a problem. If call origination is turned off, take whatever actions are needed to re-establish call origination.

133. Check to see if manual recovery is needed.

134. Check to see if manual recovery is needed.

135. This message is for information only; no action is needed.

136. Check to see if manual recovery is needed. It is possible that call origination is still turned off.

137. If this message is preceded by a pre-check failure message, follow the action to be taken specified by the preceding message. If not, then an initialization level of 2 was specified and the CU is in the OOS state. In this case, offline boot cannot continue because the OOS CU memory will be used for booting and it may be corrupt. Either specify a higher initialization level or restore the CU before trying the offline boot again.

138. No action is needed.

SEE PROPRIETARY NOTICE ON COVER PAGE

139. Wait for offline boot to terminate, then try offline boot again.

140. Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

141. Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be grown. Manually, grow those units and move them to OOS through RC/V; then restore them. If the message indicates a logic error, save the ROP and seek technical assistance.

142. No action is needed.

143. Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be grown. Manually, grow those units and move them to OOS through RC/V; then restore them. If the message indicates a logic error, save the ROP and seek technical assistance.

144. Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be split. Correct the problems and try offline boot again. If the message indicates a logic error, save the ROP and seek technical assistance.

145. To recover the units, wait for offline boot to terminate; use RC/V to move the units to GROW and then to OOS. Finally, restore the units manually.

146. Save the ROP output and seek technical assistance.

147. Save the ROP output and seek technical assistance.

148. Save the ROP output and seek technical assistance.

149. Save the ROP output and seek technical assistance.

150. Save the ROP output and seek technical assistance.

151. Save the ROP output and seek technical assistance.

152. Save the ROP output and seek technical assistance.

153. Save the ROP output and seek technical assistance.

154. Save the ROP output and seek technical assistance.

155. Save the ROP output and seek technical assistance.

156. Save the ROP output and seek technical assistance.

157. Save the ROP output and seek technical assistance.

158. Save the ROP output and seek technical assistance.

159. Save the ROP output and seek technical assistance.

160. No action is needed.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

For a minor alarm, take action as indicated in the report.

A major alarm may not be service affecting, but take immediate action as indicated in the report.

For a critical alarm, take immediate action as indicated in the report. Seek technical assistance if needed.

ID . . . . . REPT-OLBCONFIG
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT OLBCONFIG FAULT TYPE` *a* `UNIT =` *b* `PID =` *c* `LOCID =` *d*

[2] `REPT OLBCONFIG FAULT TYPE` *a* `INACCESSIBLE RID =` *e* `PID =` *c* `LOCID =` *d*

2. REASON FOR OUTPUT

To report a fault condition in the error interrupt handler (EIH) olbconfig function.

Format 1 is printed whenever the name of the unit can be determined. If not, Format 2 is printed.

3. VARIABLE FIELD DEFINITIONS

a = One or more fault types:

- `AMB` — Could not allocate a message buffer.
- `CI` — olbconfig internal failure.
- `EA` — Equipment configuration database (ECD) access problem.
- `ED` — ECD data invalid.
- `FSM` — Could not fault a process or send a message to a process.
- `IA` — Possible invalid argument.
- `PA` — Plant measurements database access problem.
- `PS` — Unit in protected state.

b = Name and number of unit.

c = Process number of the process which called the olbconfig function.

d = Identification number (LOCID number) of the fault in olbconfig.

e = Record ID (RID) of the unit control block (UCB) record in the equipment configuration database (ECD) of the unit.

4. ACTION TO BE TAKEN

If `OFLBOOT` is automatically terminated, run ECD audit.

5. ALARMS

None. This automatically-generated report is for information only.

UTILITY ID: lllllll              PROCESS NUMBER: mmmmmmmm

REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

A program tried to access unequipped memory.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in form `mm/dd/yy hh:mm:ss`.

g = The program address at the time of initialization (in hexadecimal). For software requested initializations this is the address of the PHASE OST and NOT the address where the problem was detected.

h = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode, i.e., kernel mode, kernel process, supervisor process, or user process. See *System Maintenance Manual,* Appendix P.

i = The contents of the primary segment base register (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

j = The contents of the secondary segment base register (in hexadecimal).

k = The contents of the sixteen general purpose registers (in hexadecimal).

R9: argument pointer
RA: frame pointer
RB: stack pointer

l = Process utility id (in hexadecimal). See *System Maintenance Manual*, Process / Problem Table.

m = Process number (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Forward the software log entry information to your technical assistance organization.

5. ALARMS

None.

6. REFERENCES

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

UTILITY ID: mmmmmmmm                PROCESS NUMBER: nnnnnnnn

REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

The off-line main memory considered the address to be out of range while the on-line memory did not. This usually indicates a problem with the off-line memory.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Community name.

d = Community number.

e = Unit name.

f = Unit number.

g = Time in form `mm/dd/yy hh:mm:ss`.

h = The program address at the time of initialization (in hexadecimal). For software requested initializations this is the address of the PHASE OST and NOT the address where the problem was detected.

SEE PROPRIETARY NOTICE ON COVER PAGE

i = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode, i.e., kernel mode, kernel process, supervisor process, or user process. See *System Maintenance Manual*, Appendix P.

j = The contents of the primary segment base register (in hexadecimal).

k = The contents of the secondary segment base register (in hexadecimal).

l = The contents of the sixteen general purpose registers (in hexadecimal).

R9: argument pointer
RA: frame pointer
RB: stack pointer

m = Process utility id (in hexadecimal). See *System Maintenance Manual*, Process / Problem Table.

n = Process number (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Check and replace the fuses in the off-line memory (if necessary). Run diagnostics on off-line memory.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report system performance statistics.

3. VARIABLE FIELD DEFINITIONS

a = Reporting office.

b = Report interval: HOURLY, DAILY, or DAY TO HOUR.

c = Current generic running in the reporting office.

d = Report type: SCHEDULED, RETAINED or DEMAND.

e = Date on which the report was generated.

f = Time of day.

g = Report period: that is, date and time of the beginning and end of the accumulation period of the appropriate report.

h = Data validity field: YES or NO, INITIALIZED (followed by date and time of the last system initialization).

i = Number of alarms of the specified type.

j = Number of system initializations of the specified type and level.

k = Number of processor error interrupts of the specified level.

l = Audit name.

m = Audit member number.

n = Number of audit attempts.

o = Number of audit failures.

p = Quantity of units of the specified type which have the plant bit set in the appropriate unit control block (UCB).

q = Number of requests for the given unit to go to a non-active state due to an error threshold having been exceeded.

r = Number of transient errors.

s = Number of routine automatic diagnostics.

t = The amount of time, in seconds, the unit is in a non-active state due to adp time.

u = The amount of time the unit is in a non-active state due to a manual request.

SEE PROPRIETARY NOTICE ON COVER PAGE

v = The amount of time the unit is in a non-active state due to an error threshold having been exceeded.

w = The amount of time that the unit is forced active; valid for CU unit only.

x = Unit name.

y = Unit number.

z = PART (UNIX® RTR R1.5 - R6.3).
FORM (UNIX® RTR R6.4 and later).

REPT OP PMCR REPORT *z 2* COMPLETED

2. REASON FOR OUTPUT

To report system performance statistics.

3. VARIABLE FIELD DEFINITIONS

a = Reporting office.

b = Report interval: HOURLY, DAILY, or DAY TO HOUR.

c = Current generic running in the reporting office.

d = Report type: SCHEDULED, RETAINED or DEMAND.

e = Date on which the report was generated.

f = Time of day.

g = Report period: that is, date and time of the beginning and end of the accumulation period of the appropriate report.

h = Data validity field: YES, NO or INITIALIZED (followed by date and time of the last system initialization).

i = Number of alarms of the specified type.

j = Number of system initializations of the specified type and level.

k = Number of processor interrupts of the following types:

0 — My (on-line) CC

1 — Other CC

2 — Software

3 — EAI

Type does not indicate priority level.

l = Audit name.

m = Audit member number.

n = Number of audit attempts.

o = Number of audit failures.

p = Quantity of units of the specified type which have the plant bit set in the appropriate unit control block (UCB).

q = Number of requests for the given unit to go to a non-active state due to an error threshold having been exceeded.

r = Number of transient errors.

s = Number of routine automatic diagnostics.

t = The amount of time, in seconds, the unit is in a non-active state due to adp time.

u = The amount of time the unit is in a non-active state due to a manual request. Units that are unequipped for offline boot will be reported as non-active due to a manual request on the original on-line side. On the original off-line side, unequipped units for offline boot will not be reported on.

v = The amount of time the unit is in a non-active state due to an error threshold having been exceeded.

w = The amount of time that the unit is forced active; valid for CU unit only.

x = Unit name.

y = Unit number.

z = PART (UNIX® RTR R1.5 - R6.3).
FORM (UNIX® RTR R6.4 and later).

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT OP PMCR ERROR` *a*[`,ERRNO =` *b*]

2. REASON FOR OUTPUT

To report errors encountered during the execution of the processes which comprise the plant measurements common report (PMCR) capability.

3. VARIABLE FIELD DEFINITIONS

a = Four-digit error code. This code consists of a one-digit number that indicates the PMCR process in which the error was detected, a two-digit number that indicates the error type, and a one-digit number that shows the location of the error within the specific process.

Process values are as follows:

`1` — PMCR craft interface
`2` — PMCR manager
`3` — PMCR collector
`4` — PMCR report generator

Error type values are as follows:

`01` — could not connect to system port
`02` — could not send or receive message
`03` — failed `plib` call
`04` — failed `pl_init` call
`05` — failed `pl_attrec` call
`06` — failed `pl_update` call
`07` — failed `pl_read` call
`08` — failed `lla_iatt` call
`09` — failed `lla_irel` call
`10` — failed `lla_rdget` call
`11` — failed `lla_opensq` call
`12` — failed `lla_nextseq` call
`13` — could not execute PMCR collector or PMCR report generator
`14` — could not get equipment configuration database (ECD) segments
`15` — could not get reporting office name from ECD
`16` — computation of maintenance usage time for the specified unit resulted in a time greater than 86,400 seconds (one day)
`17` — bad arguments received by PMCR report generator

SEE PROPRIETARY NOTICE ON COVER PAGE

18 — spool error during output of report
19 — no data has been collected to output a retained/demand report
20 — `fopen` UNIX® operating system call failed trying to open the `/etc/pmcrtab` file to initialize the hourly/daily report option flags
When this error is output, the hourly/daily report flags will be set to the default. This means that the hourly reports will be output every hour, and the daily reports at midnight.
21 — `create` UNIX® call failed trying to create the `/etc/pmcrtab` file
This will cause the hourly/daily report flags to be reset to the default values, if the PMCR process `/prc/pmcrman` is re-initialized (for example, if a PHASE 2 occurs).
22 — PMDB initialization time reset to current time
23 — start time reset to 0
24 — start time reset to current time
25 — change reason for start time and reset start time to 0
26 — start time reset to top unit start time
27 — change reason for start time to top unit reason and reset start time to top unit start time
28 — hour limit exceeded - time reset to one hour
29 — negative time count - time reset to 0
30 — day limit exceeded - time reset to one day
31 — current value (for example, alarm count) is less than count recorded from previous hour or previous count was invalid
32 — open of `/etc/log/pmcrlog` file failed
33 — could not execute pmdbcopy

NOTE: For messages 23 through 32, see `/etc/log/pmcrlog` for record name information. These error messages indicate that the count or time for the unit may not be valid.

The log file (`/etc/log/pmcrlog`) is reset every time a scheduled report runs.

b = Error code returned by the failing function call:

If *a* = x01x, x02x, x03x, x13x, x14x, x15x, x16x, x181, or x182, see System Error Codes Output Appendix, `SYSERR-APP`.

If *a* = x04x, x05x, x06x, or x07x, *b* is the plant measurements error code number.

If *a* = x17x or x183, *b* is the value of the bad arguments passed to the function or process.

If *a* = x08x, x09x, x10x, x11x, x12x or x19x, *b* does not specify an error code.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

The following table shows the action to be taken based on error code *a*. In all instances, seek technical assistance if the error persists.

Table A

If *a* =	Action To Be Taken
x01x	Check port 27, using the `OP:STATUS;PORTS` input command, to see if another process has control of the port.
x02x	Check that the correct `OP:PMCR;ERR` input command was entered.
x03x - x07x	Check the usability of the plant measurements database.
x08x - x12x	Check the usability of the ECD.
x13x	Check the usability of the PMCR processes.
x14x - x15x	Check the usability of the ECD.
x16x	Check system clock versus last clean report.
x17x	Check that the correct `OP:PMCR` input command was entered.
x18x - x32x	No action can be taken.
x33x	Check the usability of the `/prc/pmdbcopy` process.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

TYPE . . . . . Output
MESSAGE CLASS . . MEMF

1. FORMAT

```
REPT OTHER STORE HARDWARE ERROR  X'a
ONLINE CU: b
FAULTY UNIT: c d e f
TIME OF ERROR: g
MAIN STORE CONTROLLER 0
TRAPPED ADDRESS REGISTER:  hhhhhhhh
ERROR REGISTER 1:  iiiiiiii
ERROR REGISTER 2:  jjjjjjjj
MAIN STORE CONTROLLER 1 (MAY NOT BE CONFIGURED)
TRAPPED ADDRESS REGISTER: kkkkkkkk
ERROR REGISTER 1:  lllllllll
ERROR REGISTER 2:  mmmmmmmm
REAL TIME CLOCK: nnnnnnnn
```

2. REASON FOR OUTPUT

These errors occur in the off-line control unit (CU), but are detected by the on-line CU.

The `OTHER STORE HARDWARE ERROR` occurs because the memory controller of the mate processor has a store error A condition.

3. VARIABLE FIELD DEFINITIONS

a = Sequence hexadecimal number associating this report with previous `REPT-CU` (see its parameter *d*).

b = Active CU number.

c = Community name.

d = Community number.

e = Unit name.

f = Unit number.

g = Time in form `mm/dd/yy hh:mm:ss`.

h = If bit 27 of the main store controller (MASC) 0 trapped address register (TAR0) is set, TAR0 contains the address, in hexadecimal, where the fault occurred.

i = The contents, in hexadecimal, of the MASC 0 error register 1 (ER01). See *System Maintenance Manual*, Appendix F.

j = The contents, in hexadecimal, of the MASC 0 error register 2 (ER02). See *System Maintenance Manual*, Appendix F.

SEE PROPRIETARY NOTICE ON COVER PAGE

k = The contents, in hexadecimal, of the MASC 1 trapped address register (TAR1).

l = The contents, in hexadecimal, of the MASC 1 error register 1 (ER11). See *System Maintenance Manual*, Appendix F.

m = The contents, in hexadecimal, of the MASC 1 error register 2 (ER12). See *System Maintenance Manual*, Appendix F.

n = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the MRF.

4. ACTION TO BE TAKEN

For the OS hardware error, check the update cables on both processors and run diagnostics on the off-line processor.

For the case of `PARITY ERROR`, run diagnostics if the mate processor is removed from a standby state.

5. ALARMS

None. This automatically-generated report is for information only.

TRAPPED ADDRESS REGISTER: kkkkkkkk
ERROR REGISTER 1:  lllllllll
ERROR REGISTER 2:  mmmmmmmm
ERROR DATA:  nnnnnnnn
PHYSICAL MEMORY ADDRESS:  oooooooo
REAL TIME CLOCK: pppppppp
```

2. REASON FOR OUTPUT

These errors occur in the off-line control unit (CU), but are detected by the on-line CU.

The READ DATA PARITY ERROR indicates a noncorrectable memory error (other store C) in the mate processor. This type of error can only occur if the mate processor is in the standby state.

3. VARIABLE FIELD DEFINITIONS

a = Sequence hexadecimal number associating this report with previous REPT-CU (see its parameter *d*).

b = Active CU number.

c = Community name.

d = Community number.

e = Unit name.

f = Unit number.

g = The time in the form mm/dd/yy hh:mm:ss.

h = If bit 27 of the Main store controller (MASC) 0 trapped address register (TAR0) is set, TAR0 contains the address, in hexadecimal, where the fault occurred.

i = The contents of the MASC 0 error register 1 (ER01) (in hexadecimal). See *System Maintenance Manual*, Appendix F.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = The contents of the MASC 0 error register 2 (ER02) (in hexadecimal). See *System Maintenance Manual*, Appendix F.

k = The contents of the MASC 1 trapped address register (TAR1) (in hexadecimal).

l = The contents of the MASC 1 error register 1 (ER11) (in hexadecimal). See *System Maintenance Manual*, Appendix F.

m = The contents of the MASC 1 error register 2 (ER12) (in hexadecimal). See *System Maintenance Manual*, Appendix F.

n = Error data (in hexadecimal).

o = Physical memory address (in hexadecimal).

p = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the MRF.

4. ACTION TO BE TAKEN

For the OS hardware error, check the update cables on both processors and run diagnostics on the off-line processor.

For the case of `PARITY ERROR`, run diagnostics if the mate processor is removed from a standby state.

5. ALARMS

None. This automatically-generated report is for information only.

ERROR DATA:  nnnnnnnn
PHYSICAL MEMORY ADDRESS:  oooooooo
REAL TIME CLOCK: pppppppp
```

2. REASON FOR OUTPUT

These errors occur in the off-line control unit (CU), but are detected by the on-line CU.

The `REFRESH PARITY ERROR` indicates a correctable parity error (other store D) in the mate processor. This type of error can only occur if the mate processor is in the standby state.

3. VARIABLE FIELD DEFINITIONS

a = Sequence hexadecimal number associating this report with previous `REPT-CU` (see its parameter *d*).

b = Active CU number.

c = Community name.

d = Community number.

e = Unit name.

f = Unit number.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

REPT PCPAUD FAULT TYPE *a* ASSERT = *b*

2. REASON FOR OUTPUT

To report an error detected during the control unit (CU) administrative sequences of the processor control process audit (PCPAUD) process, or to report errors in calling the PCPAUD process or internal logic errors within the PCPAUD process.

3. VARIABLE FIELD DEFINITIONS

a = Type of fault found.

NOTE: If the assert number, variable *b*, is 0x4002, see output Fault Code Appendix, FAULT-CODE-APP, for fault-type information.

Possible faults are:

- 0x2 — bad data in equipment configuration database (ECD) for a control unit (CU) or subunit
- 0x4 — could not access the ECD - possibly a bad record ID (RID)
- 0x6 — maintenance channel failed
- 0xA — a call to the KCONFIG library failed
- 0xC — erroneous major state for a CU unit or subunit
- 0xE — bad on-line system status register (SSR) value
- 0x10 — bad off-line SSR value
- 0x12 — bad on-line hardware status register (HSR) value
- 0x14 — bad off-line HSR value
- 0x18 — plant measurement library call failed
- 0x1a — audit control library call failed
- 0x1c — internal CUMEM or CUSTAT audit error
- 0x1e — off-line store access failed
- 0x20 — memory audit internal error
- 0x28 — failure to queue message to the power switch monitor (PSM)
- 0x2a — emergency action interface (EAI) buffers data mismatch
- 0x2c — SSR values inconsistent between CUs.

b = Assert number associated with the specific cause of the error. Assert numbers 0x3000 to 0x3fff report an error detected during the CU administrative sequences of the PCPAUD process. Assert numbers 0x4000 to 0x4fff report errors in calling the PCPAUD process or

internal logic errors within the PCPAUD process.
See the following table.

Assert Number	Description
0x3000	RID for on-line CU is IDNULL.
0x3001	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x3002	On-line CU UCB *u_dtype* (device type) not DEV_CU.
0x3003	RID for off-line CU is the same as RID for on-line CU.
0x3004	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3005	Off-line CU UCB *u_dtype* (device type) not DEV_CU.
0x3006	Call to ECD *lla_rdget* to get on-line CU minor device chain table (MDCT) unsuccessful.
0x3007	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x3008	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x3009	MDCT *m_minxt[0]* equals *m_minxt[1]* indicating that CU0 and CU1 have the same RIDs.
0x300a	MDCT *m_minxt[0]* does not equal the RID for the on-line or off-line CU.
0x300b	MDCT *m_minxt[1]* does not equal the RID for the on-line or off-line CU.
0x3100	Maintenance channel (MCH) and update circuit not functional; but other CU UCB *u_stat* is STBY (standby).
0x3101	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3102	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3104	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3105	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3107	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3108	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x3109	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x310a	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3201	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3202	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3203	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3204	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3206	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3207	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3208	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3209	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.

Assert Number	Description *(continued)*
0x320a	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x320b	Call to ECD *lla_uprid* to change on-line CU UCB unsuccessful.
0x320c	Call to plant measurements unsuccessful (PL_RDGET_ERROR).
0x320d	Call to plant measurements unsuccessful (PL_RCRT_ERROR).
0x320f	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3210	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x3211	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3212	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3213	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x3214	Call to ECD *lla_uprid* to change on-line CU UCB unsuccessful.
0x3215	Call to plant measurements unsuccessful (PL_RDGET_ERROR).
0x3216	Call to plant measurements unsuccessful (PL_RCRT_ERROR).
0x3217	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3218	Call to ECD *lla_uprid* to change off-line CU UCB unsuccessful.
0x3300	Call to *clrisc* to clear off-line CU initialization sequence control (ISC) bits unsuccessful (system status register (SSR) bits 4 and 5 - SSR_ISC0 and SSR_ISC1).
0x3402	Call to ECD *lla_rdget* to get on-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for on-line CU.
0x3403	Call to ECD *lla_uprid* to change on-line CU CSU 0 UCB *u_bypass* to ON unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3404	Call to ECD *lla_rdget* to get off-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for off-line CU.
0x3405	Call to ECD *lla_uprid* to change off-line CU CSU 0 UCB *u_bypass* to ON unsuccessful.
0x3406	Call to ECD *lla_rdget* to get on-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for on-line CU.
0x3407	Call to ECD *lla_uprid* to change on-line CU CSU 0 UCB *u_bypass* to OFF unsuccessful.
0x3408	Call to ECD *lla_rdget* to get off-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for off-line CU.
0x3409	Call to ECD *lla_uprid* to change off-line CU CSU 0 UCB *u_bypass* to OFF unsuccessful.
0x340a	Call to ECD *lla_rdget* to get boot device 0 UCB unsuccessful; possibly bad bdev0 RID.
0x340b	Call to ECD *lla_rdget* to get boot device 1 UCB unsuccessful; possibly bad bdev1 RID.
0x340d	Call to PCPAUD *scoflfbd* unsuccessful; possibly bad communications to off-line CU. *scoflfbd* adjusts off-line CU SSR force boot device bits (SSR_FBFP and SSR_FBDS, bits 6 and 7) to select the active boot device, if not forced by EAI.
0x340e	Call to PCPAUD *scoflfbd* unsuccessful; possibly bad communications to off-line CU. *scoflfbd* adjusts off-line CU SSR force boot device bits (SSR_FBFP and SSR_FBDS, bits 6 and 7) to select the active boot device, if not forced by EAI.
0x3500	Call to PCPAUD *syncrtc* unsuccessful; possibly bad communications to off-line CU. *syncrtc* reads the on-line CU real time clock (RTC) and writes it to the off-line CU RTC.

Assert Number	Description *(continued)*
0x3501	Call to PCPAUD *coflpso* unsuccessful; possibly bad communications to off-line CU. *coflpso* reads and clears the the periodic scanned options in the off-line CU EAI.
0x3702	Off-line CU is in enable update mode (SSR_UPD bit 19 asserted) or off-line CU is isolating its main store bus from the on-line CU (SSR_ISOU bit 21 asserted in the off-line CU).
0x3703	Call to PCPAUD *initofl* to initialize off-line CU unsuccessful; possibly bad communications to off-line CU. *initofl* initializes the MCH in the on-line and off-line CUs, and executes the initialization microcode in the off-line CU.
0x3704	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3705	Off-line CU UCB *u_stat* is STBY (standby), but off-line CU UCB *u_update* is OFF (not updated) or on-line CU SSR is not in enable update mode (SSR_UPD bit 19 not asserted).
0x3706	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3707	On-line CU not in enable update mode (SSR_UPD bit 19 not asserted), but off-line CU UCB *u_update* is ON (updated).
0x3708	Call to ECD *chucb* to change off-line CU UCBs *u_update* to NO unsuccessful.
0x3709	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x370a	On-line CU SSR not isolating other (off-line) CU from its main store bus (SSR_ISOU bit 21 not asserted).
0x3901	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3902	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3903	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3904	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.

The following errors are errors found in calling the PCPAUD process or internal logic errors within the PCPAUD process. They cannot be reported via the audit control library (ACL) and otherwise do not fit any of the other categories.

Assert Number	Description *(continued)*
0x4000	Call to ACL *aud_minit* unsuccessful.
0x4001	Call to ACL *aud_finis* unsuccessful.
0x4002	PCPAUD was faulted, fault code is in field *a*. See output Fault Code Appendix, FAULT-CODE-APP, for type of fault information.
0x4003	Call to ACL *aud_finis* unsuccessful.
0x4004	Call to ACL *aud_error* unsuccessful.
0x4005	Call to ACL *aud_finis* unsuccessful.
0x4006	Call to ACL *aud_finis* unsuccessful.
0x4007	Call to ACL *aud_finis* unsuccessful.
0x4008	Call to ACL *aud_finis* unsuccessful.
0x4009	Call to ACL *aud_finis* unsuccessful.
0x400a	Neither CUSTAT or CUMEM was selected when PCPAUD was called to run an audit.
0x400b	Call to ECD *lla_rdget* unsuccessful.
0x400c	CUSTAT memory compare starting address is not on a full word boundary (internal error).
0x400d	Call to PCPAUD *memtst* did not complete successfully (internal error).
0x400e	Call to PCPAUD *memtst* did not complete successfully (internal error).

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description
0x400f	Call to PCPAUD *memtst* did not complete successfully (internal error).
0x4010	CUMEM starting address is not on a full word boundary (internal error).
0x4011	Call to PCPAUD *memtst* did not complete successfully (internal error).

Assert Number	Description
0x4012	PCPAUD has been unsuccessful in executing its event entry at least 8 times, or Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM after CU power-up initialization delay.
0x4013	PCPAUD has been unsuccessful in executing its fault entry at least 5 times.
0x4014	Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM after CU power-up initialization delay.
0x4015	Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM for false CU power-up.
0x4016	Call to ACL *aud_finis* unsuccessful.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. The following table contains some possible actions to specific error codes. If the message persists, contact your next level of technical assistance.

Fault Type	Action
0x4	Run ECD 1 audit.
0x6	Check maintenance channel cable. Run CU diagnostics on the off-line CU. The problem could also be in the on-line CU maintenance channel. Switch CUs, run CU diagnostics. The problem is serious and should be taken care of as soon as possible.
0xe	Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.
0x10	Take action on this error only if it occurs repeatedly. Run CU diagnostics.
0x12	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
0x14	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
0x18	Run plant measurements system (PMS) 1 audit.
0x1e	Run CU diagnostics, switch CUs, run CU diagnostics.
0x2a	Clear the EAIs with a poke 14 on the EAI page of the MTTY. Take further action on this error only if it occurs repeatedly. Run CU diagnostics, switch CUs, run CU diagnostics.
0x2c	Take action on this error only if it occurs repeatedly. Either CU could cause inconsistent values between the SSRs. Run CU diagnostics, switch CUs, run CU diagnostics.

ID . . . . . REPT-PCPAUD-B
GENERIC . . . . . UNIX RTR R21.27 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT PCPAUD FAULT TYPE` *a* `ASSERT =` *b*

[2] `REPT PCPAUD FAULT TYPE` *c* `ASSERT =` *b*

2. REASON FOR OUTPUT

Formats 1 and 2 report errors detected during the control unit (CU) administrative sequences of the processor control process audit (PCPAUD) process, or to report errors in calling the PCPAUD process or internal logic errors within the PCPAUD process.

Format 2 is used when additional fault type information is provided.

3. VARIABLE FIELD DEFINITIONS

a = Type of fault found.

NOTE: If the assert number, variable *b*, is 0x4002, see output Fault Code Appendix, FAULT-CODE-APP, for fault-type information.

NOTE: If the assert number, variable *b*, is 0x3b02 or 0x3b03, see the fault type description for a translation of the fault type variable *c*.

Possible faults are:

- `0x0` — field unused. Refer to assert number for description of problem.
- `0x2` — bad data in equipment configuration database (ECD) for a control unit (CU) or subunit
- `0x4` — could not access the ECD - possibly a bad record ID (RID)
- `0x6` — maintenance channel failed
- `0xA` — a call to the KCONFIG library failed
- `0xC` — erroneous major state for a CU unit or subunit
- `0xE` — bad on-line system status register (SSR) value
- `0x10` — bad off-line SSR value
- `0x12` — bad on-line hardware status register (HSR) value
- `0x14` — bad off-line HSR value
- `0x18` — plant measurement library call failed
- `0x1a` — audit control library call failed
- `0x1c` — internal CUMEM or CUSTAT audit error
- `0x1e` — off-line store access failed
- `0x20` — memory audit internal error

SEE PROPRIETARY NOTICE ON COVER PAGE

`0x28` — failure to allocate or queue message
`0x2a` — emergency action interface (EAI) buffers data mismatch
`0x2c` — SSR values inconsistent between CUs.
`0x2d` — Failure to attach to ECD or to get ECDORG data
`0x2e` — Failure is related to pcreating another process
`0x2f` — Timeout error

b = Assert number associated with the specific cause of the error.

Assert numbers 0x3000 to 0x3fff report an error detected during the CU administrative sequences of the PCPAUD process.

Assert numbers 0x4000 to 0x4fff report errors in calling the PCPAUD process or internal logic errors within the PCPAUD process.

See the following table.

Assert Number	Description
0x3000	RID for on-line CU is IDNULL.
0x3001	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x3002	On-line CU UCB *u_dtype* (device type) not DEV_CU.
0x3003	RID for off-line CU is the same as RID for on-line CU.
0x3004	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3005	Off-line CU UCB *u_dtype* (device type) not DEV_CU.
0x3006	Call to ECD *lla_rdget* to get on-line CU minor device chain table (MDCT) unsuccessful.
0x3007	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x3008	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x3009	MDCT *m_minxt[0]* equals *m_minxt[1]* indicating that CU0 and CU1 have the same RIDs.
0x300a	MDCT *m_minxt[0]* does not equal the RID for the on-line or off-line CU.

Assert Number	Description *(continued)*
0x300b	MDCT *m_minxt[1]* does not equal the RID for the on-line or off-line CU.
0x300c	Call to *lla_rdget* to read in new ECD org structure unsuccessful. Will continue to use preceding ECD org data.
0x3100	Maintenance channel (MCH) and update circuit not functional; but other CU UCB *u_stat* is STBY (standby).
0x3101	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3102	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3104	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3105	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3107	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3108	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x3109	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x310a	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3201	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3202	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3203	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3204	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3206	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3009	MDCT *m_minxt[0]* equals *m_minxt[1]* indicating that CU0 and CU1 have the same RIDs.
0x3009	MDCT *m_minxt[0]* equals *m_minxt[1]* indicating that CU0 and CU1 have the same RIDs.
0x3009	MDCT *m_minxt[0]* equals *m_minxt[1]* indicating that CU0 and CU1 have the same RIDs.
0x3207	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3208	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3209	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x320a	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x320b	Call to ECD *lla_uprid* to change on-line CU UCB unsuccessful.
0x320c	Call to plant measurements unsuccessful (PL_RDGET_ERROR).
0x320d	Call to plant measurements unsuccessful (PL_RCRT_ERROR).
0x320f	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3210	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x3211	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3212	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3213	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x3214	Call to ECD *lla_uprid* to change on-line CU UCB unsuccessful.
0x3215	Call to plant measurements unsuccessful (PL_RDGET_ERROR).
0x3216	Call to plant measurements unsuccessful (PL_RCRT_ERROR).

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3217	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3218	Call to ECD *lla_uprid* to change off-line CU UCB unsuccessful.
0x3300	Call to *clrisc* to clear off-line CU initialization sequence control (ISC) bits unsuccessful (system status register (SSR) bits 4 and 5 - SSR_ISC0 and SSR_ISC1).
0x3402	Call to ECD *lla_rdget* to get on-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for on-line CU.
0x3403	Call to ECD *lla_uprid* to change on-line CU CSU 0 UCB *u_bypass* to ON unsuccessful.
0x3404	Call to ECD *lla_rdget* to get off-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for off-line CU.
0x3405	Call to ECD *lla_uprid* to change off-line CU CSU 0 UCB *u_bypass* to ON unsuccessful.
0x3406	Call to ECD *lla_rdget* to get on-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for on-line CU.
0x3407	Call to ECD *lla_uprid* to change on-line CU CSU 0 UCB *u_bypass* to OFF unsuccessful.
0x3408	Call to ECD *lla_rdget* to get off-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for off-line CU.
0x3409	Call to ECD *lla_uprid* to change off-line CU CSU 0 UCB *u_bypass* to OFF unsuccessful.
0x340a	Call to ECD *lla_rdget* to get boot device 0 UCB unsuccessful; possibly bad bdev0 RID.
0x340b	Call to ECD *lla_rdget* to get boot device 1 UCB unsuccessful; possibly bad bdev1 RID.
0x340d	Call to PCPAUD *scoflfbd* unsuccessful; possibly bad communications to off-line CU. *scoflfbd* adjusts off-line CU SSR force boot device bits (SSR_FBFP and SSR_FBDS, bits 6 and 7) to select the active boot device, if not forced by EAI.

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x340e	Call to PCPAUD *scoflfbd* unsuccessful; possibly bad communications to off-line CU. *scoflfbd* adjusts off-line CU SSR force boot device bits (SSR_FBFP and SSR_FBDS, bits 6 and 7) to select the active boot device, if not forced by EAI.
0x3500	Call to PCPAUD *syncrtc* unsuccessful; possibly bad communications to off-line CU. *syncrtc* reads the on-line CU real time clock (RTC) and writes it to the off-line CU RTC.
0x3501	Call to PCPAUD *coflpso* unsuccessful; possibly bad communications to off-line CU. *coflpso* reads and clears the the periodic scanned options in the off-line CU EAI.
0x3702	Off-line CU is in enable update mode (SSR_UPD bit 19 asserted) or off-line CU is isolating its main store bus from the on-line CU (SSR_ISOU bit 21 asserted in the off-line CU).
0x3703	Call to PCPAUD *initofl* to initialize off-line CU unsuccessful; possibly bad communications to off-line CU. *initofl* initializes the MCH in the on-line and off-line CUs, and executes the initialization microcode in the off-line CU.
0x3704	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3705	Off-line CU UCB *u_stat* is STBY (standby), but off-line CU UCB *u_update* is OFF (not updated) or on-line CU SSR is not in enable update mode (SSR_UPD bit 19 not asserted).
0x3706	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3707	On-line CU not in enable update mode (SSR_UPD bit 19 not asserted), but off-line CU UCB *u_update* is ON (updated).
0x3708	Call to ECD *chucb* to change off-line CU UCBs *u_update* to NO unsuccessful.
0x3709	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x370a	On-line CU SSR not isolating other (off-line) CU from its main store bus (SSR_ISOU bit 21 not asserted).
0x3901	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3902	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x3903	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3904	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3b01	Call to PCPAUD *send_pm* function failed. Unable to pcreate **bootdiskchk** process.
0x3b02	Error found in PCPAUD *admseq11* audit of the DFC 0 side Alternate Boot Disk (ABD)
0x3b03	Error found in PCPAUD *admseq11* audit of the DFC 1 side Alternate Boot Disk (ABD)
0x3b04	Call to PCPAUD *send_pm* function failed. Unable to pcreate **bootdiskchk** process.

The following errors are errors found in calling the PCPAUD process or internal logic errors within the PCPAUD process. They cannot be reported via the audit control library (ACL) and otherwise do not fit any of the other categories.

Assert Number	Description
0x4000	Call to ACL *aud_minit* unsuccessful.
0x4001	Call to ACL *aud_finis* unsuccessful.
0x4002	PCPAUD was faulted, fault code is in field *a.* See output Fault Code Appendix, FAULT-CODE-APP, for type of fault information.
0x4003	Call to ACL *aud_finis* unsuccessful.
0x4004	Call to ACL *aud_error* unsuccessful.
0x4005	Call to ACL *aud_finis* unsuccessful.
0x4006	Call to ACL *aud_finis* unsuccessful.
0x4007	Call to ACL *aud_finis* unsuccessful.
0x4008	Call to ACL *aud_finis* unsuccessful.
0x4009	Call to ACL *aud_finis* unsuccessful.
0x400a	Neither CUSTAT or CUMEM was selected when PCPAUD was called to run an audit.
0x400b	Call to ECD *lla_rdget* unsuccessful.
0x400c	CUSTAT memory compare starting address is not on a full word boundary (internal error).
0x400d	Call to PCPAUD *memtst* did not complete successfully (internal error).
0x400e	Call to PCPAUD *memtst* did not complete successfully (internal error).

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x400f	Call to PCPAUD *memtst* did not complete successfully (internal error).
0x4010	CUMEM starting address is not on a full word boundary (internal error).
0x4011	Call to PCPAUD *memtst* did not complete successfully (internal error).
0x4012	PCPAUD has been unsuccessful in executing its event entry at least 8 times, or Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM after CU power-up initialization delay.
0x4013	PCPAUD has been unsuccessful in executing its fault entry at least 5 times.
0x4014	Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM after CU power-up initialization delay.
0x4015	Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM for false CU power-up.
0x4016	Call to ACL *aud_finis* unsuccessful.
0x4017	PCPAUD received an OST of a type not processed by PCPAUD. Variable *a* in the output message will contain the OST value.
0x4018	Call to **lla_iatt** unsuccessful (system error).
0x4019	Call to **lla_rdget** unsuccessful (system error). Unable to read new ECD org structure.
0x401a	Call to **kgetabdst** unsuccessful (system error).
0x401b	Call to create a process was unsuccessful.
0x401c	PCPAUD received a message from a non-existent process.

Assert Number	Description *(continued)*
0x401d	Call to **lla_iatt** unsuccessful (system error).
0x401e	Call to **lla_rdget** unsuccessful (system error). Unable to read new ECD org structure.
0x401f	Call to *alocmsg* unsuccessful (system error). PCPAUD could not allocate space for the message to termninate the **bootdiskchk** process.
0x4020	Call to *queuemn* unsuccessful (system error). PCPAUD could not queue the message to termninate the **bootdiskchk** process.
0x4021	Exceeded the maximum number of create attempts to start the **bootdiskchk** process.
0x4022	Timed out while waiting for results from the **bootdiskchk** process.

c = Type of fault found.

The following table applies to Assert Numbers 0x3b02 and 0x3b03. The character *n* refers to the hexadecimal value of the MHD number of the MHD being audited.

0xc001000n	Call to **lla_rdget** failed. Unable to get the MHD UCB for the MHD number in field *n*.
0xc002000n	Call to **lla_rdget** failed. Unable to get the SBUS UCB for the MHD number in field *n*.
0xc003000n	Call to **lla_rdget** failed. Unable to get the DFC UCB for the MHD number in field *n*.
0xc004000n	Call to **lla_rdget** failed. Unable to get the SBUS UCB for the MHD number in field *n*.
0xc005000n	The SBUS device ID for MHD *n* did not match that in the SBUS UCB.
0xc006000n	Call to **lla_rdget** failed. Unable to get the MHD UCB for the MHD number in field *n*.

Fault Type	Description *(continued)*
0xc007000n	The MHD device ID for MHD *n* did not match that in the MHD UCB.
0xc008000n	The unit number in the MHD ucb did not match MHD *n*.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. The following table contains some possible actions to specific error codes. If the message persists, contact your next level of technical assistance.

0x4	Run ECD 1 audit.
0x6	Check maintenance channel cable. Run CU diagnostics on the off-line CU. The problem could also be in the on-line CU maintenance channel. Switch CUs, run CU diagnostics. The problem is serious and should be taken care of as soon as possible.
0xe	Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.
0x10	Take action on this error only if it occurs repeatedly. Run CU diagnostics.
0x12	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
0x14	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
0x18	Run plant measurements system (PMS) 1 audit.
0x1e	Run CU diagnostics, switch CUs, run CU diagnostics.
0x2a	Clear the EAIs with a poke 14 on the EAI page of the MTTY. Take further action on this error only if it occurs repeatedly. Run CU diagnostics, switch CUs, run CU diagnostics.
0x2c	Take action on this error only if it occurs repeatedly. Either CU could cause inconsistent values between the SSRs. Run CU diagnostics, switch CUs, run CU diagnostics.

- `0x10` — bad off-line SSR value
- `0x12` — bad on-line hardware status register (HSR) value
- `0x14` — bad off-line HSR value
- `0x18` — plant measurement library call failed
- `0x1a` — audit control library call failed
- `0x1c` — internal CUMEM or CUSTAT audit error
- `0x1e` — off-line store access failed

SEE PROPRIETARY NOTICE ON COVER PAGE

`0x20` — memory audit internal error
`0x28` — failure to allocate or queue message
`0x2a` — emergency action interface (EAI) buffers data mismatch
`0x2c` — SSR values inconsistent between CUs.
`0x2d` — Failure to attach to ECD or to get ECDORG data
`0x2e` — Failure is related to pcreating another process
`0x2f` — Timeout error

b = Assert number associated with the specific cause of the error.

Assert numbers 0x3000 to 0x3fff report an error detected during the CU administrative sequences of the PCPAUD process.

Assert numbers 0x4000 to 0x4fff report errors in calling the PCPAUD process or internal logic errors within the PCPAUD process.

See the following table.

Assert Number	Description
0x3000	RID for on-line CU is IDNULL.
0x3001	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x3002	On-line CU UCB *u_dtype* (device type) not DEV_CU.
0x3003	RID for off-line CU is the same as RID for on-line CU.
0x3004	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3005	Off-line CU UCB *u_dtype* (device type) not DEV_CU.
0x3006	Call to ECD *lla_rdget* to get on-line CU minor device chain table (MDCT) unsuccessful.
0x3007	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x3008	MDCT for the on-line CU has too many *m_minxt* entries. This would indicate that there are more than two CUs.
0x3009	MDCT *m_minxt[0]* equals *m_minxt[1]* indicating that CU0 and CU1 have the same RIDs.
0x300a	MDCT *m_minxt[0]* does not equal the RID for the on-line or off-line CU.

Assert Number	Description *(continued)*
0x300b	MDCT *m_minxt[1]* does not equal the RID for the on-line or off-line CU.
0x300c	Call to *lla_rdget* to read in new ECD org structure unsuccessful. Will continue to use preceding ECD org data.
0x3100	Maintenance channel (MCH) and update circuit not functional; but other CU UCB *u_stat* is STBY (standby).
0x3101	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3102	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3104	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3105	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3107	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3108	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x3109	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x310a	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3201	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3202	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3203	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3204	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3206	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3207	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to UNAV unsuccessful.
0x3208	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3209	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x320a	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x320b	Call to ECD *lla_uprid* to change on-line CU UCB unsuccessful.
0x320c	Call to plant measurements unsuccessful (PL_RDGET_ERROR).
0x320d	Call to plant measurements unsuccessful (PL_RCRT_ERROR).
0x320f	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3210	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x3211	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3212	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3213	Call to ECD *lla_rdget* to get on-line CU UCB unsuccessful.
0x3214	Call to ECD *lla_uprid* to change on-line CU UCB unsuccessful.
0x3215	Call to plant measurements unsuccessful (PL_RDGET_ERROR).
0x3216	Call to plant measurements unsuccessful (PL_RCRT_ERROR).
0x3217	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.
0x3218	Call to ECD *lla_uprid* to change off-line CU UCB unsuccessful.
0x3300	Call to *clrisc* to clear off-line CU initialization sequence control (ISC) bits unsuccessful (system status register (SSR) bits 4 and 5 - SSR_ISC0 and SSR_ISC1).

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3402	Call to ECD *lla_rdget* to get on-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for on-line CU.
0x3403	Call to ECD *lla_uprid* to change on-line CU CSU 0 UCB *u_bypass* to ON unsuccessful.
0x3404	Call to ECD *lla_rdget* to get off-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for off-line CU.
0x3405	Call to ECD *lla_uprid* to change off-line CU CSU 0 UCB *u_bypass* to ON unsuccessful.
0x3406	Call to ECD *lla_rdget* to get on-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for on-line CU.
0x3407	Call to ECD *lla_uprid* to change on-line CU CSU 0 UCB *u_bypass* to OFF unsuccessful.
0x3408	Call to ECD *lla_rdget* to get off-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for off-line CU.
0x3409	Call to ECD *lla_uprid* to change off-line CU CSU 0 UCB *u_bypass* to OFF unsuccessful.
0x340a	Call to ECD *lla_rdget* to get boot device 0 UCB unsuccessful; possibly bad bdev0 RID.
0x340b	Call to ECD *lla_rdget* to get boot device 1 UCB unsuccessful; possibly bad bdev1 RID.
0x340d	Call to PCPAUD *scoflfbd* unsuccessful; possibly bad communications to off-line CU. *scoflfbd* adjusts off-line CU SSR force boot device bits (SSR_FBFP and SSR_FBDS, bits 6 and 7) to select the active boot device, if not forced by EAI.
0x340e	Call to PCPAUD *scoflfbd* unsuccessful; possibly bad communications to off-line CU. *scoflfbd* adjusts off-line CU SSR force boot device bits (SSR_FBFP and SSR_FBDS, bits 6 and 7) to select the active boot device, if not forced by EAI.
0x3500	Call to PCPAUD *syncrtc* unsuccessful; possibly bad communications to off-line CU. *syncrtc* reads the on-line CU real time clock (RTC) and writes it to the off-line CU RTC.

Assert Number	Description *(continued)*
0x3501	Call to PCPAUD *coflpso* unsuccessful; possibly bad communications to off-line CU. *coflpso* reads and clears the the periodic scanned options in the off-line CU EAI.
0x3702	Off-line CU is in enable update mode (SSR_UPD bit 19 asserted) or off-line CU is isolating its main store bus from the on-line CU (SSR_ISOU bit 21 asserted in the off-line CU).
0x3703	Call to PCPAUD *initofl* to initialize off-line CU unsuccessful; possibly bad communications to off-line CU. *initofl* initializes the MCH in the on-line and off-line CUs, and executes the initialization microcode in the off-line CU.
0x3704	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3705	Off-line CU UCB *u_stat* is STBY (standby), but off-line CU UCB *u_update* is OFF (not updated) or on-line CU SSR is not in enable update mode (SSR_UPD bit 19 not asserted).
0x3706	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x3707	On-line CU not in enable update mode (SSR_UPD bit 19 not asserted), but off-line CU UCB *u_update* is ON (updated).
0x3708	Call to ECD *chucb* to change off-line CU UCBs *u_update* to NO unsuccessful.
0x3709	Call to kconfig *fltdrvr* to remove other CU unsuccessful.
0x370a	On-line CU SSR not isolating other (off-line) CU from its main store bus (SSR_ISOU bit 21 not asserted).
0x3901	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to ON unsuccessful.
0x3902	Call to kconfig *chgstate* to change off-line CU UCB *u_stat* to OOS unsuccessful.
0x3903	Call to ECD *chucb* to change off-line CU UCBs *u_manrqst* to OFF unsuccessful.
0x3904	Call to ECD *lla_rdget* to get off-line CU UCB unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x3b01	Call to PCPAUD *send_pm* function failed. Unable to pcreate **bootdiskchk** process.
0x3b02	Error found in PCPAUD *admseq11* audit of the DFC 0 side Alternate Boot Disk (ABD)
0x3b03	Error found in PCPAUD *admseq11* audit of the DFC 1 side Alternate Boot Disk (ABD)
0x3b04	Call to PCPAUD *send_pm* function failed. Unable to pcreate **bootdiskchk** process.

The following errors are errors found in calling the PCPAUD process or internal logic errors within the PCPAUD process. They cannot be reported via the audit control library (ACL) and otherwise do not fit any of the other categories.

Assert Number	Description
0x4000	Call to ACL *aud_minit* unsuccessful.
0x4001	Call to ACL *aud_finis* unsuccessful.
0x4002	PCPAUD was faulted, fault code is in field *a*. See output Fault Code Appendix, FAULT-CODE-APP, for type of fault information.
0x4003	Call to ACL *aud_finis* unsuccessful.
0x4004	Call to ACL *aud_error* unsuccessful.
0x4005	Call to ACL *aud_finis* unsuccessful.
0x4006	Call to ACL *aud_finis* unsuccessful.
0x4007	Call to ACL *aud_finis* unsuccessful.
0x4008	Call to ACL *aud_finis* unsuccessful.
0x4009	Call to ACL *aud_finis* unsuccessful.
0x400a	Neither CUSTAT or CUMEM was selected when PCPAUD was called to run an audit.
0x400b	Call to ECD *lla_rdget* unsuccessful.
0x400c	CUSTAT memory compare starting address is not on a full word boundary (internal error).
0x400d	Call to PCPAUD *memtst* did not complete successfully (internal error).
0x400e	Call to PCPAUD *memtst* did not complete successfully (internal error).

SEE PROPRIETARY NOTICE ON COVER PAGE

Assert Number	Description *(continued)*
0x400f	Call to PCPAUD *memtst* did not complete successfully (internal error).
0x4010	CUMEM starting address is not on a full word boundary (internal error).
0x4011	Call to PCPAUD *memtst* did not complete successfully (internal error).
0x4012	PCPAUD has been unsuccessful in executing its event entry at least 8 times, or Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM after CU power-up initialization delay.
0x4013	PCPAUD has been unsuccessful in executing its fault entry at least 5 times.
0x4014	Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM after CU power-up initialization delay.
0x4015	Call to *queuemn* unsuccessful (system error). PCPAUD could not return the PSM message to PSM for false CU power-up.
0x4016	Call to ACL *aud_finis* unsuccessful.
0x4017	PCPAUD received an OST of a type not processed by PCPAUD. Variable *a* in the output message will contain the OST value. 0x4018T{ Call to **lla_iatt** unsuccessful (system error).
0x4019	Call to **lla_rdget** unsuccessful (system error). Unable to read new ECD org structure.
0x401a	Call to **kgetabdst** unsuccessful (system error).
0x401b	Call to create a process was unsuccessful.
0x401c	PCPAUD received a message from a non-existent process.

Assert Number	Description *(continued)*
0x401d	Call to **lla_iatt** unsuccessful (system error).
0x401e	Call to **lla_rdget** unsuccessful (system error). Unable to read new ECD org structure.
0x401f	Call to *alocmsg* unsuccessful (system error). PCPAUD could not allocate space for the message to termninate the **bootdiskchk** process.
0x4020	Call to *queuemn* unsuccessful (system error). PCPAUD could not queue the message to termninate the **bootdiskchk** process.
0x4021	Exceeded the maximum number of create attempts to start the **bootdiskchk** process.
0x4022	Timed out while waiting for results from the **bootdiskchk** process.
0x4023	Call to **lla_rdget** unsuccessful (system error). Unable to read ECD btparm structure used with REPT ECD report.

c = Type of fault found.

The following table applies to Assert Numbers 0x3b02 and 0x3b03. The character *n* refers to the hexadecimal value of the MHD number of the MHD being audited.

0xc001000n	Call to **lla_rdget** failed. Unable to get the MHD UCB for the MHD number in field *n*.
0xc002000n	Call to **lla_rdget** failed. Unable to get the SBUS UCB for the MHD number in field *n*.
0xc003000n	Call to **lla_rdget** failed. Unable to get the DFC UCB for the MHD number in field *n*.
0xc004000n	Call to **lla_rdget** failed. Unable to get the SBUS UCB for the MHD number in field *n*.
0xc005000n	The SBUS device ID for MHD *n* did not match that in the SBUS UCB.
0xc006000n	Call to **lla_rdget** failed. Unable to get the MHD UCB for the MHD number in field *n*.

SEE PROPRIETARY NOTICE ON COVER PAGE

Fault Type	Description *(continued)*
0xc007000n	The MHD device ID for MHD *n* did not match that in the MHD UCB.
0xc008000n	The unit number in the MHD ucb did not match MHD *n*.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. The following table contains some possible actions to specific error codes. If the message persists, contact your next level of technical assistance.

0x4,0x2d	Run ECD 1 audit.
0x6	Check maintenance channel cable. Run CU diagnostics on the off-line CU. The problem could also be in the on-line CU maintenance channel. Switch CUs, run CU diagnostics. The problem is serious and should be taken care of as soon as possible.
0xe	Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.
0x10	Take action on this error only if it occurs repeatedly. Run CU diagnostics.
0x12	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
0x14	Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
0x18	Run plant measurements system (PMS) 1 audit.
0x1e	Run CU diagnostics, switch CUs, run CU diagnostics.
0x2a	Clear the EAIs with a poke 14 on the EAI page of the MTTY. Take further action on this error only if it occurs repeatedly. Run CU diagnostics, switch CUs, run CU diagnostics.
0x2c	Take action on this error only if it occurs repeatedly. Either CU could cause inconsistent values between the SSRs. Run CU diagnostics, switch CUs, run CU diagnostics.

5. ALARMS

SEE PROPRIETARY NOTICE ON COVER PAGE

None. This automatically-generated report is for information only.

FAULT-CODE-APP

Input Messages
AUD:CUMEM
AUD:CUSTAT

ID . . . . . REPT-PCPMD
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT PCPMD FAULT TYPE` *a* `UNIT =` *b* `ASSERT =` *c*

[2] `REPT PCPMD FAULT TYPE` *a* `INACCESSIBLE RID =` *d* `ASSERT =` *c*

2. REASON FOR OUTPUT

To report an error condition in the processor control process maintenance driver (PCPMD).

Format 1 is printed whenever the name of the unit can be determined. If not, Format 2 is printed.

3. VARIABLE FIELD DEFINITIONS

a = Fault type. One or more of the following codes:

- `BOFL` — Maintenance channel (MCH) buffer overflow.
- `ECDA` — Equipment configuration database (ECD) access problem.
- `EMCH` — Incorrect number of MCH orders executed.
- `EONL` — Bad return from on-line diagnostic.
- `ESIM` — Could not fault system integrity monitor (SIM).
- `IARG` — Invalid argument.
- `IDCP` — PCPMD internal error.
- `SPRC` — Slave processor.
- `WAKE` — Supervisor wakeup failed.

b = Unit name.

c = Identification number (ASSERT number) of the FAULT in PCPMD.

d = Record ID (RID) of the unit control block (UCB) record in the ECD.

4. ACTION TO BE TAKEN

Consider bootstrapping for fault type ECDA. For other cases, save a copy of the output message and seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT PHASE a IN PROGRESS
```

2. REASON FOR OUTPUT

To report the occurrence of a system phase.

3. VARIABLE FIELD DEFINITIONS

a = Phase level number. See the *System Maintenance Manual.*

4. ACTION TO BE TAKEN

None. This message is for information only.

5. ALARMS

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

If a critical alarm occurs, take immediate action as indicated in the report. Seek technical assistance if needed.

6. REFERENCES

OMDB Keys
There is an OMDB key of 426 for phase 1 and an OMDB key of 166 for phases 2, 3, and 4.

REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

A process has attempted to access a page that is not in its page table.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Faulted control unit (CU) number.

c = Time in form `mm/dd/yy hh:mm:ss`.

d = The program address at the time of initialization (in hexadecimal). For software requested initializations this is the address of the PHASE OST and NOT the address where the problem was detected.

e = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode, i.e., kernel mode, kernel process, supervisor process, or user process. See *System Maintenance Manual*, Appendix P.

f = The contents of the primary segment base register (in hexadecimal).

g = The contents of the secondary segment base register (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

h = The contents of the sixteen general purpose registers (in hexadecimal).

R9: argument pointer
RA: frame pointer
RB: stack pointer

i = Process utility id (in hexadecimal). See *System Maintenance Manual*, Process / Problem Table.

j = Process number (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Save the ERLOG output, note the UID of the process that was reported and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

5. ALARMS

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . REPT-PLDMON,ERR
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `REPT PLDMON ERROR` *a* `ERRNO` *b*

[2] `REPT PLDMON ERROR` *a* `UNIT` *c d*

2. REASON FOR OUTPUT

To report errors discovered by pldmon while attempting to update the plant measurements system (PMS) database.

3. VARIABLE FIELD DEFINITIONS

a = One of the following error codes:

- `1` — cannot initialize PMS database
- `2` — cannot update setid record
- `3` — cannot read maintenance usage records
- `4` — cannot attach to maintenance usage record
- `5` — cannot update maintenance usage record
- `6` — ptimer call failed
- `7` — negative maintenance usage time found for the OOS unit named, or the plant database record for the OOS unit named was updated more than 15 minutes ago
- `8` — cannot allocate message buffer for scheduling hourly report
- `9` — cannot get process ID for PMCR port
- `10` — cannot queue message for scheduling hourly report
- `11` — unknown fault message buffer released

b = Error type returned for technical evaluation. Seek technical assistance for interpretation.

c = Unit name.

d = Unit number.

4. ACTION TO BE TAKEN

For error codes 1 through 5, check the usability of the PMS database.

For error code 6, `PLDMON` will not run again until a system phase occurs. Seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

For error code 7, if the error is printed due to a negative maintenance usage time for an OOS unit, it may be because of a change in the system clock. The start time for that unit in the database will be set to the current time. No action is needed. The error message is printed to warn that a discrepancy might be reflected for that unit in the daily and hourly `OP:PMCR` report.

This error code may also print due to an OOS unit record in the plant database not being updated for more than 15 minutes. Upon a boot and every quarter hour (4:15, 4:30, 4:45, for example) pldmon audits the database to ensure that records for OOS units have been updated every 15 minutes. When the system boots, a copy of the plant database is copied from the disk into memory. If the database on disk has a timestamp more than 15 minutes older than the system clock at boot time, pldmon assumes that records for OOS units have not been updated for more than 15 minutes and the error will print out. The incore database is copied to disk once an hour on the hour. You should not see this error message again if you do not plan to boot before the top of the hour. If you do plan to boot before the top of the hour and do not want to see this error message, you can copy the incore database to disk by executing `/prc/pmdbcopy` from the UNIX® shell.

For error codes 8, 9, and 10 a problem exists with pldmon sending a message to pmcrman to collect data (pmcrcol). Copy the incore PMS database to disk via the `/prc/pmdbcopy` UNIX® shell command and manually run the scheduled hourly reports. If the error persists, seek technical assistance.

For error code 11, an unknown fault message (other than a message buffer audit fault) was found and removed from the buffer. If the error persists, seek technical assistance.

5. ALARMS

None. The output is automatically generated. Action may or may not be required.

6. REFERENCES

OMDB Key
This message has an OMDB key of 212.

Input Message
`OP-PMCR`

ID . . . . . REPT-PMDBCOPY-A
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.11, R21.15 and R21.17
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `REPT PMDBCOPY ERROR` *a* [`ERRNO =` *b*]

[2] `REPT PMDBCOPY NO COPY`

[3] `REPT PMDBCOPY COMPLETED`

2. REASON FOR OUTPUT

To report the status of the Plant Measurements System (PMS) database copy program.

Format 1 is printed when errors are found.

Format 2 indicates that the PMS database audit program is conducting corrective action on the database and, therefore, the database will not be copied to disk.

Format 3 is printed if *-p* option is specified. As a default, the message is not printed at the end of the report.

3. VARIABLE FIELD DEFINITIONS

a = Error type. One of the following:

1 — failed plib function call
2 — could not attach to PMS database
3 — could not initialize lla_audit routines
4 — error detected by the lla_audit function
5 — error detected by the lla_audit function
6 — unknown return from lla_audit function
7 — could not get setid record from PMS database
8 — could not open secondary disk copy of PMS database
9 — could not write incore PMS database to secondary disk database
10 — could not release

11 — Request to audit the PMS database did not complete successfully. The incore database will not be copied.
12 — After the incore database was copied to disk, an audit on the disk database failed. (See additional errors.) The secondary disk database may be bad.
13 — The primary disk database does not exist. Attempt to move the secondary copy to primary failed. Run AUD:PMS 1.
14 — Attempt to switch primary and secondary disk databases failed. The primary may be bad. Run AUD:PMS 1.
16 — falloc failed to create a contiguous file for PMS disk database.
17 — makeseg failed to create a temporary segment for the incore database.

b = Number of errors detected by audit. Error types 2, 3, 7, 10 through 14, and 16, do not report an error number.

4. ACTION TO BE TAKEN

For Format 1, seek technical assistance.

For Formats 2 and 3, no action is needed.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

ID . . . . . REPT-PMGR,ERR-A
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT PMGR ERROR` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

To report process-manager (PMGR) related software errors. The errors are detected during the creation and termination of a supervisor or a kernel process or during a field update to a shared library.

The message identifies the type of problem encountered. There are two error types:

`Failure` — Causes the termination of the process under creation.

`Warning` — Notifies the user of the problem but does not terminate the process under creation.

3. VARIABLE FIELD DEFINITIONS

a = One of the following values:

`51` — Message type not recognized.
`53` — Library file does not exist.
`55` — Failure to load a kernel process because of insufficient memory.
`56` — All segment descriptor entries (SDEs) are allocated or there is no swap space left.
`57` — Unable to read a pfile or library file.
`58` — Segment too big for virtual address space available.
`59` — Cannot add a shared segment to the process.
`60` — Incarnation count too big for a process.
`62` — Cannot acquire a process control block (PCB) of a terminating process.
`63` — Process manager (PMGR) faulted, entered fault routine.
`64` — NUB faulted, entered fault routine.
`67` — Bad acknowledgment resulting from copyseg operating system trap (OST).
`68` — Pfile (LDP output) doesn't exist, or does not have correct magic number, or wrong supervisor or kernel mode.
`70` — Cannot open dump file specified in terminate message.
`71` — Unable to write out a segment of a process being dumped.
`72` — Cannot get capability for working directory.
`73` — Unable to close a file.
`75` — Cannot open or get segment name of device process.
`76` — Message from unauthorized process.
`77` — Segment index overlay warning.
`78` — Unable to lock shared library in memory.

SEE PROPRIETARY NOTICE ON COVER PAGE

80 — Process termination has already been completed by the process administration process termination audit.
81 — Pfile requests protected application segment (PAS); no PAS specified on sgen1 form.
82 — Could not duplicate pfile capabilities for the NUB.
83 — Could not create process because system is in disk independent operation.
84 — Shared segment index specifies different physical module than that specified by segid.
85 — Invalid PCB index.
86 — Pfile does not specify PCB segment.
87 — An expected acknowledgement message was not received within the five-minute wait interval.

If *a* = 51:

b = Process number of the process sending an unknown message fielded by the process manager mainline routine, in decimal notation.

Or one of the following messages:

CREATDFILE - Pathname is not specified to create a dump file. Check the pathname in termhdr.h message.

INIT - Process manager received a second initialization message.

NUB START - Could not recognize the type of message in START routine. Check the type of message dispatched to the NUB.

If *b* = numeric or NUB START:

c = Type of message received by the PMGR.

If *b* = INIT:

c = Process number of message sender.

If *b* = CREATDFILE:

c = User-supplied pathname in the termhdr.h message, or NULL.

If *a* = 53:

b = One of the following messages:

LMAKSEG OPEN- Could not open library file for read. Check the pathname. Could be an Input / Output failure.

LMAKSEG MAGIC- Shared library file had incorrect magic number. Check the path name; could be an Input / Output failure.

c = Pathname of the library file from pheader file.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* = 54:

b = One of the following failure messages:

MAKEKP - Failed to create a DCTE entry during kernel process creation. Check the DCTE table; it could be full.

MAKSUPER - Failed to create a DCTE entry during creation of supervisor process. Check the DCTE entry table.

c = Process pathname; process will not be created.

If *a* = 55:

b = MAKSEG - Failed to lock the requested segment in the memory.

c = Process pathname; process will not be created.

If *a* = 56:

b = One of the following failure messages:

CDUMP ACTIVSEG - Cannot find the segment in the segment table. Either the segment index is bad, or the segment points to a null segment. Core dump will not be created.

CDUMP ALOCSEG - PMGR requested the memory manager to allocate a segment. Memory manager returned failure condition. Either there is no space left on the disk to create this segment, or the SDE table is full. Core dump will not be created.

FILCOPY OPENADD - Segment ID is invalid or unallocated, or the segment index in segment flags of the segment list is out of range. Core dump will not be created.

INMEM ACTIVSEG - Same as MAKPRC ACTIVSEG, except error occurred during field update of shared library.

INMEM ALOCSEG - Same as MAKPRC ALOCSEG, except error occurred during field update of shared library.

MAKPRC ACTIVSEG - Cannot find the segment in the segment table. Segment points to a null segment: failed to make the segment nonswap process. Segment index out of range.

MAKPRC ALOCSEG - PMGR made an alocseg ost call to the memory manager. Call returned with failure condition. Either there is no space left on the swap area, or the SDE table is full. Check the SDE table entries and the swap space.

NDUP ACTIVSEG - See MAKPRC ACTIVSEG.

NDUP ADDSEG - See MAKPRC ACTIVSEG.

SEE PROPRIETARY NOTICE ON COVER PAGE

NDUP ALOCSEG - See MAKPRC ALOCSEG.

SEGADD ALOCSEG - See MAKPRC ALOCSEG.

SEGADD ALOCSEGA - See MAKPRC ALOCSEG.

SEGREAD ACTIVSEG - See MAKPRC ACTIVSEG.

SEGREAD SHARE - Sgetmodule() failed on a segment shared via "share" ldp option.

If *b* = SEGADD ALOCSEG:

c = Segment name.

If *b* = CDUMP ALOCSEG or CDUMP ACTIVSEG:

c = Process number; process is terminated.

Otherwise,

c = NULL.

If *a* = 58:

b = One of the following failure messages:

DOKPSEGS - In UNIX® RTR R1.5, process may need more than the 128 segments allowed by the system. In UNIX® RTR R6, the process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511).

NUBDOSPSEGS - In UNIX® RTR R1.5, process may need more than the 128 segments allowed by the system. In UNIX® RTR R6, the process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511). This error is from the NUB process.

NUBMAKSEG - In UNIX® RTR R1.5, failed to find free segment list entry, needs more than 128 segments to create the process. In UNIX® RTR R6, the process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511). Check segment map in the pheader file. This error is from the NUB process.

c = Process pathname; process will not be created.

If *a* = 59:

b = One of the following failure messages:

CHKSHARE DUP - Segment name is duplicated in the pheader file.

CHKSHARE EMM - extended main memory is enabled, and segment name is requested for wrong physical module.

CHKSHARE NOMATCH - Segment name does not match in the pcreate message and pheader file.

INIT ECDDATA - Failed to open equipment configuration database data segment.

INIT ECDLPATCH - Failed to open equipment configuration database patch segment.

INIT ECDLTEXT - Failed to open equipment configuration database text segment.

INIT KMSG - Failed to open kernel message buffer segment.

INIT KSTK - Failed to open kernel stack segment.

INIT PAS0- Failed to open protected application segment.

INIT PAS1- Failed to open protected application segment upper module.

INIT PLMDATA - Failed to open plant measurement library data segment.

INIT PLMPATCH - Failed to open plant measurement library patch

segment.

`INIT PLMTEXT` - Failed to open plant measurement library text segment.

`NUB DOSPSEGS` - Segment name does not match in the pcreate message and pheader.

`NUB SHSYSEG OPENSEG` - See `SHSYSEG OPENSEG`. This error is from the NUB process.

`SEGADD FNAME` - Failed to get the 32-bit segment name from file manager.

`SEGADD SHARE` - Failed to increase the segment user count.

`SHSYSEG OPENSEG` - Segment name does not match in the pcreate message and pheader.

c = Segment name.

If *b* = `CHKSHARE: NOMATCH` or `CHKSHARE DUP`

c = Segment name which does not match or is duplicated.

Otherwise,

c = Null or process pathname; process will not be created.

If *a* = `60`:

b = Failure message:

`MAKPRC` - User count for this process is greater than allowed count (255).

c = Process pathname; process will not be created.

If *a* = `62`:

b = One of the following messages:

`MAKDUMP KERNEL` - Failed to add kernel process PCB segment to the PMGR address space.

`MAKDUMP SUPER` - Failed to add user process PCB segment to PMGR address space.

c = The process number of process being dumped, core dump will not be created.

If *a* = `63` or `64`:

b = Eight digit hexadecimal number. The two high order digits are the fault code. The remaining six digits, if present, are the program address at fault. If they are missing, the fault was externally generated.

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Process or library pathname; process will not be created or library will not be locked.

If *a* = `67`:

b = One of the following failure messages:

`MAKSUPER PFILE` - Failed to copy pfile header to the NUB's address space.

`NDUP COPYSEG` - Failed to copy NUB segment into NUB address space.

`NDUP FWAIT` - Received a failure state after copyseg operation.

c = Process pathname or NULL; process will not be created.

If *a* = `68`:

b = Process number, in decimal notation. The pfile specified in a pcreate request by process *b* could not be opened.

Or one of the following messages:

`INMEM BADMAGIC` - The magic number in the library header was incorrect.

`INMEM OPEN` - Library could not be opened for reading.

`MAKPRC BADMAGIC` - Magic number in the pheader file does not match with kmagic or smagic number. Check the pheader file or reload with proper specification.

If *b* = `the process number`:

c = Status returned from file manager.

d = Pathname of the pfile which could not be opened.

If *b* = `MAKPRC BADMAGIC`:

c = Process pathname; process will not be created.

If *b* = `INMEM OPEN` or `INMEM BADMAGIC`:

c = Library pathname; library will not be locked.

If *a* = `70`:

b = `CREATDFILE` - Failed to create a dump file with the given pathname.

c = Pathname.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* = 71:

b = One of the following warning messages:

CDUMP - Failed to write out dump file header.

FILCOPY - Failed to write a segment to dump file.

c = Process number of the terminating process or NULL.

If *a* = 72:

b = Process number, in decimal notation. The capability to access the working directory of a pcreate pathname specified by process *b* could not be acquired.

Or one of the following messages:

CREATDFILE - Failed to create a file for dumping a terminating process. This is a warning message.

INIT - The capability to access the root directory failed.

INMEM - The capability to access the working directory of library file failed.

If *b* = numeric:

c = Working directory pathname of the process which will not be created.

If *b* = CREATDFILE:

c = Dump file pathname.

If *b* = INMEM:

c = Library pathname.

If *b* = INIT:

c = *i*.

If *a* = 73:

b = FMCLOSE - PMGR sent a message to the file manager to close a file. The file manager returned failure.

c = NULL.

If *a* = 76:

b = START MSTERM - Terminate message is not from scheduler.

c = Process number of the process that sent the message.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* = 77:

b = Segment index, in decimal notation. The segment being added to the address space of a kernel process overlaid a segment index already in use. The resultant process will have addressability into the second segment from code referencing both the first request and second request. This will most typically occur with the protected application segment. This message should be viewed seriously as this is a potentially disastrous situation.

c = Pathname of the kernel process containing the segment index overlay.

If *a* = 78:

b = One of the following messages:

`INMEM LIBTABLE` - internal shared library table is full.

`INMEM NOADD` - The process manager was unable to add library segment to its address space.

`INMEM NOHOLE` - The process manager has no available entries in its segment list.

`INMEM NOTABLE` - The process manager has no available entries in its internal table that it uses to lock library segments.

`INMEM OLDAGE` - A shared library has been undergoing an update for over a week. Field update has probably forgotten about it.

`UNINMEM - -` The process manager received a message to unlock a shared library but the library was not locked.

c = Library pathname.

If *a* = 81:

b = `DOKPSEGS` - The pfile requested PAS, however no PAS is in the system.

c = Process pathname; process will not be created.

If *a* = 80:

b = `OLD MSTERM` - The process termination has already occurred due to the process administration process termination audit.

c = Process number.

If *a* = 82:

b = `MAKSUPER` - Could not duplicate pfile capabilities for the NUB.

c = Process pathname; process will not be created.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* = 83:

b = MAKSUPER - pstart() failed because system is in disk independent operation.

c = Process pathname; process will not be created.

If *a* = 84:

b = SEGGADD MODULE - shared segment index does not specify same physical module as that specified by segid.

c = Process pathname; process will not be created.

If *a* = 85:

b = PCB INDEX - Invalid pcb index.

c = Process pathname; process will not be created.

If *a* = 86:

b = Kernel process pathname; process will not be created.

If *a* = 87:

b = RCVACK LOST - An expected acknowledgement was lost

c = Null.

4. ACTION TO BE TAKEN

Use the Error / Action Table to determine which of the following actions should be taken.

1. Call application system support.
2. Application system support should call UNIX® RTR system support.
3. Check the displayed pathname for accuracy.
4. Possible system generation (SYSGEN) specification change required.
5. Possible process specification file error.
6. Enter OP:STATUS;PROCESS,ALL for further documentation of problem.

GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT PMGR ERROR` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

To report process manager (PMGR) related software errors. The errors are detected during the creation and termination of a supervisor or a kernel process or during a field update to a shared library.

The message identifies the type of problem encountered. There are two error types:

Failure — Causes the termination of the process under creation.

Warning — Notifies the user of the problem but does not terminate the process under creation.

3. VARIABLE FIELD DEFINITIONS

a = One of the following values:

`51` — Message type not recognized.

`53` — Library file does not exist.

`55` — Failure to load a kernel process because of insufficient memory.

`56` — All segment descriptor entries (SDEs) are allocated or there is no swap space left.

`57` — Unable to read a pfile or library file.

`58` — Segment too big for virtual address space available.

`59` — Cannot add a shared segment to the process.

`60` — Incarnation count too big for a process.

`62` — Cannot acquire a process control block (PCB) of a terminating process.

`63` — Process manager (PMGR) faulted, entered fault routine.

`64` — NUB faulted, entered fault routine.

`67` — Bad acknowledgment resulting from copyseg operating system trap (OST).

`68` — Pfile (LDP output) doesn't exist, or does not have correct magic number, or wrong supervisor or kernel mode.

SEE PROPRIETARY NOTICE ON COVER PAGE

70 — Cannot open dump file specified in terminate message.

71 — Unable to write out a segment of a process being dumped.

72 — Cannot get capability for working directory.

73 — Unable to close a file.

75 — Cannot open or get segment name of device process.

76 — Message from unauthorized process.

77 — Segment index overlay warning.

78 — Unable to lock shared library in memory.

80 — Process termination has already been completed by the process administration process termination audit.

81 — Pfile requests protected application segment (PAS); no PAS specified on sgen1 form.

82 — Could not duplicate pfile capabilities for the NUB.

83 — Could not create process because system is in disk independent operation.

84 — Shared segment index specifies different physical module than that specified by segid.

85 — Invalid PCB index.

86 — Pfile does not specify PCB segment.

87 — An expected acknowledgement message was not received within the five-minute wait interval.

88 — Pfile specifies a segment whose virtual address is beyond the range supported on this hardware.

If *a* = 51:

b = Process number of the process sending an unknown message fielded by the process manager mainline routine, in decimal notation.

Or one of the following messages:

CREATDFILE - Pathname is not specified to create a dump file. Check the pathname in termhdr.h message.

INIT - Process manager received a second initialization message.

NUB START - Could not recognize the type of message in START routine. Check the type of message dispatched to the NUB.

If *b* = numeric or NUB START:

c = Type of message received by the PMGR.

If *b* = `INIT:`

c = Process number of message sender.

If *b* = `CREATDFILE:`

c = User-supplied pathname in the `termhdr.h` message, or `NULL`.

If *a* = `53:`

b = One of the following messages:

`LMAKSEG OPEN`- Could not open library file for read. Check the pathname. Could be an Input/Output failure.

`LMAKSEG MAGIC`- Shared library file had incorrect magic number. Check the path name; could be an Input/Output failure.

c = Pathname of the library file from pheader file.

If *a* = `54:`

b = One of the following failure messages:

`MAKEKP` - Failed to create a DCTE entry during kernel process creation. Check the DCTE table; it could be full.

`MAKSUPER` - Failed to create a DCTE entry during creation of supervisor process. Check the DCTE entry table.

c = Process pathname; process will not be created.

If *a* = `55:`

b = `MAKSEG` - Failed to lock the requested segment in the memory.

c = Process pathname; process will not be created.

If *a* = `56:`

b = One of the following failure messages:

`CDUMP ACTIVSEG` - Cannot find the segment in the segment table. Either the segment index is bad, or the segment points to a null segment. Core dump will not be created.

`CDUMP ALOCSEG` - `PMGR` requested the memory manager to allocate a segment. Memory manager returned failure condition. Either there is no space left on the disk to create this segment, or the SDE table is full. Core dump will not be created.

`FILCOPY OPENADD` - Segment ID is invalid or unallocated, or the segment index in segment flags of the segment list is out of range. Core dump will not be created.

`INMEM ACTIVSEG` - Same as `MAKPRC ACTIVSEG`, except error occurred during field update of shared library.

SEE PROPRIETARY NOTICE ON COVER PAGE

INMEM ALOCSEG - Same as MAKPRC ALOCSEG, except error occurred during field update of shared library.

MAKPRC ACTIVSEG - Cannot find the segment in the segment table. Segment points to a null segment: failed to make the segment nonswap process. Segment index out of range.

MAKPRC ALOCSEG - PMGR made an alocseg ost call to the memory manager. Call returned with failure condition. Either there is no space left on the swap area, or the SDE table is full. Check the SDE table entries and the swap space.

NDUP ACTIVSEG - See MAKPRC ACTIVSEG.

NDUP ADDSEG - See MAKPRC ACTIVSEG.

NDUP ALOCSEG - See MAKPRC ALOCSEG.

SEGADD ALOCSEG - See MAKPRC ALOCSEG.

SEGADD ALOCSEGA - See MAKPRC ALOCSEG.

SEGREAD ACTIVSEG - See MAKPRC ACTIVSEG.

SEGREAD SHARE - Sgetmodule() failed on a segment shared via "share" ldp option.

If *b* = SEGADD ALOCSEG:

c = Segment name.

If *b* = CDUMP ALOCSEG or CDUMP ACTIVSEG:

c = Process number; process is terminated.

If *b* = MAKPRC ALOCSEG or MAKPRC ACTIVSEG:

c = Process pathname; process will not be created.

If *b* = INMEM ALOCSEG or INMEM ACTIVSEG:

c = Library pathname, library will not be locked.

Otherwise,

c = NULL.

If *a* = 57:

b = One of the following failure messages:

MAKPRC - Failed to read pfile header.

LMAKSEG - Failed to read library file from the disk.

SEGREAD - Failed to read a segment from the disk.

INMEM - Failed to read library file header from the disk.

If *b* = MAKPRC:

c = Process pathname; process will not be created.

If *b* = LMAKSEG:

c = Library pathname; process will not be created.

If *b* = INMEM:

c = Library pathname; process will not be locked.

Otherwise,

c = NULL.

If *a* = 58:

b = One of the following failure messages:

DOKPSEGS - The process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511).

NUBDOSPSEGS - The process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511). This error is from the NUB process.

NUBMAKSEG - The process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511). Check segment map in the pheader file. This error is from the NUB process.

c = Process pathname; process will not be created.

If *a* = 59:

b = One of the following failure messages:

CHKSHARE DUP - Segment name is duplicated in the pheader file.

CHKSHARE EMM - extended main memory is enabled, and segment name is requested for wrong physical module.

CHKSHARE NOMATCH - Segment name does not match in the pcreate message and pheader file.

INIT ECDDATA - Failed to open equipment configuration database data segment.

INIT ECDLPATCH - Failed to open equipment configuration database patch segment.

INIT ECDLTEXT - Failed to open equipment configuration database text segment.

INIT KMSG - Failed to open kernel message buffer segment.

INIT KSTK - Failed to open kernel stack segment.

INIT PAS0 - Failed to open protected application segment.

INIT PAS1 - Failed to open protected application segment upper module.

INIT PLMDATA - Failed to open plant measurement library data segment.

INIT PLMPATCH - Failed to open plant measurement library patch segment.

INIT PLMTEXT - Failed to open plant measurement library text segment.

NUB DOSPSEGS - Segment name does not match in the pcreate message and pheader.

NUB SHSYSEG OPENSEG - See SHSYSEG OPENSEG. This error is from the NUB process.

SEGADD FNAME - Failed to get the 32-bit segment name from file manager.

SEGADD SHARE - Failed to increase the segment user count.

SHSYSEG OPENSEG - Segment name does not match in the pcreate message and pheader.

c = Segment name.

If *b* = CHKSHARE: NOMATCH or CHKSHARE DUP,

c = Segment name which does not match or is duplicated.

Otherwise,

c = NULL or process pathname; process will not be created.

If *a* = 60:

b = Failure message:

MAKPRC - User count for this process is greater than allowed count (255).

c = Process pathname; process will not be created.

If *a* = `62:`

b = One of the following messages:

`MAKDUMP KERNEL` - Failed to add kernel process PCB segment to the PMGR address space.

`MAKDUMP SUPER` - Failed to add user process PCB segment to PMGR address space.

c = The process number of process being dumped, core dump will not be created.

If *a* = `63` or `64:`

b = Eight digit hexadecimal number. The two high order digits are the fault code. The remaining six digits, if present, are the program address at fault. If they are missing, the fault was externally generated.

c = Process or library pathname; process will not be created or library will not be locked.

If *a* = `67:`

b = One of the following failure messages:

`MAKSUPER PFILE` - Failed to copy pfile header to the `NUB`'s address space.

`NDUP COPYSEG` - Failed to copy `NUB` segment into `NUB` address space.

`NDUP FWAIT` - Received a failure state after copyseg operation.

c = Process pathname or `NULL`; process will not be created.

If *a* = `68:`

b = Process number, in decimal notation. The pfile specified in a pcreate request by process *b* could not be opened.

Or one of the following messages:

`INMEM BADMAGIC` - The magic number in the library header was incorrect.

`INMEM OPEN` - Library could not be opened for reading.

`MAKPRC BADMAGIC` - Magic number in the pheader file does not match with kmagic or smagic number. Check the pheader file or reload with proper specification.

If *b* = the process number:

c = Status returned from file manager.

d = Pathname of the pfile which could not be opened.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *b* = `MAKPRC BADMAGIC:`

c = Process pathname; process will not be created.

If *b* = `INMEM OPEN` or `INMEM BADMAGIC:`

c = Library pathname; library will not be locked.

If *a* = `70:`

b = `CREATDFILE` - Failed to create a dump file with the given pathname.

c = Pathname.

If *a* = `71:`

b = One of the following warning messages:

`CDUMP` - Failed to write out dump file header.

`FILCOPY` - Failed to write a segment to dump file.

c = Process number of the terminating process or `NULL`.

If *a* = `72:`

b = Process number, in decimal notation. The capability to access the working directory of a pcreate pathname specified by process *b* could not be acquired.

Or one of the following messages:

`CREATDFILE` - Failed to create a file for dumping a terminating process. This is a warning message.

`INIT` - The capability to access the root directory failed.

`INMEM` - The capability to access the working directory of library file failed.

If *b* = numeric:

c = Working directory pathname of the process which will not be created.

If *b* = `CREATDFILE:`

c = Dump file pathname.

If *b* = `INMEM:`

c = Library pathname.

If *b* = `INIT:`

c = *i.*

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* = 73:

b = FMCLOSE - PMGR sent a message to the file manager to close a file. The file manager returned failure.

c = NULL.

If *a* = 76:

b = START MSTERM - Terminate message is not from scheduler.

c = Process number of the process that sent the message.

If *a* = 77:

b = Segment index, in decimal notation. The segment being added to the address space of a kernel process overlaid a segment index already in use. The resultant process will have addressability into the second segment from code referencing both the first request and second request. This will most typically occur with the protected application segment. This message should be viewed seriously as this is a potentially disastrous situation.

c = Pathname of the kernel process containing the segment index overlay.

If *a* = 78:

b = One of the following messages:

INMEM LIBTABLE - internal shared library table is full.

INMEM NOADD - The process manager was unable to add library segment to its address space.

INMEM NOHOLE - The process manager has no available entries in its segment list.

INMEM NOTABLE - The process manager has no available entries in its internal table that it uses to lock library segments.

INMEM OLDAGE - A shared library has been undergoing an update for over a week. Field update has probably forgotten about it.

UNINMEM - - The process manager received a message to unlock a shared library but the library was not locked.

c = Library pathname.

If *a* = 81:

b = DOKPSEGS - The pfile requested PAS, however no PAS is in the system.

c = Process pathname; process will not be created.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* = 80:

b = OLD MSTERM - The process termination has already occurred due to the process administration process termination audit.

c = Process number.

If *a* = 82:

b = MAKSUPER - Could not duplicate pfile capabilities for the NUB.

c = Process pathname; process will not be created.

If *a* = 83:

b = MAKSUPER - pstart() failed because system is in disk independent operation.

c = Process pathname; process will not be created.

If *a* = 84:

b = SEGGADD MODULE - shared segment index does not specify same physical module as that specified by segid.

c = Process pathname; process will not be created.

If *a* = 85:

b = PCB INDEX - Invalid pcb index.

c = Process pathname; process will not be created.

If *a* = 86:

b = Kernel process pathname; process will not be created.

If *a* = 87:

b = RCVACK LOST - An expected acknowledgement was lost

c = NULL.

If *a* = 88:

b = One of the following messages:

DOKPSEGS - error occurred during kernel process creation.
NUBDOSPSEGS - error occurred during supervisor process creation. This message is from the BUB process.

c = Process pathname; process will not be created.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Use the Error / Action Table to determine which of the following actions should be taken.

1. Call application system support.
2. Application system support should call UNIX® RTR system support.
3. Check the displayed pathname for accuracy.
4. Possible system generation (SYSGEN) specification change required.
5. Possible process specification file error.
6. Enter `OP:STATUS;PROCESS,ALL` for further documentation of problem.

OMDB Keys
This message has OMDB keys of 401 and 402 (3B20D only) and 686 and 687 (3B21D only).

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . REPT-POWER
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `REPT POWER {RESTORED|REMOVED} a b [c d]`

[2] `REPT POWER FAULT a b [c d]`

[3] `REPT POWER DISTRIBUTION FRAME e f ALARM`

2. REASON FOR OUTPUT

Format 1 indicates that a unit has been powered up or powered down by a manual request at a unit's power switch. The removal of power from a unit may be the result of a normal power down, a manual override power down, or the occurrence of faults where power is removed, such as a blown fuse.

Format 2 indicates that a power fault has been detected by scanning the unit's power switch (ABB1).

Format 3 indicates the occurrence of a major or minor alarm on the power distribution frame as detected by a scan point on the unit alarm circuit.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Subunit name.

d = Subunit number.

e = Identification number (0-99999). This number is arbitrary and is retrieved from the logical group name in the scsdbody form found in the equipment configuration database (ECD). If no number identification is in the group name, no number will be output.

f = Type of alarm:

MAJOR - Service is interrupted due to a power problem on another frame which resulted in a feeder fuse being blown on the power distribution frame.

MINOR - A local fuse on the power distribution frame has blown, but service is not interrupted.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Format 1, take no action, unless power removed. Check for blown fuses and take appropriate action to restore power.

For Format 2, establish and repair the cause of the fault. Check the status of alarm LEDs on unit, diagnose, and repair.

For Format 3, if a MAJOR alarm, determine the cause by looking at the accompanying messages. Fix the problem and replace the necessary output fuses on the power distribution frame. If MINOR alarm, replace fuses on the power distribution frame charging or filtering circuits.

5. ALARMS

None. This automatically-generated report is for information only.

Minor alarm. Take action as indicated in the report.

Major alarm. May not be service affecting, but take immediate action as indicated in the report.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 139.
Formats 2 and 3 have OMDB keys of 141 for MINOR alarm and 142 for MAJOR alarm.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . REPT-PSM-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `REPT PSM ERROR X'`*a* `GRPN` *b* `STATE X'`*c*

[2] `REPT PSM ERROR X'`*a* `SYSTEM ERROR` *d* `GRPN` *b*
`STATE X'`*c*

[3] `REPT PSM ERROR X'`*a* `GRPN` *b*

2. REASON FOR OUTPUT

Format 1 is to report the power switch monitor (PSM) encountered an error while trying to perform an operation.

Format 2 is to report the PSM encountered an error while attempting to send a message to the scanner and signal distributor administrator (SCSDA).

Format 3 is to report an unidentified group has been requested to be operated upon.

3. VARIABLE FIELD DEFINITIONS

a = Error code.

b = Logical group name.

c = PSM mode of logical group.

d = System error code. See `errno.h`.

Where *a* = One of the following values:

`0xe0` — Error in unit control block (UCB) pointer. Check addressing flags in the message.

`0xe1` — Error in unit number. Specified unit is not identified by the SCSDA.

`0xe2` — Error in logical group name. SCSDA cannot find reference to a group. Logical group unit may have been degrown. Check message. Possible save area corruption. Verify group in database.

`0xe3` — Error in duplex identification. Check message. Possible PSM save area corruption. Check database records.

`0xe4` — Scanner and signal distributor controller (SCSDC) is possibly out-of-service (OOS). Check status of SCSDC.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0xe5` — Invalid point number. Check message. Possible PSM save area corruption. Check database record to verify that the point is included in the group.

`0xe6` — Address type not specified in message. Check message.

`0xe7` — Scanner and signal distributor handler (SCSDH) failed to complete the operation. Check status of SCSDC and SCSDA. Check SCSDH error messages to determine the problem.

`0xe8` — Illegal class requested. Class cannot be monitored. Check message. See `ecd.h` for legal classes.

`0xe9` — SCSDA cannot add client to list. Check for multiple occurrences of processes.

`0xea` — Unknown command type. Check message.

`0xeb` — SCSDA is in incorrect state to perform operations on the SCSDC. Check status of SCSDC.

`0xec` — Point from database record retrieved by SCSDA is illegal. Review database forms.

`0xed` — SCSDA could not update database.

`0xee` — No error.

`0xef` — Illegal operation requested. Check message.

`0xf0` — Illegal number of operations requested per message. Check ad_count in message.

`0xf1` — SCSDA could not find the class requested to be monitored by PSM in any of the database forms. Check database forms and SCSDC equipage.

`0xf2` — Operation could not be completed by SCSDH. Additional information can be obtained from SCSDH error message.

`0xf3` — Unknown message type has been received by SCSDA from the SCSDH.

`0xf4` — SCSDA cannot update database.

`0x100` — PSM failed to send message to SCSDA. See msgport.

`0x101` — PSM could not get a timing chain entry.

`0x102` — PSM could not complete operation.

`0x103` — Invalid message received by PSM from SCSDA. Check the record identification (RID) of unit specified in the database. Check message.

`0x104` — PSM could not get UCB information for logical group. Possible corrupted RID in message. Review database form.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0x105` — PSM has determined group save area is corrupted. Reinitialize PSM.

`0x106` — PSM could not identify group. Check message. Possible PSM corruption. In addition, check if group was rejected upon initialization.

Where *c* = One of the following values:

`0x10` — Group is unavailable. PSM has encountered multiple internal errors.

`0x11` — Group is idle.

`0x12` — PSM is performing a directed scan operation.

`0x13` — PSM is performing a distribute operation.

`0x14` — PSM is performing an allow operation.

`0x15` — PSM is waiting for inhibits to be cleared.

4. ACTION TO BE TAKEN

For Formats 1 and 2, locate the offending code or hardware from the error code. Check the status of the hardware by using the `OP:OOS` input message. Verify that the SCSDC is equipped. Verify that the database forms contain the proper data. If corrupted areas are found in PSM, the processes should be restarted to reinitialize. If PSM is suspected of being corrupted, procedures should be taken to produce a dump of the process and forward information to the service organization.

For Format 3, verify that the database forms contain the proper logical group name. Verify that the correct logical group was input.

5. ALARMS

None. This automatically-generated report is for information only.

`0x106` — PSM could not identify group. Check message. Possible PSM corruption. In addition, check if group was rejected upon initialization.

b = Logical group name.

c = PSM mode of logical group. One of the following values:

`0x10` — Group is unavailable. PSM has encountered multiple internal errors.
`0x11` — Group is idle.
`0x12` — PSM is performing a directed scan operation.
`0x13` — PSM is performing a distribute operation.
`0x14` — PSM is performing an allow operation.
`0x15` — PSM is waiting for inhibits to be cleared.

d = System error code. See the *System Maintenance Manual.*

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Formats 1 and 2, locate the offending code or hardware from the error code. Check the status of the hardware by using the OP:OOS input message. Verify that the SCSDC is equipped. Verify that the database forms contain the proper data. If corrupted areas are found in PSM, the processes should be restarted to reinitialize. If PSM is suspected of being corrupted, procedures should be taken to produce a dump of the process and forward information to the service organization.

For Format 3, verify that the database forms contain the proper logical group name. Verify that the correct logical group was input.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
Formats 1,2, and 3 have an OMDB key of 138.

MESSAGE CLASS . . MAINT

1. FORMAT

`REPT POWER FAULT CLEARED` *a b* [*c d*]

2. REASON FOR OUTPUT

To indicate that a power fault detected by scanning the unit's power switch has been cleared.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.

b = Unit number.

c = Subunit name.

d = Subunit number.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This automatically-generated report is for information only.

ID . . . . . REPT-RCVRY,CU
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT RCVRY CU a COMPLETED
```

2. REASON FOR OUTPUT

To report that the initialization interval of the active control unit (CU) is complete.

3. VARIABLE FIELD DEFINITIONS

a = Member number (0 or 1).

4. ACTION TO BE TAKEN

The cause of the initialization can be determined by accessing the most recent post-mortem dump from PMLOG. (Use the `OP:LOG` input message and specify the current date.)

5. ALARMS

None.

6. REFERENCES

Input Message
`OP:LOG`

ID . . . . . REPT-RCVRY,DUI
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT RCVRY DUI` *a b* [*c*]

2. REASON FOR OUTPUT

To report the outcome of a direct user interface (DUI) subdevice recovery attempt. The DUI, initially in the active state, changes to the recovery state when the first error is detected. It remains in this state until the recovery is either successful or the unit is removed from service because of a high error count.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Termination status:

`ABORTED` — An error occurred: recovery failed.

`COMPLETED` — Recovery was successful.

c = Additional error information. See output IOP Appendix F, `IOP-APPF`.

4. ACTION TO BE TAKEN

If the unit is ultimately removed from service (because of a high error count), run diagnostics and repair the unit.

5. ALARMS

None.

MESSAGE CLASS . . MAINT

1. FORMAT

`REPT RCVRY HSDC` *a b* [*c*]

2. REASON FOR OUTPUT

To report the outcome of a high-speed synchronous datalink controller (HSDC) recovery attempt. The HSDC, initially in the active state, changes to the recovery state when the first error is detected. It remains in this state until the recovery is either successful or the unit is removed from service because of a high error count.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Termination status:

`ABORTED` — An error occurred: recovery failed.

`COMPLETED` — Recovery was successful.

c = Additional error information. See output IOP Appendix F, `IOP-APPF`.

4. ACTION TO BE TAKEN

If the unit is ultimately removed from service (because of a high error count), run diagnostics and repair the unit.

5. ALARMS

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . REPT-REX UNABLE
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has eight formats.

[1] `REPT REX UNABLE TO SEND MESSAGE TO APPLICATION REX PORT`

[2] `REPT REX UNABLE TO REQUEST PORTSWITCH FOR IOP DIAGNOSIS`

[3] `REPT REX ROP PORTSWITCH REQUEST DENIED`

[4] `REPT REX MTTY PORTSWITCH REQUEST DENIED`

[5] `REPT REX MAJOR ALARM` *a*

[6] `REPT REX CANNOT OPEN` *b*

[7] `REPT REX TERMINATED-INTERNAL REQUEST`

[8] `REPT REX MINOR ALARM` *a*

2. REASON FOR OUTPUT

For Format 1, before REX removes the input/output processors (IOPs) for diagnosis, it will send a message to PT_REX to notify the applications of the removal. The applications can then gracefully stop their datalink transmission. If no process is connected to this port, this message will be printed and execution will continue normally.

For Format 2, before REX removes an IOP for diagnosis, it must make sure the portswitches for the maintenance teletypewriter (MTTY) or receive-only printer (ROP) are not active. This message indicates REX had a problem locating the unit control block (UCB) for the ROP or MTTY.

For Format 3, REX sent a request to portswitch the ROP and it was denied or could not be executed.

For Format 4, REX sent a request to portswitch the MTTY and it was denied or could not be executed.

For Format 5, essential unit found to be out of service (OOS).

For Format 6, REX could not open the specified file to output the REX report.

For Format 7, REX received a sigterm signal and is terminating.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 8, REX found an OOS unit with a controlling unit that is an IOP. This is a condition to signal a minor alarm.

3. VARIABLE FIELD DEFINITIONS

a = Name and number of the essential unit found to be OOS.

b = Name of the output file for REX report.

4. ACTION TO BE TAKEN

For Format 1, this report can be ignored if the application does not wish to receive the message from the UNIX® RTR REX process.

For Format 2, check the status of IOP subunits and portswitches (ROP and MTTY). Verify that a portswitch can be executed.

For Format 3, check to see if a manual portswitch can be requested.

For Format 4, check to see if a manual portswitch can be requested. Also check the states of the IOP subunits.

For Formats 5 and 8, request a restore on the hardware unit or community. No further action is required if the restore is successful. If the hardware unit or community failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

For Format 6, determine if the specified file system is full and remove unneeded files.

For Format 7, no action is required.

5. ALARMS

This alarm is either a manually-requested report or is automatically-generated for information only.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . REX

1. FORMAT

```
REPT REX SUMMARY {IN PROGRESS |COMPLETED}
TIME    EQUIPMENT ID    RESULT    RET    STATE
a    b c [d e]   f     [g]   h
```

2. REASON FOR OUTPUT

To report a summary of routine exercise (REX) results for all hardware units that were exercised.

3. VARIABLE FIELD DEFINITIONS

a = Local time (hours, minutes, and seconds) when the exercise of the unit finished.

b = Unit name.

c = Unit number.

d = Subunit name.

e = Subunit number.

f = Result of exercising the specified unit, as follows:

- ABT — Diagnostics were aborted.
- ATP — All tests passed.
- CATP — Conditional ATP.
- ERR — Error return code received from maintenance input request administrator (MIRA).
- FAULT — Unit was excessively faulty.
- INH — REX was inhibited for this unit.
- MAN — Unit was removed manually.
- NODGN — No diagnostic phases exist for this unit.
- NRPY — No reply received from MIRA.
- NTR — No tests were run.
- OOS — Unit was out of service (OOS) and could not be exercised.
- PORTSW — Could not portswitch.
- STF — Some tests failed.
- TIMEOUT — Timeout occurred.

g = Return code. Possible return codes are:

- 2 — Request inhibited.
- 3 — MIRA out of buffers.

SEE PROPRIETARY NOTICE ON COVER PAGE

4 — MIRA cannot spawn diagnostic monitor (DIAMON) program.
5 — Duplicate request already in queue.
6 — Request aborted by `STOP:DMQ` or `STP:DMQ` request.
7 — Internal problem; request aborted.
8 — Remove attempt failed.
9 — Restore attempt failed.

h = The state of the unit after REX exercised it:

`ACT` — Active.
`GROW` — Grow state.
`INIT` — Initializing.
`OFL` — Off-line.
`OOS` — Out of service.
`STBY` — Standby.
`UNAV` — Unavailable.
`UNEQUIP` — Unequipped.

NOTE: This variable field reflects the state of the unit when the exercise of the unit finished, which may not be the current state of the unit. If external events result in the removal of a unit (that is, manually removed, removed from a fault, softswitch, etc.) after REX has exercised it, the new state is not reflected in this variable.

4. ACTION TO BE TAKEN

If any units failed diagnostics or were left out of service, manual action is required to restore them.

5. ALARMS

None. This automatically-generated report is for information only.

`REPT RMF` *a* [*b*]

2. REASON FOR OUTPUT

To report that the recovery message formatter (RMF) encountered an error condition while attempting to output an error or postmortem recovery message.

3. VARIABLE FIELD DEFINITIONS

a = Error code specifying the error condition detected. Possible error codes are:

`1` — Premature end of file (EOF) detected on /dev/pmem.
`2` — File /dev/pmem could not be opened.
`3` — Plant measurement library could not be opened.
`4` — Could not attach to plant measurement database.
`5` — Could not retrieve plant measurement record.
`6` — Could not update plant measurement record.
`7` — Seek error on file /dev/pmem.
`8` — Read error on file /dev/pmem.
`9` — Could not open intermediate file to spool message.
`10` — Could not spool intermediate file.
`11` — Spooled orphaned intermediate file.
`12` — Bad interrupt type read from erslot.

If *a* = `3`,

b = Error code returned by plib call. Printed only if a premature EOF was detected.

If *a* = `9` or `10`,

b = OMDB key of the postmortem dump or error slot which could not be spooled.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* = 11,

b = Sequence number of the postmortem dump or error logfile "presumed to have been orphaned" that will be spooled. The contents of the logfile will be appended to one of the system logfiles (ERLOG, MEMLOG, PMLOG) and printed on the receive-only printer (ROP). The information in the logfile may be a duplication of information already spooled and likely not current.

If *a* = 12,

b = Data printed for error may be incorrect.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
There is an OMDB key of 403.

ID . . . . . REPT-RMTGETTY
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has nine formats.

[1] `REPT RMTGETTY UNABLE TO ACCESS ECD FOR` *a*

[2] `REPT RMTGETTY CANNOT READ GETTY RECORD FOR` *a*

[3] `REPT RMTGETTY UNABLE TO CHANGE DIRECTORY TO` *b*

[4] `REPT RMTGETTY FAILED TO EXECUTE` *c*

[5] `REPT RMTGETTY FAILED TO OPEN` *d*

[6] `REPT RMTGETTY CHANID FOUND IN LOGDEV RECORD`

[7] `REPT RMTGETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT`

[8] `REPT RMTGETTY UNABLE TO RETRIEVE TERMINAL OPTIONS FROM APH`

[9] `REPT RMTGETTY CANNOT READ LOGDEV RECORD FOR` *d*

2. REASON FOR OUTPUT

To inform the craftsperson that the RMTGETTY process has encountered an error while trying to process initialization information for a device. This message will appear on the originating device only.

3. VARIABLE FIELD DEFINITIONS

a = Teletypewriter (TTY) device against which the RMTGETTY is executing.

b = The directory which the RMTGETTY could not access.

c = Pathname of the process to be executed.

d = Special device file for which the problem occurred.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If Format 1 or 2 is printed, verify that the getty record in the equipment configuration database (ECD) for the indicated TTY device is correct.

If Format 3 is printed, verify that the directory indicated in the getty record exists.

If Format 4 is printed, verify that the process which could not be executed exists and is executable.

If Format 5, 6, 7, 8, or 9 is printed, or the errors persist after taking actions indicated above, seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT,MAIPR

1. FORMAT

This message has three formats.

[1] `REPT ROP` *a* {`ERROR` *b* [*c*] [`COMPL CODE` *d*] |
`UNIDENTIFIED RESPONSE WD1=`*e* `WD2=`*f*}

[2] `REPT ROP` *a* `STARTED`

[3] `REPT ROP` *a* `STOPPED`

2. REASON FOR OUTPUT

Format 1 reports a receive-only printer (ROP) related software or hardware error.

Format 2 reports that the ROP has changed state from standby (STBY) to active (ACT). A ROP will change to ACT state when DTR is ON.

Format 3 reports that the ROP has changed state from ACT to STBY. A ROP will change to STBY state when data terminal ready (DTR) is OFF.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies, in hexadecimal notation, the point within the input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

c = Character string giving more information about the error identified in *b* above. Refer to IOP Appendix F, `IOP-APPF` for additional explanation.

d = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

e = First word of an unidentified completion report.

f = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Formats 2 and 3 are informational messages and indicate that the ROP has changed states.

SEE PROPRIETARY NOTICE ON COVER PAGE

These messages are output when the currently active ROP changes state to STBY, and the currently standby ROP changes state to ACT. An active ROP will change state to STBY when powered off, and a standby ROP will change state to ACT when powered up. No action is necessary.

5. ALARMS

Format 1 has no alarm. The automatically-generated report is for information only.

Formats 2 and 3 have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `REPT RTS PORT CONNECT FAILURE`

[2] `REPT RTS CANNOT ATTACH TO ECD`

[3] `REPT RTS FAILED TO  GET UCB`

[4] `REPT RTS UNABLE TO GET UCB`

2. REASON FOR OUTPUT

To report conditions that occurred during the execution of the real-time status (RTS) report process.

3. VARIABLE FIELD DEFINITIONS

See System Error Codes Output Appendix, `SYSERR-APP`.

4. ACTION TO BE TAKEN

If Format 1 is printed, check the status of port 17 using the `OP:STATUS;PORTS` input message.

If Format 2 is printed, check the permission of the /dev/ecd file.

If Format 3 is printed, there is a software coding error, and/or a wrong record ID. Submit an operational trouble report accompanied by a printout and any additional information.

If Format 4 is printed, check for the unit by displaying page 102. Unit missing status indicates the unit for which RTS was unable to get the unit control block (UCB).

5. ALARMS

None. This automatically-generated report is for information only.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT,MAIPR

1. FORMAT

This message has four formats.

[1] `REPT SCC` *a* {`ERROR` *b* [`COMPLETED CODE` *c*] |
`UNIDENTIFIED RESPONSE WD1=`*d* `WD2=`*e*}

[2] `REPT SCC` *a* `STARTED`

[3] `REPT SCC` *a* `STOPPED`

[4] `REPT SCC` *a* `WARNING LAST LINK IN DUPLEX LINK GROUP BEING REMOVED`

2. REASON FOR OUTPUT

Format 1 reports a switching control center (SCC) related software or hardware error.

Format 2 reports that the SCC has changed state from standby (STBY) to active (ACT). An SCC will change to ACT state when the level 2 connection is established, the data link is in information transfer state, and the other SCC is not in the ACT state.

Format 3 reports that the SCC has changed state from ACT to STBY. An SCC will change to STBY state when the level 2 connection is terminated, and the level 1 connection remains established.

Format 4 reports that the last available link in a duplex link group is being removed from service.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies, in hexadecimal notation, the point within the input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

c = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

d = First word of an unidentified completion report.

e = Second word of an unidentified completion report.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Formats 2 and 3 are informational messages and indicate that the SCC has changed states. These messages are output if a problem is sensed on the active SCC. The AM will then initiate recovery on the SCC with a problem, and start the mate SCC by changing its state from STBY to ACT.

Format 4 indicates that no data transmission can take place over the link facility due to the removal of the last available link in a duplex link group. One of the links in the group should be repaired and then restored to service.

5. ALARMS

Format 1 has no alarm. The automatically-generated report is for information only.

Formats 2 and 3 have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

Format 4 has a major alarm. A major alarm may not be service affecting, but take immediate action as indicated in the report.

ID . . . . . REPT-SCSDA-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `REPT SCSDA FAULT CODE` *a* [`VIRTUAL ADDRESS` *b*]

[2] `REPT SCSDA ERROR CODE` *c* [`UNIT` *d*] [`PID` *e*] [`RID` *f*] [`FAULT CODE` *a*]

[3] `REPT SCSDA UNIDENTIFIED MESSAGE FROM` *e* `TYPE` *g*

2. REASON FOR OUTPUT

To report the occurrence of either a scanner and signal distributor (SCSD) administrator (SCSDA) related software error, or of an abnormal event.

Format 1 reports the receipt of an SCSDA fault code. (A message with supplemental data may accompany this report.)

Format 2 reports an SCSDA error.

Format 3 reports the receipt of an unrecognized message sent to the SCSDA.

3. VARIABLE FIELD DEFINITIONS

a = Fault code. See DFC Output Appendix I, `DFC-APPI`.

b = Virtual address, in hexadecimal notation, where the fault occurred within the SCSDA.

c = SCSDA error code, in hexadecimal notation. One of the following:

- `50` — SCSDA cannot process request. Unit is unknown.
- `51` — Unrecognized fault code.
- `52` — Received notification that client process has terminated. Reason for termination is unknown.
- `53` — Message overload condition exists for an SCSDA client process.
- `54` — Cannot initialize an SCSD controller (SCSDC) unit.
- `55` — SCSDA is in an improper state to process the request.

d = Unit number of SCSDC, in decimal notation.

e = Process number of SCSDA client, in decimal notation.

f = Record identification (RID) of SCSDC, in hexadecimal notation.

g = Unrecognized message type, in hexadecimal notation.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If Format 1 is output or the SCSDA error is 51, collect receive-only printer (ROP) and forward to the service support organization for all fault types.

Error type 50 is caused by either corruption of the SCSDA unit save area or the maximum number of SCSDC units that can be monitored by the SCSDA has been exceeded. Enter into the equipment configuration database (ECD) to verify that the unit is equipped and the RID was not corrupted in the memory of the SCSDA. If the RID is not corrupted and the maximum number of SCSDC units by the SCSDA has not been exceeded, regrow the SCSDC unit. In either case, report that an error has occurred to the service support organization.

For error 52, restart the terminated client process if it was not automatically restarted. If this error persists, contact the service support organization.

Error 53 indicates that an SCSDA client is no longer processing messages, or has received too many messages at one time before it can dequeue them. This error indicates that the client has exceeded the maximum number of allowable messages on its queue and returned the message to the SCSDA. In either case, the conditions result with incomplete information because these messages have been returned to the SCSDA and are not re-sent. If this error persists, take corrective action, such as restarting the client process, and contact the service support organization.

Error 54 verifies that the unit is in-service. Correct as required.

Error 55 will be corrected by the SCSDA and additional action is not required. The SCSDA will re-initialize the unit.

5. ALARMS

None. This automatically-generated report is for information only.

1. FORMAT

This message has three formats.

[1] `REPT SCSDA FAULT CODE` *a* [`VIRTUAL ADDRESS` *b*]

[2] `REPT SCSDA ERROR CODE` *c* [`UNIT` *d*] [`PID` *e* [`UID` *f*]] [`RID` *g*] [`FAULT CODE` *a*]

[3] `REPT SCSDA UNIDENTIFIED MESSAGE FROM` *e* `TYPE` *h*

2. REASON FOR OUTPUT

To report the occurrence of either a scanner and signal distributor (SCSD) administrator (SCSDA) related software error, or of an abnormal event.

Format 1 reports the receipt of an SCSDA fault code. (A message with supplemental data may accompany this report.)

Format 2 reports an SCSDA error.

Format 3 reports the receipt of an unrecognized message sent to the SCSDA.

3. VARIABLE FIELD DEFINITIONS

a = Fault code. See DFC Output Appendix I, `DFC-APPI`.

b = Virtual address, in hexadecimal notation, where the fault occurred within the SCSDA.

c = SCSDA error code, in hexadecimal notation. One of the following:

- `50` — SCSDA cannot process request. Unit is unknown.
- `51` — Unrecognized fault code.
- `52` — Received notification that client process has terminated. Reason for termination is unknown.
- `53` — Message overload condition exists for an SCSDA client process.
- `54` — Cannot initialize an SCSDC unit.
- `55` — SCSDA is in an improper state to process the request.

d = Unit number of SCSDC, in decimal notation.

e = Process number of SCSDA client, in decimal notation.

f = Utility ID number of SCSDA client, in hexadecimal notation.

g = Record identification (RID) of SCSDC, in hexadecimal notation.

SEE PROPRIETARY NOTICE ON COVER PAGE

h = Unrecognized message type, in hexadecimal notation.

4. ACTION TO BE TAKEN

If Format 1 is output or the SCSDA error is 51, collect receive-only printer (ROP) and forward to the service support organization for all fault types.

Error type 50 is caused by either corruption of the SCSDA unit save area or the maximum number of SCSDC units that can be monitored by the SCSDA has been exceeded. Enter into the equipment configuration database (ECD) to verify that the unit is equipped and the RID was not corrupted in the memory of the SCSDA. If the RID is not corrupted and the maximum number of SCSDC units by the SCSDA has not been exceeded, regrow the SCSDC unit. In either case, report that an error has occurred to the service support organization.

For error 52, restart the terminated client process if its utility identification (UID) is reported and if it was not automatically restarted. If the UID is not reported, then the process with process identification (PID) is not known to the SCSDA. The process no longer exists. If this error persists, contact the service support organization.

Error 53 indicates that an SCSDA client is no longer processing messages, or has received too many messages at one time before it can dequeue them. This error indicates that the client has exceeded the maximum number of allowable messages on its queue and returned the message to the SCSDA. In either case, the conditions result with incomplete information because these messages have been returned to the SCSDA and are not re-sent. If this error persists, take corrective action, such as restarting the client process, and contact the service support organization.

Error 54 verifies that the unit is in-service. Correct as required.

Error 55 will be corrected by the SCSDA and additional action is not required. The SCSDA will re-initialize the unit.

5. ALARMS

None. This automatically-generated report is for information only.

`UNIDENTIFIED RESPONSE WD1=`*d* `WD2=`*e*}

[2] `REPT SCSDC` *a* `FLASH RAM VERSION X'`*f*

2. REASON FOR OUTPUT

Format 1 reports a scanner and signal distributor controller (SCSDC) related software or hardware error.

Format 2 is requested by diagnostics and output prior to the update of flash RAM on the unit.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies the point, in hexadecimal notation, within the input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

c = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

d = First word of an unidentifiable completion report.

e = Second word of an unidentifiable completion report.

f = Peripheral controller flash RAM version number.

4. ACTION TO BE TAKEN

Format 1 is an error message that indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Format 2, no action is necessary unless the controller is not acting normal, or cannot be restored. Contact service organization with the flash RAM version number that was used.

5. ALARMS

None. This automatically-generated report is for information only.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT, MAIPR, SPERR

1. FORMAT

This message has four formats.

[1] `REPT SDL` *a* { `[ERROR]` *b* [*c*] `[COMPL CODE` *d*] |
`UNIDENTIFIED RESPONSE WD1=`*e* `WD2=`*f* }

[2] `REPT SDL` *a* `WARNING LAST LINK IN DUPLEX LINK GROUP BEING REMOVED`

[3] `REPT SDL` *a* `STARTED`

[4] `REPT SDL` *a* `STOPPED`

2. REASON FOR OUTPUT

Format 1 reports a synchronous data link (SDL) related software or hardware error or an unauthorized attempt to use a secure dial-up data link.

Format 2 reports that the last available link in a duplex link group is being removed from service.

Format 3 reports that the SDL has changed state from standby (STBY) to active ACT). An SDL will change to ACT state when the level 2 connection is established, and the data link is in information transfer state.

Format 4 reports that the SDL has changed state from ACT to STBY. An SDL will change to STBY state when the level 2 connection is terminated, and the level 1 connection remains established.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Can be either hexadecimal notation or a message.

The hexadecimal notation identifies the point within the input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

SEE PROPRIETARY NOTICE ON COVER PAGE

The message identifies which security check failed in an attempt to use a secure dial-up link:

```
INCORRECT PASSWORD
INCORRECT PASSWORD DESTINATION ADDRESS LENGTH
INCORRECT PASSWORD DESTINATION IDENTIFICATION
INCORRECT PASSWORD LINK IDENTIFICATION
INCORRECT PASSWORD MODIFIER
INCORRECT PASSWORD ORIGINATION ADDRESS LENGTH
INCORRECT PASSWORD ORIGINATION IDENTIFICATION
INSUFFICIENT PASSWORD INFORMATION
PASSWORD NOT REQUIRED INHIBITED
PASSWORD PACKET NOT RECEIVED
PASSWORD REQUIRED
PASSWORD TEST BIT ON
PASSWORD VALID INHIBITED
UNKNOWN PASSWORD MODIFIER 2
UNKNOWN PASSWORD MODIFIER 7
UNKNOWN PASSWORD MODIFIER 10
UNKNOWN PASSWORD MODIFIER 11
UNKNOWN PASSWORD MODIFIER 15
```

c = Character string giving more information about the error (in hexadecimal notation) identified in *b* above. Refer to IOP Appendix F, `IOP-APPF` for additional explanation.

d = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

e = First word of an unidentified completion report.

f = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

For format 1, the software or hardware error messages indicate error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Or format 1 indicates the unauthorized attempt to use a secure dial-up link message by someone who is not authorized access to the computer system through a synchronous data link. Notify the person in charge of security for the computer system.

For format 2, removal of the last available link in a duplex link group indicates that no data transmission can take place over the link facility. One of the links in the group should be repaired and then restored to service.

Formats 3 and 4 are informational messages and indicate that the SDL has changed states. No action is necessary.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

Format 1 has no alarm. The automatically-generated report is for information only.

Format 2 has a major alarm. A major alarm may not be service affecting, but take immediate action as indicated in the report.

Formats 3 and 4 have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

4. ACTION TO BE TAKEN

Format 1 is an error message that indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Formats 2 and 3, no action is necessary unless the controller and/or its subdevices are not acting normal, or cannot be restored. Contact the service organization with the code version number and/or flash RAM version number that was used.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `REPT SDLRTC` *a*

[2] `REPT SDLRTC RESTORE MESSAGE FOR` *b c* `SENT TO MIRA`

[3] `REPT SDLRTC COMPLETED RESTORE OF SDLS`

[4] `REPT SDLRTC UNABLE TO GET ECD SEGMENTS, ERRNO` *d*

2. REASON FOR OUTPUT

Format 1 reports an equipment configuration database (ECD) connection or retrieval failure.

Format 2 reports that a message was sent to maintenance input request administrator (MIRA) to restore a synchronous data link unit or a synchronous data link controller.

Format 3 reports the completion of sequencing through the ECD for restoring synchronous data link units/controllers.

Format 4 reports a failure in obtaining a database segment for the synchronous data link restore tool communications protocol handler (SDLRTC) process.

3. VARIABLE FIELD DEFINITIONS

a = Identifies which type of database failure was encountered. Includes one of the following messages:

`UNABLE TO ATTACH TO ECD`

`UNABLE TO GET ECDORG RECORD`

`UNABLE TO OPEN SEQUENCE`

`INVALID UCBRID`

```
UNABLE TO GET IOP RECORD

UNABLE TO GET SDL RECORD

UNABLE TO GET CPOPT RECORD
```

b = Unit name.

c = Unit number.

d = Error code. See System Error Codes Output Appendix, SYSERR-APP.

4. ACTION TO BE TAKEN

For Format 1, obtain technical assistance. For Formats 2 and 3, no action is required. For Format 4, check error code to determine action.

5. ALARMS

None. This automatically-generated report is for information only.

[7] `REPT SHLGETTY FAILED TO OPEN` *e*

[8] `REPT SHLGETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT`

2. REASON FOR OUTPUT

To report a failure that occurred during shlgetty process execution.

3. VARIABLE FIELD DEFINITIONS

a = Teletypewriter (TTY) device which shlgetty is executing against.

b = UNIX® RTR error code. See System Error Codes Output Appendix, `SYSERR-APP`.

c = The idir file suffix entry CFTSHL executing directory.

d = Pathname of the process which could not be executed.

e = Special device file which could not be opened.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If Format 1, 2, 3, or 4 is printed, verify that the getty and ttopt records in the equipment configuration database (ECD) for the indicated TTY device are correct.

If Format 5 is printed, check that the directory indicated in the getty record exists.

If Format 6 is printed, verify that the process which could not be created exists and is executable.

If Format 7 or 8 is printed, or the error persists after taking action indicated above, seek technical assistance.

```
REPT SIM UTILITY IDS OF PROCESSES KILLED DURING CFT INIT
 a  a  a  a  a  a  a  a
```

2. REASON FOR OUTPUT

To report the utility IDs of processes killed during a level 2 or level 3 craft initialization.

3. VARIABLE FIELD DEFINITIONS

a = Utility ID in hexadecimal of a killed process.

4. ACTION TO BE TAKEN

This message lists the utility IDs of processes killed during a craft initialization. To identify the process associated with a utility ID, execute `IOP:STATUS;PROCESS,ALL` after the recovery of the craft interface. If some processes were not restarted after a craft initialization, refer to Table 4-7 in the *UNIX® RTR Operating System Software Troubleshooting Guide* for the utility IDs to specific processes.

5. ALARMS

None.

MESSAGE CLASS . . SIM

1. FORMAT

`REPT SIMCHK` *a* [*b*]

2. REASON FOR OUTPUT

To report error conditions that occurred while executing the system integrity monitor (SIM).

3. VARIABLE FIELD DEFINITIONS

a = System integrity error code. Code numbers labeled with an "*" indicate conditions that may result in a system initialization phase unless software checks are inhibited.

*1	system initialization failure
2	system initialization status message received with unknown process number
*12	unexpected fault received by SIM
101	audit control subsystem initialization failure
102	audit record initialization error
103	The system integrity output formatter (SIOF) program is not running. Some output messages were lost.
104	Routine audit scheduling was not allowed
121	failure to get an audit record from the equipment configuration database (ECD) using its record ID (RID)
122	failure to update an audit record in the ECD
123	failure to open a keyed sequence of audit records in the ECD
124	failure to get a record in a sequence of audit records
125	failure to get an audit record using the audit name and member number
126	failure to read the SIM control record
127	failure to update the SIM control record
128	failure to open a sequence of audit instance records in the ECD
129	failure to get a record in a sequence of audit instance records
130	failure to get an audit instance record using its RID
131	failure to update an audit instance record in the ECD
132	failure to get an audit instance record using its instance name and the RID of the associated audit record
141	audit marked active in its ECD record when it is not running

SEE PROPRIETARY NOTICE ON COVER PAGE

142 invalid message received from the process manager or the utility manager regarding an audit process
143 audit reply received from an inactive audit
144 timeout occurred for an inactive audit
145 invalid reply received from an active audit
146 system integrity output formatter (SIOF) output buffer overflow; some audit output messages were lost
147 failure to find one and only one audit process for the specified utility ID
148 audit error report received from an inactive audit
149 invalid request to inform an audit process when the audit's ECD record is modified
150 invalid request to run or stop an audit
151 audit blocking condition cleared because it was invalid
152 failure to create a transient audit process
153 unable to take recovery action for an audit failure
154 audit inhibited by SIM because it could not be run, timed out, died or was faulted while correcting errors
155 routine audit scheduling malfunctioned and is being reinitialized. All routine audits are temporarily inhibited.
156 failure to reinitialize routine audit scheduling after it had malfunctioned
157 routine audit scheduling has been temporarily inhibited because SIOF is not running
158 failure to reinitialize routine audit scheduling after SIOF stopped running
159 unknown error category in an error report from an audit process
161 audit system reinitializing due to error found in kernel level audit scheduling
162 audit system reinitializing due to error found for a kernel level audit timeout
163 audit system reinitializing due to error found for a routine supv-level audit timeout
164 audit system reinitializing due to error found for a requested supv-level audit timeout
165 audit system reinitializing because SIM received a reply from an inactive audit
166 audit system reinitializing because SIM received a timeout for a non-running audit
167 audit system reinitializing because SIM received a raw data report from an inactive audit
168 audit system reinitializing because SIM received an unexpected fault
169 audit system reinitializing because SIM found eligible audits not dispatched
181 failure to access an audit record in the plant measurements database

SEE PROPRIETARY NOTICE ON COVER PAGE

182	failure to create an audit record in the plant measurements database
183	failure to open the plan measurements database
190	audit has taken too much time to execute
*200	failure of the application integrity monitor (AIM) process to reset the application sanity timer within the timeout interval
201	failure to activate or de-activate the application sanity timer
202	AIM was not connected to port PT_AIM when a PHASE 0 was requested
203	failure to change craft initialization inhibit status
206	AIM not connected to port PT_AIM for reception of overload faults
207	AIM not connected to port PT_AIM for soft-switch request
208	AIM not connected to port PT_AIM for notification of CU switch completion
209	faulty AIM port during craft initialization
210	faulty IOP port during craft initialization
211	AIM not connected to port PT_AIM for notification of completion of diverge request
212	AIM not connected to port PT_AIM for converge request
213	AIM not connected to port PT_AIM for notification of completion of converge request
300	unrecognized acknowledgement message received by SIM
301	unrecognized USRACK message received by SIM
306	message with invalid type received by SIM
307	unrecognized MSFAULT message received by SIM
310	unrecognized operating system trap (OST) entry received by SIM
401	failure to respond to a request from another process for information about the most recent system initialization
602	overload status change
605	kernel-level overload monitor process failed to initialize
606	supervisor-level overload monitor process failed to initialize

b = Up to three words of optional hexadecimal data, associated with specific error conditions.

Optional Hexadecimal Data

Error	Code Hexadecimal Data

1 Boot progress indicators, from left to right (hexadecimal digit 0 to hexadecimal digit 7):

Hex Digit	Process
0	File manager.
1	Disk driver.
2	Process manager.
3	Error interrupt handler.
4	Capability manager.
5	Scheduler.
6	Utility manager.
7	Memory manager.

If a boot process indicator message is received from a kernel process, the appropriate hexadecimal digit is set to 1; otherwise, the hexadecimal digit remains at 0.

2 Process number of process sending the message (ms_from).

12 Fault code, followed by the virtual address within SIM at which the fault occurred.

102 ECD RID of the audit record that was not initialized.

121 RID used in attempt to get an audit record from the ECD.

122 RID used in attempt to update an audit record in the ECD.

126 RID of the SIM control record (as specified in the ECDORG record).

127 RID of the SIM control record (as specified in the ECDORG record).

128 If not zero, the RID of the audit record for which a sequence of instance records could not be opened.

SEE PROPRIETARY NOTICE ON COVER PAGE

Optional Hexadecimal Data *(continued)*

Error	Code Hexadecimal Data
130	RID used in attempt to get an audit instance record from the ECD.
131	RID used in attempt to update an audit instance record in the ECD.
132	RID of the audit record for which an associated instance record could not be gotten from the ECD.
141	RID of the audit record in error.
142	RID returned in the message (ms_ident).
143	RID of the audit record, as specified in the reply.
144	RID of the audit record, as specified in the timeout identification.
145	RID of the audit record, as specified in the reply.
147	Utility ID (pcode) of the process, as specified in the audit record.
148	RID of the audit record, as specified in the error report.
149	RID of the audit record, as specified in the request, followed by the process number from which the request was received.
150	RID of the audit record, as specified in the request.
151	RID of the audit instance record process number of the blocking process, and the elapsed time in milliseconds since the audit instance was blocked.
152	RID of the audit record for which the audit process was not created.
153	RID of the recovery audit that could not be run.

SEE PROPRIETARY NOTICE ON COVER PAGE

Optional Hexadecimal Data *(continued)*

Error	Code Hexadecimal Data
154	RID of the audit that was inhibited.
159	RID of the audit whose error was reported.
300	Message identity (ms_ident).
306	Message type (ms_type).
307	The fault code specified in the message.
310	The invalid operating system trap (OST) number, followed by the process number of the calling process.
602	Overload fault code: A9 — Kernel process memory overflow. Swappable main memory is at minimum size. AC — Message buffer overload cleared. AD — Message buffer 70% full. AE — Message buffer 90% full. 81 — Spooler output process overload cleared. 82 — Spooler output process overload. 85 — Data link input buffer overload cleared. 86 — Data link input buffer overload. 87 — Data link output buffer overload 88 — Data link output buffer

Optional Hexadecimal Data *(continued)*

Error Code	Hexadecimal Data

8B — IOP overload cleared.

8C — IOP command queue overloaded.

8D — An IOP was bootstrapped due to overload.

8F — Overload cleared on one disk file controller (DFC).

90 — A DFC is overloaded.

91 — File manager overload cleared.

92 — File manager overloaded.

95 — Supervisor / user level lockout cleared.

96 — Supervisor / user level process lockout.

97 — Timed entry overload cleared.

98 — Kernel process timed entries slow.

99 — Kernel level lockout cleared.

9A — Kernel level process lockout.

9C — Module 1 memory allocation reduced to 60%.

9D — Module 1 memory at 80% allocated (only for generics with EMM feature).

9E — Insufficient memory available to grant a memory allocation (module 1) (only for generics with EMM feature).

9F — DCT table overload cleared.

SEE PROPRIETARY NOTICE ON COVER PAGE

Optional Hexadecimal Data *(continued)*

Error Code	Hexadecimal Data

A0 — DCT table 70% full. For R6.3 and later, the DCT table is 85% full.

A1 — Dispatcher control table overflow.

A2 — SDE table overload cleared.

A3 — SDE table nearly full.

A4 — Segment descriptor table overflow.

A5 — Disk swap space overload cleared.

A6 — Disk swap space 80% full.

A7 — Memory overload cleared.

A8 — Kernel process memory has grown to within 1/4 megabyte of its maximum size. This has reduced the size of swappable memory to within 1/4 megabyte of its minimum size.

A9 — Kernel process memory overflow. Swappable main memory is at minimum size.

AC — Message buffer overload cleared.

AD — Message buffer 70% full.

AE — Message buffer 90% full.

4. ACTION TO BE TAKEN

For audit system initialization failures (error codes 101, 103, 104, 126, 127, 156, 158 and 183), seek technical assistance.

If the data printed with the output message includes an audit or instance RID, the audit name, member number and instance name associated with the RID may be found by using the OP:AUD input message with the ALL option. If the specified RID is not listed in the OP-AUD output message, the RID is invalid. If the error message is associated with a valid record, then an AUD output message may have been printed for the audit. If the audit aborted, the abort code printed in the output message will help in analyzing the failure.

For error code 141, use the STOP:AUD or STP:AUD input message to clear the audit record.

For error code 146, use the OP:STATUS;PROCESS input message to determine whether or not the SIOF program is running. The file name of SIOF is /etc/siof. If it is running, no further action is required. If it is not running, seek technical assistance to determine the cause of the problem and what additional action needs to be taken.

For failures that involve an audit process (error codes 147, 152, and 154), verify that a valid process file exists for that audit. For transient audits, the process file should be stored in directory /audprc and its file name should be listed in the audit's ECD record. Use the RCV:MENU;RCV3B input message to read the record. For quasi-killable audits, the process may be identified from its utility ID number (which is listed in the audit's ECD record), using Practice 254-301-815.

For error code 154, use the STOP:EXC;ANY or STP:EXC;ANY input message to terminate the audit process (if it is still running and is quasi-killable or transient). Then attempt to run the audit manually by using the AUD input command. If the problem does not recur, then use ALW:AUD to allow the audit.

For error code 159, use OP:AUD to identify the audit causing the problem. This error is due to a missing auderr form.

For error code 190, use OP:AUD to identify the audit causing the problem. There are two possible reasons for the audit taking too much time to execute: the audit may be incorrectly reporting actual time instead of CPU time or the audit may need to be broken down into several audits. Unless corrected, supervisor audit scheduling could be adversely affected resulting in the irregular scheduling of lower frequency level supervisor audits. A maximum of nine of these output messages will be printed in one 24-hour period of time.

A history of audit activity may be found in the most recent plant measurements report (REPT-OP,PMCR output message).

Additional information about the audit control subsystem may be found in the *System Maintenance Manual*.

If an overload monitor process failed to initialize (error codes 605 and 606), it may be executed manually with the EXC:ENVIR;PROC input message. The file names of these processes are /prc/klmon (kernel-level monitor) and /prc/supvprc (supervisor-level monitor).

5. ALARMS

This automatically-generated report is for information only. Action may or may not be required.

If a minor alarm occurs, take action as indicated in the report.

2. REASON FOR OUTPUT

Microcode has detected a segment index too large for the segment being accessed.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Faulted control unit (CU) number.

c = Time in form `mm/dd/yy hh:mm:ss`.

d = The program address at the time of initialization (in hexadecimal). For software requested initializations this is the address of the PHASE OST and NOT the address where the problem was detected.

e = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode, i.e., kernel mode, kernel process, supervisor process, or user process. See *System Maintenance Manual*, Appendix P.

f = The contents of the primary segment base register (in hexadecimal).

g = The contents of the secondary segment base register (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

h = The contents of the sixteen general purpose registers (in hexadecimal).

R9: argument pointer
RA: frame pointer
RB: stack pointer

i = Process utility id (in hexadecimal). See *System Maintenance Manual*, Process / Problem Table.

j = Process number (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Save the ERLOG output, note the UID of the process that was reported and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

5. ALARMS

None.

ID . . . . . REPT-SIOF,ERROR
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . AUDL

1. FORMAT

This message has 18 formats.

[1] `REPT SIOF ERROR - CANNOT OPEN INPUT FILE` *a*

[2] `REPT SIOF ERROR - CANNOT OPEN OUTPUT FILE` *a*

[3] `REPT SIOF ERROR - SIZEOF (`*b*`) NOT FACTOR OF PASSED SIZE`

[4] `REPT SIOF ERROR - CANNOT ADD SEGNUM X'`*c* `CODE` *d*

[5] `REPT SIOF ERROR - CANNOT SET VIRTUAL ADDRESS SEGNUM X'`*c*
`CODE` *d*

[6] `REPT SIOF ERROR - UNABLE TO ADD SEGMENT ID X'`*c* `CODE` *d*

[7] `REPT SIOF ERROR - INVALID SEG ID STAMP X'`*f*
`SEGID X'`*c* `PID X'`*g*

[8] `REPT SIOF ERROR - UNABLE TO FREE SEGMENT X'`*h*

[9] `REPT SIOF ERROR - UNABLE TO FIND AVAILABLE SEGMENT INDEX`

[10] `REPT SIOF ERROR - INVALID FORMAT TYPE X'`*i*

[11] `REPT SIOF ERROR - INVALID OUTPUT FORMAT TYPE X'`*j*

[12] `REPT SIOF ERROR - TOO MANY BLOCKS (`*k*`) RETURNED BY SIM`

[13] `REPT SIOF ERROR - INVALID ALARM LEVEL X'`*l* `SUBSTITUTING ' '`

[14] `REPT SIOF ERROR - INVALID SUPPLEMENTARY DATA`
`SEG_SIZE X'`*m* `OFFSET X'`*n*
`SSIZE X'`*o* `SFLAGS X'`*p*

[15] `REPT SIOF ERROR - INVALID SUPPLEMENTARY DATA FORMAT X'`*q*

[16] `REPT SIOF ERROR - CANNOT READ FILE` *a*

[17] `REPT SIOF ERROR - CANNOT WRITE FILE` *a*

SEE PROPRIETARY NOTICE ON COVER PAGE

2. REASON FOR OUTPUT

Format 1 indicates SIOF cannot open input file.

Format 2 indicates SIOF cannot open output file.

Format 3 indicates size of supplementary data block passed to SIOF is not an integral multiple of the structure to be formatted.

Format 4 indicates SIOF cannot add the segment containing the supplementary data to its address space.

Format 5 indicates SIOF cannot set the access permission modes on the segment virtual address.

Format 6 indicates SIOF cannot add segment ID to the process segment list.

Format 7 indicates the segment identity stamp does not match the audit supplementary data segment identity stamp.

Format 8 indicates SIOF cannot free the supplementary data segment.

Format 9 indicates SIOF cannot get a segment index in the segment list.

Format 10 indicates that SIOF does not recognize the supplementary data type.

Format 11 indicates that SIOF does not recognize the format type of the output message.

Format 12 indicates that the maximum number of the message which can be passed at one time from SIM to SIOF has been exceeded.

Format 13 indicates that an invalid alarm level has been specified for the audit report, and hence a space will be substituted.

Format 14 indicates that the supplementary data segment sent to SIOF is invalid.

Format 15 indicates that SIOF does not recognize the supplementary data format type.

Format 16 indicates that SIOF is unable to read the OMDB key from file.

Format 17 indicates that SIOF is unable to write first line of audit error report.

3. VARIABLE FIELD DEFINITIONS

a = Pathname of the file.

b = Name of the structure to be formatted.

c = Value of the segment ID.

d = Function return code.

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Memory module identifier.

f = Segment name identifier.

g = Process ID.

h = Segment index.

i = Invalid supplementary data format type passed to SIOF in a suptype field from audit process.

j = Invalid output format type passed to SIOF by SIM.

k = Number of blocks.

l = Alarm level.

m = Size of supplementary data segment.

n = Starting point in supplementary data segment of data.

o = Amount of supplementary data to be processed.

p = Location of status switch in supplementary data format.

r = Invalid supplementary data format passed to SIOF in a format field from audit process.

4. ACTION TO BE TAKEN

For all formats, send a copy of the message, including the previous page and the subsequent page, to the field support center. No corrective action by the user is possible.

5. ALARMS

This is a variable alarm to be supplied by the client.

Practice 254-341-120 *Interface and Integrity Facility*
DMERT/UNIX® RTR Operating System
Lucent Technologies 3B20D Computer

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . REPT-SOP
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . VAR

1. FORMAT

This message has four formats.

[1] `REPT SOP` *a* `OUTPUT MESSAGES DISCARDED FOR` *b*

[2] `REPT SOP DELETING OLDER HALF OF` *c*

[3] `REPT SOP INVALID OUTPUT REQUEST` *d e*
`Uid:` *f* `Logfile:` *c*
`Logflimit:` *g* `Request size:` *h*

[4] `REPT SOP CANNOT OPEN SCC CHANNEL`

2. REASON FOR OUTPUT

To report a spooler output process (SOP) related error or warning.

Format 1 indicates message loss because of spooler queue overflow for a particular device.

Format 2 indicates the log file became full and the older half of the log file has been deleted to allow for the storage of newly generated messages.

Format 3 indicates that an output report to be written to the named log file is larger than the maximum size of the log file.

Format 4 indicates a failure to open the output device that is associated with the switching control center (SCC).

3. VARIABLE FIELD DEFINITIONS

a = Number of output messages discarded due to spooler queue overflow.

b = Name of device.

c = Name of log file.

d = Character string "OMDB KEY" or null.

e = OMDB key number of the output report or null.

f = UID of the process requesting the output report.

h = Maximum size of the log file.

SEE PROPRIETARY NOTICE ON COVER PAGE

i = Size of the requested output report.

4. ACTION TO BE TAKEN

For Format 1, if spooler queue overflow occurs repeatedly for the same device during normal operations, seek technical assistance. Otherwise, it may be necessary to increase the queue size for that device. Use the recent change and verify (RC/V) system to modify the "maxq" field of the "device" record for the device.

For Format 2, take no action.

For Format 3, use RC/V to increase the logflimit field in the device form for the named log file.

For Format 4, use RC/V to examine the ECD logdev record for the device and verify that the channel ID is specified correctly.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

For a minor alarm, take action as indicated in the report.

6. REFERENCES

OMDB Keys
Format 2 has an OMDB key of 12.
Format 3 has an OMDB key of 715.
Format 4 has an OMDB key of 517.

Input Messages

ID . . . . . REPT-SPL,SYN
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT SPL SYNTAX ERROR` *a b*

2. REASON FOR OUTPUT

To report that an incorrectly formatted message was passed to the spoolf() function in the craft library.

3. VARIABLE FIELD DEFINITIONS

a = Error code specifying the error condition detected:

`0` — first $ in user control string missing
`-1` — teletypewriter (TTY) field too big (greater than eight characters)
`-2` — TTY size is maximum and first byte is not '-' (minus), or the contents of the string is a minus sign only
`-3` — NULL TTY is specified with no spooler options
`-4` — class not decimal
`-6` — class field too big (greater than 255)
`-7` — missing both TTY field and class field
`-8` — paction field was not 0 or two characters long
`-9` — timestamp type field too big (greater than one character)
`-10` — timestamp type field invalid
The timestamp type must be f (full time stamp), b (basic time stamp), or n (no time stamp).
`-11` — priority field not decimal
`-12` — priority field too big (greater than one character)
`-13` — priority value greater than seven (highest priority)
`-14` — ident field too big (greater than four characters)
`-15` — ident field not decimal
`-16` — type field too big (greater than four characters)
`-17` — type field not decimal
`-19` — user file does not exist or cannot be read
`-20` — user PID too big (greater than eight characters)
`-21` — user PID not decimal
`-22` — last $ in user control string missing
`-23` — invalid paction
`-24` — process number does not correspond to existing process
`-25` — send message to csop failed
`-26` — message is truncated by sendpw
`-27` — user file does not have full pathname

SEE PROPRIETARY NOTICE ON COVER PAGE

b = Control string and text of message containing error.

4. ACTION TO BE TAKEN

Submit an operational trouble report with a printout of the REPT-SPL message.

5. ALARMS

None.

6. REFERENCES

None.

ID . . . . . REPT-SYSTEM
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
REPT SYSTEM IS IN MINIMUM CONFIGURATION MODE
```

2. REASON FOR OUTPUT

To remind the operator that the system is running in the minimum configuration mode.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

Minimum configuration mode should only be used in extreme cases where the system will not stay up with the application running. It should only be used to diagnose or troubleshoot a system which will not recover by any other means, such as forcing configuration, inhibit options, or bootstrap options. Application software will not be started in the minimum configuration mode.

To return to full configuration mode, clear the MIN-CONFIG request on the emergency action page (EAI) of the maintenance terminal with an EAI command 33, then bootstrap the system with an EAI command 54.

5. ALARMS

Minor alarm. Take action as indicated in the report.

6. REFERENCES

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . TIME

1. FORMAT

`REPT TIME` *aa/bb/cc dd/ee/ff*

2. REASON FOR OUTPUT

To report the system time. This is performed by the real-time status (RTS) report process every hour on the hour.

3. VARIABLE FIELD DEFINITIONS

a = Month (01-12).

b = Day (01-31).

c = Year (00-99).

d = Hour (00-23).

e = Minute (00-59).

f = Second (00-59).

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Key
There is an OMDB key of 309.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`REPT TLP ERROR` *a* [`PACK =` *b*] [`ERRNO =` *c*]

2. REASON FOR OUTPUT

To report an error condition in the trouble locating procedure (TLP) user process.

3. VARIABLE FIELD DEFINITIONS

a = Error condition:

- `1` — open equipment configuration database (ECD) failure
- `2` — close ECD failure
- `3` — ugucbn failure
- `4` — moving head disk (MHD) drive type not specified
- `5` — bad entry in pack location file
- `6` — pack location function failed

b = Circuit pack number obtained from trouble location database.

c = Error code returned by the failing functional call. See System Error Codes Output Appendix, `SYSERR-APP`.

4. ACTION TO BE TAKEN

If *a* = `1-4` an operating system function call is failing, seek technical assistance to clear the trouble.

If *a* = `5`, verify circuit pack number exists in unit's pack location file and verify that the index in the pack location file for the circuit pack number is valid. There is one pack location file for each unit in the directory `/diag/datatbl/tlp/misc`. The files are named:

```
p.cu.0_10
p.dfc.21_22
p.duic.28_30
p.iop.20_21
p.mhd.22_23
p.mtc.24_25
p.mttyc.27_28
p.scsdc.25_26
p.sdlc.28_29
p.ttyc.23_24
```

SEE PROPRIETARY NOTICE ON COVER PAGE

If the entry is correct, seek technical assistance.

If *a* = 6, verify that the model, mv, hv, and equipage values in the unit(s) unit control block (UCB) are correct, using recent change and verify (RC/V). If UCB(s) are correct, seek technical assistance.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

ID . . . . . REPT-TS,MCASE
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . None

1. FORMAT

```
REPT TS-MCASE CHANNEL ADDRESS SEQUENCING ERROR X'a
ONLINE CU: b
FAULTY UNIT: c d
TIME OF ERROR: e
HARDWARE STATUS REGISTER:   ffffffff
REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

More that one input/output pulse point was active in the command to the channel.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in form `mm/dd/yy hh:mm:ss`.

f = Hardware status register (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Run diagnostics on the processor encountering the fault.

5. ALARMS

None.

ONLINE CU: b
FAULTY UNIT: c d
TIME OF ERROR: e
HARDWARE STATUS REGISTER:    ffffffff
REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

More than one channel responded to an input/output address.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in form `mm/dd/yy hh:mm:ss`.

f = Contents of the hardware status register (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Run diagnostics on the processor encountering the fault.

ID . . . . . REPT-TTY
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT, MAIPR

1. FORMAT

This message has three formats.

[1] `REPT TTY` *a* {`ERROR` *b* [*c*] [`COMPLETED CODE` *d*] |
`UNIDENTIFIED RESPONSE WD1=`*e* `WD2=`*f*}

[2] `REPT TTY` *a* `STARTED`

[3] `REPT TTY` *a* `STOPPED`

2. REASON FOR OUTPUT

Format 1 reports a teletypewriter (TTY) related software or hardware error.

Format 2 reports that the TTY has changed state from standby (STBY) to active (ACT). A TTY will change to ACT state when data terminal ready (DTR) is ON.

Format 3 reports that the TTY has changed state from ACT to STBY. A TTY will change to STBY state when DTR is OFF.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies, in hexadecimal notation, the point within the input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

c = Character string giving more information about the error identified in *b* above. Refer to IOP Appendix F, `IOP-APPF` for additional explanation.

d = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

e = First word of an unidentified completion report.

f = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Formats 2 and 3 are informational messages and indicate that the TTY has changed states.

SEE PROPRIETARY NOTICE ON COVER PAGE

An active TTY will change state to STBY when powered off, and a standby TTY will change state to ACT when powered up. No action is necessary.

5. ALARMS

Format 1 has no alarm. The automatically-generated report is for information only.

Formats 2 and 3 have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . REPT-TTYC
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

[1] `REPT TTYC` *a* {`ERROR` *b* `[COMPLETED CODE` *c*`]` |
`UNIDENTIFIED RESPONSE WD1=`*d* `WD2=`*e*}

[2] `REPT TTYC` *a* `CODE VERSION X'`*f*

[3] `REPT TTYC` *a* `FLASH RAM VERSION X'`*g*

2. REASON FOR OUTPUT

Format 1 reports a teletypewriter controller (TTYC) related software or hardware error.

Format 2 is output during the restoration of the unit.

Format 3 is requested by diagnostics and output prior to the update of flash RAM on the unit.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies the point, in hexadecimal notation, within the input/output driver (IODRV) where a software or hardware error was detected. See output IOP Appendix F, `IOP-APPF`.

c = Hardware error type, in hexadecimal notation. See output IOP Appendix A, `IOP-APPA`.

d = First word of an unidentifiable completion report.

e = Second word of an unidentifiable completion report.

f = Peripheral controller pump code version number.

g = Peripheral controller flash RAM version number.

4. ACTION TO BE TAKEN

Format 1 is an error message that indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Formats 2 and 3, no action is necessary unless the controller and/or its subdevices are not acting normal, or cannot be restored. Contact the service organization with the code version number and/or flash RAM version number that was used.

[18] `REPT ULARP CHILD FOUND DEAD WITHOUT ACCOMPANYING SIGNAL` *a b*

[19] `REPT ULARP CHILD EXEC ABORTED DUE TO DIOP` *a*

SEE PROPRIETARY NOTICE ON COVER PAGE

2. REASON FOR OUTPUT

To report error information or actions as the result of ULARP child process or run command execution.

3. VARIABLE FIELD DEFINITIONS

a = Record name.

b = Terminated process ID.

4. ACTION TO BE TAKEN

If Formats 4 or 11 through 14 are printed, no action is required.

If Formats 1, 2, or 15 are printed, database access problems are indicated. Contact your technical assistance organization.

If Format 9 is printed, use the `OP:LOG` input message to read the logfile ULARP and find the error report with the same record ID number. Using the record name from the `OP:LOG` output message, get the equipment configuration database (ECD) record with recent change and verify (RC/V). First make sure the record contains correct information. Then check that a file exists with the pathname that is in the record, and that is is executable. If the file does not exist, copy in a correct version.

If a large number of processor recovery message (PRM)s with this step number and function code are printed, then the UNIX® shell may not be working. Check for the existence of the file `/bin/sh`. If it exists, it should have 755 permissions. If the file does not exist, copy in a correct version. If the reason for the command failure is not apparent, contact you technical assistance center.

Once the cause of the problem has been solved, enter the `INIT:ULARP` input message. This will cause ULARP to re-execute the run command(s) that failed.

If Format 3 is printed, enter an `INIT:ULARP` input message. If the error is repeated, contact your technical assistance center.

If Formats 5, 16, or 17 are printed, use the `OP:LOG` input message to read the logfile ULARP and find the error report with the same utility ID number. Using the record name from the `OP:LOG` output message, get the ECD record with RC/V. First make sure the record contains correct information. Then check that a file exists with the pathname that is in the record, and that is is executable. If the file does not exist, copy in a correct version. Once the cause of the problem has been solved, enter the `INIT:ULARP` input message. This will cause ULARP to re-execute the process(es) that failed.

If Formats 6 or 10 are printed, use the `OP:LOG` input message to read the logfile `ULARPLOG` and find the error report with the same utility ID. Using the record name from the OP LOG output message, get the ECD record with RC/V. Make sure the record contains correct information, because there could be something wrong with the parameters passed to the process. If the reason for the process failure is not apparent, contact you technical assistance center. After the problem has been resolved, enter the `INIT:ULARP` input message to re-execute the process.

SEE PROPRIETARY NOTICE ON COVER PAGE

If Format 7 is printed, use the OP:LOG input message to read the logfile ULARPLOG and find the error report with the same record ID number. Using the record name from the OP:LOG output message, get the ECD record with RC/V. First make sure that the record contains the correct information. Then check that a file exists with the pathname that is in the record, and that it is executable. If the file does not exist, copy in a correct version. After the information in the database record has been corrected, the process may be started by entering the INIT:ULARP input message.

If Format 8 is printed, use RC/V to examine the ULARP records in the full configuration ECD. For each ULARP child process, check that a file exists, and that it is executable. After replacing the erroneous files or repairing the ECD records, reboot in full configuration. If that procedure is not successful, bootstrap on backup root, and follow normal procedures for restoring the primary root file system.

If Format 18 is printed, no action is required. ULARP has discovered a child that has died but it failed to receive the death of child signal. Ularp is now restarting the process.

If Format 19 is printed, no action is required. A child of ULARP died while the system was in disk-independent operation and no execution was attempted for the child.

5. ALARMS

This automatically-generated report is for information only. Action may or may not be required.

ID . . . . . REPT-UNIX,INIT
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT,VAR

1. FORMAT

This message has three formats.

[1] `REPT UNIX INIT ERRNO` *a* `CHANID` *b* [*c*]

[2] `REPT UNIX INIT CANNOT MOUNT` *d* `ERRNO` *f*

[3] `REPT UNIX INIT CANNOT MOUNT` *d* `READ ONLY MOUNTING` *e* `ERRNO` *f*

2. REASON FOR OUTPUT

To report a UNIX® `init` process-related error.

Format 1 indicates the process is failing to bring up a terminal. The device name will not be present if the process is failing before it has learned the name from the equipment configuration database (ECD).

Format 2 indicates the process is failing to mount a file system.

Format 3 indicates the process is failing to mount a file system in a read-only mode, and is now attempting to mount the primary/backup file system.

3. VARIABLE FIELD DEFINITIONS

a = Errors associated with the UNIX® init process:

- `0x11` — Init could not add the ECD segments to its address space.
- `0x12` — Init could not attach to the ECD.
- `0x13` — Init could not read the ECD org record.
- `0x21` — Init could not read the unit control block (UCB) record for the maintenance teletypewriter (MTTY).
- `0x22` — Init could not read the ciopt record for the emergency action interface (EAI).
- `0x23` — Init could not read the eaopt record for the EAI.
- `0x31` — Init could not set up a cursor to step through the records in the ECD.
- `0x32` — Init could not get a database record.
- `0x33` — Init was passed a bad channel ID.
- `0x41` — Init could not read the mdct record for the device.
- `0x42` — Init could not read the getty record for the device.
- `0x43` — Init could not read the UCB record for the device.
- `0x44` — Init could not read the ciopt record for the device.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0x45` — Init could not read the ttopt record for the device.
`0x46` — The device type in the mdct record for the device is bad.
`0x47` — The transmission speed in the ttopt record for the device is bad.
`0x51` — Init could not start ULARP.
`0x52` — Init could not start the appropriate getty.
`0x53` — Init could not open the device file.

b = The channel ID sent to the INIT process.

c = The name of the device. INIT will print this only if it has found a logdev record for the channel ID.

d = The name of the file system.

e = The name of the primary/backup file system.

f = System error number. See System Error Codes Output Appendix, SYSERR-APP.

4. ACTION TO BE TAKEN

For Format 1, if error code `0x11, 0x12, 0x31,` or `0x32` is printed, seek technical assistance. If error code `x13, 0x21, 0x22-0x33,` or `0x41-0x47` is printed, check the appropriate record(s) in the ECD. If error code `0x51` or `0x52` is printed, check the appropriate process to make sure that it exists and is executable. If error code `0x53` is printed, create the appropriate device file.

For Format 2, seek technical assistance.

5. ALARMS

None. This automatically-generated report is for information only.

Critical alarm. Take immediate action as indicated in the report. Seek technical assistance if needed.

6. REFERENCES

UTILITY ID: lllllll              PROCESS NUMBER: mmmmmmmm

REAL TIME CLOCK: zzzzzzzz
```

2. REASON FOR OUTPUT

Microcode has determined that a virtual address is not mappable in a processed address space.

3. VARIABLE FIELD DEFINITIONS

a = The sequence number of the report (in hexadecimal).

b = Active control unit (CU) number.

c = Unit name.

d = Member number.

e = Time in form `mm/dd/yy hh:mm:ss`.

g = The program address at the time of error interrupt (in hexadecimal). For software requested initializations this is the address of the PHASE OST and NOT the address where the problem was detected.

h = The processor status word (in hexadecimal). Among the information it contains are the execution level and the processor mode, i.e., kernel mode, kernel process, supervisor process, or user process. See *System Maintenance Manual*, Appendix P.

i = The contents of the primary segment base register (in hexadecimal).

SEE PROPRIETARY NOTICE ON COVER PAGE

j = The contents of the secondary segment base register (in hexadecimal).

k = The contents of the sixteen general purpose registers (in hexadecimal).

R9: argument pointer
RA: frame pointer
RB: stack pointer

l = Process utility ID (in hexadecimal). See *System Maintenance Manual*, Process / Problem Table.

m = Process number (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

4. ACTION TO BE TAKEN

Save the ERLOG output, note the UID of the process that was reported and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

5. ALARMS

None.

ID . . . . . RFT-FDUMP
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

a
`RFT FDUMP COMPLETED`

2. REASON FOR OUTPUT

To report the completion of executing a `RFT:FDUMP` input message to dump the contents of a file.

3. VARIABLE FIELD DEFINITIONS

a = Contents of the file output only to the devices in message class maintenance.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message
`RFT:FDUMP`

ID . . . . . RMV-CU
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`RMV CU` *a* [*b*][*c*]

2. REASON FOR OUTPUT

To report the result of executing a `RMV:CU` input message to remove a control unit (CU) from service.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Termination status:

`ABORTED` — Remove abnormally terminated due to a system error or a fault in the remove process.
`COMPLETED` — CU removed. If the CU was removed already, `COMPLETED` will still print because the remove process was run to initialize the CU.
`STOPPED` — Removal denied by the system or stopped manually.

If *b* = `STOPPED`,

c = Reason the remove was stopped.

`1` — Invalid unit name. Only the CU can be removed.
`5` — Removal denied by system.
`6` — Remove manually stopped.

4. ACTION TO BE TAKEN

If the remove was denied by the system, try switching CUs. If the result is `ABORTED`, determine what is wrong with the system. Interpret the `REPT-CURSTRMV,FAULT` output message if one occurred.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . RMV-DCI
GENERIC . . . . . UNIX RTR R21.3, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT, MAIPR

1. FORMAT

This message has six formats.

[1] `RMV DCI` *a* `COMPLETED`

[2] `RMV DCI` *a* `ABORTED` [*b*] [*c*]

[3] `RMV DCI` *a* `STOPPED` *d*

[4] `RMV DCI` *a* `TASK` *e* `MSG STARTED`

[5] `RMV DCI` *a* `STOPPED MESSAGE IN PROGRESS`

[6] `RMV DCI` *a* `STOPPED MESSAGE COMPLETE`

2. REASON FOR OUTPUT

These messages report the disposition of a request to remove a dual serial channel/computer interconnect (DCI) from service.

Format 1 reports that the removal attempt was successful.

Formats 2 and 3 report that the removal has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error:

`X'1` — Remove process error.
`X'2` — Driver error.
`[NULL]` — Remove denied by driver or configuration control (CONFIG).

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Error code:

For remove process error (*b* = X'1), see output DCI Appendix F, DCI-APPF.
For driver error (*b* = X'2), see output DCI Appendix A, DCI-APPA.

d = Error code. See output DCI Appendix G, DCI-APPG.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

The pudrv subsystem generated messages have no alarm; the automatically-generated report is for information only.

The cft subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

The diag subsystem generated messages have automatically generated alarms; action may or may not be required.

6. REFERENCES

OMDB Keys
When the message is generated by the pudrv subsystem, the OMDB key is 195 or 196.
When the message is generated by the cft subsystem, the OMDB key is 308.
When the message is generated by the diag subsystem, the OMDB key is 96.

Output Appendix(es)

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . RMV-DFC
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`RMV DFC` *a b* [*c*][*d*]

2. REASON FOR OUTPUT

To report the disposition of a request to remove a disk file controller (DFC) from service. The removal request is either automatic, as a result of excessive errors, or manual. A manual DFC removal attempt can fail (`ABORTED` or `STOPPED`) or be successful (`COMPLETED`). An automatic removal is always successful.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Termination status:

`COMPLETED` — Unit removed.
`ABORTED` — Remove aborted.
`STOPPED` — Remove stopped.

If *b* = `ABORTED`,

c = Type of error:

`1` — Remove process error.
`2` — Driver error.
`[NULL]` — Remove denied by driver or CONFIG.

d = Error code:

For remove process error, see output DFC Appendix G, `IOP-APPG`.
For driver error, see output DFC Appendix A, `IOP-APPA`.

If *b* = `STOPPED`,

c = Error code. See output DFC Appendix H, `IOP-APPH`.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

The alarm may have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

There is a major alarm for OMDB key 601.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT, MAIPR

1. FORMAT

This message has six formats.

[1] `RMV MHD` *a* `COMPLETED`

[2] `RMV MHD` *a* `ABORTED [`*b*`] [`*c*`]`

[3] `RMV MHD` *a* `STOPPED` *d*

[4] `RMV MHD` *a* `TASK` *e* `MSG STARTED`

[5] `RMV MHD` *a* `STOPPED MESSAGE IN PROGRESS`

[6] `RMV MHD` *a* `STOPPED MESSAGE COMPLETE`

2. REASON FOR OUTPUT

These messages report the disposition of a request to remove a moving head disk (MHD) from service.

Format 1 reports that the removal attempt was successful.

Formats 2 and 3 report that the removal has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped, and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error:

`X'1` — Remove process error.
`X'2` — Driver error.
`[NULL]` — Remove denied by driver or configuration control (CONFIG).

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Error code:

For remove process error (*b* = X'1), see DFC Output Appendix G, APP-DFC-APPG.
For driver error (*b* = X'2), see DFC Output Appendix A, APP-DFC-APPA.

d = Error code. See DFC Output Appendix H, APP-DFC-APPH.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

The pudrv-subsystem-generated messages have no alarms; the automatically-generated report is for information only.

The cft-subsystem-generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

The diag-subsystem-generated messages have automatically generated alarms; action may or may not be required.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT, MAIPR

1. FORMAT

`RMV MT` *a b* [*c*][*d*]

2. REASON FOR OUTPUT

To report the disposition of a request to remove a magnetic tape (MT) from service. The removal request is either automatic, as a result of excessive errors, or manual. A manual MT removal attempt can fail (`ABORTED` or `STOPPED`), or be successful (`COMPLETED`). An automatic removal is always successful.

3. VARIABLE FIELD DEFINITIONS

a = MT member number.

b = Termination status:

`ABORTED` — Remove aborted.
`COMPLETED` — Unit removed.
`STOPPED` — Remove stopped.

If *b* = `ABORTED`

c = Type of error.

`1` — Diagnostic remove process error.
`2` — disk file controller (DFC) or input/output processor (IOP) driver error.
`[NULL]` — Remove denied by driver or CONFIG.

d = Error code.

If the MT is controlled by an IOP:
For a diagnostic restore process error (*c* = 1). See IOP Output Appendix H, `IOP-APPH`.
For an IOP driver error (*c* = 2). See IOP Output Appendix G, `IOP-APPG`.

If the MT is controlled by a DFC:
For a diagnostic restore process error (*c* = 1). See DFC Output Appendix G, `DFC-APPG`.
For a DFC driver error (*c* = 2). See DFC Output Appendix A, `DFC-APPA`.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *b* = STOPPED

c = Error code.

If the MT is controlled by an IOP, see IOP Output Appendix I, IOP-APPI.
If the MT is controlled by a DFC, see DFC Output Appendix H, DFC-APPH.

4. ACTION TO BE TAKEN

If the remove was denied or aborted, clear the source of trouble and attempt the remove again.

5. ALARMS

The pudrv-subsystem-generated messages have no alarm; the automatically-generated report is for information only.

The cft-subsystem-generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

The diag-subsystem-generated messages have automatically generated alarms; action may or may not be required.

ID . . . . . RMV-SBUS-A
GENERIC . . . . . UNIX RTR R6.4 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`RMV SBUS` *a b* [*c*][*d*]

2. REASON FOR OUTPUT

To report the status of a request to remove a small computer system interface (SCSI) bus (SBUS) and all the associated moving head disks (MHDs) from service.

If the remove process was invoked via the `RMV SBUS` poke on the data file system access (DFSA) display page during disk independent operation (DIOP) mode, a `REPT-DKDIP;MESSAGE` message will precede the output message line.

3. VARIABLE FIELD DEFINITIONS

a = SBUS member number.

b = Status of request:

`ABORTED`	— The remove is aborted.
`COMPLETED`	— The unit is removed.
`ERROR`	— An error is encountered; the remove is aborted.
`NOT STARTED`	— The remove is not started.
`STARTED`	— The remove is started by DKDIP.
`STOPPED`	— The remove is stopped.

If *b* = `ABORTED`, `ERROR`, `NOT STARTED`, or `STOPPED`, and if the command is started via the `RMV SBUS` poke on the DFSA display page, then

c = one of the following DKDIP error codes:

`f09`	— failed to get the UCB of the unit by name
`f0d`	— unit is not ACTIVE, remove stopped
`f18`	— failed to open the device
`f20`	— see DKDRV error report on the ROP
`f57`	— message to driver port failed
`f60`	— message reception failure
`f63`	— process timed out waiting for message
`f67`	— failed to close special device file

d = Error code. See the System Error Codes Output Appendix, `SYSERR`.

If *b* = ABORTED and if ABORTED is done manually or a diagnostic fails, then

c = Type of error:

1 — Diagnostic remove process error.
2 — Driver/Disk remove process error.
[NULL] — Remove denied by driver or CONFIG.

d = Error code:

Diagnostic remove process. See DFC Output Appendix G, DFC-APPG.
Driver/Disk remove process. See DFC Output Appendix A, DFC-APPA.

If *b* = STOPPED and if STOPPED is done manually or a diagnostic fails, then

c = Error code. See DFC Output Appendix H, DFC-APPH.

4. ACTION TO BE TAKEN

If the remove did not complete successfully, correct the source of trouble and attempt the remove again. If the error condition persists, contact the next level of technical assistance.

5. ALARMS

The alarm may be a manually-requested report.

There is a manual alarm for OMDB key 154.

The alarm may have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

There is a major alarm for OMDB key 601.

6. REFERENCES

`RMV SBUS` *a b* [*c*][*d*]

2. REASON FOR OUTPUT

To report the status of a request to remove a SCSI bus (SBUS) and all the associated moving head disks (MHDs) from service.

If the remove process was invoked via the `RMV SBUS` poke on the DFSA display page during disk independent operation (DIOP) mode, a `REPT-DKDIP,MESSAGE` message will precede the output message line.

3. VARIABLE FIELD DEFINITIONS

a = SBUS member number.

b = Status of request:

`ABORTED` — The remove is aborted.
`COMPLETED` — The unit is removed.
`ERROR` — An error is encountered; the remove is aborted.
`NOT STARTED` — The remove is not started.
`STARTED` — The remove is started by `DKDIP`.
`STOPPED` — The remove is stopped.

If *b* = `ABORTED`, `ERROR`, `NOT STARTED`, or `STOPPED`, and if the command is started via the `RMV SBUS` poke on the DFSA display page.

c = One of the following `DKDIP` error codes.

f09 — failed to get the UCB of the unit by name
f1b — unit is not active (ACT)
f1e — failed to open the device
f20 — see DKDRV error report on the ROP
f57 — message to driver port failed
f60 — message reception failure
f63 — process timed out waiting for message
f67 — failed to close special device file
ffe — aborted due to phase 1

d = Error code. See the System Error Codes Appendix, `SYSERR`.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *b* = ABORTED and if ABORTED is done manually or diagnostics fail.

c = Type of error.

1 — Diagnostic remove process error.
2 — Driver/Disk remove process error.
[NULL] — Remove denied by driver or CONFIG.

d = Error code.

Diagnostic remove process. See DFC Appendix G, DFC-APPG.
Driver/Disk remove process. See DFC Appendix A, DFC-APPA.

If *b* = STOPPED and if STOPPED is done manually or if diagnostics fail.

c = Error code. See DFC Appendix H, DFC-APPH.

4. ACTION TO BE TAKEN

If the remove did not complete successfully, correct the source of trouble and attempt the remove again. If the error condition persists, contact the next level of technical assistance.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

There is a major alarm for OMDB key 601.

6. REFERENCES

TYPE . . . . . Output
MESSAGE CLASS . . MAINT,MAIPR

1. FORMAT

This message has six formats.

[1] `RMV SCC` *a* `COMPLETED`

[2] `RMV SCC` *a* `ABORTED` [*b*] [*c*]

[3] `RMV SCC` *a* `STOPPED` *d*

[4] `RMV SCC` *a* `TASK` *e* `MSG STARTED`

[5] `RMV SCC` *a* `STOPPED MESSAGE IN PROGRESS`

[6] `RMV SCC` *a* `STOPPED MESSAGE COMPLETE`

2. REASON FOR OUTPUT

To report the disposition of a request to remove a Switching Control Center (SCC) from service.

Format 1 reports that the removal attempt was successful.

Formats 2 and 3 report that the removal has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error:

`X'1` — Remove process error.
`X'2` — Driver error.
`[NULL]` — Remove denied by driver or configuration control

(CONFIG).

c = Error code:

For remove process error (*b* = X'1), see the output IOP Appendix H, IOP-APPH.
For driver error (*b* = X'2), see the output IOP Appendix G, IOP-APPG.

d = Error code. See the output IOP Appendix I, IOP-APPI.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

The pudrv subsystem generated messages have no alarm; the automatically-generated report is for information only.

The cft subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

The diag subsystem generated messages have automatically generated alarms; action may or may not be required.

ID . . . . . RST-CU
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`RST CU` *a b* [*c*]

2. REASON FOR OUTPUT

To report the status of executing a request to restore a control unit (CU) to standby status.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Request status:

- `ABORTED` — Restore abnormally terminated due to a system error or a fault in the restore process.
- `COMPLETED` — Restore successfully completed.
- `IN PROGRESS` — Restore is in progress.
- `STOPPED` — Restore denied by the system or stopped manually.

c = Reason the restore was stopped:

- `1` — Invalid unit name. Only the CU can be restored.
- `2` — CU is not out of service (OOS).
- `3` — The mate CU must be ACTIVE or INIT.
- `4` — Diagnostic test failures for the CU.
- `5` — Expanded main memory (EMM) straps do not match on both CUs.
- `6` — The restore was terminated because of a system request (manual or automatic).

4. ACTION TO BE TAKEN

If *c* = `2`, remove the CU. If *b* = `ABORTED`, determine what is wrong with the system. Interpret the `REPT-CURSTRMV` output message if one occurred.

If *c* = `4`, fix the CU, or restore it unconditionally.

If *c* = `5`, fix the EMM straps.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

ID . . . . . RST-DFC-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`RST DFC` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

To report the status of a request to restore a disk file controller (DFC) to service.

If the restore process was invoked via the RST DFC poke on the data file system access (DFSA) display page during disk independent operation (DIOP) mode, a `REPT-DKDIP MESSAGE` message will precede the output message line.

3. VARIABLE FIELD DEFINITIONS

a = DFC Member number.

b = Status of request:

`ABORTED` — Restore aborted.
`COMPLETED` — Unit restored.
`ERROR` — Encountered an error, restore aborted.
`IN PROGRESS` — Unit is being initialized.
`NOT STARTED` — The restore not started.
`STARTED` — The restore was started by DKDIP.
`STOPPED` — Unit failed diagnosis.

If *b* = `ABORTED`, `ERROR`, `NOT STARTED`, or `STOPPED`
and if the command is started via the RST DFC poke on the DFSA display page, then

c = one of the following DKDIP error codes:

`f09` — Failed to get the UCB of the unit by name.
`f0b` — Unit is not out-of-service, restore stopped.
`f18` — Failed to open the device.
`f20` — See DKDRV error report on the ROP.
`f57` — Message to driver port failed.
`f60` — Message reception failure.
`f63` — Process timed out waiting for message.
`f67` — Failed to close special device file.

d = Error code. See System Error Codes Output Appendix, `SYSERR-APP`.

If *b* = ABORTED

c = Type of error:

1 — Diagnostic restore process error.
2 — Driver/Disk restore process error.
[NULL] — Bootstrap restore failure.

d = Error code:

Diagnostic restore process. See DFC Output Appendix G, DFC-APPG.
Driver/Disk restore process. See DFC Output Appendix A, DFC-APPA.

If *b* = STOPPED

c = Error code. See DFC Output Appendix H, DFC-APPH.

4. ACTION TO BE TAKEN

If the restore did not complete successfully, correct the source of trouble and attempt the restore again. If the error condition persists, contact the next level of technical assistance.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the status of a request to restore a disk file controller (DFC) to service.

If the restore process was invoked via the `RST DFC` poke on the DFC status page during disk independent operation (DIOP) mode, a `REPT-DKDIP,MESSAGE` message will precede the actual output message line.

3. VARIABLE FIELD DEFINITIONS

a = DFC member number.

b = Status of request.

`ABORTED` — Restore aborted.
`COMPLETED` — Unit restored.
`ERROR` — Encountered an error, restore aborted.
`IN PROGRESS` — Unit is being initialized.
`NOT STARTED` — The restore not started.
`STARTED` — The restore was started by `DKDIP`.
`STOPPED` — Unit failed diagnosis.

If *b* = `ABORTED`, `ERROR`, `NOT STARTED`, or `STOPPED`, and if the command is started via the `RST DFC` poke on the DFC status page.

c = One of the following `DKDIP` error codes.

`f09` — failed to get the UCB of the unit by name
`f18` — unit is not out-of-service (OOS)
`f1e` — failed to open the device
`f20` — see DKDRV error report on the ROP
`f57` — message to driver port failed
`f60` — message reception failure
`f63` — process timed out waiting for message
`f67` — failed to close special device file
`ffe` — aborted due to phase 1

d = Error code. See the System Error Codes Output Appendix, `SYSERR`.

If *b* = ABORTED

c = Type of error.

1 — Diagnostic restore process error.
2 — DFC driver restore process error.
[NULL] — Bootstrap restore failure.

d = Error code.

For a diagnostic restore process error (*c* = 1). See DFC Output Appendix G, DFC-APPG.

If the restore did not complete successfully, correct the source of trouble and attempt the restore again. If the error condition persists, contact the next level of technical assistance.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

[5] `RST DUI` *a* `STOPPED MESSAGE IN PROGRESS`

[6] `RST DUI` *a* `STOPPED MESSAGE COMPLETE`

2. REASON FOR OUTPUT

These messages report the disposition of a request to restore a direct user interface (DUI) subdevice to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error:

`X'1` — Restore process error.
`X'2` — Driver error.
`[NULL]` — Restoration denied by driver or configuration control (CONFIG).

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Error code:

For restore process error (*b* = `X'1`), see output IOP Appendix H, `IOP-APPH`.
For driver error (*b* = `X'2`), see output IOP Appendix G, `IOP-APPG`.

d = Error code. See output IOP Appendix I, `IOP-APPI`.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was aborted or stopped, clear the source of trouble and attempt the restoration again.

5. ALARMS

The pudrv subsystem generated messages have no alarm; the automatically-generated report is for information only.

The cft subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

The diag subsystem generated messages have automatically generated alarms; action may or may not be required.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

RST MHD *a b* [*c*] [*d*]
e

2. REASON FOR OUTPUT

To report the disposition of a request to restore a moving head disk (MHD) to service, whether bootstrap or manual. The MHD was initially in the out-of-service state.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Disposition of the request:

- ABORTED — Restore aborted or was terminated.
- COMPLETED — Unit restored to service.
- IN PROGRESS — MHD *a* is being initialized. If MHD *a* has an active mate, data will be copied from the active mate to MHD *a*.
- STOPPED — Unit failed diagnosis.

If *b* = ABORTED,

c = Type of error:

- 1 — Restore process error.
- 2 — Driver error.
- [NULL] — Bootstrap restore failure.

d = Error code:

Restore process. See output DFC Appendix G, DFC-APPG.
Driver and output DFC Appendix A, DFC-APPA.

If *b* = STOPPED,

c = Error code. See output DFC Appendix H, DFC-APPH.

If *b* = IN PROGRESS,

e = No message or one of the following status messages:

APPLICATION DID NOT RESPOND
Application did not request to abort the restore. The disk to disk copy is being started.

MHD *f* SINGLE BLOCK READ RETRY {WORKED|FAILED}

SEE PROPRIETARY NOTICE ON COVER PAGE

`START DISK BLOCK =` *g* `{END|FAILING} DISK BLOCK =` *h*

f = Member number.

g = First relative physical disk block number of a range that could not be read.

h = Last relative physical disk block number.

When read with a range of blocks, the read failed. When read with single blocks, the reads were successful.

`MHD` *f* `{READ | WRITE} FAILED`
`PARTITION =` *i* `OFFSET =` *j* `DISK BLOCK =` *k*

f = Member number.

i = Partition number for the failed I/O.

j = Start block number within the partition of the failure.

k = Relative physical disk block for the failed I/O. The read or write job specified by the data could not be successfully performed.

```
**************
* WARNING *
**************
```

`MHD` *f* `{PRIMARY | BACKUP} BBOOT PARTITION INVALID`

f = Member number.

The indicated `BBOOT` partition (`PRIMARY` or `BACKUP`) on the specified disk was found to be marked invalid. The data in that partition is questionable and cannot be guaranteed to boot. However, the data is still being copied to the destination disk and the indicated `BBOOT` partition on the destination disk will also be marked invalid.

NOTE: Relative physical block number is a physical block number of the disk which may have been adjusted by disk defect management for SMD disk drive. In order to use it in the defect table, this number may need to be readjusted.

4. ACTION TO BE TAKEN

If restore is stopped, correct the source of trouble and attempt to restore again.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

e

2. REASON FOR OUTPUT

To report the disposition of a request to restore a moving head disk (MHD) to service, whether bootstrap or manual. The MHD was initially in the out-of-service (OOS) state.

If the restore process was invoked via the `RST MHD` poke on the DFC status page during disk independent operation (DIOP) mode, a `REPT DKDIP MESSAGE` message will precede the actual output message line.

3. VARIABLE FIELD DEFINITIONS

a = MHD member number.

b = Disposition of the request.

- `ABORTED` — Restore aborted or was terminated.
- `COMPLETED` — Unit restored to service.
- `ERROR` — Encountered an error, restore aborted.
- `IN PROGRESS` — `MHD` *a* is being initialized. If `MHD` *a* has an active mate, data is being copied from the active mate to `MHD` *a*.
- `NOT STARTED` — The restore not started.
- `STARTED` — The restore was started by `DKDIP`.
- `STOPPED` — Unit failed diagnosis.

If *b* = `ABORTED`, `ERROR`, `NOT STARTED`, or `STOPPED`, and if the command is started via the `RST MHD` poke on the DFC status page.

c = One of the following `DKDIP` error codes.

- `f09` — failed to get the UCB of the unit by name
- `f0c` — ugucbm() failed
- `f0f` — DIOP restore not allowed — mate MHD is active
- `f12` — DIOP restore not allowed — MHD is marked essential
- `f18` — unit is not OOS
- `f1e` — failed to open the device
- `f20` — see DKDRV error report on the ROP
- `f57` — message to driver port failed
- `f60` — message reception failure
- `f63` — process timed out waiting for message
- `f67` — failed to close special device file
- `ffe` — aborted due to phase 1

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Error code. See the System Error Codes Output Appendix, SYSERR.

If *b* = ABORTED

c = Type of error.

1 — Diagnostic restore process error.
2 — DFC driver restore process error.
[NULL] — Bootstrap restore failure.

d = Error code.

For a diagnostic restore process error (*c* = 1). See DFC Output Appendix G, DFC-APPG.
For a DFC driver error (*c* = 2). See DFC Output Appendix A, DFC-APPA.

If *b* = STOPPED

c = Error code. See DFC Output Appendix H, DFC-APPH.

If *b* = IN PROGRESS

e = No message or one of the following status messages.

APPLICATION DID NOT RESPOND
Application did not request to abort the restore. The disk to disk copy is being started.

MHD *f* SINGLE BLOCK READ RETRY {WORKED|FAILED}
START DISK BLOCK = *g* {END|FAILING} DISK BLOCK = *h*

f = Member number.

g = First relative physical disk block number of a range that could not be read.

2. REASON FOR OUTPUT

To report the status of a request to restore a magnetic tape (MT) device to service.

If the restore process was invoked via the `RST MT` poke on the disk file controller (DFC) status page during disk independent operation (DIOP) mode, a `REPT DKDIP MESSAGE` message will precede the actual output message line.

3. VARIABLE FIELD DEFINITIONS

a = MT member number.

b = Status of request.

`ABORTED` — Restore aborted.
`COMPLETED` — Unit restored.
`ERROR` — Encountered an error, restore aborted.
`IN PROGRESS` — Unit is being initialized.
`NOT STARTED` — The restore not started.
`STARTED` — The restore was started by DKDIP.
`STOPPED` — Unit failed diagnosis.

If *b* = `ABORTED`, `ERROR`, `NOT STARTED`, or `STOPPED`, and if the command is started via the `RST MT` poke on the DFC status page.

c = One of the following DKDIP error codes.

`f09` — Failed to get the UCB of the unit by name.
`f15` — MT restore not allowed: controller is not a DFC.
`f18` — Unit is not out-of-service (OOS).
`f1e` — Failed to open the device.
`f20` — See DKDRV error report on the ROP.
`f57` — Message to driver port failed.
`f60` — Message reception failure.
`f63` — Process timed out waiting for message.
`f67` — Failed to close special device file.
`ffe` — Aborted due to phase 1.

d = Error code. See the System Error Codes Output Appendix, `SYSERR`.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *b* = ABORTED

c = Type of error.

1 — Diagnostic restore process error.
2 — DFC or IOP driver error.
[NULL] — Restoration denied by driver or configuration (CONFIG) control.

d = Error code.

If the MT is controlled by an IOP:
For a diagnostic restore process error (*c* = 1). See IOP Output Appendix H, IOP-APPH.
For a IOP driver error (*c* = 2). See IOP Output Appendix G, IOP-APPG.

If the MT is controlled by a DFC:
For a diagnostic restore process error (*c* = 1). See DFC Output Appendix G, DFC-APPG.
For a DFC driver error (*c* = 2). See DFC Output Appendix A, DFC-APPA.

If *b* = STOPPED

c = Error code.

If the MT is controlled by an IOP, see IOP Output Appendix I, IOP-APPI.
If the MT is controlled by a DFC, see DFC Output Appendix H, DFC-APPH.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The pudrv-subsystem-generated messages have no alarm; the automatically-generated report is for information only.

The cft-subsystem-generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

The diag-subsystem-generated messages have automatically generated alarms; action may or may not be required.

[6] `RST MTC` *a* `STOPPED MESSAGE COMPLETE`

2. REASON FOR OUTPUT

To report the disposition of a request to restore a magnetic tape controller (MTC) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error:

`X'1` — Restore process error.
`X'2` — Driver error.
`[NULL]` — Restoration denied by driver or configuration control (CONFIG).

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Error code:

For restore process error (*b* = `X'1`), see output IOP Appendix H, `IOP-APPH`.
For driver error (*b* = `X'2`), see output IOP Appendix G, `IOP-APPG`.

d = Error code. See output IOP Appendix I, `IOP-APPI`.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The pudrv subsystem generated messages have no alarm; the automatically-generated report is for information only.

The cft subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

The diag subsystem generated messages have automatically generated alarms; action may or may not be required.

ID . . . . . RST-SBUS-A
GENERIC . . . . . UNIX RTR R6.4 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`RST SBUS` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

To report the status of a request to restore a small computer system interface (SCSI) bus (SBUS) to service.

If the restore process was invoked via the `RST SBUS` poke on the data file system access (DFSA) display page during disk independent operation (DIOP) mode, a `REPT DKDIP MESSAGE` message will precede the output message line.

3. VARIABLE FIELD DEFINITIONS

a = SBUS member number.

b = Status of request:

`ABORTED` — Restore aborted.
`COMPLETED` — Unit restored.
`ERROR` — Encountered an error, restore aborted.
`IN PROGRESS` — Unit is being initialized.
`NOT STARTED` — The restore is not started.
`STARTED` — The restore was started by DKDIP.
`STOPPED` — Restore stopped.

If *b* = `ABORTED`, `ERROR`, `NOT STARTED`, or `STOPPED`,
and if the command was started via the `RST SBUS` poke on the DFSA display page, then

c = one of the following DKDIP error codes:

`f09` — failed to get the UCB of the unit by name
`f0b` — unit is not out of service, restore stopped
`f18` — failed to open the device
`f20` — see DKDRV error report on the ROP
`f57` — message to driver port failed
`f60` — message reception failure
`f63` — process timed out waiting for message
`f67` — failed to close special device file

d = See the System Error Codes Appendix, `SYSERR`.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *b* = ABORTED

c = Type of error:

1 — Diagnostic restore process error.
2 — Driver/Disk restore process error.
[NULL] — Bootstrap restore failure.

d = Error code:

Diagnostic restore process. See output DFC Appendix G, DFC-APPG.
Driver/Disk restore process. See output DFC Appendix A, DFC-APPA.

If *b* = STOPPED

c = Error code. See output DFC Appendix H, DFC-APPH.

4. ACTION TO BE TAKEN

If the restore did not complete successfully, correct the source of trouble and attempt the restore again. If the error condition persists, contact the next level of technical assistance.

5. ALARMS

The alarm may be a manually-requested report.

There is a manual alarm for OMDB key 154.

The alarm may have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

There is a major alarm for OMDB key 601.

6. REFERENCES

1. FORMAT

`RST SBUS` *a b* [*c*] [*d*]

2. REASON FOR OUTPUT

To report the status of a request to restore a small computer system interface (SCSI) bus (SBUS) to service.

If the restore process was invoked via the `RST SBUS` poke on the DFC status page during disk independent operation (DIOP) mode, a `REPT-DKDIP,MESSAGE` message will precede the actual output message line.

3. VARIABLE FIELD DEFINITIONS

a = SBUS member number.

b = Status of request.

`ABORTED` — Restore aborted.
`COMPLETED` — Unit restored.
`ERROR` — Encountered an error, restore aborted.
`IN PROGRESS` — Unit is being initialized.
`NOT STARTED` — The restore is not started.
`STARTED` — The restore was started by DKDIP.
`STOPPED` — Restore stopped.

If *b* = `ABORTED`, `ERROR`, `NOT STARTED`, or `STOPPED`, and if the command was started via the `RST SBUS` poke on the DFC status page.

c = One of the following DKDIP error codes.

`f09` — failed to get the UCB of the unit by name
`f18` — unit is not out-of-service (OOS)
`f1e` — failed to open the device
`f20` — see DKDRV error report on the ROP
`f57` — message to driver port failed
`f60` — message reception failure
`f63` — process timed out waiting for message
`f67` — failed to close special device file
`ffe` — aborted due to phase 1

d = Error code. See the System Error Codes Appendix, `SYSERR`.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *b* = ABORTED

c = Type of error.

1 — Diagnostic restore process error.
2 — DFC driver restore process error.
[NULL] — Bootstrap restore failure.

d = Error code.

For a diagnostic restore process error (*c* = 1). See DFC Output Appendix G, DFC-APPG.
For a DFC driver error (*c* = 2). See DFC Output Appendix A, DFC-APPA.

If *b* = STOPPED

c = Error code. See DFC Output Appendix H, DFC-APPH.

4. ACTION TO BE TAKEN

If the restore did not complete successfully, correct the source of trouble and attempt the restore again. If the error condition persists, contact the next level of technical assistance.

[4] `RST SDLC` *a* `TASK` *e* `MSG STARTED`

[5] `RST SDLC` *a* `STOPPED MESSAGE IN PROGRESS`

[6] `RST SDLC` *a* `STOPPED MESSAGE COMPLETE`

2. REASON FOR OUTPUT

To report the disposition of a request to restore a synchronous data link controller (SDLC) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error:

`X'1` — Restore process error.
`X'2` — Driver error.
`[NULL]` — Restoration denied by driver or configuration control (CONFIG).

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Error code:

For restore process error (*b* = `X'1`), see output IOP Appendix H, `IOP-APPH`.
For driver error (*b* = `X'2`), see output IOP Appendix G, `IOP-APPG`.

d = Error code. See output IOP Appendix I, `IOP-APPI`.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The pudrv subsystem generated messages have no alarm; the automatically-generated report is for information only.

The cft subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report that is for information only.

The diag subsystem generated messages have automatically generated alarms; action may or may not be required.

ID . . . . . SET-CLK
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `SET CLK COMPLETED`
a b

[2] `SET CLK STOPPED`
c

[3] `SET CLK COMPLETED`
a b
`WARNING - ONLY THE AM CLOCK HAS BEEN UPDATED`
`IT MAY AUTOMATICALLY BE RESET LATER TO AGREE`
`WITH THE SYSTEM TIME`

2. REASON FOR OUTPUT

To report the result of executing a `SET:CLK` input message to set the date and time.

3. VARIABLE FIELD DEFINITIONS

a = Date.

b = Time.

c = Text explaining why the command was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates successful execution. Take no action.

If Format 2 is printed, correct any command line errors and reissue the command. If the error message is not self-explanatory, seek technical assistance.

Format 3 should be printed only when the `SET:CLK` input message is executed on a machine running in MIN-CONFIG mode. Although Format 1 is normally printed to indicate successful execution of the input command, Format 3 may be printed under certain conditions. If the machine is running in application mode, seek technical assistance. Otherwise, the `SET:CLK` input message may need to be re-executed after the machine is rebooted in application mode.

5. ALARMS

None. This alarm is a manually-requested report.

SEE PROPRIETARY NOTICE ON COVER PAGE

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `SET IODRV {COMPLETED|ABORTED}`

[2]
```
SET IODRV NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
```

2. REASON FOR OUTPUT

To report the result of executing a `SET:IODRV` input message.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

If the message reads `ABORTED`, the message could not be processed due to a conflict with the system status. The message will not be successfully processed until the system status changes. Check system status to determine why message aborted.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Key
Format 1 has an OMDB key of 159.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `STOP AUD COMPLETED`

[2]
```
STOP AUD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS - NOT RUNNING
```

[3]
```
STOP AUD NOT STARTED
CANNOT STOP NON-SEGMENTED AUDIT
```

2. REASON FOR OUTPUT

To report the termination status of the `STOP:AUD` input message.

3. VARIABLE FIELD DEFINITIONS

None.

NOTE: See the *System Maintenance Manual*, Appendixes A and B for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

Format 1 indicates successful execution. No action is necessary.

Format 2 indicates that no audits were running at the time the command was entered. The `OP:AUD` input message can be used to determine the current system status.

If Format 3 is printed, the audit cannot be stopped.

5. ALARMS

None. This automatically-generated report is for information only.

1. FORMAT

This message has three formats.

[1] `STOP DCI COMPLETED`

[2] `STOP DCI NOT STARTED`

[3] `STOP DCI ABORTED`

2. REASON FOR OUTPUT

The first format is to report the termination of the dual serial channel interface (DCI) process in response to a `STOP:DCI` input message.

The second format is in response to a `STOP:DCI` input message when the dual serial channel interface (DCI) process was not running.

The third format is in response to a `STOP:DCI` input message when the dual serial channel interface (DCI) process could not be terminated.

3. VARIABLE FIELD DEFINITIONS

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `STOP EXC USER COMPLETED`

[2] `STOP EXC USER STOPPED`
a

2. REASON FOR OUTPUT

To report the result of executing a `STOP:EXC;USER` or `STP:EXC;USER` input command to stop a user process.

NOTE: If the `STOP:EXC;USER;PID` *a* or `STP:EXC;USER;PID` *a* input command is used to kill a supervisor process, a `COMPLETED` message will be printed, but the process has not really been killed.

3. VARIABLE FIELD DEFINITIONS

a = Description of the error encountered.

4. ACTION TO BE TAKEN

Format 1 indicates success. No action is necessary.

Format 2 indicates the command has failed. The explanatory text will indicate the error encountered. Refer to the input messages manual for the correct format and reenter the command, or check the status of the file using the `OP:STATUS;LISTDIR` input message if the message indicates that the process or file may not exist as printed. If the message indicates that an invalid signal has been used, refer to the input messages manual for available signals.

Seek technical assistance if any other error message is printed.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

ID . . . . . STOP-OFLBOOT
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `STOP OFLBOOT COMPLETED`

[2] `STOP OFLBOOT` *a*
b
`OLBSTATE LASTATE FUNCTION LINE`
c *d* *e* *f*

[3] `STOP OFLBOOT STARTED`
`TYPE` *g*

[4] `STOP OFLBOOT IN PROGRESS`

2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

a = Message type.

`ABORTED` — Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.

`INFO` — For information only.

`STOPPED` — Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.

`TERMINATED` — UNIX® RTR software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

b = Text line.

1. `ABORT IN PROGRESS`

   Indicates a stop was issued when a stop was already in progress. The first stop could be either manual or software initiated.

2. `CANNOT INVOKE COMMAND ON OFFLINE SIDE`

   Printed if `STOP:OFLBOOT` is invoked on the off-line side.

3. `ILLEGAL STOP OFLBOOT COMMAND`

   A second `STOP:OFLBOOT` command was issued either without the restore option or outside the time limit (one hour) to execute a `STOP:OFLBOOT` with the RST option.

4. `STOP FROM OFF-LINE SIDE NOT ALLOWED`

   Printed if `STOP:OFLBOOT` is invoked from the off-line side.

c = Current offline boot state.

d = Previous offline boot state.

e = Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.

f = Line number in the function *e* from which the output message originated. This field is used by UNIX® RTR, in conjunction with field *e*, to diagnose offline boot problems.

g = Abort type: MANUAL, APPLICATION, or SOFTWARE; indicates how abort was initiated. MANUAL is associated with a manual `STOP:OFLBOOT` request; APPLICATION, with an application-initiated abort; and SOFTWARE, with a UNIX® RTR-initiated termination.

4. ACTION TO BE TAKEN

For Formats 1, 3, and 4, no action needs to be taken.

For Format 2, the action to be taken depends on text line *b*.

Text Line: Action to be Taken:

1. No action is needed; let the first stop run to completion.
2. Execute `STOP:OFLBOOT` on the on-line side.
3. If within the 1-hour time limit (from the first `STOP:OFLBOOT` command), try `STOP:OFLBOOT` again with the RST option.
4. Execute `STOP:OFLBOOT` from the on-line side.

5. ALARMS

For a minor alarm, take action as indicated in the report.

A major alarm may not be service affecting, but take immediate action as indicated in the report.

3. VARIABLE FIELD DEFINITIONS

a = Error code. See System Error Codes Output Appendix, `SYSERR-APP`.

b = Unit number of CU switched to active.

c = Description of conflict with current system status.

4. ACTION TO BE TAKEN

For Format 1, take action as appropriate for the error condition.

For Format 2, no action is needed.

For Format 3, determine the conflict with the current system status. After the conflict is resolved, retry the CU softswitch.

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

OMDB Keys
Format 1 has an OMDB key of 415.
Formats 2 and 3 have an OMDB key of 314.

SYSERR-APP

Input Message
SW:CU

WARNING
INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

ID . . . . . SW-OFLBOOT
GENERIC . . . . . UNIX RTR R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

****WARNING****

The boot was unsuccessful and the side switch might be too. This can potentially affect call origination.

1. FORMAT

This message has three formats.

[1] `SW OFLBOOT` *a*
b
`OLBSTATE LASTATE FUNCTION LINE`
c d e f

[2] `SW OFLBOOT` *a*
{*b h* | *b h i*}
`OLBSTATE LASTATE FUNCTION LINE`
c d e f

[3] `SW OFLBOOT` *a*
h i [*j*] *b*
`OLBSTATE LASTATE FUNCTION LINE`
c d e f

2. REASON FOR OUTPUT

To report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

a = Message type.

`ABORTED` — Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.

`COMPLETED` — Indicates off-line side boot has completed.

`INFO` — For information only.

`STOPPED` — Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.

TERMINATED — UNIX® RTR software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

b = Text line.

1. AIM SWITCH PRECHECKS TIMED OUT

   Printed when the timer for AIM SW:OFLBOOT off-line pre-checks expires. The pre-check results will default to failure.

2. BOOT UNSUCCESSFUL, CANNOT SWITCH

   SW:OFLBOOT was requested after a completed but unsuccessful offline boot. SW:OFLBOOT is valid only after a completed, successful offline boot or after a side switch.

3. CANNOT ACCESS ECD

   SW:OFLBOOT encountered problems accessing RC/V ECD device information.

4. CANNOT SEND MESSAGE TO USER PROCESS, PID:

   SW:OFLBOOT cannot send a message to the user process identified by its process identifier. Usually the problem is no message buffers are available.

5. CORRUPT ECD UCB RECORD FOR *h i*

   SW:OFLBOOT encountered inconsistent information about a device from the off-line ECD. For example, SW:OFLBOOT accessed the RC/V ECD UCB record for a DFC and the device type in the UCB record is not DFC. This may indicate that the off-line ECD is corrupt.

6. DIAGNOSTICS IN PROGRESS

   Indicates the specified device's RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

7. INTERNAL DFC TABLE CORRUPT

   Internal data or internal tables have been corrupted.

8. INTERNAL IOP TABLE CORRUPT

   Internal data or internal tables have been corrupted.

SEE PROPRIETARY NOTICE ON COVER PAGE

9. `INTERNAL UNITS TABLE CORRUPT`

   Internal data or internal tables have been corrupted.

10. `LOW CORE IOPMASK CORRUPT`

    Data store in low core has been corrupted.

11. `LOW CORE ORIGSIDE CORRUPT`

    Data store in low core has been corrupted.

12. `NO DISK FORCED`

    A DFC is not forced.

13. `NO IOP ON THE OFFLINE SIDE`

    Indicates that IOP 0 and IOP 1 are both on the on-line side. The switch will fail because it will not have a MTTY or ROP on the other side.

14. `NOT ACTIVE`

    Printed if the specified device is not in the ACT state. The incorrect state is given in variable *j*.

15. `OFLBOOT NEEDS TO BE COMPLETED FIRST`

    Offline boot is supported; however, one is not in progress at this time, or it is in progress but has not finished booting yet.

16. `OFFLINE SYSTEM IS RUNNING IN MINIMUM CONFIGURATION MODE`

    Indicates the off-line side is running in minimum configuration mode. There is no AIM process on the off-line side to support offline boot; cannot side switch.

17. `OLBSTATE EXPECTED TO BE AFTERBOOT OR AFTERSW`

    `SW:OFLBOOT` cannot switch due to the fact that OLBSTATE is not AFTERBOOT or AFTERSW. `SW:OFLBOOT` is valid only immediately after a successful offline boot or side switch.

18. `SWITCH FROM OFF-LINE SIDE NOT ALLOWED`

    Printed if `SW:OFLBOOT` is invoked from the off-line side.

19. `SWITCH FAILED`

    Serious errors are encountered during a side switch procedure. Nevertheless, the procedure may be completed if the RETROFIT option was specified. This may mean that operation will continue without call origination. If the

RETROFIT option was not specified, the side switch procedure will be terminated. Note however, the system still remains inside the offline boot procedure.

20. `SWITCH OFFLINE SIDE COMPLETE`

    The off-line side completed its portion of a side switch. This message may be found in the OLBLOG file.

21. `SWITCH ONLINE SIDE COMPLETE`

    The on-line side completed its portion of a side switch. This message will be found only in the OLBLOG file.

22. `UNEXPECTED MESSAGE FROM AIM`

    Indicates a message has been received unexpectedly from AIM.

c = Current offline boot state.

d = Previous offline boot state.

e = Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.

f = Line number in the function *e* from which the output message originated. This field is used by UNIX® RTR, in conjunction with field *e*, to diagnose offline boot problems.

g = Process identification number.

h = String giving device type information; CU, DFC, IOP, MHD, TTY, TTYC, and DSCH, for example. Unit names are listed in the Member Numbers Appendix, `MEM-NUM-APP`, Table C, of this manual.

i = Device number. A value of zero, when used with *h*, could form DFC 0, for example.

j = Device state.

4. ACTION TO BE TAKEN

Text line: Action to be Taken:

1. Check the OLBLOG files on the off-line side to determine if AIM is having problems; if not, try the side switch again.
2. Try `SW:OFLBOOT` again with the UCL option to override the unsuccessful offline boot.

WARNING: The boot was unsuccessful and the side switch might be too. This can potentially affect call origination.

3. Wait for the side switch to fail, then manually stop offline boot. The error is in the off-line side ECD which cannot be audited; seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. Try the side switch again.
5. Seek technical assistance.
6. Wait for diagnostics to complete, fix any problems, and then try side switching again. If diagnostics are not running, the RC/V ECD UCB record is corrupt. In this case, the UCB needs to be unreserved manually or through the ECDOWN audit.
7. The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete. Seeking technical assistance is recommended.
8. The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete. Seeking technical assistance is recommended.
9. The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete. Seeking technical assistance is recommended.
10. Seek technical assistance.
11. Seek technical assistance.
12. Force the DFC that was previously forced; try `SW:OFLBOOT` again.
13. Stop offline boot; wait for it to terminate. Try oflboot with IOP 0 or IOP 1 specified. Wait for the off-line side to be booted, then try `SW:OFLBOOT` again.
14. Restore this device; try `SW:OFLBOOT` again.
15. A `SW:OFLBOOT` can be executed only after `EXC:OFLBOOT` has executed successfully.
16. To side switch, stop oflboot and execute `EXC:OFLBOOT` without specifying the minconfig option. When this second offline boot completes, try the side switch again.
17. Wait for offline boot or side switch to complete; try `SW:OFLBOOT` again.
18. Execute `SW:OFLBOOT` from the on-line side.
19. If RETROFIT was not specified, the system will remain in offline boot. The side switch may be retried, if desired. If RETROFIT was specified, the side switch will continue; no action is needed.
20. This message is for information only; no action is needed.
21. This message is for information only; no action is needed.
22. Seek technical assistance.

5. ALARMS

For a minor alarm, take action as indicated in the report.

A major alarm may not be service affecting, but take immediate action as indicated in the report.

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

ID . . . . . SW-PORTSW
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `SW PORTSW {ABORTED|COMPLETED|DENIED|STOPPED} FOR [a] [b]`

[2]
```
SW PORTSW NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
```

[3]
```
SW PORTSW NOT STARTED
INVALID ID FIELD
```

2. REASON FOR OUTPUT

To report the result of executing the `SW:PORTSW` input message.

3. VARIABLE FIELD DEFINITIONS

a = Port switchable subdevice name (maintenance teletypewriter [MTTY] or receive-only printer [ROP]).

b = One of the following if the result is `ABORTED` or `DENIED`:

```
ECD ERROR
UNABLE TO ACCESS DRIVER
UNABLE TO GET DRIVER STATUS
```

The input message failed due to equipment configuration database (ECD) failure or communication failure with the input/output driver (IODRV) process.

4. ACTION TO BE TAKEN

For a `STOPPED` message, check the portswitch hardware; it should be set in the automatic position, not in position 0 or 1. Both subdevices should be restored to service.

For `ABORTED` and `DENIED` messages, check the ROP output and the IODRV log files for additional help in determining the problem. IODRV log files are `/etc/log/IODRVLOG0` and `/etc/log/IODRVLOG1`. If necessary, seek technical assistance.

5. ALARMS

None. This is a manually-requested report.

SEE PROPRIETARY NOTICE ON COVER PAGE

OMDB Key
Format 1 has an OMDB key of 164.

Input Message
`SW:PORTSW`

ID . . . . . TST-SPL
GENERIC . . . . . UNIX RTR R1.5 only
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `TST SPL UNABLE TO CREATE TEMPORARY FILE`

[2] `TST SPL MAXIMUM MESSAGES PER MINUTE IS 430`

[3] `TST SPL RATE OF MESSAGES/MINUTE WAS` *a*

[4] `TST SPL LINE` *a*

2. REASON FOR OUTPUT

Format 1 reports an open failure on file used for messages with more than eight lines or information on messages / minute errors. Format 4 responds to a `TST:SPL`, `TST:SPREL`, or `TST:ACKU` input message.

3. VARIABLE FIELD DEFINITIONS

a = Actual number of messages produced in the minute if the time to produce the requested messages / minute exceeded one minute.

4. ACTION TO BE TAKEN

If format 1 prints, retry the `TST:SPL` input message.

If format 2 prints, the process will attempt to produce 430 messages / minute.

For format 3, take no action; information only.

Format 4 contains the requested output. No action is necessary.

5. ALARMS

None.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `UPD APPLY REPT`
a

[2] `UPD APPLY` *b*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:APPLY` command.

Format 1 is output to give information about the progress of an update, or to report an error encountered while processing the update.

Format 2 is output upon termination of the process.

3. VARIABLE FIELD DEFINITIONS

a = Information about the progress of an update, or report on an error encountered while processing the update. Error messages may be one of the following six categories.

`usage` — reports an error using field update
`internal` — reports an error found by the field update code
`system` — reports a system error that occurred
`COFF` — reports an error in the internal format of a file
`database` — reports an error in the database
`filesys` — reports an error in the file system

See the output Field Update Error Codes Appendix, `FUEC-APP`, for explanations of error codes which may appear in error messages.

b = Termination mode of the input message `UPD:APPLY;BYTER`, `UPD:APPLY;FILER`, or `UPD:APPLY;FUNCR`. The mode will be either `COMPLETED` for successful completion or `ABORTED` for termination with errors.

4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

-----------------------------------------------------------------------

UPD AUTOCHK REPORT COMPLETED

[2]    UPD AUTOCHK IN PROGRESS

[3]    UPD AUTOCHK PASSED

[4]    UPD AUTOCHK FAILED

[5]    UPD AUTOCHK COMPLETED

[6]    UPD AUTOCHK ABORTED
```

[7] UPD AUTOCHK HEALTHCHECK HAS NOT YET BEEN RUN

2. REASON FOR OUTPUT

Format 1 is in response to the UPD:AUTOCHK input message requesting a report on the status of the "health" of the switch. A short summary is printed indicating the items checked and their status at the time the report was run (ie, PASSED, FAILED, NOT CHECKED or UNABLE TO CHECK). If any of the system health check items indicate failure or unable to check, the overall status of the UPD AUTOCHK REPORT is FAILED. In addition, if inconsistencies are detected, additional information is provided.

Format 2 is in response to the UPD:AUTOCHK input message. It indicates that the request is in progress.

Format 3 is in response to the UPD:AUTOCHK input message. It indicates that the requested system health check passed.

Format 4 is in response to the UPD:AUTOCHK input message. It indicates that the requested system health check failed.

Format 5 is in response to the UPD:AUTOCHK input message. It indicates that the request has completed.

Format 6 is in response to the UPD:AUTOCHK input message. It indicates that the request has aborted.

Format 7 is in response to the UPD:AUTOCHK input message. It indicates that the requested report was not available since the system health check has not been run yet.

3. VARIABLE FIELD DEFINITIONS

b = Type of inconsistency. See UPD:VFYCON output message page for more detailed information.

4. ACTION TO BE TAKEN

This report lists any activities or situations that may interfere with the automatic application of a software update (SU). If the report shows that the overall status is failed, corrective action may be necessary. However, some instances of this report require that no action be taken. These instances are:

- conflicting switch activity
- other processes are in progress

Wait until the process in question completes or until the proper amount of time, according to the information set in the office profile, has passed.

If the UPD AUTOCHK report lists failures that indicate off-normal situations, request a copy of the off-normal report through the use of the OP:SYSSTAT input message. Refer to the OP:SYSSTAT input message in the Input Messages manual for the correct format and take the appropriate action to correct the situation. Also, any SUs in the temporary state on the switch, must be either made official (9330 poke on the 1960 page) or backed out (9340 poke on the 1960 page). Any breakpoints that exist must be cleared. If the consistency check fails, refer to the UPD:VFYCON output message in the Output Messages manual for the action to be taken according to the type of inconsistency detected.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None.

```
UPD AUTOMATION  a
       b
       c
       d
```

2. REASON FOR OUTPUT

To give information or status regarding Software Update (SU) Automation.

3. VARIABLE FIELD DEFINITIONS

a = category of the message. Valid values are:

`INFO`	= Information regarding the last SU Automation request, or information on the current automatic installation that is in progress
`HEALTH CHECK`	= To report information regarding the current (or last) SU Automation Health Check
`OFFICE PROFILE`	= To report on the status of the request to update the SU Automation Office Profile.
`SCHEDULE`	= To report on a request to schedule an SU for automatic installation, or to report the status of the current SU scheduled.
`INSTALL`	= To report on the current automatic SU installation that is already in progress.

b = A brief text phrase providing information or describing an error related to the Software Update Automation activity.

c = One of the following:

`SU`	= An SU name
`SU Stage Date Time`	= The SU is scheduled for installation for the given date/time to the given installation stage.
`Reason`	= Reports the reason why SU automation is inhibited
`Info`	= Provides information on the health check condition for which it was requested.
`text phrase`	= A brief text phrase providing more information

d = Provides information on the health check condition for which it was requested.

4. ACTION TO BE TAKEN

The specific action required depends on the *b* field in the message. Most of these reports are informational in nature.

1. FORMAT

This message has two formats.

[1] `UPD BKOUT REPT`
a

[2] `UPD BKOUT` *b*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:BKOUT` command.

Format 1 is output to give information about the progress of backing out an update, or to report an error encountered while processing the backout.

Format 2 is output upon termination of the process.

3. VARIABLE FIELD DEFINITIONS

a = Information about the progress of backing out an update, or report on an error encountered while processing the backout. Error messages may be one of the following six categories.

`usage` — reports an error using field update
`internal` — reports an error found by the field update code
`system` — reports a system error that occurred
`COFF` — reports an error in the internal format of a file
`database` — reports an error in the database
`filesys` — reports an error in the file system

See the output Field Update Error Codes Appendix, `FUEC-APP`, for explanations of error codes which may appear in error messages.

b = Termination mode of the input message `UPD:BKOUT`. The mode will be either `COMPLETED` for successful completion or `ABORTED` for termination with errors.

4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

UPD CSCANS ERROR, FAILED TO CONNECT TO PORT
```

2. REASON FOR OUTPUT

Format 1 reports that a remote system tried to connect to the switch via CSCANS interface, and reports the time for this attempt.

Format 2 reports that the CSCANS file receive process (SUfilercv) could not send an upload query return message to the remote CSCANS system. The return message contains the last official software update (SU) number from the switch. The link is disconnected upon encountering this error.

Format 3 reports that the SUfilercv process sent a message with an invalid pathname to the SUexpand process.

Format 4 is a warning message indicating that the SUfilercv process failed to send a message to SUexpand. No SU files will be expanded.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5 reports that a remote system connected to the switch successfully via CSCANS interface.

Format 6 reports that the connection over the scans data link was disconnected.

Format 7 reports that a SU download via CSCANS interface completed successfully. Files downloaded, elapsed time, and the remaining file space were also output.

Format 8 reports that no SU files were received on the switch.

Format 9 reports that the CSCANS password file was missing or had an invalid format. No SU files will be downloaded.

Format 10 reports that a security violation occurred because the password from the CSCANS system and the switch did not match. The link is disconnected upon encountering this error.

Format 11 reports that the remote system disconnected the data link for an unknown reason.

Format 12 reports that there is no CSCANS download currently in progress.

Format 13 reports the progress of the `UPD:CSCANS-STOP` input message.

Format 14 is used to report the termination of the SUfilercv process due to an error unrelated to the actual transmission of files. This message may occur either before, during or after the transmission of files.

Format 15 reports that the SUfilercv process failed to allocate working space for the password file contents.

Format 16 reports that the sugetty process did not execute SUfilercv process with correct parameters. The link is disconnected upon encountering this error.

Format 17 reports that the sugetty process did not execute SUfilercv process with password as a parameter. The link is disconnected upon encountering this error.

Format 18 reports that the SUfilercv failed to connect to its system port.

3. VARIABLE FIELD DEFINITIONS

a = The pathname that SUfilercv sent to the SUexpand process.

b = The pathname where the SU files were stored in the switch.

c = File space, expressed as the number of blocks before SU download session start.

d = Number of files received in current download session.

e = Complete pathname for the SU files received.

f = List of files received in current download session.

g = File space, in blocks, left after the current download session.

h = Hour.

i = Minute.

SEE PROPRIETARY NOTICE ON COVER PAGE

j = Pathname of a file issued by the sending end which was not received by the CSCANS file receive process.

k = Error code specifying the reason why the file was not received by the CSCANS file receive process. Valid values are:

`01` = Insufficient space on disk to store the file.
`02` = File length exceeds the maximum length permitted.
`03` = The pathname being processed matches that of a file already on disk.
`04` = Could not create incoming file on disk.
`05` = File transmission was interrupted.

l = Code indicating reason for termination. Valid values are:

`0` = Successful completion of the file transfer session.
`1` = Time limit to receive messages from the remote system has expired.
`2` = Unable to resynchronize messages with the remote sender.
`3` = Unable to resynchronize files with the remote sender.
`4` = Bad file sequence number.
`5` = Insufficient disk space to store incoming files.
`6` = Too many files interrupted.
`7` = An internal error occurred in the process.
`8` = The file receive process was terminated in response to the UPD:CSCANS-STOP input message.
`9` = An I/O error occurred in writing a file to disk.
`10` = The remote sender aborted transmission.
`11` = A bad disconnect message was received from the sender.
`12` = CSCANS password file does not exist.
`13` = Security violation, too many unauthorized connection attempts.

m = Reason for termination. Valid values are:

`1` = A bad argument was passed to the file receive process.
`2` = Failed stat call on base directory.
`3` = Failed ustat call on base directory.
`4` = Could not enable reception of messages.
`5` = Failed to read connect message or received invalid connect message from the remote sending system.
`6` = A `UPD:CSCANS` request failed because of invalid request message.

n = The system error number. The system error number will be printed if *a*=2, 3 or 4.

4. ACTION TO BE TAKEN

Verify that all files have been received. If required, try to download software update again later.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

```
UPD:CSCANS;REPT
UPD:CSCANS;STOP
```

Output Message(s):

```
UPD:CSCANS-REPT
```

CIP 254-303-106 *Lucent Technologies 3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

TYPE . . . . . Output
MESSAGE CLASS . . MTCE

1. FORMAT

```
UPD CSCANS REPORT:
      a FILE RECEIVED UNDER b:
       c
      .
      .
      .
      FILE CURRENTLY DOWNLOADING: c
      ELAPSED TIME dd:dd SPACE REMAINING e
      [f ERROR g]
```

2. REASON FOR OUTPUT

To report the current status of a software update download session through Customer Service Computer Access Network Standards (CSCANS) machine. This report displays the number of files received, and the name of the file currently downloading. It also displays the total time used for receiving software update files and the amount of disk space available for receiving more software update files.

3. VARIABLE FIELD DEFINITIONS

a = The number of files received.

b = Complete path name of the software update files received.

c = The name of the files received.

Note: The file names displayed in *c* may not be consistent with the actual file names seen under the software update directory. This is the result of the software update expansion mechanism which changes the file name from the compressed file name to the original file name.

d = The total number of hours and minutes used for receiving files, in the form of hours:minutes.

e = Amount of space remaining under `/etc/bwm` that can be used to receive more software update files.

f = Pathname of a file issued by the sending end which was not received by the CSCANS file receive process.

g = Error code specifying the reason why the file was not received by the CSCANS file receive process. Valid values are:

`01` = Insufficient space on disk to store the file.
`02` = File length exceeds the maximum length permitted.

SEE PROPRIETARY NOTICE ON COVER PAGE

03 = The pathname being processed matches that of a file already on disk.
04 = Could not create incoming file on disk.
05 = File transmission was interrupted.

4. ACTION TO BE TAKEN

Verify that all files have been received. If the software update expansion mechanism is not turned on, the file names in the software update directory should be consistent with those from CSCANS. If the software update expansion mechanism is turned on, the files in the software update directory should be the expanded version of the files sent through the CSCANS machine.

5. ALARMS

None.

GENERIC . . . . . UNIX RTR R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL

1. FORMAT

This message has five formats.

[1] `UPD FLASH DFC` *a* [`CHECKSUM`] `NOT STARTED` *b c*

[2] `UPD FLASH DFC` *a* [`CHECKSUM`] `STOPPED` *b c*

[3] `UPD FLASH DFC` *a* [`CHECKSUM`] `ERROR` *b c*

[4] `UPD FLASH DFC` *a* [`CHECKSUM`] `ABORTED` *b*

[5] `UPD FLASH DFC` *a* [`CHECKSUM`] `COMPLETED` *d*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:FLASH;DFC` input command.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the disk file controller (DFC).

b = Process step or reason code:

f03 — failed to open the ECD

f04 — see DKDRV report on the ROP

f06 — failed to get UCB by name

f07 — Invalid DFC model

f08 — unable to open the pumpfile

f09 — failed to open pumpcode file

f0c — failed to allocate buffer

f0e — failed to read the pumpfile header

f13 — failed to reserve the UCB

f16 — failed to assign SDF name for DFC

f19 — failed to open SDF for DFC

f1b — failed to enable message reception

f20 — invalid pumpcode file

f25 — unable to `lseek()` to beginning of file

SEE PROPRIETARY NOTICE ON COVER PAGE

f2a — DFC auto pump failed

f2e — DFC pump failed

f31 — DFC pump failed notification

f34 — process timed out

f37 — failed to close special device file

f3a — failed to release special device file

f3c — failed to un-reserve UCB

f3e — failed to close ECD

f3f — failed to close pumpfile

f41 — unable to read pumpfile

f44 — message to port failure

f47 — message reception failure

f4c — terminated externally with signal

f4e — invalid header magic number

f51 — invalid pump header

f54 — unused portion of the pump header is not zero

f61 — failed to read the pumpfile header

f63 — invalid header magic number

f65 — unable to open pumpfile

f67 — fw and pumpfile are incompatible - issue

f69 — fw and pumpfile are incompatible - generic

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = There are two formats for this field:

`VALID PUMPCODE` — pumpcode has passed the hashsum check

`INVALID PUMPCODE` — pumpcode failed the hashsum check

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried. The pump failure can also be caused by the incompatibility between the pumpcode and firmware. The pump can also fail due to a corrupted pumpcode file. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

Output Appendix
SYSERR-APP

Input Messages
UPD:FLASH;DFC

Output Messages
UPD-FLASH,DFC

ID . . . . . UPD-DISPLAY-A
GENERIC . . . . . UNIX RTR R1.5, R6.4 and R21.3
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `UPD DISPLAY REPT [CONTINUE]`
a

[2] `UPD DISPLAY` *b*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:DISPLAY` command.

Format 1 is output to give information about the progress of displaying an update, or to report an error encountered while processing the display.

Format 2 is output upon termination of the process.

3. VARIABLE FIELD DEFINITIONS

a = Information about the progress of displaying an update, or report of an error encountered while processing the display. Error messages may be one of the following six categories.

`usage` — reports an error using field update
`internal` — reports an error found by the field update code
`system` — reports a system error that occurred
`COFF` — reports an error in the internal format of a file
`database` — reports an error in the database
`filesys` — reports an error in the file system

See the output Field Update Error Codes Appendix, `FUEC-APP`, for explanations of error codes which may appear in error messages.

b = Termination mode of the input message `UPD:DISPLAY`. The mode will be either `COMPLETED` for successful completion, or `ABORTED` for termination with errors.

4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

If the information requested in the `UPD:DISPLAY` input message is not found in any of the records in the field update database, or if the field update database contains no records, then only the `UPD-DISPLAY, COMPLETED` output message will be printed (no `UPD-DISPLAY, REPT` message will be printed).

5. ALARMS

None. This automatically-generated report is for information only.

2. REASON FOR OUTPUT

Format 1 reports the result of executing the UPD:DISPLAY input message in verbose form.

Format 2 reports the result of executing the UPD:DISPLAY input message in normal form.

Format 3 is printed when the SUM option is chosen in UPD:DISPLAY.

Format 4 is printed when the BACKLOG option is chosen in UPD:DISPLAY.

3. VARIABLE FIELD DEFINITIONS

a = Unique internally assigned update number. This uniquely identifies each update record.

b = The generic identifier as it appears in the ECD.

c = Software update package name.

d = Pathname of official product being updated.

e = Processor type for this update.

f = Time and date of creation of this update item, in the form weekday month day hour:minute:second year.

g = The updated process's utility identification number.

h = The process ID of the running version of the process. This is only set for killable function replacement updates.

i = The software update package sequence number for this update which appears in the HDR file.

j = The previous software update package sequence number.

k = Pathname of a working file.

l = The sum of the saved bolo file used for verifying its integrity.

m = The current status flag for this update item. Below are the particular flags that are set 4 per line. Valid values are:

PERMED = Update has been made official and is permanent in the system.
INMEMORY = Update has been installed in incore memory.
TEMPED = The new version of the product file has been installed in a temporary state.
OGEN = Update has been run through the overwrite generator to convert the relocatable .m file(s) into an absolute .u file.
OILD = Update has been run through the overwrite incremental loader.
RECLAIMED = Update has been audited to reclaim patchspace.

SEE PROPRIETARY NOTICE ON COVER PAGE

RECL_ABRT = Update aborted attempting to reclaim patchspace.
SGEN = Update has been run through system generation to recreate the boot image to include this update.

n = The attribute flag for this update item. Below are the particular flags that are set 4 per line. Valid values are:

ACF = Update is to an always contiguous product which means the product must always remain contiguous.
BOOTIMAGE = Update product is part of the boot image.
KERNAL = Update product is a kernel level process.
SUPERVISOR = Update product is a supervisor level process.
SHRLIB = Update product is a shared library.
KILLABLE = Update product is a killable process.
BYTER = Update is a byte overwrite type.
CRC_INTERNAL = Update has internally stored CRC value.
FUNCR = Update is a function overwrite type.
FILER = Update is a file replacement type.
PSEUDO = This update record is a dummy update used for place holding.
CRC_EXTERNAL = Update has externally stored CRC value.
3B_PROCESS = Update is to a process that runs on the 3B20/3B21.
PACKINFO = Update uses PACKINFO= to denote update products.
UFFN = Update uses UFFN= to denote update products.
NEW_PRODUCT = This is a newly introduced update product.

o = For byter updates only, the starting address of the byter overwrite.

p = New byter update values.

q = Old byter update values.

r = CONTINUES if there is additional information to be printed for this update record otherwise COMPLETED.

4. ACTION TO BE TAKEN

There is no action to take since this is an only informational output message.

5. ALARMS

None.

UPD:REPT

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . UPD-FLASH
GENERIC . . . . . UNIX RTR R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `UPD FLASH MEMORY` *a b* `STARTED`

[2] `UPD FLASH MEMORY` *a b* `NOT SUPPORTED` *c*

[3] `UPD FLASH MEMORY` *a b* `ABORTED` *d*

[4] `UPD FLASH MEMORY` *a b* `IN PROGRESS` *e*

[5] `UPD FLASH MEMORY` *a b* `FAILED` *f*

[6] `UPD FLASH MEMORY` *a b* `COMPLETED`

2. REASON FOR OUTPUT

To report the start and execution of the `UPD:FLASH` input message. FLASH is a device designed to be programmed in a system with a standard 5 volt supply.

3. VARIABLE FIELD DEFINITIONS

a = Member name (`HSDC`, `MTTYC`, `SCSDC`, `SDLC`, or `TTYC`).

b = Member number (0-255).

c = Reason why the device is not supported.

`101` — The member name is not that of a peripheral controller which supports the updating of FLASH memory.

`104` — The value in the u_mv field of the ECD indicates that this version of the peripheral controller does not support the updating of FLASH memory.

`111` — The value in the pcpackcode field of the ECD indicates that this peripheral controller does not support the updating of FLASH memory.

`112` — The u_dtype field in the ECD does not indicate the type of peripheral controller associated with the "member name."

`113` — Not allowed to update FLASH memory (lcall failed).

`114` — Not allowed to update FLASH memory (no permission).

`115` — Timeout - no response from update permission checking process.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Reason why the UPD:FLASH request was aborted.

`102` — Cannot open /dev/ecd.

`103` — Cannot get ucb for device from ecd for device.

`105` — Cannot reserve ucb for device.

`106` — Cannot create output file used by IODRV to update FLASH memory.

`107` — Cannot send message to IODRV to update FLASH memory.

`108` — System indicates message there but message not from IODRV process.

`109` — Update FLASH memory job timed out.

`110` — Cannot write all of data to output file used to update FLASH memory.

`116` — Not enough FLASH data files to update FLASH memory.

`117` — More FLASH data files than are needed to update FLASH memory.

`118` — FLASH data file has a size other than 49160.

`200` — System function getdbseg failed.

`201` — System function lla_iatt failed.

`202` — System function lla_rdget failed.

`203` — Get UCB RID of possible peripheral controller unit failed.

`204` — Get up pointer of possible peripheral controller unit failed.

`205` — The up pointer does not point to an IOP.

`206` — The IOP to which this peripheral controlled is not in active state. The IOP must be active before the FLASH memory on the peripheral controller can be updated.

`207` — The peripheral controller is not in OOS state. The peripheral controller must be OOS before the FLASH memory on the board can be updated.

e = Count of the *IN PROGRESS* messages displayed. The first message is displayed after a message has been sent to the IODRV process requesting that the FLASH memory on the peripheral controller be updated. Subsequent messages are displayed while the FLASH memory is in the process of being updated by the IODRV process.

f = Reason why the FLASH memory on the peripheral controller was not updated. Contact your technical support center for assistance.

`10080` — Cannot get ucb into uarray.

SEE PROPRIETARY NOTICE ON COVER PAGE

`10081` — Failure returned by "proc_diag_ufm".

`10082` — Invalid mv value.

`10083` — Could not get a timing chain entry.

`b0000` — Timeout in peripheral controller sequence number 0.

`b0001` — Timeout in peripheral controller sequence number 1.

`b0002` — Timeout in peripheral controller sequence number 2.

`b0003` — Timeout in peripheral controller sequence number 3.

`b0004` — Timeoui in peripheral controller sequence number 4.

`b0005` — Timeout in peripheral controller sequence number 5.

`b0006` — Timeout in peripheral controller sequence number 6.

`b0007` — Timeout in peripheral controller sequence number 7.

`b0008` — Timeout in peripheral controller sequence number 8.

`b000c` — FLASH memory timeout.

`1a000b` — Could not queue command to peripheral controller.

`1a000c` — Could not queue command to peripheral controller.

`1a000d` — Could not queue command to peripheral controller.

`1a000e` — Could not queue command to peripheral controller.

`1a000f` — Unable to get page table address to read version number.

`1a0010` — Could not queue command to peripheral controller.

`1a0011` — Could not queue command to peripheral controller.

`1a0012` — Could not queue command to peripheral controller.

`1a0013` — Unable to allocate buffer for update FLASH memory return message.

`1a0014` — Bad internal sequence number.

`1a0020` — Could not get a timing chain entry.

`1a0021` — Could not get a timing chain entry.

`1a0022` — Could not get a timing chain entry.

`1a0023` — Could not get a timing chain entry.

`1a0024` — Could not get a timing chain entry.

`1a0025` — Could not get a timing chain entry.

`1a0026` — Could not get a timing chain entry.

`1b000a` — Attempt to free use of pump code file failed.

`1b000b` — Cancellation of request for pump code file failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`1b000c` — Unable to assign a DMA slot.

`1b000d` — Could not queue command to peripheral controller.

`1b000e` — Could not queue command to peripheral controller.

`1b000f` — Could not queue command to peripheral controller.

`1b0010` — Unable to get a page table address.

`1b0011` — Unsuccessful return from the "cfread" function.

`1b0012` — FLASH memory on the board is already being updated.

`1b0014` — Could not get ucb associated with peripheral controller.

`1b0015` — Cancellation of request for pump code file failed.

`1bXX17` — All of the FLASH files are not present. "XX" is the relative number of the FLASH file that is not there.

`1bXX18` — A FLASH data file has an incorrect size, not 49160. "XX" is the relative number of the FLASH file that is not there.

`1b0019` — There are more FLASH data files than expected.

`1b0020` — Could not get a timing chain entry.

`1b0021` — Could not get a timing chain entry.

`1b0022` — Could not get a timing chain entry.

`1b014X` — Unsuccessful read of FLASH data file. Requester stack overflow. Requester stack overflow. "X" is the relative number of the failing FLASH data file.

`1b024X` — Unsuccessful read of FLASH data file. File request stack overflow. "X" is the relative number of the failing FLASH data file.

`1b034X` — Unsuccessful read of FLASH data file. Message buffer overflow. "X" is the relative number of the failing FLASH data file.

`1b044X` — Unsuccessful read of FLASH data file. Failure in setting timer. "X" is the relative number of the failing FLASH data file.

`1b054X` — Unsuccessful read of FLASH data file. Could not open common file, bad status in ack msg. "X" is the relative number of the failing FLASH data file.

`1b064X` — Unsuccessful read of FLASH data file. Could not get segment number of file buffer for "file manager" read. "X" is the relative number of the failing FLASH data file.

`1b074X` — Unsuccessful read of FLASH data file. Memory manager unable to allocate memory for the IODRV. "X" is the relative number of the failing FLASH data file.

SEE PROPRIETARY NOTICE ON COVER PAGE

`1b084X` — Unsuccessful read of FLASH data file. Error in reading common file. "X" is the relative number of the failing FLASH data file.

`1b094X` — Unsuccessful read of FLASH data file. Open or read message to "file manager" timed out. "X" is the relative number of the failing FLASH data file.

`1b0a4X` — Unsuccessful read of FLASH data file. File in invalid state upon timeout. "X" is the relative number of the failing FLASH data file.

`1b0b4X` — Unsuccessful read of FLASH data file. Zero Length File expected for FLASH programming. "X" is the relative number of the failing FLASH data file.

`1cZZ0a` — Peripheral controller FLASH programming failure.

`1cZZ0b` — Peripheral controller FLASH programming failure.

`1cZZ0c` — Peripheral controller FLASH programming failure.

`1c000d` — Peripheral controller not plugged in.

`1cZZ0e` — Peripheral controller FLASH programming failure.

`1cZZ0f` — Peripheral controller FLASH programming failure.

`1cZZ10` — Peripheral controller FLASH programming failure.

`1cZZ11` — Peripheral controller FLASH programming failure.

`1cZZ12` — Peripheral controller FLASH programming failure.

`1cZZ13` — Peripheral controller FLASH programming failure.

`1c0014` — Invalid sequence number.

`1c0020` — Could not get a timing chain entry.

`1c0021` — Could not get a timing chain entry.

`1c0030` — Unidentified / unexpected response for FLASH programming from peripheral controller.

`1c0031` — Unidentified / unexpected response for FLASH programming from peripheral controller.

`1c0032` — Unidentified / unexpected response for FLASH programming from peripheral controller.

`1c0033` — Unidentified / unexpected response for FLASH programming from peripheral controller.

`1c0034` — Unidentified / unexpected response for FLASH programming from peripheral controller.

`1c0035` — Unidentified / unexpected response for FLASH programming from peripheral controller.

SEE PROPRIETARY NOTICE ON COVER PAGE

`1c0036` — Unidentified / unexpected response for FLASH programming from peripheral controller.

`1c0037` — Unidentified / unexpected response for FLASH programming from peripheral controller.

`1c0038` — Unidentified / unexpected response for FLASH programming from peripheral controller.

ZZ = Failing completion code from peripheral controller.

`02` — Bad checksum on pump.

`03` — Invalid job code.

`04` — Bad byte count for pump command.

`05` — Bad restore parameters .

`06` — Invalid pump state.

`07` — No PSA record found in pump file or reached end of data too soon.

`08` — Failure to program FLASH memory.

`09` — Failure to clear and erase FLASH memory.

`0a` — Amount of Data exceeds size of FLASH memory.

`0b` — Invalid hash sum over updated FLASH memory.

4. ACTION TO BE TAKEN

No action is required for `STARTED`, `IN PROGRESS`, or `COMPLETED` messages.

`ABORTED` or `NOT-SUPPORTED` messages usually indicate that a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

For `FAILED` messages, contact your technical support center for assistance.

The receive only printer (ROP) output and IODRV log files can be helpful in determining the problem. IODRV log files are `/etc/log/IODRVLOG0` and `/etc/log/IODRVLOG1`. If necessary, seek technical assistance.

5. ALARMS

None. This is a manually-requested report.

6. REFERENCES

Input Message(s)
`UPD:FLASH`

SEE PROPRIETARY NOTICE ON COVER PAGE

ID . . . . . UPD-FTRC
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `UPD FTRC REPT`
a

[2] `UPD FTRC` *b*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:FTRC` command.

Format 1 is output to give information about the progress of a function trace, or to report an error encountered while processing the function trace.

Format 2 is output upon termination of the process.

3. VARIABLE FIELD DEFINITIONS

a = Information about the progress of a function trace, or report of an error encountered while processing the function trace. Error messages may be one of the following six categories.

`usage` — reports an error using field update
`internal` — reports an error found by the field update code
`system` — reports a system error that occurred
`COFF` — reports an error in the internal format of a file
`database` — reports an error in the database
`filesys` — reports an error in the file system

See the output Field Update Error Codes Appendix, `FUEC-APP`, for explanations of error codes which may appear in error messages.

b = Termination mode of the input message `UPD:FTRC`. The mode will be either `COMPLETED` for successful completion, or `ABORTED` for termination with errors.

4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

Input Message
UPD:FTRC

ID . . . . . UPD-G,APPLPROC
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has nine formats.

[1] `UPD GEN APPLPROC CANNOT GET THE TERMINAL TYPE`

[2] `UPD GEN APPLPROC ERROR: CANNOT GET THE TERMINAL TYPE`

[3] `UPD GEN APPLPROC ERROR: ARG KEYWORD ON CMD LINE WITHOUT ARGUMENT`

[4] `UPD GEN APPLPROC ERROR: INVALID DATA KEYWORD ON CMD LINE`

[5] `UPD GEN APPLPROC ERROR: CANNOT EXECUTE THE APPLPROC`

[6] `UPD GEN APPLPROC APPLICATION PROCESS IS EXECUTING`

[7] `UPD GEN APPLPROC APPLICATION PROCESS EXECUTED WITH ARGUMENT`

[8] `UPD GEN APPLPROC APPLICATION PROCESS EXECUTED WITHOUT ARGUMENT`

[9] `UPD GEN APPLPROC APPLICATION PROCESS HAS TERMINATED SUCCESSFULLY`

2. REASON FOR OUTPUT

To report the execution status of the dummy application process and whether or not it was executed with an argument on the command line. If an application inserts their own application process in place of the dummy application process, these output messages may no longer be valid.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

For formats 1 - 9, when the dummy application process is executed, no action needs to be taken, since the dummy application process performs no actions except print out these output messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is a manually-requested report.

GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has six formats.

[1] `UPD GEN BACKOUT COMPLETED`

[2] `UPD GEN BACKOUT STOPPED WITH ERROR CODE` *a*

[3] `UPD GEN BACKOUT UPON COMPLETION BOOT SYSTEM SELECTING` *b*

[4] `UPD GEN BACKOUT TRANSFERRING CONTROL TO APPLICATION`

[5] `UPD GEN BACKOUT APPLICATION COMPLETION WITHIN` *c*`SECONDS`

[6] `UPD GEN BACKOUT NOT STARTED CONFLICT WITH CURRENT SYSTEM STATUS`

2. REASON FOR OUTPUT

To report the result of executing a `UPD:GEN;BACKOUT` input message, and to inform the craft as to which boot option should be used when booting the old generic.

3. VARIABLE FIELD DEFINITIONS

a = Error code causing the process to stop. See the System Update Error Codes Appendix, `SUPR-APP`.

b = Boot options:

`PRIMARY ROOT` — Select primary root on emergency action interface (EAI).

`BACKUP ROOT` — Select backup root on EAI.

`MHD {0|1}` — Force moving head disk (MHD) specified on EAI (off-line disk method only).

c = Number of seconds for application processing.

4. ACTION TO BE TAKEN

Format 1 indicates the backout process has completed. There is no action to be taken when this output occurs.

Format 2 indicates that the backout stopped due to an error. Error codes are defined in the System Update Error Codes Appendix, `SUPR-APP`. Along with each error code is a

description of the appropriate action to take.

Format 3 indicates that the backout is completed, boot the system as directed in this message. The force for `MHD {0/1}` should be left in effect until instructions to remove it are output by `UPD-GEN, COMMTS` or `UPD-GEN, RESTORE`.

Formats 4 and 5 are informal messages and do not require any action to be taken.

Format 6 indicates that a condition exists which will not allow the `UPD-GEN, BACKOUT` process to start. Possibly `/prc/supr/backout` does not exist or is not executable. If the file exists and is not executable, make it executable. If the file does not exist or does exist and is already executable retry the command. If the message is output again, seek technical assistance.

5. ALARMS

None.

MESSAGE CLASS . . MAINT

1. FORMAT

This message has four formats.

[1] `UPD GEN COMMIT COMPLETED`

[2] `UPD GEN COMMIT STOPPED WITH ERROR CODE` *a*

[3] `UPD GEN COMMIT TRANSFERRING CONTROL TO APPLICATION`

[4] `UPD GEN COMMIT APPLICATION COMPLETION WITHIN` *b* `SECONDS`

2. REASON FOR OUTPUT

To report the result of executing a `UPD:GEN;COMMIT` input message.

3. VARIABLE FIELD DEFINITIONS

a = Error code causing the process to stop. See the System Update Error Codes Appendix, `SUPR-APP`.

b = Number of seconds for application processing.

4. ACTION TO BE TAKEN

For Formats 1,3, and 4, take no action.

For Format 2, comply with instructions given. Craft execution errors can be corrected by examining the procedures used for execution of the command. If any other errors occur, seek technical assistance.

5. ALARMS

[8] `UPD GEN ENTER TRANSFERRING CONTROL TO APPLICATION`

[9] `UPD GEN ENTER APPLICATION COMPLETION WITHIN` *d* `SECONDS`

[10] `UPD GEN ENTER UPDATING PARTITION` *e* `IN MHD` *f*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:GEN;ENTER` input message, and to provide status information and instructions concerning the update.

3. VARIABLE FIELD DEFINITIONS

a = Error code causing the process to stop. See the System Update Error Codes Appendix, `SUPR-APP`.

b = Number of additional blocks of data written since last output message of this type.

c = Member number of disk to be forced off-line for data entry (if off-line disk method being used).

d = Number of seconds for application processing.

e = Number of a backup partition that needs to be updated from its primary.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = Member number of off-line disk in which partition is being updated.

4. ACTION TO BE TAKEN

Format 1 indicates the proceed enter has completed. There is no action to be taken when this output occurs.

Format 2 indicates that enter stopped due to an error. Error codes are defined in the System Update Error Codes Appendix, SUPR-APP. Along with each error code is a description of the appropriate action to take.

Format 3 indicates to mount the appropriate tape and CONTINUE the system update procedure.

Formats 4 - 10 are informational messages and do not require any action to be taken.

5. ALARMS

`pf_getndx:` invalid pfile.

`pf_getndx:` invalid request.

`pf_offset:` invalid request.

`pf_open:` could not find the file *b*.

`pf_segclass:` segment *d* of process *b* has fsize !=0; csize = 0.

`pf_segclass:` segment *d* of process *b* has fsize = csize =0.

`pf_segclass:` segment *d* of process *b* is marked common but core size = 0.

`pf_sgflags:` invalid pfile request.

`pf_sgflags:` invalid request.

`sgen:` size of boot image is *e* pages.

`spcb_firstsn:` exceeded maximum number of pfile segments.

`spcb_put:` write failed.

`spcb_seglist:` access of child lowered.

`spcb_seglist:` segment in *b* is marked common, but csize is zero.

`va_putpgt:` write failed.

`va_putsgt:` write failed.

`va_resume:` out of room in kboot's address space.

`va_setseg:` segment already in use.

`pf_getfile:` file *b* must be 3bswabbed.

b = Name of file.

c = Number of blocks the file should have.

d = Segment number.

e = Number of pages.

4. ACTION TO BE TAKEN

A successful run will print a message stating the amount of memory needed to boot the system. Ensure that the system is configured with this amount.

5. ALARMS

None. This alarm is a manually-requested report.

6. REFERENCES

OMDB Key
This message has an OMDB key 578.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has seven formats.

[1] `UPD OMDB COMPLETED FOR THE FOLLOWING KEYS:`
a

[2] `UPD OMDB NO DATABASE ENTRY FOUND FOR THE FOLLOWING KEYS:`
b

[3] `UPD OMDB FAILED`
`UNABLE TO ACCESS /cft/spl/omdb`

[4] `UPD OMDB COMPLETED`

[5] `UPD OMDB CANNOT OPEN OR CREATE LOGFILE`
`UPDATE NOT LOGGED`

[6] `UPD OMDB ABORTED`
`UNABLE TO SEND REQUEST TO CSOP`

[7] `UPD OMDB NOT STARTED`
`CONFLICT WITH CURRENT SYSTEM STATUS` *c*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:OMDB` input message.

3. VARIABLE FIELD DEFINITIONS

a = List of message keys for which the `UPD:OMDB` completed successfully.

b = List of message keys for which the `UPD:OMDB` failed.

c = Further explanation of error: `SYNTAX ERROR, INVALID KEY, TOO MANY KEYS, INVALID MSGCLS, INVALID ALARM`.

4. ACTION TO BE TAKEN

For Format 2, verify that the key(s) was entered correctly.

For Format 3, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the `OP:STATUS;LISTDIR` command for `/cft/spl/omdb`.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5 indicates a possible file system problem, such as lack of available disk space. The update being processed is not saved in the OMDB logfile (`/cft/spl/OMDB_LOG`).

For Format 6, verify that the coordinator of spooler output process (CSOP) is running.

For Format 7, verify that the input message was entered correctly.

1. FORMAT

This message has two formats.

[1] `UPD OMIT REPT`
a

[2] `UPD OMIT` *b*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:OMIT` command.

Format 1 is output to give information about the progress of omitting an update, or to report an error encountered while processing the omission.

Format 2 is output upon termination of the process.

3. VARIABLE FIELD DEFINITIONS

a = Information about the progress of omitting an update, or report of an error encountered while processing the omission. Error messages may be one of the following six categories.

`usage` — reports an error using field update
`internal` — reports an error found by the field update code
`system` — reports a system error that occurred
`COFF` — reports an error in the internal format of a file
`database` — reports an error in the database
`filesys` — reports an error in the file system

See the Field Update Error Codes output Appendix, `FUEC-APP` for explanations of error codes which may appear in error messages.

b = Termination mode of the input message `UPD:OMIT`. The mode will be either `COMPLETED` for successful completion, or `ABORTED` for termination with errors.

4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

1. FORMAT

This message has two formats.

[1] `UPD` *a* `REPT`
b

[2] `UPD` *a c*

2. REASON FOR OUTPUT

To report the result of executing a `UPD` command.

3. VARIABLE FIELD DEFINITIONS

a = The identification field of the field update input message producing this output. (Identification fields are APPLY, BLDBOOT, BKOUT, CLR, DISPLAY, FTRC, OMIT, PERM, PURGE, RECLAIM, RESET, VFY.)

b = Messages from the field update processes. These messages may contain information about the progress of an update or report an error encountered while processing the update. Error messages fall into six categories:

`Coff error` — reports an error in the internal format of a file.

`Database error` — reports an error in the database.

`Filesys error` — reports an error in the file system.

`Internal error` — reports an error found by the field update code.

`System error` — reports a system error that occurred.

`Usage error` — reports an error using field update.

c = Termination mode of the input message. The mode will be either `COMPLETED`, for successful completion or `ABORTED`, for termination with errors.

4. ACTION TO BE TAKEN

Take no action for informational reports. If a command aborts, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is a manually-requested report.

ID . . . . . UPD:REPT-B
GENERIC . . . . . UNIX RTR R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

```
UPD REPT  a
      b
      [c]
      [PATHNAME: f]
      [VALUES g]
      [TAG=d ERRNO=e]
```

2. REASON FOR OUTPUT

To specify errors or events that occurred as a result of performing a software update activity.

3. VARIABLE FIELD DEFINITIONS

a = category of the report message. Valid values are:

`INFORMATION` = Informational message associated with some software update activity.

`SYSTEM ERROR` = System error encountered during some software update activity.

`USER ERROR` = User error encountered attempting to execute a software update command. Most often the result of bad input to the command.

`WARNING` = A non-fatal problem was encountered while executing a software update activity that did not cause the command to abort, but may require attention.

b = A brief text phrase describing an error or providing information associated with a software update activity.

c = The SU name associated with the report message.

d = A tag value which indicates the location where the error message originated from. This value is used by LUCENT personnel for troubleshooting purposes.

e = A unix system error number.

f = Pathnames of the files associated with this report 1 per line.

g Values associated with the text message in *a* 4 per line. These provide the data which caused the text message to be printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For INFORMATION category messages, no action is necessary. For the SYSTEM ERROR, USER ERROR, and WARNING categories, the specific action required depends on the b field in the message. Most of these reports require technical assistance; however, some can be corrected and are listed below alphabetically. If these actions do not succeed, then seek technical assistance.

`FILE MANAGER CALL FAILED DUE TO BUSY FILE` = This indicates that a file manager operation on the pathname(s) given in field *f* cannot be performed because a process or user has one of those files open. If this problem is corrected a retry of the failed command will usually succeed.

`MULTIPLE INVOCATIONS OF SUucm NOT ALLOWED` = There is already a SU command running which must be completed before another command is given. Retry the command at a later time.

`NOT ENOUGH FREE SPACE TO INSTALL FILE` = Check the filesystem referred to by *f* for un-necessary files which may be using up all of the space.

`PREVIOUS SU HAS TEMPORARY UPDATE ON THIS FILE` = The previous SU *c* must be made official before the current SU can be applied because they have overlapping updates.

`THIS IS NOT THE LATEST SU THAT CAN BE BACKED OUT` = Use the display commands on 1950 MCC page to determine which SU needs to be backed out first.

`UPDATE ITEM IS IN OFFICIAL STATUS` = The SU in *c* has at least one update made official. That means that a SU must be backed out using the back out last official (BOLO) SU mechanism on the 1950 MCC page.

5. ALARMS

None

ID . . . . . UPD-RESET
GENERIC . . . . . UNIX RTR R1.5, R6.4 and R21.3
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `UPD RESET REPT`
a

[2] `UPD RESET` *b*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:RESET` command.

Format 1 is output to give information about the progress of resetting an update, or to report an error encountered while resetting the update.

Format 2 is output upon termination of the process.

3. VARIABLE FIELD DEFINITIONS

a = Information about the progress of resetting an update, or report an error encountered while resetting the update. Error messages may be one of the following six categories.

`usage` — reports an error using field update
`internal` — reports an error found by the field update code
`system` — reports a system error that occurred
`COFF` — reports an error in the internal format of a file
`database` — reports an error in the database
`filesys` — reports an error in the file system

See the Field Update Error Codes output Appendix `FUEC-APP` for explanations of error codes which may appear in error messages.

b = Termination mode of the input message `UPD:RESET`. The mode will be either `COMPLETED` for successful completion, or `ABORTED` for termination with errors.

4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This automatically-generated report is for information only.

6. REFERENCES

Input Message
UPD:RESET

Output Appendix
FUEC-APP

ID . . . . . UPD-UPNM
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has three formats.

[1] `UPD UPNM - AUTO BACK-OUT DELAY STARTED`

[2] `UPD UPNM DUFR WARNING: -2: UPDATE REQUEST ON NAMED DATA SEGMENT`

[3] `UPD UPNM DUFR WARNING: -4: TARGET PROCESS SEGMENT NAMES CLEARED`

2. REASON FOR OUTPUT

To specify an action or provide information outside of the normal field update reporting scheme (through UPD).

Format 1 indicates that the in-core copy of the target process has been overwritten, and the automatic backout delay has started (default is five minutes). Should a phase 1 occur before the delay period completes, the update will be backed out, leaving the update in a pending temp state. A continue may be requested.

Format 2 is provided when a killable kernel processes (KPUPDATE) feature is the target process and a named data segment has been encountered (the name is included in the SDE for the segment, located in the kernel's address space). Normally, any (text) segment DUFR attaches to will have its name cleared to prevent inconsistencies should the target process die. For named data segments, DUFR will attach to the segment and see that it is overwritten, but the name will NOT be cleared.

Format 3 is given to inform the user that during an update on a KPUPDATE type process, one or more (text) segment names were cleared.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

Format 1 tells the user to begin any sanity testing before the update is made temporary, in case sanity degrades to the point where a backout cannot be made manually.

Format 2 informs the user of the named data segments, as there now is added risk of data inconsistencies if the target process dies and is recreated during update.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 3, the user should be aware of the situation in case the target process' segment name is important to other application programming. Otherwise, the warning may be ignored.

5. ALARMS

None. This alarm is a manually-requested report.

TYPE . . . . . Output

1. FORMAT

```
UPD VERSION {APPLY|BKOUT} [MISMATCH]

    PARTITION       VERSION         BWM
    a               b               c
    .               .               .
    .               .               .
    .               .               .
```

2. REASON FOR OUTPUT

To respond to the input message UPD:VERSION.

3. VARIABLE FIELD DEFINITIONS

APPLY = The input message used the APPLY keyword.

BKOUT = The input message used the BKOUT keyword.

MISMATCH = The applied or backed out generic text version and/or software update level does not logically follow from the current generic text versions and/or software update levels.

a = Partition name. The pseudo-partition name APPLY or BKOUT refers to the generic text string specified in the UPD:VERSION input command. The pseudo-partition ECD refers to the 'systype' and 'genid' items from the 'eaiopt' form in the equipment configuration database.

b = Generic text version of this partition.

c = Software update level of this partition. The ECD partition does not have a software update level.

4. ACTION TO BE TAKEN

If a mismatch was indicated, check that the generic text specified on the last UPD:VERSION input message was correct. If incorrect, re-enter with correct information. If it was correct, then check and correct, if need be, the items 'systype' and 'genid' on the 'eaiopt' form using ECD recent change. The key is 'option_name: eaiop0'.

MESSAGE CLASS . . MAINT

1. FORMAT

This message has two formats.

[1] `UPD VFY REPT`
a

[2] `UPD VFY` *b*

2. REASON FOR OUTPUT

To report the result of executing a `UPD:VFY` command.

Format 1 is output to give information about the progress of verifying an update, or to report an error encountered while verifying the update.

Format 2 is output upon termination of the process.

3. VARIABLE FIELD DEFINITIONS

a = Information about the progress of verifying an update, or report of an error encountered while verifying the update. Error messages may be one of the following six categories.

`usage` — reports an error using field update
`internal` — reports an error found by the field update code
`system` — reports a system error that occurred
`COFF` — reports an error in the internal format of a file
`database` — reports an error in the database
`filesys` — reports an error in the file system

See the Field Update Error Codes output Appendix `FUEC-APP` for explanations of error codes which may appear in error messages.

b = Termination mode of the input message `UPD:VFY`. The mode will be either `COMPLETED` for successful completion, or `ABORTED` for termination with errors.

4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

ID . . . . . UPD:VFYCON
GENERIC . . . . . UNIX RTR R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MTCE

1. FORMAT

```
UPD VFYCON - TABLE OF a INCONSISTENCIES
        SUNAME          UPD     PRODUCT  TYPE
        ========================================================
           b      c    d   e

UPD VFYCON - TABLE f
```

2. REASON FOR OUTPUT

To report all software update inconsistencies associated with temporary updates in the system, in response to a `UPD:VFYCON` input message or poke that performs SU inconsistency checks.

3. VARIABLE FIELD DEFINITIONS

a = TARGET processor that consistency check was run for. If none listed then all processors were checked.

b = Software update name associated with the inconsistency.

c = Update number in the SU database.

d = The product name associated with the inconsistency.

e = The type of inconsistency. Valid values are:

`UPDATE NOT INSTALLED IN PROCESSOR` = FUNCR or BYTER type update is not installed in processor memory meaning it is not activated.

`UPDATE NOT IN TEMPORARY STATE` = Update has lost filesystem temp meaning it is not activated.

`MISSING APPLY UFILE` = FUNCR or BYTER type update is missing a working file needed to install the update.

`MISSING APPLY PFILE` = FUNCR or BYTER type update is missing a working file needed to install the update.

`MISSING MIRROR FILE` = An always contiguous product is missing its mirror disk image which is required to software update the product.

`MISSING TEMPORARY FILE` = FILER update is missing a working file needed to install the update.

`MISSING OFFICIAL PRODUCT FILE` = This official version of a product being updated is missing. Technical assistance is required to clear this inconsistency.

`MISSING BOLO SAVEFILE` = Working files necessary to perform back out of last official SU are missing. Technical assistance is required to clear this inconsistency.

SEE PROPRIETARY NOTICE ON COVER PAGE

f = COMPLETED if only one inconsistency table or CONTINUES if there are additional tables to follow.

4. ACTION TO BE TAKEN

The normal recovery actions are to roll forward or roll backward the current temporary updates using a UPD:RCVRY input message, unless the inconsistency type above indicates that technical assistance is required.

5. ALARMS

None.

[26] VFY FILE PATH NAME TOO LONG *a*

[27] VFY FILE VERIFICATION FAILURE ON FILE *a*
STORED CRC VALUE = *h* CALCULATED CRC VALUE = *i*

[28] VFY FILE STOPPED - MOUNT OFF-LINE PARTITION FAILURE
CANNOT START A MOP BECAUSE ONE IS ALREADY RUNNING

2. REASON FOR OUTPUT

Formats 1 through 5 are printed to inform the user of the message's status.

Formats 6 through 28 are printed to inform the user of various problems which the VFY:FILE command has encountered.

3. VARIABLE FIELD DEFINITIONS

a = Name of the file for which the message is printed.

b = The size of the essential file (mod 2).

c = The calculated cyclic redundancy check (CRC) value for the essential file. For files which contain their own CRC information, this value should match the size of the file.

d = The number of files verified. This count includes files that failed verification.

e = The error message reported by /usr/bin/mop.

f = The line number in the specfile that contains the formatting error.

g = The off-line disk number specified as the argument to the DN keyword on the VFY:FILE command line.

h = The stored CRC value for the current file. If the CRC information is stored in /.crcvalues, this field contains both the size of file and the CRC.

SEE PROPRIETARY NOTICE ON COVER PAGE

i = The calculated CRC value for the current file. If the stored CRC information for this file is kept in `/.crcvalues`, this field contains both the calculated size of the file and the CRC.

4. ACTION TO BE TAKEN

If Formats 1 through 5 are printed, no action is required.

Format 6 indicates that `VFY:FILE` has terminated.

If Format 7 is printed, the mount off-line partition (MOP) process has failed. Examine the mop error message and take appropriate action.

If Format 8 is printed, the user has selected a database partition which does not represent a file system. Find the correct partition number and reenter the command.

If Format 9 is printed, one or more of the boot files is newer than the boot image identified in the message. Use `VFY:FILE` to verify the correctness of the boot files, and regenerate the out-of-date boot image.

Format 10 is generally printed because the user is attempting to use the GEN option on a file which is not executable and trying to store the CRC internally. These files must have their CRC information stored in `/.crcvalues`. If this is not the case, seek technical assistance.

If Formats 11, 13, 14, 16, 17, 23, or 27 are printed, seek technical assistance.

Format 12 indicates that a file is missing or does not have execute permission.

Format 15 is a warning message which may be ignored if CRC information is being generated for the first time. If this is not the case, seek technical assistance.

Format 18 indicates that `VFY:FILE` cannot find CRC information which is supposed to be in `/.crcvalues`. If the CRC information was present and has been lost, seek technical assistance.

If Format 19 is printed, `VFY:FILE` cannot open the file. This is usually an input error. If this is not the case, seek technical assistance.

Formats 20 and 21 indicate problems with specification file supplied to the FLIST parameter. Verify the correctness of the input command and the contents of the specification file.

Format 22 indicates that a field update is in progress for the current file. `VFY:FILE` will not run the CRC algorithm against this file until the update is made permanent.

If Format 24 is printed, mop has been terminated unexpectedly and has left the off-line partition mounted. `VFY:FILE` has attempted to unmount the file system unsuccessfully. Use **`mop -u`** to unmount the file system.

If Format 25 is printed, `VFY:FILE` is unable to verify `/dev/boot`, `/dev/lboot`, and `/dev/vtoc` from the off-line disk. Seek technical assistance.

Format 26 is printed when the path name of the file to be verified is too long for searching `/.crcvalues`. Although the maximum allowed length for the arguments to either of the FN or OLMP options is 63 characters, their combined length must not exceed 63 characters.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 28 indicates that `VFY:FILE` was unable to mount an off-line partition (using the mop command) to verify a file because a mop process was already active at the time. Try again later.

5. ALARMS

None. This automatically-generated report is for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

2. REASON FOR OUTPUT

Formats 1 through 5 are printed to inform the user of the message's status.

Formats 6 through 32 are printed to inform the user of various problems which the VFY:FILE command has encountered.

3. VARIABLE FIELD DEFINITIONS

a = Name of the file for which the message is printed.

b = The size of the essential file (mod 2).

c = The calculated cyclic redundancy check (CRC) value for the essential file. For files which contain their own CRC information, this value should match the size of the file.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = The number of files verified. This count includes files that failed verification.

e = The error message reported by `/usr/bin/mop`.

f = The line number in the specfile that contains the formatting error.

g = The off-line disk number specified as the argument to the DN keyword on the `VFY:FILE` command line.

h = The stored CRC value for the current file. If the CRC information is stored in `/.crcvalues`, this field contains both the size of file and the CRC.

i = The calculated CRC value for the current file. If the stored CRC information for this file is kept in `/.crcvalues`, this field contains both the calculated size of the file and the CRC.

j = The requested file type against which the specified file was checked.

k = The number of errors encountered during processing.

4. ACTION TO BE TAKEN

If the error count for Format 3 or 5 is non-zero, examine the ROP output for other message formats to determine the cause of the errors. Otherwise, no user action is required for Formats 1 through 5.

Format 6 indicates that `VFY:FILE` has terminated.

If Format 7 is printed, the mount off-line partition (MOP) process has failed. Examine the MOP error message and take appropriate action.

If Format 8 is printed, the user has selected a database partition which does not represent a file system. Find the correct partition number and reenter the command.

If Format 9 is printed, one or more of the boot files is newer than the boot image identified in the message. Use `VFY:FILE` to verify the correctness of the boot files, and regenerate the out-of-date boot image.

Format 10 is generally printed because the user is attempting to use the GEN option on a file which is not executable and trying to store the CRC internally. These files must have their CRC information stored in `/.crcvalues`. If this is not the case, seek technical assistance.

If Formats 11, 13, 14, 16, 17, 23, 27, or 31 are printed, seek technical assistance.

Format 12 indicates that a file is missing or does not have execute permission.

Format 15 is a warning message which may be ignored if CRC information is being generated for the first time. If this is not the case, seek technical assistance.

Format 18 indicates that `VFY:FILE` cannot find CRC information which is supposed to be in `/.crcvalues`. If the CRC information was present and has been lost, seek technical assistance.

If Format 19 is printed, `VFY:FILE` cannot open the file. This is usually an input error. If

this is not the case, seek technical assistance.

Formats 20 and 21 indicate problems with specification file supplied to the FLIST parameter. Verify the correctness of the input command and the contents of the specification file.

Format 22 indicates that a field update is in progress for the current file. `VFY:FILE` will not run the CRC algorithm against this file until the update is made permanent.

If Format 24 is printed, mop has been terminated unexpectedly and has left the off-line partition mounted. `VFY:FILE` has attempted to unmount the file system unsuccessfully. Use **`mop -u`** to unmount the file system.

If Format 25 is printed, `VFY:FILE` is unable to verify `/dev/boot`, `/dev/lboot`, and `/dev/vtoc` from the off-line disk. Seek technical assistance.

Format 26 is printed when the path name of the file to be verified is too long for searching `/.crcvalues`. Although the maximum allowed length for the arguments to either of the FN or OLMP options is 63 characters, their combined length must not exceed 63 characters.

Format 28 indicates that `VFY:FILE` cannot get status of the file. This is usually an input error. If this is not the case, seek technical assistance.

Format 29 indicates that the specified file's actual file type is something other than the expected file type. Use the `OP:STATUS;LISTDIR` command to examine the existing file type. If the specified file's existing file type does not match the expected file type, seek technical assistance. Otherwise, verify the correctness of the input message.

Format 30 indicates that execute permission is not set for owner. Use the `ALW:FILESYS;ACCESS` command to set the appropriate bit.

Format 32 indicates that `VFY:FILE` was unable to mount an off-line partition, using the mop command, to verify a file because a mop process was already active at the time. Try again later.

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

SEE PROPRIETARY NOTICE ON COVER PAGE

2. REASON FOR OUTPUT

Formats 1 through 5 are printed to inform the user of the message's status.

Formats 6 through 37 are printed to inform the user of various problems that the `VFY:FILE` command has encountered.

3. VARIABLE FIELD DEFINITIONS

a = Name of the file for which the message is printed.

b = The size of the essential file (mod 2).

c = The calculated cyclic redundancy check (CRC) value for the essential file. For files which contain their own CRC information, this value should match the size of the file.

d = The number of files verified. This count includes files that failed verification.

e = The number of errors encountered during processing.

f = The error message reported by `/usr/bin/mop`.

g = The name of the file being used for global CRC values. Normally this is `/.crcvalues`. This name will be `/._crcvalues` if the pfile currently being processed is in a temporary state, the `/.crclock` directory exists, and there is no lock file for the pfile in the `/.crclock` directory.

h = The line number in the specfile that contains the formatting error.

i = The off-line disk number specified as the argument to the DN keyword on the `VFY:FILE` command line.

j = The stored CRC value for the current file. If the CRC information is stored in `/.crcvalues`, this field contains both the size of file and the CRC.

k = The calculated CRC value for the current file. If the stored CRC information for this file is kept in `/.crcvalues`, this field contains both the calculated size of the file and the CRC.

l = The requested file type against which the specified file was checked.

4. ACTION TO BE TAKEN

If the error count for Format 3 or 5 is non-zero, examine the receive-only printer (ROP) output for other message formats to determine the cause of the errors. Otherwise, no user action is required for Formats 1 through 5.

Format 6 indicates that `VFY:FILE` has terminated.

If Format 7 is printed, the mount off-line partition (MOP) process has failed. Examine the mop error message and take appropriate action.

SEE PROPRIETARY NOTICE ON COVER PAGE

If Format 8 is printed, the user has selected a database partition which does not represent a file system. Find the correct partition number and reenter the command.

Format 9 is generally printed because the user is attempting to use the GEN option on a file which is not executable and trying to store the CRC internally. These files must have their CRC information stored in `/.crcvalues`. If this is not the case, seek technical assistance.

If Formats 10, 12, 13, 15, 16, 22, 26, or 30 are printed, seek technical assistance.

Format 11 indicates that a file is missing or does not have execute permission.

Format 14 is a warning message which may be ignored if CRC information is being generated for the first time. If this is not the case, seek technical assistance.

Format 17 indicates that `VFY:FILE` cannot find CRC information which is supposed to be in `/.crcvalues`. If the CRC information was present and has been lost, seek technical assistance.

If Format 18 is printed, `VFY:FILE` cannot open the file. This is usually an input error. If this is not the case, seek technical assistance.

Formats 19 and 20 indicate problems with specification file supplied to the FLIST parameter. Verify the correctness of the input command and the contents of the specification file.

Format 21 indicates that a field update is in progress for the current file. `VFY:FILE` will not run the CRC algorithm against this file until the update is made permanent. This is an information only message. If this message reoccurs for several days in a row, then check the Software Update status of the file to determine why it has not been made official.

If Format 23 is printed, MOP has been terminated unexpectedly and has left the off-line partition mounted. `VFY:FILE` has attempted to unmount the file system unsuccessfully. Use **`mop -u`** to unmount the file system.

If Format 24 is printed, `VFY:FILE` is unable to verify `/dev/boot`, `/dev/lboot`, and `/dev/vtoc` from the off-line disk. Seek technical assistance.

Format 25 is printed when the path name of the file to be verified is too long for searching `/.crcvalues`. Although the maximum allowed length for the arguments to either of the FN or OLMP options is 63 characters, their combined length must not exceed 63 characters.

Format 27 indicates that `VFY:FILE` cannot get status of the file. This is usually an input error. If this is not the case, seek technical assistance.

Format 28 indicates that the specified file's actual file type is something other than the expected file type. Use the `OP:STATUS;LISTDIR` command to examine the existing file type. If the specified file's existing file type does not match the expected file type, seek technical assistance. Otherwise, verify the correctness of the input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 29 indicates that execute permission is not set for owner. Use the `ALW:FILESYS;ACCESS` command to set the appropriate bit.

Formats 31, 32 and 33 indicate problems with accessing an off partition VTOC; seek technical assistance.

Format 34 is printed when the user has requested that a CRC value be generated for a file and stored in that file. The file is not suitable for storing the CRC value internally. The user should store the generated value globally; for example, use the *g* character when specifying the checking type.

If Format 35 is printed, the user may be attempting to process a file that is being updated. If file update is in progress, the user must wait until it is completed before attempting to run `VFY:FILE`; otherwise, the user needs to go into the crclock directory and remove the file that has the same name as the file that `VFY:FILE` will not process.

Format 36 is printed when `VFY:FILE` is unable to allocate sufficient space to read the specification file into memory. The user should seek technical assistance.

Format 37 is printed when `VFY:FILE` is unable to read the specification file into memory. The user should seek technical assistance.

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

6. REFERENCES

TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL

1. FORMAT

This message has two formats.

[1] `VFY MHD` *a* { `NOT STARTED` *b c* |
`STOPPED` *b c* |
`ERROR` *b c* |
`ABORTED` *b c* |
`STARTED` |
`COMPLETED` |
`IN PROGRESS` }

[2] `VFY MHD` *a* `TERM VFY FAILED` *d*
`TRACK/CYL/HD/SC` *e f g h* [`TRACK/CYL/HD/SC` *e f g h*] [`TRACK/CYL/HD/SC` *e f h h*]
`TRACK/CYL/HD/SC` [*e f g h*]

2. REASON FOR OUTPUT

To report the result of executing an `VFY:MHD` input message. See the ACTION TO BE TAKEN section for explanation as to why and when each output message format will be used.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Process step or reason code.

`f03` — failed to fopen /tmp file
`f04` — fseek failed on the output file
`f06` — cannot open ECD
`f09` — cannot get UCB by name
`f12` — cannot reserve UCB
`f15` — cannot assign special device file name
`f18` — cannot open special device file
`f21` — cannot set I/O mode of device file
`f24` — cannot enable message reception
`f27` — see DKDRV error report on the ROP
`f30` — DFC is not in S_ACT state
`f33` — MHD size not recognized
`f36` — see DKDRV error report on the ROP
`f39` — see DKDRV error report on the ROP
`f42` — DFC RAM read failed
`f45` — VFY data overwritten, repeat input request starting from

SEE PROPRIETARY NOTICE ON COVER PAGE

track number
`f48` — lseek to "combined" defect table failed
`f51` — first read of defect table failed
`f54` — lseek to "combined" defect table failed
`f57` — second read of defect table failed
`f60` — message to port failure
`f63` — message reception failure
`f66` — process timed out
`f69` — failed to close special device file
`f72` — failed to release special device file
`f75` — failed to unreserve UCB
`f78` — failed to close ECD
`f81` — terminated externally

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

d = Number of failures (bad sectors for SMD MHD or bad blocks for SCSI MHD) found during the verify step.

e = Relative track number of the indicated bad sector. The track number is relative to the beginning of the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management. This variable field only applies to SMD MHD.

f = Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to SMD MHD.

g = Physical head number of the indicated bad sector. This number is calculated using all tracks or the disk including those mapped out by defect management. This variable field only applies to SMD MHD.

h = Sector number in use when the failure occurred. It is a relative number (0 to 31). This variable field only applies to SMD MHD.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

A termination report that specifies a verification failure means that the indicated disk sectors had uncorrect table data errors or that the format information contained in the sector headers was not expected. This MHD and disk pack should NOT be used until the problem is corrected. If the disk is an SMD drive, the HEAD and TRACK information is output to provide data in helping to determine if the problem is in the MHD (head alignment) or in the disk pack (bad surface).

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

ID . . . . . VFY-MHD-B
GENERIC . . . . . UNIX RTR R6.4 only
TYPE . . . . . Output
MESSAGE CLASS . . DSKUTL

1. FORMAT

This message has three formats.

[1] `VFY MHD` *a* { `NOT STARTED` *b c* |
`STOPPED` *b c* |
`ERROR` *b c* |
`ABORTED` *b c* |
`STARTED` |
`COMPLETED` |
`IN PROGRESS` }

[2] `VFY MHD` *a* `EARLY TERM VFY FAILED` *d*
`TRACK/CYL/HD/SC TRACK/CYL/HD/SC TRACK/CYL/HD/SC TRACK/CYL/HD/SC`
e f g h [*e f g h*] [*e f g h*] [*e f g h*]

[3] `VFY MHD` *a* `EARLY TERM VFY FAILED` *d*
`BLOCKS BLOCKS BLOCKS BLOCKS`
i [*i*] [*i*] [*i*]

2. REASON FOR OUTPUT

To report the status of a request to verify a moving head disk (MHD).

If the verify process was invoked via the VFY MHD poke on the data file system access (DFSA) display page during disk independent operation (DIOP) mode, a `REPT-DKDIP` message will precede the output message line.

3. VARIABLE FIELD DEFINITIONS

a = MHD Member number.

b = Process step or reason code.

`f01` — failed to `fopen() /tmp` file
`f03` — `fseek()` failed on the output file
`f06` — failed to open ECD
`f09` — failed to get UCB by name
`f0a` — "TRACK", "BLOCK" or "NEW" are not valid for SCSI MHD
`f0c` — "TRACK" is not valid for SCSI MHD
`f0e` — single block format not allowed for SCSI disk
`f12` — "BLOCK" is not valid for SMD MHD
`f18` — failed to reserve UCB
`f1b` — failed to assign special device file name
`f1d` — failed to open device file
`f21` — failed to set I/O mode of device file
`f24` — failed to enable message reception

SEE PROPRIETARY NOTICE ON COVER PAGE

`f27` — see DKDRV report on the ROP
`f30` — DFC is not in S_ACT state
`f33` — MHD size not recognized
`f36` — see DKDRV report on the ROP
`f37` — DKDIP virtual address translation failure
`f39` — see DKDRV report on the ROP
`f42` — DFC RAM read failed
`f45` — verify data overwritten - repeat input request starting from track number
`f46` — start block greater than LBA
`f47` — see DKDRV report on the ROP
`f48` — DKDIP virtual address translation failure
`f49` — see DKDRV report on the ROP
`f4c` — read of the HA RAM data table failed
`f4e` — see DKDRV report on the ROP
`f52` — read of the DFC firmware UPT failed
`f55` — failed to get UCB of the MHD's SBUS by RID
`f58` — see DKDRV report on the ROP
`f5b` — read of the verify failure data failed
`f5e` — invalid verify data
`f63` — `lseek()` to "combined" defect table failed
`f64` — DKDIP virtual address translation failure
`f66` — first read of defect table failed
`f69` — `lseek()` to "combined" defect table failed
`f6a` — DKDIP virtual address translation failure
`f6c` — second read of defect table failed
`f6e` — message to port failure
`f71` — message reception failure
`f72` — manual abort requested
`f73` — manual abort requested
`f74` — process timed out
`f78` — failed to close special device file
`f7c` — failed to release special device file
`f7f` — failed to unreserve UCB
`f83` — failed to close ECD
`f86` — terminated externally with signal
`f93` — failed to get the segment number
`f96` — SCSI "format" command failed
`f99` — message to port failure
`f9c` — message reception failure
`f9f` — see DKDRV report on the ROP
`fa1` — failed to get the segment number
`fa5` — SCSI "inquiry" command failed
`fa9` — failed to get the segment number
`fb1` — SCSI "mode sense" command failed
`fb2` — data overflow - too many block descriptors
`fb5` — failed to get the segment number
`fb9` — SCSI "mode select" command failed
`fc1` — see DKDRV report on the ROP
`fc6` — failed to get segment number

SEE PROPRIETARY NOTICE ON COVER PAGE

`fc9` — SCSI "read capacity" command failed

c = System error code number. See System Error Codes Output Appendix, `SYSERR-APP`.

d = Number of failures (bad sectors for SMD MHD or bad blocks for SCSI MHD) found during the verify step.

e = Relative track number of the indicated bad sector. The track number is relative to the beginning of the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management. This variable field only applies to an SMD MHD.

f = Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

g = Physical head number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

h = Sector number in use when the failure occurred. It is a relative number (0 to 31). This variable field only applies to an SMD MHD.

i = Logical disk block number of the bad disk block found on the SCSI disk drive during the verify operation.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

A termination report specifying a verification failure means that the indicated disk sectors had uncorrectable data errors or that the format information contained in the sector headers was not as expected. This disk media should NOT be used until the problem is corrected. For an SMD MHD, the HEAD and TRACK information is output to help determine if the problem is with the MHD (head alignment) or in the disk media (bad surface).

For an SMD MHD, the CYL, HEAD, and SECT information can be used as input to the `LOAD:MHD;DEFECT` command. For an SCSI MHD, the BLOCK information can be used as input to the `LOAD:MHD;DEFECT` command.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

SEE PROPRIETARY NOTICE ON COVER PAGE

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report for information only.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

[4] `VFY MHD` *a* `ABORTED` *b*
`ERROR DATA` *j k l m n*

2. REASON FOR OUTPUT

To report the status of a request to verify a moving head disk (MHD).

If the verify process was invoked via the VFY MHD poke on the data file system access (DFSA) display page during disk independent operation (DIOP) mode, a `REPT-DKDIP` message will precede the output message.

Format 4 provides additional error information when an explicit small computer system interface (SCSI) command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

a = MHD member number.

b = Process step or reason code.

`f01` — failed to `fopen() /tmp` file
`f03` — `fseek()` failed on the output file
`f04` — failed to open ECD
`f05` — failed to get UCB by name

`f06` — failed to get UCB of controlling unit
`f07` — controlling unit is not active
`f09` — MHD size not recognized

`f96` — SCSI "format" command failed
`f99` — message to port failure
`f9c` — message reception failure
`f9f` — see DKDRV report on the ROP
`fa1` — failed to get the segment number
`fa5` — SCSI "inquiry" command failed
`fa7` — SCSI "inquiry" command data underflow
`fa9` — failed to get the segment number
`fb1` — SCSI "mode sense" command failed
`fb2` — data overflow - too many block descriptors
`fb5` — failed to get the segment number
`fb9` — SCSI "mode select" command failed
`fc1` — see DKDRV report on the ROP
`fc6` — failed to get the segment number
`fc9` — SCSI "read capacity" command failed
`ffe` — aborted due to phase 1

c = System error code number. See System Error Codes Output Appendix, SYSERR-APP.

d = Number of failures (bad sectors for SMD MHD or bad blocks for SCSI MHD) found during the verify step.

e = Relative track number of the indicated bad sector. The track number is relative to the beginning of the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management. This variable field only applies to an SMD MHD.

f = Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

g = Physical head number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

h = Sector number in use when the failure occurred. It is a relative number (0 to 31). This variable field only applies to an SMD MHD.

i = Logical disk block number of the bad disk block found on the SCSI disk drive during the verify operation.

j = Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.

AAAA = SCSI job block (SJB) completion code. See "Job completion code" under "General Job Information" in output DFC Appendix K, DFC-APPK.

BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in output DFC Appendix K, DFC-APPK.

CC = Fill. Not used.

k = First word of extended sense data (ESD). See output DFC Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 0 of ESD.

BB = Byte 1 of ESD.

CC = Byte 2 of ESD.

DD = Byte 3 of ESD.

l = Second word of ESD. See output DFC Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 4 of ESD.

BB = Byte 5 of ESD.

CC = Byte 6 of ESD.

DD = Byte 7 of ESD.

m = Third word of ESD. See output DFC Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 8 of ESD.

BB = Byte 9 of ESD.

CC = Byte 10 of ESD.

DD = Byte 11 of ESD.

n = Fourth word of ESD. See output DFC Appendix J, DFC-APPJ. This word is structured as eight hexadecimal digits of the form AABBCCDD.

AA = Byte 12 of ESD.

BB = Byte 13 of ESD.

CC = Byte 14 of ESD.

DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

SEE PROPRIETARY NOTICE ON COVER PAGE

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

A termination report specifying a verification failure means that the indicated disk sectors had uncorrectable data errors or that the format information contained in the sector headers was not as expected. This disk media should not be used until the problem is corrected. For an SMD MHD, the HEAD and TRACK information is output to help determine if the problem is with the MHD (head alignment) or in the disk media (bad surface).

For an SMD MHD, the CYL, HEAD, and SECT information can be used as input to the `LOAD:MHD;DEFECT` command. For an SCSI MHD, the BLOCK information can be used as input to the `LOAD:MHD;DEFECT` command.

If Format 4 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report for information only.

There is a manual alarm for OMDB keys 147 and 666, and an information alarm for OMDB key 148.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

There is a major alarm for OMDB keys 146, 149, and 569.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

This message has five formats.

[1] `VFY TAPE STARTED`

[2] `VFY TAPE ABORTED [OPEN ERROR]`
`VFY TAPE STOPPED, LSEEK FAILED`

[3] `VFY TAPE STOPPED {UNABLE TO READ HEADER` *a* `|`
`DATA READ ERROR - BLOCK TOO LARGE - HEADER` *a* `|`
`DATA READ ERROR - HEADER` *a*`, RECORD` *b* `|`
`EOF ON INPUT - HEADER` *a*`, RECORD` *b*
`LSEEK FAILED}`

[4] `VFY TAPE IN PROGRESS {HEADER HASH SUM MATCH - HEADER` *a* `|`
`HEADER HASH SUM MISMATCH - HEADER` *a* `|`
`DATA HASH SUM MISMATCH - HEADER` *a* `|`
c `RETRIES NEEDED TO READ HEADER` *a* `|`
c `RETRIES NEEDED TO READ DATA` *a*`, RECORD` *b*`}`

[5] `VFY TAPE COMPLETED RETRIES =` *d*`, HEADER MISMATCHES =` *e*`,`
`DATA MISMATCHES =` *f*

2. REASON FOR OUTPUT

To output information concerning the condition of a system tape which is being verified in response to the `VFY:TAPE` input message.

3. VARIABLE FIELD DEFINITIONS

a = Number of header (counted from beginning of tape).

b = Number of data record following a given header.

c = Number of retries needed to read successfully.

d = Total number of retries needed in reading system tape.

e = Total number of header hash sum mismatches found on tape.

f = Total number of data hash sum mismatches found on tape.

4. ACTION TO BE TAKEN

A `STOPPED` output message indicates probable physical damage to the tape or an improper end of tape marker. HASH `SUM MISMATCH` output messages indicate an

inconsistency between the data being read and that which was originally written. A `RETRIES NEEDED` output message implies difficulty with reading a certain spot on the tape. An `LSEEK FAILED` output message indicates difficulty when trying to find the offset to re-read the tape when initial read has failed. All of these messages imply that the spot on the tape being read when the message occurred may be unusable.

A `COMPLETED` message with zero retries, zero header mismatches, and zero data mismatches indicates a completely verified tape.

5. ALARMS

None. This alarm is a manually-requested report.

[7] VFY TAPE COMPLETED RETRIES = *d*, HEADER MISMATCHES = *e*,
DATA MISMATCHES = *f*

2. REASON FOR OUTPUT

To output information concerning the condition of a system tape which is being verified in response to the VFY:TAPE input message.

3. VARIABLE FIELD DEFINITIONS

a = Number of header (a count that identifies the header within a logical volume).

b = Number of data record following a given header.

c = Number of retries needed to read successfully (0-9).

d = Total number of retries needed in reading system tape.

e = Total number of header hash sum mismatches found on tape.

f = Total number of data hash sum mismatches found on tape.

g = Number of backup session on tape (1-9).

h = Number of logical volume within a backup session (0-9).

4. ACTION TO BE TAKEN

A STOPPED output message indicates probable physical damage to the tape or an improper end of tape marker. HASH SUM MISMATCH output messages indicate an inconsistency between the data being read and that which was originally written. A RETRIES NEEDED output message implies difficulty with reading a particular spot on the tape. An LSEEK FAILED output message indicates difficulty when trying to find the offset to re-read the tape when initial read has failed. All of these messages imply that the spot on the tape being read when the message occurred may be unusable.

A COMPLETED message with zero retries, zero header mismatches, and zero data mismatches indicates a completely verified tape.

5. ALARMS

None. This alarm is a manually-requested report.

2. REASON FOR OUTPUT

To verify the requested terminal identities in the terminal authority (TAUTH) database resulting from the VFY:TAUTH input command.

3. VARIABLE FIELD DEFINITIONS

a = List of terminal identities in four characters, starting with "tty".

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This manually-generated report is for information only.

6. REFERENCES

OMDB Key
This message has an OMDB key of 305.

               .
               .
               .
```

2. REASON FOR OUTPUT

To print in response to the VFY:TCGRP command, which allows the retrieval of entries from the terminal command group (TCGRP) database.

3. VARIABLE FIELD DEFINITIONS

a = Terminal identity in four characters.

b = Command group.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. This manually-generated report is for information only.

ID . . . . . WHEN-COND
GENERIC . . . . . UNIX RTR R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`WHEN COND E` *a b c #d*

2. REASON FOR OUTPUT

To report the status of processing a breakpoint definition.

3. VARIABLE FIELD DEFINITIONS

a = Termination or progress report:

- `STARTED` — The operation has begun. Some information on the breakpoint is available and is supplied here. Expect another message indicating the termination status.
- `STOPPED` — The operation could not be completed. The cause of the error is also printed. The breakpoint definition has been removed.
- `COMPLETED` — The breakpoint was successfully 'planted'. Supplementary information is also supplied.

If *a* is `STARTED`,

b = H = Hard breakpoint implementation.

If *a* is `STOPPED`,

b = Type of error that was encountered:

- `TOOMANY` — Only 20 breakpoints are allowed to be defined at one time.
- `UCERR` — The utility circuit either does not respond or does not match the circuit present earlier in the debugging session.
- `UCFNAV` — The particular utility circuit function requested is not available.

SEE PROPRIETARY NOTICE ON COVER PAGE

If *a* is COMPLETED,

b = State of the breakpoint:

ENABLED — The breakpoint's action list will be executed as soon as the breakpoint conditions occur.

DISABLED — The breakpoint's action list will not be executed at all unless the breakpoint is allowed with an ALW:UTIL or ALW:UTILFLAG input message.

c = Breakpoint number. This is used in all future references to the breakpoint.

d = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If the termination status was STOPPED because of TOOMANY, NGBPT, or UCFNAV, another breakpoint will have to be cleared with the CLR:UTILFLAG input message before this one can be processed.

If the termination status was STOPPED because of UCERR, the utility circuit hardware may be faulty. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

5. ALARMS

None. This alarm is a manually-requested report.

ID . . . . . WHEN-PID
GENERIC . . . . . UNIX RTR R1.5, R6.4, R21.3, R21.11, R21.15 and later
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

1. FORMAT

`WHEN PID` *a* `ADDR` *b c d e #f*

2. REASON FOR OUTPUT

To report the status of processing a breakpoint definition.

3. VARIABLE FIELD DEFINITIONS

a = Process ID (PID) of the target process.

b = Address of the breakpoint.

c = Termination or progress report:

`COMPLETED` — The breakpoint was successfully "planted". Supplementary information is also supplied.

`STARTED` — The operation has begun. Some information on the breakpoint is available and is supplied here. Expect another message indicating the termination status.

`STOPPED` — The operation could not be completed. The cause of the error is also printed. The breakpoint definition has been removed.

If *c* is `STARTED`:

d = Breakpoint implementation:

`HARD` — Hardware implementation.
`SOFT` — Software implementation.

If *c* is `STOPPED`:

d = Type of error that was encountered:

`NGADDR` — The address specified is not valid for the specified process.

`NGBPT` — There is already a breakpoint defined for the same address of the same process.

`NGOPC` — The first byte of the specified opcode does not agree with that specified on the `WHEN` input message.

`NGPID` — The process ID specified is not that of a running process.

SEE PROPRIETARY NOTICE ON COVER PAGE

TOOMANY — Only 20 breakpoints are allowed to be defined at one time.
UCERR — The utility circuit either does not respond or does not match the circuit present earlier in the debugging session.
UCFNAV — The particular utility circuit function requested is not available.
PLNTFAIL — Attempt to plant software breakpoint failed.

If *c* is COMPLETED:

d = State of the breakpoint:

DISABLED — The breakpoint's action list will not be executed at all unless the breakpoint is allowed with an ALW:UTIL or ALW:UTILFLAG input message.

ENABLED — The breakpoint's action list will be executed as soon as the breakpoint conditions occur.

e = Breakpoint number. This is used in all future references to the breakpoint.

f = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If the termination status was STOPPED because of TOOMANY, NGBPT, or UCFNAV, another breakpoint will have to be cleared with the CLR:UTILFLAG input message before this one can be processed.

If the termination status was STOPPED because of NGADDR or NGOPC, recheck the address or opcode used against the program listings. Consider that the listings themselves might be in error.

If the termination status was STOPPED because of NGPID and it happens repeatedly, consider using the process utility identification (UID) instead of a PID.

If the termination status was STOPPED because of UCERR, the utility circuit hardware may be faulty. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

5. ALARMS

None.

ACKNOWLEDGEMENT DATABASE APPENDIX

If an error is encountered with the Acknowledgement Database, an input message acknowledgement of the following format may appear.

NA BAD ACKDB <key *1*> <key *2*> <key *3*> <key *4*>

where key = a numerical value.

This appendix lists the text associated with each key.

To clear the condition where every command results in the NA BAD ACKDB acknowledgement, enter the CLR:ACKDB command followed by the 808 and 805 pokes on the 103 page.

The following list contains acknowledgements which print after an input indicator (; ! or ?) or delete command character (DEL or CAN) is entered. The ACKDB key assigned to each acknowledgement is also given.

KEY	TEXT

Audit Parsing Errors Following ?D

Explanation	Reason for Failure
EXTRA KEYWORD	Too many keywords in data field.
INVALID CHARACTER	Member number given was not numeric.
INVALID DATA, ERROR 101	Cannot specify a range of member numbers.
INVALID DATA, ERROR 102	Only one member number allowed.
INVALID DATA, ERROR 103	The record for the specified audit name and member number is not found in the Equipment Configuration Database.
INVALID DATA, ERROR 105	An instance can be associated with one and only one audit name and member number.
INVALID DATA, ERROR 201	The data field must be empty.
INVALID DATA, ERROR 202	Only one instance can be specified.
INVALID DATA, ERROR 203	The record for the specified instance is not in the Equipment Configuration Database for the given audit name and member number.
INVALID DATA, ERROR 204	No additional data can be entered when ALL is used in an input or RUN is used with the OP:AUD input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

Audit Parsing Errors Following ?D *(continued)*

Explanation	Reason for Failure
INVALID DATA, ERROR 501	Data string to AUD command too long.
INVALID DATA, ERROR 502	Only one additional parameter string can be specified.
INVALID KEYWORD, ERROR 101	The audit name is too long.
INVALID KEYWORD, ERROR 102	No records for specified audit name were found in the Equipment Configuration Database.
INVALID KEYWORD, ERROR 201	The keyword is not INS.
INVALID KEYWORD, ERROR 501	Keyword is not PARAM.
MISSING DATA, ERROR 101	No member number was given.
MISSING DATA, ERROR 201	The INS keyword was entered but no instance name was specified.
MISSING DATA, ERROR 501	The PARAM keyword was entered but no additional parameter string was specified.
RANGE ERROR	Member number out of range.

Audit Parsing Errors Following `?I`

Explanation	Reason for Failure
`INCONSISTENT KEYWORDS`	Conflicting action items.
`INVALID DATA, ERROR 101`	Cannot specify a range.
`INVALID DATA, ERROR 102`	Only one member number allowed.
`INVALID DATA, ERROR 103`	The record for the specified audit name and member number is not found in the Equipment Configuration Database.
`INVALID DATA, ERROR 201`	The instance name is too long.
`INVALID DATA, ERROR 202`	Only one instance can be specified.
`INVALID DATA, ERROR 203`	The record for the specified instance is not in the Equipment Configuration Database for the given audit name and member number.
`INVALID DATA, ERROR 301`	First action option keyword must not have a keyword data field.
`INVALID DATA, ERROR 302`	Second action option keyword must not have a keyword data field.
`INVALID DATA, ERROR 401`	Keyword data cannot follow keyword `AUD`.
`EXTRA KEYWORD, ERROR 1`	Too many action options.

Audit Parsing Errors Following `?I` *(continued)*

Explanation	Reason for Failure
`EXTRA KEYWORD, ERROR 2`	The third identification field subfield must be empty.
`INVALID KEYWORD, ERROR 101`	The audit name is too long.
`INVALID KEYWORD, ERROR 201`	The keyword is not `INS`.
`INVALID KEYWORD, ERROR 202`	The keyword is invalid.
`INVALID KEYWORD, ERROR 203`	The keyword `RUN` is valid only with the `OP:AUD` input message.
`INVALID KEYWORD, ERROR 301`	The first action option is not valid.
`INVALID KEYWORD, ERROR 401`	The second action option is not valid.
`INVALID KEYWORD, ERROR 501`	ID keywords cannot follow `AUD` keyword.
`MISSING DATA, ERROR 101`	No member number was given.
`MISSING DATA, ERROR 201`	The `INS` keyword was entered but no instance name was specified.
`MISSING KEYWORD, ERROR 1`	No audit name was given.
`MISSING KEYWORD, ERROR 2`	The `INS` keyword (and its data) is missing.
`RANGE ERROR`	Member number out of range.

Audit Errors Resulting from a Conflict with System States

Explanation	Reason for Failure
ALREADY ALLOWED, ERROR 1	All member numbers associated with the audit name are already allowed. At least one member must not be currently allowed for the ALW:AUD input message to be executed.
ALREADY ALLOWED, ERROR 2	At least one of the specified members is already allowed. Use the OP:AUD input message to determine which members associated with the audit are currently allowed and which are not.
ALREADY ALLOWED, ERROR 3	The instance of the audit is already allowed.
ALREADY INHIBITED, ERROR 1	All the member numbers associated with the audit name are already inhibited. There must be at least one member number which is not inhibited.
ALREADY INHIBITED, ERROR 2	At least one of the specified members is already inhibited. Use the OP:AUD input message to determine which members associated with the audit are currently inhibited and which are not.
ALREADY INHIBITED, ERROR 3	The instance of the audit is already inhibited.
NO CHANGE	
NOT MANUAL AUDIT	
NOT RUNNING	The audit specified to be stopped is not running.

Explanation for Retry Later Audit Errors

Explanation	Reason for Failure
ALREADY RUNNING	The requested audit is already running.
AUDIT BLOCKED	Audit blocked.
AUDIT PROCESS NOT FULLY CREATED	Audit has not been dispatched yet, retry STOP:AUD later.
DIFFERENT MEMBER OF THIS AUDIT RUNNING	Another audit with the same name is already running. Only uniquely-named audits are permitted to run at the same time. The OP:AUD input message may be used to obtain further information about currently-running audits which may be preventing the initiation of the requested audit.
ECD INTERFACE ERROR 1	Cannot attach the segments of the equipment configuration database to the command.
ECD INTERFACE ERROR 2	Cannot connect to the equipment configuration database.
ECD INTERFACE ERROR 3	Cannot read the equipment configuration database control record.
ECD INTERFACE ERROR 4	Cannot open a sequence for all audits with the specified name.
ECD INTERFACE ERROR 5	Error occurred while obtaining an audit record sequentially.

Explanation for Retry Later Audit Errors *(continued)*

Explanation	Reason for Failure
ECD INTERFACE ERROR 6	Error occurred while obtaining an audit record by key.
ECD INTERFACE ERROR 7	Error occurred while obtaining an instance record.
ECD INTERFACE ERROR 8	Cannot read SIM control record. If these equipment configuration database error conditions continue, obtain technical assistance.
MAXIMUM KERNEL AUDITS RUNNING	A kernel process audit is already running, and only one kernel process audit may run at one time. (It may have been initiated manually, or by a system process.) The OP:AUD input message may be used to obtain further information about currently-running audits which may be preventing the initiation of the requested audit.
MAXIMUM SUPERVISOR AUDITS RUNNING	The maximum number of supervisor process audits is already running. (They may have been initiated manually, or by a system process.) This number is controlled by a parameter in the SIMCNTL record in the equipment configuration database. The OP:AUD input message may be used to obtain further information about currently-running audits which may be preventing the initiation of the requested audit.
RUNNING AUDIT, ERROR 6	The requested audit is already running.

SEE PROPRIETARY NOTICE ON COVER PAGE

Explanation for Retry Later Audit Errors *(continued)*

Explanation	Reason for Failure
RUNNING AUDIT, ERROR 7	A kernel process audit is already running, and only one kernel process audit may run at one time. (It may have been initiated manually, or by a system process.) The OP:AUD input message may be used to obtain further information about currently-running audits which may be preventing the initiation of the requested audit.
RUNNING AUDIT, ERROR 8	The maximum number of supervisor process audits is already running. (They may have been initiated manually, or by a system process.) This number is controlled by a parameter in the SIMCNTL record in the equipment configuration database. The OP:AUD input message may be used to obtain further information about currently-running audits which may be preventing the initiation of the requested audit.
RUNNING AUDIT, ERROR 11	Another audit with the same name is already running. Only uniquely-named audits are permitted to run at the same time. The OP:AUD input message may be used to obtain further information about currently-running audits which may be preventing the initiation of the requested audit.
SIM INTERFACE ERROR 3	Audit system initialization is in progress.
SIM INTERFACE ERROR 4	Audit system initialization failed.

Explanation for Retry Later Audit Errors *(continued)*

Explanation	Reason for Failure
SIM INTERFACE ERROR 5	SIM was unable to access an equipment configuration database record using a record identifier (RID) passed to it by the command program.
SIM INTERFACE ERROR 10	SIM failed to start the audit.
SIM INTERFACE ERROR 15	System integrity output formatter is dead.
SIM INTERFACE ERROR 19	An invalid RID was passed to SIM by the command program.
SIM INTERFACE ERROR 20	An invalid instance RID was passed to SIM by the command program.
SIM INTERFACE ERROR 23	Cannot stop a non-segmented audit.

AUTHORITY CODE APPENDIX

The authority group code was implemented with the introduction of the Dialogue Shell in Release 1.5 (see *System Maintenance Manual*). This code is used by the Dialogue Shell to determine whether a person or terminal has the proper authority to execute the requested input command. Each input message in Release 1.5 will belong to only one authority group. The valid authority group code are as follows:

Group	Description
ALARM	Alarm Manipulation
AUDIT	Audits
AUTH	Command and Authority Administration
ECCR	Central Complex Data Retrieval
ECCSC	Central Complex Service Condition Modification
ECCT	Central Complex test and Diagnostic
FHADM	File Handling and Administration
MISC	Miscellaneous
PASS	Personal Password Modification
SERV	Service Observation
SFTMGT	Software Management
SFTUTIL	Software Utilities
SYSINH	System Inhibits
SYSINIT	System Initialization

The following is a cross reference of the input message and its associated authority group code.

BOOTDISKCHK CODE NUMBERS

Result Code	Description
1	UCB RID is set to IDNULL.
2	Could not get UCB record using specified RID.
3	Unit is marked UNEQIP.
4	Could not get UCB record for controlling unit.
5	Controlling unit is not marked ACT.
6	Could not reserve the unit.
7	Failed to fill in special device file name.
8	Failed to open special device file.
9	Could not set up physical I/O.
10	Could not read VTOC on the unit.
11	No LBOOT21 partition with size greater than zero.
12	No BBOOT partition with size greater than zero.
13	No SWAP partition with size greater than zero.
14	No ROOT partition with size greater than zero.
15	ROOT partition is not a file system.
16	No ECD partition with size greater than zero.
17	ECD partition is not a file system.
18	No ETC partition with size greater than zero.
19	ETC partition is not a file system.
20	Seek error while accessing root inode.
21	Read error while accessing root inode.
22	UCB specified by RID is not for a MHD.
23	Seek error while accessing "time stamp" inode.
24	Read error while accessing "time stamp" inode.
25	Seek error while accessing direct data block.
26	Read error while accessing direct data block.
27	Seek error while accessing single indirect header block.
28	Read error while accessing single indirect header block.
29	Seek error while accessing single indirect data block.
30	Read error while accessing single indirect data block.
31	Seek error while accessing double indirect header block.
32	Read error while accessing double indirect header block.

SEE PROPRIETARY NOTICE ON COVER PAGE

Result Code	Description
33	Seek error while accessing single from double indirect header block.
34	Read error while accessing single from double indirect header block.
35	Seek error while accessing double indirect data block.
36	Read error while accessing double indirect data block.
37	Seek error while accessing triple indirect header block.
38	Read error while accessing triple indirect header block.
39	Seek error while accessing double from triple indirect header block.
40	Read error while accessing double from triple indirect header block.
41	Seek error while accessing single from triple indirect header block.
42	Read error while accessing single from triple indirect header block.
43	Seek error while accessing triple indirect data block.
44	Read error while accessing triple indirect data block.
45	MHD number is not in the range of 0-15 inclusive.
46	MHDs attached to DFC are not cabled to the expected DMAC, channel and device.
47	Up UCB from the SBUS is not a DFC.
48	Up UCB from the MHD is not a SBUS.
49	MHD number and internal device number do not correspond.
50	MHD number and SBUS internal device number do not correspond.
51	Cannot get to the DFC using up RID.
52	Cannot get to the channel using up RID.
53	Cannot get to the DMAC using up RID.
54	Up UCB from the DFC is not a channel.
55	Up UCB from the channel is not a DMAC.
56	No VTOC partition with size greater than zero.
57	VTOC partition does not start at address zero.
58	VTOC partition too small to hold "vtoc" data.

Exit Code	Description
1	Unable to enable messages.
2	Message returned not of size requested.
3	Unable to open /dev/ecd.
4	Received message is not of expected size.
5	Received message is not of expected inter-process type.
6	Received message is not of expected internal type.
7	Timed out waiting for message.
8	Unable to send event - parent process gone.
9-64	Not used at present.
65-97	Exiting due to signal. Subtract 64 to calculate the specific signal value.

This appendix contains a table describing the DCI driver special completion codes, which are applicable for autonomous response output messages.

All error codes are in hexadecimal notation.

Table 1 - Autonomous Response Special Completion Code

Code	Definition
3	SYSGEN command completed. The DCI is reporting the completion of a SYSGEN command. The job id code for the SYSGEN command is zero by design.
5	DCI idle. This is in response to a SUN driver initiated ABORT sequence, simply indicating that the DCI was idle when the SUN driver sent abort command.
6	Illegal command. The DCI received a bit pattern in the command field which it could not decode.
7	DCI Autonomous Error. When BIC reports software error during data transfer, the Sun driver aborts the data transfer if it is in progress.

REMOVE/RESTORE PROCESS ERROR CODES

NOTE: These remove/restore process error codes are in hexadecimal notation.

CODE	DESCRIPTION
1	Cannot enable message reception
2	recvw function error
3	Cannot open spooler
4	Cannot open ECD manager
5	Cannot get UCB
6	UCB not for requested unit
7	Cannot get special device file
8	Cannot open special device file
9	Invalid command tag from DIAMON
a	Cannot reset reserve bit
b	sendw function error
c	Cannot set `u_tnum` in UCB
d	Request type from DIAMON not manual or auto
e	Cannot set `u_manrqst` in UCB
f	Cannot release special device file
10	Abort request made via DIAMON, reasons for abort request are by manual input by recovery process

FAULT CODES

NOTE: These fault codes are in hexadecimal notation.

No Fault

00	No fault (normal)

Peripheral Faults - With Accompanying Message

b1	Device reported error - device implicated - pio in progress
b2	Parity divert error - device implicated - pio in progress
b3	Channel error - device not implicated but possibly affected - pio in progress
b4	Device reported error - device implicated
b5	DMA addressing error - device implicated
b6	DMA used OOR address - device implicated
b7	Channel error - device not implicated but possibly affected

Peripheral Faults - Without Accompanying Message

b8	Device reported error - cannot identify unit
b9	Parity divert error - cannot identify unit
ba	Addressing error - cannot identify unit

Configuration Manager Fault Codes - With Accompanying Message

c3	Informative - excessive recoverable errors
c4	Remove directive - excessive errors
c5	Remove request - attempt restoral of oos usable unit
c6	Limp mode - attempt restoral of oos unusable unit
c7	Limp mode - no replacement avail
c8	Manual remove
c9	Unconditional remove
cc	Config. manager remove under fault conditions

Software Errors - No Accompanying Message

SEE PROPRIETARY NOTICE ON COVER PAGE

d1	Memory Management - page invalid or not in memory
d3	Memory Management - segment invalid
d4	Memory Management - segment index too large
d5	Illegal operating system trap (OST)
d6	Protection violation
d7	Byte or halfword addressing violation
d8	Instruction privilege violation
d9	Illegal op code

System Initialization - No Accompanying Message

e1	Substantial system recovery has occurred

Message Buffer Audit Faults

bc	Message buffer audit fault for queued error messages
bd	Message buffer audit fault for non-queued error messages

DKDRV Error / Warning Codes

NOTE: These error / warning codes are in hexadecimal notation.

`005` Branch to virtual address 0 detected.
`010` No inventory room - restructure disk driver (DKDRV).
`020` Just report failure.
`030` Access to bus interface controller (BIC) failed.
`035` Desired BIC status not obtained.
`040` Input / Output (I / O) job has no associated I / O message.
`045` Message type not IOREAD or IOWRITE.
`04a` No job found in inventory data.
`055` Job reported error.
`05a` Response contains job ID not in use.
`060` Response specified an unknown device.
`06f` Driver status error.
`075` Special queue full.
`076` `queuejob` failed.
`077` `spqjobid` failed.
`07a` `intpwait` function failed.
`090` `Dfcpump` base queue full.
`092` `Dfcpump getjobid` failed.
`094` `Dfcpump queuejob` failed.
`096` `Dfcpump intpwait` function failed.
`098` `Dfcpump special` queue full.
`09a` `Dfcpump spqjobid` failed.
`09c` `Dfcpump queuejob` failed.
`09e` `Dfcpump intpwait` function failed.
`0a0` `initmem1()` failed.
`0a5` Disk file controller (DFC) restore failed.
`0aa` Moving head disk (MHD) marked `S_ACT` but DFC not marked `S_ACT`.
`0b0` Simplex MHD restore failed config denied removal.
`0b1` Simplex MHD restore failed config OKed removal.
`0b5` MHD restore failed and no `S_ACT` mate.
`0c0` `initkint` (intr detach / attach) failed.
`0c5` `DKDRV` timing chain index 0 already assigned.
`0cf` Duplicate fields in the msg do not match.
`0d0` `DMA_OK` flag not set in msg.
`0d5` Byte offset not on word boundary.
`0e0` Unknown `ACK` message received.
`0e1` Power switch monitor (PSM) sent a bad power transmission message.

SEE PROPRIETARY NOTICE ON COVER PAGE

0e5 Unrecognizable message type.
0ea maint job failure - see DKDRV error report.
0ee temmmmmp.
0ef temp msg - old msg returned.
0f0 Incorrect swap LOG_REC RID from ECDORG.
0f1 Incorrect SWAP MDCT RID.
0f2 dlm indicator msg alloc failed (to SIM).
0f3 Can't update the ROOT/SWAP device table.
0f4 dlm indicator msg alloc failed (to DKDIP).
0f6 dlm indicator msg alloc failed (to DKDIP).
0f8 dlm indicator msg alloc failed (to DKDIP).
0fa Could not get a CDLM timer entry.
0fb dlmstrt ost returned SWFAIL.
0fd Microstore limpmode flag set.
0fe Bad return from dlmstrt.
0ff Invalid opercode in util message.
100 Power down of a non-out of service (OOS) unit.
101 DFC power down msg received - unit still usable.
102 MHD power down msg received - unit still usable.
103 dlm indicator msg alloc failed.
105 Special priority queue full.
106 Queuejob failed.
107 Spqjobid failed.
10a intpwait function failed.
110 No volume table of contents (VTOC) on disk pack.
113 VTOC too large for DKDRV to handle.
116 Invalid partition number in vtoc entry.
119 Invalid partition number in msg.
130 DFCDRV should not see this type job.
135 DFCDRV should not see this type job.
13a Illegal command type.
140 v. addr does not map into segment no.
145 iolock() failed.
14a uniolock() failed.
160 Record identification number (RID) to unit control block (UCB) low level access (LLA) call failed.
165 RID update and release failed.
16a RID unknown by DKDRV.
170 RID to UCB LLA call failed.
175 RID update and release failed.
17a RID to UCB LLA call failed.
180 RID update and release failed.
185 RID to UCB LLA call failed.
18a RID update and release failed.
190 Invalid inhibit administration opcode.
1a0 dtchintr call returned fail.
1a5 atchintr call returned fail.
1aa enabintr call returned fail.
1b0 Equipment configuration data base (ECD) attach failed.
1b1 DLM INIT failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`1b5` `CONFIG OPEN` failed.
`1ba` `atchdata` call to ECD failed.
`1c0` No DFCs in ECD.
`1c5` DFC growth failed.
`1ca` `downucbs` ECD call failed.
`1d0` MHD growth failed.
`1d5` Too many devices.
`1da` RID to UCB conversion failed.
`1e0` Device not DFC or MHD.
`1e5` RID update and release failed.
`1ea` Device is unequipped.
`1f0` Channel RID to UCB conversion failed.
`1f5` DFC RID to UCB conversion failed.
`1fa` No DKDRV memory allocated for DFC.
`200` No DKDRV memory allocated for MHD.
`205` Memory initialization failed.
`20a` DKDRV port attach failed.
`210` `getpta()` function failed.
`215` RID to UCB conversion failed.
`21a` `idmadev()` (write to DMAC RAM) failed.
`220` `atchintr` call failed.
`222` RID not known to DKDRV.
`224` DFC being degrown is being used.
`225` Update of DKDRV local DFC UCB failed.
`226` DFC being degrown not UNEQIP.
`22a` MHD being degrown is being used.
`22b` Update of DKDRV local MHD UCB failed.
`22c` MHD being degrown not UNEQIP.
`230` RID to UCB conversion failed.
`231` RID update and release failed.
`232` Drive type in ECD does not agree with backplane - restore aborted. For SMD MHDs with UCB device_id field = 0 (first MHD on DFC, usually MHD 0 or 1): MHD type read from DFC backplane may not agree with MHD UCB equipage field or may not be read correctly by DFC TN65 or UN64 board.
`233` RID to UCB conversion failed.
`234` RID update and release failed.
`240` Delay (failed to find intr set in BIC).
`250` Job complete code == fail.
`260` Incorrect minor device chain table (MDCT) from I/O message.
`263` Warning - enlarge DKDRV's internal MDCT.
`265` Growth of device failed.
`26a` No RIDs in ECD MDCT.
`26c` Disk specific write not allowed.
`26f` No `S_ACT` device - open.
`270` No `S_ACT` device - read.
`275` Invalid partition number in read msg.
`27a` Unable to inventory job.
`27d` `bhqjobid` failed.
`280` `io_blk` exceeds partition size - read.
`290` No `S_ACT` device - write.

295 Invalid partition number in write msg.
29a Tried to write into protected partition.
2b1 No job ID's left.
2ba Unable to inventory all jobs.
2c0 `io_blk` exceeds partition size - write.
305 Unrecognizable DKDRV internal job type.
320 Boot indicator msg allocation failed.
325 INIT entry failed.
32a Unexpected event.
341 Failed to restart driver.
34b Old nonqueued audit error message.
34c Msg buffer audit error - abort maint on this unit.
350 Unexpected fault code.
351 Critical hit - `S_RSP`.
352 Critical hit - `S_MSG`.
353 Driver state error.
362 `ss32b()` failed.
365 PIC never reset `CMD IN PROG` flag.
367 `progio` (D2SBS clear) failed.
36a `progio` (BIC init & PIC reset) failed.
370 `initmem5` (DMAC RAM init) failed.
375 `enabintr` function failed.
37a `progio` (send ABORT cmd to PIC) failed.
380 `progio` (set BIC IFEN flag) failed.
385 Unknown RID faulted.
38a PIO lost for a unit.
390 Unknown RID faulted.
391 Invalid `pdfptr`.
392 Invalid `pdfptr`.
393 Unexpected fault code.
395 RID to UCB LLA call failed.
397 `msg alloc` failed (to file manager (FMGR)).
398 Could not get a timer entry for FMGR.
39a `timereq()` failed -`dfcinit`.
39b Operational problems - major reinitialization.
39d Warning - queue full detected.
3a0 Invalid `dfcinit()` sequence.
3a3 Can't identify panic dump device.
3a6 Incorrect `PANIC DUMP RID`.
3a9 `ss32b()` failed.
3ac PIC never reset `CMD IN PROG` flag.
3af `progio` (D2SBS clear) failed.
3b0 `progio` (BIC init & PIC reset) failed.
3ba Failed to clear `BIC INTP`.
3bc `kint` - stray interrupts detected.
3d0 Device file not open.
3d5 DKDRV has aborted client.
3da Invalid maintenance state.
3e0 Request prohibited on `S_ACT DFC`.
3e5 `Maint attach intr` failed.

3ea `Maint enable intr` failed.
3f0 UCB is not a DFC.
3f5 Direct memory access controller (DMAC) ram init failed.
3fa `Detach/attach/enable intr` failed.
400 `Detach intr` failed.
405 CONFIG denied request to remove unit.
40a MHD restore `NG` not `S_ACT`.
40b `compare/correct` - unit not a disk.
40c `compare/correct` - `DFC` not `S_ACT`.
40d May not `compare/correct` a `S_INIT` unit.
410 May only restore `S_OOS` units.
412 DFC restore `NG` device.
414 May only restore `S_OOS` units.
415 `DIAG SYSGEN pio` failed.
41a UCB is not a DFC UCB.
420 Not allowed to DGN an `S_ACT` unit.
426 Special queue full.
427 `queuejob` failed.
428 `spqjobid` failed.
430 `getdmaa` function failed.
435 Received `WSETUP0` before `SPECDMA`.
43a `WSETUP1` received before `WSETUP0`.
440 `uniolock` failed.
450 `getdmaa` function failed.
455 `queuejob` failed.
456 Base queue full.
457 `bhqjobid` failed.
458 Version job failed.
45a RID not known by DKDRV.
460 `FORMAT` requires non-`S_ACT MHD`.
465 `FORMAT/VERIFY` requires `S_ACT DFC`.
467 MHD usability changed because of INIT operation.
46a `VERIFY` in progress - retry later.
470 Start track > last track.
475 Base queue full.
476 `bhqjobid` failed.
477 `queuejob` failed.
47a Another process has device file open.
480 Invalid when MHD is `S_ACT`.
485 DFC must be `S_ACT`.
48a Invalid when MHD is `S_ACT`.
490 DFC must be `S_ACT`.
495 REMAP `dskserv()` failed.
496 Device major status update failed.
499 Request is not for `MOD_0` - job failed.
4a0 Base queue full.
4a3 Unable to queue LM job.
4a5 No base / high job ID's left.
4a7 Failed to get page table address.
4a9 No job ID's left for base / high Q.

SEE PROPRIETARY NOTICE ON COVER PAGE

`4b0` Invalid opercode in maintenance message.
`4b5` Unexpected maint interrupt.
`4ba` `dtchintr` call failed.
`4c0` `maint. work` timed out.
`4d0` `readvtoc()` function failed.
`4d5` `readvtoc` job failed.
`4da` VTOC sort function failed.
`4e0` Invalid `newvtoc()` sequence.
`4e5` Partition number out of range for DKDRV.
`4e8` Partition number out of range for VTOC.
`500` Tried to use invalid VTOC.
`505` Invalid partition number in msg.
`508` Invalid blk in ptn.
`50a` Unable to inventory job.
`50c` Base queue full.
`50d` `bhqjobid` failed.
`510` Invalid blk on disk.
`520` Tried to use invalid VTOC.
`525` Tried to write into protected partition.
`528` Invalid partition number in msg.
`530` Invalid blk in ptn.
`532` Invalid blk on disk.
`535` Unable to inventory job.
`536` Base queue full.
`537` MHD usability changed because of `pdfwrite` job.
`538` `bhqjobid` failed.
`550` Physical device file not opened.
`555` Can't write to read only (RO) disk.
`55a` `iolock` failed.
`55b` `getjobid` failed.
`56a` DISK read or write requires active DFC.
`570` This physical device file already open.
`575` Device major status update failed.

DKDRV Information Codes

NOTE: These information codes are in hexadecimal notation.

`005` Branch to virtual address 0 detected.
`010` No inventory room - restructure DKDRV.
`020` Report failure.
`030` Access to BIC failed.
`035` Desired BIC status not obtained.
`039` IO job has no associated IO message.
`040` IO message "ms_to" field is invalid.
`045` Message type not IOREAD or IOWRITE.
`04a` No job found in inventory data.
`050` Invalid completion code returned by DFC.
`055` Job reported error.
`05a` Response contains job ID not in use.
`060` Response specified an unknown device.
`06f` Drive status error.
`070` Special queue full.
`073` `spqjobid` failed.
`076` `queuejob` failed for DFC change maintenance mode command.
`07a` `intpwait` function failed for DFC change maintenance mode.
`07c` Special queue full for SBUS change mode job.
`07e` `spqjobid` failed for SBUS change mode command.
`082` `queuejob` for SBUS change maintenance mode failed.
`085` `intpwait` function failed for SBUS change maintenance mode.
`098` DFC version command: special queue full.
`09a` DFC version command: `spqjobid` failed.
`09c` Version command fail.
`09e` `dfc_vers: intpwait` function failed.
`0a0` `initmem1()` failed.
`0a2` Timeout request to get DIOP feature level failed.
`0a3` DKDRV timing chain index 0 already assigned.
`0a4` Failed to read `btparm` record.
`0a5` No mate for boot device found.
`0a8` DFC restore failed during boot.
`0ab` Fail to change the usable bit for SBUS.
`0af` MHD marked `S_ACT` but DFC not marked `S_ACT`.
`0b1` MHD marked `S_ACT` but SBUS not marked `S_ACT`.
`0b3` Simplex MHD restore failed config denied removal.
`0b5` Simplex MHD restore failed config OKed removal.

SEE PROPRIETARY NOTICE ON COVER PAGE

0b8 MHD restore failed and no S_ACT mate.
0c0 initkint (interrupt detach / attach) failed.
0c3 Fail to request pump after boot.
0c6 Invalid MHD to be restored during boot.
0c9 Invalid mate MHD.
0cf Duplicate fields in the message do not match.
0d0 DMA_OK flag not set in message.
0d5 Byte offset not on word boundary.
0d7 Maintenance job failure - see DKDRV error report.
0d9 PSM sent a bad power transition message.
0db temp message - old message returned.
0dd Unknown maintenance ACK received.
0df Unrecognizable message type.
0e2 Unrecognizable device.
0e5 Unknown FMGR ACK message received.
0e6 Segment removed failed, pump buffer retained.
0e8 Unknown MMGR ACK message received.
0ec Unknown DKDRV ACK message received.
0ef Unknown ACK message received.
0f0 Incorrect swap LOG_REC RID from ECDORG.
0f1 Incorrect SWAP MDCT RID.
0f2 Can't update the ROOT / SWAP device table.
0f3 dlm indicator msg alloc failed (to SIM).
0f4 dlm indicator msg alloc failed (to DKDIP).
0f6 dlm indicator msg alloc failed(to DKDIP).
0f8 dlm indicator msg alloc failed(to DKDIP).
0fa Could not get a CDLM timer entry.
0fb dlmstrt ost returned SWFAIL.
0fd microstore limpmode flag set.
0fe Bad return from dlmstrt.
0ff Invalid opercode in util message.
100 Power down of a non-OOS unit.
101 DFC power down message received - unit still usable.
102 MHD is powered down - abort client.
103 MHD power down message received - unit still usable.
104 dlm indicator msg alloc failed.
105 Special priority queue full.
106 queuejob failed.
107 spqjobid failed.
10a intpwait function failed.
110 No VTOC on disk pack.
113 VTOC too large for DKDRV to handle.
116 Invalid partition number in VTOC entry.
119 Invalid partition number in message.
130 DFCDRV should not see this type job.
135 DFCDRV should not see this type job.
13a Illegal command type.
140 Virtual address does not map into segment number.
145 iolock() failed.
14a uniolock() failed.

DKDRV Information Codes

NOTE: These information codes are in hexadecimal notation.

`010` No inventory room - restructure DKDRV.
`020` Report failure.
`030` Access to BIC failed.
`035` Desired BIC status not obtained.
`039` IO job has no associated IO message.
`040` IO message "`ms_to`" field is invalid.
`045` Message type not `IOREAD` or `IOWRITE`.
`04a` No job found in inventory data.
`050` Invalid completion code returned by DFC.
`055` Job reported error.
`05a` Response contains job ID not in use.
`060` Response specified an unknown device.
`06f` Drive status error.
`070` Special queue full.
`073` `spqjobid` failed.
`076` `queuejob` failed for DFC change maintenance mode command.
`07a` `intpwait` function failed for DFC change maintenance mode.
`07c` Special queue full for SBUS change mode job.
`07e` `spqjobid` failed for SBUS change mode command.
`082` `queuejob` for SBUS change maintenance mode failed.
`085` `intpwait` function failed for SBUS change maintenance mode.
`098` DFC version command: special queue full.
`09a` DFC version command: `spqjobid` failed.
`09c` Version command fail.
`09e` `dfc_vers`: `intpwait` function failed.
`0a0` `initmem1()` failed.
`0a2` Timeout request to get DIOP feature level failed.
`0a3` DKDRV timing chain index 0 already assigned.
`0a4` Failed to read `btparm` record.
`0a5` No mate for boot device found.
`0a8` DFC restore failed during boot.
`0ab` Fail to change the usable bit for SBUS.
`0af` MHD marked `S_ACT` but DFC not marked `S_ACT`.
`0b1` MHD marked `S_ACT` but SBUS not marked `S_ACT`.
`0b3` Simplex MHD restore failed config denied removal.
`0b5` Simplex MHD restore failed config OKed removal.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0b8` MHD restore failed and no `S_ACT` mate.
`0c0` `initkint` (interrupt detach / attach) failed.
`0c3` Fail to request pump after boot.
`0c6` Invalid MHD to be restored during boot.
`0c9` Invalid mate MHD.
`0cf` Duplicate fields in the message do not match.
`0d0` `DMA_OK` flag not set in message.
`0d5` Byte offset not on word boundary.
`0d7` Maintenance job failure - see DKDRV error report.
`0d9` PSM sent a bad power transition message.
`0db` temp message - old message returned.
`0dd` Unknown maintenance `ACK` received.
`0df` Unrecognizable message type.
`0e2` Unrecognizable device.
`0e5` Unknown `FMGR ACK` message received.
`0e6` Segment removed failed, pump buffer retained.
`0e8` Unknown `MMGR ACK` message received.
`0ec` Unknown `DKDRV ACK` message received.
`0ef` Unknown `ACK` message received.
`0f0` Incorrect swap `LOG_REC RID` from ECDORG.
`0f1` Incorrect SWAP MDCT RID.
`0f2` Can't update the ROOT / SWAP device table.
`0f3` dlm indicator `alocmsg()` failed (to SIM).
`0f4` dlm indicator `alocmsg()` failed (to DKDIP).
`0f6` dlm indicator `alocmsg()` failed(to DKDIP).
`0f8` dlm indicator `alocmsg()` failed(to DKDIP).
`0fa` Could not get a CDLM timer entry.
`0fb` `dlmstrt ost` returned SWFAIL.
`0fd` microstore limpmode flag set.
`0fe` Bad return from `dlmstrt`.
`0ff` Unknown RID from DKDIP.
`100` Invalid operation code in UTIL message.
`101` Power down of an active unit.
`102` DFC power down message received - unit still usable.
`103` Device powered down - abort client.
`104` Power down message received - unit still usable.
`105` dlm indicator `alocmsg()` failed.
`106` Special priority queue full.
`107` `spqjobid` failed.
`108` Invalid device type for power up check.
`10a` `intpwait` function failed.
`110` No VTOC on disk pack.
`113` VTOC too large for DKDRV to handle.
`116` Invalid partition number in VTOC entry.
`119` Invalid partition number in message.
`140` Virtual address does not map into segment number.
`145` `iolock()` failed.
`14a` `uniolock()` failed.
`160` RID to UCB LLA call failed.
`165` RID update and release failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`16a` RID unknown by DKDRV.
`170` RID to UCB LLA call failed.
`175` RID update and release failed.
`17a` RID to UCB LLA call failed.
`180` RID update and release failed.
`185` RID to UCB LLA call failed.
`18a` RID update and release failed.
`190` Invalid inhibit administration opcode.
`1a0` `dtchintr` call returned fail.
`1a5` `atchintr` call returned fail.
`1aa` `enabintr` call returned fail.
`1b0` ECD attach failed.
`1b3` DLM INIT failed.
`1b5` CONFIG OPEN failed.
`1b8` atchdata call to ECD failed.
`1bc` No DFCs in ECD.
`1be` DFC growth failed.
`1c3` downucbs ECD call failed.
`1c6` SBUS growth failed.
`1c9` downucbs ECD call failed.
`1cc` Growth of SCSI device failed.
`1ce` downucbs ECD call failed.
`1d1` SMD MHD growth failed.
`1d3` Too many devices.
`1d6` RID to UCB conversion failed.
`1d8` Invalid device type.
`1d9` Unable to determine DFC type.
`1dc` RID update and release failed.
`1de` Device is unequipped.
`1df` Invalid DFC internal device ID.
`1e1` Channel RID to UCB conversion failed.
`1e3` Invalid SBUS internal device ID.
`1e5` DFC RID to UCB conversion failed.
`1e7` Invalid device ID for SCSI device.
`1e9` SBUS RID to UCB conversion failed.
`1eb` Invalid SBUS internal device id.
`1ed` DFC RID to UCB conversion failed.
`1ef` Invalid device ID for SMD MHD.
`1f2` DFC RID to UCB conversion failed.
`1f4` Incorrect device type for the device's control unit.
`1fc` Memory initialization failed.
`1fe` DKDRV port attach failed.
`203` `getpta()` function failed.
`206` RID to UCB conversion failed.
`209` `idmadev()` (write to DMAC RAM) failed.
`20c` `atchintr` call failed.
`20f` RID not known by DKDRV.
`213` DFC being de-grown is in use.
`216` Update of DKDRV local DFC UCB failed.
`219` DFC being de-grown not in UNEQIP state.

SEE PROPRIETARY NOTICE ON COVER PAGE

21c SBUS being de-grown is in use.
21f Update of DKDRV local SBUS UCB failed.
223 SBUS being de-grown not in UNEQIP state.
226 Unit being de-grown is in use.
229 Update of DKDRV local device UCB failed.
22c Unit being de-grown not in UNEQIP state.
22f RID to UCB conversion failed.
233 RID update and release failed.
236 Drive type in ECD does not agree with backplane - restore aborted.
239 RID to UCB conversion failed.
23a RID update and release failed.
23b RID to UCB conversion failed.
23c Get option block for DFC failed.
23d Invalid `eirflag` field in DFC option block.
23e Get option block for MHD failed.
240 Delay (failed to find interrupt set in BIC).
242 RID to UCB conversion failed.
250 Job complete code == fail.
252 Job request not allowed.
254 Job request not allowed.
258 Tape device already opened.
25a Driver I/O error.
25c No `S_ACT` device - open.
260 Incorrect MDCT from IO message.
263 Growth of device failed.
265 No RIDs in ECD MDCT.
268 Warning - enlarge DKDRV's internal MDCT.
26c Disk specific write not allowed.
270 No `S_ACT` device - read.
275 Invalid partition number in read message.
278 Access to DIAG partition is not allowed - read.
27a Unable to inventory job.
27d `bhqjobid` failed.
280 `io_blk` exceeds partition size - read.
290 No `S_ACT` device - write.
295 Invalid partition number in write message.
29a Tried to write into protected partition.
2b1 No job IDs left.
2ba Unable to inventory all jobs.
2be Access to DIAG partition is not allowed - write.
2c0 `io_blk` exceeds partition size - write.
305 Unrecognizable DKDRV internal job type.
307 Unexpected denial of request to remove MHD.
308 Duplex operation compromised due to removing MHD.
320 Boot indicator message allocation failed.
325 INIT entry failed.
32a Unexpected event.
340 do_error(0x340) `FLT_SINIT` fault code.
343 Failed to restart driver.
346 Old non-queued audit error message.

SEE PROPRIETARY NOTICE ON COVER PAGE

`349` Unexpected fault code.
`34c` Critical hit - `S_RSP`.
`34f` Critical hit - `S_MSG`.
`353` Driver state error.
`355` Calling `dfcinit()` for lack of "warm" restart.
`356` `ss32b()` failed.
`359` PIC never reset CMD IN PROG flag.
`35f` `progio` (D2SBS clear) failed.
`363` `progio` (BIC initialization and PIC reset) failed.
`366` `initmem5` (DMAC RAM initialization) failed.
`369` `enabintr` function failed.
`36c` `progio` (send ABORT command to PIC) failed.
`36f` `progio` (set BIC IFEN flag) failed.
`373` Unknown RID faulted.
`376` PIO lost for a unit.
`379` Unknown RID faulted.
`37c` Unexpected fault code.
`37f` Message buffer audit error - abort maintenance on this unit.
`383` `timereq()` failed - `dfcinit()`.
`391` invalid `pdfptr`.
`392` invalid `pdfptr`.
`395` RID to UCB LLA call failed.
`397` Message alloc failed (to FMGR).
`398` Could not get a timer entry for FMGR.
`39b` Major DFC reinitialization due to either operational problems or manual request.
`39c` Tape operations aborted.
`39e` Warning - queue full detected.
`3a6` Invalid `dfcinit()` sequence.
`3a9` Can't identify panic dump device.
`3ac` Incorrect PANIC DUMP RID.
`3af` `ss32b()` failed.
`3b3` PIC never reset CMD IN PROG flag.
`3b6` `progio` (D2SBS clear) failed.
`3b9` `progio` (BIC initialization and PIC reset) failed.
`3ba` Failed to clear BIC INTP.
`3bc` `kint()` - stray interrupts detected.
`3be` `kint()` entered before `kfault()` after panic dump.
`3d0` RID not known by DKDRV.
`3d3` DKDRV has aborted client.
`3d5` Invalid maintenance state.
`3d8` Device file not open.
`3dc` Another process has device file open.
`3dd` Tape device is already open.
`3de` Request prohibited on `S_ACT DFC`.
`3e1` `maint()` attach interrupt failed.
`3e3` `maint()` enable interrupt failed.
`3e5` UCB is not a DFC.
`3e8` DMAC RAM initialization failed.
`3ec` Detach / attach / enable interrupt failed.
`3ef` Detach interrupt failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

401 Device type is not SCSI.
402 FORMAT - unit is not a disk.
403 Device type is not SCSI for explicit SCSI command.
404 DFC must be active.
405 DFC is not ACTIVE for SCSI command.
406 SBUS must be active.
407 SBUS is not ACTIVE for SCSI command.
409 CONFIG denied request to remove unit.
40a Base queue full.
40b Time limit exceeds capability.
40c May only restore S_OOS units.
40d Failed to get job id.
40e Restore request no good - DFC not S_ACT.
40f queuejob failed.
412 Restore request no good - SBUS not S_ACT.
415 Compare/correct - unit not a disk.
418 Compare/correct - DFC not S_ACT.
41b Compare/correct - SBUS not ACTIVE.
41d May not compare/correct a S_INIT unit.
422 May only restore S_OOS units.
425 SBUS restore - DFC is not ACTIVE.
426 MHD or MT restore - SBUS is not ACTIVE.
427 MHD restore - DFC is not ACTIVE.
428 DIAG SYSGEN PIO failed.
429 Restore not allowed - device not supported.
42a UCB is not a DFC UCB.
42c Not allowed to DGN an S_ACT unit.
42e Special queue full.
432 Invalid device to be diagnosed.
435 spqjobid failed.
438 queuejob failed.
43c getdmaa function failed.
43e Received WSETUP0 before SPECDMA.
442 WSETUP1 received before WSETUP0.
445 uniolock failed.
448 getdmaa function failed.
44c Invalid disk lock process.
44f Base queue full.
452 bhqjobid failed.
455 queuejob failed.
458 Version job failed.
460 FORMAT requires non-S_ACT MHD.
462 FORMAT/VERIFY - unit is not a disk.
465 FORMAT/VERIFY requires S_ACT DFC.
468 INIT/VFY MHD - SBUS not S_ACT.
46a VERIFY in progress - retry later.
470 Start track/block greater than last track/block.
473 Base queue full.
476 bhqjobid failed.
479 MHD usability changed because of INIT operation.

SEE PROPRIETARY NOTICE ON COVER PAGE

47c `queuejob` failed.
480 Invalid when MHD is `S_ACT`.
483 DFC must be `S_ACT`.
486 Invalid when MHD is `S_ACT`.
489 DFC must be `S_ACT`.
48b `REMAP devserv()` failed.
48d Device major status update failed.
48f Failed to initialize device status.
492 Base queue full.
494 Unable to queue LM job.
496 Invalid DFC type for DFC reset request.
498 DFC is not ACTIVE to be reset.
49a Firmware is running - cannot reset DFC.
49f DFC type does not support pump.
4a3 DFC is not ACTIVE for pumpcode downloading.
4a6 Other pump in progress - retry later.
4a9 Unable to queue pump job.
4aa Device must be non-ACT to initialize error message inhibit flag.
4ab CLRMAEC - unit is not a disk.
4ac Invalid opercode in maintenance message.
4ae Unexpected maintenance interrupt.
4b3 `dtchintr` call failed.
4b6 Maintenance work timed out.
4b9 No base or high job IDs left.
4bc Failed to get page table address.
4be No job IDs left for base or high queue.
4c2 Offset of the SCSI command is not on word boundary.
4c5 Explicit SCSI command, response and data are not on the same segment.
4c8 Base queue full for SCSI command.
4ca Request exceeds DFC capability.
4cb Invalid second device for SCSI command.
4cc Request exceeds expscsi capability.
4cd Unable to queue the SCSI command.
4d0 `readvtoc()` function failed.
4d5 `readvtoc()` job failed.
4da VTOC sort function failed.
4e0 Invalid `newvtoc()` sequence.
4e5 Partition number out of range for DKDRV.
4e8 Partition number out of range for VTOC.
500 Base queue full for maintenance read.
503 Tried to use invalid VTOC for maintenance read.
505 Invalid partition number in message.
508 Invalid block in partition.
50c `bhqjobid` failed for maintenance read.
50e Unable to inventory job for maintenance read.
520 Base queue full for maintenance write.
523 Tried to use invalid VTOC for maintenance write.
526 Invalid partition number in message.
529 Tried to write into protected partition.
52c Invalid block in partition.

537 MHD usability changed because of `pdfwrite` job.
539 `bhqjobid` failed for maintenance write.
53b Unable to inventory job for maintenance write.
550 Physical device file not opened.
553 Incorrect READ/WRITE access permissions.
556 `iolock` failed.
55b `getjobid` failed.
55f Maintenance I/O request to a non-disk device.
56a DISK read or write requires active DFC.
56f DISK read or write requires active SBUS.
573 This physical device file already open.
575 Device major status update failed.
57a Update of device file variables failed.
580 May not maintenance write ACT device.
583 SDF prematurely closed during a restore.
585 `uniolock` failed.
5a0 Command to BIC failed.
5a5 Command to PIC failed.
5aa Clear of DDSBS failed.
5b0 Read status of DDSBS failed.
5b5 Read of BIC FIFO failed.
5ba Write of BIC FIFO failed.
5bc Read status of BIC failed.
5bf BIC command to read HA shadow register failed.
5c3 Read status of SCSI HA shadow register failed.
5c5 `progio cmdtype` not defined.
5e0 `queuejob` failed.
5e1 Base queue full.
5e2 `getjobid` failed.
5ec `intpwait` function failed.
5f0 `Readdisk queuejob` failed.
5f1 `Readdisk` base queue full.
5f2 `Readdisk getjobid` failed.
5fc `Readdisk intpwait` function failed.
600 Excessive errors - device being reset.
601 Excessive errors - device being reset.
603 SBUS work terminated - DFC going `S_OOS`.
609 DFC sub-device work terminated - DFC going `S_OOS`.
60a Tape work terminated - DFC going `S_OOS`.
60c SBUS sub-device work terminated - SBUS going `S_OOS`.
60d Tape work terminated - SBUS going `S_OOS`.
60e CONFIG `chgstate()` call failed.
613 `dtchintr()` failed.
615 `devserv(OFFLINE)` function failed.
618 `devserv(OFFLINE)` job failed.
61c `sbuserv(OFFLINE)` function failed.
61f `sbuserv(OFFLINE)` job failed.
650 RID to UCB LLA call failed.
653 RID to UCB LLA call failed.
655 RID to UCB LLA call failed.

`658` RID to UCB LLA call failed.

`669` RID to UCB LLA call failed.
`673` RID to UCB LLA call failed.
`678` RID to UCB LLA call failed.
`67a` EIR contains job ID not in use.
`67b` RID to UCB LLA call failed.
`67c` RID to UCB LLA call failed.
`67d` RID to UCB LLA call failed.
`67e` RID to UCB LLA call failed.
`682` RID to UCB LLA call failed.
`6a9` Retry PIO failed.
`6aa` Failed to requeue job.
`6b0` Remake: job ID not in use.
`6b5` Remake: bad message type.
`6be` Restore - invalid device type.
`6c0` Unable to change usable bit for DFC.
`6c3` `CONFIG chgstate` call failed.
`6c5` DKDRV DFC memory init failed.
`6c8` `initmem5()` (DMAC init) failed.
`6ca` `initmem6()` (atchintr) failed.
`6ce` `progio` (D2SBS clear) failed.
`6d1` `progio` (BIC initialization and PIC reset) failed.
`6d3` `enabintr()` failed.
`6d5` `SYSGEN` function failed.
`6d8` `sysgen` job failed.
`6db` `dfc_vers` request function failed.
`6dd` `dfc_vers` job failed.
`6df` `dfcserv(ONLINE)` function failed.
`6e2` `dfcserv(ONLINE)` job failed.
`6e5` CONFIG chgstate call failed.
`6e8` Unable to change usable bit for DFC.
`6eb` Cannot request a timer for pump after DFC restore.
`6ef` Invalid DFC restore sequence number.
`6f2` Unit is in FULL DLM - abort restore.
`6f5` Mate unit is in FULL DLM - abort restore.
`6f8` Unable to change usable bit for MHD.
`6fb` CONFIG chgstate call failed.
`6fe` DKDRV MHD memory initialization failed.
`6ff` `dlm_chks()` denied restore request.
`701` `readdisk()` function failed.
`703` Disk job (`readdisk`) failed.
`706` `devserv(ONLINE,RSTJOB)` function failed.
`709` DFC failed to put MHD on-line.
`70c` `readvtoc()` function failed.

70e Disk job (readvtoc) failed.
711 VTOC integrity check failed.
713 CONFIG chgstate call failed.
715 Unable to change usable bit for MHD.
718 Invalid MHD restore sequence number.
71c CONFIG chgstate call failed.
71e sbuserv(ONLINE) function failed.
722 sbuserv(ONLINE) job failed.
725 CONFIG chgstate call failed.
728 Unable to change usable bit for SBUS.
72c Invalid SBUS restore sequence number.
730 Maintenance state audit requested.
732 Invalid MHD "compcor" sequence number.
741 Unit is in FULL DLM - abort restore.
742 Failed to change usable bit for tape.
745 CONFIG chgstate call failed.
748 DKDRV tape memory initialization failed.
74b devserv(ONLINE) function failed.
74e Failed to put tape device ONLINE.
752 CONFIG chgstate call failed.
755 Failed to change usable bit for tape.
758 Invalid tape restore sequence number.
75b DIOP restore not allowed - mate MHD is active.
75e DIOP restore not allowed - MHD is marked essential.
760 progio (set BIC IFEN flag) failed.
761 Wakeup PIO failed.
762 Resume PIO failed.
765 progio (send SYSGEN command to PIC) failed.
76a intpwait function failed.
770 Job timed out.
775 DFC timed out.
776 Invalid pump state.
778 Cannot request timer for DFC pump.
77a DFC entering overload.
77c DFC leaving overload.
77f DFC usability audit failed.
790 Timing table full.
795 Timeout request is out of range.
7c0 No base or high job IDs left.
7c3 No job IDs left for base or high queue.
7c5 No job IDs left for special queue.
800 prc/s_update terminated abnormally.
801 prc/s_dskutil terminated abnormally.
825 Could not alloc msg buf.
830 Could not pcreat process.
835 Could not alloc msg buf.
900 DKDIP pid is null.
903 alocmsg failed.
906 Failed to remove the segment.
909 Cannot pump - other pump in progress.

`90c` Invalid DFC state for pump.
`90e` Cannot perform pump at this time.
`911` DFC is not `S_ACT` for pump.
`913` Invalid global pump state.
`916` DFC is scheduled for major reinitialization - can't pump.
`919` Pump not started - DFC is reserved.
`91c` Failed to allocate message for FMGR.
`91e` File stat error.
`91f` Pump-file is zero byte in size.
`921` Pump-file is not a contiguous single extent file.
`923` Can't get `segnum`.
`926` Fail to queue the pump request.
`929` Can't get `segnum`.
`92c` Fail to determine pump type.
`92d` Can't get `segnum` for DKDRV's internal pump buffer.
`92e` Failed to download the pumpcode.
`931` Request to read pump-file failed.
`933` Failed to read pump-file.
`936` Failed to send the pump request.
`939` Pump failed at last pump.
`93c` Failed to queue a version command in pump procedure.
`93e` Pumpcode version command failed.
`93f` Failed to start new pump.
`943` Invalid pump sequence.
`946` Invalid MDCT RID for pump file.
`949` Invalid segment size requested.
`94c` Failed to get a segment index for new segment.
`94e` Failed to get a segment number for new segment.
`951` Failed to allocate a message buffer.
`953` Failed to allocate a message buffer.
`956` Can't `iolock` the buffer.
`959` Can't allocate the message buffer for reading pumpfile.
`95c` Can't send the I/O message.
`95f` DFC pump: high priority queue full.
`963` DFC pump: base priority queue full.
`966` DFC pump: `getjobid` failed.
`969` DFC pump: `queuejob` failed.
`96c` Can't remove the segment used for pump buffer.
`96f` Invalid time out for pump procedure.
`971` Pump timeout - abort pump.
`980` Incorrect root `LOG_REC RID` from ECDORG.
`981` Incorrect root MDCT RID.
`a01` `s_update` started.
`a0a` Bad MAINT message opercode.
`a15` Can't open ECD.
`a1a` Cannot get specified unit UCB.
`a20` Specified unit UCB not reserved.
`a25` Failed to get "to" unit SDF.
`a2a` Open of "to" SDF failed.
`a30` `ugucbm()` failed.

a35 No active mate found.
a3a Failed to reserve active mate UCB.
a40 Failed to get "from" unit SDF.
a45 Open of "from" SDF failed.
a48 Can't read VTOC on active disk.
a4a Invalid VTOC on active disk.
a55 Asynchronous write failure.
a5a Asynchronous write failure.
a60 VTOC read (source disk) failed.
a65 VTOC write (destination disk) failed.
a6a Too many partitions.
a70 Block number not within VTOC.
a75 Primary BBOOT partition is INVALID.
a7a Backup BBOOT partition is INVALID.
a80 Tried to access unopened file.
a85 `segoff` failure.
a8a `movetrap` failure.
a90 Disk read error.
a95 Disk read error - correctly reread.
a9a Invalid file descriptor.
aa0 `IOQUEUEM` failure.
aa5 Maintenance job to DKDRV failed.
aaa Received application abort restore request.
ab5 Invalid argument.
aba `segname` already exists.
ac0 Segment exists.
ac5 No segments available.
aca Not enough space.
ad0 Bad `segndx`.
ad3 Can't find a free `segindex`.
ad5 `segoff` failure.
ada Driver startup message not received.
ae0 Terminated externally.
ae5 Invalid `U_ABRTRST` message.
aea Invalid maintenance message.
af0 Unknown `ACK` message.
af5 Process was faulted.
b01 `s_dskutil` started.
b06 Cannot connect to port `PT_DSKUTL`.
b09 Bad MAINT message opercode.
b10 Can't open ECD.
b13 "DEST" unit not specified.
b16 `ugucbm()` failed for "DEST" unit.
b19 Cannot get "DEST" unit UCB.
b1c "DEST" unit UCB not reserved.
b20 Failed to get "TO" unit SDF.
b23 Open of "TO" SDF failed.
b26 Dup of "TO" SDF failed.
b29 `ugetucb()` failed for "FROM" unit.
b36 Failed to reserve "FROM" unit UCB.

SEE PROPRIETARY NOTICE ON COVER PAGE

`b39` Failed to get "FROM" unit SDF.
`b3c` Open of "FROM" SDF failed.
`b40` Remove mate of "DEST" unit and re-enter command.
`b46` Dup of "FROM" SDF failed.
`b48` Failed to read VTOC on "TO" disk.
`b49` Invalid VTOC on "TO" disk.
`b4b` Failed to read VTOC on "FROM" disk.
`b4c` Invalid VTOC on "FROM" disk.
`b50` Both VTOCs do not match.
`b5c` Read failure (DEST disk).
`b60` Read failure (SRC disk).
`b63` Too many partitions.
`b66` VTOCs do not match in size.
`b69` Sync write failure (DEST disk).

DKDRV Information Codes

NOTE: These information codes are in hexadecimal notation.

`010` No inventory room - restructure DKDRV.
`020` Report failure.
`030` Access to BIC failed.
`035` Desired BIC status not obtained.
`039` IO job has no associated IO message.
`040` IO message "`ms_to`" field is invalid.
`045` Message type not `IOREAD` or `IOWRITE`.
`04a` No job found in inventory data.
`050` Invalid completion code returned by DFC.
`055` Job reported error.
`05a` Response contains job ID not in use.
`060` Response specified an unknown device.
`06f` Drive status error.
`070` Special queue full.
`073` `spqjobid()` failed.
`076` `queuejob()` failed for DFC change maintenance mode command.
`07a` `intpwait()` function failed for DFC change maintenance mode.
`07c` Special queue full for SBUS change mode job.
`07e` `spqjobid()` failed for SBUS change mode command.
`082` `queuejob()` for SBUS change maintenance mode failed.
`085` `intpwait()` function failed for SBUS change maintenance mode.
`098` DFC version command: special queue full.
`09a` DFC version command: `spqjobid` failed.
`09c` Version command fail.
`09e` `dfc_vers`: `intpwait` function failed.
`0a0` `initmem1()` failed.
`0a2` Timeout request to get DIOP feature level failed.
`0a3` DKDRV timing chain index 0 already assigned.
`0a4` Failed to read `btparm` record.
`0a5` No mate for boot device found.
`0a8` DFC restore failed during boot.
`0ab` Fail to change the usable bit for SBUS.
`0af` MHD marked `S_ACT` but DFC not marked `S_ACT`.
`0b1` MHD marked `S_ACT` but SBUS not marked `S_ACT`.
`0b3` Simplex MHD restore failed config denied removal.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0b5` Simplex MHD restore failed config OKed removal.
`0b8` MHD restore failed and no `S_ACT` mate.
`0c0` `initkint()` (interrupt detach/attach) failed.
`0c3` Fail to request pump after boot.
`0c6` Invalid MHD to be restored during boot.
`0c9` Invalid mate MHD.
`0ca` RID to UCB conversion failed.
`0cb` RID update and release failed.
`0cf` Duplicate fields in the message do not match.
`0d5` Byte offset not on word boundary.
`0d7` Maintenance job failure - see DKDRV error report.
`0d9` PSM sent a bad power transition message.
`0db` temp message - old message returned.
`0dd` Unknown maintenance `ACK` received.
`0df` Unrecognizable message type.
`0e2` Unrecognizable device.
`0e5` Unknown `FMGR ACK` message received.
`0e6` Segment removed failed, pump buffer retained.
`0e8` Unknown `MMGR ACK` message received.
`0ec` Unknown `DKDRV ACK` message received.
`0ef` Unknown `ACK` message received.
`0f0` Incorrect swap `LOG_REC RID` from ECDORG.
`0f1` Incorrect SWAP MDCT RID.
`0f2` Can't update the ROOT/SWAP device table.
`0f3` dlm indicator `alocmsg()` failed (to SIM).
`0f4` dlm indicator `alocmsg()` failed (to DKDIP).
`0f6` dlm indicator `alocmsg()` failed(to DKDIP).
`0f8` dlm indicator `alocmsg()` failed(to DKDIP).
`0fa` Could not get a CDLM timer entry.
`0fb` `dlmstrt ost` returned SWFAIL.
`0fd` microstore limpmode flag set.
`0fe` Bad return from `dlmstrt`.
`0ff` Unknown RID from DKDIP.
`100` Invalid operation code in UTIL message.
`101` Power down of an active unit.
`102` DFC power down message received - unit still usable.
`103` Device powered down - abort client.
`104` Power down message received - unit still usable.
`105` dlm indicator `alocmsg()` failed.
`106` Special priority queue full.
`107` `spqjobid()` failed.
`108` Invalid device type for power up check.
`10a` `intpwait()` function failed.
`110` No VTOC on disk pack.
`113` VTOC too large for DKDRV to handle.
`116` Invalid partition number in VTOC entry.
`119` Invalid partition number in message.
`140` Virtual address does not map into segment number.
`145` `iolock()` failed.
`14a` `uniolock()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`160` RID to UCB LLA call failed.
`165` RID update and release failed.
`16a` RID unknown by DKDRV.
`170` RID to UCB LLA call failed.
`175` RID update and release failed.
`17a` RID to UCB LLA call failed.
`180` RID update and release failed.
`185` RID to UCB LLA call failed.
`18a` RID update and release failed.
`190` Invalid inhibit administration opcode.
`1a0` `dtchintr()` call returned fail.
`1a5` `atchintr()` call returned fail.
`1aa` `enabintr()` call returned fail.
`1b0` ECD attach failed.
`1b3` DLM INIT failed.
`1b5` CONFIG OPEN failed.
`1b8` atchdata call to ECD failed.
`1bc` No DFCs in ECD.
`1be` DFC growth failed.
`1c3` downucbs ECD call failed.
`1c6` SBUS growth failed.
`1c9` downucbs ECD call failed.
`1cc` Growth of SCSI device failed.
`1ce` downucbs ECD call failed.
`1d1` SMD MHD growth failed.
`1d3` Too many devices.
`1d6` RID to UCB conversion failed.
`1d8` Invalid device type.
`1d9` Unable to determine DFC type.
`1dc` RID update and release failed.
`1de` Device is unequipped.
`1df` Invalid DFC internal device ID.
`1e1` Channel RID to UCB conversion failed.
`1e3` Invalid SBUS internal device ID.
`1e5` DFC RID to UCB conversion failed.
`1e7` Invalid device ID for SCSI device.
`1e9` SBUS RID to UCB conversion failed.
`1eb` Invalid SBUS internal device id.
`1ed` DFC RID to UCB conversion failed.
`1ef` Invalid device ID for SMD MHD.
`1f2` DFC RID to UCB conversion failed.
`1f4` Incorrect device type for the device's control unit.
`1fc` Memory initialization failed.
`1fe` DKDRV port attach failed.
`203` `getpta()` function failed.
`206` RID to UCB conversion failed.
`209` `idmadev()` (write to DMAC RAM) failed.
`20c` `atchintr` call failed.
`20f` RID not known by DKDRV.
`213` DFC being de-grown is in use.

SEE PROPRIETARY NOTICE ON COVER PAGE

`216` Update of DKDRV local DFC UCB failed.
`219` DFC being de-grown not in UNEQIP state.
`21c` SBUS being de-grown is in use.
`21f` Update of DKDRV local SBUS UCB failed.
`223` SBUS being de-grown not in UNEQIP state.
`226` Unit being de-grown is in use.
`229` Update of DKDRV local device UCB failed.
`22c` Unit being de-grown not in UNEQIP state.
`22f` RID to UCB conversion failed.
`233` RID update and release failed.
`236` Drive type in ECD does not agree with backplane - restore aborted.
`239` RID to UCB conversion failed.

`280` `io_blk` exceeds partition size - read.
`290` No `S_ACT` device - write.
`295` Invalid partition number in write message.
`29a` Tried to write into protected partition.
`2b1` No job IDs left.
`2ba` Unable to inventory all jobs.
`2be` Access to DIAG partition is not allowed - write.
`2c0` `io_blk` exceeds partition size - write.
`305` Unrecognizable DKDRV internal job type.
`307` Unexpected denial of request to remove MHD.
`308` Duplex operation compromised due to removing MHD.
`320` Boot indicator message allocation failed.
`325` INIT entry failed.
`32a` Unexpected event.
`340` do_error(0x340) `FLT_SINIT` fault code.

SEE PROPRIETARY NOTICE ON COVER PAGE

343 Failed to restart driver.
346 Old non-queued audit error message.
349 Unexpected fault code.
34c Critical hit - S_RSP.
34f Critical hit - S_MSG.
353 Driver state error.
355 Calling dfcinit() for lack of "warm" restart.
356 ss32b() failed.
359 PIC never reset CMD IN PROG flag.
35f progio (D2SBS clear) failed.
363 progio (BIC initialization and PIC reset) failed.
366 initmem5 (DMAC RAM initialization) failed.
369 enabintr function failed.
36c progio (send ABORT command to PIC) failed.
36f progio (set BIC IFEN flag) failed.
373 Unknown RID faulted.
376 PIO lost for a unit.
379 Unknown RID faulted.
37c Unexpected fault code.
37f Message buffer audit error - abort maintenance on this unit.
383 timereq() failed - dfcinit().
391 invalid pdfptr.
392 invalid pdfptr.
395 RID to UCB LLA call failed.
397 Message alloc failed (to FMGR).
398 Could not get a timer entry for FMGR.
39b Major DFC reinitialization due to either operational problems or manual request.
39c Tape operations aborted.
39e Warning - queue full detected.
3a6 Invalid dfcinit() sequence.
3a9 Can't identify panic dump device.
3ac Incorrect PANIC DUMP RID.
3af ss32b() failed.
3b3 PIC never reset CMD IN PROG flag.
3b6 progio (D2SBS clear) failed.
3b9 progio (BIC initialization and PIC reset) failed.
3ba Failed to clear BIC INTP.
3bc kint() - stray interrupts detected.
3be kint() entered before kfault() after panic dump.
3d0 RID not known by DKDRV.
3d3 DKDRV has aborted client.
3d5 Invalid maintenance state.
3d8 Device file not open.
3dc Another process has device file open.
3dd Tape device is already open.
3de Request prohibited on S_ACT DFC.
3e1 maint() attach interrupt failed.
3e3 maint() enable interrupt failed.
3e5 UCB is not a DFC.
3e8 DMAC RAM initialization failed.

3ec Detach / attach / enable interrupt failed.
3ef Detach interrupt failed.
401 Device type is not SCSI.
402 FORMAT - unit is not a disk.
403 Device type is not SCSI for explicit SCSI command.
404 DFC must be active.
405 DFC is not ACTIVE for SCSI command.
406 SBUS must be active.
407 SBUS is not ACTIVE for SCSI command.
409 CONFIG denied request to remove unit.
40a Base queue full.
40b Time limit exceeds capability.
40c May only restore S_OOS units.
40d Failed to get job id.
40e Restore request no good - DFC not S_ACT.
40f queuejob failed.
412 Restore request no good - SBUS not S_ACT.
415 Compare / correct - unit not a disk.
418 Compare / correct - DFC not S_ACT.
41b Compare / correct - SBUS not ACTIVE.
41d May not compare / correct a S_INIT unit.
41f Only one compare / correct is allowed to run at one time.
422 May only restore S_OOS units.
425 SBUS restore - DFC is not ACTIVE.
426 MHD or MT restore - SBUS is not ACTIVE.
427 MHD restore - DFC is not ACTIVE.
428 DIAG SYSGEN PIO failed.
429 Restore not allowed - device not supported.
42a UCB is not a DFC UCB.
42c Not allowed to DGN an S_ACT unit.
42e Special queue full.
432 Invalid device to be diagnosed.
435 spqjobid() failed.
438 queuejob() failed.
43c getdmaa() function failed.
43e Received WSETUP0 before SPECDMA.
442 WSETUP1 received before WSETUP0.
445 uniolock() failed.
448 getdmaa function failed.
44c Invalid disk lock process.
44f Base queue full.
452 bhqjobid() failed.
455 queuejob failed.
458 Version job failed.
460 FORMAT requires non-S_ACT MHD.
462 FORMAT/VERIFY - unit is not a disk.
465 FORMAT/VERIFY requires S_ACT DFC.
468 INIT/VFY MHD - SBUS not S_ACT.
46a VERIFY in progress - retry later.
470 Start track / block greater than last track / block.

`cec` Unable to inventory job.
`cf2` Device not active.
`cf4` Device not open.

SEE PROPRIETARY NOTICE ON COVER PAGE

`cf6` Incorrect read / write permissions.
`cf8` Base queue full.
`cfa` Failed to get job ID.
`cfc` Unable to inventory job.
`d01` Wrong device type specified.
`d02` Failed to send `mode sense` command.
`d05` `Mode sense` command failed.
`d08` `Mode sense` command failed.
`d0b` Failed to send `mode sense` command.
`d0e` `Mode sense` command failed.
`d12` `Mode sense` command failed.
`d15` Not enough data returned from `mode sense` command.
`d18` Unexpected amount of data returned from `mode sense` command.
`d1b` Device is write protected.
`d1e` Failed to obtain expected mode pages.
`d22` Failed to send `mode select` command.
`d25` `Mode select` command failed.
`d28` `Mode select` command failed.
`d2b` Invalid tape sequence number.
`d2e` Multi-partition tape is not supported.
`d31` Wrong device type specified.
`d32` Failed to send `mode sense` command.
`d35` `Mode sense` command failed.
`d38` `Mode sense` command failed.
`d3b` Failed to send `mode sense` command.
`d3e` `Mode sense` command failed.
`d42` `Mode sense` command failed.
`d45` Not enough data returned from `mode sense` command.
`d48` Unexpected amount of data returned from `mode sense` command.
`d4b` Device is write protected.
`d4c` 120 meter tapes are not supported.
`d4e` Failed to obtain expected mode pages.
`d52` Failed to send `mode select` command.
`d55` `Mode select` command failed.
`d58` `Mode select` command failed.
`d5b` Invalid tape sequence number.
`d5e` Multi-partition tape is not supported.
`d61` Wrong device type specified.
`d62` Invalid density specified.
`d65` Failed to send `mode sense` command.
`d68` `Mode sense` command failed.
`d6b` `Mode sense` command failed.
`d6e` Failed to send `mode sense` command.
`d72` `Mode sense` command failed.
`d75` `Mode sense` command failed.
`d78` Not enough data returned from `mode sense` command.
`d7b` Unexpected amount of data returned from `mode sense` command.
`d7e` Device is write protected.
`d82` Requested density does not match set device density.
`d85` Failed to obtain expected mode pages.

`d88` Failed to send `mode select` command.
`d8e` `Mode select` command failed.
`d92` `Mode select` command failed.
`d95` Invalid tape sequence number.
`da1` Wrong device type specified.
`da2` Invalid density specified.
`da5` Failed to send `mode sense` command.
`da8` `Mode sense` command failed.
`dab` `Mode sense` command failed.
`dae` Failed to send `mode sense` command.
`db2` `Mode sense` command failed.
`db5` `Mode sense` command failed.
`db8` Not enough data returned from `mode sense` command.
`dbb` Unexpected amount of data returned from `mode sense` command.
`dbe` Device is write protected.
`dc2` Requested density does not match set device density.
`dc5` Failed to obtain expected mode pages.
`dc8` Failed to send `mode select` command.
`dce` `Mode select` command failed.
`dd2` `Mode select` command failed.
`dd5` Invalid tape sequence number.
`e01` Not SCSI DFC.
`e03` Invalid DFC state for pump.
`e05` `dtchintr()` call returned fail.
`e07` Unable to clear DDSBS.
`e09` Unable to send command to BIC.
`e0a` Unable to send command to BIC.
`e0b` `atchintr()` call returned fail.
`e0d` `enabintr()` call returned fail.
`e0f` `getjobid()` failed.
`e11` Failed to write word in BIC FIFO.
`e13` `wakeup()` PIO failed.
`e15` `version` command failed.
`e17` `getjobid()` failed.
`e19` Failed to write word in BIC FIFO.
`e1a` `wakeup()` PIO failed.
`e1b` `version` command failed.
`e1c` Unable to allocate message for FMGR.
`e1d` 1-byte wide firmware version not known.
`e1f` Unable to allocate message for FMGR.
`e20` Unable to do a `stat()` on the pumpfile.
`e22` Pumpfile invalid size.
`e24` Pumpfile is not a single extent contiguous file.
`e26` Unable to get segnum.
`e28` Unable to `iolock` the buffer.
`e2a` Unable to allocate the message buffer for reading pumpfile.
`e2c` Unable to send the I/O message.
`e2e` Unable to read pumpfile header.
`e2f` Pumpfile has invalid size.
`e30` 4-wide firmware needs to be reprogrammed, retry later.

`e32` Unable to get segnum.
`e33` Unable to get segnum for DKDRV's internal pump buffer.
`e35` Unable to download the pumpcode.
`e37` Unable to request reading pumpfile.
`e39` Unable to read pumpfile.
`e3a` DFC pump: `getjobid` failed.
`e3b` Failed to write word in BIC FIFO.
`e3d` Failed to write word in BIC FIFO.
`e3f` Failed to write word in BIC FIFO.
`e41` Failed to write word in BIC FIFO.
`e43` `wakeup` PIO failed.
`e45` Pump failed at last pump.
`e46` Cannot remove the segment.
`e47` `dtchintr()` call returned fail.
`e48` Unable to send command to BIC.
`e49` Invalid pump sequence.
`e4a` `dtchintr()` call returned fail.
`e4b` Cannot remove the segment.
`e4c` Unable to send command to BIC.
`e50` Invalid header magic number.
`e53` 1-byte wide firmware and pumpfile are incompatible - issue.
`e55` 1-byte wide firmware and pumpfile are incompatible - generic.
`e57` 4-byte wide firmware and pumpfile are incompatible with 1-byte wide firmware.
`e59` Pumpfile has different revision level.
`e5a` 1-byte wide firmware and pumpfile are incompatible.
`e5c` Unable to determine revision levels.
`e60` Unable to send command to BIC.
`e62` `jcistat` command failed.
`e64` Read status of BIC failed.
`e66` Failed to read BIC FIFO.
`e68` Failed to read BIC FIFO.
`e69` Received interrupt but no response.
`e6a` Failed to clear BIC interrupt.
`e6b` `dtchintr()` call returned fail.
`e6c` Unable to send command to BIC.
`e6d` `dtchintr` call returned fail.
`e6e` `atchintr` call returned fail.
`e6f` `enabintr` call returned fail.
`e70` DFC flash programming timed out.
`e71` Unable to clear DDSBS.
`e72` Unable to send command to BIC.
`e73` DFC `version` command failed.
`e74` Unable to send command to BIC.
`e78` `initmem5()` DMAC initialization failed.
`e7a` `dtchintr` call returned fail.
`e7b` `atchintr` call returned fail.
`e7c` `enabintr` call returned fail.
`e7d` `getjobid` failed.
`e7f` Unable to send `version` command failed.
`e80` Unrecognizable DKDRV internal job type.

SEE PROPRIETARY NOTICE ON COVER PAGE

`e85` Response contains jobid not in use.
`e86` IO job has no associated IO message.
`e88` IO message "ms_to" field is invalid.
`e8a` Message type not IOREAD or IOWRITE.
`e8c` No job found in inventory data.
`e8d` Invalid completion code returned by DFC.
`e8f` Job reported error.

ID . . . . . APP-DFC-APPA-E

DKDRV Information Codes

NOTE: These information codes are in hexadecimal notation.

`010` No inventory room - restructure DKDRV.
`020` Report failure.
`030` Access to BIC failed.
`035` Desired BIC status not obtained.
`039` IO job has no associated IO message.
`040` IO message "`ms_to`" field is invalid.
`041` Message buffer not marked allocated.
`045` Message type not `IOREAD` or `IOWRITE`.
`04a` No job found in inventory data.
`050` Invalid completion code returned by DFC.
`055` Job reported error.
`05a` Response contains job ID not in use.
`060` Response specified an unknown device.
`06f` Drive status error.
`070` Special queue full.
`073` `spqjobid()` failed.
`076` `queuejob()` failed for DFC change maintenance mode command.
`07a` `intpwait()` function failed for DFC change maintenance mode.
`07c` Special queue full for SBUS change mode job.
`07e` `spqjobid()` failed for SBUS change mode command.
`082` `queuejob()` for SBUS change maintenance mode failed.
`085` `intpwait()` function failed for SBUS change maintenance mode.
`098` DFC version command: special queue full.
`09a` DFC version command: `spqjobid` failed.
`09c` Version command fail.
`09e` `dfc_vers`: `intpwait` function failed.
`0a0` `initmem1()` failed.
`0a2` Timeout request to get DIOP feature level failed.
`0a3` DKDRV timing chain index 0 already assigned.
`0a4` Failed to read `btparm` record.
`0a5` No mate for boot device found.
`0a8` DFC restore failed during boot.
`0ab` Fail to change the usable bit for SBUS.
`0af` MHD marked `S_ACT` but DFC not marked `S_ACT`.
`0b1` MHD marked `S_ACT` but SBUS not marked `S_ACT`.
`0b3` Simplex MHD restore failed config denied removal.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0b5` Simplex MHD restore failed config OKed removal.
`0b8` MHD restore failed and no `S_ACT` mate.
`0c0` `initkint()` (interrupt detach/attach) failed.
`0c3` Fail to request pump after boot.
`0c6` Invalid MHD to be restored during boot.
`0c9` Invalid mate MHD.
`0ca` RID to UCB conversion failed.
`0cb` RID update and release failed.
`0cf` Duplicate fields in the message do not match.
`0d5` Byte offset not on word boundary.
`0d7` Maintenance job failure - see DKDRV error report.
`0d9` PSM sent a bad power transition message.
`0db` temp message - old message returned.
`0dd` Unknown maintenance `ACK` received.
`0df` Unrecognizable message type.
`0e2` Unrecognizable device.
`0e5` Unknown `FMGR ACK` message received.
`0e6` Segment removed failed, pump buffer retained.
`0e8` Unknown `MMGR ACK` message received.
`0ec` Unknown `DKDRV ACK` message received.
`0ef` Unknown `ACK` message received.
`0f0` Incorrect swap `LOG_REC RID` from ECDORG.
`0f1` Incorrect SWAP MDCT RID.
`0f2` Can't update the ROOT/SWAP device table.
`0f3` dlm indicator `alocmsg()` failed (to SIM).
`0f4` dlm indicator `alocmsg()` failed (to DKDIP).
`0f6` dlm indicator `alocmsg()` failed(to DKDIP).
`0f8` dlm indicator `alocmsg()` failed(to DKDIP).
`0fa` Could not get a CDLM timer entry.
`0fb` `dlmstrt ost` returned SWFAIL.
`0fd` microstore limpmode flag set.
`0fe` Bad return from `dlmstrt`.
`0ff` Unknown RID from DKDIP.
`100` Invalid operation code in UTIL message.
`101` Power down of an active unit.
`102` DFC power down message received - unit still usable.
`103` Device powered down - abort client.
`104` Power down message received - unit still usable.
`105` dlm indicator `alocmsg()` failed.
`106` Special priority queue full.
`107` `spqjobid()` failed.
`108` Invalid device type for power up check.
`10a` `intpwait()` function failed.
`110` No VTOC on disk pack.
`113` VTOC too large for DKDRV to handle.
`116` Invalid partition number in VTOC entry.
`119` Invalid partition number in message.
`140` Virtual address does not map into segment number.
`145` `iolock()` failed.
`14a` `uniolock()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`160` RID to UCB LLA call failed.
`165` RID update and release failed.
`16a` RID unknown by DKDRV.
`170` RID to UCB LLA call failed.
`175` RID update and release failed.
`17a` RID to UCB LLA call failed.
`180` RID update and release failed.
`185` RID to UCB LLA call failed.
`18a` RID update and release failed.
`190` Invalid inhibit administration opcode.
`1a0` `dtchintr()` call returned fail.
`1a5` `atchintr()` call returned fail.
`1aa` `enabintr()` call returned fail.
`1b0` ECD attach failed.
`1b3` DLM INIT failed.
`1b5` CONFIG OPEN failed.
`1b8` atchdata call to ECD failed.
`1bc` No DFCs in ECD.
`1be` DFC growth failed.
`1c3` downucbs ECD call failed.
`1c6` SBUS growth failed.
`1c9` downucbs ECD call failed.
`1cc` Growth of SCSI device failed.
`1ce` downucbs ECD call failed.
`1d1` SMD MHD growth failed.
`1d3` Too many devices.
`1d6` RID to UCB conversion failed.
`1d8` Invalid device type.
`1d9` Unable to determine DFC type.
`1dc` RID update and release failed.
`1de` Device is unequipped.
`1df` Invalid DFC internal device ID.
`1e1` Channel RID to UCB conversion failed.
`1e3` Invalid SBUS internal device ID.
`1e5` DFC RID to UCB conversion failed.
`1e7` Invalid device ID for SCSI device.
`1e9` SBUS RID to UCB conversion failed.
`1eb` Invalid SBUS internal device id.
`1ed` DFC RID to UCB conversion failed.
`1ef` Invalid device ID for SMD MHD.
`1f2` DFC RID to UCB conversion failed.
`1f4` Incorrect device type for the device's control unit.
`1fc` Memory initialization failed.
`1fe` DKDRV port attach failed.
`203` `getpta()` function failed.
`206` RID to UCB conversion failed.
`209` `idmadev()` (write to DMAC RAM) failed.
`20c` `atchintr` call failed.
`20f` RID not known by DKDRV.
`213` DFC being de-grown is in use.

SEE PROPRIETARY NOTICE ON COVER PAGE

`216` Update of DKDRV local DFC UCB failed.
`219` DFC being de-grown not in UNEQIP state.
`21c` SBUS being de-grown is in use.
`21f` Update of DKDRV local SBUS UCB failed.
`223` SBUS being de-grown not in UNEQIP state.
`226` Unit being de-grown is in use.
`229` Update of DKDRV local device UCB failed.
`22c` Unit being de-grown not in UNEQIP state.
`22f` RID to UCB conversion failed.
`233` RID update and release failed.
`236` Drive type in ECD does not agree with backplane - restore aborted.
`239` RID to UCB conversion failed.
`23a` RID update and release failed.
`23b` RID to UCB conversion failed.
`23c` Get option block for DFC failed.
`23d` Invalid `eirflag` field in DFC option block.
`23e` Get option block for MHD failed.
`240` Delay (failed to find interrupt set in BIC).
`242` RID to UCB conversion failed.
`250` Job complete code == fail.
`252` Job request not allowed.
`254` Job request not allowed.
`258` Tape device already opened.
`25a` Driver I/O error.
`25c` No `S_ACT` device - open.
`260` Incorrect MDCT from IO message.
`263` Growth of device failed.
`265` No RIDs in ECD MDCT.
`268` Warning - enlarge DKDRV's internal MDCT.
`26c` Disk specific write not allowed.
`270` No `S_ACT` device - read.
`275` Invalid partition number in read message.
`278` Access to DIAG partition is not allowed - read.
`27a` Unable to inventory job.
`27d` `bhqjobid()` failed.
`280` `io_blk` exceeds partition size - read.
`290` No `S_ACT` device - write.
`295` Invalid partition number in write message.
`29a` Tried to write into protected partition.
`2b1` No job IDs left.
`2ba` Unable to inventory all jobs.
`2be` Access to DIAG partition is not allowed - write.
`2c0` `io_blk` exceeds partition size - write.
`305` Unrecognizable DKDRV internal job type.
`307` Unexpected denial of request to remove MHD.
`308` Duplex operation compromised due to removing MHD.
`320` Boot indicator message allocation failed.
`325` INIT entry failed.
`32a` Unexpected event.
`340` do_error(0x340) `FLT_SINIT` fault code.

SEE PROPRIETARY NOTICE ON COVER PAGE

343 Failed to restart driver.
346 Old non-queued audit error message.
349 Unexpected fault code.
34c Critical hit - S_RSP.
34f Critical hit - S_MSG.
353 Driver state error.
355 Calling dfcinit() for lack of "warm" restart.
356 ss32b() failed.
359 PIC never reset CMD IN PROG flag.
35f progio (D2SBS clear) failed.
363 progio (BIC initialization and PIC reset) failed.
366 initmem5 (DMAC RAM initialization) failed.
369 enabintr function failed.
36c progio (send ABORT command to PIC) failed.
36f progio (set BIC IFEN flag) failed.
373 Unknown RID faulted.
376 PIO lost for a unit.
379 Unknown RID faulted.
37c Unexpected fault code.
37f Message buffer audit error - abort maintenance on this unit.
383 timereq() failed - dfcinit().
391 invalid pdfptr.
392 invalid pdfptr.
395 RID to UCB LLA call failed.
397 Message alloc failed (to FMGR).
398 Could not get a timer entry for FMGR.
39b Major DFC reinitialization due to either operational problems or manual request.
39c Tape operations aborted.
39e Warning - queue full detected.
3a6 Invalid dfcinit() sequence.
3a9 Can't identify panic dump device.
3ac Incorrect PANIC DUMP RID.
3af ss32b() failed.
3b3 PIC never reset CMD IN PROG flag.
3b6 progio (D2SBS clear) failed.
3b9 progio (BIC initialization and PIC reset) failed.
3ba Failed to clear BIC INTP.
3bc kint() - stray interrupts detected.
3be kint() entered before kfault() after panic dump.
3d0 RID not known by DKDRV.
3d3 DKDRV has aborted client.
3d5 Invalid maintenance state.
3d8 Device file not open.
3dc Another process has device file open.
3dd Tape device is already open.
3de Request prohibited on S_ACT DFC.
3e1 maint() attach interrupt failed.
3e3 maint() enable interrupt failed.
3e5 UCB is not a DFC.
3e8 DMAC RAM initialization failed.

`3ec` Detach / attach / enable interrupt failed.
`3ef` Detach interrupt failed.
`401` Device type is not SCSI.
`402` FORMAT - unit is not a disk.
`403` Device type is not SCSI for explicit SCSI command.
`404` DFC must be active.
`405` DFC is not ACTIVE for SCSI command.
`406` SBUS must be active.
`407` SBUS is not ACTIVE for SCSI command.
`409` CONFIG denied request to remove unit.
`40a` Base queue full.
`40b` Time limit exceeds capability.
`40c` May only restore `S_OOS` units.
`40d` Failed to get job id.
`40e` Restore request no good - DFC not `S_ACT`.
`40f` `queuejob` failed.
`412` Restore request no good - SBUS not `S_ACT`.
`415` Compare / correct - unit not a disk.
`418` Compare / correct - DFC not `S_ACT`.
`41b` Compare / correct - SBUS not ACTIVE.
`41d` May not compare / correct a `S_INIT` unit.
`41f` Only one compare / correct is allowed to run at one time.
`422` May only restore `S_OOS` units.
`425` SBUS restore - DFC is not ACTIVE.
`426` MHD or MT restore - SBUS is not ACTIVE.
`427` MHD restore - DFC is not ACTIVE.
`428` `DIAG SYSGEN PIO` failed.
`429` Restore not allowed - device not supported.
`42a` UCB is not a DFC UCB.
`42c` Not allowed to DGN an `S_ACT` unit.
`42e` Special queue full.
`432` Invalid device to be diagnosed.
`435` `spqjobid()` failed.
`438` `queuejob()` failed.
`43c` `getdmaa()` function failed.
`43e` Received `WSETUP0` before `SPECDMA`.
`442` `WSETUP1` received before `WSETUP0`.
`445` `uniolock()` failed.
`448` `getdmaa` function failed.
`44c` Invalid disk lock process.
`44f` Base queue full.
`452` `bhqjobid()` failed.
`455` queuejob failed.
`458` Version job failed.
`460` `FORMAT` requires non-`S_ACT` MHD.
`462` `FORMAT/VERIFY` - unit is not a disk.
`465` `FORMAT/VERIFY` requires `S_ACT` DFC.
`468` `INIT/VFY` MHD - SBUS not `S_ACT`.
`46a` `VERIFY` in progress - retry later.
`470` Start track / block greater than last track / block.

SEE PROPRIETARY NOTICE ON COVER PAGE

473 Base queue full.
476 `bhqjobid()` failed.
479 MHD usability changed because of INIT operation.
47c `queuejob()` failed.
480 Invalid when MHD is `S_ACT`.
483 DFC must be `S_ACT`.
486 Invalid when MHD is `S_ACT`.
489 DFC must be `S_ACT`.
48b `REMAP devserv()` failed.
48d Device major status update failed.
48f Failed to initialize device status.
492 Base queue full.
494 Unable to queue LM job.
496 Invalid DFC type for DFC reset request.
498 DFC is not ACTIVE to be reset.
49a Firmware is running - cannot reset DFC.
49f DFC type does not support pump.
4a3 DFC is not ACTIVE for pumpcode downloading.
4a6 Other pump in progress - retry later.
4a9 Unable to queue pump job.
4aa Device must be non-ACT to initialize error message inhibit flag.
4ab CLRMAEC - unit is not a disk.
4ac Invalid opercode in maintenance message.
4ae Unexpected maintenance interrupt.
4b3 `dtchintr()` call failed.
4b6 Maintenance work timed out.
4b9 No base or high job IDs left.
4bc Failed to get page table address.
4be No job IDs left for base or high queue.
4c2 Offset of the SCSI command is not on word boundary.
4c5 Explicit SCSI command, response and data are not on the same segment.
4c8 Base queue full for SCSI command.
4ca Request exceeds DFC capability.
4cb Invalid second device for SCSI command.
4cc Request exceeds expscsi capability.
4cd Unable to queue the SCSI command.
4d0 `readvtoc()` function failed.
4d1 Another pump in progress, retry later.
4d2 Flash reprogram not started.
4d3 Unable to program flash memory on S_ACT unit.
4d5 `readvtoc()` job failed.
4d6 Unable to clear DDSBS.
4d8 Unable to send command to BIC.
4d9 `getpta()` function failed.
4da VTOC sort function failed.
4db `initmem5()` DMAC init failed.
4dc Unable to send command to BIC.
4dd `dtchintr` call returned fail.
4de `atchintr` call returned fail.
4df DFC pump: `getjobid()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`4e0` Invalid `newvtoc()` sequence.
`4e1` Failed to write word in BIC FIFO.
`4e2` `enabintr()` call returned fail.
`4e3` Failed to write word in BIC FIFO.
`4e5` Partition number out of range for DKDRV.
`4e6` Failed to write word in BIC FIFO.
`4e7` Failed to write word in BIC FIFO.
`4e8` Partition number out of range for VTOC.
`4e9` `wakeup()` PIO failed.
`4eb` Unable to get firmware versions.
`4f1` Flash reprogram not started.
`4f2` Unable to clear DDSBS.
`4f3` Unable to send command to BIC.
`4f5` DFC pump: `getjobid()` failed.
`4f7` Failed to write word in BIC FIFO.
`4f9` Failed to write word in BIC FIFO.
`4fa` Failed to write word in BIC FIFO.
`4fb` Failed to write word in BIC FIFO.
`4fc` `wakeup()` PIO failed.
`500` Base queue full for maintenance read.
`503` Tried to use invalid VTOC for maintenance read.
`505` Invalid partition number in message.
`508` Invalid block in partition.
`50c` `bhqjobid()` failed for maintenance read.
`50e` Unable to inventory job for maintenance read.
`520` Base queue full for maintenance write.
`523` Tried to use invalid VTOC for maintenance write.
`526` Invalid partition number in message.
`529` Tried to write into protected partition.
`52c` Invalid block in partition.
`537` MHD usability changed because of `pdfwrite` job.
`539` `bhqjobid()` failed for maintenance write.
`53b` Unable to inventory job for maintenance write.
`550` Physical device file not opened.
`553` Incorrect READ/WRITE access permissions.
`556` `iolock` failed.
`55b` `getjobid` failed.
`55f` Maintenance I/O request to a non-disk device.
`56a` DISK read or write requires active DFC.
`56f` DISK read or write requires active SBUS.
`573` This physical device file already open.
`575` Device major status update failed.
`57a` Update of device file variables failed.
`580` May not maintenance write ACT device.
`583` SDF prematurely closed during a restore.
`585` `uniolock` failed.
`5a0` Command to BIC failed.
`5a5` Command to PIC failed.
`5aa` Clear of DDSBS failed.
`5b0` Read status of DDSBS failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

5b5 Read of BIC FIFO failed.

b40 Remove mate of "DEST" unit and reenter command.
b46 Dup of "FROM" SDF failed.
b48 Failed to read VTOC on "TO" disk.
b49 Invalid VTOC on "TO" disk.
b4b Failed to read VTOC on "FROM" disk.
b4c Invalid VTOC on "FROM" disk.

SEE PROPRIETARY NOTICE ON COVER PAGE

`b50` Both VTOCs do not match.
`b5c` Read failure (DEST disk).
`b60` Read failure (SRC disk).
`b63` Too many partitions.
`b66` VTOCs do not match in size.
`b69` Sync write failure (DEST disk).
`b6c` Block number not within VTOC.
`b70` Block number not within VTOC.
`b73` Block number not within VTOC.
`b80` Tried to access unopened file.
`b85` `segoff` failure.
`b8a` `movetrap` failure.
`b90` Disk read error.
`b95` Disk read error - correctly reread.
`b9a` Invalid file descriptor.
`ba0` `IOQUEUEM` failure.
`ba5` Maintenance job to DKDRV failed.
`baa` Received application abort restore request.
`bb5` Invalid argument.
`bba` `segname()` already exists.
`bc0` segment exists.
`bc5` No segments available.
`bca` Not enough space.
`bd0` Bad segndx.
`bd3` Can't find a free `segindex`.
`bd5` `segoff` failure.
`bda` Driver startup message not received.
`be0` Terminated externally.
`be5` Invalid `U_ABRTRST` message.
`bea` Invalid maintenance message.
`bf0` Unknown `ACK` message.
`bf5` Process was faulted.
`c02` Tape device already open.
`c0b` Device not active.
`c12` Open for both read and write.
`c15` Incorrect read / write access permissions.
`c18` Failed to send `test unit ready` command.
`c1b` `Test unit ready` command failed.
`c1e` `Test unit ready` command failed.
`c22` Failed to send `test unit ready` command.
`c25` `Test unit ready` command failed.
`c28` `Test unit ready` command failed.
`c2b` Failed to send `test unit ready` command.
`c2e` `Test unit ready` command failed.
`c32` `Test unit ready` command failed.
`c35` Failed to send `inquiry` command.
`c38` `Inquiry` command failed.
`c3b` `Inquiry` command failed.
`c3e` Insufficient `inquiry` data.
`c42` Failed to send `inquiry` command.

SEE PROPRIETARY NOTICE ON COVER PAGE

c45 `Inquiry` command failed.
c48 `Inquiry` command failed.
c4b Unknown device.
c4e Failed to send `read block limits` command.
c52 `Read block limits` command failed.
c55 `Read block limits` command failed.
c58 Partition information is invalid.
c5b Not a supported tape device.
c5e Invalid tape I/O open sequence number.
c62 Reserved field in partition used.
c65 Device does not support variable record sizes.
c68 Device does not support fixed records.
c69 Fixed record size is invalid.
c6a Invalid record type specified.
c6b Record size greater than device capability.
c6e Record size less than device capability.
c72 Failed to send tape setup command to DFC.
c75 Tape setup command failed.
c78 Invalid sequence number.
c82 Base queue full.
c85 Failed to get job ID.
c88 Request exceeds DFC capability.
c89 Request exceeds expscsi capability.
c8b No base/high job IDs left.
c8e No job IDs left for base/high queue.
c92 Base queue full.
c95 Failed to get job ID.
c9b Base queue full.
c9e Failed to get job ID.
ca2 Entity type to space over is invalid.
ca5 Base queue full.
ca8 Failed to get job ID.
cab Base queue full.
cae Failed to get job ID.
cb1 Device not active.
cb2 Invalid state for closing device.
cb7 Invalid state for closing device.
cb8 Failed to send tape `rewind` command to DFC.
cbb Tape `rewind` failed.
cbe Invalid sequence number.
cc2 Failed to send tape `space` command to DFC.
cc5 Tape `space` command failed.
cc8 Invalid sequence number.
ccb Failed to send `write filemarks` command to DFC.
cce `Write filemarks` command failed.
cd2 Failed to send tape `space` command to DFC.
cd5 Tape `space` command failed.
cd8 Invalid sequence number.
ce2 Device not active.
ce4 Device not open.

`ce6` Incorrect read / write permissions.
`ce8` Base queue full.
`cea` Failed to get job ID.
`cec` Unable to inventory job.
`cf2` Device not active.
`cf4` Device not open.
`cf6` Incorrect read / write permissions.
`cf8` Base queue full.
`cfa` Failed to get job ID.
`cfc` Unable to inventory job.
`d01` Wrong device type specified.
`d02` Failed to send `mode sense` command.
`d05` `Mode sense` command failed.
`d08` `Mode sense` command failed.
`d0b` Failed to send `mode sense` command.
`d0e` `Mode sense` command failed.
`d12` `Mode sense` command failed.
`d15` Not enough data returned from `mode sense` command.
`d18` Unexpected amount of data returned from `mode sense` command.
`d1b` Device is write protected.
`d1e` Failed to obtain expected mode pages.
`d22` Failed to send `mode select` command.
`d25` `Mode select` command failed.
`d28` `Mode select` command failed.
`d2b` Invalid tape sequence number.
`d2e` Multi-partition tape is not supported.
`d31` Wrong device type specified.
`d32` Failed to send `mode sense` command.
`d35` `Mode sense` command failed.
`d38` `Mode sense` command failed.
`d3b` Failed to send `mode sense` command.
`d3e` `Mode sense` command failed.
`d42` `Mode sense` command failed.
`d45` Not enough data returned from `mode sense` command.
`d48` Unexpected amount of data returned from `mode sense` command.
`d4b` Device is write protected.
`d4c` 120 meter tapes are not supported.
`d4e` Failed to obtain expected mode pages.
`d52` Failed to send `mode select` command.
`d55` `Mode select` command failed.
`d58` `Mode select` command failed.
`d5b` Invalid tape sequence number.
`d5e` Multi-partition tape is not supported.
`d61` Wrong device type specified.
`d62` Invalid density specified.
`d65` Failed to send `mode sense` command.
`d68` `Mode sense` command failed.
`d6b` `Mode sense` command failed.
`d6e` Failed to send `mode sense` command.
`d72` `Mode sense` command failed.

`d75` `Mode sense` command failed.
`d78` Not enough data returned from `mode sense` command.
`d7b` Unexpected amount of data returned from `mode sense` command.
`d7e` Device is write protected.
`d82` Requested density does not match set device density.
`d85` Failed to obtain expected mode pages.
`d88` Failed to send `mode select` command.
`d8e` `Mode select` command failed.
`d92` `Mode select` command failed.
`d95` Invalid tape sequence number.
`da1` Wrong device type specified.
`da2` Invalid density specified.
`da5` Failed to send `mode sense` command.
`da8` `Mode sense` command failed.
`dab` `Mode sense` command failed.
`dae` Failed to send `mode sense` command.
`db2` `Mode sense` command failed.
`db5` `Mode sense` command failed.
`db8` Not enough data returned from `mode sense` command.
`dbb` Unexpected amount of data returned from `mode sense` command.
`dbe` Device is write protected.
`dc2` Requested density does not match set device density.
`dc5` Failed to obtain expected mode pages.
`dc8` Failed to send `mode select` command.
`dce` `Mode select` command failed.
`dd2` `Mode select` command failed.
`dd5` Invalid tape sequence number.
`e01` Not SCSI DFC.
`e03` Invalid DFC state for pump.
`e05` `dtchintr()` call returned fail.
`e07` Unable to clear DDSBS.
`e09` Unable to send command to BIC.
`e0a` Unable to send command to BIC.
`e0b` `atchintr()` call returned fail.
`e0d` `enabintr()` call returned fail.
`e0f` `getjobid()` failed.
`e11` Failed to write word in BIC FIFO.
`e13` `wakeup()` PIO failed.
`e15` `version` command failed.
`e17` `getjobid()` failed.
`e19` Failed to write word in BIC FIFO.
`e1a` `wakeup()` PIO failed.
`e1b` `version` command failed.
`e1c` Unable to allocate message for FMGR.
`e1d` 1-byte wide firmware version not known.
`e1f` Unable to allocate message for FMGR.
`e20` Unable to do a `stat()` on the pumpfile.
`e22` Pumpfile invalid size.
`e24` Pumpfile is not a single extent contiguous file.
`e26` Unable to get segnum.

`e28` Unable to `iolock` the buffer.
`e2a` Unable to allocate the message buffer for reading pumpfile.
`e2c` Unable to send the I/O message.
`e2e` Unable to read pumpfile header.
`e2f` Pumpfile has invalid size.
`e30` 4-wide firmware needs to be reprogrammed, retry later.
`e32` Unable to get segnum.
`e33` Unable to get segnum for DKDRV's internal pump buffer.
`e35` Unable to download the pumpcode.
`e37` Unable to request reading pumpfile.
`e39` Unable to read pumpfile.
`e3a` DFC pump: `getjobid` failed.
`e3b` Failed to write word in BIC FIFO.
`e3d` Failed to write word in BIC FIFO.
`e3f` Failed to write word in BIC FIFO.
`e41` Failed to write word in BIC FIFO.
`e43` `wakeup` PIO failed.
`e45` Pump failed at last pump.
`e46` Cannot remove the segment.
`e47` `dtchintr()` call returned fail.
`e48` Unable to send command to BIC.
`e49` Invalid pump sequence.
`e4a` `dtchintr()` call returned fail.
`e4b` Cannot remove the segment.
`e4c` Unable to send command to BIC.
`e50` Invalid header magic number.
`e53` 1-byte wide firmware and pumpfile are incompatible - issue.
`e55` 1-byte wide firmware and pumpfile are incompatible - generic.
`e57` 4-byte wide firmware and pumpfile are incompatible with 1-byte wide firmware.
`e59` Pumpfile has different revision level.
`e5a` 1-byte wide firmware and pumpfile are incompatible.
`e5c` Unable to determine revision levels.
`e60` Unable to send command to BIC.
`e62` `jcistat` command failed.
`e64` Read status of BIC failed.
`e66` Failed to read BIC FIFO.
`e68` Failed to read BIC FIFO.
`e69` Received interrupt but no response.
`e6a` Failed to clear BIC interrupt.
`e6b` `dtchintr()` call returned fail.
`e6c` Unable to send command to BIC.
`e6d` `dtchintr` call returned fail.
`e6e` `atchintr` call returned fail.
`e6f` `enabintr` call returned fail.
`e70` DFC flash programming timed out.
`e71` Unable to clear DDSBS.
`e72` Unable to send command to BIC.
`e73` DFC `version` command failed.
`e74` Unable to send command to BIC.
`e78` `initmem5()` DMAC initialization failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`e7a` `dtchintr` call returned fail.
`e7b` `atchintr` call returned fail.
`e7c` `enabintr` call returned fail.
`e7d` `getjobid` failed.
`e7f` Unable to send `version` command failed.
`e80` Unrecognizable DKDRV internal job type.
`e85` Response contains jobid not in use.
`e86` IO job has no associated IO message.
`e88` IO message "ms_to" field is invalid.
`e8a` Message type not IOREAD or IOWRITE.
`e8c` No job found in inventory data.
`e8d` Invalid completion code returned by DFC.
`e8f` Job reported error.
`e95` NULL message buffer pointer.
`e96` Invalid "ms_to" field in message.
`e97` Message buffer not marked allocated.

DKDRV Information Codes

NOTE: These information codes are in hexadecimal notation.

`010` No inventory room - restructure DKDRV.
`020` Report failure.
`030` Access to BIC failed.
`035` Desired BIC status not obtained.
`039` IO job has no associated IO message.
`040` IO message "`ms_to`" field is invalid.
`041` Message buffer not marked allocated.
`042` Cannot start the I/O Assist process. 3B21 emulator only.
`043` Cannot grow device data into disk driver memory. 3B21 emulator only.
`044` Cannot set the u_boot flag in a device's UCB. 3B21 emulator only.
`045` Message type not `IOREAD` or `IOWRITE`. 3B20D/3B21D only.
`045` A mate disk does not exist for the boot disk. 3B21 emulator only.
`046` Cannot turn off u_boot flag in the mate disk's UCB. 3B21 emulator only.
`047` Cannot turn off u_boot flag in the mate disk's UCB. 3B21 emulator only.
`048` Cannot turn off u_boot flag in a disk's UCB. 3B21 emulator only.
`049` DFC could not be restored. 3B21 emulator only.
`04a` No job found in inventory data.
`04b` MHD is active, but DFC is not active. 3B21 emulator only.
`04c` SBUS could not be restored. 3B21 emulator only.
`050` Invalid completion code returned by DFC.
`055` Job reported error.
`05a` Response contains job ID not in use.
`060` Response specified an unknown device.
`06f` Drive status error.
`070` Special queue full.
`073` `spqjobid()` failed.
`076` `queuejob()` failed for DFC change maintenance mode command.
`07a` `intpwait()` function failed for DFC change maintenance mode.
`07c` Special queue full for SBUS change mode job.
`07e` `spqjobid()` failed for SBUS change mode command.
`082` `queuejob()` for SBUS change maintenance mode failed.
`085` `intpwait()` function failed for SBUS change maintenance mode.
`098` DFC version command: special queue full.
`09a` DFC version command: `spqjobid` failed.
`09c` Version command fail.

SEE PROPRIETARY NOTICE ON COVER PAGE

`09e` `dfc_vers`: `intpwait` function failed.
`0a0` `initmem1()` failed.
`0a2` Timeout request to get DIOP feature level failed.
`0a3` DKDRV timing chain index 0 already assigned.
`0a4` Failed to read `btparm` record.
`0a5` No mate for boot device found.
`0a8` DFC restore failed during boot.
`0ab` Fail to change the usable bit for SBUS.
`0af` MHD marked `S_ACT` but DFC not marked `S_ACT`.
`0b1` MHD marked `S_ACT` but SBUS not marked `S_ACT`.
`0b3` Simplex MHD restore failed config denied removal.
`0b5` Simplex MHD restore failed config OKed removal.
`0b6` Cannot turn off u_boot flag in a disk's UCB. 3B21 emulator only.
`0b7` Cannot turn off u_boot flag in a disk's UCB. 3B21 emulator only.
`0b8` MHD restore failed and no `S_ACT` mate.
`0b9` Cannot turn off u_boot flag in mate disk's UCB. 3B21 emulator only.
`0c0` `initkint()` (interrupt detach / attach) failed.
`0c3` Fail to request pump after boot.
`0c6` Invalid MHD to be restored during boot.
`0c9` Invalid mate MHD.
`0ca` RID to UCB conversion failed.
`0cb` RID update and release failed.
`0cf` Duplicate fields in the message do not match.
`0d5` Byte offset not on word boundary.
`0d6` Job failed. 3B21 emulator only.
`0d7` Maintenance job failure - see DKDRV error report.
`0d8` Invalid file type return code from io_ucbs(). 3B21 emulator only.
`0d9` PSM sent a bad power transition message.
`0db` temp message - old message returned.
`0dd` Unknown maintenance `ACK` received.
`0df` Unrecognizable message type.
`0e2` Unrecognizable device.
`0e5` Unknown `FMGR ACK` message received.
`0e6` Segment removed failed, pump buffer retained.
`0e8` Unknown `MMGR ACK` message received.
`0ec` Unknown `DKDRV ACK` message received. 3B20D / 3B21D only.
`0ec` Received an unknown acknowledgement from the file manager. 3B21 emulator only.
`0ef` Unknown `ACK` message received.
`0f0` Incorrect swap `LOG_REC RID` from ECDORG.
`0f1` Incorrect SWAP MDCT RID.
`0f2` Can't update the ROOT / SWAP device table.
`0f3` dlm indicator `alocmsg()` failed (to SIM).
`0f4` dlm indicator `alocmsg()` failed (to DKDIP).
`0f6` dlm indicator `alocmsg()` failed(to DKDIP).
`0f8` dlm indicator `alocmsg()` failed(to DKDIP).
`0fa` Could not get a CDLM timer entry.
`0fb` `dlmstrt ost` returned SWFAIL.
`0fd` microstore limpmode flag set.
`0fe` Bad return from `dlmstrt`.
`0ff` Unknown RID from DKDIP.

SEE PROPRIETARY NOTICE ON COVER PAGE

`100` Invalid operation code in UTIL message.
`101` Power down of an active unit.
`102` DFC power down message received - unit still usable.
`103` Device powered down - abort client.
`104` Power down message received - unit still usable.
`105` dlm indicator `alocmsg()` failed.
`106` Special priority queue full.
`107` `spqjobid()` failed.
`108` Invalid device type for power up check.
`10a` `intpwait()` function failed.
`110` No VTOC on disk pack.
`113` VTOC too large for DKDRV to handle.
`116` Invalid partition number in VTOC entry.
`119` Invalid partition number in message.
`140` Virtual address does not map into segment number.
`145` `iolock()` failed.
`14a` `uniolock()` failed.
`160` RID to UCB LLA call failed.
`165` RID update and release failed.
`16a` RID unknown by DKDRV.
`170` RID to UCB LLA call failed.
`175` RID update and release failed.
`17a` RID to UCB LLA call failed.
`180` RID update and release failed.
`185` RID to UCB LLA call failed.
`18a` RID update and release failed.
`190` Invalid inhibit administration opcode.
`1a0` `dtchintr()` call returned fail.
`1a5` `atchintr()` call returned fail.
`1aa` `enabintr()` call returned fail.
`1b0` ECD attach failed.
`1b3` DLM INIT failed.
`1b5` CONFIG OPEN failed.
`1b8` atchdata call to ECD failed.
`1bc` No DFCs in ECD.
`1be` DFC growth failed.
`1c3` downucbs ECD call failed.
`1c6` SBUS growth failed.
`1c9` downucbs ECD call failed.
`1cc` Growth of SCSI device failed.
`1cd` No tape devices configured in ECD. 3B21 emulator only.
`1ce` downucbs ECD call failed.
`1d1` SMD MHD growth failed.
`1d3` Too many devices.
`1d6` RID to UCB conversion failed.
`1d8` Invalid device type.
`1d9` Unable to determine DFC type.
`1dc` RID update and release failed.
`1de` Device is unequipped.
`1df` Invalid DFC internal device ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

`1e1` Channel RID to UCB conversion failed.
`1e3` Invalid SBUS internal device ID.
`1e5` DFC RID to UCB conversion failed.
`1e6` Attempt to grow more than one tape device. 3B21 emulator only.
`1e7` Invalid device ID for SCSI device.
`1e8` DAT or SMT must have internal device ID 6. 3B21 emulator only.
`1e9` SBUS RID to UCB conversion failed.
`1ea` Failed to get tape device's SBUS controller UCB. 3B21 emulator only.
`1eb` Invalid SBUS internal device id.
`1ec` Invalid SBUS internal device id. 3B21 emulator only.
`1ed` DFC RID to UCB conversion failed.
`1ee` Device is not a SCSI device. 3B21 emulator only.
`1ef` Invalid device ID for SMD MHD.
`1f0` Tape device is not configured on SCSI DFC. 3B21 emulator only.
`1f1` The tape device controller is not an SBUS. 3B21 emulator only.
`1f2` DFC RID to UCB conversion failed.
`1f3` Failed to retrieve the tape's DFC UCB. 3B21 emulator only.
`1f4` Incorrect device type for the device's control unit.
`1f5` Tape device DFC must have internal ID 0. 3B21 emulator only.
`1f6` Change state to ACT failed for tape device. 3B21 emulator only.
`1fc` Memory initialization failed.
`1fe` DKDRV port attach failed.
`1ff` `atchchan()` function failed. 3B21 emulator only.
`203` `getpta()` function failed.
`206` RID to UCB conversion failed.
`209` `idmadev()` (write to DMAC RAM) failed.
`20c` `atchintr` call failed.
`20d` Cannot set up timeout request. 3B21 emulator only.
`20f` RID not known by DKDRV.
`213` DFC being de-grown is in use.
`216` Update of DKDRV local DFC UCB failed.
`219` DFC being de-grown not in UNEQIP state.
`21c` SBUS being de-grown is in use.
`21f` Update of DKDRV local SBUS UCB failed.
`223` SBUS being de-grown not in UNEQIP state.
`226` Unit being de-grown is in use.
`229` Update of DKDRV local device UCB failed.
`22c` Unit being de-grown not in UNEQIP state.
`22f` RID to UCB conversion failed.
`233` RID update and release failed.
`236` Drive type in ECD does not agree with backplane - restore aborted.
`239` RID to UCB conversion failed.
`23a` RID update and release failed.
`23b` RID to UCB conversion failed.
`23c` Get option block for DFC failed.
`23d` Invalid `eirflag` field in DFC option block.
`23e` Get option block for MHD failed.
`240` Delay (failed to find interrupt set in BIC).
`242` RID to UCB conversion failed.
`24e` Cannot send read VTOC job during boot. 3B21 emulator only.

SEE PROPRIETARY NOTICE ON COVER PAGE

250 Job complete code == fail. 3B20D/3B21D only.
250 Error occurred while trying to read a VTOC. 3B21 emulator only.
252 Job request not allowed.
254 Job request not allowed.
258 Tape device already opened.
25a Driver I/O error.
25c No S_ACT device - open.
260 Incorrect MDCT from IO message.
261 MDCT pointer missing from a message received. 3B21 emulator only.
263 Growth of device failed.
265 No RIDs in ECD MDCT.
268 Warning - enlarge DKDRV's internal MDCT.
26c Disk specific write not allowed.
270 No S_ACT device - read.
275 Invalid partition number in read message.
278 Access to DIAG partition is not allowed - read.
279 Disk driver in overload - no free job table entries. 3B21 emulator only.
27a Unable to inventory job.
27d bhqjobid() failed. 3B20D/3B21D only.
27d Unable to queue a job, I/O Assist error. 3B21 emulator only.
280 io_blk exceeds partition size - read.
282 Attempting to read a device other than a disk or a tape. 3B21 emulator only.
290 No S_ACT device - write.
295 Invalid partition number in write message.
29a Tried to write into protected partition.
2b1 No job IDs left.
2ba Unable to inventory all jobs.
2be Access to DIAG partition is not allowed - write.
2c0 io_blk exceeds partition size - write.
2c2 Attempting to write to a device other than a disk or a tape. 3B21 emulator only.
305 Unrecognizable DKDRV internal job type.
307 Unexpected denial of request to remove MHD.
308 Duplex operation compromised due to removing MHD.
320 Boot indicator message allocation failed.
325 INIT entry failed.
32a Unexpected event.
32b No timeouts are set. 3B21 emulator only.
32c Cannot set up timeout request. 3B21 emulator only.
32d Received FLT_CMD fault. 3B21 emulator only.
32e atchchan() function failed. 3B21 emulator only.
32f atchintr() function failed. 3B21 emulator only.
330 Cannot set up timeout request. 3B21 emulator only.
340 FLT_SINIT fault code.
343 Failed to restart driver.
345 Phase occurred during critical disk operations. 3B21 emulator only.
346 Old non-queued audit error message.
349 Unexpected fault code.
34c Critical hit - S_RSP.
34f Critical hit - S_MSG.
351 Cannot get a job response. 3B21 emulator only.

SEE PROPRIETARY NOTICE ON COVER PAGE

353 Driver state error.
355 Calling `dfcinit()` for lack of "warm" restart.
356 `ss32b()` failed.
358 Job response contained a failure response code. 3B21 emulator only.
359 PIC never reset CMD IN PROG flag.
35a Putting read message on reprocess queue. 3B21 emulator only.
35c Read job failed - CONFIG denied request to remove device. 3B21 emulator only.
35e Write job failed - CONFIG denied request to remove device. 3B21 emulator only.
35f `progio` (D2SBS clear) failed.
363 `progio` (BIC initialization and PIC reset) failed.
366 `initmem5` (DMAC RAM initialization) failed.
369 `enabintr` function failed.
36c `progio` (send ABORT command to PIC) failed.
36f `progio` (set BIC IFEN flag) failed.
370 Excessive errors, device being reset. 3B21 emulator only.
373 Unknown RID faulted.
376 PIO lost for a unit.
379 Unknown RID faulted.
37c Unexpected fault code.
37d Job response does not match a job table entry. 3B21 emulator only.
37f Message buffer audit error - abort maintenance on this unit.
380 Message buffer audit error. 3B21 emulator only.
383 `timereq()` failed - `dfcinit()`.
391 invalid `pdfptr`.
392 invalid `pdfptr`.
395 RID to UCB LLA call failed.
397 Message alloc failed (to FMGR).
398 Could not get a timer entry for FMGR.
39b Major DFC reinitialization due to either operational problems or manual request.
39c Tape operations aborted.
39e Warning - queue full detected.
3a6 Invalid `dfcinit()` sequence.
3a9 Can't identify panic dump device.
3ac Incorrect PANIC DUMP RID.
3af `ss32b()` failed.
3b3 PIC never reset CMD IN PROG flag.
3b6 `progio` (D2SBS clear) failed.
3b9 `progio` (BIC initialization and PIC reset) failed.
3ba Failed to clear BIC INTP.
3bc `kint()` - stray interrupts detected.
3bd Too many job timeouts occurred. 3B21 emulator only.
3be `kint()` entered before `kfault()` after panic dump.
3bf Unable to requeue job - I/O Assist error. 3B21 emulator only.
3c0 Unable to requeue job - I/O Assist error. 3B21 emulator only.
3c1 Unable to resend job - I/O Assist error. 3B21 emulator only.
3c2 Handling an unfinished job found in the disk driver's job table. 3B21 emulator only.
3c3 A job exists in the job table that is too old. 3B21 emulator only.
3d0 RID not known by DKDRV.
3d3 DKDRV has aborted client.
3d5 Invalid maintenance state.

SEE PROPRIETARY NOTICE ON COVER PAGE

3d8 Device file not open.
3dc Another process has device file open.
3dd Tape device is already open.
3de Request prohibited on S_ACT DFC. 3B20D / 3B21D only.
3de Unsupported maintenance request. 3B21 emulator only.

`d4b` Device is write protected.
`d4c` 120 meter tapes are not supported.

d4e Failed to obtain expected mode pages.
d52 Failed to send `mode select` command.
d55 `Mode select` command failed.
d58 `Mode select` command failed.
d5b Invalid tape sequence number.
d5e Multi-partition tape is not supported.
d61 Wrong device type specified.
d62 Invalid density specified.
d65 Failed to send `mode sense` command.
d68 `Mode sense` command failed.
d6b `Mode sense` command failed.
d6e Failed to send `mode sense` command.
d72 `Mode sense` command failed.
d75 `Mode sense` command failed.
d78 Not enough data returned from `mode sense` command.
d7b Unexpected amount of data returned from `mode sense` command.
d7e Device is write protected.
d82 Requested density does not match set device density.
d85 Failed to obtain expected mode pages.
d88 Failed to send `mode select` command.
d8e `Mode select` command failed.
d92 `Mode select` command failed.
d95 Invalid tape sequence number.
da1 Wrong device type specified.
da2 Invalid density specified.
da5 Failed to send `mode sense` command.
da8 `Mode sense` command failed.
dab `Mode sense` command failed.
dae Failed to send `mode sense` command.
db2 `Mode sense` command failed.
db5 `Mode sense` command failed.
db8 Not enough data returned from `mode sense` command.
dbb Unexpected amount of data returned from `mode sense` command.
dbe Device is write protected.
dc2 Requested density does not match set device density.
dc5 Failed to obtain expected mode pages.
dc8 Failed to send `mode select` command.
dce `Mode select` command failed.
dd2 `Mode select` command failed.
dd5 Invalid tape sequence number.
e01 Not SCSI DFC.
e03 Invalid DFC state for pump.
e05 `dtchintr()` call returned fail.
e07 Unable to clear DDSBS.
e09 Unable to send command to BIC.
e0a Unable to send command to BIC.
e0b `atchintr()` call returned fail.
e0d `enabintr()` call returned fail.
e0f `getjobid()` failed.
e11 Failed to write word in BIC FIFO.

e13 `wakeup()` PIO failed.
e15 `version` command failed.
e17 `getjobid()` failed.
e19 Failed to write word in BIC FIFO.
e1a `wakeup()` PIO failed.
e1b `version` command failed.
e1c Unable to allocate message for FMGR.
e1d 1-byte wide firmware version not known.
e1f Unable to allocate message for FMGR.
e20 Unable to do a `stat()` on the pumpfile.
e22 Pumpfile invalid size.
e24 Pumpfile is not a single extent contiguous file.
e26 Unable to get segnum.
e28 Unable to `iolock` the buffer.
e2a Unable to allocate the message buffer for reading pumpfile.
e2c Unable to send the I/O message.
e2e Unable to read pumpfile header.
e2f Pumpfile has invalid size.
e30 4-wide firmware needs to be reprogrammed, retry later.
e32 Unable to get segnum.
e33 Unable to get segnum for DKDRV's internal pump buffer.
e35 Unable to download the pumpcode.
e37 Unable to request reading pumpfile.
e39 Unable to read pumpfile.
e3a DFC pump: `getjobid` failed.
e3b Failed to write word in BIC FIFO.
e3d Failed to write word in BIC FIFO.
e3f Failed to write word in BIC FIFO.
e41 Failed to write word in BIC FIFO.
e43 `wakeup` PIO failed.
e45 Pump failed at last pump.
e46 Cannot remove the segment.
e47 `dtchintr()` call returned fail.
e48 Unable to send command to BIC.
e49 Invalid pump sequence.
e4a `dtchintr()` call returned fail.
e4b Cannot remove the segment.
e4c Unable to send command to BIC.
e50 Invalid header magic number.
e53 1-byte wide firmware and pumpfile are incompatible - issue.
e55 1-byte wide firmware and pumpfile are incompatible - generic.
e57 4-byte wide firmware and pumpfile are incompatible with 1-byte wide firmware.
e59 Pumpfile has different revision level.
e5a 1-byte wide firmware and pumpfile are incompatible.
e5c Unable to determine revision levels.
e60 Unable to send command to BIC.
e62 `jcistat` command failed.
e64 Read status of BIC failed.
e66 Failed to read BIC FIFO.
e68 Failed to read BIC FIFO.

DKDRV Information Codes

NOTE: These information codes are in hexadecimal notation.

`010` No inventory room - restructure DKDRV.
`020` Report failure.
`030` Access to BIC failed.
`035` Desired BIC status not obtained.
`039` IO job has no associated IO message.
`040` IO message "`ms_to`" field is invalid.
`045` Message type not `IOREAD` or `IOWRITE`.
`04a` No job found in inventory data.
`050` Invalid completion code returned by DFC.
`055` Job reported error.
`05a` Response contains job ID not in use.
`060` Response specified an unknown device.
`06f` Drive status error.
`070` Special queue full.
`073` `spqjobid()` failed.
`076` `queuejob()` failed for DFC change maintenance mode command.
`07a` `intpwait()` function failed for DFC change maintenance mode.
`07c` Special queue full for SBUS change mode job.
`07e` `spqjobid()` failed for SBUS change mode command.
`082` `queuejob()` for SBUS change maintenance mode failed.
`085` `intpwait()` function failed for SBUS change maintenance mode.
`098` DFC version command: special queue full.
`09a` DFC version command: `spqjobid` failed.
`09c` Version command fail.
`09e` `dfc_vers`: `intpwait` function failed.
`0a0` `initmem1()` failed.
`0a2` Timeout request to get DIOP feature level failed.
`0a3` DKDRV timing chain index 0 already assigned.
`0a4` Failed to read `btparm` record.
`0a5` No mate for boot device found.
`0a8` DFC restore failed during boot.
`0ab` Fail to change the usable bit for SBUS.
`0af` MHD marked `S_ACT` but DFC not marked `S_ACT`.
`0b1` MHD marked `S_ACT` but SBUS not marked `S_ACT`.
`0b3` Simplex MHD restore failed config denied removal.

SEE PROPRIETARY NOTICE ON COVER PAGE

0b5 Simplex MHD restore failed config OKed removal.
0b8 MHD restore failed and no S_ACT mate.
0c0 initkint() (interrupt detach/attach) failed.
0c3 Fail to request pump after boot.
0c6 Invalid MHD to be restored during boot.
0c9 Invalid mate MHD.
0ca RID to UCB conversion failed.
0cb RID update and release failed.
0cf Duplicate fields in the message do not match.
0d5 Byte offset not on word boundary.
0d7 Maintenance job failure - see DKDRV error report.
0d9 PSM sent a bad power transition message.
0db temp message - old message returned.
0dd Unknown maintenance ACK received.
0df Unrecognizable message type.
0e2 Unrecognizable device.
0e5 Unknown FMGR ACK message received.
0e6 Segment removed failed, pump buffer retained.
0e8 Unknown MMGR ACK message received.
0ec Unknown DKDRV ACK message received.
0ef Unknown ACK message received.
0f0 Incorrect swap LOG_REC RID from ECDORG.
0f1 Incorrect SWAP MDCT RID.
0f2 Can't update the ROOT/SWAP device table.
0f3 dlm indicator alocmsg() failed (to SIM).
0f4 dlm indicator alocmsg() failed (to DKDIP).
0f6 dlm indicator alocmsg() failed(to DKDIP).
0f8 dlm indicator alocmsg() failed(to DKDIP).
0fa Could not get a CDLM timer entry.
0fb dlmstrt ost returned SWFAIL.
0fd microstore limpmode flag set.
0fe Bad return from dlmstrt.
0ff Unknown RID from DKDIP.
100 Invalid operation code in UTIL message.
101 Power down of an active unit.
102 DFC power down message received - unit still usable.
103 Device powered down - abort client.
104 Power down message received - unit still usable.
105 dlm indicator alocmsg() failed.
106 Special priority queue full.
107 spqjobid() failed.
108 Invalid device type for power up check.
10a intpwait() function failed.
110 No VTOC on disk pack.
113 VTOC too large for DKDRV to handle.
116 Invalid partition number in VTOC entry.
119 Invalid partition number in message.
140 Virtual address does not map into segment number.
145 iolock() failed.
14a uniolock() failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`160` RID to UCB LLA call failed.
`165` RID update and release failed.
`16a` RID unknown by DKDRV.
`170` RID to UCB LLA call failed.
`175` RID update and release failed.
`17a` RID to UCB LLA call failed.
`180` RID update and release failed.
`185` RID to UCB LLA call failed.
`18a` RID update and release failed.
`190` Invalid inhibit administration opcode.
`1a0` `dtchintr()` call returned fail.
`1a5` `atchintr()` call returned fail.
`1aa` `enabintr()` call returned fail.
`1b0` ECD attach failed.
`1b3` DLM INIT failed.
`1b5` CONFIG OPEN failed.
`1b8` atchdata call to ECD failed.
`1bc` No DFCs in ECD.
`1be` DFC growth failed.
`1c3` downucbs ECD call failed.
`1c6` SBUS growth failed.
`1c9` downucbs ECD call failed.
`1cc` Growth of SCSI device failed.
`1ce` downucbs ECD call failed.
`1d1` SMD MHD growth failed.
`1d3` Too many devices.
`1d6` RID to UCB conversion failed.
`1d8` Invalid device type.
`1d9` Unable to determine DFC type.
`1dc` RID update and release failed.
`1de` Device is unequipped.
`1df` Invalid DFC internal device ID.
`1e1` Channel RID to UCB conversion failed.
`1e3` Invalid SBUS internal device ID.
`1e5` DFC RID to UCB conversion failed.
`1e7` Invalid device ID for SCSI device.
`1e9` SBUS RID to UCB conversion failed.
`1eb` Invalid SBUS internal device id.
`1ed` DFC RID to UCB conversion failed.
`1ef` Invalid device ID for SMD MHD.
`1f2` DFC RID to UCB conversion failed.
`1f4` Incorrect device type for the device's control unit.
`1fc` Memory initialization failed.
`1fe` DKDRV port attach failed.
`203` `getpta()` function failed.
`206` RID to UCB conversion failed.
`209` `idmadev()` (write to DMAC RAM) failed.
`20c` `atchintr` call failed.
`20f` RID not known by DKDRV.
`213` DFC being de-grown is in use.

SEE PROPRIETARY NOTICE ON COVER PAGE

`216` Update of DKDRV local DFC UCB failed.
`219` DFC being de-grown not in UNEQIP state.
`21c` SBUS being de-grown is in use.
`21f` Update of DKDRV local SBUS UCB failed.
`223` SBUS being de-grown not in UNEQIP state.
`226` Unit being de-grown is in use.
`229` Update of DKDRV local device UCB failed.
`22c` Unit being de-grown not in UNEQIP state.
`22f` RID to UCB conversion failed.
`233` RID update and release failed.
`236` Drive type in ECD does not agree with backplane - restore aborted.
`239` RID to UCB conversion failed.
`23a` RID update and release failed.
`23b` RID to UCB conversion failed.
`23c` Get option block for DFC failed.
`23d` Invalid `eirflag` field in DFC option block.
`23e` Get option block for MHD failed.
`240` Delay (failed to find interrupt set in BIC).
`242` RID to UCB conversion failed.
`250` Job complete code == fail.
`252` Job request not allowed.
`254` Job request not allowed.
`258` Tape device already opened.
`25a` Driver I/O error.
`25c` No `S_ACT` device - open.
`260` Incorrect MDCT from IO message.
`263` Growth of device failed.
`265` No RIDs in ECD MDCT.
`268` Warning - enlarge DKDRV's internal MDCT.
`26c` Disk specific write not allowed.
`270` No `S_ACT` device - read.
`275` Invalid partition number in read message.
`278` Access to DIAG partition is not allowed - read.
`27a` Unable to inventory job.
`27d` `bhqjobid()` failed.
`280` `io_blk` exceeds partition size - read.
`290` No `S_ACT` device - write.
`295` Invalid partition number in write message.
`29a` Tried to write into protected partition.
`2b1` No job IDs left.
`2ba` Unable to inventory all jobs.
`2be` Access to DIAG partition is not allowed - write.
`2c0` `io_blk` exceeds partition size - write.
`305` Unrecognizable DKDRV internal job type.
`307` Unexpected denial of request to remove MHD.
`308` Duplex operation compromised due to removing MHD.
`320` Boot indicator message allocation failed.
`325` INIT entry failed.
`32a` Unexpected event.
`340` do_error(0x340) `FLT_SINIT` fault code.

SEE PROPRIETARY NOTICE ON COVER PAGE

343 Failed to restart driver.
346 Old non-queued audit error message.
349 Unexpected fault code.
34c Critical hit - S_RSP.
34f Critical hit - S_MSG.
353 Driver state error.
355 Calling dfcinit() for lack of "warm" restart.
356 ss32b() failed.
359 PIC never reset CMD IN PROG flag.
35f progio (D2SBS clear) failed.
363 progio (BIC initialization and PIC reset) failed.
366 initmem5 (DMAC RAM initialization) failed.
369 enabintr function failed.
36c progio (send ABORT command to PIC) failed.
36f progio (set BIC IFEN flag) failed.
373 Unknown RID faulted.
376 PIO lost for a unit.
379 Unknown RID faulted.
37c Unexpected fault code.
37f Message buffer audit error - abort maintenance on this unit.
383 timereq() failed - dfcinit().
391 invalid pdfptr.
392 invalid pdfptr.
395 RID to UCB LLA call failed.
397 Message alloc failed (to FMGR).
398 Could not get a timer entry for FMGR.
39b Major DFC reinitialization due to either operational problems or manual request.
39c Tape operations aborted.
39e Warning - queue full detected.
3a6 Invalid dfcinit() sequence.
3a9 Can't identify panic dump device.
3ac Incorrect PANIC DUMP RID.
3af ss32b() failed.
3b3 PIC never reset CMD IN PROG flag.
3b6 progio (D2SBS clear) failed.
3b9 progio (BIC initialization and PIC reset) failed.
3ba Failed to clear BIC INTP.
3bc kint() - stray interrupts detected.
3be kint() entered before kfault() after panic dump.
3d0 RID not known by DKDRV.
3d3 DKDRV has aborted client.
3d5 Invalid maintenance state.
3d8 Device file not open.
3dc Another process has device file open.
3dd Tape device is already open.
3de Request prohibited on S_ACT DFC.
3e1 maint() attach interrupt failed.
3e3 maint() enable interrupt failed.
3e5 UCB is not a DFC.
3e8 DMAC RAM initialization failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

3ec Detach / attach / enable interrupt failed.
3ef Detach interrupt failed.
401 Device type is not SCSI.
402 FORMAT - unit is not a disk.
403 Device type is not SCSI for explicit SCSI command.
404 DFC must be active.
405 DFC is not ACTIVE for SCSI command.
406 SBUS must be active.
407 SBUS is not ACTIVE for SCSI command.
409 CONFIG denied request to remove unit.
40a Base queue full.
40b Time limit exceeds capability.
40c May only restore S_OOS units.
40d Failed to get job id.
40e Restore request no good - DFC not S_ACT.
40f queuejob failed.
412 Restore request no good - SBUS not S_ACT.
415 Compare / correct - unit not a disk.
418 Compare / correct - DFC not S_ACT.
41b Compare / correct - SBUS not ACTIVE.
41d May not compare / correct a S_INIT unit.
41f Only one compare / correct is allowed to run at one time.
422 May only restore S_OOS units.
425 SBUS restore - DFC is not ACTIVE.
426 MHD or MT restore - SBUS is not ACTIVE.
427 MHD restore - DFC is not ACTIVE.
428 DIAG SYSGEN PIO failed.
429 Restore not allowed - device not supported.
42a UCB is not a DFC UCB.
42c Not allowed to DGN an S_ACT unit.
42e Special queue full.
432 Invalid device to be diagnosed.
435 spqjobid() failed.
438 queuejob() failed.
43c getdmaa() function failed.
43e Received WSETUP0 before SPECDMA.
442 WSETUP1 received before WSETUP0.
445 uniolock() failed.
448 getdmaa function failed.
44c Invalid disk lock process.
44f Base queue full.
452 bhqjobid() failed.
455 queuejob failed.
458 Version job failed.
460 FORMAT requires non-S_ACT MHD.
462 FORMAT/VERIFY - unit is not a disk.
465 FORMAT/VERIFY requires S_ACT DFC.
468 INIT/VFY MHD - SBUS not S_ACT.
46a VERIFY in progress - retry later.
470 Start track / block greater than last track / block.

SEE PROPRIETARY NOTICE ON COVER PAGE

473 Base queue full.
476 `bhqjobid()` failed.
479 MHD usability changed because of INIT operation.
47c `queuejob()` failed.
480 Invalid when MHD is `S_ACT`.
483 DFC must be `S_ACT`.
486 Invalid when MHD is `S_ACT`.
489 DFC must be `S_ACT`.
48b `REMAP devserv()` failed.
48d Device major status update failed.
48f Failed to initialize device status.
492 Base queue full.
494 Unable to queue LM job.
496 Invalid DFC type for DFC reset request.
498 DFC is not ACTIVE to be reset.
49a Firmware is running - cannot reset DFC.
49f DFC type does not support pump.
4a3 DFC is not ACTIVE for pumpcode downloading.
4a6 Other pump in progress - retry later.
4a9 Unable to queue pump job.
4aa Device must be non-ACT to initialize error message inhibit flag.
4ab CLRMAEC - unit is not a disk.
4ac Invalid opercode in maintenance message.
4ae Unexpected maintenance interrupt.
4b3 `dtchintr()` call failed.
4b6 Maintenance work timed out.
4b9 No base or high job IDs left.
4bc Failed to get page table address.
4be No job IDs left for base or high queue.
4c2 Offset of the SCSI command is not on word boundary.
4c5 Explicit SCSI command, response and data are not on the same segment.
4c8 Base queue full for SCSI command.
4ca Request exceeds DFC capability.
4cb Invalid second device for SCSI command.
4cc Request exceeds expscsi capability.
4cd Unable to queue the SCSI command.
4d0 `readvtoc()` function failed.
4d1 Another pump in progress, retry later.
4d2 Flash reprogram not started.
4d3 Unable to program flash memory on S_ACT unit.
4d5 `readvtoc()` job failed.
4d6 Unable to clear DDSBS.
4d8 Unable to send command to BIC.
4d9 `getpta()` function failed.
4da VTOC sort function failed.
4db `initmem5()` DMAC init failed.
4dc Unable to send command to BIC.
4dd `dtchintr` call returned fail.
4de `atchintr` call returned fail.
4df DFC pump: `getjobid()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

`4e0` Invalid `newvtoc()` sequence.
`4e1` Failed to write word in BIC FIFO.
`4e2` `enabintr()` call returned fail.
`4e3` Failed to write word in BIC FIFO.
`4e5` Partition number out of range for DKDRV.
`4e6` Failed to write word in BIC FIFO.
`4e7` Failed to write word in BIC FIFO.
`4e8` Partition number out of range for VTOC.
`4e9` `wakeup()` PIO failed.
`4eb` Unable to get firmware versions.
`4f1` Flash reprogram not started.
`4f2` Unable to clear DDSBS.
`4f3` Unable to send command to BIC.
`4f5` DFC pump: `getjobid()` failed.
`4f7` Failed to write word in BIC FIFO.
`4f9` Failed to write word in BIC FIFO.
`4fa` Failed to write word in BIC FIFO.
`4fb` Failed to write word in BIC FIFO.
`4fc` `wakeup()` PIO failed.
`500` Base queue full for maintenance read.
`503` Tried to use invalid VTOC for maintenance read.
`505` Invalid partition number in message.
`508` Invalid block in partition.
`50c` `bhqjobid()` failed for maintenance read.
`50e` Unable to inventory job for maintenance read.
`520` Base queue full for maintenance write.
`523` Tried to use invalid VTOC for maintenance write.
`526` Invalid partition number in message.
`529` Tried to write into protected partition.
`52c` Invalid block in partition.
`537` MHD usability changed because of `pdfwrite` job.
`539` `bhqjobid()` failed for maintenance write.
`53b` Unable to inventory job for maintenance write.
`550` Physical device file not opened.
`553` Incorrect READ/WRITE access permissions.
`556` `iolock` failed.
`55b` `getjobid` failed.
`55f` Maintenance I/O request to a non-disk device.
`56a` DISK read or write requires active DFC.
`56f` DISK read or write requires active SBUS.
`573` This physical device file already open.
`575` Device major status update failed.
`57a` Update of device file variables failed.
`580` May not maintenance write ACT device.
`583` SDF prematurely closed during a restore.
`585` `uniolock` failed.
`5a0` Command to BIC failed.
`5a5` Command to PIC failed.
`5aa` Clear of DDSBS failed.
`5b0` Read status of DDSBS failed.

`6d1` `progio` (BIC initialization and PIC reset) failed.
`6d3` `enabintr()` failed.
`6d5` `SYSGEN` function failed.
`6d8` `sysgen` job failed.
`6d9` `dfc_vers` request function failed.
`6da` `dfc_vers` job failed.
`6db` `dfc_vers` request function failed.
`6dd` `dfc_vers` job failed.
`6df` `dfcserv(ONLINE)` function failed.
`6e2` `dfcserv(ONLINE)` job failed.
`6e5` CONFIG chgstate call failed.
`6e8` Unable to change usable bit for DFC.
`6eb` Cannot request a timer for pump after DFC restore.
`6ef` Invalid DFC restore sequence number.
`6f2` Unit is in FULL DLM - abort restore.
`6f5` Mate unit is in FULL DLM - abort restore.
`6f8` Unable to change usable bit for MHD.
`6fb` CONFIG chgstate call failed.
`6fe` DKDRV MHD memory initialization failed.
`6ff` `dlm_chks()` denied restore request.
`701` `readdisk()` function failed.
`703` Disk job `(readdisk)` failed.
`706` `devserv(ONLINE,RSTJOB)` function failed.
`709` DFC failed to put MHD on-line.
`70c` `readvtoc()` function failed.
`70e` Disk job `(readvtoc)` failed.
`711` VTOC integrity check failed.
`713` CONFIG chgstate call failed.
`715` Unable to change usable bit for MHD.
`718` Invalid MHD restore sequence number.
`71c` CONFIG chgstate call failed.
`71e` `sbuserv(ONLINE)` function failed.
`722` `sbuserv(ONLINE)` job failed.
`725` CONFIG chgstate call failed.
`728` Unable to change usable bit for SBUS.
`72c` Invalid SBUS restore sequence number.
`730` Maintenance state audit requested.
`732` Invalid MHD "`compcor`" sequence number.
`741` Unit is in FULL DLM - abort restore.
`742` Failed to change usable bit for tape.
`745` CONFIG `chgstate` call failed.
`748` DKDRV tape memory initialization failed.
`74b` `devserv(ONLINE)` function failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

74e Failed to put tape device ONLINE.
752 CONFIG `chgstate` call failed.
755 Failed to change usable bit for tape.
758 Invalid tape restore sequence number.
75b DIOP restore not allowed - mate MHD is active.
75e DIOP restore not allowed - MHD is marked essential.
760 `progio` (set BIC IFEN flag) failed.
761 Wakeup PIO failed.
762 Resume PIO failed.
765 `progio` (send SYSGEN command to PIC) failed.
76a `intpwait` function failed.
770 Job timed out.
775 DFC timed out.
776 Invalid pump state.
778 Cannot request timer for DFC pump.
77a DFC entering overload.
77c DFC leaving overload.
77f DFC usability audit failed.
790 Timing table full.
795 Timeout request is out of range.

`dab` `Mode sense` command failed.
`dae` Failed to send `mode sense` command.
`db2` `Mode sense` command failed.
`db5` `Mode sense` command failed.
`db8` Not enough data returned from `mode sense` command.
`dbb` Unexpected amount of data returned from `mode sense` command.
`dbe` Device is write protected.
`dc2` Requested density does not match set device density.
`dc5` Failed to obtain expected mode pages.
`dc8` Failed to send `mode select` command.
`dce` `Mode select` command failed.
`dd2` `Mode select` command failed.
`dd5` Invalid tape sequence number.
`e01` Not SCSI DFC.
`e03` Invalid DFC state for pump.
`e05` `dtchintr()` call returned fail.
`e07` Unable to clear DDSBS.
`e09` Unable to send command to BIC.
`e0a` Unable to send command to BIC.
`e0b` `atchintr()` call returned fail.
`e0d` `enabintr()` call returned fail.
`e0f` `getjobid()` failed.
`e11` Failed to write word in BIC FIFO.
`e13` `wakeup()` PIO failed.
`e15` `version` command failed.
`e17` `getjobid()` failed.
`e19` Failed to write word in BIC FIFO.
`e1a` `wakeup()` PIO failed.
`e1b` `version` command failed.
`e1c` Unable to allocate message for FMGR.
`e1d` 1-byte wide firmware version not known.
`e1f` Unable to allocate message for FMGR.
`e20` Unable to do a `stat()` on the pumpfile.
`e22` Pumpfile invalid size.
`e24` Pumpfile is not a single extent contiguous file.
`e26` Unable to get segnum.
`e28` Unable to `iolock` the buffer.

`e2a` Unable to allocate the message buffer for reading pumpfile.
`e2c` Unable to send the I/O message.
`e2e` Unable to read pumpfile header.
`e2f` Pumpfile has invalid size.
`e30` 4-wide firmware needs to be reprogrammed, retry later.
`e32` Unable to get segnum.
`e33` Unable to get segnum for DKDRV's internal pump buffer.
`e35` Unable to download the pumpcode.
`e37` Unable to request reading pumpfile.
`e39` Unable to read pumpfile.
`e3a` DFC pump: `getjobid` failed.
`e3b` Failed to write word in BIC FIFO.
`e3d` Failed to write word in BIC FIFO.
`e3f` Failed to write word in BIC FIFO.
`e41` Failed to write word in BIC FIFO.
`e43` `wakeup` PIO failed.
`e45` Pump failed at last pump.
`e46` Cannot remove the segment.
`e47` `dtchintr()` call returned fail.
`e48` Unable to send command to BIC.
`e49` Invalid pump sequence.
`e4a` `dtchintr()` call returned fail.
`e4b` Cannot remove the segment.
`e4c` Unable to send command to BIC.
`e50` Invalid header magic number.
`e53` 1-byte wide firmware and pumpfile are incompatible - issue.
`e55` 1-byte wide firmware and pumpfile are incompatible - generic.
`e57` 4-byte wide firmware and pumpfile are incompatible with 1-byte wide firmware.
`e59` Pumpfile has different revision level.
`e5a` 1-byte wide firmware and pumpfile are incompatible.
`e5c` Unable to determine revision levels.
`e60` Unable to send command to BIC.
`e62` `jcistat` command failed.
`e64` Read status of BIC failed.
`e66` Failed to read BIC FIFO.
`e68` Failed to read BIC FIFO.
`e69` Received interrupt but no response.
`e6a` Failed to clear BIC interrupt.
`e6b` `dtchintr()` call returned fail.
`e6c` Unable to send command to BIC.
`e6d` `dtchintr` call returned fail.
`e6e` `atchintr` call returned fail.
`e6f` `enabintr` call returned fail.
`e70` DFC flash programming timed out.
`e71` Unable to clear DDSBS.
`e72` Unable to send command to BIC.
`e73` DFC `version` command failed.
`e74` Unable to send command to BIC.
`e78` `initmem5()` DMAC initialization failed.
`e7a` `dtchintr` call returned fail.

SEE PROPRIETARY NOTICE ON COVER PAGE

`e7b` `atchintr` call returned fail.
`e7c` `enabintr` call returned fail.
`e7d` `getjobid` failed.
`e7f` Unable to send `version` command failed.
`e80` Unrecognizable DKDRV internal job type.
`e85` Response contains jobid not in use.
`e86` IO job has no associated IO message.
`e88` IO message "ms_to" field is invalid.
`e8a` Message type not IOREAD or IOWRITE.
`e8c` No job found in inventory data.
`e8d` Invalid completion code returned by DFC.
`e8f` Job reported error.

ID . . . . . APP-DFC-APPB-A
GENERIC . . . . . UNIX RTR R1.5 and R6.4
TYPE . . . . . Output
MESSAGE CLASS . . MAINT

This appendix contains several tables. Table 1 describes disk file controller (DFC) error codes and the corrective actions which may be taken. Table 2 describes several conditional success codes. Table 3 explains the special completion codes, which are applicable for autonomous response output messages. Table 4 contains the enhanced completion codes. Table 5 contains the values of the firmware/pumpcode, driver communications register. Table 6 contains job types pending.

The data in Table 2 and Table 3 are seen only by the disk driver. They are included here only to provide complete documentation on the DFC error codes.

Table 1 lists the errors which can be detected by the DFC, explains the cause of the error, and shows any corrective actions which may be required. The DFC responds to all system-requested work with job completion codes. When the DFC detects errors on those jobs, it reports with the error information shown in Table 1. In addition to running those jobs, the DFC can create its own internal work and can handle requests which do not have unique job identification codes.

All error codes are in hexadecimal.

Table 1 - DFC Error Codes

DFC Name	Code	Probable Cause and Corrective Action
CCOK	00	Job completed okay. This code implies successful completion, except in some autonomous responses. In the case of autonomous responses, the special completion code takes precedence over this code.
CCRAMWE	80,81	PIC ram read/write boundary error. If the DFC is a SMD-DFC. The DFC was requested to write outside the address range of E00 to FFF (hexadecimal). This area is reserved for the diagnostics group and may be read and/or written by them. Addresses outside this range are reserved for the operational portion of the firmware and may not be written by anyone. **ACTION** - This error should never occur since only the diagnostics group uses the write ram command.

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
		If the DFC is a SCSI-DFC. The DFC was requested to write to write-protected RAM. The DFC was requested to write to outside of allowed area of DFC RAM. The DFC was requested to read non-existent memory. **ACTION** - This error should never occur since only the diagnostics groups uses the ram read and write commands.
CCSEEKER	82,83	Seek error on disk. The DFC issued a seek to an MHD and then detected an error in the MHD. The error from the MHD indicates either that the seek did not complete within 75 milliseconds, or that the drive interpreted the address seek as beyond the last available cylinder on the disk. **ACTION** - Check the cables to the MHDs for loose connections or perform preventive maintenance.
CCNOINDX	84,85	No index detected on disk. The DFC could not find an 'index' mark from the disk after counting 33 sector marks. **ACTION** - Replace either the disk pack or the MHD in question.
CCERRCMD	86,87	Invalid command from computer. The DFC received a command that was not valid for the state of the DFC. **ACTION** - There is no user response for this error. See support group.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCSTATER	88,89	MHD status error. There is a problem with the drive which the DFC tried to access. One of the following: No unit ready - The drive is not powered up or the ID plug is missing. No on cylinder indication - The drive has not been powered up or the disk pack is not spinning. Fault - There is a hard fault on the drive, *not* the disk pack, which the firmware cannot correct. **ACTION -** Correct the problem and try again.
CCUCDE	8A,8B	Uncorrectable data error. If the DFC is a SMD-DFC, the DFC detected an error in the data on the disk which is beyond 11 bits long. The data which has been read cannot be used. **ACTION -** Use the VERIFY command to determine the location of the error and re-format the track on which the error is located. The data on that track is lost forever, and the whole disk pack may have to be re-populated with data from a mate disk. If the DFC is a SCSI-DFC, the target controller was not able to read a block of data from the disk. **ACTION -** Use the VERIFY command to determine the location of the error. Place the location of the error in a defect list and re-format the disk. The whole disk pack must be repopulated with data from a mate disk.
CCDBO	8C,8D	Disk boundary overflow. An attempt to read or write beyond the last block on a disk was made. **ACTION** - Run MHD diagnostics, and check the data cables. Another possibility is that the VTOC on the disk specifies a partition which exceeds the last available cylinder on the disk pack.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUHSM	8E,8F	Head - sector mismatch error. The DFC read a sector off the disk and the header information, which contains the cylinder, head and sector number, did not agree with the value the DFC calculated for the head-sector number. **ACTION** - Try the job again and if it fails, reformat that area of the disk.
CCUWD	90,91	Wrong disk selected. A disk which the controller did not try to select answered to the poll of the disks. **ACTION** - Check the id plug of the drive and then make sure that the data cable to the drive is properly placed on the backplane of the DFC.
CCUND	92,93	No disk selected. There was no answer to the polling of the disks, but the DFC expected an answer. **ACTION** - Ensure that the disk to be selected is powered up, that its data cable is in the right place on the DFC backplane, and that the drive has an id plug.
CCUHP	94,95	Head positioning error. The drive was requested to go to a given cylinder, but upon reading the header from the cylinder, the cylinder number there did not match the number that the DFC had calculated it should be. There was no seek error (8300) detected. **ACTION** - Try the job again or reformat that area of the disk pack where the error occurred.
CCUHSE	96,97	Head selection error. The head number read from the disk did not agree with what the DFC had calculated it should be. **ACTION** - Retry the job, or reformat the area of the disk pack where the error occurred, or check the control cable to the MHD.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUBPE	98,99	BIC parity error. There was a data parity error on a data transfer either to or from the BIC when the BIC was communicating with the processor. **ACTION** - The DFC cannot cause this error, only report it. The BIC and/or the DDSBS should be diagnosed.
CCUBPSE	9A,9B	BIC-PIC Soft Error. **ACTION** - Run DFC diagnostics.
CCPICE	9C,9D	PIC error. The DFC tried to do a match against a known condition but could not detect a match condition. For example, if the DFC knows that there is a command to decode from BIC, the DFC tries to decode the command; if no match is found, this error is generated. **ACTION** - Run DFC diagnostics.
CCU3BE	9E,9F	DMA setup overwrite. The BIC detects that the DMA has attempted to write to the BIC data fifo while a setup request is pending. **ACTION** - Run DFC and DMA diagnostics.
CCUJTE	A0,A1	Early EOT from DMA. The error is detected in the BIC when the BIC receives an EOT signal from the DMA and the DFC has not set the EOT EXPECT flag in the BIC. **ACTION** - Run BIC and DMA diagnostics.
CCUNET	A2,A3	No EOT from DMA. The error is detected in the BIC when the DFC has set the EOT EXPECT flag in the BIC and the DMA has responded to a transfer request with data rather than an EOT. **ACTION** - Run BIC and/or DMA diagnostics.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCPUMPER	A4,A5	Error detected in pumped data. The file containing the data to be pumped is not compatible with the firmware on the SCSI-DFC or there is an error in the contents of the pump file. **ACTION** - Check that the UCB associated with the SCSI-DFC points to the pump file compatible with the SCSI-DFC.
CCUFPE	A6,A7	PSDI fifo parity error. The parallel to serial data interface in the DFC has detected a parity error in the data stream which has been written on the disk. **ACTION** - Run DFC diagnostics.
CCUFUF	A8,A9	PSDI fifo underflow. The PSDI has run out of data while trying to write data on the disk. This will cause a single sector on the disk to be scrambled, and a reformat of the track must be initiated. **ACTION** - Reformat the track where the error occurred and run DFC/MHD diagnostics.
CCUFOV	AA,AB	PSDI fifo overflow. The PDSI fifo received more data than it could hold while reading the disk. **ACTION** - Run DFC/MHD diagnostics.
CCUPAK	AC,AD	PSDI acknowledge failure. The DFC tried to start the PSDI in a read or write mode but the PSDI failed to respond. **ACTION** - Run DFC/MHD diagnostics.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUFED	AE,AF	Extra data in PSDI. The DFC has finished reading what it thought was 512 data bytes from the disk, but data continued to arrive. **ACTION** - The data format on the disk is not correct and must be reformatted.
CCUDBE	B0,B1	Disk data buffer error. The DFC could not find any internal data buffers into which it could put data. This is a DFC internal error code. **ACTION** - None.
CCMASADR	B2,B3	Main store address error. The DFC has calculated a setup of an address in 3B mainstore which will cross a page table (segment) boundary. **ACTION** - Check the coding of the program in 3B which causes this to occur.
CCDEVTO	B4,B5	Device timed out. The DFC has tried to access a device, and the device has failed to respond in a reasonable amount of time. **ACTION** - Check the following DKDRV error for the MHD status to determine the failure.
CCFAIL	B8,B9	Generic failure response. An error has occurred which does not fall into any other category. Check the enhanced completion code in the "Enhanced Information Report" for more data. **ACTION** - There is no user response for this error. See support group.
CCUUDD	BA,BB	Uncorrectable data error in manufacturer defect table. **ACTION** - Rebuild manufacturer default table. If error persists, replace disk drive.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUTOV	BC,BD	Defect table overflow. **ACTION** - Call support group.
CCDMUNDD	BE,BF	Inappropriate command for defect managed disk. **ACTION** - There is no user response for this error. See support group.
CCDMUCDT	C0,C1	Unable to create user defect table on disk. **ACTION** - There is no user response for this error. See support group.
CCDMTMD	C2,C3	Too many defects in mfgr table. **ACTION** - There is no user response for this error. See support group.
CCDMEPA	C4,C5	Uncorr. data error on area supposedly error-free. **ACTION** - There is no user response for this error. See support group.
CCDMIDDT	C6,C7	Invalid data in defect table. **ACTION** - There is no user response for this error. See support group.
CCDMIDR	C8,C9	Invalid data in ram. **ACTION** - There is no user response for this error. See support group.
CCDMTNG	CA,CB	Invalid manufacturer defect table. **ACTION** - There is no user response for this error. See support group.
CCDMEMA	CC,CD	Uncorr. data error in mfgr. defect table. **ACTION** - There is no user response for this error. See support group.

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCDMURDT	CE,CF	Unable to read defect table. **ACTION** - There is no user response for this error. See support group.
CCDMURMT	D0,D1	Unable to read mfgr. defect table. **ACTION** - There is no user response for this error. See support group.
CCDMUWDT	D2,D3	Unable to write defect table. **ACTION** - There is no user response for this error. See support group.
CCUBPR	D4,D5	Mismatch between RAM and expected value. **ACTION** - There is no user response for this error. See support group.
CCBUSOFF	D6,D7	Bus drivers for selected SCSI bus turned off. The bus drivers for a SCSI bus have been turned off. A command using a device on that SCSI bus was sent to the SCSI-DFC. **ACTION** - Turn on the bus drivers before sending commands to devices on the bus. See craft command RST SBUS.
CCINCONC	D8,D9	Command arguments are inconsistent. The arguments passed in a command to the SCSI-DFC are not consistent. The command fails error checks. **ACTION** - There is no user response for this error. See support group.
CCUSTL	DA,DB	Uncorrectable data error and attempt to write temp list failed. **ACTION** - See support group.

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCBVD	E0,E1	Mismatch between FIRM and PUMP version. **ACTION** - There is no user response for this error. See support group.
CCPTO	E4,E5	Pump job timed out. **ACTION** - There is no user response for this error. See support group.
CCDKDRV	FF	Reserved for disk driver use.

Table 2 describes the conditional success codes which are seen only by the disk driver.

Table 2 - Conditional Success Codes

Code	Definition
02	The read disk job completed successfully but the DFC had to perform error correction to complete the job. This is an indication that the data are becoming somewhat marginal and that the disk pack may soon require reformatting.
04	In response to a VERIFY command, the DFC found that one or more sectors were not usable. The header information was incorrect or the data could not be corrected using ECC. The disk pack must be reformatted.
07	During a system phase one, the DFC was reset and could not continue a job that was in progress. This success code indicates that the job was reported to the disk driver for appropriate recovery actions.
08	There was a fault condition detected on the disk drive, the DFC was able to correct it and proceed to successful completion.
0A	The DFC detected a seek error on the disk, but was able to correct it and complete the job successfully.
0C	Job was early terminated by the DFC because a subsequent command was received for the same target device.

Table 3 explains the special completion codes, which are only applicable for autonomous response output messages. The description of an error code in Table 1 may be used to supplement Table 3 code descriptions to give a more detailed reason for job failure.

Table 3 - Autonomous Response Special Completion Code

Code	Definition
0	Special job. DFC information report. The DFC is letting the disk driver know there is some EIR information to report.
1	On-board diagnostic error. The on-board diagnostic of the DFC has detected an error, and the DFC should be removed and diagnosed as soon as possible.
2	On-board exerciser error. The disk exerciser has detected an error. The error may be an uncorrectable data error, or a head/sector mismatch, the error should be analyzed using the DFC enhanced error data (REPT-DFCE), if available.
3	SYSGEN command completed. The DFC is reporting the completion of a SYSGEN command. The job id code for the SYSGEN command is zero by design.
4	Boot command completed. The DFC is reporting the completion of a BOOT command. The job id code for the BOOT command is zero by design. Since the disk driver does not issue a BOOT command, this is regarded as an error.

Table 3 - Autonomous Response Special *(continued)*

Code	Definition
5	DFC idle. This is in response to a disk driver initiated ABORT sequence, simply indicating that the DFC was not sending any data for a particular job to the computer using the DMAC.
6	Illegal command. The DFC received a bit pattern in the command field which it could not decode.
7	Hitemp warning. The disk exerciser has detected a high temperature condition in a disk drive and is giving warning that the air flow may be becoming insufficient to continue to allow the heads to fly over the disk pack.

Table 4 - Enhanced Completion Codes

DFC Name	Code	Definition
NOERROR	0x0000	Nothing is wrong.
ERROR_ICS	0x1001	Command from invalid source.
ERROR_IDHA	0x1002	Device id code belongs to HA.
ERROR_RETRIES	0x1024	Too many retries.
ERROR_BSYTMO	0x1025	Device returned BUSY status for too long.
ERROR_INVCMD	0x1003	Invalid command received from computer.
ERROR_CMDNEX	0x1004	Command from computer not expected.
ERROR_NUMWRD	0x1005	Invalid number of words to transfer.
ERROR_NUMBLK	0x1006	Invalid number of blocks specified.
ERROR_NOTFIT	0x1007	The data to transfer will not fit within segment on computer.
ERROR_NOTRAM	0x1008	The data to be transferred from HA is not RAM or EPROM.
ERROR_WRTPRO	0x1009	The destination location in RAM is write-protected.
ERROR_INVPMP	0x100a	Invalid pump option in pump command.
ERROR_PMPNGO	0x100b	A pump must be going for the pump to be continued.
ERROR_NODEV	0x100c	There is no working device with the specified device id.
ERROR_INVBLK	0x100d	The block number(s) specified do not fit on specified device.
ERROR_BDMGC	0x100e	Bad MAGIC number for pumpfile.
ERROR_HDHSH	0x100f	Hash failed over pumpfile header.
ERROR_UNNZR	0x1010	Unused area of pumpfile header not zero.
ERROR_INVADR	0x1011	Data to be pumped not in valid areas.
ERROR_DTHSH	0x1012	Hash failed over pumpfile data.
ERROR_PFNST	0x1013	Pump file did not start.
ERROR_PABRT	0x1014	Pump file restart did not succeed.
ERROR_INVTV	0x1015	Invalid transfer vector address in header.
ERROR_INVFMT	0x1016	Invalid format option in format command.
ERROR_DFCTBIG	0x1017	User defect list in format command too big.
ERROR_INVEXPS	0x1018	Invalid SCSI option in explicit SCSI command.
ERROR_EXCMDTB	0x1019	Size of SCSI command in explicit SCSI command too big.
ERROR_EXCMDTS	0x101a	Size of SCSI command in explicit SCSI command too small.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 4 - Enhanced Completion Codes *(continued)*

DFC Name	Code	Definition
ERROR_OPTNOT2	0x101b	SCSI option in explicit SCSI command does not allow two devices.
ERROR_DIFBUS	0x101c	Explicit SCSI command has two devices on different busses.
ERROR_RETCODE	0x101d	Unexpected return code from a function call.
ERROR_DEFCASE	0x101e	Default case reached in a switch() statement.
ERROR_VERSION	0x101f	Version in pumpfile does not match firmware.
ERROR_ETERM	0x1020	Unable to early terminate job in progress.
ERROR_OKCR	0x1021	Job completed OK, but ECC was required.
ERROR_UCDE	0x1022	Job failed; uncorrectable data (media error).
ERROR_DBO	0x1023	Disk boundary overflow (end of disk reached).
ERROR_RSVFL	0x2001	Reserve / unreserve failed.
ERROR_RSTFL	0x2002	Reset disk failed.
ERROR_SPCJF	0x2003	spc_job failed to start.
ERROR_REXFL	0x2004	Read failure during REX job.
ERROR_SJB0	0x3000	Base value of SJB failures; used by the error_sjb() function.
ERROR_ABORT	0x3001	Command was aborted.
ERROR_BRESET	0x3002	Reset was detected on the bus, and was probably not caused by this job; it may or may not have been caused by this HA.
ERROR_CKSTAT	0x3003	Check the status byte.
ERROR_CRESET	0x3004	This HA reset the bus due to an irrecoverable error while processing this job.
ERROR_SJBERR	0x3006	SJB contents error.
ERROR_MEMERR	0x3007	Memory fault.
ERROR_BADBUS	0x3008	The SCSI bus is unterminated.
ERROR_QFLUSH	0x300a	Job was flushed.
ERROR_SHORT	0x300b	Target ctrlr did not xfer all of the data.
ERROR_TIMEOUT	0x300c	Job timed out.
ERROR_CHAIN_LINKS	0x300d	Insufficient DMA Chain Links.
ERROR_LU_QNODES	0x300e	Insufficient LU Queue Nodes.
ERROR_BUS_OFFLINE	0x300f	The SCSI Bus is off-line.
ERROR_BUS_PARITY	0x3010	HA detected SCSI Bus Parity Error and terminated the job.
ERROR_SJBDEF	0x301f	Unknown sjb completion code.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 4 - Enhanced Completion Codes *(continued)*

DFC Name	Code	Definition
ERROR_NOT_READY	0x3020	Target device not ready to process jobs.
ERROR_REQ_SEN	0x3021	Request Sense Command failed.
ERROR_BAD_STATE	0x3022	Invalid SCSI Job State.
ERROR_BAD_PROTOCOL	0x3023	Invalid SCSI Protocol Transition.
ERROR_SJABTFL	0x3024	Fail to send ABORT message to SCSI device.

Table 5 - Firmware-Driver Communications Register

Code	Definition
0x01	Power-on or reset received from computer.
0x02	Invalid interrupt.
0x03	Sanity timer failure.
0x04	Normal exception - integer zero divide.
0x05	Normal exception - trace trap.
0x06	Normal exception - illegal opcode.
0x07	Normal exception - reserved opcode.
0x08	Normal exception - invalid descriptor.
0x09	Normal exception - external memory.
0x0a	Normal exception - gate vector.
0x0b	Normal exception - illegal level change.
0x0c	Normal exception - reserved data type.
0x0d	Normal exception - integer overflow.
0x0e	Normal exception - privileged opcode.
0x0f	Normal exception - breakpoint.
0x10	Normal exception - privileged register.
0x11	Normal exception - unknown type.
0x12	Stack exception - stack bound.
0x13	Stack exception - stack.
0x14	Stack exception - interrupt ID fetch.
0x15	Stack exception - unknown type.
0x16	Process exception - old PCB.
0x17	Process exception - gate PCB.
0x18	Process exception - new PCB.
0x19	Process exception - unknown type.
0x1a	BIC error.
0x1b	Parity error.
0x1c	Write protect violation.
0x1d	BIC FIFO overflow / underflow.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 5 - Firmware-Driver Communications Register *(continued)*

Code	Definition
0x1e	Channel 0 of HA DMAC dead.
0x1f	Channel 1 of HA DMAC dead.
0x20	Channel 2 of HA DMAC dead.
0x21	Channel 3 of HA DMAC dead.
0x22	Unexpected interrupt from DMAC (32104).
0x23	Unexpected interrupt from read / write word / blk.
0x24	Unexpected interrupt from software timer 2.
0x25	Unexpected interrupt from software timer 1.
0x26	Unexpected interrupt from SCSI bus 0.
0x27	Unexpected interrupt from SCSI bus 1.
0x28	Unexpected interrupt from data in BIC cmd reg.
0x29	Oper firm invalid major state.
0x2a	Oper firm invalid command source.
0x2b	An error was detected during boot command processing.
0x2c	FW PC transition failure; PUMPCODE initialization failure.
0x2d	dgn_fault() returned to SW Timer 2 Int Hdlr.
0x2e	dgn_fault() returned to SPC0 Int Hdlr.
0x2f	dgn_fault() returned to SPC1 Int Hdlr.
0x30	No timer nodes avail for timeout processing.
0x31	Job response is using JCISTAT interface.
0x32	Firmware to pumpcode restart failed.
0x33	ON RESET: all memory is being cleared.
0x34	ON RESET: normal memory is being cleared.
0x35	ON RESET: no memory is being cleared.
0x3F	No command from computer is being processed.
0x40	Invalid command opcode 0x00 received from computer.
0x41	Invalid command opcode 0x01 received from computer.
0x42	Invalid command opcode 0x02 received from computer.
0x43	Invalid command opcode 0x03 received from computer.
0x44	Invalid command opcode 0x04 received from computer.
0x45	Invalid command opcode 0x05 received from computer.
0x46	Invalid command opcode 0x06 received from computer.
0x47	Invalid command opcode 0x07 received from computer.
0x48	Invalid command opcode 0x08 received from computer.
0x49	Invalid command opcode 0x09 received from computer.
0x4a	Invalid command opcode 0x0a received from computer.
0x4b	Invalid command opcode 0x0b received from computer.
0x4c	Invalid command opcode 0x0c received from computer.
0x4d	Invalid command opcode 0x0d received from computer.
0x4e	Invalid command opcode 0x0e received from computer.
0x4f	Invalid command opcode 0x0f received from computer.

Table 5 - Firmware-Driver Communications Register *(continued)*

Code	Definition
0x50	Invalid command opcode 0x10 received from computer.
0x51	Invalid command opcode 0x11 received from computer.
0x52	Invalid command opcode 0x12 received from computer.
0x53	Invalid command opcode 0x13 received from computer.
0x54	Invalid command opcode 0x14 received from computer.
0x55	Invalid command opcode 0x15 received from computer.
0x56	Invalid command opcode 0x16 received from computer.
0x57	Invalid command opcode 0x17 received from computer.
0x58	Invalid command opcode 0x18 received from computer.
0x59	Invalid command opcode 0x19 received from computer.
0x5a	Invalid command opcode 0x1a received from computer.
0x5b	Invalid command opcode 0x1b received from computer.
0x5c	Invalid command opcode 0x1c received from computer.
0x5d	Invalid command opcode 0x1d received from computer.
0x5e	Invalid command opcode 0x1e received from computer.
0x5f	Invalid command opcode 0x1f received from computer.
0x60	No-op command being processed by operational firmware.
0x61	Spare command having opcode of 0x01 being processed by operational firmware.
0x62	Spare command having opcode of 0x02 being processed by operational firmware.
0x63	Version command being processed by operational firmware.
0x64	Reserve command being processed by operational firmware.
0x65	Retry command being processed by operational firmware.
0x66	Wakeup command being processed by operational firmware.
0x67	Read options command being processed by operational firmware.
0x68	Resume command being processed by operational firmware.
0x69	Reset disk command being processed by operational firmware.
0x6a	Change MHD mode command being processed by operational firmware.
0x6b	Sysgen command being processed by operational firmware.
0x6c	Change DFC mode command being processed by operational firmware.
0x6d	Boot command being processed by operational firmware.
0x6e	JCI command being processed by operational firmware.
0x6f	Abort command being processed by operational firmware.

Table 5 - Firmware-Driver Communications Register *(continued)*

Code	Definition
0x70	Read RAM command being processed by operational firmware.
0x71	Read DISK command being processed by operational firmware.
0x72	Explicit SCSI command being processed by operational firmware.
0x73	Verify command being processed by operational firmware.
0x74	Spare command having opcode of 0x14 being processed by operational firmware.
0x75	Spare command having opcode of 0x15 being processed by operational firmware.
0x76	Spare command having opcode of 0x16 being processed by operational firmware.
0x77	Spare command having opcode of 0x17 being processed by operational firmware.
0x78	Write RAM command being processed by operational firmware.
0x79	Write DISK command being processed by operational firmware.
0x7a	Pump command being processed by operational firmware.
0x7b	Format command being processed by operational firmware.
0x7c	Request device status command being processed by operational firmware.
0x7d	Diagnostic helper command being processed by operational firmware.
0x7e	Disk to disk copy command being processed by operational firmware.
0x7f	Diagnostic device command being processed by operational firmware.
0xa0	SPC:timeout for DMAC normal termination.
0xa1	SPC:timeout on DMAC flush.
0xa2	SPC:bad disconnect; non-word boundary.
0xa3	SPC:timeout for SPC FIFO to empty.
0xa4	SPC:DMAC error on READ / WRITE completion.
0xa5	SPC:DMAC error on READ flush.
0xa6	SPC:Bad time value passed to timeout().
0xc0	The pump code is running.
0xc1	A function returned that should not have.
0xc2	The dispatcher is in an invalid state.
0xc3	Invalid pump state value.
0xc4	Invalid return code.
0xc5	Invalid task major state value.
0xc6	Invalid task minor state value.
0xc7	Invalid SCSI job state.
0xc8	Invalid task ID number argument.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 5 - Firmware-Driver Communications Register *(continued)*

Code	Definition
0xc9	Buffer management error.
0xca	Error occurred while initializing pump code.
0xcb	Pump state is ERROR but no error task exists.
0xcc	Task allocation failed - all tasks busy.
0xcd	DMAC should not be busy but is.
0xce	Error occurred during slow job early term.

Table 6 - Job Type Pending

Code	Definition
0	No device exists.
1	No status received from device.
2	Slow command active on device.
3	Fast command active on device.
4	Diagnostic command active on device.
5	No command active on device.
6	Secondary device for slow command.
7	Secondary device for fast command.

This appendix contains the following tables:

Table 1 - DFC Error Codes;
Table 2 - Conditional Success Codes;
Table 3 - Autonomous Response Special Completion Codes;
Table 4 - Enhanced Completion Codes;
Table 5 - Firmware Driver Communications Register (FW / PC versions 7.0 and 8.0);
Table 5a - Firmware Driver Communications Register (FW / PC version 9.0); and
Table 6 - Job Types Pending.

The data in Tables 2 and 3 are seen only by the disk file controller (DFC) driver. They are included here only to provide complete documentation on the DFC error codes.

Table 1 lists the errors which can be detected by the DFC, explains the cause of the error, and shows any corrective actions which may be required. The DFC responds to all system-requested work with job completion codes. When the DFC detects errors on those jobs, it reports with the error information shown in Table 1. In addition to running those jobs, the DFC can create its own internal work and can handle requests which do not have unique job identification codes.

All error codes are in hexadecimal.

Table 1 - DFC Error Codes

DFC Name	Code	Probable Cause and Corrective Action
CCOK	00	Job completed okay. This code implies successful completion, except in some autonomous responses. In the case of autonomous responses, the special completion code takes precedence over this code.
CCRAMWE	80,81	PIC RAM read / write boundary error. If the DFC is a SMD-DFC. The DFC was requested to write outside the address range of E00 to FFF (hexadecimal). This area is reserved for the diagnostics group and may be read and / or written by them. Addresses outside this range are reserved for the operational portion of the firmware and may not be written by anyone.

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
		ACTION - This error should never occur since only the diagnostics group uses the WRITERAM command.
		If the DFC is a SCSI-DFC.
		The DFC was requested to write to write-protected RAM. The DFC was requested to write to outside of allowed area of DFC RAM. The DFC was requested to read non-existent memory.
		ACTION - This error should never occur since only the diagnostics groups uses the READRAM and WRITERAM commands.
CCSEEKER	82,83	Seek error on disk.
		The DFC issued a seek to an MHD and then detected an error in the MHD. The error from the MHD indicates either that the seek did not complete within 75 milliseconds, or that the drive interpreted the address seek as beyond the last available cylinder on the disk.
		ACTION - Check the cables to the MHDs for loose connections or perform preventive maintenance.
CCNOINDX	84,85	No index detected on disk.
		The DFC could not find an 'index' mark from the disk after counting 33 sector marks.
		ACTION - Replace either the disk pack or the MHD in question.
CCERRCMD	86,87	Invalid command from the 3B.
		The DFC received a command that was not valid for the state of the DFC.
		ACTION - There is no user response for this error. Contact support group.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCSTATER	88,89	Device status error. There is a problem with the drive which the DFC tried to access. It could be one of the following: No unit ready - The drive is not powered up or the ID plug is missing. No on-cylinder indication - The disk drive has not been powered up or the disk pack is not spinning. Fault - There is a hard fault on the drive, *not* the disk pack, which the firmware cannot correct. **ACTION** - Correct the problem and try again.
CCUCDE	8A,8B	Uncorrectable data error. If the DFC is a SMD-DFC, the DFC detected an error in the data on the disk which is beyond 11 bits long. The data which has been read cannot be used. **ACTION** - Use the VERIFY command to determine the location of the error and re-format the track on which the error is located. The data on that track is lost forever, and the whole disk pack may have to be re-populated with data from a mate disk. If the DFC is a SCSI-DFC, the target controller was not able to read a block of data from the disk. **ACTION** - Use the VERIFY command to determine the location of the error. Place the location of the error in a defect list and re-format the disk. The whole disk pack must be re-populated with data from a mate disk.
CCDBO	8C,8D	Disk boundary overflow. An attempt to read or write beyond the last block on a disk was made. **ACTION** - Run MHD diagnostics, and check the data cables. Another possibility is that the VTOC on the disk specifies a partition which exceeds the last available cylinder on the disk pack.

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUHSM	8E,8F	Head - sector mismatch error. The DFC read a sector off the disk and the header information, which contains the cylinder, head and sector number, did not agree with the value the DFC calculated for the head-sector number. **ACTION** - Try the job again and if it fails, reformat that area of the disk.
CCUWD	90,91	Wrong device selected. A device which the controller did not try to select answered to the poll of the devices. **ACTION** - Check the ID of the drive. For SMD, make sure that the data cable to the drive is properly placed on the backplane of the DFC. For SCSI, make sure the device is connected to the bus and the backplane of the DFC correctly.
CCUND	92,93	No device selected. There was no answer to the polling of the devices, but the DFC expected an answer. **ACTION** - Ensure that the device to be selected is powered up. For SMD, make sure that its data cable is in the right place on the DFC backplane and verify the drive has an ID plug. For SCSI, make sure the device is connected correctly to the bus and the backplane of the DFC.
CCUHP	94,95	Head positioning error. The drive was requested to go to a given cylinder, but upon reading the header from the cylinder, the cylinder number there did not match the number that the DFC had calculated it should be. There was no seek error (82, 83) detected. **ACTION** - Try the job again or reformat that area of the disk pack where the error occurred.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUHSE	96,97	Head selection error. The head number read from the disk did not agree with what the DFC had calculated it should be. **ACTION** - Retry the job, or reformat the area of the disk pack where the error occurred, or check the control cable to the MHD.
CCUBPE	98,99	BIC parity error. There was a data parity error on a data transfer either to or from the BIC when the BIC was communicating with the processor. **ACTION** - The DFC cannot cause this error, only report it. The BIC and/or the DDSBS should be diagnosed.
CCUBPSE	9A,9B	BIC-PIC Soft Error. **ACTION** - Run DFC diagnostics.
CCPICE	9C,9D	PIC error. The DFC software encountered a condition which prevented it from continuing to execute. This is usually due to faulty hardware which provides incorrect information to the software. **ACTION** - Run DFC diagnostics.
CCU3BE	9E,9F	DMA setup overwrite. The BIC detects that the DMA has attempted to write to the BIC data FIFO while a setup request is pending. **ACTION** - Run DFC and DMA diagnostics.
CCUJTE	A0,A1	Early EOT from DMA. The error is detected in the BIC when the BIC receives an EOT signal from the DMA and the DFC has not set the EOT EXPECT flag in the BIC. **ACTION** - Run BIC and DMA diagnostics.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUNET	A2,A3	No EOT from DMA. The error is detected in the BIC when the DFC has set the EOT EXPECT flag in the BIC and the DMA has responded to a transfer request with data rather than an EOT. **ACTION** - Run BIC and/or DMA diagnostics.
CCPUMPER	A4,A5	Error detected in pumped data. The file containing the data to be pumped is not compatible with the firmware on the SCSI-DFC or there is an error in the contents of the pump file. **ACTION** - Check that the UCB associated with the SCSI-DFC points to the pump file compatible with the SCSI-DFC.
CCUFPE	A6,A7	PSDI FIFO parity error. The parallel to serial data interface in the DFC has detected a parity error in the data stream which has been written on the disk. **ACTION** - Run DFC diagnostics.
CCUFUF	A8,A9	PSDI FIFO underflow. The PSDI has run out of data while trying to write data on the disk. This will cause a single sector on the disk to be scrambled, and a reformat of the track must be initiated. **ACTION** - Reformat the track where the error occurred and run DFC/MHD diagnostics.
CCUFOV	AA,AB	PSDI FIFO overflow. The PDSI FIFO received more data than it could hold while reading the disk. **ACTION** - Run DFC/MHD diagnostics.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUPAK	AC,AD	PSDI acknowledge failure. The DFC tried to start the PSDI in a read or write mode but the PSDI failed to respond. **ACTION** - Run DFC/MHD diagnostics.
CCUFED	AE,AF	Extra data in PSDI. The DFC has finished reading what it thought was 512 data bytes from the disk, but data continued to arrive. **ACTION** - The data format on the disk is not correct and must be reformatted.
CCUDBE	B0,B1	Disk data buffer error. The DFC could not find any internal data buffers into which it could put data. This is a DFC internal error code. **ACTION** - There is no user response for this error. Contact support group.
CCMASADR	B2,B3	Main store address error. The DFC has calculated a setup of an address in 3B mainstore which will cross a page table (segment) boundary. **ACTION** - Check the coding of the program in the 3B which causes this to occur.
CCDEVTO	B4,B5	Device timed out. The DFC has tried to access a device, and the device has failed to respond in a reasonable amount of time. **ACTION** - Check for DKDRV error(s) on the ROP for the device status to determine the failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCFAIL	B8,B9	Generic failure response. An error has occurred which does not fall into any other category. Check the enhanced completion code in the "Enhanced Information Report" for more data. **ACTION** - There is no user response for this error. Contact support group.
CCUUDD	BA,BB	Uncorrectable data error in manufacturer defect table. **ACTION** - Rebuild manufacturer default table. If error persists, replace disk drive.
CCUTOV	BC,BD	Defect table overflow. **ACTION** - There is no user response for this error. Contact support group.
CCDMUNDD	BE,BF	Inappropriate command for disks that use defect management. **ACTION** - There is no user response for this error. Contact support group.
CCDMUCDT	C0,C1	Unable to create user defect table on disk. **ACTION** - There is no user response for this error. Contact support group.
CCDMTMD	C2,C3	Too many defects in the manufacturer's table. **ACTION** - There is no user response for this error. Contact support group.
CCDMEPA	C4,C5	Uncorrectable data error on area supposedly error-free. **ACTION** - There is no user response for this error. Contact support group.
CCDMIDDT	C6,C7	Invalid data in defect table. **ACTION** - There is no user response for this error. Contact support group.
CCDMIDR	C8,C9	Invalid data in RAM. **ACTION** - There is no user response for this error. Contact support group.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCDMTNG	CA,CB	Invalid manufacturer defect table. **ACTION** - There is no user response for this error. Contact support group.
CCDMEMA	CC,CD	Uncorrectable data error in manufacturer's defect table. **ACTION** - There is no user response for this error. Contact support group.
CCDMURDT	CE,CF	Unable to read defect table. **ACTION** - There is no user response for this error. Contact support group.
CCDMURMT	D0,D1	Unable to read manufacturer's defect table. **ACTION** - There is no user response for this error. Contact support group.
CCDMUWDT	D2,D3	Unable to write defect table. **ACTION** - There is no user response for this error. Contact support group.
CCUBPR	D4,D5	Mismatch between RAM and expected value. **ACTION** - There is no user response for this error. Contact support group.
CCBUSOFF	D6,D7	Bus drivers for selected SCSI bus turned off. The bus drivers for a SCSI bus have been turned off. A command using a device on that SCSI bus was sent to the SCSI-DFC. **ACTION** - Turn on the bus drivers before sending commands to devices on the bus. See user command RST SBUS. Verify that bus terminators were installed properly.
CCINCONC	D8,D9	Command arguments are inconsistent. The arguments passed in a command to the SCSI-DFC are not consistent. The command fails error checks. **ACTION** - There is no user response for this error. Contact support group.

Table 1 - DFC Error Codes *(continued)*

DFC Name	Code	Probable Cause and Corrective Action
CCUSTL	DA,DB	Uncorrectable data error and attempt to write temp list failed. **ACTION** - There is no user response for this error. Contact support group.
CCBVD	E0,E1	Mismatch between Firmware and Pumpcode versions. **ACTION** - There is no user response for this error. Contact support group.
CCPTO	E4,E5	Pump job timed out. **ACTION** - There is no user response for this error. Contact support group.
CCDEVERR	FA,FB	Job failed due to medium error. An error condition associated with the medium. At or beyond end of partition / medium (EOP / M). A check condition status was encountered by the DFC and the sense key indicated an error such as volume overflow or medium error. **ACTION** - Try a different medium if possible; otherwise, contact support group.
CCDEVFAIL	FC,FD	Device hardware error. Job failed due to hardware error. **ACTION** - Run diagnostics on the device.
CCDKDRV	FE,FF	Reserved for DFC driver use.

Table 2 describes the conditional success codes which are seen only by the DFC driver.

Table 2 - Conditional Success Codes

Code	Definition
02	The read disk job completed successfully but the DFC had to perform error correction to complete the job. This is an indication that the data are becoming somewhat marginal and that the disk pack may soon require reformatting.
04	In response to a VERIFY command, the DFC found that one or more sectors were not usable. The header information was incorrect or the data could not be corrected using ECC. The disk pack must be reformatted.
07	During a system phase one, the DFC was reset and could not continue a job that was in progress. This success code indicates that the job was reported to the DFC driver for appropriate recovery actions.
08	There was a fault condition detected on the disk drive, the DFC was able to correct it and proceed to successful completion.
0A	The DFC detected a seek error on the disk, but was able to correct it and complete the job successfully.
0C	Job was early terminated by the DFC because a subsequent command was received for the same target device.
0E	The pump job was successful, but the DFC is expecting more data before the pump can be completed.
12	A "check condition" status was encountered by the DFC, but the sense key did not indicate a medium or hardware error. An early warning or a filemark may have been encountered.

Table 3 explains the special completion codes, which are only applicable for autonomous response output messages. The description of an error code in Table 1 may be used to supplement Table 3 code descriptions to give a more detailed reason for job failure.

Table 3 - Autonomous Response Special Completion Code

Code	Definition
0	Special job. DFC information report. The DFC is letting the DFC driver know there is some EIR information to report.
1	On-board diagnostic error. The on-board diagnostic of the DFC has detected an error, and the DFC should be removed and diagnosed as soon as possible.
2	On-board exerciser error. The disk exerciser has detected an error. The error may be an uncorrectable data error, or a head/sector mismatch, the error should be analyzed using the DFC enhanced error data (REPT DFCE), if available.
3	SYSGEN command completed. The DFC is reporting the completion of a SYSGEN command. The job ID code for the SYSGEN command is zero by design.
4	BOOT command completed. The DFC is reporting the completion of a BOOT command. The job ID code for the BOOT command is zero by design. Since the DFC driver does not issue a BOOT command, this is regarded as an error.
5	DFC idle. This is in response to a DFC driver initiated ABORT sequence, simply indicating that the DFC was not sending any data for a particular job to the 3B using the 3B DMAC.
6	Illegal command. The DFC received a bit pattern in the command field which it could not decode.

Table 3 - Autonomous Response Special Completion Code *(continued)*

Code	Definition
7	Hitemp warning. The disk exerciser has detected a high temperature condition in a disk drive and is giving warning that the air flow may be becoming insufficient to continue to allow the heads to fly over the disk pack.

Table 4 - Enhanced Completion Codes

DFC Name	Code	Definition
NOERROR	0x0000	Nothing is wrong.
ERROR_ICS	0x1001	Command from invalid source.
ERROR_IDHA	0x1002	Device ID code belongs to HA.
ERROR_INVCMD	0x1003	Invalid command received from the 3B.
ERROR_CMDNEX	0x1004	Command from the 3B not expected.
ERROR_NUMWRD	0x1005	Invalid number of words to transfer.
ERROR_NUMBLK	0x1006	Invalid number of blocks specified.
ERROR_NOTFIT	0x1007	The data transfer will exceed the boundary of a 3B memory segment.
ERROR_NOTRAM	0x1008	The data to be transferred from HA is not RAM or EPROM.
ERROR_WRTPRO	0x1009	The destination location in RAM is write-protected.
ERROR_INVPMP	0x100a	Invalid pump option in pump command.
ERROR_PMPNGO	0x100b	A pump continue was received but a pump was not in progress.
ERROR_NODEV	0x100c	There is no working device with the specified device ID.
ERROR_INVBLK	0x100d	The block number(s) specified do not fit on specified device.
ERROR_BDMGC	0x100e	Bad MAGIC number for pumpfile.
ERROR_HDHSH	0x100f	Hash check over pumpfile header failed.
ERROR_UNNZR	0x1010	Unused area of pumpfile header not zero.
ERROR_INVADR	0x1011	Data to be pumped not in valid areas.
ERROR_DTHSH	0x1012	Hash check over pumpfile data failed.
ERROR_PFNST	0x1013	Pump file did not start.
ERROR_PABRT	0x1014	Pump file restart did not succeed.
ERROR_INVTV	0x1015	Invalid transfer vector address in pumpfile header.
ERROR_INVFMT	0x1016	Invalid format option in format command.
ERROR_DFCTBIG	0x1017	User defect list in format command too big.
ERROR_INVEXPS	0x1018	Invalid SCSI option in explicit SCSI command.
ERROR_EXCMDTB	0x1019	Size of SCSI command in explicit SCSI command too big.
ERROR_EXCMDTS	0x101a	Size of SCSI command in explicit SCSI command too small.
ERROR_OPTNOT2	0x101b	SCSI option in explicit SCSI command does not allow two devices.
ERROR_DIFBUS	0x101c	Explicit SCSI command has two devices on different busses.
ERROR_RETCODE	0x101d	Unexpected return code from a function call.
ERROR_DEFCASE	0x101e	Default case reached in a `switch()` statement.
ERROR_VERSION	0x101f	Version in pumpfile does not match firmware.
ERROR_ETERM	0x1020	Unable to early terminate job in progress.
ERROR_OKCR	0x1021	Job completed OK, but ECC was required.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 4 - Enhanced Completion Codes *(continued)*

DFC Name	Code	Definition
ERROR_UCDE	0x1022	Job failed; uncorrectable data (media error).
ERROR_DBO	0x1023	Disk boundary overflow (end of disk reached).
ERROR_RETRIES	0x1024	Too many retries.
ERROR_BSYTMO	0x1025	Device returned BUSY status for too long.
ERROR_NOBUF	0x1026	Unable to obtain an HA data buffer.
ERROR_TAPEOP	0x1027	Invalid tape operation specified.
ERROR_OPTION	0x1028	Invalid option to tape operation specified.
ERROR_NOFUNC	0x1029	Function address expected but not found.
ERROR_SEEK	0x102a	Seek failed to achieve desired location. ESD SK == Extended Sense Data Sense Key
ERROR_OKCS	0x102d	ESD SK indicated no error: check status word.
ERROR_DEVERR	0x102e	ESD SK indicated a device (medium) error.
ERROR_DEVFAIL	0x102f	ESD SK indicated a device failure.
ERROR_FWWFCLR	0x1030	Flash word write failed - doing flash clear
ERROR_FWWFERA	0x1031	Flash word write failed - doing flash erase
ERROR_FWWFPGM	0x1032	Flash word write failed - doing flash program
ERROR_CMDSIZE	0x1033	Command received by 1-wide code has wrong command size
ERROR_RSVFL	0x2001	Reserve / unreserve failed.
ERROR_RSTFL	0x2002	Reset disk failed.
ERROR_SPCJF	0x2003	spc_job failed to start.
ERROR_REXFL	0x2004	Read failure during REX job.
ERROR_SJB0	0x3000	Base value of SJB failures; used by the `error_sjb()` function.
ERROR_ABORT	0x3001	Command was aborted.
ERROR_BRESET	0x3002	Reset was detected on the bus, and was probably not caused by this job; it may or may not have been caused by this HA.
ERROR_CKSTAT	0x3003	Check the status byte.
ERROR_CRESET	0x3004	This HA reset the bus due to an unrecoverable error while processing this job.
ERROR_INPROG	0x3005	Job is still in progress.
ERROR_SJBERR	0x3006	SJB contents error.
ERROR_MEMERR	0x3007	Memory fault.
ERROR_BADBUS	0x3008	The SCSI bus is unterminated.
ERROR_SELECT	0x3009	Device select failed.
ERROR_QFLUSH	0x300a	Job was flushed.
ERROR_SHORT	0x300b	Target controller did not transfer all of the data.
ERROR_TIMEOUT	0x300c	Job timed out.
ERROR_CHAIN_LINKS	0x300d	Insufficient DMA Chain Links.

Table 4 - Enhanced Completion Codes *(continued)*

DFC Name	Code	Definition
ERROR_LU_QNODES	0x300e	Insufficient LU Queue Nodes.
ERROR_BUS_OFFLINE	0x300f	The SCSI Bus is off-line.
ERROR_BUS_PARITY	0x3010	HA detected SCSI Bus Parity Error and terminated the job.
ERROR_SJBDEF	0x301f	Unknown SJB completion code.
ERROR_NOT_READY	0x3020	Target device not ready to process jobs.
ERROR_REQ_SEN	0x3021	Request Sense Command failed.
ERROR_BAD_STATE	0x3022	Invalid SCSI Job State.
ERROR_BAD_PROTOCOL	0x3023	Invalid SCSI Protocol Transition.
ERROR_SJABTFL	0x3024	Failed to send ABORT message to SCSI device.

Table 5 - Firmware-Driver Communications Register (FW / PC versions 7.0 and 8.0)

Code	Definition
0x01	Power-on or reset received from the 3B.
0x02	Invalid interrupt.
0x03	Sanity timer failure.
0x04	Normal exception - integer zero divide.
0x05	Normal exception - trace trap.
0x06	Normal exception - illegal opcode.
0x07	Normal exception - reserved opcode.
0x08	Normal exception - invalid descriptor.
0x09	Normal exception - external memory.
0x0a	Normal exception - gate vector.
0x0b	Normal exception - illegal level change.
0x0c	Normal exception - reserved data type.
0x0d	Normal exception - integer overflow.
0x0e	Normal exception - privileged opcode.
0x0f	Normal exception - breakpoint.
0x10	Normal exception - privileged register.
0x11	Normal exception - unknown type.
0x12	Stack exception - stack bound.
0x13	Stack exception - stack.
0x14	Stack exception - interrupt ID fetch.
0x15	Stack exception - unknown type.
0x16	Process exception - old PCB.
0x17	Process exception - gate PCB.
0x18	Process exception - new PCB.
0x19	Process exception - unknown type.
0x1a	BIC error.
0x1b	Parity error.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 5 - Firmware-Driver Communications Register (FW / PC versions 7.0 and 8.0)

Code	Definition
0x1c	Write protect violation.
0x1d	BIC FIFO overflow / underflow.
0x1e	Channel 0 of HA DMAC dead.
0x1f	Channel 1 of HA DMAC dead.
0x20	Channel 2 of HA DMAC dead.
0x21	Channel 3 of HA DMAC dead.
0x22	Unexpected interrupt from DMAC (32104).
0x23	Unexpected interrupt from read / write word / block counter.
0x24	Unexpected interrupt from software timer 2.
0x25	Unexpected interrupt from software timer 1.
0x26	Unexpected interrupt from SCSI bus 0.
0x27	Unexpected interrupt from SCSI bus 1.
0x28	Unable to early terminate job on device.
0x29	Operational firmware invalid major state.
0x2a	Operational firmware invalid command source.
0x2b	An error was detected during boot command processing.
0x2c	Firmware to pumpcode transition failure.
0x2d	`dgn_fault()` returned to SW Timer 2 interrupt handler.
0x2e	`dgn_fault()` returned to SPC0 interrupt handler.
0x2f	`dgn_fault()` returned to SPC1 interrupt handler.
0x30	No timer nodes available for timeout processing.
0x31	Job response is using JCISTAT interface.
0x32	Firmware to pumpcode restart failed.
0x33	ON RESET: all memory is being cleared.
0x34	ON RESET: normal memory is being cleared.
0x35	ON RESET: no memory is being cleared.
0x36	Invalid switch value.
0x37	Buffer management error.
0x3F	No command from the 3B is being processed.
0x40	Invalid command received from the 3B (opcode 0x00).
0x41	Invalid command received from the 3B (opcode 0x01).
0x42	Invalid command received from the 3B (opcode 0x02).
0x43	Invalid command received from the 3B (opcode 0x03).
0x44	Invalid command received from the 3B (opcode 0x04).

0xa0	SPC:timeout for DMAC normal termination.
0xa1	SPC:timeout on DMAC flush.
0xa2	SPC:bad disconnect; non-word boundary.
0xa3	SPC:timeout for SPC FIFO to empty.
0xa4	SPC:DMAC error on READ / WRITE completion.
0xa5	SPC:DMAC error on READ flush.
0xa6	SPC:bad time value passed to timeout().
0xb0	Timeout on DMAC normal termination (bus A).
0xb1	Timeout on DMAC normal termination (bus B).
0xb2	Timeout on DMAC flush (bus A).
0xb3	Timeout on DMAC flush (bus B).
0xb4	Timeout for SPC FIFO to empty (bus A).
0xb5	Timeout for SPC FIFO to empty (bus B).
0xb6	DMAC error on READ / WRITE completion (bus A).

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 5 - Firmware-Driver Communications Register *(continued)*

Code	Definition
0xb7	DMAC error on READ / WRITE completion (bus B).
0xb8	DMAC error on READ flush (bus A).
0xb9	DMAC error on READ flush (bus B).
0xc0	The pump code is running.
0xc1	A function returned that should not have.
0xc2	The dispatcher is in an invalid state.
0xc3	Invalid pump state value.
0xc4	Invalid return code.
0xc5	Invalid task major state value.
0xc6	Invalid task minor state value.
0xc7	Invalid SCSI job state.
0xc8	Invalid task ID number argument.
0xc9	Buffer management error.
0xca	Error occurred while initializing pump code.
0xcb	Pump state is ERROR but no error task exists.
0xcc	Task allocation failed - all tasks busy.
0xcd	3B DMAC should not be busy but is.
0xce	Error occurred during slow job early term.
0xcf	Error occurred during overlapped RDDSK job.
0xd0	No free task management link-list queue nodes.
0xd1	Pumpcode has failed to install a code patch.

Table 5a - Firmware-Driver Communications Register (FW / PC versions 9.0)

Code	Definition
0x01	Power-on or reset received from 3B.
0x02	Invalid interrupt.
0x03	Sanity timer failure.
0x04	4wide state - ready.
0x05	4wide state - error.
0x06	4wide state - sleeping and slow jobs.
0x07	4wide state - sleeping and no slow jobs.
0x08	4wide state - awake.
0x09	4wide state - running interrupt node task.
0x0a	4wide state - reading commands.
0x0b	4wide state - routing commands.
0x0c	4wide state - start a job on a device.
0x0d	4wide state - flush a job on a device.
0x0e	4wide state - start a job on the 3B DMA.
0x19	Other level 6 error.

Table 5a - Firmware-Driver Communications Register (FW / PC versions 9.0)

Code	Definition

Table 5a - Firmware-Driver Communications Register (FW / PC versions 9.0)

Code	Definition
0x1a	BIC error.
0x1b	Memory parity error.
0x1c	Write protect violation.
0x1d	BIC FIFO overflow / underflow.
0x1e	Channel 0 of HA DMAC dead.
0x1f	Channel 1 of HA DMAC dead.
0x20	Channel 2 of HA DMAC dead.
0x21	Channel 3 of HA DMAC dead.
0x22	Unexpected interrupt from DMAC (32104).
0x23	Unexpected interrupt from word / block transfer counter.
0x24	Unexpected interrupt from software timer 2.
0x25	Unexpected interrupt from software timer 1.
0x26	Unexpected interrupt from SCSI bus 0.
0x27	Unexpected interrupt from SCSI bus 1.
0x28	Unable to early terminate job on device.
0x29	Operational firmware invalid major state.
0x2a	Operational firmware invalid command source.
0x2b	An error was detected during boot command processing.
0x2c	Firmware to pumpcode transition failure.
0x2d	dgn_fault() returned to SW Timer 2 interrupt handler.
0x2e	dgn_fault() returned to SPC0 interrupt handler.
0x2f	dgn_fault() returned to SPC1 interrupt handler.
0x30	No timer nodes available for timeout processing.
0x31	Job response is using JCISTAT interface.
0x32	Firmware to pumpcode restart failed.
0x33	ON RESET: all memory is being cleared.
0x34	ON RESET: normal memory is being cleared.
0x35	ON RESET: no memory is being cleared.
0x36	Invalid switch value.
0x37	Buffer management error.
0x38	1-byte wide firmware is running.
0x39	FPGA programming error / failure.
0x3a	Double bus fault detected.
0x3b	Count of jobs in HA is less than zero.
0x3F	No command from the 3B is being processed.
0x40	Invalid command received from the 3B (opcode 0x00).
0x41	Invalid command received from the 3B (opcode 0x01).
0x42	Invalid command received from the 3B (opcode 0x02).
0x43	Invalid command received from the 3B (opcode 0x03).
0x44	Invalid command received from the 3B (opcode 0x04).

DEVICE STATUS WORD LAYOUT

The layout of the Device Status Word varies depending on the DFC firmware / pumpcode version, the device type, and the circumstance or event that caused the Device Status Word to be printed. All the variations of the Device Status Word layout are listed in one of the tables that follow:

Table 1 - For SCSI DFC firmware / pumpcode version 7.1, for all device types, under all circumstances.
Table 2 - For SCSI DFC firmware / pumpcode version 8.0 and later, for all device types, for failure responses.
Table 3 - For SCSI DFC firmware / pumpcode version 8.0 and later, for tape devices, for conditional success responses.
Table 4 - For SCSI DFC firmware / pumpcode version 8.0 and later, for all device types, for EIR device status.
Table 5 - For SCSI DFC firmware / pumpcode version 8.0 and later, for all device types, in response to RQDEVSTAT command.
Table 6 - For SMD DFC firmware version 6.0 and earlier, for all device types, under all circumstances.

NOTE: Mode bit: 0 = on-line, 1 = off-line (maintenance).

The following acronyms are used in this appendix:

bdid = Bus Device ID
DFC = Disk File Controller
EIR = Enhanced Information Report
LSB = Least Significant Bit
MHD = Moving head disk
MHSR = MHD status register
MSB = Most Significant Bit
SCSI = Small Computer System Interface
SMD = Storage Module Drive

Table 1 - For SCSI DFC firmware / pumpcode version 7.1,
for all device types, under all circumstances

Bits 27 through 20 provide SCSI Extended Sense Data. If bits 27-24 are 0111B respectively, then bits 23-20 contain the Sense Key; otherwise, bits 27-20 contain the Additional Sense Code. The SCSI Extended Sense Data is described in the DFC Output Appendix J, APP-DFC-APPJ.

BIT	DESCRIPTION
31	Mode bit of bdid
30	Mode bit of DFC
29	Incorrect disk selected (always 0)
28	Multiple disks selected (always 0)
27	SCSI Extended Sense Data

REMOVE / RESTORE PROCESS ERROR CODES

NOTE: These remove / restore process error codes are in hexadecimal notation.

CODE	DESCRIPTION
1	Cannot enable message reception.
2	recvw function error
3	Cannot open spooler.
4	Cannot open ECD manager.
5	Cannot get UCB.
6	UCB not for requested unit.
7	Cannot get special device file.
8	Cannot open special device file.
9	Invalid command tag from DIAMON.
a	Cannot reset reserve bit.
b	sendw function error.
c	Cannot set `u_tnum` in UCB.
d	Request type from DIAMON not manual or auto.
e	Cannot set `u_manrqst` in UCB.
f	Cannot release special device file.
10	Abort request made via DIAMON, reasons for abort request are by manual input by recovery process

REMOVE/RESTORE STOPPED CODES

CODE	DESCRIPTION
1	Diagnostic had failures.
2	ROS (power control switch) is off normal.
3	Diagnostic request only, not remove or restore.
4	Unit is already active.
5	Unit is already out of service.
6	Unit is off-line.
7	Unit is unavailable (forced).
8	Unit is in the `INIT` state.
9	Unit is in the `GROWTH` state.
a	Diagnostic abort, request denied.
b	Unit is essential.

FAULT CODES

NOTE: These fault codes are in hexadecimal notation.

No Fault

`00` No fault (normal)

Peripheral Faults - With Accompanying Message

`b1` Device reported error - device implicated - pio in progress
`b2` Parity divert error - device implicated - pio in progress
`b3` Channel error - device not implicated but possibly affected - pio in progress
`b4` Device reported error - device implicated
`b5` DMA addressing error - device implicated
`b6` DMA used OOR address - device implicated
`b7` Channel error - device not implicated but possibly affected

Peripheral Faults - Without Accompanying Message

`b8` Device reported error - cannot identify unit
`b9` Parity divert error - cannot identify unit
`ba` Addressing error - cannot identify unit

Configuration Manager Fault Codes - With Accompanying Message

`c3` Informative - excessive recoverable errors
`c4` Remove directive - excessive errors
`c5` Remove request - attempt restoral of oos usable unit
`c6` Limp mode - attempt restoral of oos unusable unit
`c7` Limp mode - no replacement avail
`c8` Manual remove
`c9` Unconditional remove

SEE PROPRIETARY NOTICE ON COVER PAGE

Not Seen By DRIVER - No Accompanying Message

`cb` Routine soft switch - pcpeih only

Software Errors - No Accompanying Message

`d1` Memory Management - page invalid or not in memory
`d2` Memory Management - page index too large
`d3` Memory Management - segment invalid
`d4` Memory Management - segment index too large
`d5` Illegal operating system trap (OST)
`d6` Protection violation
`d7` Byte or halfword addressing violation
`d8` Instruction privilege violation
`d9` Illegal op code

System Initialization - No Accompanying Message

`e1` Substantial system recovery has occurred
`e2` System initialization critical

EXTENDED SENSE LAYOUT

Extended sense data format								
Bit Byte	7	6	5	4	3	2	1	0
0	Valid	Error code						
1	Segment number							
2	FM	EOM	ILI	R	Sense key			
3	Information byte (MSB)							
4	Information byte							
5	Information byte							
6	Information byte (LSB)							
7	Additional sense length (n)							
8	Command-Specific Information byte (MSB)							
9	Command-Specific Information byte							
10	Command-Specific Information byte							
11	Command-Specific Information byte (LSB)							
12	Additional Sense Code							
13	Additional Sense Code Qualifier							
14	Field Replaceable Unit Code							
15	SKSV	Sense-Key Specific						

The *valid* bit indicates whether or not the information bytes contain valid data. If the valid bit is zero, the information bytes are not defined. If the valid bit is one, the information bytes contain valid information.

An *error code* value of 70 (hex) specifies that the sense data is for a current condition. An error code value of 71 (hex) specifies that the sense data is for a deferred condition. Error code values 72 (hex) to 7E (hex) are reserved. Error code value 7F (hex) is for vendor-specific sense data formats. All other error code values are undefined.

The *segment number* contains the number of the current segment descriptor if extended sense is in response to a `COPY`, `COMPARE`, or `COPY` and `VERIFY` command. Up to 256 segments are supported beginning with segment zero.

The *filemark* (FM) bit indicates that the current command has read a filemark. This bit is only used for sequential-access devices.

The *end-of-medium* (EOM) bit indicates that an end-of-medium condition (end-of-tape, beginning-of-tape, out-of-paper, etc.,) exists on a sequential-access device or printer device. For sequential access devices, this bit indicates that the unit is at or past the early-warning

end-of-tape if the direction was forward or that the command could not be completed because beginning-of-tape was encountered if the direction was reverse. Direct-access devices do not use this bit; instead, these devices report attempts to access beyond the end-of-medium as ILLEGAL REQUEST sense key [see Sense keys 0 - 7 (hex) in the sense key listing].

The *incorrect length indicator* (ILI) bit indicates that the requested logical block length did not match the logical block length of the data on the medium.

R indicates reserved.

The *sense key* field is used to describe an error or exception condition. The sense keys are described in the following listing.

Sense key	Description
0x0	NO SENSE. Indicates that there is no specific sense key information to be reported for the designated logical unit. This is the case for a successful command or a command that received a CHECK CONDITION status because one of the FM, EOM, or ILI bits is set to one.
0x1	RECOVERED ERROR. Indicates that the last command completed successfully with some recovery action performed by the target controller. Details may be determined by examining the additional sense bytes and the information bytes.
0x2	NOT READY. Indicates that the logical unit addressed cannot be accessed. Operator intervention may be required to correct this condition.
0x3	MEDIUM ERROR. Indicates that the command terminated with a nonrecovered error condition that was probably caused by a flaw in the medium or an error in the recorded data.
0x4	HARDWARE ERROR. Indicates that the target controller detected a nonrecoverable hardware failure (for example, controller failure, device failure, parity error, etc.,) while performing the command or during a self-test.
0x5	ILLEGAL REQUEST. Indicates that there was an illegal parameter in the command descriptor block or in the additional parameters supplied as data for some commands (FORMAT UNIT, SEARCH DATA, etc.). If the target controller detects an invalid parameter in the command descriptor block, then it terminates the command without altering the medium. If the target controller detects an invalid parameter in the additional parameters supplied as data, then the target controller may have already altered the medium.
0x6	UNIT ATTENTION. Indicates that the removable medium may have been changed or the target controller has been reset.

Sense key Description

`0x7` `DATA PROTECT`. Indicates that a command that reads or writes the medium was attempted on a block that is protected from this operation. The read or write operation is not performed.

`0x8` `BLANK CHECK`. Indicates that a write-once read-multiple device or a sequential-access device encountered a blank block while reading or a write-once read-multiple device encountered a nonblank block while writing.

`0x9` Vendor specific. This sense key is available for reporting vendor specific conditions.

`0xa` `COPY ABORTED`. Indicates a `COPY`, `COMPARE`, or `COPY` and `VERIFY` command was aborted due to an error condition on the source device, the destination device, or both. (See `COPY` command for additional information about this sense key.)

`0xb` `ABORTED COMMAND`. Indicates that the target controller aborted the command. The initiator may be able to recover by trying the command again.

`0xc` `EQUAL`. Indicates a `SEARCH DATA` command has satisfied an equal comparison.

`0xd` `VOLUME OVERFLOW`. Indicates that a buffered peripheral device has reached the end-of-medium and data remains in the buffer that has not been written to the medium. A `RECOVER BUFFERED DATA` command(s) may be issued to read the unwritten data from the buffer.

`0xe` `MISCOMPARE`. Indicates that the source data did not match the data read from the medium.

`0xf` This sense key is reserved.

The *information bytes* are device-type or command specific. If the valid bit is one, the information bytes contain information as follows:

1. The unsigned logical block address associated with the sense key for direct-access devices (Type 0), write-once read-multiple devices (Type 4), and read-only direct-access devices (Type 5).
2. The difference (residue) of the requested length minus the actual length in either bytes or blocks, as determined by the command for sequential-access devices (Type 1), printer devices (Type 2), and processor devices (Type 3). (Negative values are indicated by two's complement notation.)
3. The difference (residue) of the requested number of blocks minus the actual number of blocks copied or compared for the current segment descriptor of a `COPY`, `COMPARE`, or `COPY` and `VERIFY` command.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. For sequential-access devices operating in buffered modes 1 or 2 that detect unrecoverable write errors when unwritten data blocks, filemarks, or setmarks remain in the buffer, the value of the information field for all commands shall be:

    a. the total number of data blocks, filemarks, and setmarks in the buffer if the device is in fixed block mode (block length field of the MODE SENSE block descriptor is non-zero and the fixed bit of the WRITE command is one).

    b. the number of bytes in the buffer, including filemarks and setmarks, if the device is in variable mode (the fixed bit of the WRITE command is zero).

The *additional sense length* specifies the number of additional sense bytes to follow. If the allocation length of the command descriptor block is too small to transfer all of the additional sense bytes, the additional sense length is not adjusted to reflect the truncation.

The *command-specific information bytes* contain command specific data, peripheral device specific data, or both kinds of data that further define the nature of the CHECK CONDITION status. The COPY, COMPARE, COPY and VERIFY, and SEARCH DATA commands define a standard purpose for some of these bytes. Except as described in these commands, the additional sense bytes are vendor unique.

The *additional sense code* (byte 12) may be applied with the same code by the target controller to extended and nonextended sense formats. The additional sense code 00 (hex) indicates that the target controller does not support any additional sense code for the related sense key or does not have any appropriate additional sense to return for the CHECK CONDITION status that it created. The additional sense codes are either defined, reserved, or vendor unique. The codes are allocated to the peripheral device type returned by the INQUIRY command. Some additional sense codes may be shared among various device types.

The *additional sense code qualifier* (byte 13) indicates detailed information related to the additional sense code. The additional sense code qualifier is optional.

Field replaceable unit code is used to define a device-specific mechanism or unit that has failed. A value of zero indicates that no specific mechanism or unit has been identified to have failed or that the data is not available. The field replaceable unit code field is optional.

ASC and ASCQ Assignments Legend

D = Direct Access Device
T = Sequential Access Device
L = Printer Device
P = Processor Device
W = Write Once Read Multiple Device
R = Read Only (CD-ROM) Device
S = Scanner Device
O = Optical Memory Device
M = Media Changer Device
C = Communication Device

Table 1
Additional Sense Code (ASC) and
Additional Sense Code Qualifier (ASCQ) Assignments

BYTE 12	BYTE 13	DTLPWRSOMC	Description
00	00	DTLPWRSOMC	No additional sense information
00	01	T	Filemark detected
00	02	T S	End-of-partition/medium detected
00	03	T	Setmark detected
00	04	T S	Beginning-of-partition/medium detected
00	05	T S	End-of-data detected
00	06	DTLPWRSOMC	I/O process terminated
00	11	R	Audio play operation in progress
00	12	R	Audio play operation paused
00	13	R	Audio play operation successfully completed
00	14	R	Audio play operation stopped due to error
00	15	R	No current audio status to return
01	00	D W O	No index/sector signal
02	00	D WR OM	No seek complete
03	00	DTL W SO	Peripheral device write fault
03	01	T	No write current
03	02	T	Excessive write errors
04	00	DTLPWRSOMC	Logical unit not ready, cause not reportable
04	01	DTLPWRSOMC	Logical unit is in process of becoming ready
04	02	DTLPWRSOMC	Logical unit not ready, initializing command required
04	03	DTLPWRSOMC	Logical unit not ready, manual intervention required
04	04	DTL O	Logical unit not ready, format in progress
05	00	DTL WRSOMC	Logical unit does not respond to selection
06	00	D WR OM	No reference position found
07	00	DTL WRSOM	Multiple peripheral devices selected
08	00	DTL WRSOMC	Logical unit communication failure

Table 1

SCSI JOB BLOCK STRUCTURE LAYOUT

```
AABBCCDD EEEEEEEE FFFFFFFF GGGGGGGG HHHHHHHH IIIIIIII JJJJJJJJ KK--LLLL
MMMMMMMM NNNNNNNN OOOOOOOO PPPPPPPP
```

General notations:

`in` — Input, that is, provided by firmware / pumpcode.

`out` — Output, that is, returned by small computer system interface (SCSI) protocol controller (SPC) code.

`res` — Reserved for SPC code usage.

Device ID information:

`A` — SCSI bus number: 0 or 1.

`B` — SCSI target controller number: 0 - 7.

General job information:

`C` `in` — Job state - initialized by `spc_job()`, but updated by firmware / pumpcode.

- `0` Initial state of job when `spc_job()` returns.
- `1` Job has been retried once.
- `2` SCSI Request Sense command has been issued.
- `3` Job has been retried twice.
- `4` Job has completed successfully.
- `5` Job has failed.

`D` `out` — Miscellaneous flags - used by the SPC to convey additional information to firmware / pumpcode.

- `1` One or more RESTORE POINTERS messages received after host adapter (HA) direct memory access (DMA) was begun for this job.

`E` `in` — Job ID code (optional).

`F` `in` — Function to be performed:

0 => SCSI command.
!0 => Function code.

SEE PROPRIETARY NOTICE ON COVER PAGE

G in — Time limit for job, in milliseconds:

!0 => Time limit.
0 => No time limit.

H out — Job completion code:

- 0x00 Job completed normally.
- 0x01 Command was aborted.
- 0x02 Reset was detected on the bus and was probably not caused by this job; it may or may not have been caused by this HA.
- 0x03 Check the status byte.
- 0x04 This HA reset the bus due to an unrecoverable error while processing this job.
- 0x05 Job in progress.
- 0x06 SCSI job block (SJB) contents error.
- 0x07 Memory fault.
- 0x08 The bus appears to be unterminated.
- 0x09 The SCSI bus device select failed.
- 0x0a Job was flushed.
- 0x0b Target controller did not transfer all of the data.
- 0x0c Job timed out.
- 0x0d Insufficient DMA chain links.
- 0x0e Insufficient logical unit (LU) queue nodes.
- 0x0f The SCSI bus is off-line.
- 0x10 HA detected SCSI bus parity error and terminated the job.

I res — Value returned from function timeout().

SCSI command information:

J out — Bytes of data not transferred.

K out — Target SCSI status byte.

- 0x00 Successful command completion.
- 0x02 Check condition.
- 0x04 Condition met good status.
- 0x08 Busy.
- 0x10 Intermediate good status.
- 0x14 Intermediate condition met good.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0x18` Reservation conflict.

`0x22` Command terminated.

`0x28` Queue full.

`0xff` Status not available.

`L` `in` — Mode flags for current job.

`0x00` Non-read command.

`0x01` Read command.

`0x02` External chaining.

`0x04` Read overlap is active.

`0x80` Immediate command.

`M` `in` — Pointer to SCSI command descriptor block (CDB).

`N` `in` — Size of SCSI CDB in bytes.

`O` `in` — Pointer to HA data buffer, or pointer to memory or pointer to 32104 DMA chain control node.

`P` `in` — Byte count of data to transfer over the SCSI bus.

INQUIRY LAYOUT

Standard INQUIRY Data Format								
Bit Byte	7	6	5	4	3	2	1	0
0	Peripheral Qualifier			Peripheral device type				
1	RMB	Device-type qualifier						
2	ISO version		ECMA version			ANSI version		
3	AENC	TrmIOP	Reserved			Response data format		
4	Additional length (n - 4)							
5	Reserved							
6	Reserved							
7	RelAdr	WBus32	WBus16	Sync	Linked	Reserved	CmdQue	SftRe
8 - 15	Vendor identification (in ASCII)							
16 - 31	Product identification (in ASCII)							
32 - 35	Product revision level (in ASCII)							
36 - 55	Vendor Specific							
56 - 95	Reserved							
Vendor-Specific Parameters								
96 - n	Vendor Specific							

The *peripheral qualifier* and *peripheral device-type* fields identify the device currently connected to the logical unit. If the target is not capable of supporting a device on this logical unit, this field will be set to 7F hex (peripheral qualifier set to 011 binary and peripheral device type set to 1F hex).

SEE PROPRIETARY NOTICE ON COVER PAGE

The peripheral qualifier is defined in the following table.

Peripheral Qualifier	
Qualifier (binary)	Description
000	The specified peripheral device is currently connected to this logical unit. If the target cannot determine whether or not a physical device is currently connected, it will also use this peripheral qualifier when returning the INQUIRY data. Note: This peripheral qualifier does not imply that the device is ready for access by the initiator.
001	The target is capable of supporting the specified peripheral device type on this logical unit; however, the physical device is not currently connected to this logical unit.
010	Reserved
011	The target is not capable of supporting a physical device on this logical unit. For this peripheral qualifier, the peripheral device type will be set to 1Fh to provide compatibility with previous versions of SCSI. All other peripheral device type values are reserved for this peripheral qualifier.
1XX	Vendor Specific

The peripheral device types are shown in the following table.

Peripheral Device Type Table	
Code (hex)	Description
00	Direct-access device (e.g., magnetic disk)
01	Sequential-access device (e.g., magnetic tape)
02	Printer device
03	Processor device
04	Write-once device (e.g., some optical disks)
05	CD-ROM device
06	Scanner device
07	Optical memory device (e.g., some optical disks)
08	Medium Changer device (e.g., jukeboxes)
09	Communications device
0A - 0B	Defined by ASC IT8 (Graphic Arts Pre-Press Devices)
0C - 1E	Reserved
1F	Unknown or no device type

SEE PROPRIETARY NOTICE ON COVER PAGE

A *removable medium* (RMB) bit of zero indicates that the medium is not removable. An RMB bit of one indicates that the medium is removable.

The *device-type modifier* field was defined in SCSI-1 to permit vendor-specific qualification codes of the device type. This field contains a 7-bit user-specified code, which may be set with switches or by some other means by the target controller or peripheral device. SCSI controllers that do not support this feature return all zero bits. This feature allows each user to assign unique codes to each specific type of peripheral device that is supported on the system being used. These codes may then be used by self-configuring software to determine what specific peripheral device is at each logical unit number. This is especially valuable for systems that support multiple types of removable medium.

The usage of nonzero code values in the *international standards organization (ISO) version* and *European computer manufacturers (ECMA) version* fields are defined by the ISO and the ECMA, respectively. A zero code value in these fields indicates that the target controller does not claim compliance to the ISO or ECMA versions of SCSI. Note that it is possible to claim compliance to more than one of these SCSI standards.

The *ANSI version* indicates the implemented version of the ANSI standard and is defined in the following ANSI version listing.

ANSI-Approved Version	
Code (hex)	Description
0	The device might or might not comply to an ANSI-approved standard.
1	The device complies to ANSI X3.131-1986 (SCSI-1).
2	This code is reserved to designate the SCSI-2 standard upon approval by ANSI.
3 - 7	Reserved.

The asynchronous event notification capability (AENC) bit indicates that the device supports the asynchronous event notification capability:

1. Processor device-type definition: An AENC bit of one indicates that the processor device is capable of accepting asynchronous event notifications. An AENC bit of zero indicates that the processor device does not support asynchronous event notifications.
2. All other device types: This bit is reserved.

A terminate I/O process (TrmIOP) bit of one indicates that the device supports the TERMINATE I/O PROCESS message. A value of zero indicates that the device does not support the TERMINATE I/O PROCESS message.

The response data formats are given in the response data format table that follows. Target controllers conforming to at least conformance level 2 and conforming to ANSI X3.131-1986 (SCSI-1) set the common command set code (1 hex) in the response data format field.

Response Data Format Table	
Code (hex)	Description
0	SCSI-1
1	Common Command Set (CCS)
2	SCSI-2
3 - F	Reserved

The *additional length* byte specifies the length in bytes of the parameters. If the allocation length of the command descriptor block is too small to transfer all of the parameters, the additional length is not adjusted to reflect the truncation.

A *relative addressing* (RelAdr) bit of one indicates that the device supports the relative addressing mode for this logical unit. If this bit is set to one, the linked command (Linked) bit will also be set to one since relative addressing can only be used with linked commands. A Rel Adr bit of zero indicates the device does not support relative addressing for this logical unit.

A *wide bus 32* (WBus32) bit of one indicates that the device supports 32-bit wide data transfers. A value of zero indicates that the device does not support 32-bit wide data transfers.

A *wide bus 16* (WBus16) bit of one indicates that the device supports 16-bit wide data transfers. A value of zero indicates that the device does not support 16-bit wide data transfers.

If the values of both the WBus16 and WBus32 bits are zero, the device only supports 8-bit wide data transfers.

A *synchronous transfer* (Sync) bit of one indicates that the device supports synchronous data transfer. A value of zero indicates that the device does not support synchronous data transfer.

A *linked command* (Linked) bit of one indicates that the device supports linked commands for this logical unit. A value of zero indicates the device does not support linked commands for this logical unit.

A *command queuing* (CmdQue) bit of one indicates that the device supports tagged command queuing for this logical unit. A value of zero indicates the device does not support tagged command queuing for this logical unit.

A *soft reset* (SftRe) bit of zero indicates that the device responds to the RESET condition with the hard RESET alternative. A SftRe bit of one indicates that the device responds to the RESET condition with the soft RESET alternative.

SEE PROPRIETARY NOTICE ON COVER PAGE

SCSI devices that implement the hard reset alternative, upon detection of the reset condition, will:

1. Clear all I/O processes including queued I/O processes.
2. Release all SCSI device reservations.
3. Return any SCSI device operating modes to their appropriate initial conditions, similar to those conditions that would be found after a normal power-on reset. MODE SELECT conditions will be restored to their last saved values if saved values have been established. MODE SELECT conditions for which no values have been saved will be returned to their default values.

SCSI devices that implement the soft reset alternative, upon detection of the reset condition, will:

1. Attempt to complete any I/O processes which have not completed and that were fully identified.
2. Preserve all SCSI device reservations.
3. Preserve any SCSI device operating modes (MODE SELECT, PREVENT/ALLOW MEDIUM REMOVAL commands, etc.).
4. Preserve all the information required to continue normal dispatching of I/O processes queued prior to the reset condition.

ASCII data fields contain only graphic codes (i.e., code values 20 hex through 7E hex). Left-aligned fields will place any unused bytes at the end of the field (highest offset) and the unused bytes are filled with the space characters (20 hex). Right-aligned fields will place any unused bytes at the start of the field (lowest offset) and the unused bytes will be filled with space characters (20 hex).

The *vendor identification* field contains eight bytes of ASCII data identifying the vendor of the product. The data is left-aligned within this field.

The *product identification* field contains sixteen bytes of ASCII data as defined by the vendor. The data is left-aligned within this field.

The *product revision level* field contains four bytes of ASCII data as defined by the vendor. The data is left-aligned within this field.

HOST ADAPTER COMMAND DEFINITIONS

This appendix provides the definitions of the commands sent from the 3B computer to the host adapter (HA). The commands are either one word or four words in size. If the command is a one-word command, the last three words in the output are unknown and undefined. Only those words which are used are defined in this document.

The leftmost five bits of the first word of each command is the command operation code (opcode). Apply the following bit-field template to the first word of the command to determine the command opcode, then find that opcode in the following listing to decipher the remainder of the command.

```
aaaa axxx xxxx xxxx xxxx xxxx xxxx xxxx
```

a = Operation code (Opcode).

x = Command specific.

`0x0 (0)` — `no-op` command.

```
aaaa abbb bbbb bbbb bbbb bbbb bbbb bccc
```

a = Opcode.

b = Must be all zeros.

c = Programmed Input / Output (PIO) destination bits.

`0x1 (1)` — `invalid` command.

`0x2 (2)` — `tape` command.

```
aaaa abbb bbbb cccc dddd deee eeee exxx
ffff ffff ffff ffff ffff ffff ffff ffff
gghh hhhh hhhh hhhi iiii iiii iiii iiii
jjjj jjjj jjjj jjjj jjjj jjjj jjjj jjjj
```

a = Opcode.

b = Tape command operation.

`0x1` — Erase medium.
`0x2` — Load - enable tape unit.
`0x3` — Locate.
`0x4` — Read position.
`0x5` — Read reverse.
`0x6` — Read forward.
`0x7` — Rewind.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0x8` — Space forward.
`0x9` — Space reverse.
`0xa` — Tape setup options.
`0xb` — Set tape speed.
`0xc` — Unload - disable tape unit.
`0xd` — Verify.
`0xe` — Write.
`0xf` — Write filemarks.
`0x10` — Set variable record mode.
`0x11` — Set fixed record mode.

c = Small computer system interface (SCSI) bus and device ID.

d = Tape options (depends on the tape operation).

e = Job ID assigned by the 3B.

x = Not used and undefined.

f = Block number (depends on the tape operation).

Read	Tape block number.
Write	Tape block number.
Write filemarks	Number of filemarks.
Tape setup	Tape blocking factor.
Space	Number of entities to space over.

g = Number of bytes to ignore.

h = Job time limit in seconds.

i = Byte offset into the 3B segment.

j = 3B transfer length in words for read or write.

`0x3 (3)` — `version` command.

```
aaaa abbb bbbb bbbb bbbb cddd dddd deee
```

a = Opcode.

b = Data address in 3B mainstore.

c = Version requested.

`0` — Request for firmware version number.
`1` — Request for pumpcode version number.

d = Job ID assigned by the 3B.

e = PIO destination bits.

`0x4 (4)` — `reserve/unreserve` command.

`aaaa abxx xxxx cccc xxxx xddd dddd deee`

a = Opcode.

b = Type of command.

`0` — Unreserve.
`1` — Reserve.

x = Not used and undefined.

c = SCSI bus and device ID.

d = Job ID assigned by the 3B.

e = PIO destination bits.

`0x5 (5)` — `retry` command.

`aaaa axxx xxxx xxxx xxxx xxxx xxxx xbbb`

a = Opcode.

x = Not used and undefined.

b = PIO destination bits.

`0x6 (6)` — `wakeup` command.

`aaaa axxx xxxx xxxx xxxx xxxx xxxx xbbb`

a = Opcode.

x = Not used and undefined.

b = PIO destination bits.

`0x7 (7)` — `change DFC options` command.

`aaaa axxx xxxx bbbb xxxx xccc cccc cddd`

a = Opcode.

x = Not used and undefined.

b = SCSI bus and device ID.

c = Job ID assigned by the 3B.

d = PIO destination bits.

`0x8 (8)` — `resume` command.

`aaaa axxx xxxx xxxx xxxx xxxx xxxx xbbb`

a = Opcode.

x = Not used and undefined.

b = PIO destination bits.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0x9 (9)` — `reset device` command.

`aaaa axxx xxxx bbbb xxxx xccc cccc cddd`

a = Opcode.

x = Not used and undefined.

b = SCSI bus and device ID.

c = Job ID assigned by the 3B.

d = PIO destination bits.

`0xa (10)` — `change device mode` command.

`aaaa abxx xxxx cccc xxxx xddd dddd deee`

a = Opcode.

b = New maintenance mode.

`0` — Device is ONLINE.
`1` — Device is OFFLINE.

x = Not used and undefined.

c = SCSI bus and device ID.

d = Job ID assigned by the 3B.

e = PIO destination bits.

`0xb (11)` — `sysgen` command.

`aaaa axxx xxxx bbbb bbbb bbbb bbbb bccc`

a = Opcode.

x = Not used and undefined.

b = Sysgen data block addr.

c = PIO destination bits.

`0xc (12)` — `change DFC mode` command.

`aaaa abxx xcde ffff xxxx xggg gggg ghhh`

a = Opcode.

b = New maintenance mode.

`0` — Device is ONLINE.
`1` — Device is OFFLINE.

x = Not used and undefined.

c = Select DFC.

`0` — Device is not selected.
`1` — Device is selected.

SEE PROPRIETARY NOTICE ON COVER PAGE

d = Select SCSI bus 1.

`0` — Bus is not selected.
`1` — Bus is selected.

e = Select SCSI bus 0.

`0` — Bus is not selected.
`1` — Bus is selected.

f = SCSI bus and device ID.

g = Job ID assigned by the 3B.

h = PIO destination bits.

NOTE: If *c*, *d*, and *e* are all zero, all three are selected.

`0xd (13)` — `boot` command.

```
aaaa abcc cccc dddd eeee eeee eeee efff
```

a = Opcode.

b = Retry boot job.

c = Number of disk blocks to read.

d = SCSI bus and device ID.

e = Starting disk block number.

f = PIO destination bits.

`0xe (14)` — `jcistat` command.

```
aaaa axxx xxxx xxxx bxxx xxxx xxxx xccc
```

a = Opcode.

x = Not used and undefined.

b = More jobs in submit queue.

`0` — No jobs in submit queue.
`1` — At least one job in submit queue.

c = PIO destination bits.

`0xf (15)` — `abort` command.

```
aaaa abxx xxxx xxxx xxxx xxxx xxxx xccc
```

a = Opcode.

b = Option.

x = Not used and undefined.

c = PIO destination bits.

`0x10 (16)` — `read DFC RAM` command.

```
aaaa axxx xxxx bbbb xxxx xccc cccc cxxx
dddd dddd dddd dddd dddd dddd dddd dddd
xxxx xxxx xxxx xxxe eeee eeee eeee eeee
ffff ffff ffff ffff ffff ffff ffff ffff
```

a = Opcode.

x = Not used and undefined.

b = SCSI bus and device ID.

c = Job ID assigned by the 3B.

d = HA Random Access Memory (RAM) address.

e = Data address in 3B mainstore.

f = Number of words to be transferred.

`0x11 (17)` — `read disk` command.

```
aaaa abxx xxxx cccc xxxx xddd dddd dxxx
eeee eeee eeee eeee eeee eeee eeee eeee
xxxx xxxx xxxx xxxf ffff ffff ffff ffff
gggg gggg gggg gggg gggg gggg gggg gggg
```

a = Opcode.

b = Retry on job failure.

x = Not used and undefined.

c = SCSI bus and device ID.

d = Job ID assigned by the 3B.

e = Starting disk block number.

f = Data address in 3B mainstore.

g = Number of words to be transferred.

`0x12 (18)` — `explicit SCSI` command.

```
aaaa abcd dddd eeee fggg ghhh hhhh hiii
jjjj jjjj jjjj jjjk kkkk kkkk kkkk kkkk
llll llll llll lllm mmmm mmmm mmmm mmmm
nnnn nnnn nnnn nnno oooo oooo oooo oooo
```

a = Opcode.

b = Indicates a slow SCSI command.

c = Command is done with minimum error checks and no recovery.

`0` — Do not just do the command.
`1` — Just do the command.

d = SCSI command options.

`0` — No data to transfer to or from SCSI device.
`1` — Data is transferred to SCSI device.
`2` — Data is transferred from SCSI device.
`3` — Send message to reset SCSI bus 0.
`4` — Send message to reset SCSI bus 1.
`5` — Send "abort" message to device.
`6` — Send "reset device" message to device.

e = SCSI bus and device ID.

f = Device may use two SCSI devices.

`0` — Command does not use two devices.
`1` — Command uses two devices.

g = Second SCSI bus and device ID.

h = Job ID assigned by the 3B.

i = Job time limit in minutes for slow jobs.

j = Size of SCSI command in bytes.

k = 3B memory address of SCSI command.

l = Size of response in bytes.

m = 3B memory address of response to SCSI command.

n = Number of bytes of data to be transferred.

o = 3B memory address of data to be transferred.

`0x13 (19)` — `verify disk` command.

```
aaaa axxx xxxx bbbb xxxx xccc cccc cxxx
dddd dddd dddd dddd dddd dddd dddd dddd
xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx
xxxx xxxx xxxx xxxx ffff ffff ffff ffff
```

a = Opcode.

x = Not used and undefined.

b = SCSI bus and device ID.

c = Job ID assigned by the 3B.

d = Starting disk block number.

f = Number of disk blocks to be verified.

`0x14 (20)` — invalid command.

`0x15 (21)` — invalid command.

`0x16 (22)` — invalid command.

`0x17 (23)` — invalid command.

`0x18 (24)` — `write DFC RAM` command.

```
aaaa axxx xxxx bbbb xxxx xccc cccc cxxx
dddd dddd dddd dddd dddd dddd dddd dddd
xxxx xxxx xxxx xxxe eeee eeee eeee eeee
ffff ffff ffff ffff ffff ffff ffff ffff
```

a = Opcode.

x = Not used and undefined.

b = SCSI bus and device ID.

c = Job ID assigned by the 3B.

d = HA RAM address.

e = Data address in 3B mainstore.

f = Number of words to be transferred.

`0x19 (25)` — `write disk` command.

```
aaaa axxx xxxx bbbb xxxx xccc cccc cxxx
dddd dddd dddd dddd dddd dddd dddd dddd
xxxx xxxx xxxx xxxe eeee eeee eeee eeee
ffff ffff ffff ffff ffff ffff ffff ffff
```

a = Opcode.

x = Not used and undefined.

b = SCSI bus and device ID.

c = Job ID assigned by the 3B.

d = Starting disk block number.

e = Data address in 3B mainstore.

f = Number of words to be transferred.

`0x1a (26)` — `pump` command.

```
aaaa axxx xxxx bbbb cddd deee eeee exxx
ffff ffff ffff ffff ffff ffff ffff ffff
xxxx xxxx xxxx xxxg gggg gggg gggg gggg
hhhh hhhh hhhh hhhh hhhh hhhh hhhh hhhh
```

a = Opcode.

x = Not used and undefined.

b = SCSI bus and device ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

c = Auto-vector at end of pump.

`0` — Do not auto-vector.
`1` — Auto-vector.

d = DFC pump options.

`1` — Pump from disk.
`2` — Begin pump from RAM.
`6` — Continue pump from RAM.

e = Job ID assigned by the 3B.

f = Starting disk block number.

g = Data address in 3B mainstore.

h = Number of words to be pumped.

`0x1b (27)` — `format` command.

```
aaaa abbx xxxx cccc xxxx xddd dddd dxxx
eeee eeee xxxx xxxx xfgh hhii jjjj jjjj
kkkk kkkk kkkk kkkl llll llll llll llll
mmmm mmmm nnnn nnnn oooo oooo pppp pppp
```

a = Opcode.

b = Format options.

`1` — No header or defect list provided by the 3B.
`2` — Header only provided by the 3B.
`3` — Both header and defect list provided by the 3B.

x = Not used and undefined.

c = SCSI bus and device ID.

d = Job ID assigned by the 3B.

e = Time limit for format commands.

f = Format data.

g = Complete list.

h = Defect list format.

i = Vendor unique data 2.

j = Vendor unique data 1.

k = Flaw data length in bytes.

l = Flaw data 3B mainstore address.

m = Format header byte 0.

n = Format header byte 1.

o = Format header byte 2.

p = Format header byte 3.

`0x1c (28)` — `request device status` command.

```
aaaa axxx xxxx bbbb xxxx xccc cccc cxxx
xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx
xxxx xxxx xxxx xxxd dddd dddd dddd dddd
eeee eeee eeee eeee eeee eeee eeee eeee
```

a = Opcode.

x = Not used and undefined.

b = SCSI bus and device ID.

c = Job ID assigned by the 3B.

d = Data address in 3B mainstore.

e = Number of words to be transferred.

`0x1d (29)` — `diagnostic helper` command.

```
aaaa abbb bbbb bbbb bbbb bbbb bbbb bccc
```

a = Opcode.

b = Diagnostic control data.

c = PIO destination bits.

`0x1e (30)` — `disk-to-disk copy` command.

```
aaaa axxx xxxx bbbb xccc cddd dddd dxxx
eeee eeee eeee eeee eeee eeee eeee eeee
ffff ffff ffff ffff ffff ffff ffff ffff
gggg gggg gggg gggg gggg gggg gggg gggg
```

a = Opcode.

x = Not used and undefined.

b = Source SCSI bus and device ID.

c = Destination SCSI bus and device ID.

d = Job ID assigned by the 3B.

e = Starting source disk block number.

f = Starting destination disk block number.

g = Number of disk blocks to be copied.

SEE PROPRIETARY NOTICE ON COVER PAGE

`0x1f (31)` — `diagnose DFC/device` command.

`aaaa abbb bbbb cccc dddd deee eeee efff`

a = Opcode.

b = Diagnostic control data.

c = SCSI bus and device ID.

d = Device type selected.

`0` — Device.
`1` — DFC.

e = Job ID assigned by the 3B.

f = PIO destination bits.

BIT	DESCRIPTION
07	Force bad parity byte 3
06	Force bad parity byte 2
05	Force bad parity byte 1
04	Force bad parity byte 0
03	Bus interface controller (BIC) access error
02	Parity error on HA static random access memory (SRAM)
01	Write protect violation
00	Sanity failure

The HA central processing unit (CPU) can read this register a byte at a time and write to each bit individually with each bit having a unique address. The HA status register bits are also controlled by individual jam sets derived from asynchronous events on the HA board. All the bits are cleared on the "Power On" reset or the "HA Reset". The detailed description of each bit is given below.

Bit 31 - (Power on reset) This bit is set after the power on reset. This bit differentiates between the two resets, the power on reset and the HA reset.

Bit 30 - (HA waiting for 3B DMAC) This bit is set via software when the HA is waiting for the 3B DMAC to complete a transfer of data between the 3B and the HA. After the HA detects completion of the transfer, the bit is cleared via software.

Bit 29 - (Power disconnect one) This bit is reserved for use by the HA CPU to disconnect SCSI bus 1.

Bit 28 - (Power disconnect zero) This bit is reserved for use by the HA CPU to disconnect SCSI bus 0.

Bit 27 - (Over temperature 1) This bit is reserved for a possible future application.

Bit 26 - (Over temperature 0) This bit is reserved for a possible future application.

Bit 25 - (Mask interrupt level 9) When this bit is set by the software control, level 9 interrupt to the HA CPU is selectively masked regardless of the interrupt priority level (IPL) of the HA CPU in the processor status word (PSW). In a special case, when this bit is set after the interrupt occurs but before it is recognized by the HA CPU, the interrupt will be negated and will not be recognized by the HA CPU (unless the interrupt is still present after the mask bit is cleared).

Bit 24 - (Mask interrupt level 10) Same as bit 25 except the interrupt level is 10.

Bit 23 - (HA DMAC channel 1 flush) When '0', the HA DMAC channel operates normally. When '1', any incoming bytes from SCSI bus that are buffered in the HA DMAC are flushed and channel operation is terminated.

Bit 22 - (SCSI bus 1 enable) Enables SCSI bus 1. When '0', SCSI bus drivers and receivers are disabled. When '1', drivers and receivers are enabled.

Bit 21 - (SCSI bus 1 receive bad parity) When this bit is set, bad parity is received on SCSI bus 1. This bit is cleared on a RESET.

Bit 20 - (SCSI bus 1 send bad parity) When this bit is set, bad parity is sent to SCSI bus 1. This bit is cleared on a RESET.

Bit 19 - (HA DMAC channel 0 flush) Same as bit 23 but for SCSI bus 0.

Bit 18 - (SCSI bus 0 enable) Same as bit 22 but for SCSI bus 0.

Bit 17 - (SCSI bus 0 receive bad parity) Same as bit 21 but for SCSI bus 0.

Bit 16 - (SCSI bus 0 send bad parity) Same as bit 20 but for SCSI bus 0.

Bit 15 - (Address overlap inactive) This bit is set or cleared by the software writing a '1' or '0' respectively, in the HASR bit 15. When this bit is set, address overlap is inactive. This bit is cleared on the RESET or after interrupt 15 to the HA CPU, so that just after the HA reset or memory fault, the address overlap is active and the system operates through EPROM.

SEE PROPRIETARY NOTICE ON COVER PAGE

Bit 14 - (Mask interrupt level 11) When this bit is set by the software, level 11 interrupt (information present in BIC command register) is selectively masked regardless of the IPL value of the PSW in the HA CPU. This bit functions similar to the bit 25 in the HASR.

Bit 13 - (Mask interrupt level 13) Same as bit 25 except the interrupt level is 13.

Bit 12 - (HA DMAC channel 1 high priority) This bit selects which SCSI bus has higher HA DMAC priority.

Bit 11 - (Diagnostics passed) This bit is set or cleared by the software writing a '1' or '0' respectively, in the HASR bit 11. When this bit is set, it indicates that the diagnostics have passed. This bit is cleared on a RESET.

Bit 10 - (Fault caused by diagnostics) This bit is set or cleared by the software writing a '1' or '0' respectively, in the HASR bit 10. Diagnostics set this bit before initiating an error on the board to distinguish between an actual error and an error caused by the diagnostic test.

Bit 9 - (Spare) Spare bit.

Bit 8 - (Diagnostics in progress) This bit is set or cleared by the software writing a '1' or '0' respectively, in the HASR bit 8. When this bit is set, it indicates that the diagnostics are in progress.

Bit 7 - (Force bad parity on byte 3) When this bit is set, bad parity is generated on byte 3 of HA SRAM during a write operation. This bit is set or cleared by the software writing a '1' or '0' respectively, in the HASR bit 7. This bit is cleared on a RESET.

Bit 6 - (Force bad parity on byte 2) When this bit is set, in the HASR, a bad parity is generated on byte 2 of HA SRAM during the write operation. This bit is set or cleared by the software writing a '1' or '0' respectively, in the HASR bit 6. This bit is cleared on a RESET.

Bit 5 - (Force bad parity on byte 1) When this bit is set, bad parity is generated on byte 1 of HA SRAM during a write operation. This bit is set or cleared by the software writing a '1' or '0' respectively, in the HASR bit 5. This bit is cleared on a RESET.

Bit 4 - (Force bad parity on byte 0) When this bit is set, bad parity is forced on byte 0 of the HA SRAM during a write operation. This bit is set or cleared by the software writing a '1' or '0' respectively, in the HASR bit 4. This bit is cleared on a RESET.

Bit 3 - (BIC access error) This bit is set when the HA CPU or the HA DMAC tries to access the FIFO or BIC registers when the access is inhibited (the status bit "BIC - HA CPU interface enabled" in the BIC status register not set). It also generates an interrupt (level 13) to the HA CPU if it is not masked.

Bit 2 - (Parity error) This bit is set by the parity checker / generator when the parity error is detected while reading the HA SRAM. This bit can also be set or cleared by the software. It is cleared on RESET. A level 15 interrupt is also generated when the parity error is detected on the read operation on the HA SRAM.

SEE PROPRIETARY NOTICE ON COVER PAGE

Bit 1 - (Write protect violation) This bit is set when the microbus master tries to write in to the write protected area of the HA SRAM. A level 15 interrupt is generated to the HA CPU when this bit is set. This bit can also be set or cleared by the software.

Bit 0 (Sanity failure) - This bit is set when the sanity timer times out. A non-maskable interrupt is generated when the sanity failure occurs. This bit can also be set or cleared by the software.

Table 2 - Host Adapter Status Register (FW / PC versions 9.0)

SEE PROPRIETARY NOTICE ON COVER PAGE

The HA central processing unit (CPU) can read this register a byte at a time and write to each bit individually with each bit having a unique address. The HA status register bits are also controlled by individual jam sets derived from asynchronous events on the HA board. All the bits are cleared on the "Power On" reset or the "HA Reset". The detailed description of each bit is given below.

Bit 31 - Spare bit.

Bit 30 - (3B DMA transfer in progress) This bit is set to '1' by HA software to indicate that a 3B21D DMA transfer is in progress. Note: there are cases when 3B DMA is in progress and the bit is not set.

Bit 29 - Spare bit.

Bit 28 - Spare bit.

Bit 27 - Spare bit.

Bit 26 - Spare bit.

Bit 25 - (Mask (hide) SPC-B interrupt) This bit is set to '1' by software to block interrupts from SPC-B. The output from this bit is used by the interrupt logic inside the FPGA.

Bit 24 - (Mask (hide) SPC-A interrupt) This bit is set to '1' by software to inhibit interrupts from SPC-A. The output from this bit is used by the interrupt logic inside the FPGA.

Bit 23 - Spare bit.

Bit 22 - (Enable SCSI Bus-B drivers) The SCSI bus drivers are enabled when this bit is set to '1' and disabled when this bit is '0' (ie. tri-stated).

Bit 21 - Spare bit.

Bit 20 - Spare bit.

Bit 19 - Spare bit.

Bit 18 - (Enable SCSI Bus-A drivers) The SCSI bus drivers are enabled when this bit is set to '1' and disabled when this bit is inactive '0' (ie. tri-stated).

Bit 17 - Spare bit.

Bit 16 - (Mask (inhibit) setting the QUICC bus clear bit) This bit is always set to '1' by HA software to prevent the HA CPU interrupt pending output from setting QUICC bus clear HASR bit.

Bit 15 - (Write Protect Violation) This bit is set to '1' by software when the bus master attempts to write into a protected area of SRAM.

Bit 14 - (Mask (hide) command present interrupt level 4) This bit is set to '1' by HA software to inhibit the BIC command interrupt. This masking is independent of the interrupt priority mask in the HA CPU's status register.

Bit 13 - (Swap QUICC-1 and SPC interrupt levels (3/2 to 2/3)) This bit is set to '1' by HA software to make the QUICC-1 interrupt a level 2 interrupt and the SPC interrupt a level 3 interrupt. When this bit is not set '0', the QUICC-1 interrupt is level 3 and the SPC interrupt is level 2.

Bit 12 - (QUICC-0 IDMAs have high priority than QUICC-1) This bit is set to '1' by HA software

to give bus requests from the QUICC-0 IDMA channels higher priority than the request form the QUICC-1 IDMA channels. *HA software can only change the state for this bit when the IDMAs are idle.*

Bit 11 - (Diagnostics passed) This bit is set to '1' by HA diagnostic software to indicate that diagnostics have passed.

Bit 10 - (Fault caused by diagnostics) This bit is set to '1' by HA diagnostics software before it causes an error to distinguish between an operational error and an error caused by a diagnostic test.

Bit 9 - (Enable EOT Signal as interrupt source) . This bit is set to '1' by HA software to enable the EOT signal as level 3 interrupt source in place of the 3B read / write complete interrupt source from QUICC-1 timer 4. Note that software must disable the 3B read / write complete interrupt as a separate operation. This bit is used in the interrupt logic inside the FPGA.

Bit 8 - (Diagnostics in progress) This bit is set to '1' by HA diagnostic software to indicate when diagnostic execution is in progress.

Bit 7 - (Force bad parity - microbus byte 3 (07-00)) This bit is set to '1' by the HA diagnostic software to force bad parity onto the HA CPU data bus and write bad parity into the SRAM or BIC FIFO. This bit is not set by hardware.

Bit 6 - (Force bad parity - microbus byte 2 (15-08)) This bit is set to '1' by the HA diagnostic software to force bad parity onto the HA CPU data bus and write bad parity into the SRAM or BIC FIFO. This bit is not set by hardware.

Bit 5 - (Force bad parity - microbus byte 1 (23-16)) This bit is set to '1' by the HA diagnostic software to force bad parity onto the HA CPU data bus and write bad parity into the SRAM or BIC FIFO. This bit is not set by hardware.

Bit 4 - (Force bad parity - microbus byte 0 (31-24)) This bit is set to '1' by the HA diagnostic software to force bad parity onto the HA CPU data bus and write bad parity into the SRAM or BIC FIFO. This bit is not set by hardware.

Bit 3 - (BIC access error) This bit is set to '1' via hardware when the bus master attempts to access the BIC FIFO when the access is inhibited. The output of this bit triggers a level 6 interrupt to the HA CPU.

Bit 2 - (Parity error on SRAM) This bit is set to '1' via hardware when a parity error is detected during an SRAM read. The output of this bit triggers a level 6 interrupt to the HA CPU.

Bit 1 - (QUICC bus clear) This bit is set to '1' via hardware by the interrupt pending output from the HA CPU. Can also be set to '1' and cleared '0' by HA software. The output from this register bit goes to the bus clear inputs of QUICC-0 and QUICC-1.

Bit 0 (Sanity failure) - This bit is set to '1' via hardware when the HA sanity timer times out.

HOST ADAPTER SHADOW REGISTER

The Host Adapter (HA) shadow register provides information about the HA status at the time of the HA's last reset. All fields except the last field provide a snapshot of HA status immediately prior to the last HA reset. The last field provides a snapshot of HA status immediately after the last HA reset. The HA status register is known as the HASR.

HA Shadow Register layout: `abcd efgh ijkl mnop qqqq qqqq rrrr rrrr`

Field	Description	HASR bit
a	Not used	-
b	Not used	-

Fault Codes and Definitions

Fault codes `0xff` - `0xf0` and `0x80` - `0x10` are reserved for UNIX® RTR applications.

Code	Comment
`0x00`	No fault (normal).
`0xb0`	Disk Independent Operation (DIOP) state is FULL DISK LIMP MODE.
`0xb1`	Device reported error for programmed input/output (PIO) (kernel process only).
`0xb2`	PIC fault for PIO (kernel process only).
`0xb3`	Processor fault for PIO (kernel process only).
`0xb4`	Device reported error for direct memory access (DMA) input/output (IO).
`0xb5`	DMA addressing fault for DMA IO (kernel process only).
`0xb6`	PIC fault for DMA IO (kernel process only).
`0xb7`	Processor fault for DMA IO (kernel process only).
`0xb8`	Device reported error - PIO. No message.
`0xb9`	Peripheral interface controller (PIC) implicated - PIO in progress. No message sent with fault.
`0xba`	Addressing error - PIO in progress. No message associated with fault.
`0xbb`	Data being used by the process has non-correctable parity error.
`0xbc`	Message buffer audit fault for queued error messages.
`0xbd`	Message buffer audit fault for non-queued error messages.
`0xbe`	DIOP state is DUPLEX.
`0xbf`	DIOP state is SIMPLEX.
`0xc0`	Craft initialization fault.
`0xc1`	Recovery switch of processors is complete - sent from pcpeih to SIM to AIM.
`0xc2`	Soft switch is complete - sent from pcpeih to SIM.
`0xc3`	Configuration manager initialize request (kernel process only).
`0xc4`	Configuration manager remove request (kernel process only).
`0xc5`	Configuration manager remove request (kernel process only).
`0xc6`	Configuration manager limp mode (kernel process only).
`0xc7`	Configuration manager limp mode (kernel process only).

SEE PROPRIETARY NOTICE ON COVER PAGE

Code	Comment *(continued)*
0xc8	Configuration manager manual or automatic diagnostic process (ADP) or routine remove (kernel process only).
0xc9	Unconditional remove (kernel process only).
0xca	Request that soft switch be done - sent from pcpmd to SIM.
0xcb	Routine soft switch - pcpeih only. Sent from SIM to pcpeih.
0xcc	Configuration manager remove under fault conditions (kernel process only).
0xcd	Non-segmented kernel-level audit has been timed out by SIM.
0xd1	Memory management - page invalid or not in memory.
0xd2	Memory management - page index too large.
0xd3	Memory management - segment invalid.
0xd4	Memory management - segment index too large.
0xd5	Illegal operating system trap (OST).
0xd6	Protection violation.
0xd7	Byte or halfword addressing violation.
0xd8	Instruction privilege violation.
0xd9	Illegal OP code.
0xda	Illegal switch between kernel and private stack (or vice versa).
0xe0	Phase level - initialization.
0xe1	System initialization.
0xe2	System initialization - critical.

FIELD UPDATE ERROR CODES

Field update error messages are categorized into one of the following error types:

`Internal` — The error occurred due to incorrect processing within a field update process.

`System` — A system call [for example, `malloc()`, `realloc()`, and `fork()`] failed.

`Database` — The process failed to access or update the field update database (`/etc/bwm/fudb`), the BWM database (`/etc/bwm/bwmdb`), or the system generation (SG) database.

`Usage` — The process was invoked with incorrect or missing arguments.

`COFF` — Common object file format errors were found.

`Filesys` — Errors occurred in file system functions [for example, `open()`, `close()`, `read()`, `lseek()`, and `fopen()`].

A number may follow the error category as in, for example, `DATABASE ERROR -1`. This error value is simply the value passed to `exit()` upon termination. It will always be non-zero to show the process's parent that an error has occurred.

The error category message is followed by additional information about the error and may contain field update error codes. Error messages of type `System` or `Filesys` sometimes contain their own error codes; the user must refer to the *UNIX® RTR Operating System/Operating System Interfaces Programmer's Manual*, Volume 3, for their meanings.

Error messages of type `Database` generally occur as a result of a function call which accesses or updates the field update database, the BWM database, or the SG database and are printed as Field Update Database Errors (`FUDBERRNO` or `ERRNO`). They are described in this appendix.

Error messages specific to the field update `DUFR` process are also described in this appendix, after the field update database errors.

Field Update Error Codes

CODE EXPLANATION

1 `UNABLE TO ADD RID 0X%lX to SETID 0X%lX`
The call to lla library function `lla_attrid()` failed.

Field Update Error Codes *(continued)*

CODE	EXPLANATION
2	`UNABLE TO ATTACH TO %s` The call to lla library function `lla_dbatt()` failed.
3	`UNABLE TO CREATE %s` The call to lla library function `lla_dbcrte()` failed.
4	`UNABLE TO RELEASE DATABASE` The call to lla library function `lla_dbrel()` failed.
5	`UNABLE TO REMOVE RID 0X%lX FROM SET 0X%lX` The call to lla library function `lla_delete()` failed.
6	`UNABLE TO DUPLICATE CURSOR` The call to lla library function `lla_dupsq()` failed.
7	`UNABLE TO GET RECORD` The call to lla library function `lla_get()` failed.
8	`UNABLE TO GET RID` The call to lla library function `lla_gtrid()` failed.
9	`UNABLE TO GET NEXT RECORD` The call to lla library function `lla_nextseq()` failed.
10	`UNABLE TO GET NEXT RID` The call to lla library function `lla_nsqrid()` failed.
11	`UNABLE TO GET NUMBER OF SETS CONTAINING RID 0X%lX` The call to lla library function `lla_numset()` failed.
12	`UNABLE TO OPEN SEQUENCE FOR SETID 0X%lX` The call to lla library function `lla_opensq()` failed.
13	`UNABLE TO OPEN SET SEQUENCING` The call to lla library function `lla_opnsets()` failed.
14	`UNABLE TO GET RECORD FOR RID 0X%lX` The call to lla library function `lla_rdget()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Field Update Error Codes *(continued)*

CODE	EXPLANATION
15	UNABLE TO CREATE RECORD FOR SET 0X%lX The call to lla library function `lla_reccrt()` failed.
16	UNABLE TO FIND RECORD INFORMATION FOR RECORD 0X%lX The call to lla library function `lla_rinfo()` failed.
17	UNABLE TO REMOVE SET 0X%lX The call to lla library function `lla_rmset()` failed.
18	UNABLE TO FIND SETS CONTAINING RID 0X%lX The call to lla library function `lla_rsets()` failed.
19	*UNABLE TO GET NEXT SET IDENTIFIER The call to lla library function `lla_seqset()` failed.
20	UNABLE TO CREATE SET The call to lla library function `lla_setcrt()` failed.
21	UNABLE TO FIND INFORMATION FOR SET 0X%lX The call to lla library function `lla_sinfo()` failed.
22	UNABLE TO CLOSE SEQUENCE The call to lla library function `lla_sqcl()` failed.
23	UNABLE TO SYNC DISK AND CORE The call to lla library function `lla_sync()` failed.
24	UNABLE TO ABORT TRANSACTION BLOCKS The call to lla library function `tb_abort()` failed.
25	UNABLE TO COMMIT TRANSACTION BLOCKS The call to lla library function `tb_commit()` failed.
26	UNABLE TO PUMP CHANGES FOR %s The call to lla library function `tb_cleanup()` failed.
27	UNABLE TO GET SPACE INFORMATION The call to lla library function `tb_get_sp()` failed.
28	UNABLE TO UPDATE RID 0X%lX The call to lla library function `lla_uprid()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Field Update Error Codes *(continued)*

CODE	EXPLANATION
29	Attempt to continue with no pending BWM An update process must be in a pending temp state before `CONT` can be used to continue an operation.
30	Cannot find record for %s No record exists for the update.
31	Do not recognize action (%d) An attempt was made to perform some action that is not known to field update.
32	*Head of queue (0x%lx) does not match pending (0x%lx) There is a mismatch between the head of the queue and the pending update.
33	For %s, expected status (%s) does not match status (%s) There is a mismatch between the status of update files.
34	Cannot perform action when BWM is pending A BWM is in a pending state and the user is still trying to perform updates. The user should perform an `APPLY:CONT`, `BKOUT:CONT`, `RESET`, or `OMIT` before doing more updates.
35	BWM is out of order An attempt was made to update a BWM with a lower number than one that has already been updated. BWMs must be applied in increasing numerical order.
36	Attempt to apply official BWM The user is trying to update a BWM that has already been `PERMED`.
37	%s exists and is not the last BWM applied When backing out BWMs, the last one applied has to be the first one backed out.
38	Cannot %s a BWM which is not temporary A BWM has to be in a temporary state before it can be `PERMED`.
39	*Expecting RID 0x%lx for %s to be in queue The record ID for a particular record cannot be found in the queue.
40	Cannot back out a PENDOFC BWM with no omitted updates If a BWM is in a pending official state, the user will have to do an `OMIT` in order to get it out of that state.

SEE PROPRIETARY NOTICE ON COVER PAGE

Field Update Error Codes *(continued)*

CODE	EXPLANATION
41	For %s, expected status %s or %s does not match %s There is a mismatch between the status of two or more update files.
42	*Set 0x%lx has wrong set count (%d) The count is incorrect for a particular set.
43	*Record 0x%lx is in %d sets The number of sets an update record is in.
44	Expecting a pending update but found none If the user is trying to do an `APPLY:CONT`, `BKOUT:CONT`, `OMIT`, or `RESET`, the process expects the update to be in a pending state.
45	*Pending update RID 0x%lx not in queue The pending update record is not on the queue.
46	Do not recognize operation %d There user is attempting to do an operation that is not in the MSGS file.
47	Cannot reset an update which is not pending An update must be in a pending state for a `RESET` to work.
48	Unknown release action (%d) The specified generic is not valid.
49	Update for %s is not a function replacement Most likely, the user is using the wrong MSGS file. The commands in the MSGS file are for function replacement when the update may actually be a file replacement or byte replacement.
50	Update set 0x%lx for %s does not match saved set (0x%lx) There is a mismatch between the current set and saved set of the update.
51	Must pass non-NULL BWM buffer to updget The buffer passed to the call to function `updget()` must contain data.
52	Incompatible database versions: %d vs. %d The correct version of the database is not being used.
53	BWM name (%s) does not match that of update (%s) A mismatch between BWM names occurred.

Field Update Error Codes *(continued)*

CODE	EXPLANATION
54	%s cannot be made official before %s The record the user is trying to make official is out of order.
55	For %s, expecting update record for %s The process expects a record of the update.
56	Could not malloc space for reclaimable RIDs The system call `malloc()` failed.
57	Unexpected end of sequence for reclaimable loop `RECLAIM` processing ended before it should have ended.
58	`UNABLE TO REFRESH` The call to lla library function `tb_refresh()` failed.
59	Could not attach to port for %s The process failed to attach to the proper port. Most likely, another process (perhaps another instance of the same process) has already attached to it.
60	Inconsistent attaches to update databases The process did not attach to the field update database correctly.
61	Basedir %s does not match record %s There is a mismatch between the user's base directory and the record being updated.
62	Unknown status: %s The state of the BWM is not known (examples of known states are PENDOFC, PENDBKOUT, etc.).
63	Unknown type: %s The type of the BWM is not known (examples of known types are FILER, FUNCR, BYTER, DMRT, ADMRT, and BOOTBOTH).
64	`CANNOT ATTACH TO %s` The process failed to attach to the database.
65	`CANNOT RELEASE %s` The process failed to release the database.

Field Update Error Codes *(continued)*

CODE	EXPLANATION
66	`RID %x IS IN TOO MANY SETS (%d)` The return value from lla library function `lla_numset()` was greater than 3.
67	`CANNOT PURGE %s: STILL {HAS UNRECLAIMED UPDATES | TEMPORARY}` An attempt was made to purge a BWM which still has unreclaimed updates or is still in a temporary state.
68	`UNKNOWN NAME FOR RID %x` The database does not have a name for the RID.
69	`NO UPDATE PENDING` An attempt was made to omit a field update which was not in a pending state.
70	`BWM PENDING` An attempt was made to omit a BWM which was in the pending reclaim state.
71	`CANNOT CONDENSE RECLAIMED RECORDS FOR %s` The call to function condrecl() failed.
72	`NO BWM PENDING` An attempt was made to omit a BWM which was not in a pending state (pending temp, pending bkout, or pending ofc).
73	`UNKNOWN STATE (%d) FOR %s` The BWM was found to be in an unknown state in the database.
74	`UNABLE TO PERM BWM RECORD FOR %s` In trying to omit the BWM, the `perm_bwm()` function failed.

Field Update Warning/Error Codes for DUFR

CODE	EXPLANATION
-2	Warning that the attached data segment is named.
-4	Warning that the segment names have been cleared.
2	Bad return from the kernel overwrite process (KOP).
4	Error in opening or reading the update file, or error in the update file format.
6	Too many segments need attaching in order to perform update.
8	Could not grow patch segment.
10	Error in attempting to attach segments to dufr process.
12	Mismatch between old data in update file and core data.
14	Too many address-data couplets.
16	dufr internal error.
18	Error in detaching segments from dufr.
20	Overwrite attempts to reference address that is not in process's address space.
22	Address of transfer vector or address-data overwrite not aligned on a full word boundary.
24	Error in obtaining process IDs from utility manager.
26	Error in processing overwrite for multiple invocations of process, although at least one process was updated correctly.
28	Error in p_creating kopf process.
30	kopf did not send kopf-init event to KOP.
32	kopf and KOP faulted; overwrite was backed out.

SEE PROPRIETARY NOTICE ON COVER PAGE

Field Update Warning/Error Codes for DUFR *(continued)*

CODE	EXPLANATION
34	KOP process faulted; neither an overwrite nor a backout was performed.
36	dufr process faulted.
38	dufr process externally terminated.
40	Invalid message for dufr process.
42	dufr process segment name clear failed for system reasons.
44	dufr process target process died (for KPUPDATE).

IODRV JOB COMPLETION ERROR CODES

Job completion reports have the same format as commands except for the addition of a completion code field.

For peripheral interface controller (PIC) reports the completion field size is 16 bits.

For peripheral controller (PC) and peripheral controller subdevice (PCSD) reports the completion field size is 12 bits.

NOTE: The codes are in hexadecimal.

Errors reported by the PC or PCSD (rejected commands):

`0000` Successful completion.
`0001` Successful completion - recoverable errors.
`0002` Job aborted - unrecoverable errors.
`0003` Job rejected - illegal command format.
`0004` Job rejected - illegal command context codes 05-0f reserved.

Errors reported by the PC (rejected commands):

`0010` PC XMT buffer underflow.
`0011` PC RCV buffer overflow.
`0012` PC RCV queue underflow (asynch report): codes 14-1f reserved; codes 20-ef spare.

Errors reported by the PIC (rejected commands):

`00f0` PC dequeue full.
`00f1` PC out-of-service.
`00f2` PC DAM error - CSA timeout.
`00f3` PC DAM error - data parity error.

Errors reported by the PIC (asynchronous reports):

`00f5` BP resp queue overflow.
`00f6` PC community power failure.
`aaf7` PC error detected by the PIC: (`aa` = PC error type, see below); codes `f8-ff` reserved.

PC errors detected by the PIC (asynchronous reports - `aaf7` format):

Upon detection of a PC error, the PIC will isolate the faulty PC from the common community busses, mark the PC out-of-service, flush all outstanding requests for PIC service by the faulty PC, and issue a HP autonomous error report to the driver. The completion report field includes one of the following error types:

`LD/ULD` - Load / unload
`DAM` - Dual Access Memory
`CSA` - Control Signal Acknowledgment
`IR` - Interrupt Request
`SR` - Service Request
`ER` - Error Report

`01f7` PC ER lead set.
`02f7` Spare IR status bit set.
`03f7` Spare SR status bit set.
`04f7` Illegal test IR received.
`05f7` Illegal test SR received.
`06f7` Illegal test ER received.
`10f7` PC DAM parity error detected.
`11f7` PC CSA timed-out.
`12f7` 3B transfer for PC job aborted.
`20f7` Illegal LD / ULD buffer IR parameter: Illegal PCSD ID.
`21f7` Illegal LD / ULD buffer IR parameter: Illegal byte count.
`22f7` Illegal LD / ULD buffer IR parameter: Illegal LD / ULD pointer.
`23f7` Illegal LD / ULD buffer IR parameter: Illegal buffer boundaries.
`30f7` Illegal LD / ULD buffer SR parameter: Illegal PCSD ID.
`31f7` Illegal LD / ULD buffer SR parameter: Illegal byte count.
`32f7` Illegal LD / ULD buffer SR parameter: Illegal LD / ULD pointer.
`33f7` Illegal LD / ULD buffer SR parameter: Illegal buffer boundaries.
`40f7` Error detected during HP job order: Boundary error.
`41f7` Error detected during HP job order: ULD PTR OOR.
`42f7` Error detected during HP job order: LD PTR OOR.
`43f7` Error detected during HP job order: PC job PTR OOR.
`50f7` Error detected during BP job order: Boundary error.
`51f7` Error detected during BP job order: ULD PTR OOR.
`52f7` Error detected during BP job order: LD PTR OOR.
`53f7` Error detected during BP job order: PC job PTR OOR.
`60f7` Error detected during HP job compl: Boundary error.
`61f7` Error detected during HP job compl: ULD PTR OOR.
`62f7` Error detected during HP job compl: LD PTR OOR.
`63f7` Error detected during HP job compl: PC job PTR OOR.
`70f7` Error detected during BP job compl: Boundary error.

SEE PROPRIETARY NOTICE ON COVER PAGE

`71f7` Error detected during BP job compl: ULD PTR OOR.
`72f7` Error detected during BP job compl: LD PTR OOR.
`73f7` Error detected during BP job compl: PC job PTR OOR.
`80f7` Illegal HP job cmp report: Illegal response destination field.
`81f7` Illegal HP job cmp report: Illegal PC ID field.
`82f7` Illegal HP job cmp report: Illegal PCSD ID field.
`90f7` Illegal BP job cmp report: Illegal response destination field.
`91f7` Illegal BP job cmp report: Illegal PC ID field.
`92f7` Illegal BP job cmp report: Illegal PCSD ID field.
`a0f7` Babbling PC IR signal.
`a1f7` Babbling PC SR signal.

PC and PCSD reported errors (device dependent):

TTY or MTTY (PCSD)

`0003` Invalid command type or maint access command without 4 control bits properly set (invalid format).
`0011` Input buffer overflow.
`0013` Command other than RST or RMV with PCSD out-of-service.
`0020` Job terminated by quit, interrupt, or break.
`0021` Job aborted by disconnect or flush.
`0022` High priority message too long for job.

TTYC or MTTY (PC)

`0003` Invalid command type or maint access command without 4 control bits properly set (invalid format).
`0006` Checksum error (PC pump).
`0009` PC pump file (i.e., `/iop/pccode/t98300xx`) issue does not match the micro code issue of the PC (TN983) circuit pack.

MT (PCSD)

`0100` Tape unit write protected.
`0200` End of physical tape.
`0300` Subdevice off-line.
`0400` Timeout error.
`0500` Reached end of file during read.

FAULT CODES RECOGNIZED BY IODRV

NOTE: The codes are in hexadecimal.

No Fault

`00` No fault (normal).

Peripheral faults - with accompanying message

`b1` Device reported error - IOPn (PIC or PCm) implicated - IOPn had pio in progress.
`b2` Parity divert error - IOPn (PIC) implicated - IOPn had pio in progress.
`b3` Channel error - IOPn not implicated but possibly affected - IOPn had pio in progress.
`b4` Device reported error - IOPn (PIC or PCm) implicated.
`b5` DMA addressing error - IOPn (PIC or PCm) implicated.
`b6` DMA used OOR address - IOPn (PIC) implicated.
`b7` Channel error - IOPn not implicated but possibly affected.

Peripheral faults - no accompanying message

`b8` Device reported error - cannot identify unit.
`b9` Parity divert error - cannot identify unit.
`ba` Addressing error - cannot identify unit.

Message buffer audit faults

`bc` Old or new queued audit messages (with accompanying message).
`bd` Old non-queued audit messages (no accompanying message).

Configuration manager fault codes - with accompanying message

`c3` Config. manager - excessive recoverable errors.
`c4` Config. manager remove directive - excessive errors.
`c5` Config. manager remove request - attempt restoral of oos usable unit.
`c6` Config. manager limp mode - attempt restoral of oos unusable unit.

SEE PROPRIETARY NOTICE ON COVER PAGE

`c7` Config. manager limp mode - no replacement avail.
`c8` Config. manager manual remove.
`c9` Unconditional remove - not used by IODRV.

Not seen by IODRV - no accompanying message

`cb` Routine soft switch - pcpeih only.

Software errors - no accompanying message

`d1` Memory management - page invalid or not in memory.
`d2` Memory management - page index too large.
`d3` Memory management - segment invalid.
`d4` Memory management - segment index too large.
`d5` Illegal ost (from kernel).
`d6` Protection violation.
`d7` Byte or halfword addressing violation.
`d8` Instruction privilege violation.
`d9` Illegal op code.

System initialization - no accompanying messages

`e1` Substantial system recovery has occurred IOPn might be affected.
`e2` System initialization - critical.

ERROR CODES GENERATED BY IODRV

NOTE: These error codes are in hexadecimal notation.

IODRV

FUNCTION	CODE	COMMENT
iointr.c	0100	Cannot convert iorid to ucblp.
iointr.c	0101	Report error has exceeded the acceptable error count.
iointr.c	0102	Cannot reset interrupt flag in BIC.
iointr.c	0104	PIC passed out of range load printer.
iointr.c	0106	Failed to sense D2SBS status.
iointr.c	0107	D2SBS status off-normal.
procrsp.c	0200	Base priority queue overflow.
procrsp.c	0300	Cannot convert iorid to ucblp.
procrsp.c	0301	Unknown response received.
procrsp.c	0304	PC audit response failure.
procrsp.c	0400	Cannot convert iorid to ucblp.
procrsp.c	0401	Unknown response received.
kost.c	0501	OST is invalid for this dev.
kost.c	0504	Extraneous OST.
kost.c	0505	Cannot map ldin to UCB(s).
servr2.c	0600	Cannot convert iorid to ucblp.
servr2.c	0640	Failed to get PCSD's UCB.
servr2.c	0641	downucb() failed for PCSDs.
servr2.c	0642	Cannot get PC's UCB.
servr2.c	0643	downucb() failed to get PC's UCB.
servr2.c	0644	Failed to get IOP's UCB.
servr2.c	0645	Link to device handler failed.
servr2.c	0646	Link to device handler failed.
servr2.c	0670	Failed to get PCSD's UCB.
servr2.c	0671	downucb() failed for PCSDs.
servr2.c	0672	Cannot get PC's UCB.
servr2.c	0673	downucb() failed to get PC's UCB.
servr2.c	0674	Failed to get IOP's UCB.

FUNCTION	CODE	COMMENT *(continued)*
servr2.c	0677	Cannot get PC's UCB.
procrsp.c	0711	Encountered idle response queue entry.
procrsp.c	0712	Response queue load pointer out of range.
isc.c	0740	isalloc failure - align argument out of acceptable range.
isc.c	0741	isalloc failure - user requested more than segment of space.
isc.c	0742	isalloc failure - iolockseg failed.
isc.c	0743	isalloc failure - no requester nodes available.
isc.c	0744	isalloc error - isalign could not find growable element.
isc.c	0748	isalloc failure - IMF add message could not be sent to MMGR.
isc.c	0749	isalloc failure - IMF grow message could not be sent to MMGR.
isc.c	074a	isalloc failure - IMF add message could not be sent to MMGR.
isc.c	0750	isc problem - MSACK from MMGR indicates add failed.
isc.c	0751	isc failure - grow retry failed.
isc.c	0752	isc failure - isimfretry could not find growable element.
isc.c	0758	isc failure - normal grow request failed.
isc.c	0759	isc failure - retry grow request for single user failed.
isc.c	075a	isc failure - degrow request failed.
isc.c	075b	isc failure - grow of unidentifiable type failed.
isc.c	075c	isalloc failure - iolockseg failed.
isc.c	0760	isc problem - IMF could not send remove message to MMGR.
isc.c	0761	isc problem - IMF could not send degrow message to MMGR.
isc.c	0768	iscanreq failure - invalid cancellation identifier.
isc.c	0769	iscanreq failure - invalid cancellation identifier (o).
isc.c	0770	isfree problem - attempt to unlock failed.
isc.c	0771	isfree failure - invalid security identifier.
isc.c	0772	isfree failure - invalid user area address.
isc.c	077a	isunlk failure - imf could not decrement lock count.
isc.c	077b	isunlk warning - block unlocked but iounlkseg not invoked.

SEE PROPRIETARY NOTICE ON COVER PAGE

FUNCTION	CODE	COMMENT *(continued)*
isc.c	077c	isunlk failure - invalid security identifier.
isc.c	077d	isunlk failure - invalid user area address.
isc.c	077e	isc problem - no growable free space element in segment.
smc.c	0780	smalloc failure - SMID length argument exceeds maximum.
smc.c	0781	smalloc failure - invalid alignment boundary argument.
smc.c	0782	smalloc failure - block length argument exceeds allocated size.
smc.c	0783	smalloc failure - alignment argument differs from allocated block.
smc.c	0784	smalloc failure - no requester nodes available.
smc.c	0785	smalloc failure - block length argument exceeds size requested.
smc.c	0786	smalloc failure - no shared memory block request nodes available.
smc.c	0787	smalloc failure - no requester nodes available.
smc.c	0788	smalloc failure - ISC allocation failed.
smc.c	0789	smalloc error - rqip node not found.
smc.c	078a	smalloc failure - ISC allocation failed.
smc.c	0790	smcanreq failed - invalid cancel request identifier.
smc.c	0791	smcanreq failed - invalid shared memory identifier.
smc.c	0792	smcanreq failed - zero is invalid cancel request identifier.
smc.c	0798	smfree failed - invalid shared memory block address.
smc.c	0799	smfree failed - invalid security identifier.
cfr.c	07c0	cfread failure - no requester nodes available.
cfr.c	07c1	cfread failure - no file request nodes available.
cfr.c	07c2	cfread failure - no requester nodes available.
cfr.c	07c8	cfread failure - unable to open file.
cfr.c	07d0	cfread failure - isalloc unsuccessful.
cfr.c	07d1	cfread abort by cfreadbuf - no requesters or invalid state.
cfr.c	07d8	cfread - iounlk failed in cfreadack.
cfr.c	07d9	cfread failure - FMGR message acknowledgement has bad status.

SEE PROPRIETARY NOTICE ON COVER PAGE

FUNCTION	CODE	COMMENT *(continued)*
cfr.c	07da	cfread - no file request node found for read acknowledgement.
cfr.c	07e0	cfread failure - FMGR message retry threshold exceeded.
cfr.c	07e4	cfread failure - RQIP node with timeout tag not found.
cfr.c	07e8	cfcanreq error - invalid cancel request identifier.
cfr.c	07e9	cfcanreq error - file not found.
cfr.c	07ea	cfcanreq error - invalid cancel request identifier.
cfr.c	07f0	cffree - freeing file with negative use count.
cfr.c	07f1	cffree error - invalid security identifier.
cfr.c	07f2	cffree error - invalid address.
cfr.c	07f3	`cfaunlock()` - freeing file with negative use count.
cfr.c	07f8	cfread failure - message buffer overflow.
cfr.c	07f9	cfread failure - timer request unsuccessful.
cfr.c	07fa	cfread failure - message buffer overflow.
cfr.c	07fb	cfread failure - timer request unsuccessful.
cfr.c	07fc	cfread failure - kgetsgn call unsuccessful.
cfr.c	07fd	cfread - queuemn for close message to FMGR unsuccessful.
cfr.c	07fe	cfread - buffer allocation failure for close message.
faultaud.c	0802	No handler to process message audit. Format of additional string information is defined as: `UNIT` *a b* *a* = A string for device name. *b* = A decimal for device number.
ioevnt.c	0803	Invalid message type.
ioevnt.c	0804	Message does not contain an iorid.
ioevnt.c	0805	Message does not contain an iorid.
ioevnt.c	0806	IOMESG msg does not contain an iorid.
ioevnt.c	0808	Cannot link msg to device handler.
ioevnt.c	0809	Cannot link msg to maint handler.
ioevnt.c	080a	Unknown message type.
ioevnt.c	080b	Cannot link msg to device handler.
ioevnt.c	080c	IODRV both send and receiver of message (not USRACK).
ioevnt.c	0810	Not a pointer in driver's data space.

FUNCTION	CODE	COMMENT *(continued)*
ioevnt.c	0813	Cannot link message to Transport Protocol Handler.
faultaud.c	0828	lkhand1() returned ENOHAND.
faultaud.c	0829	Cannot map to a UCB.
faultaud.c	082a	Invalid input option.
faultaud.c	0830	USRACK expected in system returned message.
faultaud.c	0831	lkhand1() returned ENOHAND.
faultaud.c	0832	lkhand1() returned ENOHAND.
faultaud.c	0833	lkhand1() returned ENOHAND.
procmsg.c	0901	RID cannot map to a UCB. Format of additional string information is defined as: *a b c d* *a* = Message sender's process number in hexadecimal. *b* = '0' indicates following item in c is a MDCT RID '1' indicates that to be a UCB RID. *c* = UCB PID or MDCT RID in hexadecimal. *d* = Message sender's utility id in hexadecimal. To get a full copy of the above UCB or MDCT, use following browse procedures: ">" is the browse prompt, after it is the operator input. The line below the input line is response from browse. Comments enclosed are not part of the input/response. >**browse %-ecd** /* Enter database name for browse */ %-ecd /* browse acknowledgement */ >**dd /usr/bin/ecd_aux** /* Enter data dictionary look up */ /usr/bin/ecd_aux /* browse acknowledgement */ >**0x496a0/r** /* dump record with RID of 0x496a0 */ ..... content of the record ..... >**q** /* quit after dump completion */
procmsg.c	0902	Invalid input option (not CVTRID or CVTLDIN).
procmsg.c	0905	Cannot link msg to maint handler.

FUNCTION	CODE	COMMENT *(continued)*
procmsg.c	0906	Cannot link msg to device handler.
procmsg.c	0a01	Cannot map RID to UCB.
procmsg.c	0a06	Cannot link msg to device handler.
initma.c	0c00	`initdb()` cannot get list of IOPs.
initma.c	0c01	`initdb()` cannot attach to database.
initma.c	0c02	Failed DMAC RAM initialization - IOPn not restored.
initma.c	0c03	EMPT pointer has bad virtual address.
initma.c	0c04	EMPT has bad virtual address.
initma.c	0d00	IOP member number too large - IOPn not restored.
initma.c	0d03	Cannot convert iorid to ucblp.

initmb.c	0e07	No memory exists for PC.
initmb.c	0e08	No memory exists for PCSD.
initmb.c	0e0a	Downucbs returned fail.
initmb.c	0e0b	Downucbs function returned fail.
servr2.c	0f00	Unable to convert I/O rid to a ucblp.
servr2.c	0f01	Cannot map virt addr to a seg no. or downucbs failed for PCSDs.
servr2.c	0f02	Cannot lock segment or cannot get PC's ucb.
servr2.c	0f03	Cannot unlock segment or cannot get PC's ucb.
servr2.c	0f04	Failed to get IOP's UCB.
servr2.c	0f05	Failed to link to application handler.
servr2.c	0f06	Link to device handler failed.
picgh.c	1001	Asynchronous PIC completion failure report (not during restoral).
picgh.c	1002	Generic PIC handler in wrong state for given response.
servr1.c	1100	C_FAIL returned by CONFIG for rptrerr.
servr1.c	1101	Recovery - timeout request failure.
servr1.c	1102	Cannot convert iorid to ucblp.

FUNCTION	CODE	COMMENT *(continued)*
servr1.c	1103	Recovery will be performed on device.
picgh.c	1200	IOPn restore - no timing available.
picgh.c	1300	IOPn restore - cannot clear BIC.
picgh.c	1302	IOPn restore - invalid sequence number.
picgh.c	1303	IOPn restore - cannot reset PIC.
picgh.c	1306	IOPn restore - cannot send sysgen pio.
picgh.c	1307	IOPn restore - failed to enable interrupts.
picgh.c	1308	IOPn restore - cannot clear D2SBS.
picgh.c	1400	IOPn restore - completion code error.
picgh.c	1401	IOPn restore - invalid sequence number.
picgh.c	1500	IOPn restore - timed out.
pcgh.c	1601	Asynchronous PC completion failure report (not during restoral).
pcgh.c	1602	Generic PC handler in wrong state for given response.
pcgh.c	1701	PCn restore failed.
pcgh.c	1702	Cannot get PIC UCB.
prms.c	170a	Unable to get message buffer for PRM.
prms.c	170b	Unable to send PRM message to SIM.
pcgh.c	1800	PCn restore - command queue failure - mark PC comm in service.
pcgh.c	1801	PCn restore - command queue failure - clear PC.
pcgh.c	1802	PCn restore - command queue failure - reset PC isol ff and mark in service.
pcgh.c	1803	PCn restore - command queue failure - read PC scanback.
pcgh.c	1804	PCn restore - command queue failure - pump PC code.
pcgh.c	1805	PCn restore - command queue failure - execute PC code.
pcgh.c	1806	`getpta()` returned failure.
pcgh.c	1807	PCn restore - invalid sequence number.
pcgh.c	1808	PCn restore - command queue failure - read PC code version.
pcgh.c	1809	MTTYC restore - PC pump failure - trying alternate pumpcode filename. ECD database may have incorrect name for MTTYC pump file (TN83/TN983).
pcgh.c	180a	pcclear failed to free copy of pump file.
pcgh.c	180b	pcclear failed to cancel pending request for copy of pump file.

FUNCTION	CODE	COMMENT *(continued)*
pcgh.c	180c	Asndma1() failure.
pcgh.c	180d	pccomp cannot pump - getpta call failed.
pcgh.c	180e	pccomp cannot pump - cfread failed.
pcgh.c	180f	PCn pump abort - PC already being pumped.
pcgh.c	1810	PCn pump abort - wrong sequence number.
pcgh.c	1811	PCn restore failure - could not get UCB.
pcgh.c	1820	PCn restore - no timing available.
pcgh.c	1900	PCn restore - completion code failure mark PC comm in service.
pcgh.c	1901	PCn restore - completion code failure- clear PC.
pcgh.c	1902	PCn restore - completion code failure - reset PC isol ff and mark in service.
pcgh.c	1903	PCn restore - completion code failure - read PC scan back.
pcgh.c	1904	PCn restore - completion code failure - pump PC code.
pcgh.c	1905	PCn restore - completion code failure - execute PC code.
pcgh.c	1906	PCn restore - invalid sequence no.
pcgh.c	1907	PCn restore - no timing available.
pcgh.c	1908	PCn restore - completion code failure - read PC code version.
pcgh.c	1909	PCn restore - PC not plugged in.
pcgh.c	1930	PCn restore - unrecognized response - mark PC comm in service.
pcgh.c	1931	PCn restore - unrecognized response - clear PC.
pcgh.c	1932	PCn restore - unrecognized response - reset PC isolff and mark in service.
pcgh.c	1933	PCn restore - unrecognized response - read PC scan back.
pcgh.c	1934	PCn restore - unrecognized response - pump PC code.
pcgh.c	1935	PCn restore - unrecognized response - execute PC code.
pcgh.c	1938	PCn restore - unrecognized response - read PC code version.
pcgh.c	1a00	PCn restore - timed out - mark PC comm in service.

SL HANDLER

modglob.c	e1	A signal has been delivered to a locked model. Model name, signal number, and state of the model are given. Format of additional string information is defined as: m4:*p*, *q*, *r* *p* = A string of model name. *q* = Signal in hexadecimal. *r* = Major control block's state in decimal.

FUNCTION	CODE	COMMENT *(continued)*
`modglob.c`	`e2`	A signal is not recognized by a model. Model name, signal number, and state of the model are given. Format of additional string information is defined as: `m4:`*p, q, r* *p* = A string of model name. *q* = Signal in hexadecimal. *r* = Major control block's state in decimal.
`modglob.c`	`e3`	A signal is sent from a major model to a submodel that has not been invoked. Hex code for the major model, state of the major model, and signal number are given. Format of additional string information is defined as: `m4:`*p, q, xr* *p* = Major model in hexadecimal. *q* = State of the major model in decimal. *r* = Signal in hexadecimal.
`modglob.c`	`e4`	A major model attempted to invoke a submodel that is already invoked. Address of the major model and state of the major model are given. Format of additional string information is defined as: `m4:` *xp q* *p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
`pmsgsl3.C`	`e5`	The model failed to free an scb from the user. Some scb structures may be orphaned.
`modglob.c`	`f0`	`Idle_model()` was called with a Session Control Block address of NULL. Return address of the caller is given. Format of additional string information is defined as: `m4:`*ra x' p* *p* = Idle_model() return address in hexadecimal.

FUNCTION	CODE	COMMENT *(continued)*
`modglob.c`	`f1`	`Idle_model()` was called with a Session Control Block still joined to the user. Address of the model and state of the model is given. Format of additional string information is defined as: `m4`: *xp q* *p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
`modglob.c`	`f2`	`Idle_model()` was called with a Session Control Block still joined to the circuit. Address of the model and state of the model is given. Format of additional string information is defined as: *p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
`modglob.c`	`f3`	`Idle_model()` was called and the Input submodel has not been updated to idle. Address of the input submodel, state of the input submodel, address of the major model, and state of the major model are given. Format of additional string information is defined as: `m4`: *xp q r s* *p* = Input model control function's program address in hexadecimal. *q* = Input model control block's state in decimal. *r* = Model control function's program address in hexadecimal. *s* = Model control block's state in decimal.

SEE PROPRIETARY NOTICE ON COVER PAGE

FUNCTION	CODE	COMMENT *(continued)*
`modglob.c`	`f4`	`Idle_model()` was called and the Output submodel has not been updated to idle. Address of the output submodel, state of the output submodel, address of the major model, and state of the major model are given. Format of additional string information is defined as: `m4`: *xp q r s* *p* = Output model control function's program address in hexadecimal. *q* = Output model control block's state in decimal. *r* = Model control function's program address in hexadecimal. *s* = Model control block's state in decimal.
`modglob.c`	`f5`	`Idle_model()` was called and the auxiliary input buffer has not been released. Address and state of the model are given. Format of additional string information is defined as: `m4`: *xp q* *p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
`modglob.c`	`f6`	`Idle_model()` was called and a timer is still running. The timer type, address and state of the model are given. Format of additional string information is defined as: `m4`: *xp q r* *p* = Session control block's timer type in hexadecimal. *q* = Output model control function's program address in hexadecimal. *r* = Output model control block's state in decimal.

FUNCTION	CODE	COMMENT *(continued)*
`modglob.c`	`f7`	`Idle_model()` was called and the Session Control Block is still on the list of pcreated processes. Address of the model and state of the model are given. Format of additional string information is defined as: `m4`: *xp q* *p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.

SPECIAL WARNING MESSAGES

	CODE	COMMENT
	`fff01`	No responses to process in interrupt entry.
	`fff02`	Response not properly passed to handler (lost).
	`fff03`	Resp queue ul ptr written by someone other than IODRV.
`sltime.C`	`7`	Current timer index in SCB is not the same as the time-out index. Format of additional string information is defined as: `TIM; SCB: xp to_index`: *xq* *p* = Current timer index in hexadecimal; *q* = Time-out index in hexadecimal. Connect id mapping failed. Format of additional string information is defined as: `Tmapfail; sconnid:` *xp* *p* = Session connect id in hexadecimal.

The output of all of the above error codes can be controlled by the `SET:IODRV` and `CLR:IODRV` input commands.

PP HANDLER

Each error code is of the form *SNN*, where *S* is the severity of the error and *NN* is an error identifier unique within the given severity level.

The severity of an error will be one of the following:

`0` - Minor error. Either a resource was exhausted, a procedural error was committed, or a minor software error was encountered. In the second two cases, the user may proceed normally, though if a software error occurred, some resources may have been lost.

These messages print at level 2.

`1` - Association fatal error. An application association has gone insane. PPH will fail all send or receive requests from the user of the association until PPH is reinitialized, and any indication received by the association will result in an abort. Since the damage was limited to only the single association, other associations may proceed normally, though some resources may have been lost. Note that the affected user process may hang when errors of this sort occur. Each process will receive an E_ABORT event if the PPH is reinitialized. It is the process' responsibility to clean up and exit when this event is received.

These messages print at level 1.

`2` - PPH fatal error. PPH's global data structures have become inconsistent or corrupted. All associations will be locked up, and PPH will fail all send and receive requests from any user until PPH is reinitialized. An indication received for any association will result in an abort. Note that some or all user processes may hang when errors of this sort occur. Each process will receive an E_ABORT event if the PPH is reinitialized. It is the process' responsibility to clean up and exit when this event is received.

These messages print at level 1.

If a severity `1` or `2` error is encountered, contact the first level of technical support for instructions on how to reinitialize the PPH.

BXSL HANDLER

modglob.c	e1	A signal has been delivered to a locked model. Model name, signal number, and state of the model are given. Format of additional string information is defined as: m4:*p q r p* = A string of model name. *q* = Signal in hexadecimal. *r* = Major control block's state in decimal.
modglob.c	e2	A signal is not recognized by a model. Model name, signal number, and state of the model are given. Format of additional string information is defined as: m4:*p q r p* = A string of model name. *q* = Signal in hexadecimal. *r* = Major control block's state in decimal.
modglob.c	e3	A signal is sent from a major model to a submodel that has not been invoked. Hex code for the major model, state of the major model, and signal number are given. Format of additional string information is defined as: m4:*p q r p* = Major model in hexadecimal. *q* = State of the major model in decimal. *r* = Signal in hexadecimal.

FUNCTION	CODE	COMMENT *(continued)*
modglob.c	e4	A major model attempted to invoke a submodel that is already invoked. Address of the major model and state of the major model are given. Format of additional string information is defined as: m4: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
pmsgsl3.C	e5	The model failed to free an scb from the user. Some scb structures may be orphaned.
modglob.c	f0	Idle_model() was called with a Session Control Block address of NULL. Return address of the caller is given. Format of additional string information is defined as: m4: *p p* = Idle_model() return address in hexadecimal.
modglob.c	f1	Idle_model() was called with a Session Control Block still joined to the user. Address of the model and state of the model is given. Format of additional string information is defined as: m4: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
modglob.c	f2	Idle_model() was called with a Session Control Block still joined to the circuit. Address of the model and state of the model is given. Format of additional string information is defined as: m4: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
modglob.c	f3	Idle_model() was called and the Input submodel has not been updated to idle. Address of the input submodel, state of the input submodel, address of the major model, and state of the major model are given. Format of additional string information is defined as: m4: *p q r s p* = Input model control function's program address in hexadecimal. *q* = Input model control block's state in decimal. *r* = Model control function's program address in hexadecimal. *s* = Model control block's state in decimal.

FUNCTION	CODE	COMMENT *(continued)*
`modglob.c`	`f4`	`Idle_model()` was called and the Output submodel has not been updated to idle. Address of the output submodel, state of the output submodel, address of the major model, and state of the major model are given. Format of additional string information is defined as: `m4`: *p q r s p* = Output model control function's program address in hexadecimal. *q* = Output model control block's state in decimal. *r* = Model control function's program address in hexadecimal. *s* = Model control block's state in decimal.
`modglob.c`	`f5`	`Idle_model()` was called and the auxiliary input buffer has not been released. Address and state of the model are given. Format of additional string information is defined as: `m4`: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
`modglob.c`	`f6`	`Idle_model()` was called and a timer is still running. The timer type, address and state of the model are given. Format of additional string information is defined as: `m4`: *p q r p* = Session control block's timer type in hexadecimal. *q* = Output model control function's program address in hexadecimal. *r* = Output model control block's state in decimal.
`modglob.c`	`f7`	`Idle_model()` was called and the Session Control Block is still on the list of pcreated processes. Address of the model and state of the model are given. Format of additional string information is defined as: `m4`: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
`sltime.C`	`7`	Current timer index in SCB is not the same as the time-out index. Format of additional string information is defined as: `TIM`: *p q p* = Current timer index in hexadecimal; *q* = Time-out index in hexadecimal. Connect id mapping failed. Format of additional string information is defined as: `Tmapfail`: *p p* = Session connect id in hexadecimal;

SPECIAL WARNING MESSAGES

CODE	COMMENT
`fff01`	No responses to process in interrupt entry.

CODE COMMENT *(continued)*

`fff02`	Response not properly passed to handler (lost).
`fff03`	Resp queue ul pointer written by someone other than IODRV.

The output of all of the above error codes can be controlled by the `SET:IODRV` and `CLR:IODRV` input commands.

PP HANDLER

Each error code is of the form *SNN*, where *S* is the severity of the error and *NN* is an error identifier unique within the given severity level.

The severity of an error will be one of the following:

`0` - Minor error. Either a resource was exhausted, a procedural error was committed, or a minor software error was encountered. In the second two cases, the user may proceed normally, though if a software error occurred, some resources may have been lost.

These messages print at level 2.

`1` - Association fatal error. An application association has gone insane. PPH will fail all send or receive requests from the user of the association until PPH is reinitialized, and any indication received by the association will result in an abort. Since the damage was limited to only the single association, other associations may proceed normally, though some resources may have been lost. Note that the affected user process may hang when errors of this sort occur. Each process will receive an E_ABORT event if the PPH is reinitialized. It is the process' responsibility to clean up and exit when this event is received.

These messages print at level 1.

`2` - PPH fatal error. PPH's global data structures have become inconsistent or corrupted. All associations will be locked up, and PPH will fail all send and receive requests from any user until PPH is reinitialized. An indication received for any association will result in an abort. Note that some or all user processes may hang when errors of this sort occur. Each process will receive an E_ABORT event if the PPH is reinitialized. It is the process' responsibility to clean up and exit when this event is received.

These messages print at level 1.

If a severity `1` or `2` error is encountered, contact the first level of technical support for instructions on how to reinitialize the PPH.

BXSL HANDLER		
modglob.c	e1	A signal has been delivered to a locked model. Model name, signal number, and state of the model are given. Format of additional string information is defined as: m4:*p q r p* = A string of model name. *q* = Signal in hexadecimal. *r* = Major control block's state in decimal.
modglob.c	e2	A signal is not recognized by a model. Model name, signal number, and state of the model are given. Format of additional string information is defined as: m4:*p q r p* = A string of model name. *q* = Signal in hexadecimal. *r* = Major control block's state in decimal.
modglob.c	e3	A signal is sent from a major model to a submodel that has not been invoked. Hex code for the major model, state of the major model, and signal number are given. Format of additional string information is defined as: m4:*p q r p* = Major model in hexadecimal. *q* = State of the major model in decimal. *r* = Signal in hexadecimal.

FUNCTION	CODE	COMMENT *(continued)*
modglob.c	e4	A major model attempted to invoke a submodel that is already invoked. Address of the major model and state of the major model are given. Format of additional string information is defined as: m4: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
pmsgsl3.C	e5	The model failed to free an scb from the user. Some scb structures may be orphaned.
modglob.c	f0	Idle_model() was called with a Session Control Block address of NULL. Return address of the caller is given. Format of additional string information is defined as: m4: *p p* = Idle_model() return address in hexadecimal.
modglob.c	f1	Idle_model() was called with a Session Control Block still joined to the user. Address of the model and state of the model is given. Format of additional string information is defined as: m4: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
modglob.c	f2	Idle_model() was called with a Session Control Block still joined to the circuit. Address of the model and state of the model is given. Format of additional string information is defined as: m4: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
modglob.c	f3	Idle_model() was called and the Input submodel has not been updated to idle. Address of the input submodel, state of the input submodel, address of the major model, and state of the major model are given. Format of additional string information is defined as: m4: *p q r s p* = Input model control function's program address in hexadecimal. *q* = Input model control block's state in decimal. *r* = Model control function's program address in hexadecimal. *s* = Model control block's state in decimal.

FUNCTION	CODE	COMMENT *(continued)*
`modglob.c`	`f4`	`Idle_model()` was called and the Output submodel has not been updated to idle. Address of the output submodel, state of the output submodel, address of the major model, and state of the major model are given. Format of additional string information is defined as: `m4`: *p q r s p* = Output model control function's program address in hexadecimal. *q* = Output model control block's state in decimal. *r* = Model control function's program address in hexadecimal. *s* = Model control block's state in decimal.
`modglob.c`	`f5`	`Idle_model()` was called and the auxiliary input buffer has not been released. Address and state of the model are given. Format of additional string information is defined as: `m4`: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
`modglob.c`	`f6`	`Idle_model()` was called and a timer is still running. The timer type, address and state of the model are given. Format of additional string information is defined as: `m4`: *p q r p* = Session control block's timer type in hexadecimal. *q* = Output model control function's program address in hexadecimal. *r* = Output model control block's state in decimal.
`modglob.c`	`f7`	`Idle_model()` was called and the Session Control Block is still on the list of pcreated processes. Address of the model and state of the model are given. Format of additional string information is defined as: `m4`: *p q p* = Model control function's program address in hexadecimal. *q* = Model control block's state in decimal.
`sltime.C`	`7`	Current timer index in SCB is not the same as the time-out index. Format of additional string information is defined as: `TIM`: *p q p* = Current timer index in hexadecimal; *q* = Time-out index in hexadecimal. Connect id mapping failed. Format of additional string information is defined as: `Tmapfail`: *p p* = Session connect id in hexadecimal;

SPECIAL WARNING MESSAGES

CODE	COMMENT
`fff01`	No responses to process in interrupt entry.

CODE COMMENT *(continued)*

`fff02`	Response not properly passed to handler (lost).
`fff03`	Resp queue ul pointer written by someone other than IODRV.

The output of all of the above error codes can be controlled by the `SET:IODRV` and `CLR:IODRV` input commands.

crmvcont.c	33	Peripheral controller subdevices (PCSD) conditional remove failed by handler.
crmvcont.c	34	PCSD conditional remove failed - ECD access error.
crmvcont.c	35	Peripheral controller (PC) subsystem conditional remove failed by handler.
crmvcont.c	36	PC conditional remove failed - ECD access error.
crmvcont.c	37	Peripheral interface controller (PIC) conditional remove failed by handler.
outmsg.c	39	No timing available to continue conditional remove.
outmsg.c	40	Conditional remove failed.
outmsg.c	42	Handler failed to restore unit to service.
outmsg.c	44	Restore failed - PC not plugged in slot.
servr1.c	46	An error has occurred - abort restoral.
servr1.c	47	An error has occurred - abort conditional removal.
faultaud.c	48	Remove or restore aborted - causes diagnostic message to fail.
mainthan.c	51	Failed iolock.
mainthan.c	52	Error on asndma1 function.
mainthan.c	53	Handler is not in DMAEXP state.
mainthan.c	54	Error on asndma1 function.
mainthan.c	56	Error on timreq1 function.
mainthan.c	57	`u_stat` is in undefined state.
maintfu.c	70	Byte cnt is not correct.
maintfun.c	72	Abort the diagnostic.
maintfun.c	73	Abort the diagnostic.
updflsh.c	80	Update Flash RAM has been aborted.

ERROR CODES GENERATED BY REMOVE/RESTORE PROCESS

NOTE: The codes are in hexadecimal.

CODE	DESCRIPTION
1	Cannot enable message reception.
2	recvw function error.
3	Cannot open spooler.
4	Cannot open equipment configuration data base (ECD) manager.
5	Cannot get unit control block (UCB).
6	UCB not for requested unit.
7	Cannot get special device file.
8	Cannot open special device file.
9	Invalid command tag from diagnostic monitor program (DIAMON).
0a	Cannot reset reserve bit.
0b	sendw function error.
0c	Cannot set `u_tnum` in UCB.
0d	Request type from DIAMON not manual or auto.
0e	Cannot set `u_manrqst` in UCB.
0f	Cannot release special device file.
10	Abort request via manual input.

REASONS FOR A REMOVE OR RESTORE REQUEST BEING STOPPED

CODE	DESCRIPTION
1	The diagnostic had failures.
2	The request out of service (ROS) (power control switch) is off normal.
3	Diagnostic request only, not remove or restore.
4	The unit is already active.
5	The unit is already out of service.
6	The unit is off-line (in update or growth mode).
7	The unit is unavailable (forced).
8	The unit is in the INIT state.
9	The unit is in the GROWTH state.
a	Aborted diagnostic, request denied.

ERROR CODES GENERATED BY IODRV
FOR GROWTH AND DEGROWTH

NOTE: The codes are in hexadecimal notation.

Error Code	Description
1	Cannot get peripheral controller subdevices (PCSD) scratch size for boot time growth.
2	Cannot get PCSD unit control block (UCB) for boot time growth.
3	Cannot get peripheral controller subsystem (PC) scratch size for boot time growth.
4	`downucb()` failed to get PCSDs for boot time growth.
5	Cannot get PC UCB for boot time growth.
6	`downucb()` failed to get PCs for boot time growth.
7	Cannot get PIC UCB for boot time growth.
8	Intelligent serial controller (ISC) failed to allocate memory for boot time growth of peripheral interface controller (PIC).
9	Bad unit level for boot time growth.
a	Cannot restore the PIC during boot time growth.
b	`ioplevl()` failed to get level of unit.
c	Cannot get PC or PCSD UCB for boot time growth.
d	ISC failed to allocate memory for boot time growth of PC or PCSD.
e	Failed to restore a PIC which has no subunits.
f	Cannot initialize PC scratch area during boot time growth.
10	Cannot initialize PCSD scratch area during boot time growth.
11	Cannot link to handler for boot time growth of PC.

SEE PROPRIETARY NOTICE ON COVER PAGE

Error Code	Description (continued)
12	Cannot link to handler for boot time growth of PCSD.
20	Bad unit level for dynamic growth.
21	Cannot dynamically grow a unit, controlling unit is unequipped.
22	Cannot get UCB of the controlling unit for dynamic growth.
23	Unit has wrong major state for dynamic growth.
24	Failed to initialize PIC during dynamic growth.
25	Failed to initialize PC during dynamic growth.
26	Failed to link to handler for dynamic growth of a PC.
27	Failed to initialize PCSD during dynamic growth.
28	Failed to link to handler for dynamic growth of a PCSD.
29	Cannot get level of unit for dynamic growth.
2a	Cannot get UCB of unit for dynamic growth.
2b	ISC failed to allocate memory for dynamic growth of a unit.
2c	Cannot get size of unit for dynamic growth.
2d	Bad unit level during dynamic growth completion.
2e	`grow()` encountered bad unit level.
30	ISC failed to deallocate memory for dynamic degrowth of a PIC.
31	ISC failed to deallocate memory for dynamic degrowth of a PC.
32	ISC failed to deallocate memory for dynamic degrowth of a PCSD.
33	Invalid unit level during dynamic degrowth.
34	Cannot dynamically degrow a unit, it has equipped units below it.
35	Unit has wrong major state for dynamic degrowth.
36	Cannot link to handler for PC dynamic degrowth.
37	Cannot link to handler for PCSD dynamic growth.
38	`degrow()` encountered unit level out of range.
39	`degrow()` encountered NULL pointer to IOP data area.
40	`dyngrow()` got bad opcode for growth.
41	`dyngrow()` failed to get UCB of unit.

LLA Audit Output Messages

The LLA audit output messages come in three types:

- DIAG - Diagnostic only
- RCVY - Error detection and associated recovery actions
- UNRCVY - Detection of an unrecoverable error

NOTE: A percent character, "%", followed by *x*, *lx*, *d*, and *ld* in an error message means that the appropriate value is substituted into the output message at this point.

lx	long (four byte) hexadecimal number
x	integer hexadecimal number
ld	long (four bytes) decimal number
d	integer decimal number

Error Code	Status	Message	Descriptions
100	RCVY	STRAUD00	incore data base sanity id found to have incorrect value 0x%*lx*
101	RCVY	STRAUD01	offset to sdp SPACE structure being reset from 0x%*lx* to 0x%*x*
102	RCVY	STRAUD02	offset to user data section being reset from 0x%*lx* to 0x%*lx*
103	UNRCVY	STRAUD03	either user rootid in STARTUP(=0x%*lx*) or DMLHEAD(=0x%*lx*) is bad, use browse to patch error
104	RCVY	STRAUD04	startup data base size being reset from 0x%*lx* to 0x%*lx*

Error Code	Status	Message	Descriptions (continued)
105	RCVY	STRAUD05	space maxpage being reset from 0x%*lx* to 0x%*lx*
106	RCVY	STRAUD06	number of SDP space allocation stacks being reset from 0x%*lx* to 0x%*lx*
107	RCVY	STRAUD07	pointer to SDP stacks being reset from 0x%*lx* to 0x%*lx*
108	RCVY	STRAUD08	SDP space pointer to environ being reset from 0x%*lx* to 0x%*lx*
109	RCVY	STRAUD09	ENVIRON manager pointer being reset from 0x%*lx* to 0x%*lx*
110	RCVY	STRAUD10	SDP manager frame pointer being reset from 0x%*lx* to 0x%*lx*
111	RCVY	STRAUD11	SDP manager page id being reset from 0x%*lx* to 0x0
112	RCVY	STRAUD12	SDP manager use count being reset from 0x%*lx* to 0x1
113	RCVY	STRAUD13	SDP manager next index being reset from 0x%*lx* to 0xl
114	RCVY	STRAUD14	SDP manager previous index being reset from 0x%*lx* to 0x1
115	RCVY	STRAUD15	SDP manager page id being reset from 0x%*lx* to IDNULL
116	RCVY	STRAUD16	SDP manager use count being reset from 0x%*lx* to 0x0
117	RCVY	STRAUD17	SDP manager next index being reset from 0x%*lx* to 0x0
118	RCVY	STRAUD18	SDP manager previous index being reset from 0x%*lx* to 0x0
200	DIAG	SDPAUD00	stack entry 0x%*lx* next id found to have incorrect value 0x%*lx*
201	DIAG	SDPAUD01	stack entry 0x%*lx* on %*d* list size %ld out of range
202	RCVY	SDPAUD02	resetting depth of %*d* control stack from %*ld* to %*ld*
203	RCVY	SDPAUD03	resetting next id of %d control stack from 0x%*lx* to 0x%*lx*
204	RCVY	SDPAUD04	stack entry 0x%*lx* next id being reset from 0x%*lx* to 0x%*lx*

SEE PROPRIETARY NOTICE ON COVER PAGE

Error Code	Status	Message	Descriptions (continued)
205	RCVY	SDPAUD05	resetting next id of %*d* control stack from 0x%*lx* to 0x%*lx*
206	DIAG	SDPAUD06	four byte stack entry 0x%*1x* top found to have incorrect value 0x%*1x*.
207	RCVY	SDPAUD07	resetting top itemid of 4 byte stack from 0x%1x to 0x%1x.
208	RCVY	SDPAUD08	resetting depth of 4 byte stack from %*ld*
209	RCVY	SDPAUD09	resetting top of 4 byte stack from 0x%1x to 0x%1x
210	RCVY	SDPAUD10	4 byte stack entry 0x%1x next id being reset from 0x%1x to 0x%1x
300	UNRCVY	DMLAUD00	unable to load DMLHEAD structure with SDP
301	RCVY	DMLAUD01	DML sanity id at itemid = 0 was found to have incorrect value 0x%*lx*
302	RCVY	DMLAUD02	DML page size found to have incorrect value %*d*, should be %*d*
303	RCVY	DMLAUD03	number of rids in ridblk per page found to have incorrect value %d, should be %*d*
304	DIAG	DMLAUD04	start of set header list found to have incorrect value 0x%*lx*
305	DIAG	DMLAUD05	set start points to bad set header at 0x%*lx*
306	DIAG	DMLAUD06	end of set header list found to have incorrect value 0x%*lx*
307	DIAG	DMLAUD07	set end points to bad set header at 0x%*lx*
3.0	RCVY	DMLAUD08	set start itemid being reset to 0x%*lx* from 0x%*lx*
309	RCVY	DMLAUD09	set end itemid being reset to 0x%*lx* from 0x%*lx*
310	DIAG	DMLAUD10	start of rid block list found to have incorrect value 0x%*lx*
311	DIAG	DMLAUD11	rid block start points to bad rid block header at 0x%*lx*
312	DIAG	DMLAUD12	end of rid block list found to have incorrect value 0x%*lx*

Error Code	Status	Message	Descriptions (continued)
313	DIAG	DMLAUD13	rid block end points to bad rid block at 0x%*lx*
314	RCVY	DMLAUD14	rid block start itemid being reset to 0x%*lx* from 0x%*lx*
315	RCVY	DMLAUD15	rid block end itemid being reset to 0x%*lx* from 0x%*lx*
316	RCVY	DMLAUD16	SPACE page size found to have incorrect value %*d*, should be %*d*
400	RCVY	SETAUD00	set header sanity id at 0x%*lx* found to have incorrect value 0x%*lx*
401	RCVY	SETAUD01	previous link field in set header at 0x%*lx* being reset from 0x%*lx* to 0x%*lx*
402	RCVY	SETAUD02	next link field in set header at 0x%*lx* being reset from 0x%*lx* to 0x%*lx*
500	RCVY	RBLAUD00	rid block sanity id at 0x%*lx* found to have incorrect value 0x%*lx*
501	RCVY	RBLAUD01	previous link field in rid block at 0x%*lx* being reset from 0x%*lx* to 0x%*lx*
502	RCVY	RBLAUD02	next link field in rid block at 0x%*lx* being reset from 0x%*lx* to 0x%*lx*
600	RCVY	BCKAUD00	record sanity id at 0x%*lx* found to have incorrect value 0x%*lx*
601	RCVY	BCKAUD01	record at 0x%*lx* back link being reset from 0x%*lx* to 0x%*lx*
602	RCVY	BCKAUD02	rid block slot at 0x%*lx* being reset from 0x%*lx* to 0x%*lx*
603	RCVY	BCKAUD03	rid block slot 0x%*lx* bad, being reset from 0x%*lx* to 0x%*lx*
700	RCVY	ORPAUD00	resetting ridblk slot at 0x%*lx* to 0x%*lx* from 0x%*lx*
800	RCVY	FREAUD00	rid block 0x%*lx* being put on free rid block list at head

SEE PROPRIETARY NOTICE ON COVER PAGE

Error Code	Status	Message	Descriptions (continued)
801	RCVY	FREAUD01	rid block 0x%*lx* on free list has no free slots
900	DIAG	FRLAUD00	rid block 0x%*lx* next free link found to have incorrect value 0x%*lx*
901	DIAG	FRLAUD01	dmlhead link to start of rid block free list found to have incorrect value 0x%*lx*
1000	RCVY	FRLAUDR00	rid block 0x%*lx* next free link being reset from 0x%*lx* to 0x%*lx*
1001	RCVY	FRLAUDR01	resetting free rid block id in dmlhead from 0x%*lx* to 0x%*lx*
1200	UNRCVY	SHDAUD00	set 0x%*lx* ordinal in both header and accessid bad
1201	RCVY	SHDAUD01	set 0x%*lx* ordinal being reset from 0x%*x* to 0x%*x*
1202	RCVY	SHDAUD02	set 0x%*lx* number of access methods being reset from %*d* to %*d*
1203	RCVY	SHDAUD03	set 0x%*lx* cluster flag being reset from 0x%*x* to 0x%*x*
1204	RCVY	SHDAUD04	set 0x%*lx*, access method %*d*, accessid being reset from 0x%*lx* to 0x%*lx*
1205	RCVY	SHDAUD05	set 0x%*lx*, access method %*d*, pagesize being reset from 0x%*x* to 0x%*x*
1206	RCVY	SHDAUD06	set 0x%*lx*, access method %*d*, keylength being reset from %*d* to %*ld*
1300	RCVY	DMLAUDR0	start and end rid block links being reset from 0x%*lx*, 0x%*lx* to 0x%*lx*, 0x%*lx*
1301	RCVY	DMLAUDR1	start and end set header links being reset from 0x%*lx*, 0x%*lx* to 0x%*lx*, 0x%*lx*
1400	RCVY	DSTRAUD1400	offset to DML structure being reset from 0x%*1x* to 0x%*1x*
1401	UNRCVY	DSTRAUD1401	offset to DML structure found to be 0x%1x but should be 0x%1x

Error Code	Status	Message	Descriptions (continued)
1402	RCVY	DSTRAUD1402	disk database sanity id being reset from 0x%1x to 0x%1x
1403	UNRCVY	DSTRAUD1403	disk database sanity id found to be 0x%1x but should be 0x%1x
1404	RCVY	DSTRAUD1404	offset to sdp SPACE structure being reset from 0x%1x to 0x%1x
1405	UNRCVY	DSTRAUD1405	offset to sdp SPACE structure found to be 0x%1x but should be 0x%1x
1406	UNRCVY	DSTRAUD1406	sanity id for DML structure found to be 0x%1x but should be 0x%1x
1407	UNRCVY	DSTRAUD1407	either user rootid in STARTUP(=0x%1x) or DMLHEAD(=0x%1x) is bad, use fsdb to patch
1408	RCVY	DSTRAUD1408	dsik database size in STARTUP being reset from 0x%1x to 0x%1x
1409	UNRCVY	DSTRAUD1409	dsik database size in STARTUP found to be 0x%1x but should be 0x%1x

Table B Audit Names and Member Numbers

Audit Name	Member Number	Audit Description
CUMEM	1	Control unit memory comparison
CUSTAT	1	Control unit hardware status
ECD	1	Incore equipment configuration data base (ECD) structure
	2	Disk ECD structure
	3	Incore ECD raw data
ECDOWN	1	ECD record ownership
FMGR	1	File manager task queue
	2	File manager incore inode table
	3	File manager hash table & inode pointer
	4	File manager file table
	5	File manager capability table
	6	File manager buffers
	7	File manager mount table
	8	File manager delayed queue
	9	File manager message queue
FSBLK	1	File system block (all file systems)
FSCMPT	1	File system compaction (all file systems)
FSLINK	1	File system link (all file systems)

Table B Audit Names and Member Numbers *(continued)*

Audit Name	Member Number	Audit Description
MMGR	1	Memory manager segment descriptor table
	2	Memory manager page tables
	3	Memory manager page descriptor table
	4	Memory manager segment release
	5	Memory manager segment unlock
	9	Memory manager swap space compaction
MSGBUF	1	Message buffer queues
	2	Message buffer extenders
PMS	1	Plant measurements data base integrity
	2	Plant measurements data base recovery
PROAD	1	Process administration

Table C Hardware Unit Names and Member Numbers

Unit Name	Meaning	*Allowed Member Numbers
CU	Control unit	0 or 1
DFC	Disk file controller	0 - 7
DUI	Direct user interface	0 - 255
DUIC	DUI controller	0 - 255
EAI	Emergency action interface (G2 only)	0 - 255
HSD	High-speed synchronous data link	0 - 255
HSDC	HSD controller	0 - 255
IOP	Input/output processor	0 - 15
MHD	Moving head disk	0 - 255
MT	Magnetic tape drive	0 - 255
MTC	Magnetic tape controller	0 - 255
MTTY	Maintenance terminal	0 - 255
MTTYC	MTTY controller	0 - 255
ROP	Receive only printer	0 - 255
SBUS	SCSI Bus	0 - 255
SCC	Switching Control Center data link	0 - 255
SCSDC	Scanner & signal distributor controller	0 - 255
SDL	Synchronous data link	0 - 255
SDLC	Synchronous data link controller	0 - 255
TTY	Terminal (other than MTTY)	0 - 255
TTYC	TTY controller (other than MTTYC)	0 - 255

* These represent the limits imposed by input messages. The actual member numbers of units in a administrative module (AM) computer system are defined in the equipment configuration data base for that system.

MESSAGE CLASS NUMBER/REPORT DESTINATION NAME RELATIONSHIP

This appendix shows the relationship between the message class number (as used to access the ECD Classdef records, and as it appears in the OMDB Cross Reference Appendix), and the report destination name as it appears in output message headers.

The first table gives the translation from class number to report destination name, together with a short textual description of the message class. The second table provides the reverse translation.

Table 1 - Message Class to Report Destination Translation

MGS CLASS	REPORT DEST	DESCRIPTION
0	SPERR	Spooler Error reports
1	MAINT	General Maintenance reports
2	MAIPR	Low Priority Maintenance reports
3	DEBUG	Debugging reports
4	TIME	Data and Time reports
5	PMORT	Post-Mortem reports
6	EIH	Processor Error Interrupt reports
7	MEMF	Memory Fault reports
8	CONF	Configuration Management reports
9	DGN	Diagnostic reports
10	TLP	Trouble Locating Procedure reports
11	AUDT	Audit reports (printed)
12	AUDL	Audit reports (logged)
13	RC	Recent Change reports
14	UTIL	Field Utility reports
15	SIM	System Integrity reports
16	XUNIT	Unit Abnormal Condition reports
17	REX	Routine Exercise reports
18	GSPM	Generic Utility reports (printed)
19	GSPL	Generic Utility reports (logged)
20	LGTRM	Log File Output reports
21	PMCR	Plant Measurement Common reports

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 1 - Message Class to Report Destination Translation (continued)

MGS CLASS	REPORT DEST	DESCRIPTION
22	ULARP	Unix Level Automatic Restart Process reports
23		
24	DSKUTL	Disk Utility reports
25	DSKSYS	Disk Subsystem reports
26	PSSWD	Password Break Attempt reports
27	AUTH	Authority Administration reports

Table 2 - Report Destination to Message Class Translation

MSG CLASS	REPORT DEST	DESCRIPTION
12	AUDL	Audit reports (logged)
11	AUDT	Audit reports (printed)
27	AUTH	Authority Administration reports
8	CONF	Configuration Management reports
3	DEBUG	Debugging reports
9	DGN	Diagnostic reports
25	DSKSYS	Disk Subsystem reports
24	DSKUTL	Disk Utility reports
6	EIH	Processor Error Interrupt reports
19	GSPL	Generic Utility reports (logged)
18	GSPM	Generic Utility reports (printed)
20	LGTRM	Log File Output reports
1	MAINT	General Maintenance reports
2	MAIPR	Low Priority Maintenance reports

OMDB CROSS REFERENCE APPENDIX

The Output Message Database (OMDB) cross reference gives information about every message contained in the OMDB. The information includes its key, message class, alarm level, message text, variable offsets, sizes and translation types.

The following is an example of a cross reference entry and an explanation of the fields.

KEY = 5 MSGCLS = 1 ALARM = MAN *%1* OMDB COMPLETED

Figure 1

Field Name	Description
KEY	The key (index) into the OMDB. The key(s) for each message in the database can be found on the Output Message manual pages.
MSGCLS	The numeric message class for this message (0-255). For a complete list of message classes, refer to the MSGCLASS Appendix, MSGCLASS-APP.
ALARM	The alarm level defined for this message. It will be one of the following: CRIT, MAJ, MIN, MAN, ACT, INFO, VAR.
MESSAGE	Reason the OMDB was output. The percent sign (%) in this field indicates variable information. Please contact Lucent Technologies Customer Technical Support for assistance.

Figure 1 shows a database entry for key number 5, which has a message class of 1 (MAINT) and an alarm level of MAN (manual). The message has a variable field indicated by the %. In this particular case the variable field shows which enum the OMDB completed.

The following is a listing of the possible DMERT/UNIX® RTR OMDB keys.

Explanations of OP-FNAME Output Messages

Explanation	Reason for Failure
CANNOT CHANGE DIRECTORY TO/dev	Unable to change working directory to /dev.
CANNOT FIND FILE SYSTEM	Unable to find the first directory of the mounted file system.
CANNOT OPEN FILE SYSTEM	Cannot open the file system at its mount point.
CANNOT READ SUPERBLOCK	Unable to read the superblock for the file system.
CANNOT SEEK TO SUPERBLOCK	Unable to seek to the file system's superblock.
INCONSISTENT DATA 1	The greater value must be equal to or larger than the lower value in the range.
INVALID CHARACTER 1	The first or only range value is not an integer.
INVALID CHARACTER 2	The last range value is not an integer.
INVALID KEYWORD 1	FS must be the first keyword.
INVALID KEYWORD 2	INODE or BLOCK must be the second keyword,
MISSING DATA 1	No file system name given.
MISSING DATA 2	No inode or block # given.

Explanations of OP-FNAME Output Messages (continued)

Explanation	Reason for Failure
`MISSING KEYWORD 1`	FS must appear after FNAME.
`MISSING KEYWORD 2`	Either INODE or BLOCK must be entered.
`MOUNT TABLE ERROR`	Unable to obtain the mount table from the file manager.
`RANGE ERROR 1,` *a*	File system requested does not exist. *a* is the value entered.
`RANGE ERROR 4`	One of the following: Either the lower or only INODE value is less than two or the greater or only INODE value is larger than the maximum allowed in the file system.
`RANGE ERROR 5`	The greater or only BLOCK value is larger than the maximum allowed in the file system.
`RANGE ERROR 6`	The lower or only BLOCK value is less than the minimum allowed in the file system.

System Update Error Codes Appendix

1. Introduction

This appendix contains the error codes for System Update in Release 1. The error codes consist of six decimal digits. The first three digits indicate the nature of the error. The next two digits (xx) indicate the module in which the error occurred (that information is not provided here). The last digit (the error number, y) is used to differentiate errors of the same error code that can occur multiple times in the same module. To locate exactly which error in the module failed, each error is given its own unique error number.

2. Errors Associated with UNIX® System Calls

More information about these UNIX® System Calls can be found in *Output Message Manuals* under System Error Codes Appendix, `SYSERR-APP`. The error code that corresponds with the System Call that failed is kept in the System Update log file. It can be read by executing `OP:GEN;READLOG`. The log entry specifying the UNIX® error number will be the error code for the UNIX® call that failed. The manual pages for these System Calls may be found in the *UNIX® RTR Operating System Manuals.*

`101xxy` `mkseg() error.`

The UNIX® system call `mkseg()` failed when the System Update Enter command tried to create a segment using `makeseg()` that was to be used as a buffer when reading in a new partition from the LDFT tape and writing it to disk. `Makeseg()` may have failed because there was not enough space in memory for the segment. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`102xxy` `open() error`.

The UNIX® system call `open()` failed when System Update attempted to open the System Update log file. The open may have failed because

- the System Update log file does not exist (`/etc/log/suprlog`)
- one of the directories in the System Update log file pathname (`/etc/log`) does not exist or does not have read permissions
- the System Update log file is not readable or writable depending on what it is being opened for (reading or writing)

- too many files are open

After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`103xxy` `read() error.`

The UNIX® system call `read()` failed when System Update tried to read an entry from the System Update log file. The read may have failed because of

- a damaged log file
- physical I/O errors
- a bad `read()` parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`104xxy` `seek() error.`

The UNIX® system call `lseek()` failed when System Update attempted to seek to a particular log entry in the System Update log file. The lseek may have failed because the file descriptor for the log file is undefined, the seek went to a position before the beginning of the log file, or the log file is damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`105xxy` `write() error.`

The UNIX® system call `write()` failed when System Update attempted to write a log entry to the System Update log file. The write may have failed because of

- physical I/O errors
- a bad `write()` parameter
  - — bad buffer address from where the data is to be read
  - — number of bytes to be written is bad
  - — bad file descriptor for the System Update log file to which the data is to be written

Try to continue the update using the `UPD:GEN;CONTINUE` command.

`106xxy` `close() error.`

The UNIX® system call `close()` failed when System Update attempted to close the System Update log file. An incorrect file descriptor for the log file may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the

update over from the beginning of the Enter step.

`107xxy unlink() error.`

The UNIX® system call `unlink()` failed when the System Update Proceed command attempted to unlink (remove) the special device file that was used to copy the System Update log file to the offline disk (offline disk method) or to the backup `/etc` partition (backup partition method). The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the enter step.

`108xxy setio() error.`

The UNIX® system call `setio()` failed when System Update attempted to set the input/output mode for the disk being updated to physical I/O. The setio may have failed because the disk being updated was never opened. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the enter step.

`109xxy mknod() error.`

The UNIX® system call `mknod()` failed when the System Update Restore or Commit command attempted to make a node that would be used to copy the new/old partitions over the old/new partitions using the backup partition method. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then manually execute the applhook process.

`110xxy lcall() error.`

The UNIX® system call `lcall()` failed when System Update attempted to execute applhook (`/prc/supr/applhook`). Applhook may not exist or may not have execution permissions. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`111xxy msgenab() error.`

The UNIX® system call `msgenab()` failed when System Update attempted to enable message reception from one of the following processes: Applhook, Continue, the disk driver, MIRA, or SIM. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update

over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing he old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

`112xxy` `send() error.`

The UNIX® system call `sendw()` failed when the System Update Continue command either attempted to send an acknowledgement message to the System Update Enter process which is currently running or attempted to send a message to SIM in order to request system initialization information. Try to continue the update again using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`113xxy` `kill() error.`

The UNIX® system call `kill()` failed when the System Update Stop command attempted to terminate the System Update process that is currently running. The kill command may have failed because

- the process to be killed does not exist
- the sending process is not a superuser, and the sending and receiving processes do not have the same effective user ID
- the Process ID (PID) of the process being terminated is damaged in the System Update log; The Stop command passes this PID as a parameter to `kill()`

If the System Update still needs to be stopped, execute the Stop process unconditionally (using the UCL argument on its command line).

CAUTION: If Stop is executed unconditionally, it will attempt to terminated the running System Update process by an extreme method using the `pkill()` command. Some system resources in use by the process may not be released automatically.

`114xxy` `stat() error.`

The UNIX® system call `stat()` failed when System Update attempted to obtain status information about the disk that is to be updated. This function may have failed because the disk does not exist. If this error occurred during the Enter step of System Update, make sure that all destination file names specified on the Enter command line exist. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`115xxy` `msgport() error.`

The UNIX® system call `msgport()` failed when System Update attempted to send a message to the disk driver so that System Update could have access to an out of service disk at the partition level rather than at the disk level. The msgport may have failed because

- the disk driver is nonexistent
- the port number specified is invalid
- no process is connected to the specified port
- the message buffer is not in the user address space

Try to continue the update using the `UPD:GEN;CONTINUE` command.

`116xxy` `mount() error.`

The UNIX® system call `mount()` failed when System Update attempted to mount the `/etc` file system so that the System Update log file can be copied to the new generic or the database file system so that the ECD can by updated. The mount may have failed because

- the effective user ID of the process executing the mount is not a superuser
- the specified file system does not exist
- the file system to be mounted is not specified
- the block special file from which the file system is to be mounted is inaccessible or not an appropriate file
- the file system is already mounted
- the directory pathname that the file system is to be mounted on is not a directory
- too many file systems are mounted

Try to continue the update by using the `UPD:GEN;CONTINUE` command.

`117xxy` `unmount() error.`

The UNIX® system call `umount()` failed when System Update attempted to unmount the `/etc/` file system after the System Update log file has been copied to the new generic or the database file system after the ECD has been updated. The umount may have failed because

- the effective user ID of the process executing the umount is not a superuser

- the file system is not mounted
- there are active files on the file system being unmounted

Try to continue the update using the `UPD:GEN;CONTINUE` command.

`118xxy link() error.`

RC/V recognizes the ECD by the name `/mount directory/ecd` where mount directory represents the directory path on which the ecd file system is mounted. But, System Update recognizes the ECD by the name `/mount directory/dmert` or `/mount directory/appdmert`. In order for System Update to use RC/V, it must link its database name with the name that RC/V recognizes. This error occurs when the link fails using the UNIX® system call `link()`. The link may have failed because

- the original name that is being linked to cannot be found
- the new name that is being linked already exists
- the directory that contains the new name does not have write permissions
- the link is done by a user other than a superuser
- the link was attempted on a file that is on another file system
- the file has too many links

If this update is continued using the `UPD:GEN;CONTINUE` command, it will keep failing until this problem is resolved. Start the update over from the beginning of the Enter step.

`119xxy create() error.`

The UNIX® system call `create()` failed when a file was being created under the `/tmp` directory in one of the following situations: the System Update Enter command attempted to create the System Update log file, or the System Update Readlog command attempted to create a buffer used to store log entries that are about to be printed to the terminal and to the ROP. The create may have failed because

- a directory in the pathname of the file to be created is not searchable
- the file to be created does not exist and the directory in which it is to be created does not have write permission
- the file to be created does exist an does not have write permissions
- the file to be created is a directory
- the maximum number of files (20) are already open
- there is not enough space in the `/tmp` file system for the created file

After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`120xxy  vcall() error.`

The UNIX® system call `vcall()` failed when the System Update Continue command executed the System Update process that is being continued. This function normally fails when the process being executed does not exist or does not have execution permissions. Make sure that all System Update processes in `/prc/supr` have execution permissions. After resolving the problem, re-enter the System Update command `UPD:GEN;CONTINUE`.

`121xxy  rmovseg() error.`

The UNIX® system call `rmovseg()` failed when the System Update Enter command attempted to remove a previously created segment after it was no longer needed. The segment may have been created in the first place to be used as: 1) a buffer used to hold the new generic which was read in from tape and then written to disk, or 2) a buffer used to hold the new generic which was read from the primary partitions and written to the backup partitions using the offline disk method. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`122xxy  mkseg() error.`

The UNIX® system call `mkseg()` failed when the System Update Enter command tried to create a segment using `makeseg()` that was to be used as a buffer when reading in an updated segment from the offline disk and writing it to its backup partition. `makeseg()` may have failed because there was not enough space in memory for the segment. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`123xxy  fopen() error.`

The UNIX® system call `fopen()` failed when the System Update Restore or Commit command attempted to open a partition that is to be used to update the old or new generic to the new or old generic. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.

SEE PROPRIETARY NOTICE ON COVER PAGE

`124xxy` `open() error.`

The UNIX® system call `open()` failed when System Update attempted to open the ECD. The open may have failed because

- the ECD special device file does not exist (`/dev/ecd`)
- the root directory which contains the ECD does not have read permissions
- the ECD is not readable or writable depending on what it is being opened for (reading or writing)
- too many files are open

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

`125xxy` `open() error.`

The UNIX® system call `open()` failed when System Update attempted to open the disk that is being updated for one of the following reasons:

- the VTOC needs to be read
- the backup partitions need to be updated during the Enter process using the offline disk method
- the little boot start block address in the VTOC needs to be restored

The `open()` may have failed because

- the disk does not exist
- one of the directories in the disk pathname does not exist or does not have read permissions
- the disk is not readable or writable depending on what it is being opened for (reading or writing)
- too many files are open

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`126xxy  open() error.`

The UNIX® system call `open()` failed when System Update attempted to open one of the partitions that is being updated. The open may have failed because

- the partition does not exist
- one of the directories in the partition pathname does not exist or does not have read permissions
- the partition is not readable or writable depending on what it is being opened for (reading or writing)
- too many files are open

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`127xxy  read() error.`

The UNIX® system call `read()` failed when System Update tried to read the VTOC from the LDFT tape. The read may have failed because of

- physical I/O errors
- a bad read() parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Make sure the "head" of the tape drive is clean and continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`128xxy  read() error.`

The UNIX® system call `read()` failed when System Update tried to read the VTOC from disk. The read may have failed because of

- physical I/O errors
- a bad read() parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

SEE PROPRIETARY NOTICE ON COVER PAGE

`129xxy read() error.`

The UNIX® system call `read()` failed when System Update tried to read a data block from an LDFT tape. The read may have failed because of

- physical I/O errors
- a bad `read()` parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Make sure the "head" of the tape drive is clean and continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`130xxy read() error.`

The UNIX® system call `read()` failed when System Update tried to read a partition from the offline disk for one of two reasons: the hash sum needed to be computed to make sure that the partition was written correctly, or the backup partition needed to be updated from its primary partition which contained the new generic (for offline disk method only). The read may have failed because of

- physical I/O errors
- a bad `read()` parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`131xxy read() error.`

The UNIX® system call `read()` failed when System Update tried to read a header from an LDFT tape. The read may have failed because of

- physical I/O errors
- a bad `read()` parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Make sure the "head" of the tape drive is clean and continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

SEE PROPRIETARY NOTICE ON COVER PAGE

`132xxy lseek() error.`

The UNIX® system call `lseek()` failed when System Update attempted to seek to a particular partition on disk. The lseek may have failed because the file descriptor for the disk is undefined, or the seek went to a position before the beginning of the disk. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the disk may be damaged.

`133xxy lseek() error.`

The UNIX® system call `lseek()` failed when System Update attempted to seek to a previous block on an LDFT tape. A tape read failure may have occurred. If this happens, System Update automatically seeks back to the beginning of the set of blocks it tried to read and tries to read those blocks again. Since a read error may have occurred first, check the possible causes for a read error located at error codes `103xxy`, and `127xxy - 131xxy` and take the action listed there. If a read error is not the problem, make sure the "head" of the tape drive is clean and continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`134xxy write() error.`

The UNIX® system call `write()` failed when the System Update Readlog command attempted to write log entries to an output buffer which is later spooled to the terminal and to the ROP. The write may have failed because of

- physical I/O errors
- a bad `write()` parameter
  - — bad buffer address where the data is to be read from
  - — number of bytes to be written is bad
  - — bad file descriptor for the buffer to which the data is to be written

The log file cannot be read.

`135xxy write() error.`

The UNIX® system call `write()` failed when the System Update Enter command attempted to write the VTOC to the disk being updated. The write may have failed because of

- physical I/O errors
- a bad `write()` parameter
  - — bad buffer address from where the data is to be read
  - — number of bytes to be written is bad
  - — bad file descriptor for the disk to which the data is to be written

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the

error persists, the disk may be damaged.

`136xxy write() error.`

The UNIX® system call `write()` failed when the System Update Enter command attempted to write a partition to the disk being updated. The write may have failed because of

- physical I/O errors
- a bad write() parameter
  - — bad buffer address where the data is to be read from
  - — number of bytes to be written is bad
  - — bad file descriptor for the disk to which the data is to be written

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the disk may be damaged.

`137xxy fclose() error.`

The UNIX® system call `fclose()` failed when the System Update Restore or Commit command attempted to close a partition that was used to update the old or new generic to the new or old generic. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.

`138xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close the disk being updated. An incorrect file descriptor for the disk may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the Enter step.

`139xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close the ECD. An incorrect file descriptor for the ECD may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

`140xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close a partition on the disk being updated. An incorrect file descriptor for the disk partition may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`141xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close the tape device from which the new generic was read. An incorrect file descriptor for the tape device may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`142xxy unlink() error.`

The UNIX® system call `unlink()` failed when System Update attempted to unlink (remove) the special device file that was used to access the offline disk when updating the backup partitions using the offline disk method. The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`143xxy unlink() error.`

The UNIX® system call `unlink()` failed when System Update attempted to unlink (remove) the special device file that was used to access a partition being updated. The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

SEE PROPRIETARY NOTICE ON COVER PAGE

`144xxy unlink() error.`

The UNIX® system call `unlink()` failed when System Update attempted to unlink (remove) a special device file that was used to perform a Recent Change function on the ECD. The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`145xxy setio() error.`

The UNIX® system call `setio()` failed when System Update attempted to set the Input/Output mode for the tape device from which the new generic is to be read to physical I/O. The setio may have failed because the tape device was never opened. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`146xxy setio() error.`

The UNIX® system call `setio()` failed when System Update attempted to set the Input/Output mode for a partition to be updated to physical I/O. The setio may have failed because the partition was never opened. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`147xxy mknod() error.`

The UNIX® system call `mknod()` failed when the System Update Proceed command attempted to make a node that would be used to copy the System Update log file to the offline disk (offline disk method) or to the backup `/etc` partition (backup partition method). Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update from the beginning of the Enter step.

`148xxy mknod() error.`

The UNIX® system call `mknod()` failed when System Update attempted to make a node that would be used to update the backup partitions using the offline disk method. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update from the beginning of the Enter step.

`149xxy mknod() error.`

The UNIX® system call `mknod()` failed when System Update attempted to make a node that would be used to copy the new generic to the offline disk (offline disk method) or to the backup partitions (backup partition method). Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update from the beginning of the Enter step.

SEE PROPRIETARY NOTICE ON COVER PAGE

`150xxy mknod() error.`

The UNIX® system call `mknod()` failed when System Update attempted to make a node that would be used to perform a Recent Change function on the ECD. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update from the beginning of the Enter step.

`151xxy fopen() error.`

The UNIX® system call `fopen()` failed when System Update attempted to open a file (located in `/tmp`) that is to be used to create a Recent Change script which is used to change the ECD. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`152xxy fclose() error.`

The UNIX® system call `fclose()` failed when System Update attempted to close the file (located in `/tmp`) that contains a Recent Change script used to change the ECD. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`153xxy sendpw error.`

The UNIX® system call `sendpw()` failed when System Update attempted to send a message to MIRA in order to remove or restore a UCB. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

3. Errors Associated with the Input Data

`201xxy` VTOC is not the first piece of data on the mounted LDFT tape.

This error occurred when System Update could not find the VTOC because

- System Update incorrectly thinks it should have the first tape of the sequence and therefore searches for the VTOC

SEE PROPRIETARY NOTICE ON COVER PAGE

- the wrong tape may have been mounted; check to make sure that the mounted LDFT tape is the first tape in the sequence

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the problem persists, the LDFT tape may be damaged. Regenerate a new tape.

`202xxy` HEADER and VTOC addresses are different.

While a partition entry was being searched for in the disk VTOC, the search erroneously went beyond the scope of the VTOC. The disk partition address that was specified in the LDFT header for that partition does not match the disk partition address in the corresponding VTOC entry on the disk. The LDFT tape may be damaged. Regenerate a new LDFT tape and start the update over from the beginning of the Enter step.

`203xxy` Disk and tape VTOCs are different.

The VTOC entry on tape must be identical to the VTOC entry on disk. The VTOC on the LDFT tape may be damaged. Regenerate a new tape sequence.

`204xxy` A partition being updated does not have a backup partition.

All partitions must have backup partitions if they are being updated via the backup partition method (except for the VTOC and little boot partitions). If some partitions need to be updated but do not have backup partitions, start the update over from the beginning of the Enter step using the offline disk method.

`205xxy` Primary and backup versions of same partition found on same tape.

An LDFT tape can only contain the primary or the backup version of the same partition. Both cannot be found on the LDFT tape. The LDFT tape may be damaged. Regenerate a new tape.

`206xxy` Partition data spans across partition boundaries.

Each header on the LDFT tape contains the starting address for that partition on the disk and the partition's size. The address plus the size gives the starting address for the next partition. But, in this case, the address plus the size gives an address that is past the starting address for the next partition. The LDFT tape may be damaged. Regenerate a new tape.

`207xxy` Two VTOCs found in same tape sequence.

Only one VTOC is allowed per tape sequence. This may be a bad tape sequence. The entire tape sequence should be regenerated.

`208xxy` End-of-Tape and End-of-Sequence flags on LDFT tape are incompatible.

The End of Sequence flag is set in the last header on the last tape, but the End of Tape flag is not set. This may be a bad tape. Regenerate a new tape.

SEE PROPRIETARY NOTICE ON COVER PAGE

`209xxy` Different hash sums.

Hash sum - a computed integer used to make sure that the data on the LDFT tape has not been damaged since the tape was created. The hash sum that is in one of the headers on the LDFT tape for that header or its data block does not match the hash sum that System Update computed for that header or data block.

Make sure that the "head" of the tape drive is clean and try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`210xxy` Ichk() detected error(s) on file system.

At this time, this error will never occur because System Update does not call `ichk()`.

`211xxy` Cannot find VTOC partition entry in the VTOC VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

`212xxy` Cannot find the RTC partition entry in the VTOC on the disk.

The VTOC on the disk may be bad. This update cannot be continued until this problem is resolved.

`213xxy` Cannot find ETC partition entry in the VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

`214xxy` Cannot find ECD partition entry in the VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

`215xxy` SG ID on LDFT tape does not match the SG ID on previous LDFT tape.

SG ID - identifier in the first header of an LDFT tape that describes the SG database from which this tape was written. It is used to make sure that multiple tapes and sequences were written using the same SG database. The SG ID on the LDFT tape does not match the SG ID on the previously loaded LDFT tape. This is not really an error, just a warning. This may occur if a field site uses its own SG database when generating tapes. Continue the update using the `UPD:GEN;CONTINUE` command and the error will be ignored.

`216xxy` Generic version number on LDFT tape does not match generic version number on previous LDFT tape.

Generic version number - used to make sure that multiple tapes and sequences were written using the same generic version.

Continue the update using the `UPD:GEN;CONTINUE` command and the error will be ignored.

SEE PROPRIETARY NOTICE ON COVER PAGE

`217xxy` Little boot entry in offline disk VTOC could not be found when System Update attempted to restore the little boot start block address to its valid value.

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the VTOC on the offline disk may be damaged.

`218xxy` Little boot entry in the VTOC on the LDFT tape is different from the little boot entry in the VTOC on the disk when the backup partition method is being used.

During a backup partition method update, the old and new VTOCs must be identical. The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

`219xxy` One of the VTOC entries for a partition being updated (excluding VTOC and little boot) in the VTOC on the LDFT tape is different from its corresponding VTOC entry on disk when the backup partition method is being used.

During a backup partition method update, the old and new VTOCs must be identical. The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

`220xxy` One of the VTOC entries for a partition being updated (excluding VTOC and little boot) in the VTOC on the LDFT tape is different from its corresponding VTOC entry on disk when the offline disk method is being used.

This partition was also already updated in a previous tape sequence. During an offline disk method update, a VTOC may be different only as long as the partition corresponding to the VTOC entry that changed has not been updated in a previous tape sequence.

`221xxy` VTOC entry for little boot on LDFT tape is different from VTOC entry for little boot on disk when the offline disk method is being used.

The little boot partition was also already updated in a previous tape sequence. During an offline disk method update, a VTOC may be different only as long as the partition corresponding to the VTOC entry that changed has not been updated in a previous tape sequence.

`222xxy` Header for VTOC on LDFT tape contains starting address for VTOC on the disk and the VTOC's size.

The address plus the size gives the starting address for the next partition. But, in this case, the address plus the size gives an address that is past the starting address for the next partition. The LDFT tape may be damaged. Regenerate a new tape.

`223xxy` VTOC entry for primary source or backup destination partition not found in offline disk VTOC.

When updating the backup partitions using the offline disk method, the VTOC entry for a source (primary) or destination (backup) partition could not be found in the offline disk VTOC. The offline disk VTOC may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

SEE PROPRIETARY NOTICE ON COVER PAGE

`224xxy` VTOC entry in VTOC on LDFT tape could not be found.

This may be a bad VTOC on the tape. Regenerate a new tape and start the update over from the beginning of the Enter step.

`225xxy` Little boot entry in VTOC read from LDFT tape could not be found when System Update attempted to invalidate the little boot start block address to prevent a boot from occurring from the disk that is being updated.

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the VTOC on the LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

`226xxy` VTOC entry could not be found in VTOC on the mounted LDFT tape.

The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

`227xxy` Note: This error message is not available in all releases.

UNIX® RTR R6.2 only:
The pack number specified in the VTOC on the mounted LDFT tape does not match the destination VTOC number. Check that the proper destination VTOC was entered. If correct, verify the intended destination device for the tape. (Check that proper tape was mounted.)

UNIX® RTR R6.4 and later:
The pack ids in the tape and destination disk VTOCs do not match. Check that the proper tape is mounted, and that the destination VTOC was entered correctly. This check can be overridden by performing the update unconditionally with the UCL parameter.

4. Internal System Update Errors

`301xxy` Too many command line arguments used.

The maximum number of arguments allowed on the command line has been exceeded for one of the following commands: `Continue`, `Readlog`, `Stop`, `Commit`, `Restore`, `Backout`, `Enter`, or `Proceed`. The only way this error message could appear is if the System Update process has been executed from a UNIX® terminal instead of a user terminal. Re-execute the System Update process using the correct arguments, or execute the process from a user terminal using the corresponding PDS or MML Craft Input Message.

`302xxy` Message returned was not what was expected.

Any time System Update sends a message to SIM, the disk driver, applhook, or continue, it checks the return message that is sent back. In this case, a bad message was returned or the time limit set to receive the message from continue expired. Try to continue the update using the `UPD:GEN;CONTINUE` command.

SEE PROPRIETARY NOTICE ON COVER PAGE

`303xxy` Internal buffers are too small.

The data after a header on the LDFT tape is larger than one segment. Up to only one segment is allowed after each header. The LDFT tape may be damaged. Regenerate a new tape.

`304xxy` Cannot locate System Update log.

Any time the System Update log is accessed, it is assumed to be in `/etc/log/suprlog`. In this case, it could not be found. System Update may have been attempting to retrieve or write a log entry or attempting to read the entire log file. The log file may have been accidentally removed. If the System Update Readlog command was executed to read the log file, the log file cannot be read since Readlog cannot locate it. If any other System Update process was executed, start the update over from the beginning of the Enter step.

`305xxy` No "enter" entries in log.

Log entries for the Enter step cannot be found in the System Update log. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the log file may be damaged. Start the update over from the beginning of the Enter step.

`306xxy` Log entries are inconsistent.

The System Update Continue command found that one of the entries in the System Update log file contains a bad value (the type of log entry, tape sequence number, or disk pair number). The System Update log may be damaged. Start the update over from the beginning of the Enter step.

`307xxy` Bad process type.

A bad process type was found in one of the log entries in the System Update log file. This error occurs when System Update tries to continue an update and the entry for the System Update process that is being continued cannot be found in the log. The log may be damaged. Start the entire update over from the beginning of the Enter step.

`308xxy` Bad update method.

The System Update Readlog command found an incorrect update method specified in one of the System Update log file entries (Begin or Disk) or the System Update Enter command found an incorrect update method specified on its command line. Only two methods are allowed: backup partition method or off-line disk method. If the Readlog command was executed, the log may be damaged and therefore cannot be read. If the Enter command was executed, start the update over from the beginning of the Enter step.

`309xxy` Bad execution mode.

The System Update Readlog command found a bad execution mode in a Begin log entry for one of the System Update processes. Only two execution modes are allowed: conditional or unconditional. The log file may be damaged and

SEE PROPRIETARY NOTICE ON COVER PAGE

therefore cannot be read.

`310xxy` Bad bootfile.

The System Update Readlog command found an incorrect bootfile specified in the End entry in the System Update log file. Only two bootfile types are allowed: DMERT or APPDMERT. The log file may be damaged and therefore cannot be read.

`311xxy` Bad file system.

The System Update Readlog command found an incorrect file system specified in the End entry in the System Update log file. Only two file systems are allowed: PRIMARY or SECONDARY. The log file may be damaged and therefore cannot be read.

`312xxy` Bad log entry.

A bad disk pair number was found in either the Disk or End log entry in the System Update log. The log file may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`313xxy` Bad completion code.

The System Update Readlog command found that the End entry in the System Update log file contains a bad completion code. Only two completion codes are allowed: SUCCESS or FAILURE. The log may be damaged and therefore cannot be read.

`314xxy` Tried to reserve the same disk twice.

System Update tried to reserve a disk that has already been reserved. Try to continue the update using the `UPD:GEN;CONTINUE` command.

`315xxy` Tried to release an unreserved disk.

System Update tried to release a disk that was never previously reserved. Try to continue the update using the `UPD:GEN;CONTINUE` command.

`316xxy` Bad UCB disk state requested.

A bad state was specified when System Update attempted to change the state of a UCB (valid states = `OOS`, `ACT`) or a disk (valid states = `OOS`, `OFL`). Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists,

SEE PROPRIETARY NOTICE ON COVER PAGE

either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

`317xxy` Bad sequence indicator.

The System Update Readlog command found that the Tape entry in the System Update log file contains a bad sequence number. Only three sequence entries are allowed: FIRST, SECOND, or THIRD. The log may be damaged and therefore cannot be read.

`318xxy` Bad continuable indicator.

The System Update Readlog command found that the End entry of the System Update log contains a bad continuable flag variable. Only two continuable flag variables are allowed: YES or NO. The log may be damaged and therefore cannot be read.

`319xxy` BEGIN ENTER log entry could not be found in the System Update log file.

The log may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`320xxy` System Update Enter command terminated.

The System Update Enter command terminated while it was updating the backup partitions using the offline disk method and then was continued using the `UPD:GEN;CONTINUE` command. In order for System Update to know which partition it was in the middle of updating before it terminated, it looks in the log file and attempts to find the last UPDATE ENTER log entry.

In this case, the UPDATE ENTER log entry could not be found. Therefore, System Update could not do any further processing. Try to continue the update again using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter command.

`321xxy` VTOC on FDFT tape exceeds maximum allowed.

The size of the VTOC on the LDFT tape is greater than the maximum size allowed: 512 bytes (for Generic 2) and 1024 bytes (for Release 1). The VTOC may be damaged on the LDFT tape. Regenerate a new tape.

322xxy Write log entry found in System Update log file without a proceeding Disk log entry.

The log file may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

323xxy Log file retrived not requested.

System Update requested a log entry (Disk, Tape, or End) from the log file, but the log entry that was retrieved was not the one requested. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

324xxy Corresponding disk log not found.

While searching the System Update log file, System Update could not find the Disk log entry that corresponds to the bootdisk being updated. Try to continue the update using the `UPD:GEN;CONTINUE` command.

325xxy Incorrect update method specified.

System Update found an incorrect update method specified in the internal variable `glob_method` which was obtained through the Enter command line or the System Update log file. Only two methods are allowed: backup partition method or off-line disk method. The log may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the entire update over from the beginning of the Enter step.

326xxy Bad execution mode found on Enter command line.

Only two execution modes are allowed: conditional or unconditional. Start the update over from the beginning of the Enter step.

327xxy Bad sequence option in log file.

System Update found bad sequence option in the log file. Valid sequence options are: SGL, DBL, or TPL. The log may be damaged and therefore cannot be read. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter command.

5. Errors Associated with Execution

401xxy Context of request is invalid.

The System Update Enter command was executed conditionally (without the UCL argument) while the System Update log file contained log entries (possibly from a previous update session). Either remove the log file (`/etc/log/suprlog`) or execute the Enter command using the UCL argument on the command line.

`402xxy` Bad input file (tape unit) specified.

The input file specified (normally a tape unit) on the Enter command line is invalid. Make sure that the name is entered correctly (the name of a tape unit is of the form `/dev/mt`*nn* where *nn* is a two digit hexadecimal number). If the input is from a tape, make sure that the unit is on-line. Re-execute the Enter command with the UCL argument on its command line.

`403xxy` Data not in sync.

The tape being read is either not a tape usable with System Update (not in LDFT format), the data on it has been mutilated, or the LDFT formatted tape being used was created for a different processor. Make sure that the correct tape has been mounted, and continue the update using the `UPD:GEN;CONTINUE` input command.

`404xxy` Data sequence id incorrect (wrong tape).

The data input does not belong on the disk being written. Make sure that correct tape has been mounted and continue the update using the `UPD:GEN;CONTINUE` input command.

`405xxy` Data sequence number out of order.

One of the tapes in the sequence has been mounted out of order. Mount the correct tape and continue the update using the `UPD:GEN;CONTINUE` input command.

`406xxy` Bad destination VTOC specified.

The filename specified for the disk being updated is not a block special device file or the disk cannot be opened. Check that the filename was entered correctly. If not, re-execute the Enter command using the UCL argument on the command line.

`407xxy` This error code is no longer used.

`408xxy` User did not return from "continue" request.

When a new tape needs to be mounted, a `mount tape and continue` message appears. After the user mounts the tape, the `UPD:GEN;CONTINUE` command needs to be executed in order for the update to continue its processing.

System Update waits 30 minutes for the Continue command to be executed. If it is not executed, another `mount tape and continue` message appears and System Update waits another 30 minutes for the Continue command to be executed. If it still is not executed, System Update terminates with this error code. Execute the `UPD:GEN;CONTINUE` command to continue the update process where System Update left off.

SEE PROPRIETARY NOTICE ON COVER PAGE

`409xxy` Attempt to run two system update processes.

The user attempted to

- run two System Update processes at the same time (when one System Update process is running another one may not be started unless it is one of the following: Stop, Continue, or Readlog)
- run a System Update process while Field Update or PDT is currently running (a System Update cannot be performed while Field Update or PDT is running)

If a System Update process needs to be stopped, the System Update Stop command may be used to stop it. If this is not successful, seek technical assistance.

`410xxy` User stopped process (not a fault condition).

This `error` code is used to acknowledge that the user terminated one of the System Update processes (`Commit`, `Restore`, `Backout`, `Enter`, or `Proceed`) using the System Update `Stop` command. There is no fault condition associated with this code.

`411xxy` No process exists to talk to (e.g., nothing to stop).

The user has attempted to stop a System Update process using the System Update Stop command when there are no System Update processes that are running.

`412xxy` System update log is empty.

The System Update log file does not contain any log entries when it is expected to in one of the following situations:

- An attempt to continue a System Update process was made, but the command to be continued could not be figured out since this information is contained in the log file and the log file is either empty or does not contain the BEGIN ENTER log entry,
- The log file was attempted to be read via the System Update Readlog command, but there was nothing to read since the log file was empty,
- One of the System Update processes (excluding the Enter process) was executed when the log file was empty. These processes need information in the log in order to complete their processing, or
- The log file was attempted to be searched for information, but the log file is empty.

Start the update over from the beginning of the Enter command.

`413xxy` Off-line disk method started with one disk active.

The offline disk method is being used and a disk was selected by System Update to retain the old generic, but this disk is not in the Active state. All disk pairs must be duplexed (active) before the Enter command is executed. Restore

SEE PROPRIETARY NOTICE ON COVER PAGE

all affected disks to service and execute the Enter command again using the UCL argument on its command line. If this error occurred because the System Update Enter process aborted leaving one or more disks in the offline state, execute the Restore command using the UCL argument on its command line and wait for it to complete. Then, start the update over from the beginning of the Enter step.

`414xxy` In off-line disk method with both disks active.

An offline disk was somehow restored to service when System Update expected it to be in the offline state. If all affected disks are offline, try to continue the update using the `UPD:GEN;CONTINUE` command. If an affected disk(s) is active or if the error persists after the continue, start the update over from the beginning of the Enter step.

`415xxy` Process did not log failure termination.

The user attempted to restart a System Update process with the Continue command but the last System Update process that was run logged a successful termination and therefore cannot be continued. Dumping the System Update log file using the Readlog command may be helpful in determining what happened to the last process. Try to execute the next System Update process.

`416xxy` Process is not continuable.

The user attempted to restart a System Update process using the Continue command, but the last System Update process that was run failed due to a problem which would usually cause it to fail again. For example, one of the pathnames in an Enter input message was bad, or one or more log entries needed for continuing the process are corrupted.

Dumping the log file using the Readlog command may be helpful in determining what happened to the original process. Try to re-enter the original input message using the UCL argument on the command line (for the Enter command, make sure the disks are duplexed first - see error code `413xxy`).

`417xxy` Disk is no longer off-line.

A specified disk device is not in any of the following valid states: offline, out of service, or active. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Enter process, restore the disk to an active state and re-execute the Enter command using the UCL argument on its command line.
- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.

`418xxy` Bad destination DFC specified.

An invalid DFC unit number was specified as an argument to the `OFLDISK` keyword on the Enter command line. Valid DFC unit numbers are 0 (zero) and 1 (one). The DFC number can be omitted, in which case the Enter process will chose DFC 1.

`419xxy` Command executed out of order.

A System Update command was executed out of order.

- The `Proceed` command was executed before the `Enter` command completed successfully.
- The `Commit` command was executed before the Proceed command completed successfully.
- The `Backout` command was executed before the Proceed command completed successfully.
- If error code `y` is `4`, the `Restore` command was executed before the `Proceed` command completed successfully. Execute the `Restore` command unconditionally using the UCL argument on its command line.
- If error code `y` is `5`, `Conditional Restore` after successful `Backout` or `Proceed` is no longer valid. Execute the `Restore` command unconditionally using the UCL argument on its command line.

`420xxy` Incorrect file system base is running.

The wrong file system base is currently running for the System Update command that was just executed.

- `Backout` and `Commit` commands - the file system currently running needs to be the new generic.
- `Proceed` and `Restore` commands - the file system currently running needs to be the old generic.

If the wrong command was executed, execute the right one. If the right command was executed, boot the system so that it is running on the correct file system, then execute the command again.

`421xxy` Disk not in active state.

The offline disk method is being used and a disk was selected by System Update to contain the new generic, but this disk is not in the Active state. All disk pairs must be duplexed (active) before the `Enter` command is executed. Restore all affected disks to service and execute the `Enter` command again.
If this error occurred because the System Update Enter process aborted leaving

SEE PROPRIETARY NOTICE ON COVER PAGE

one or more disks in the offline state, execute the Restore command using the UCL argument on the command line and wait for it to complete. Then, start the update over from the beginning of the Enter step.

`422xxy` Disk being updated not in offline state.

When the backup partitions are being updated using the offline disk method, the disk being updated should be in the offline state, but it is not. Check the Common Processor Display page (page 102) or another page which shows the MHDs. If all disks affected are active, try to re-execute the Enter command using the UCL argument on the command line. If any affected disks are out of service, restore them and then re-execute the Enter command using the UCL argument on the command line.

`423xxy` Disk being updated is no longer in offline state.

The disk being updated, which should be in the offline state, is no longer in that state. Check the Common Processor Display page (page 102) or another page which shows the MHDs. If all disks affected are active, try to re-execute the Enter command using the UCL argument on the command line. If any affected disks are out of service, restore them and then re-execute the Enter command using the UCL argument on the command line.

6. Errors Associated with Application Processing

`501xxy` Time limit message error.

This error may have occurred because

- the application process did not send a message indicating a time limit that it needs to do its processing
- the message that the application process sent to set a time limit was damaged
- the UNIX® RTR `send()` process failed when the application process tried to use it to send a time limit message to the System Update Process

If the error occurred because the application process did not send a time limit message, start the application process over using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`502xxy` Application hook process failed or did not return.

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

7. Errors Associated with Interfaces with UNIX® RTR

`601xxy` User is not privileged for execution.

The System Update process must be executed from a login that has superuser permissions. After resolving the problem, try to continue the update using the

`UPD:GEN;CONTINUE` command.

`602xxy` Timeout for SIM message.

When System Update sends SIM a message, it sets a time out limit by which it must receive the return message from SIM. This error occurred when System Update was waiting for the return message from SIM. This error may have occurred because

- System Update did not receive a return message from SIM within the time out limit
- the `recvw()` process that waits for the return message from SIM failed

Try to continue the update using the `UPD:GEN;CONTINUE` command.

`603xxy` Time out for MIRA message.

When System Update sends MIRA a message, it sets a time out limit by which it must receive the return message from MIRA. This error occurred when System Update was waiting for the return message from MIRA. This error may have occurred because

- System Update did not receive a return message from MIRA within the time out limit
- the `recvw()` process that waits for the return message from MIRA failed

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the `Enter` step, or take one of the following actions:

- If this error occurred during the `Restore` process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the `Commit` process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.
- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`604xxy` Timeout for disk driver message.

When System Update sends the disk driver a message, it sets a time out limit by which it must receive the return message from the disk driver. This error occurred when System Update was waiting for the return message from the disk driver. This error may have occurred because

- System Update did not receive a return message from the disk driver within the time out limit
- the `recvw()` process that waits for the return message from the disk driver

failed

Try to continue the update using the `UPD:GEN;CONTINUE` command.

`605xxy1` Bad MIRA return on message.

When System Update receives a return message from MIRA, it checks certain fields in the message for bad values. This error occurs when System Update finds a bad value in one of the fields in the return message. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.
- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`606xxy` Bad disk driver return on message.

When System Update receives a return message from the disk driver, it checks the return code that is in the message. The value of the return code must be zero. This error occurred because the return code was a value other than zero. Try to continue the update using the `UPD:GEN;CONTINUE` command.

`607xxy` Wrong disk state result.

After MIRA changes the state of the disk (to Active or Out of Service), System Update checks the UCB of that disk in the ECD to make sure that the change actually took place. This error occurred when System Update thought it changed the state of the disk, but the UCB of that disk does not reflect the change. Either MIRA did not change the state correctly or the state field in the UCB is damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`608xxy` No active boot disks.

System Update checks the UCB in the ECD to find out which disk is the current system disk that is in the active state. This error occurred because there were not any disks that were in the active state. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, restore both disks to the active state and start the update over from the beginning of the `Enter` step.

`609xxy` Partition copy error.

The command `COPY:PTN:ALL` failed when the System Update Restore or `Commit` command used it to copy the new or old generic over the old or new generic during a backup partition method update. The error(s) associated with the command `COPY:PTN:ALL` will be saved in `/tmp/supr.prtcp`. The most common cause for this error is when the disks are not duplexed (e.g., both disks are not active) when the `Restore` or `Commit` commands are executed. After resolving the problem, (e.g., duplex both disks), continue the update using the `UPD:GEN;CONTINUE` command.

`610xxy` Recent change error.

This error occurred when System Update was performing a Recent Change on the ECD. The journal file and the error messages will be saved in `/tmp/supr.rcv` and `/tmp/supr.rcvout` respectively. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`611xxy` Copy command failed.

This error may have occurred when System Update was copying the log from the old generic to the new generic. Additional error codes can be found in `/tmp/supr.cp`. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`612xxy` `ECDMAN ugucbn() error`.

This error occurred when System Update used the ECD function `ugucbn()` to get information about the UCB record associated with a specified disk. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the `Restore` process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the `Commit` process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.

- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`613xxy ECDMAN ugetucb() error.`

This error occurred when System Update used the ECD function `ugetucb()` to get the UCB record for a specified disk. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the `Enter` step, or take one of the following actions:

- If this error occurred during the `Restore` process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the `Commit` process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.
- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`614xxy ECDMAN ugmamirids() error.`

This error occurred when System Update used the ECD function `ugetrec()` to get the pointer to the UCBs for the two disks that are associated with the update. Try to continue the update using the `UPD:GEN;CONTINUE` command.

`615xxy ECDMAN ursvucd() error.`

This error occurred when System Update used the ECD function `ursvucb()` to reserve a UCB. The disk that System Update is trying to update must first be reserved so that no other processes can write to it. This is done by reserving the disk's UCB. The `ursvucb()` function may have failed because another process has already reserved the disk that is trying to be reserved. Check to see if the disk is already reserved. If it has been reserved, execute the following command on a UNIX® terminal to unreserve the disk: `/etc/udgnnm MHD` *x* where *x* is the disk number that needs to be unreserved. Then, try to continue the update using the `UPD:GEN;CONTINUE` command.

`616xxy ECDMAN ugsdf() error.`

This error occurred when System Update used the ECD function `ugsdf()` to get the special device file name associated with the disk to be updated so that System Update can access that disk. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`617xxy ECDMAN urelucb() error.`

This error occurred when System Update used the ECD function `urelucb()` to release (unreserve) a reserved UCB. Try to continue the update using the

`UPD:GEN;CONTINUE` command.

`618xxy` `ECDMAN ursdf() error.`

This error occurred when System Update used the ECD function `ursdf()` to give back to the system the special device file name of the updated disk that was obtained by the `ugsdf()` command (see error `616xxy`). Try to continue the update using the `UPD:GEN;CONTINUE` command.

`619xxy` `ECDMAN usettnum() error.`

System Update no longer uses the ECD `usettnum()` function, so this error should never appear.

`620xxy` `ECDMAN usetucb() error.`

System Update no longer uses the ECD `usetucb()` function, so this error should never appear.

`621xxy` `Unable to stop process with pkill.`

The System Update `Stop` command could not stop the currently running System Update process using the `pkill()` function call. If the `Stop` command cannot kill a System Update in progress using the `kill()` function call, it then tries to kill it using the `pkill()` function call. The `pkill` function call may have failed because there was a bad Process ID number (PID) in the System Update log file for the process that needed to be terminated.

The `Stop` command looks in the log file to find the PID of the process that is currently running and calls `pkill` with that PID. If the PID is damaged in the log file, the `pkill` command may be executed manually using the correct PID of the process that needs to be terminated.

`622xxy` `Unable to stop process with kill.`

The System Update `Stop` command could not stop the currently running System Update process using the `kill()` function call. The `kill()` function call is used in the Stop command to terminate the System Update process that is currently running. The `kill` function call may have failed because

- the process to be killed does not exist
- the sending process is not a superuser, and the sending and receiving processes do not have the same effective user ID
- the Process ID (PID) of the process being terminated is damaged in the System Update log. The `Stop` command passes this PID as a parameter to `kill()`

If the System Update still needs to be stopped, execute the System Update `Stop` process unconditionally using the UCL argument on its command line. **CAUTION:** if `Stop` is executed unconditionally, the System Update process will be terminated by a more extreme method than a kill (`pkill`). Some system resources in use by the process may not be automatically released.

SEE PROPRIETARY NOTICE ON COVER PAGE

`623xxy  System error killed the process.`

A System Update process was terminated due to a phase 1 signal. System Update may not get a chance to print this error message when the interrupt occurs. If the System Update process is continued using the `UPD:GEN;CONTINUE` command, the `Continue` command will put this error code in the End entry of the System Update log file.

TYPE . . . . . Output
MESSAGE CLASS . . MAINT

System Update Error Codes Appendix

1. Introduction

This appendix contains the error codes for System Update in Release 1. The error codes consist of six decimal digits. The first three digits indicate the nature of the error. The next two digits (xx) indicate the module in which the error occurred (that information is not provided here). The last digit (the error number, y) is used to differentiate errors of the same error code that can occur multiple times in the same module. To locate exactly which error in the module failed, each error is given its own unique error number.

2. Errors Associated with UNIX® System Calls

More information about these UNIX® System Calls can be found in *Output Message Manuals* under System Error Codes Appendix, `SYSERR-APP`. The error code that corresponds with the System Call that failed is kept in the System Update log file. It can be read by executing `OP:GEN;READLOG`. The log entry specifying the UNIX® error number will be the error code for the UNIX® call that failed. The manual pages for these System Calls may be found in the *UNIX® RTR Operating System Manuals.*

`101xxy` `mkseg() error.`

The UNIX® system call `mkseg()` failed when the System Update Enter command tried to create a segment using `makeseg()` that was to be used as a buffer when reading in a new partition from the LDFT tape and writing it to disk. `Makeseg()` may have failed because there was not enough space in memory for the segment. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`102xxy` `open() error`.

The UNIX® system call `open()` failed when System Update attempted to open the System Update log file. The open may have failed because

- the System Update log file does not exist (`/etc/log/suprlog`)
- one of the directories in the System Update log file pathname (`/etc/log`) does not exist or does not have read permissions
- the System Update log file is not readable or writable depending on what it is being opened for (reading or writing)
- too many files are open

After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`103xxy read() error.`

The UNIX® system call `read()` failed when System Update tried to read an entry from the System Update log file. The read may have failed because of

- a damaged log file
- physical I/O errors
- a bad `read()` parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`104xxy seek() error.`

The UNIX® system call `lseek()` failed when System Update attempted to seek to a particular log entry in the System Update log file. The lseek may have failed because the file descriptor for the log file is undefined, the seek went to a position before the beginning of the log file, or the log file is damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`105xxy write() error.`

The UNIX® system call `write()` failed when System Update attempted to write a log entry to the System Update log file. The write may have failed because of

- physical I/O errors
- a bad `write()` parameter
  - — bad buffer address from where the data is to be read
  - — number of bytes to be written is bad
  - — bad file descriptor for the System Update log file to which the data is to be written

Try to continue the update using the `UPD:GEN;CONTINUE` command.

`106xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close the System Update log file. An incorrect file descriptor for the log file may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

SEE PROPRIETARY NOTICE ON COVER PAGE

`107xxy unlink() error.`

The UNIX® system call `unlink()` failed when the System Update Proceed command attempted to unlink (remove) the special device file that was used to copy the System Update log file to the offline disk (offline disk method) or to the backup `/etc` partition (backup partition method). The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the enter step.

`108xxy setio() error.`

The UNIX® system call `setio()` failed when System Update attempted to set the input/output mode for the disk being updated to physical I/O. The setio may have failed because the disk being updated was never opened. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the enter step.

`109xxy mknod() error.`

The UNIX® system call `mknod()` failed when the System Update Restore or Commit command attempted to make a node that would be used to copy the new/old partitions over the old/new partitions using the backup partition method. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then manually execute the applhook process.

`110xxy lcall() error.`

The UNIX® system call `lcall()` failed when System Update attempted to execute applhook (`/prc/supr/applhook`). Applhook may not exist or may not have execution permissions. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`111xxy msgenab() error.`

The UNIX® system call `msgenab()` failed when System Update attempted to enable message reception from one of the following processes: Applhook, Continue, the disk driver, MIRA, or SIM. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

SEE PROPRIETARY NOTICE ON COVER PAGE

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing he old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

`112xxy send() error.`

The UNIX® system call `sendw()` failed when the System Update Continue command either attempted to send an acknowledgement message to the System Update Enter process which is currently running or attempted to send a message to SIM in order to request system initialization information. Try to continue the update again using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`113xxy kill() error.`

The UNIX® system call `kill()` failed when the System Update Stop command attempted to terminate the System Update process that is currently running. The kill command may have failed because

- the process to be killed does not exist
- the sending process is not a superuser, and the sending and receiving processes do not have the same effective user ID
- the Process ID (PID) of the process being terminated is damaged in the System Update log; The Stop command passes this PID as a parameter to `kill()`

If the System Update still needs to be stopped, execute the Stop process unconditionally (using the UCL argument on its command line).

CAUTION: If Stop is executed unconditionally, it will attempt to terminated the running System Update process by an extreme method using the `pkill()` command. Some system resources in use by the process may not be released automatically.

`114xxy stat() error.`

The UNIX® system call `stat()` failed when System Update attempted to obtain status information about the disk that is to be updated. This function may have failed because the disk does not exist. If this error occurred during the Enter step of System Update, make sure that all destination file names specified on the Enter command line exist. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

SEE PROPRIETARY NOTICE ON COVER PAGE

115xxy `msgport() error.`

The UNIX® system call `msgport()` failed when System Update attempted to send a message to the disk driver so that System Update could have access to an out of service disk at the partition level rather than at the disk level. The msgport may have failed because

- the disk driver is nonexistent
- the port number specified is invalid
- no process is connected to the specified port
- the message buffer is not in the user address space

Try to continue the update using the `UPD:GEN;CONTINUE` command.

116xxy `mount() error.`

The UNIX® system call `mount()` failed when System Update attempted to mount the `/etc` file system so that the System Update log file can be copied to the new generic or the database file system so that the ECD can by updated. The mount may have failed because

- the effective user ID of the process executing the mount is not a superuser
- the specified file system does not exist
- the file system to be mounted is not specified
- the block special file from which the file system is to be mounted is inaccessible or not an appropriate file
- the file system is already mounted
- the directory pathname that the file system is to be mounted on is not a directory
- too many file systems are mounted

Try to continue the update by using the `UPD:GEN;CONTINUE` command.

117xxy `unmount() error.`

The UNIX® system call `umount()` failed when System Update attempted to unmount the `/etc/` file system after the System Update log file has been copied to the new generic or the database file system after the ECD has been updated. The umount may have failed because

- the effective user ID of the process executing the umount is not a superuser
- the file system is not mounted
- there are active files on the file system being unmounted

Try to continue the update using the `UPD:GEN;CONTINUE` command.

118xxy `link() error.`

RC/V recognizes the ECD by the name `/mount directory/ecd` where mount directory represents the directory path on which the ecd file system is mounted. But, System Update recognizes the ECD by the name `/mount`

`directory/dmert` or `/mount directory/appdmert`. In order for System Update to use RC/V, it must link its database name with the name that RC/V recognizes. This error occurs when the link fails using the UNIX® system call `link()`. The link may have failed because

- the original name that is being linked to cannot be found
- the new name that is being linked already exists
- the directory that contains the new name does not have write permissions
- the link is done by a user other than a superuser
- the link was attempted on a file that is on another file system
- the file has too many links

If this update is continued using the `UPD:GEN;CONTINUE` command, it will keep failing until this problem is resolved. Start the update over from the beginning of the Enter step.

`119xxy create() error.`

The UNIX® system call `create()` failed when a file was being created under the `/tmp` directory in one of the following situations: the System Update Enter command attempted to create the System Update log file, or the System Update Readlog command attempted to create a buffer used to store log entries that are about to be printed to the terminal and to the ROP. The create may have failed because

- a directory in the pathname of the file to be created is not searchable
- the file to be created does not exist and the directory in which it is to be created does not have write permission
- the file to be created does exist an does not have write permissions
- the file to be created is a directory
- the maximum number of files (20) are already open
- there is not enough space in the `/tmp` file system for the created file

After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`120xxy vcall() error.`

The UNIX® system call `vcall()` failed when the System Update Continue command executed the System Update process that is being continued. This function normally fails when the process being executed does not exist or does not have execution permissions. Make sure that all System Update processes in `/prc/supr` have execution permissions. After resolving the problem, re-enter the System Update command `UPD:GEN;CONTINUE`.

`121xxy rmovseg() error.`

The UNIX® system call `rmovseg()` failed when the System Update Enter

command attempted to remove a previously created segment after it was no longer needed. The segment may have been created in the first place to be used as: 1) a buffer used to hold the new generic which was read in from tape and then written to disk, or 2) a buffer used to hold the new generic which was read from the primary partitions and written to the backup partitions using the offline disk method. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`122xxy mkseg() error.`

The UNIX® system call `mkseg()` failed when the System Update Enter command tried to create a segment using `makeseg()` that was to be used as a buffer when reading in an updated segment from the offline disk and writing it to its backup partition. `makeseg()` may have failed because there was not enough space in memory for the segment. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`123xxy fopen() error.`

The UNIX® system call `fopen()` failed when the System Update Restore or Commit command attempted to open a partition that is to be used to update the old or new generic to the new or old generic. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.

`124xxy open() error.`

The UNIX® system call `open()` failed when System Update attempted to open the ECD. The open may have failed because

- the ECD special device file does not exist (`/dev/ecd`)
- the root directory which contains the ECD does not have read permissions
- the ECD is not readable or writable depending on what it is being opened for (reading or writing)
- too many files are open

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

SEE PROPRIETARY NOTICE ON COVER PAGE

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

`125xxy open() error.`

The UNIX® system call `open()` failed when System Update attempted to open the disk that is being updated for one of the following reasons:

- the VTOC needs to be read
- the backup partitions need to be updated during the Enter process using the offline disk method
- the little boot start block address in the VTOC needs to be restored

The `open()` may have failed because

- the disk does not exist
- one of the directories in the disk pathname does not exist or does not have read permissions
- the disk is not readable or writable depending on what it is being opened for (reading or writing)
- too many files are open

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`126xxy open() error.`

The UNIX® system call `open()` failed when System Update attempted to open one of the partitions that is being updated. The open may have failed because

- the partition does not exist

- one of the directories in the partition pathname does not exist or does not have read permissions
- the partition is not readable or writable depending on what it is being opened for (reading or writing)
- too many files are open

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`127xxy` `read() error.`

The UNIX® system call `read()` failed when System Update tried to read the VTOC from the LDFT tape. The read may have failed because of

- physical I/O errors
- a bad read() parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Make sure the "head" of the tape drive is clean and continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`128xxy` `read() error.`

The UNIX® system call `read()` failed when System Update tried to read the VTOC from disk. The read may have failed because of

- physical I/O errors
- a bad read() parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`129xxy` `read() error.`

The UNIX® system call `read()` failed when System Update tried to read a data block from an LDFT tape. The read may have failed because of

- physical I/O errors
- a bad `read()` parameter
  - — bad buffer address where the data is to be read

— number of bytes to be read is bad

— file descriptor indicating the file to be read from is not that of an input file

Make sure the "head" of the tape drive is clean and continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`130xxy read() error.`

The UNIX® system call `read()` failed when System Update tried to read a partition from the offline disk for one of two reasons: the hash sum needed to be computed to make sure that the partition was written correctly, or the backup partition needed to be updated from its primary partition which contained the new generic (for offline disk method only). The read may have failed because of

- physical I/O errors
- a bad `read()` parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`131xxy read() error.`

The UNIX® system call `read()` failed when System Update tried to read a header from an LDFT tape. The read may have failed because of

- physical I/O errors
- a bad `read()` parameter
  - — bad buffer address where the data is to be read
  - — number of bytes to be read is bad
  - — file descriptor indicating the file to be read from is not that of an input file

Make sure the "head" of the tape drive is clean and continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`132xxy lseek() error.`

The UNIX® system call `lseek()` failed when System Update attempted to seek to a particular partition on disk. The lseek may have failed because the file descriptor for the disk is undefined, or the seek went to a position before the beginning of the disk. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the disk may be damaged.

`133xxy lseek() error.`

The UNIX® system call `lseek()` failed when System Update attempted to seek to a previous block on an LDFT tape. A tape read failure may have occurred. If this happens, System Update automatically seeks back to the beginning of the set of blocks it tried to read and tries to read those blocks again. Since a read error may have occurred first, check the possible causes for a read error located at error codes `103xxy`, and `127xxy - 131xxy` and take the action listed there. If a read error is not the problem, make sure the "head" of the tape drive is clean and continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`134xxy write() error.`

The UNIX® system call `write()` failed when the System Update Readlog command attempted to write log entries to an output buffer which is later spooled to the terminal and to the ROP. The write may have failed because of

- physical I/O errors
- a bad `write()` parameter
  - — bad buffer address where the data is to be read from
  - — number of bytes to be written is bad
  - — bad file descriptor for the buffer to which the data is to be written

The log file cannot be read.

`135xxy write() error.`

The UNIX® system call `write()` failed when the System Update Enter command attempted to write the VTOC to the disk being updated. The write may have failed because of

- physical I/O errors
- a bad `write()` parameter
  - — bad buffer address from where the data is to be read
  - — number of bytes to be written is bad
  - — bad file descriptor for the disk to which the data is to be written

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the

error persists, the disk may be damaged.

`136xxy write() error.`

The UNIX® system call `write()` failed when the System Update Enter command attempted to write a partition to the disk being updated. The write may have failed because of

- physical I/O errors
- a bad write() parameter
  - — bad buffer address where the data is to be read from
  - — number of bytes to be written is bad
  - — bad file descriptor for the disk to which the data is to be written

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the disk may be damaged.

`137xxy fclose() error.`

The UNIX® system call `fclose()` failed when the System Update Restore or Commit command attempted to close a partition that was used to update the old or new generic to the new or old generic. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.

`138xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close the disk being updated. An incorrect file descriptor for the disk may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the Enter step.

`139xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close the ECD. An incorrect file descriptor for the ECD may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

`140xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close a partition on the disk being updated. An incorrect file descriptor for the disk partition may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`141xxy close() error.`

The UNIX® system call `close()` failed when System Update attempted to close the tape device from which the new generic was read. An incorrect file descriptor for the tape device may have been passed to the `close()` command. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`142xxy unlink() error.`

The UNIX® system call `unlink()` failed when System Update attempted to unlink (remove) the special device file that was used to access the offline disk when updating the backup partitions using the offline disk method. The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`143xxy unlink() error.`

The UNIX® system call `unlink()` failed when System Update attempted to unlink (remove) the special device file that was used to access a partition being updated. The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

SEE PROPRIETARY NOTICE ON COVER PAGE

`144xxy unlink() error.`

The UNIX® system call `unlink()` failed when System Update attempted to unlink (remove) a special device file that was used to perform a Recent Change function on the ECD. The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`145xxy setio() error.`

The UNIX® system call `setio()` failed when System Update attempted to set the Input/Output mode for the tape device from which the new generic is to be read to physical I/O. The setio may have failed because the tape device was never opened. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`146xxy setio() error.`

The UNIX® system call `setio()` failed when System Update attempted to set the Input/Output mode for a partition to be updated to physical I/O. The setio may have failed because the partition was never opened. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`147xxy mknod() error.`

The UNIX® system call `mknod()` failed when the System Update Proceed command attempted to make a node that would be used to copy the System Update log file to the offline disk (offline disk method) or to the backup `/etc` partition (backup partition method). Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update from the beginning of the Enter step.

`148xxy mknod() error.`

The UNIX® system call `mknod()` failed when System Update attempted to make a node that would be used to update the backup partitions using the offline disk method. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update from the beginning of the Enter step.

`149xxy mknod() error.`

The UNIX® system call `mknod()` failed when System Update attempted to make a node that would be used to copy the new generic to the offline disk (offline disk method) or to the backup partitions (backup partition method). Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update from the beginning of the Enter step.

SEE PROPRIETARY NOTICE ON COVER PAGE

`150xxy mknod() error.`

The UNIX® system call `mknod()` failed when System Update attempted to make a node that would be used to perform a Recent Change function on the ECD. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update from the beginning of the Enter step.

`151xxy fopen() error.`

The UNIX® system call `fopen()` failed when System Update attempted to open a file (located in `/tmp`) that is to be used to create a Recent Change script which is used to change the ECD. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`152xxy fclose() error.`

The UNIX® system call `fclose()` failed when System Update attempted to close the file (located in `/tmp`) that contains a Recent Change script used to change the ECD. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`153xxy sendpw error.`

The UNIX® system call `sendpw()` failed when System Update attempted to send a message to MIRA in order to remove or restore a UCB. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the applhook process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the applhook process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

3. Errors Associated with the Input Data

`201xxy` VTOC is not the first piece of data on the mounted LDFT tape.

This error occurred when System Update could not find the VTOC because

- System Update incorrectly thinks it should have the first tape of the sequence and therefore searches for the VTOC

- the wrong tape may have been mounted; check to make sure that the mounted LDFT tape is the first tape in the sequence

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the problem persists, the LDFT tape may be damaged. Regenerate a new tape.

`202xxy` HEADER and VTOC addresses are different.

While a partition entry was being searched for in the disk VTOC, the search erroneously went beyond the scope of the VTOC. The disk partition address that was specified in the LDFT header for that partition does not match the disk partition address in the corresponding VTOC entry on the disk. The LDFT tape may be damaged. Regenerate a new LDFT tape and start the update over from the beginning of the Enter step.

`203xxy` Disk and tape VTOCs are different.

The VTOC entry on tape must be identical to the VTOC entry on disk. The VTOC on the LDFT tape may be damaged. Regenerate a new tape sequence.

`204xxy` A partition being updated does not have a backup partition.

All partitions must have backup partitions if they are being updated via the backup partition method (except for the VTOC and little boot partitions). If some partitions need to be updated but do not have backup partitions, start the update over from the beginning of the Enter step using the offline disk method.

`205xxy` Primary and backup versions of same partition found on same tape.

An LDFT tape can only contain the primary or the backup version of the same partition. Both cannot be found on the LDFT tape. The LDFT tape may be damaged. Regenerate a new tape.

`206xxy` Partition data spans across partition boundaries.

Each header on the LDFT tape contains the starting address for that partition on the disk and the partition's size. The address plus the size gives the starting address for the next partition. But, in this case, the address plus the size gives an address that is past the starting address for the next partition. The LDFT tape may be damaged. Regenerate a new tape.

`207xxy` Two VTOCs found in same tape sequence.

Only one VTOC is allowed per tape sequence. This may be a bad tape sequence. The entire tape sequence should be regenerated.

`208xxy` End-of-Tape and End-of-Sequence flags on LDFT tape are incompatible.

The End of Sequence flag is set in the last header on the last tape, but the End of Tape flag is not set. This may be a bad tape. Regenerate a new tape.

SEE PROPRIETARY NOTICE ON COVER PAGE

`209xxy` Different hash sums.

Hash sum - a computed integer used to make sure that the data on the LDFT tape has not been damaged since the tape was created. The hash sum that is in one of the headers on the LDFT tape for that header or its data block does not match the hash sum that System Update computed for that header or data block.

Make sure that the "head" of the tape drive is clean and try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

`210xxy` Ichk() detected error(s) on file system.

At this time, this error will never occur because System Update does not call `ichk()`.

`211xxy` Cannot find VTOC partition entry in the VTOC VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

`212xxy` Cannot find the RTC partition entry in the VTOC on the disk.

The VTOC on the disk may be bad. This update cannot be continued until this problem is resolved.

`213xxy` Cannot find ETC partition entry in the VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

`214xxy` Cannot find ECD partition entry in the VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

`215xxy` SG ID on LDFT tape does not match the SG ID on previous LDFT tape.

SG ID - identifier in the first header of an LDFT tape that describes the SG database from which this tape was written. It is used to make sure that multiple tapes and sequences were written using the same SG database. The SG ID on the LDFT tape does not match the SG ID on the previously loaded LDFT tape. This is not really an error, just a warning. This may occur if a field site uses its own SG database when generating tapes. Continue the update using the `UPD:GEN;CONTINUE` command and the error will be ignored.

`216xxy` Generic version number on LDFT tape does not match generic version number on previous LDFT tape.

Generic version number - used to make sure that multiple tapes and sequences were written using the same generic version.

Continue the update using the `UPD:GEN;CONTINUE` command and the error will be ignored.

SEE PROPRIETARY NOTICE ON COVER PAGE

`217xxy` Little boot entry in offline disk VTOC could not be found when System Update attempted to restore the little boot start block address to its valid value.

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the VTOC on the offline disk may be damaged.

`218xxy` Little boot entry in the VTOC on the LDFT tape is different from the little boot entry in the VTOC on the disk when the backup partition method is being used.

During a backup partition method update, the old and new VTOCs must be identical. The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

`219xxy` One of the VTOC entries for a partition being updated (excluding VTOC and little boot) in the VTOC on the LDFT tape is different from its corresponding VTOC entry on disk when the backup partition method is being used.

During a backup partition method update, the old and new VTOCs must be identical. The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

`220xxy` One of the VTOC entries for a partition being updated (excluding VTOC and little boot) in the VTOC on the LDFT tape is different from its corresponding VTOC entry on disk when the offline disk method is being used.

This partition was also already updated in a previous tape sequence. During an offline disk method update, a VTOC may be different only as long as the partition corresponding to the VTOC entry that changed has not been updated in a previous tape sequence.

`221xxy` VTOC entry for little boot on LDFT tape is different from VTOC entry for little boot on disk when the offline disk method is being used.

The little boot partition was also already updated in a previous tape sequence. During an offline disk method update, a VTOC may be different only as long as the partition corresponding to the VTOC entry that changed has not been updated in a previous tape sequence.

`222xxy` Header for VTOC on LDFT tape contains starting address for VTOC on the disk and the VTOC's size.

The address plus the size gives the starting address for the next partition. But, in this case, the address plus the size gives an address that is past the starting address for the next partition. The LDFT tape may be damaged. Regenerate a new tape.

`223xxy` VTOC entry for primary source or backup destination partition not found in offline disk VTOC.

When updating the backup partitions using the offline disk method, the VTOC entry for a source (primary) or destination (backup) partition could not be found in the offline disk VTOC. The offline disk VTOC may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

SEE PROPRIETARY NOTICE ON COVER PAGE

`224xxy` VTOC entry in VTOC on LDFT tape could not be found.

This may be a bad VTOC on the tape. Regenerate a new tape and start the update over from the beginning of the Enter step.

`225xxy` Little boot entry in VTOC read from LDFT tape could not be found when System Update attempted to invalidate the little boot start block address to prevent a boot from occurring from the disk that is being updated.

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the VTOC on the LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

`226xxy` VTOC entry could not be found in VTOC on the mounted LDFT tape.

The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

`227xxy` Note: This error message is not available in all releases.

UNIX® RTR R6.2 only:
The pack number specified in the VTOC on the mounted LDFT tape does not match the destination VTOC number. Check that the proper destination VTOC was entered. If correct, verify the intended destination device for the tape. (Check that proper tape was mounted.)

UNIX® RTR R6.4 and later:
The pack ids in the tape and destination disk VTOCs do not match. Check that the proper tape is mounted, and that the destination VTOC was entered correctly. This check can be overridden by performing the update unconditionally with the UCL parameter.

4. Internal System Update Errors

`301xxy` Too many command line arguments used.

The maximum number of arguments allowed on the command line has been exceeded for one of the following commands: `Continue`, `Readlog`, `Stop`, `Commit`, `Restore`, `Backout`, `Enter`, or `Proceed`. The only way this error message could appear is if the System Update process has been executed from a UNIX® terminal instead of a user terminal. Re-execute the System Update process using the correct arguments, or execute the process from a user terminal using the corresponding PDS or MML Craft Input Message.

`302xxy` Message returned was not what was expected.

Any time System Update sends a message to SIM, the disk driver, applhook, or continue, it checks the return message that is sent back. In this case, a bad message was returned or the time limit set to receive the message from continue expired. Try to continue the update using the `UPD:GEN;CONTINUE` command.

SEE PROPRIETARY NOTICE ON COVER PAGE

`303xxy` Internal buffers are too small.

The data after a header on the LDFT tape is larger than one segment. Up to only one segment is allowed after each header. The LDFT tape may be damaged. Regenerate a new tape.

`304xxy` Cannot locate System Update log.

Any time the System Update log is accessed, it is assumed to be in `/etc/log/suprlog`. In this case, it could not be found. System Update may have been attempting to retrieve or write a log entry or attempting to read the entire log file. The log file may have been accidentally removed. If the System Update Readlog command was executed to read the log file, the log file cannot be read since Readlog cannot locate it. If any other System Update process was executed, start the update over from the beginning of the Enter step.

`305xxy` No "enter" entries in log.

Log entries for the Enter step cannot be found in the System Update log. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, the log file may be damaged. Start the update over from the beginning of the Enter step.

`306xxy` Log entries are inconsistent.

The System Update Continue command found that one of the entries in the System Update log file contains a bad value (the type of log entry, tape sequence number, or disk pair number). The System Update log may be damaged. Start the update over from the beginning of the Enter step.

`307xxy` Bad process type.

A bad process type was found in one of the log entries in the System Update log file. This error occurs when System Update tries to continue an update and the entry for the System Update process that is being continued cannot be found in the log. The log may be damaged. Start the entire update over from the beginning of the Enter step.

`308xxy` Bad update method.

The System Update Readlog command found an incorrect update method specified in one of the System Update log file entries (Begin or Disk) or the System Update Enter command found an incorrect update method specified on its command line. Only two methods are allowed: backup partition method or off-line disk method. If the Readlog command was executed, the log may be damaged and therefore cannot be read. If the Enter command was executed, start the update over from the beginning of the Enter step.

`309xxy` Bad execution mode.

The System Update Readlog command found a bad execution mode in a Begin log entry for one of the System Update processes. Only two execution modes are allowed: conditional or unconditional. The log file may be damaged and

SEE PROPRIETARY NOTICE ON COVER PAGE

therefore cannot be read.

`310xxy` Bad bootfile.

The System Update Readlog command found an incorrect bootfile specified in the End entry in the System Update log file. Only two bootfile types are allowed: DMERT or APPDMERT. The log file may be damaged and therefore cannot be read.

`311xxy` Bad file system.

The System Update Readlog command found an incorrect file system specified in the End entry in the System Update log file. Only two file systems are allowed: PRIMARY or SECONDARY. The log file may be damaged and therefore cannot be read.

`312xxy` Bad log entry.

A bad disk pair number was found in either the Disk or End log entry in the System Update log. The log file may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`313xxy` Bad completion code.

The System Update Readlog command found that the End entry in the System Update log file contains a bad completion code. Only two completion codes are allowed: SUCCESS or FAILURE. The log may be damaged and therefore cannot be read.

`314xxy` Tried to reserve the same disk twice.

System Update tried to reserve a disk that has already been reserved. Try to continue the update using the `UPD:GEN;CONTINUE` command.

`315xxy` Tried to release an unreserved disk.

System Update tried to release a disk that was never previously reserved. Try to continue the update using the `UPD:GEN;CONTINUE` command.

`316xxy` Bad UCB disk state requested.

A bad state was specified when System Update attempted to change the state of a UCB (valid states = `OOS`, `ACT`) or a disk (valid states = `OOS`, `OFL`). Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists,

either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.
- If this error occurred during any other System Update process, start the update over from the beginning of the Enter step.

`317xxy` Bad sequence indicator.

The System Update Readlog command found that the Tape entry in the System Update log file contains a bad sequence number. Only three sequence entries are allowed: FIRST, SECOND, or THIRD. The log may be damaged and therefore cannot be read.

`318xxy` Bad continuable indicator.

The System Update Readlog command found that the End entry of the System Update log contains a bad continuable flag variable. Only two continuable flag variables are allowed: YES or NO. The log may be damaged and therefore cannot be read.

`319xxy` BEGIN ENTER log entry could not be found in the System Update log file.

The log may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`320xxy` System Update Enter command terminated.

The System Update Enter command terminated while it was updating the backup partitions using the offline disk method and then was continued using the `UPD:GEN;CONTINUE` command. In order for System Update to know which partition it was in the middle of updating before it terminated, it looks in the log file and attempts to find the last UPDATE ENTER log entry.

In this case, the UPDATE ENTER log entry could not be found. Therefore, System Update could not do any further processing. Try to continue the update again using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter command.

`321xxy` VTOC on FDFT tape exceeds maximum allowed.

The size of the VTOC on the LDFT tape is greater than the maximum size allowed: 512 bytes (for Generic 2) and 1024 bytes (for Release 1). The VTOC may be damaged on the LDFT tape. Regenerate a new tape.

SEE PROPRIETARY NOTICE ON COVER PAGE

322xxy Write log entry found in System Update log file without a proceeding Disk log entry.

The log file may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

323xxy Log file retrived not requested.

System Update requested a log entry (Disk, Tape, or End) from the log file, but the log entry that was retrieved was not the one requested. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

324xxy Corresponding disk log not found.

While searching the System Update log file, System Update could not find the Disk log entry that corresponds to the bootdisk being updated. Try to continue the update using the `UPD:GEN;CONTINUE` command.

325xxy Incorrect update method specified.

System Update found an incorrect update method specified in the internal variable `glob_method` which was obtained through the Enter command line or the System Update log file. Only two methods are allowed: backup partition method or off-line disk method. The log may be damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the entire update over from the beginning of the Enter step.

326xxy Bad execution mode found on Enter command line.

Only two execution modes are allowed: conditional or unconditional. Start the update over from the beginning of the Enter step.

327xxy Bad sequence option in log file.

System Update found bad sequence option in the log file. Valid sequence options are: SGL, DBL, or TPL. The log may be damaged and therefore cannot be read. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter command.

5. Errors Associated with Execution

401xxy Context of request is invalid.

The System Update Enter command was executed conditionally (without the UCL argument) while the System Update log file contained log entries (possibly from a previous update session). Either remove the log file (`/etc/log/suprlog`) or execute the Enter command using the UCL argument on the command line.

`402xxy` Bad input file (tape unit) specified.

The input file specified (normally a tape unit) on the Enter command line is invalid. Make sure that the name is entered correctly (the name of a tape unit is of the form `/dev/mt`*nn* where *nn* is a two digit hexadecimal number). If the input is from a tape, make sure that the unit is on-line. Re-execute the Enter command with the UCL argument on its command line.

`403xxy` Data not in sync.

The tape being read is either not a tape usable with System Update (not in LDFT format), the data on it has been mutilated, or the LDFT formatted tape being used was created for a different processor. Make sure that the correct tape has been mounted, and continue the update using the `UPD:GEN;CONTINUE` input command.

`404xxy` Data sequence id incorrect (wrong tape).

The data input does not belong on the disk being written. Make sure that correct tape has been mounted and continue the update using the `UPD:GEN;CONTINUE` input command.

`405xxy` Data sequence number out of order.

One of the tapes in the sequence has been mounted out of order. Mount the correct tape and continue the update using the `UPD:GEN;CONTINUE` input command.

`406xxy` Bad destination VTOC specified.

The filename specified for the disk being updated is not a block special device file or the disk cannot be opened. Check that the filename was entered correctly. If not, re-execute the Enter command using the UCL argument on the command line.

`407xxy` This error code is no longer used.

`408xxy` User did not return from "continue" request.

When a new tape needs to be mounted, a `mount tape and continue` message appears. After the user mounts the tape, the `UPD:GEN;CONTINUE` command needs to be executed in order for the update to continue its processing.

System Update waits 30 minutes for the Continue command to be executed. If it is not executed, another `mount tape and continue` message appears and System Update waits another 30 minutes for the Continue command to be executed. If it still is not executed, System Update terminates with this error code. Execute the `UPD:GEN;CONTINUE` command to continue the update process where System Update left off.

SEE PROPRIETARY NOTICE ON COVER PAGE

`409xxy` Attempt to run two system update processes.

The user attempted to

- run two System Update processes at the same time (when one System Update process is running another one may not be started unless it is one of the following: Stop, Continue, or Readlog)
- run a System Update process while Field Update or PDT is currently running (a System Update cannot be performed while Field Update or PDT is running)

If a System Update process needs to be stopped, the System Update Stop command may be used to stop it. If this is not successful, seek technical assistance.

`410xxy` User stopped process (not a fault condition).

This `error` code is used to acknowledge that the user terminated one of the System Update processes (`Commit`, `Restore`, `Backout`, `Enter`, or `Proceed`) using the System Update `Stop` command. There is no fault condition associated with this code.

`411xxy` No process exists to talk to (e.g., nothing to stop).

The user has attempted to stop a System Update process using the System Update Stop command when there are no System Update processes that are running.

`412xxy` System update log is empty.

The System Update log file does not contain any log entries when it is expected to in one of the following situations:

- An attempt to continue a System Update process was made, but the command to be continued could not be figured out since this information is contained in the log file and the log file is either empty or does not contain the BEGIN ENTER log entry,
- The log file was attempted to be read via the System Update Readlog command, but there was nothing to read since the log file was empty,
- One of the System Update processes (excluding the Enter process) was executed when the log file was empty. These processes need information in the log in order to complete their processing, or
- The log file was attempted to be searched for information, but the log file is empty.

Start the update over from the beginning of the Enter command.

`413xxy` Off-line disk method started with one disk active.

The offline disk method is being used and a disk was selected by System Update to retain the old generic, but this disk is not in the Active state. All disk pairs must be duplexed (active) before the Enter command is executed. Restore

SEE PROPRIETARY NOTICE ON COVER PAGE

all affected disks to service and execute the Enter command again using the UCL argument on its command line. If this error occurred because the System Update Enter process aborted leaving one or more disks in the offline state, execute the Restore command using the UCL argument on its command line and wait for it to complete. Then, start the update over from the beginning of the Enter step.

`414xxy` In off-line disk method with both disks active.

An offline disk was somehow restored to service when System Update expected it to be in the offline state. If all affected disks are offline, try to continue the update using the `UPD:GEN;CONTINUE` command. If an affected disk(s) is active or if the error persists after the continue, start the update over from the beginning of the Enter step.

`415xxy` Process did not log failure termination.

The user attempted to restart a System Update process with the Continue command but the last System Update process that was run logged a successful termination and therefore cannot be continued. Dumping the System Update log file using the Readlog command may be helpful in determining what happened to the last process. Try to execute the next System Update process.

`416xxy` Process is not continuable.

The user attempted to restart a System Update process using the Continue command, but the last System Update process that was run failed due to a problem which would usually cause it to fail again. For example, one of the pathnames in an Enter input message was bad, or one or more log entries needed for continuing the process are corrupted.

Dumping the log file using the Readlog command may be helpful in determining what happened to the original process. Try to re-enter the original input message using the UCL argument on the command line (for the Enter command, make sure the disks are duplexed first - see error code `413xxy`).

`417xxy` Disk is no longer off-line.

A specified disk device is not in any of the following valid states: offline, out of service, or active. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Enter process, restore the disk to an active state and re-execute the Enter command using the UCL argument on its command line.
- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.

`418xxy` Bad destination DFC specified.

An invalid DFC unit number was specified as an argument to the `OFLDISK` keyword on the Enter command line. Valid DFC unit numbers are 0 (zero) and 1 (one). The DFC number can be omitted, in which case the Enter process will chose DFC 1.

`419xxy` Command executed out of order.

A System Update command was executed out of order.

- The `Proceed` command was executed before the `Enter` command completed successfully.
- The `Commit` command was executed before the Proceed command completed successfully.
- The `Backout` command was executed before the Proceed command completed successfully.
- If error code `y` is `4`, the `Restore` command was executed before the `Proceed` command completed successfully. Execute the `Restore` command unconditionally using the UCL argument on its command line.
- If error code `y` is `5`, `Conditional Restore` after successful `Backout` or `Proceed` is no longer valid. Execute the `Restore` command unconditionally using the UCL argument on its command line.

`420xxy` Incorrect file system base is running.

The wrong file system base is currently running for the System Update command that was just executed.

- `Backout` and `Commit` commands - the file system currently running needs to be the new generic.
- `Proceed` and `Restore` commands - the file system currently running needs to be the old generic.

If the wrong command was executed, execute the right one. If the right command was executed, boot the system so that it is running on the correct file system, then execute the command again.

`421xxy` Disk not in active state.

The offline disk method is being used and a disk was selected by System Update to contain the new generic, but this disk is not in the Active state. All disk pairs must be duplexed (active) before the `Enter` command is executed. Restore all affected disks to service and execute the `Enter` command again.
If this error occurred because the System Update Enter process aborted leaving

one or more disks in the offline state, execute the Restore command using the UCL argument on the command line and wait for it to complete. Then, start the update over from the beginning of the Enter step.

`422xxy` Disk being updated not in offline state.

When the backup partitions are being updated using the offline disk method, the disk being updated should be in the offline state, but it is not. Check the Common Processor Display page (page 102) or another page which shows the MHDs. If all disks affected are active, try to re-execute the Enter command using the UCL argument on the command line. If any affected disks are out of service, restore them and then re-execute the Enter command using the UCL argument on the command line.

`423xxy` Disk being updated is no longer in offline state.

The disk being updated, which should be in the offline state, is no longer in that state. Check the Common Processor Display page (page 102) or another page which shows the MHDs. If all disks affected are active, try to re-execute the Enter command using the UCL argument on the command line. If any affected disks are out of service, restore them and then re-execute the Enter command using the UCL argument on the command line.

6. Errors Associated with Application Processing

`501xxy` Time limit message error.

This error may have occurred because

- the application process did not send a message indicating a time limit that it needs to do its processing
- the message that the application process sent to set a time limit was damaged
- the UNIX® RTR `send()` process failed when the application process tried to use it to send a time limit message to the System Update Process

If the error occurred because the application process did not send a time limit message, start the application process over using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`502xxy` Application hook process failed or did not return.

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

7. Errors Associated with Interfaces with UNIX® RTR

`601xxy` User is not privileged for execution.

The System Update process must be executed from a login that has superuser permissions. After resolving the problem, try to continue the update using the

`UPD:GEN;CONTINUE` command.

`602xxy` Timeout for SIM message.

When System Update sends SIM a message, it sets a time out limit by which it must receive the return message from SIM. This error occurred when System Update was waiting for the return message from SIM. This error may have occurred because

- System Update did not receive a return message from SIM within the time out limit
- the `recvw()` process that waits for the return message from SIM failed

Try to continue the update using the `UPD:GEN;CONTINUE` command.

`603xxy` Time out for MIRA message.

When System Update sends MIRA a message, it sets a time out limit by which it must receive the return message from MIRA. This error occurred when System Update was waiting for the return message from MIRA. This error may have occurred because

- System Update did not receive a return message from MIRA within the time out limit
- the `recvw()` process that waits for the return message from MIRA failed

Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the `Enter` step, or take one of the following actions:

- If this error occurred during the `Restore` process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the `Commit` process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.
- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`604xxy` Timeout for disk driver message.

When System Update sends the disk driver a message, it sets a time out limit by which it must receive the return message from the disk driver. This error occurred when System Update was waiting for the return message from the disk driver. This error may have occurred because

- System Update did not receive a return message from the disk driver within the time out limit
- the `recvw()` process that waits for the return message from the disk driver

failed

Try to continue the update using the `UPD:GEN;CONTINUE` command.

`605xxy1` Bad MIRA return on message.

When System Update receives a return message from MIRA, it checks certain fields in the message for bad values. This error occurs when System Update finds a bad value in one of the fields in the return message. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.
- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`606xxy` Bad disk driver return on message.

When System Update receives a return message from the disk driver, it checks the return code that is in the message. The value of the return code must be zero. This error occurred because the return code was a value other than zero. Try to continue the update using the `UPD:GEN;CONTINUE` command.

`607xxy` Wrong disk state result.

After MIRA changes the state of the disk (to Active or Out of Service), System Update checks the UCB of that disk in the ECD to make sure that the change actually took place. This error occurred when System Update thought it changed the state of the disk, but the UCB of that disk does not reflect the change. Either MIRA did not change the state correctly or the state field in the UCB is damaged. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the Commit process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`608xxy` No active boot disks.

System Update checks the UCB in the ECD to find out which disk is the current system disk that is in the active state. This error occurred because there were not any disks that were in the active state. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, restore both disks to the active state and start the update over from the beginning of the `Enter` step.

`609xxy` Partition copy error.

The command `COPY:PTN:ALL` failed when the System Update Restore or `Commit` command used it to copy the new or old generic over the old or new generic during a backup partition method update. The error(s) associated with the command `COPY:PTN:ALL` will be saved in `/tmp/supr.prtcp`. The most common cause for this error is when the disks are not duplexed (e.g., both disks are not active) when the `Restore` or `Commit` commands are executed. After resolving the problem, (e.g., duplex both disks), continue the update using the `UPD:GEN;CONTINUE` command.

`610xxy` Recent change error.

This error occurred when System Update was performing a Recent Change on the ECD. The journal file and the error messages will be saved in `/tmp/supr.rcv` and `/tmp/supr.rcvout` respectively. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`611xxy` Copy command failed.

This error may have occurred when System Update was copying the log from the old generic to the new generic. Additional error codes can be found in `/tmp/supr.cp`. After resolving the problem, try to continue the update using the `UPD:GEN;CONTINUE` command.

`612xxy` `ECDMAN ugucbn() error`.

This error occurred when System Update used the ECD function `ugucbn()` to get information about the UCB record associated with a specified disk. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the `Restore` process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the `Commit` process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`613xxy ECDMAN ugetucb() error.`

This error occurred when System Update used the ECD function `ugetucb()` to get the UCB record for a specified disk. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, either start the update over from the beginning of the `Enter` step, or take one of the following actions:

- If this error occurred during the `Restore` process, manually restore the partitions containing the new generic (for the backup partition update method) or the disks containing the new generic (for the offline disk update method) to the old generic. Then, manually execute the `applhook` process.
- If this error occurred during the `Commit` process, manually restore the partitions containing the old generic (for the backup partition update method) or the disks containing the old generic (for the offline disk update method) to the new generic. Then, manually execute the `applhook` process.
- If this error occurred during any other System Update process, start the update over from the beginning of the `Enter` step.

`614xxy ECDMAN ugmamirids() error.`

This error occurred when System Update used the ECD function `ugetrec()` to get the pointer to the UCBs for the two disks that are associated with the update. Try to continue the update using the `UPD:GEN;CONTINUE` command.

`615xxy ECDMAN ursvucd() error.`

This error occurred when System Update used the ECD function `ursvucb()` to reserve a UCB. The disk that System Update is trying to update must first be reserved so that no other processes can write to it. This is done by reserving the disk's UCB. The `ursvucb()` function may have failed because another process has already reserved the disk that is trying to be reserved. Check to see if the disk is already reserved. If it has been reserved, execute the following command on a UNIX® terminal to unreserve the disk: `/etc/udgnnm MHD` *x* where *x* is the disk number that needs to be unreserved. Then, try to continue the update using the `UPD:GEN;CONTINUE` command.

`616xxy ECDMAN ugsdf() error.`

This error occurred when System Update used the ECD function `ugsdf()` to get the special device file name associated with the disk to be updated so that System Update can access that disk. Try to continue the update using the `UPD:GEN;CONTINUE` command. If the error persists, start the update over from the beginning of the Enter step.

`617xxy ECDMAN urelucb() error.`

This error occurred when System Update used the ECD function `urelucb()` to release (unreserve) a reserved UCB. Try to continue the update using the

`UPD:GEN;CONTINUE` command.

`618xxy` `ECDMAN ursdf() error.`

This error occurred when System Update used the ECD function `ursdf()` to give back to the system the special device file name of the updated disk that was obtained by the `ugsdf()` command (see error `616xxy`). Try to continue the update using the `UPD:GEN;CONTINUE` command.

`619xxy` `ECDMAN usettnum() error.`

System Update no longer uses the ECD `usettnum()` function, so this error should never appear.

`620xxy` `ECDMAN usetucb() error.`

System Update no longer uses the ECD `usetucb()` function, so this error should never appear.

`621xxy` `Unable to stop process with pkill.`

The System Update `Stop` command could not stop the currently running System Update process using the `pkill()` function call. If the `Stop` command cannot kill a System Update in progress using the `kill()` function call, it then tries to kill it using the `pkill()` function call. The `pkill` function call may have failed because there was a bad Process ID number (PID) in the System Update log file for the process that needed to be terminated.

The `Stop` command looks in the log file to find the PID of the process that is currently running and calls `pkill` with that PID. If the PID is damaged in the log file, the `pkill` command may be executed manually using the correct PID of the process that needs to be terminated.

`622xxy` `Unable to stop process with kill.`

The System Update `Stop` command could not stop the currently running System Update process using the `kill()` function call. The `kill()` function call is used in the Stop command to terminate the System Update process that is currently running. The `kill` function call may have failed because

- the process to be killed does not exist
- the sending process is not a superuser, and the sending and receiving processes do not have the same effective user ID
- the Process ID (PID) of the process being terminated is damaged in the System Update log. The `Stop` command passes this PID as a parameter to `kill()`

If the System Update still needs to be stopped, execute the System Update `Stop` process unconditionally using the UCL argument on its command line. **CAUTION:** if `Stop` is executed unconditionally, the System Update process will be terminated by a more extreme method than a kill (`pkill`). Some system resources in use by the process may not be automatically released.

SEE PROPRIETARY NOTICE ON COVER PAGE

623xxy System error killed the process.

A System Update process was terminated due to a phase 1 signal. System Update may not get a chance to print this error message when the interrupt occurs. If the System Update process is continued using the UPD:GEN;CONTINUE command, the Continue command will put this error code in the End entry of the System Update log file.

624xxy Cannot execute System Update while the Alternate Boot Disk (ABD) Feature is active.

System Update checks the status of the ABD feature when starting. If the system has a boot disk other than MHD 0 or 1, then ABD feature is active. Wait until the ABD active state has been cleared and then start the update.

SYSTEM UPDATE PROCEDURE MENU PAGE APPENDIX

1. Introduction

This appendix contains the System Update Menu Page error codes in Release 1. This appendix describes all the possible System Update menu page error conditions that can occur when installing a System Update using the System Update menu page. These error conditions are not affiliated in any way with the error conditions output by the System Update processes. System Update error conditions are described in the *UNIX® RTR Output Message Manuals* under the SUPR Appendix. The System Update menu page error conditions are divided into five categories: System Update log file errors (1-199), UNIX® RTR system call errors (200-399), System Update menu page internal errors (400-599), Craft user errors (600-799), and general warning messages (800-999).

The following sections describe, in detail, each error condition and the possible actions that may be taken to correct the error. For all error conditions corresponding to System Update processes, the following actions should be taken in the order they are listed here.

1. After correcting the condition that caused the error, try to continue the update using the 704 menu page poke for the `Continue` command.
2. If the `Continue` does not work, try finishing the update manually using input command on the Manual Input Command Line.
3. If the update cannot be finished manually, remove the System Update log file (`/etc/log/suprlog`), terminate the System Update menu page, and start the update over from the very beginning of the System Update procedures (the `Enter` command). The update may be installed using either manual procedures or menu driven procedures (System Update menu page). Make sure that the system is in a sane state before re-starting the update.

2. System Update Log File Errors

These error conditions occur when System Update is accessing the System Update log file.

`1` The System Update `getlog()` function failed when the `Continue` command was specified. The `getlog()` function was called to get the last log entry in the System Update log file to determine which command is to be continued. If continuing the update does not work, the log file may be damaged.

`2` When the `Continue` command was specified, the last log entry in the System Update log file was obtained in order to determine which command is to be continued. Either no log entries were found in the log file or only the

LOGFIRST entry was found which indicates that no command was executed far enough to be able to be continued. Try to execute the desired command from the beginning of that command. If continuing the update does not work, the log file may be damaged.

3 When the `Continue` command was specified, the last log entry in the System Update log file was obtained in order to determine which command is to be continued. The process type in the log entry found contains a bad value. Therefore, the process being continued cannot be determined. Valid process types are:

`b` = `Backout` command
`c` = `Commit` command
`e` = `Enter` command
`p` = `Proceed` command
`r` = `Restore` command

If continuing the update does not work, the log file may be damaged.

4 The System Update log file was being searched in order to determine which System Update process last completed successfully so that a visual indication of the successfully completed commands can be displayed in reverse video on the System Update Menu Page. A bad process type was found in the log entry corresponding to the last completed process. Valid process types are:

`b` = `Backout` process
`c` = `Commit` process
`e` = `Enter` process
`p` = `Proceed` process
`r` = `Restore` process

The log file may be damaged.

5 The System Update menu page was trying to get, from the `Begin Enter` entry in the System Update log file, the `Enter` command line arguments that were previously specified. An invalid sequence option was found in the `Begin Enter` log entry. Valid sequence options are:

`f` = single sequence (first sequence)
`s` = double sequence (second sequence)
`t` = triple sequence (third sequence)

The menu page terminates when this error occurs since this may be an indication that the log file is damaged. Try to bring up the menu page again. If the error persists, read the log file using the `OP:GEN:READLOG` command. Look at the Begin Enter log entry and make sure that the sequence options are listed correctly. If not, remove the log file and start the update over from the beginning of the `Enter` step. If the sequence options are correct, try to finish the update manually using MML input commands.

6 The System Update menu page was trying to get, from the `Begin Enter` entry in the System Update log file, the Enter command line arguments that were previously specified. An invalid update method was found in the `Begin Enter` log entry. Valid update methods are:

SEE PROPRIETARY NOTICE ON COVER PAGE

b = backup partition update method
o = offline disk update method

The menu page terminates when this error occurs since this may be an indication that the log file is damaged. Try to bring up the menu page again. If the error persists, read the log file using the `OP:GEN:READLOG` command. Look at the `Begin Enter` log entry and make sure that the sequence options are listed correctly. If not, remove the log file and start the update over from the beginning of the `Enter` step. If the sequence options are correct, try to finish the update manually using MML input commands.

7 When it is time for a user to mount a tape and continue the update during the `Enter` command, the Enter command sends a signal to the menu page in order to tell the menu page that a `mount tape and continue` message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the System Update log file. When the menu page receives the `mount tape and continue` signal from the `Enter` command, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the `Enter` command line in the display area of the menu page. In this case, the fake disk log entry could not be found in the log file. Terminate the menu page and try to bring it back up again. The `mount tape and continue` message should be displayed and the MML `Enter` input command line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the `Enter` command, or try to continue the update manually using MML input commands.

8 When it is time for a user to mount a tape and continue the update during the `Enter` command, the `Enter` command sends a signal to the menu page in order to tell the menu page that a `mount tape and continue` message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the System Update log file. When the menu page receives the `mount tape and continue` signal from the `Enter` command, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the `Enter` command line in the display area of the menu page. In this case, an invalid disk pair number was found in the fake disk log entry. The disk pair number found was a number less than one. Valid values are 1 and greater. Terminate the menu page and try to bring it back up again. The `mount tape and continue` message should be displayed and the MML `Enter` input command line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the `Enter` command, or try to continue the update manually using MML input commands.

9 When it is time for a user to mount a tape and continue the update during the

`Enter` command, the `Enter` command sends a signal to the menu page in order to tell the menu page that a `mount tape and continue` message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the System Update log file. When the menu page receives the `mount tape and continue` signal from the `Enter` command, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the `Enter` command line in the display area of the menu page. In this case, an invalid disk pair number was found in the fake disk log entry. The disk pair number found was a number that is greater than the total number of disks being updated. Terminate the menu page and try to bring it back up again. The `mount tape and continue` message should be displayed and the MML `Enter` input command line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the `Enter` command, or try to continue the update manually using MML input commands.

3. UNIX® RTR System Call Errors

These error conditions occur when a UNIX® RTR system call executed by the System Update menu page fails. More information about these UNIX® RTR System Calls can be found in Volume 3 of the Output Message Manuals under System Error Codes. The manual pages for these system calls may be found in Volume 3 Section 6 of the UNIX® RTR Operating System manuals.

`200` The function `sendpw()` failed when the menu page was sending DAP a message to free and initialize the System Update Menu Page. Try to bring up the System Update menu page again by typing the 107 menu poke.

`201` When the TERM PAGE poke was requested, the function `sendpw()` failed. The menu page was sending DAP a message to free the System Update Menu Page before it terminated so that the menu page would terminate cleanly. Try to terminate the menu page again using the TERM PAGE poke.

`202` When the TERM PAGE poke was requested, the function `sendpw()` failed. The menu page was sending DAP a message to free Enter Arguments Page 1 before it terminated the menu page so that the menu page would terminate cleanly. Try to terminate the menu page again using the TERM PAGE poke.

`203` When the TERM PAGE poke was requested, the function `sendpw()` failed. The menu page was sending DAP a message to free Enter Arguments Page 2 before it terminated the menu page so that the menu page would terminate cleanly. Try to terminate the menu page again using the TERM PAGE poke.

`204` The `getenv()` function failed when the menu page tried to get the terminal type from the environment. Try to bring up the System Update menu page again by typing the 107 poke.

`205` The `sendpw()` function failed when the menu page tried to send DAP a message to display one of the System Update pages.

page number 0 = System Update Menu Page
page number 1 = Enter Arguments Page 1
page number 2 = Enter Arguments Page 2

Try to display the page again by typing the appropriate poke.

206 The `msgenab()` function failed when the menu page tried to enable message reception. Try to bring up the System Update menu page again by typing the 107 poke.

207 The `recvw()` function failed when receiving or waiting for a message from DAP indicating that a poke was requested from the System Update Menu Page. Re-request the poke that failed.

208 The `sendpw()` function failed when sending a message to DAP to display one of the PDS/MML input command lines in the display area of the System Update Menu Page. Re-request the poke for the command that is desired to be displayed.

209 The `recvw()` function failed when receiving or waiting for a poke on one of the Enter Arguments pages. Try to specify the desired poke again.

210 The `recvw()` function failed when receiving or waiting for an argument to the Enter command line to be input by the user. Re-request the poke to the desired argument and then try to specify the argument contents again.

211 The `sendpw()` function failed when sending a pokeop message to DAP so that a poke on the System Update Menu Page can be processed. Try to request the desired poke again.

212 The `open()` function failed when the System Update log file was being opened for reading. The menu page was going to read the log file entries to determine which System Update process last completed successfully in order to visually indicate the successfully completed commands in reverse video on the System Update Menu Page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

213 The `read()` function failed when reading the first log entry in the System Update log file. It was being read when the menu page was in the process of determining which System Update process last completed successfully in order to visually indicate the successfully completed commands in reverse video on the System Update Menu Page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

214 The `lseek()` function failed when seeking to the last log entry in the System Update log file. The `lseek()` function was called when the menu page was in the process of determining which System Update process last completed successfully in order to visually indicate the successfully completed commands in reverse video on the System Update Menu Page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

215 The `read()` function failed when reading the last log entry in the System Update log file. It was being read when the menu page was in the process of determining which System Update process last completed successfully in order

to visually indicate the successfully completed commands in reverse video on the System Update Menu Page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

216 The `lseek()` function failed when seeking backwards to the next log entry in the System Update log file. The `lseek()` function was called when the menu page was in the process of determining which System Update process last completed successfully in order to visually indicate the successfully completed commands in reverse video on the System Update Menu Page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

217 The `read()` function failed when reading the next log entry in the System Update log file. It was being read when the menu page was in the process of determining which System Update process last completed successfully in order to visually indicate the successfully completed commands in reverse video on the System Update Menu Page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

218 The function `sendpw()` failed when the menu page was sending DAP a message to free and initialize Enter Arguments Page 2. Try to bring up the System Update menu page again by typing the 107 menu poke.

219 The `lcall()` function failed when the `Restore` process was attempting to be executed. Try to execute the `Restore` process again. If this error still occurs, try to finish the update manually using PDS/MML input commands.

220 The `lcall()` function failed when the `Stop` process was attempting to be executed. Try to execute the `Stop` process again. If this error still occurs, try to execute the Stop process manually using the Craft PDS/MML input command. **NOTE:** The execution and termination messages for the `Stop` process will not be displayed on the System Update menu page if the `Stop` process is executed manually.

221 The `lcall()` function failed when the application process was attempting to be executed. Try to execute the application process again. If this error still occurs, try to execute the application process manually using the Craft input command. **NOTE:** The execution and termination messages for the application process will not be displayed on the System Update menu page if the application process is executed manually.

222 The `lcall()` function failed when the `Backout` process was attempting to be executed. Try to execute the Backout process again. If this error still occurs, try to finish the update procedures manually using Craft input commands. **NOTE:** The execution and termination messages for the System Update commands will not be displayed on the System Update menu page if the commands are executed manually.

223 The `lcall()` function failed when the `Commit` process was attempting to be executed. Try to execute the `Commit` process again. If this error still occurs, try to execute the `Commit` process manually using the Craft input command. **NOTE:** The execution and termination messages for the `Commit` process will not be displayed on the System Update menu page if the `Commit` process is executed manually.

SEE PROPRIETARY NOTICE ON COVER PAGE

224 The `lcall()` function failed when the `Continue` process was attempting to be executed. Try to execute the `Continue` process again. If this error still occurs, finish the update manually using Craft input commands.

225 The `vcall()` function failed when the `Enter` process was attempting to be executed. Try to execute the `Enter` process again. If this error still occurs, finish the update manually using Craft input commands.

226 The `lcall()` function failed when the `Proceed` process was attempting to be executed. Try to execute the `Proceed` process again. If this error still occurs, try to finish the update manually using Craft input commands. **NOTE:** The execution and termination messages for the System Update commands will not be displayed on the System Update menu page if the commands are executed manually.

227 The `lcall()` function failed when the `Readlog` process was attempting to be executed. Try to execute the `Readlog` process again. If it still does not work, try to execute the Readlog process manually using the Craft input command. **NOTE:** The execution and termination messages for the `Readlog` process will not be displayed on the System Update menu page if the `Readlog` process is executed manually.

228 The function `sendpw()` failed when the menu page was sending DAP a message to free and initialize Enter Arguments Page 1. Try to bring up the System Update menu page again by typing the 107 menu poke.

229 When the System Update menu page is first brought up, it figures out which System Update commands have already been successfully executed so that it can display those menu numbers in reverse video on the menu page. It does this by reading the System Update log file. This error occurred when the menu page was trying to seek to the very first entry in the log file. The `lseek()` command failed. Try to bring up the menu page again. If the error persists, either try to continue the update manually using MML input commands, or remove the log file and start the update over from the beginning of the `Enter` step.

230 When it is time for a user to mount a tape and continue the update during the Enter command, the Enter command sends a signal to the menu page in order to tell the menu page that a `mount tape and continue` message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the System Update log file. When the menu page receives the `mount tape and continue` signal from the `Enter` command, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the `Enter` command line in the display area of the menu page. In this case, the `open()` command failed when the menu page was trying to open the log file. Terminate the menu page and try to bring it back up again. The `mount tape and continue` message should be displayed and the MML Enter input command line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the Enter command, or try to continue the update manually using

MML input commands.

231 When it is time for a user to mount a tape and continue the update during the `Enter` command, the `Enter` command sends a signal to the menu page in order to tell the menu page that a `mount tape and continue` message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the System Update log file. When the menu page receives the `mount tape and continue` signal from the `Enter` command, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the `Enter` command line in the display area of the menu page. In this case, the `lseek()` command failed when the menu page was trying to seek to the first entry in the log file. Terminate the menu page and try to bring it back up again. The `mount tape and continue` message should be displayed and the MML Enter input command line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the `Enter` command, or try to continue the update manually using MML input commands.

232 When it is time for a user to mount a tape and continue the update during the `Enter` command, the `Enter` command sends a signal to the menu page in order to tell the menu page that a `mount tape and continue` message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the System Update log file. When the menu page receives the `mount tape and continue` signal from the `Enter` command, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the `Enter` command line in the display area of the menu page. In this case, the `read()` command failed when the menu page was trying to read the first entry in the log file. Terminate the menu page and try to bring it back up again. The `mount tape and continue` message should be displayed and the MML `Enter` input command line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the Enter command, or try to continue the update manually using MML input commands.

233 When it is time for a user to mount a tape and continue the update during the `Enter` command, the `Enter` command sends a signal to the menu page in order to tell the menu page that a `mount tape and continue` message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the System Update log file. When the menu page receives the `mount tape and continue` signal from the `Enter` command, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the `Enter` command line in the display area of the menu page. In this case, the

`lseek()` command failed when the menu page was trying to seek to the fake disk entry in the log file. Terminate the menu page and try to bring it back up again. The `mount tape and continue` message should be displayed and the MML `Enter` input command line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the `Enter` command, or try to continue the update manually using MML input commands.

`234` When it is time for a user to mount a tape and continue the update during the `Enter` command, the `Enter` command sends a signal to the menu page in order to tell the menu page that a `mount tape and continue` message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the System Update log file. When the menu page receives the `mount tape and continue` signal from the `Enter` command, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the Enter command line in the display area of the menu page. In this case, the `read()` command failed when the menu page was trying to read the fake disk entry in the log file. Terminate the menu page and try to bring it back up again. The `mount tape and continue` message should be displayed and the MML `Enter` input command line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the `Enter` command, or try to continue the update manually using MML input commands.

4. System Update Menu Page Internal Errors

These error conditions occur when the System Update menu page gets "mixed up" internally.

`400` One of the three System Update pages was attempting to be displayed using the internal `dispage()` function which failed because a bad page number corresponding to the page to be displayed was passed to this function.

page number 0 = System Update Menu Page
page number 1 = Enter Arguments Page 1
page number 2 = Enter Arguments Page 2

Try to display the page again by typing the appropriate poke.

`401` While waiting for a poke to be specified on the System Update Menu Page, the `recvw()` function received a message from DAP that either contained less than the minimum number of bytes allowed or contained greater than the maximum number of bytes allowed in a message. Try to specify the desired poke again.

`402` The `Stop` command was requested, but the `Execcmd` variable, which contains the poke number of the current executing System Update command, contains a bad poke number. Therefore, the menu page does not know which command to stop. Try to specify the `Stop` command again.

`403` The application process was being formatted in order to be displayed when a

bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the application process again. If this error still occurs, execute the application manually using the PDS/MML input command.

404 While waiting for a poke to be specified on one of the Enter Arguments pages, the `recvw()` function received a message from DAP that either contained less than the minimum number of bytes allowed or contained greater than the maximum number of bytes allowed in a message. Try to specify the desired poke again.

405 A poke number could not be found in the text portion of the poke message sent from DAP to the menu page when the user requested a poke from one of the Enter Arguments pages. Therefore, the specified poke could not be processed. DAP may have sent the menu page a damaged message. Try to specify the desired poke again.

406 While waiting for an argument to be specified on one of the Enter Arguments pages, the `recvw()` function received a message from DAP that either contained less than the minimum number of bytes allowed or contained greater than the maximum number of bytes allowed in a message. Specify the poke corresponding to the desired argument and then try to specify the argument again.

407 An invalid number of literal strings were found in the text portion of the poke message sent from DAP to the menu page when the user specified arguments contents on one of the Enter Arguments pages. Therefore, the specified poke or literal string could not be processed. DAP may have sent the menu page a damaged message. Try to specify the desired argument poke and argument contents again.

408 The internal function `checkargs()` checks to make sure that all of the mandatory Enter command line arguments have been specified. If all of them have not been specified, `checkargs()` returns the Enter Arguments page number of the page that contains the poke for the argument that was not specified:

page number 1 = Enter Arguments Page 1
page number 2 = Enter Arguments Page 2

The appropriate Enter Arguments page is displayed depending on the return value from checkargs so that the missing argument can be specified. Checkargs returned a bad page number and therefore the appropriate Enter Arguments page cannot be displayed. Make sure that all of the mandatory `Enter` command line arguments have been specified then type the poke 753 to return to the System Update Menu Page.

409 When formatting the PDS `Enter` input command line, the bootdisk specified was searched for in the Enter arguments structure. It could not be found. Since it is mandatory for a bootdisk to be specified on the `Enter` command line, the PDS `Enter` input command line could not be formatted and therefore could not be displayed in the display area of the System Update Menu Page. Display Enter Arguments Page 2 and make sure that a bootdisk has been specified.

SEE PROPRIETARY NOTICE ON COVER PAGE

410 When formatting the PDS `Enter` input command line, a sequence option specified was searched for in the Enter arguments structure. It could not be found. Display Enter Arguments Page 2 again and respecify sequence options for all the disks specified.

411 When formatting the PDS Enter input command line that is to be displayed in the display area of the System Update Menu Page, too many lines were used for the command. The display area only contains 13 lines and more than 13 lines were used to format the `Enter` input command line.

412 After formatting the PDS `Enter` input command line, not all of the disks specified were included in the command line (the number of disks formatted into the command line did not match the number of disks that were specified). The counter that contains the number of disks specified may be damaged. Terminate the menu page using poke 750, bring up the menu page again using poke 107, and re-specify all of the `Enter` command line arguments.

413 When formatting the MML `Enter` input command line, the bootdisk specified was searched for in the Enter arguments structure. It could not be found. Since it is mandatory for a bootdisk to be specified on the `Enter` command line, the MML Enter input command line could not be formatted and therefore could not be displayed in the display area of the System Update Menu Page. Display Enter Arguments Page 2 and make sure that a bootdisk has been specified.

414 When formatting the MML `Enter` input command line, a sequence option specified was searched for in the Entry arguments structure. It could not be found. Display Enter Arguments Page 2 again and re-specify sequence options for all the disks specified.

415 When formatting the MML `Enter` input command line that is to be displayed in the display area of the System Update Menu Page, too many lines were used for the command. The display area only contains 12 lines and more than 12 lines were used to format the `Enter` input command line.

416 After formatting the MML `Enter` input command line, not all of the disks specified were included in the command line (the number of disks formatted into the command line did not match the number of disks that were specified). The counter that contains the number of disks specified may be damaged. Terminate the menu page using poke 750, bring up the menu page again using poke 107, and re-specify all of the `Enter` command line arguments.

417 When the `Enter` input command line was being formatted in order to be displayed in the display area of the System Update Menu Page, the variable containing the input mode of the system was found to be damaged (it contained something other than PDS or MML). Since the menu page does not know which format to use, it cannot display the `Enter` input command line. Terminate the menu page, bring up the menu page again, and re-specify all of the `Enter` command line arguments.

418 When deleting a specified disk, an invalid poke number corresponding to the disk being deleted was found. Try to type in the poke again for the disk being deleted, and then hit the Return key to delete the previously specified disk. If that still does not work, terminate the menu page, bring up the menu page again, and re-specify all of the `Enter` command line arguments.

SEE PROPRIETARY NOTICE ON COVER PAGE

419 When specifying a disk, an invalid poke number corresponding to the disk being specified was found. Try to type in the poke again for the disk being specified, and then type in the full pathname of the desired disk. If that still does not work, terminate the menu page, bring up the menu page again, and re-specify all of the `Enter` command line arguments.

420 A specified tape sequence option was being added to the Enter arguments structure when a bad tape sequence option poke was found in the variable that saves the poke last specified. Try to specify the tape sequence option poke again and then re-specify the tape sequence option argument.

421 A previously specified tape sequence option was being deleted from the Enter arguments structure when a bad tape sequence option poke was found in the variable that saves the poke past specified. Try to specify the tape sequence option poke again and then try to delete the previously specified tape sequence option.

422 A bad poke number was specified on one of the Enter Arguments pages. Specify only a poke number that is on the page currently being displayed.

423 The System Update menu page process received a SIGCLD signal. When the function `qwait()` was executed to find the process id of the child that terminated, the `qwait()` function returned a process id of 0 (zero) which indicates that no child process terminated. If the rest of the System Update cannot be performed using the menu page because of this error, finish the update manually using PDS/MML Craft input commands.

424 The System Update menu page process received a SIGCLD signal. When the function `qwait()` was executed to find the process id of the child that terminated, the `qwait()` function returned a process id of -1 which indicates that no child existed that could terminate. If the rest of the System Update cannot be performed using the menu page because of this error, finish the update manually using PDS/MML Craft input commands.

425 The `Enter` poke was specified and the menu page process executed the `checkargs()` function to make sure that all of the mandatory `Enter` command line arguments have been specified. If at least one of these arguments have not been specified, `checkargs()` returns the page number of the Enter Arguments page that needs to be displayed so that the missing argument can be specified. In this case, checkargs returned an invalid Enter Arguments page number. Valid page numbers are:

page number 1 = Enter Arguments Page 1
page number 2 = Enter Arguments Page 2

Try to specify the `Enter` poke again.

426 The application process terminated unsuccessfully with an error code (a value other than one). Fix the error and then execute the application process again.

427 The `Backout` process terminated unsuccessfully with an error code (a value other than one). To determine the exact System Update error that occurred, look at the `UPD-GEN,BACKOUT` error message that was printed on the ROP by the `Backout` process. This message contains a System Update error code. Look up this error code in the SUPR Appendix, `SUPR-APP`, (Volume 3 of the *UNIX® RTR Output Message Manuals*) to find the exact cause of the error. Fix

the error and then continue the Backout process using the Continue poke.

428 The Commit process terminated unsuccessfully with an error code (a value other than one). To determine the exact System Update error that occurred, look at the UPD-GEN,COMMIT error message that was printed on the ROP by the Commit process. This message contains a System Update error code. Look up this error code in the SUPR Appendix, SUPR-APP, of the *Output Message Manuals* to find the exact cause of the error. Fix the error and then continue the Commit process using the Continue poke.

429 The Continue process terminated unsuccessfully with an error code (a value other than one). To determine the exact System Update error that occurred, look at the UPD-GEN,CONTINUE error message that was printed on the ROP by the Continue process. This message contains a System Update error code. Look up this error code in the SUPR Appendix, SUPR-APP, of the *Output Message Manuals* to find the exact cause of the error. Fix the error and then re-execute the Continue process.

430 The Enter process terminated unsuccessfully with an error code (a value other than one). To determine the exact System Update error that occurred, look at the UPD-GEN,ENTER error message that was printed on the ROP by the Enter process. This message contains a System Update error code. Look up this error code in the SUPR Appendix, SUPR-APP, of the *Output Message Manuals* to find the exact cause of the error. Fix the error and then continue the Enter process using the Continue poke.

431 The Proceed process terminated unsuccessfully with an error code (a value other than one). To determine the exact System Update error that occurred, look at the UPD-GEN,PROCEED error message that was printed on the ROP by the Proceed process. This message contains a System Update error code. Look up this error code in the SUPR Appendix, SUPR-APP, of the *Output Message Manuals* to find the exact cause of the error. Fix the error and then continue the Proceed process using the Continue poke.

432 The Readlog process terminated unsuccessfully with an error code (a value other than one). To determine the exact System Update error that occurred, look at the OP-GEN,READLOG error message that was printed on the ROP by the Readlog process. This message contains a System Update error code. Look up this error code in the SUPR Appendix, SUPR-APP, of the *Output Message Manuals* to find the exact cause of the error. Fix the error and then re-execute the Readlog process.

433 The Restore process terminated unsuccessfully with an error code (a value other than one). To determine the exact System Update error that occurred, look at the UPD-GEN,RESTORE error message that was printed on the ROP by the Restore process. This message contains a System Update error code. Look up this error code in the SUPR Appendix, SUPR-APP, of the *Output Message Manuals* to find the exact cause of the error. Fix the error and then continue the Restore process using the Continue poke.

434 The Stop process terminated unsuccessfully with an error code (a value other than one). The process that was attempted to be stopped is still executing. To determine the exact System Update error that occurred, look at the STOP-GEN error message that was printed on the ROP by the Stop process. This message

SEE PROPRIETARY NOTICE ON COVER PAGE

contains a System Update error code. Look up this error code in the SUPR Appendix, SUPR-APP, of the *Output Message Manuals* to find the exact cause of the error. Fix the error if possible and then try to re-execute the Stop process.

435 A child process terminated, but the process id of the terminated child that was obtained via the qwait() function does not match any of the process ids that were saved when each child was executed. If the update cannot be finished using the menu page because of this error, finish the update manually using PDS/MML Craft input commands.

436 The Backout command was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the Backout command again. If this error still occurs, finish the update procedures manually using PDS/MML Craft input commands.

437 The Backout command was being formatted in order to be displayed when a bad value was found in the Ucl flag variable. Try to request the Backout command again. If this error still occurs, finish the update procedures manually using PDS/MML Craft input commands.

438 The Commit command was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the Commit command again. If this error still occurs, finish the update procedures manually using PDS/MML Craft input commands.

439 The Commit command was being formatted in order to be displayed when a bad value was found in the Ucl flag variable. Try to request the Commit command again. If this error still occurs, finish the update procedures manually using PDS/MML Craft input commands.

440 The Continue command was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the Continue command again. If this error still occurs, finish the update procedures manually using PDS/MML Craft input commands.

441 A command is being continued. When the command begins execution, a message indicating that this command is executing is printed on the messages line of the menu page and its input command line is displayed in the display area of the System Update Menu Page. The appropriate message and command line are printed depending on the command that was continued. The menu poke number for the continued command is saved in an internal variable which appears to be damaged because an invalid menu poke number was found. Therefore, the execution message and the input command cannot be displayed. This may not disrupt the rest of the update. The System Update command is still executing. If problems arise, finish the update manually using Craft PDS/MML input commands.

442 The Proceed command was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the Proceed command again. If this error still occurs, finish the update procedures manually using PDS/MML Craft input commands.

SEE PROPRIETARY NOTICE ON COVER PAGE

443 The UCL flag (an internal variable) contains an invalid value. This flag indicates whether or not the UCL argument was requested for the last command specified (which in this case is the Proceed command). Valid values are:

0 = UCL argument was not requested
1 = UCL argument was requested

Try to specify the Proceed command first without any arguments. If arguments are desired, specify them next. If this error still occurs, finish the update manually using Craft PDS/MML input commands.

444 The Retro flag (an internal variable) contains an invalid value. This flag indicates whether or not the RETRO argument was requested for the Proceed command. Valid values are:

0 = RETRO argument was not requested
1 = RETRO argument was requested

Try to specify the Proceed command first without any arguments. If arguments are desired, specify them next. If this error still occurs, finish the update manually using Craft PDS/MML input commands.

445 The Readlog command was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the Readlog command again. If this error still occurs, execute the Readlog command manually using the PDS/MML Craft input command.

446 The Restore command was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the Restore command again.

447 The UCL flag (an internal variable) contains an invalid value. This flag indicates whether or not the UCL argument was requested for the last command specified (which in this case is the Restore command). Valid values are:

0 = UCL argument was not requested
1 = UCL argument was requested

Try to specify the Restore command first without any arguments. If arguments are desired, specify them next. If problems still arise, finish the update manually using Craft PDS/MML input commands.

448 The Proceed command was being formatted with the Retro argument in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the Proceed command without any arguments. Then, if arguments (such as Retro) are desired, specify them next. If this error still occurs, finish the update procedures manually using PDS/MML Craft input commands.

449 The Proceed command was being formatted with the Retro argument in order to be displayed when a bad value was found in the UCL flag (internal variable) which indicates whether or not the UCL argument was requested for the last command specified (which in this case is the Proceed command). Valid values are:

SEE PROPRIETARY NOTICE ON COVER PAGE

0 = UCL argument was not requested
1 = UCL argument was requested

Try to specify the Proceed command first without any arguments. If arguments are desired, specify them next. If this error still occurs, finish the update manually using Craft PDS/MML input commands.

450 The Stop command was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1, PDS = 2). Try to request the Stop command again. If this error still occurs, execute the Stop command manually using the PDS/MML Craft input command.

451 The UCL flag (an internal variable) contains an invalid value. This flag indicates whether or not the UCL argument was requested for the last command specified (which in this case is the Stop command). Valid values are:

0 = UCL argument was not requested
1 = UCL argument was requested

Try to specify the Stop command first without any arguments. If arguments are desired, specify them next. If this error still occurs, execute the Stop command manually using the Craft PDS/MML input command.

452 After the menu page poke (107) was requested while on one of the Enter Arguments pages which displayed the System Update Menu Page, a poke was requested from the System Update Menu Page. In order to process this poke, the poke number must be converted to its corresponding literal string name using the internal getname() function which could not find the corresponding literal string name. Try to request the desired poke number again.

453 When a System Update process is continued, the Continue command executes the System Update process and returns the process id and the process type of the continued process to the menu page. The menu page saves the process id in one of the process id variables depending on the process being continued (indicated by the process type). In this case, a bad process type was received from the Continue command. Valid process types are:

b = Backout process
c = Commit process
e = Enter process
p = Proceed process
r = Restore process

Therefore, the process id of the continued process could not be saved. Since the menu page determines when a process terminates using the saved process ids of executed processes, the completion message for the continued process cannot be printed and the menu page will never know when a process terminates. This may or may not be a problem depending on how far the update has gotten. If the Enter command was continued, the Proceed command will fail since the menu page does not know that the Enter command has completed. In all other cases, the update should still work except that the completion message for the continued command will not be displayed on the menu page (but, System Update does display the completion message on the ROP).

SEE PROPRIETARY NOTICE ON COVER PAGE

454 The menu page determined the System Update command that was last successfully completed in order to visually display the appropriate commands that have completed in reverse video on the System Update Menu Page and to keep track internally of which System Update commands have already been executed. But, the variable containing the menu number corresponding to the last successfully completed command contains an invalid menu number. Valid menu numbers of successfully completed System Update processes are:

701 = Enter process
702 = Proceed process
703 = Commit process
707 = Restore process
708 = Backout process

Since the menu page has no way of knowing which System Update processes have been successfully executed and which have not, the menu page cannot continue with the update and therefore terminates with an error. Try to bring up the System Update menu page again.

455 The System Update menu page terminated itself due to an error occurring. The error code that corresponds to the error that occurred can be found printed on the ROP. Fix the error, bring up the System Update menu page again, and try to finish the update.

456 The Lastcmd variable which contains the menu number of the last command that was specified, contains an invalid menu number. When the Execute poke is requested, the command to be executed is obtained from the Lastcmd variable. Since the Lastcmd variable contains an invalid menu number, no process can be executed. Re-specify the desired command that is to be executed, and then type in the Execute poke again.

457 The unconditional flag for the Restore command contains an invalid value. Valid values are:

0 = the Restore command is to be executed conditionally
1 = the Restore command is to be executed unconditionally

The Restore command cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the Restore command again.

458 The unconditional flag for the Stop command contains an invalid value. Valid values are:

0 = the Stop command is to be executed conditionally
1 = the Stop command is to be executed unconditionally

The Stop command cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the Stop command again.

459 The unconditional flag for the Backout command contains an invalid value. Valid values are:

0 = the Backout command is to be executed conditionally

1 = the Backout command is to be executed unconditionally

The Backout command cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the Backout command again.

460 The unconditional flag for the Commit command contains an invalid value. Valid values are:

0 = the Commit command is to be executed conditionally
1 = the Commit command is to be executed unconditionally

The Commit command cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the Commit command again.

461 The Enter command cannot be executed because the Ucl variable in the Enter arguments structure contains an invalid value. Valid values are:

UCL = the Enter command is to be executed conditionally
NOTSET = the Enter command is to be executed unconditionally

Re-specify YES or NO for the Ucl argument on Enter Arguments Page 1. Then, try to execute the Enter command again.

462 The Enter command cannot be executed because the DFC preference variable in the Enter arguments structure contains an invalid value. Valid values are:

0 = DFC 0
1 = DFC 1
NOTSET = no preference

Re-specify the DFC preference on Enter Arguments Page 1. Then, try to execute the Enter command again.

463 The Enter command cannot be executed because the variable in the Enter arguments structure that indicates whether or not backup partitions are to be updated contains an invalid value. Valid values are:

NOBKUPD = do not update the backup partitions
NOTSET = update backup partitions

Re-specify whether or not backup partitions are to be updated on Enter Arguments Page 1. Then, try to execute the Enter command again.

464 The Enter command cannot be executed because the update method variable in the Enter arguments structure contains an invalid value. Valid values are:

BKPRT = backup partition update method
OFLDISK = offline disk update method

Re-specify the update method on Enter Arguments Page 1. Then, try to execute the Enter command again.

465 The Enter command cannot be executed because the tape sequence option variable for the bootdisk in the Enter arguments structure contains an invalid value. Valid values are:

SGLSEQ = single tape sequence
DBLSEQ = double tape sequence
TPLSEQ = triple tape sequence

Re-specify the tape sequence option on Enter Arguments Page 2. Then, try to execute the Enter command again.

466 The Enter command cannot be executed because the bootdisk could not be found in the Enter arguments structure (System Update will not work unless a bootdisk is being updated in addition to the other disks). Make sure a bootdisk was specified. If not, specify the bootdisk on Enter Arguments Page 2 and attempt to execute the Enter command again.

467 The unconditional flag for the Proceed command contains an invalid value. Valid values are:

0 = the Proceed command is to be executed conditionally
1 = the Proceed command is to be executed unconditionally

The Proceed command cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the Proceed command again.

468 The retrofit flag for the Proceed command contains an invalid value. Valid values are:

0 = execute the Proceed command without the RETRO argument
1 = execute the Proceed command with the RETRO argument

The Proceed command cannot be executed since it cannot be determined if it is to be executed with or without the RETRO argument. Try to specify and execute the Proceed command again.

469 When the System Update menu page is first displayed, the System Update log file is read in order to determine which System Update process last completed successfully. The menu number corresponding to that process is saved in the lastcmd variable. In this case, the lastcmd variable was found to contain an invalid menu number. Since the last System Update process that last completed successfully could not be determined, the System Update menu page terminated because it needs this information to run properly. Try to bring up the System Update menu page again. If errors still persist, finish the update manually using Craft PDS/MML input commands. If this still does not work, the System Update log file may be damaged. Return the system to its original sane state, remove the System Update log file, and then start the update from the very beginning (the Enter command).

470 If the System Update menu page is terminated while a System Update process is still executing and the menu page is brought back up before the System Update process completes, the menu page reads the last entry written to the log file and sets an internal variable to indicate which process is executing. The currently executing process is determined by the value in the process type field in the last log entry. In this case, an invalid process type was found. Valid process types are:

SEE PROPRIETARY NOTICE ON COVER PAGE

e = Enter process
p = Proceed process
c = Commit process
r = Restore process
b = Backout process

The menu page terminates when this error occurs since this may be an indication that the log file is damaged. Try to bring up the menu page again. If the error persists, read the log file using the OP:GEN:READLOG command. Look at the Begin Enter log entry and make sure that the process type for the last entry is correct. If not, remove the log file and start the update over from the beginning of the Enter step. If the process type is correct, try to finish the update manually using MML input commands.

471 When the menu page is first brought up, it reads the Begin entries in the System Update log file to determine the command line arguments that were previously specified for various System Update processes that either were executing or are executing. In this case, a Begin log entry was read which contains an invalid process type. Valid process types are:

e = Enter process
p = Proceed process
c = Commit process
r = Restore process
b = Backout process

The menu page terminates when this error occurs since this may be an indication that the log file is damaged. Try to bring up the menu page again. If the error persists, read the log file using the OP:GEN:READLOG command. Look at the Begin log entries and make sure that the process types for the entries are correct. If not, remove the log file and start the update over from the beginning of the Enter step. If the process types are correct, try to finish the update manually using MML input commands.

472 If the System Update menu page was terminated while the System Update Enter process was executing and the menu page was brought back up before the Enter process terminated, the menu page reads the System Update log file to determine the Enter command line arguments that were previously specified. In this case, not all of the mandatory Enter command line arguments could be determined. Try to bring up the menu page again. If the error persists, read the log file using the OP:GEN:READLOG command. Look at the Begin Enter log entry and make sure that the mandatory command line arguments are correct. If not, remove the log file and start the update over from the beginning of the Enter step. If the process types are correct, try to finish the update manually using MML input commands.

473 If the System Update menu page was terminated while the System Update Enter process was executing and the menu page was brought back up before the Enter process terminated, the menu page reads the System Update log file to determine the Enter command line arguments that were previously specified. In this case, the Begin Enter log entry, which contains the Enter command line arguments, could not be found in the log file. Try to bring up the menu page again. If the error persists, read the log file using the OP:GEN:READLOG command. Look at the Begin Enter log entry and make

sure that the command line arguments were specified correctly. If not, remove the log file and start the update over from the beginning of the Enter step. If the command line arguments were specified correctly, try to finish the update manually using MML input commands.

474 If the System Update menu page was terminated while a System Update process was executing and the menu page was brought back up before the process terminated, the menu page determines which command is currently executing and sets an internal variable to the process id of the currently executing process. In this case, a process is executing, but the menu page cannot figure out which one since all of the internal variables containing the process ids of the System Update process all indicate that there is no process executing. Try to bring up the menu page again. If the error persists, wait until the currently executing System Update process terminates. Then, try to bring up the menu page.

5. User Errors

These error conditions occur when the error may have been caused by the user.

600 The poke to terminate the System Update menu page was requested when one of the System Update processes or the application process was executing. The menu page can only be terminated if there are no processes currently executing. Wait until the executing process terminates and then try to terminate the menu page again using the TERMPAGE poke.

601 More than three pokes were specified on the CMD< line of the System Update Menu Page. Specify the correct number of pokes (one, two, or three) separated by commas.

602 The RETRO poke was specified on the CMD< line of the System Update Menu Page. System Update does not currently handle this flag yet in Release 1. Therefore, the menu page does not allow it to be specified.

603 The first poke that was specified on the CMD< line of the System Update Menu Page is invalid. It must be one of the pokes that are displayed on that page. Pokes from the two Enter Arguments pages cannot be specified from the System Update Menu Page.

604 The Enter command was requested when it has already successfully completed. The Enter command cannot be executed more than once in one update. Either execute the Proceed and/or Commit commands or execute the Backout and/or Restore commands. If the update needs to be started from the very beginning of the update procedures, remove the System Update log file (/etc/log/suprlog) and then execute the Enter command.

605 The Commit command was requested when it has already successfully completed. The Commit command cannot be executed more than once in one update. If the update needs to be started from the very beginning of the update procedures, remove the System Update log file (/etc/log/suprlog) and then execute the Enter command.

606 The Stop command can be used to stop only the following System Update processes: Backout, Commit, Continue, Enter, Proceed, and Restore. The Stop command was erroneously executed to stop either the Readlog process or the Stop process itself which are not allowed to be stopped by the

`Stop` command.

607 The `Stop` command was requested when no System Update processes that can be stopped are executing.

608 For the following commands, only one or two pokes are allowed to be specified on the CMD< line of the System Update Menu Page at one time (the command poke and the `UCL` flag if desired): `Backout`, `Commit`, `Enter`, `Restore`, and `Stop`. A third poke was specified which is not allowed. Re-request the desired command specifying only the command poke and the `UCL` flag if desired.

609 Two pokes were specified on the CMD< line of the System Update Menu Page for one of the following commands: `Backout`, `Commit`, `Enter`, `Restore`, or `Stop`. The first poke was the poke for the command itself. The only poke value allowed for the second poke for these commands is the UCL poke (using either the UCL poke number 710 or the "UCL" or "ucl" literal string) since this is the only argument allowed on these command lines. In this case, something other than the `UCL` poke or the "UCL" or "ucl" literal string was specified. Re-request the desired command.

610 The `Proceed` command was requested when it has already successfully completed. The `Proceed` command cannot be executed more than once in one update. Either execute the `Commit` command or execute the `Restore` command. If the update needs to be started from the very beginning of the update procedures, remove the System Update log file (`/etc/log/suprlog`) and then execute the `Enter` command.

611 The `RETRO` poke or the "RETRO" or "retro" literal string was specified as the second poke on the CMD< line of the System Update Menu Page when the Proceed command was specified as the first poke. The menu page does not allow this flag since System Update does not handle it yet.

612 The `Proceed` command was specified with an argument on the CMD< line of the System Update Menu Page. The only argument `Proceed` allows is the `UCL` poke or the "UCL" or "ucl" literal string. The argument specified was something other than `UCL`.

613 Three pokes were specified on the CMD< line of the System Update Menu Page when only two are allowed at one time.

614 The third poke specified on the CMD< line of the System Update Menu Page was found to be invalid. Since the first poke specified corresponded to the `Proceed` command, the other two pokes have to correspond with the `UCL` or `RETRO` arguments since these are the only arguments that the `Proceed` command allows. In this case, the third poke was something other than the `UCL` or the `RETRO` argument.

615 Three pokes are not allowed to be specified on the CMD< line of the System Update Menu Page at the same time when the first poke corresponds to the application process.

616 Only one poke is allowed to be specified on the CMD< line of the System Update Menu Page when that poke corresponds to one of the following: `Enter Args1`, `Enter Args2`, `Continue`, `Execute`, `Readlog`, and `Termpage`. In this case, more than one poke was specified.

SEE PROPRIETARY NOTICE ON COVER PAGE

617 The Retro poke was specified on the CMD< line of the System Update Menu Page, but the last command specified was not the Proceed command. The Retro poke is only allowed to be specified for the Proceed command.

618 Two pokes were specified on the CMD< line of the System Update Menu Page. The first corresponded to the Retro flag for the Proceed command. The only other poke that is allowed to be specified for the Proceed command corresponds to the UCL flag. In this case the second poke did not correspond to the UCL poke or literal string.

619 Three pokes are not allowed to be specified on the CMD< line of the System Update Menu Page when the first poke corresponds to the UCL poke. Only two pokes are allowed: the UCL poke and the poke or literal string corresponding to the Retro flag (only if the last command currently being displayed in the display area is the Proceed command).

620 Until System Update is changed to handle the Retro flag on the Proceed command line, the System Update menu page will not allow the user to specify the Retro poke. In this case, the UCL poke was specified on the CMD< line of the System Update Menu Page. A second poke was also specified on the CMD< line. A second poke is not allowed to be specified since the only valid value allowed with the UCL poke is the Retro poke and System Update does not handle it yet.

621 When System Update is changed to handle the Retro flag on the Proceed command line and the UCL poke is specified on the CMD< line of the System Update Menu Page along with a second poke, the second poke must correspond to the Retro flag since that is the only argument that can be specified with the UCL argument.

622 The UCL and Retro flags were specified on the CMD< line of the System Update Menu Page, but the last command specified was not the Proceed command. The Retro argument is only allowed to be specified for the Proceed command.

623 The UCL poke was specified on the CMD< line of the System Update Menu Page, but the last command specified does not accept the UCL argument on its command line.

624 The number zero (0) was specified for the update method on the Enter command line. Zero does not correspond to a valid update method argument. If the offline disk method is desired, type the letter **O**. If the backup partition method is desired, type the letter **B**.

625 An invalid update method was specified for the Enter command line. Specify the letter **O** for the offline disk method and the letter **B** for the backup partition method.

626 An invalid tape device was specified. Prior to release 6, the full path name was required. In Release 6 and later, either the full pathname or "mt0", "mT0", "mt1", or "mT1" may be used to specify the tape device.

627 The specified tape device either does not exist or cannot be accessed for reading.

SEE PROPRIETARY NOTICE ON COVER PAGE

628 A dfc preference cannot be specified until an update method has been specified. This is done for error checking since a dfc preference can only be made if using the offline disk update method.

629 A dfc preference was specified when the update method specified was not the offline disk method. A DFC preference can only be specified when using the offline disk update method.

630 An invalid dfc preference was specified. Type **0** (zero) for DFC 0, **1** (one) for DFC 1, or **2** (two) to specify no preference.

631 It cannot be specified whether or not the backup partitions will be updated until an update method has been specified. In this case, an update method has not yet been specified. This is done for error checking since it can be specified that the backup partitions will or will not be updated only when using the offline disk update method.

632 It was specified that the backup partitions will or will not be specified when the update method specified was not the offline disk method. It can be specified that the backup partitions will or will not be updated only when using the offline disk update method.

633 When requesting that the backup partitions will or will not be updated, an invalid argument value was specified. Type `N` if the backup partitions are not to be updated, type `Y` if the backup partitions are to be updated.

634 When specifying whether or not the `Enter` command is to be executed unconditionally, an invalid argument value was specified. To execute the `Enter` command unconditionally, type **`Y`**. To execute the `Enter` command conditionally, type **`N`**.

635 All of the mandatory `Enter` command line arguments were being checked to make sure that they were all specified (update method, tape device, and bootdisk to be updated). It was found that the update method has not yet been specified.

636 All of the mandatory `Enter` command line arguments were being checked to make sure that they were all specified (update method, tape device, and bootdisk to be updated). It was found that the tape device has not yet been specified.

637 All of the mandatory `Enter` command line arguments were being checked to make sure that they were all specified (update method, tape device, and bootdisk to be updated). It was found that a tape sequence option was specified for a disk that was not specified. Either remove all tape sequence option specifications, or specify the corresponding disks to be updated.

638 When the tape sequence option becomes a mandatory `Enter` command line argument, this error message will be printed when a disk to be updated has been specified, but its corresponding tape sequence option has not been specified. Either remove the disk to be updated specification or specify its corresponding tape sequence option.

639 A disk to be updated was not specified. It is mandatory that at least one disk is specified. This disk must be a bootdisk.

SEE PROPRIETARY NOTICE ON COVER PAGE

640 It is a System Update requirement that one of the specified disks to be updated has to be the bootdisk (currently called /dev/vtoc). The bootdisk could not be found and therefore is assumed to have not yet been specified.

641 A full pathname was not specified for the specified disk to be updated.

642 The specified disk to be updated does not exist, cannot be accessed for reading, or cannot be accessed for writing. Make sure the correct disk has been specified.

643 A bad tape sequence option was specified. The only valid tape sequence options are:

S = single tape sequence option
D = double tape sequence option
T = triple tape sequence option

Specify the tape sequence option again using a correct value.

644 The Commit command was specified before the Enter command was executed. First execute the Enter and Proceed commands and then execute the Commit command.

645 The Commit command was specified before the Proceed command was executed. Execute the Proceed command and then execute the Commit command.

646 The Proceed command was specified before the Enter command was executed. Execute the Enter command and then execute the Proceed command.

647 The first poke that was specified on the CMD< line of the System Update Menu Page was invalid. The only pokes allowed are the pokes that are being displayed on the current page. Try to specify the desired poke again.

648 A System Update process was attempted to be continued when the continue flag in the System Update log file for that process indicates that this process is not continuable. Make sure that the last command executed really needs to be continued.

649 The UCL argument was specified. But, a command that the UCL argument is for has not yet been specified. Specify the command that is to be executed. If the UCL argument is desired,

650 The UCL argument was specified. But, the last command specified that the UCL argument is for does not allow the UCL argument on its command line. Specify the desired command and the UCL argument again. specify it next.

651 The Commit command cannot be executed because it has already been successfully executed. If the Commit command was not really executed previously, try to execute the Commit command manually using the Craft PDS/MML input command. If this error still occurs, terminate the System Update menu page, remove the System Update log file, return the system to a sane state, and start the entire update over again from the very beginning of the Enter command.

652 The Enter command cannot be executed because it has already been successfully executed. If the Enter command was not really executed previously, try to execute the Enter command manually using the Craft PDS/MML input command. If this error still occurs, terminate the System Update menu page, remove the System Update log file, return the system to a sane state, and start the entire update over again from the very beginning of the Enter command.

653 The Proceed command cannot be executed because it has already been successfully executed. If the Proceed command was not really executed previously, try to execute the Proceed command manually using the Craft PDS/MML input command. If this error still occurs, terminate the System Update menu page, remove the System Update log file, return the system to a sane state, and start the entire update over again from the very beginning of the Enter command.

654 The Execute menu poke was requested before the System Update or application command that is to be executed was specified. Type the menu poke that corresponds to the process to be executed, and then type the Execute menu poke.

655 The application process was requested while a previous call to the application process is still executing. Only one application process can be executing at a time. Wait for the first application process to terminate. Then execute the next application process call.

656 The Backout command was attempted to be executed while another System Update command (Commit, Continue, Enter, Proceed, or Restore) was executing that would conflict with the Backout command. Wait for the executing System Update command to terminate or terminate it manually using the Stop command, and then try to execute the Backout command again.

657 The Commit command was attempted to be executed while another System Update command (Backout, Continue, Enter, Proceed, or Restore) was executing that would conflict with the Commit command. Wait for the executing System Update command to terminate or terminate it manually using the Stop command, and then try to execute the Commit command again.

658 The Continue command was attempted to be executed while another System Update command (Backout, Commit, Enter, Proceed, or Restore) was executing that would conflict with the Continue command. Wait for the executing System Update command to terminate or terminate it manually using the Stop command, and then try to execute the Continue command again.

659 The Enter command was attempted to be executed while another System Update command (Backout, Commit, Continue, Proceed, or Restore) was executing that would conflict with the Enter command. Wait for the executing System Update command to terminate or terminate it manually using the Stop command, and then try to execute the Enter command again.

660 The Proceed command was attempted to be executed while another System

Update command (`Backout`, `Commit`, `Continue`, `Enter`, or `Restore`) was executing that would conflict with the `Proceed` command. Wait for the executing System Update command to terminate or terminate it manually using the `Stop` command, and then try to execute the `Proceed` command again.

661 The `Restore` command was attempted to be executed while another System Update command (`Backout`, `Commit`, `Continue`, `Enter`, or `Proceed`) was executing that would conflict with the `Restore` command. Wait for the executing System Update command to terminate or terminate it manually using the `Stop` command, and then try to execute the `Restore` command again.

662 Enter Arguments Page 1 was attempted to be displayed while the `Enter` command was executing. Since arguments for the `Enter` command cannot be changed, added, or deleted after the `Enter` command has begun its execution, the System Update menu page prevents the user from going to Enter Arguments Page 1 in case the user tries to change, add, or deleted `Enter` command line arguments.

663 Enter Arguments Page 2 was attempted to be displayed while the `Enter` command was executing. Since arguments for the `Enter` command cannot be changed, added, or deleted after the `Enter` command has begun its execution, the System Update menu page prevents the user from going to Enter Arguments Page 2 in case the user add, or deleted `Enter` command line arguments.

664 A double tape sequence was specified on Enter Arguments Page 2. But, a Corresponding disk to be updated was not previously specified for this sequence option. A disk must first be specified, then its corresponding tape sequence option may be specified.

665 After formatting the MML `Enter` input command line, not all the sequence options specified were included in the command line (the number of sequence options formatted into the command line did not match the number of sequence options that were specified). The counter that contains the number of sequence options specified may be damaged. Terminate the menu page using poke 750, bring up the menu page again using poke 107, and re-specify all the `Enter` command line arguments.

666 A triple tape sequence was specified on Enter Arguments Page 2. But, a corresponding disk to be updated was not previously specified for this sequence option. A disk must first be specified, then its corresponding tape sequence option may be specified.

667 After formatting the PDS `Enter` input command line, not all the sequence options specified were included in the command line (the number of sequence options formatted into the command line did not match the number of sequence options that were specified). The counter that contains the number of sequence options specified may be damaged. Terminate the menu page using poke 750, bring up the menu page again using poke 107, and re-specify all the `Enter` command line arguments.

SEE PROPRIETARY NOTICE ON COVER PAGE

668 The backup partition method was attempting to be specified using the poke on Enter Arguments Page 1. But, a dfc preference was previously specified which is valid only for the offline disk method. If the backup partition method is still desired, delete the dfc preference that was specified and then re-specify the backup partition method.

669 The backup partition method was attempting to be specified using the poke on Enter Arguments Page 1. But, the update backup partition option was previously specified which is valid only for the offline disk method. If the backup partition method is still desired, delete the update backup partition option that was specified and then re-specify the backup partition method.

670 A single tape sequence was specified on Enter Arguments Page 2. But, a corresponding disk to be updated was not previously specified for this sequence option. A disk must first be specified, then its corresponding tape sequence option may be specified.

671 When executing the System Update `Enter` command using pokes on the System Update menu page, the log file must be either empty or non-existent. It may not contain log entries from a previous update session. In this case, the log file contains entries. Remove the log file and terminate the menu page. Bring up the menu page again and re-execute the `Enter` command.

6. Warning Messages

These warning messages are printed when an error occurs that may not affect the outcome of the update.

800 The function `sendpw()` failed when the menu page was sending DAP a message to display a message on the messages line of one of the menu page screens:

`SUPRPG` = System Update Menu Page
`ARGSPG1` = Enter Arguments Page 1
`ARGSPG2` = Enter Arguments Page 2

Look for the message on the ROP. The message was also printed there.

801 The menu page was trying to change a portion of a page either from normal video to reverse video or from reverse video to normal video. A bad video flag (VFLAG) specifying how to display the page (normal video or reverse video) was passed to the internal function `chgvideo()`.

802 The menu page was trying to send a message to DAP to change a portion of a page from normal video to reverse video when the `sendpw()` function failed.

803 The menu page was trying to send a message to DAP to change a portion of a page from reverse video to normal video when the `sendpw()` function failed.

804 The `sendpw()` function failed when a message was sent to DAP to blank out the messages line on one of the three System Update pages.

`SUPRPG` = System Update Menu Page
`ARGSPG1` = Enter Arguments Page 1
`ARGSPG2` = Enter Arguments Page 2

805 One of the Enter Arguments pages was displayed. The menu page found that the UCL argument was previously specified and tried to send a message to DAP to display a Y next to the UCL argument poke on Enter Arguments Page 1 to indicate that this argument has previously been specified. The sendpw() function failed when sending DAP this message. Try to specify the UCL argument using the poke on Enter Arguments Page 1.

806 An attempt was made to blank out the messages line of the Enter Arguments page that is currently being displayed in order to erase a message that may have previously been displayed. The variable that saves the page that is currently being displayed contains a bad value. The messages line of the current Enter Arguments page cannot be blanked out since it is unknown which Enter Arguments page is being displayed.

807 The application process completed and the variable Execcmd indicated that a System Update command is currently executing. The internal function chkexec() was executed to find the name of the System Update process that is currently executing. But, chkexec could not find the name of the process currently executing. Therefore, the execution message of the currently executing System Update process could not be re-displayed on the messages line of the System Update Menu Page.

808 The sendpw() function failed when sending a message to DAP to display the mount tape and continue message on the messages line of the System Update Menu Page. After mounting the tape, try to continue the update using the continue poke on the menu page.

809 The sendpw() function failed when sending a message to DAP to blank out a line in the display area of the System Update Menu Page.

810 The sendpw() function failed when sending a message to DAP to either blank out a previously specified invalid Enter command line argument from one of the Enter Arguments pages or draw an underline on one of the Enter Arguments pages to indicate where an argument is to be specified. If an argument was being blanked out, try to correct the invalid argument using the pokes on the appropriate Enter Arguments page. If an argument poke was specified, but the underline was not drawn where the argument is to be specified, type in the argument where the underline should have been drawn (the cursor should appear in the correct input area). The menu page should accept it.

811 When the poke corresponding to the Enter argument that indicates whether or not backup partitions are to be updated is specified, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

812 When the poke corresponding to the Enter argument that indicates whether or not backup partitions are to be updated is specified, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the Enter argument is specified, the cursor

is moved back up to the CMD< line so that the next Enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

813 The `Readlog` command or the application command was executed while there may have been another System Update executing at the same time, or the `Stop` command was executed but completed unsuccessfully. When one of these three conditions occur, the execution message and the command line of the command that is currently executing is re-displayed since it was overwritten by the `Readlog`, `Stop`, or application message and command line. The internal variable `Execcmd` contains the poke menu number that corresponds to the executing command. In this case, `Execcmd` contained an invalid menu number. Therefore, the currently executing command and its execution message could not be displayed. This may not affect the outcome of the update (just the display on the menu page).

814 The `Enter` input command line was attempting to be re-displayed for one of three reasons:

1) The `readlog` command was executed while the `Enter` command was executing at the same time (when the `Readlog` process completes, the command line for the `Enter` command is re-displayed since the `Readlog` command line overwrote the `Enter` command line),

2) The `Stop` command was executed but completed unsuccessfully (since the `Stop` command line overwrote the `Enter` command line, the `Enter` command line is re-displayed since it is still executing), or

3) The application process was executed while the `Enter` command was executing at the same time (since the application command line overwrote the `Enter` command line, the `Enter` command line is re-displayed since it is still executing).

But, the `Enter` command line cannot be displayed because not all of the mandatory arguments can be found in the Enter Arguments structure. This may not affect the outcome of the update (just the display on the menu page).

815 After opening and reading the contents of the System Update log file, the log file is closed. But, the close failed. This should not affect the outcome of the update.

816 When the poke corresponding to the Enter argument that specifies a DFC (Disk File Controller), the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

817 When the poke corresponding to the Enter argument that specified a DFC (Disk

File Controller), the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the Enter argument is specified, the cursor is moved back up to the CMD< line so that the next Enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

`818` When the poke corresponding to the Enter argument that specifies a disk to be updated is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

`819` When the poke corresponding to the Enter argument that specified a disk to be updated is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the Enter argument is specified, the cursor is moved back up to the CMD< line so that the next Enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

`820` If a disk to be updated was not specified using a full pathname (starting with a slash '/'), the invalid disk pathname specified is blanked from the page. In order to do this, the indicator name corresponding to the disk menu number specified is needed (the menu page sends a message to DAP with this information and then DAP blanks out the appropriate argument). In this case, the indicator name corresponding to the disk menu number specified cannot be obtained and therefore the invalid disk pathname cannot be blanked out. Specify the valid disk pathname by typing the desired disk poke again and then typing the correct disk pathname in the input field indicated by the blinking cursor. If it is desired to not correct the invalid disk pathname, the invalid pathname displayed should not affect the update (the invalid disk pathname remains on the screen but is ignored by the menu page).

`821` The specified disk to be updated either does not exist or cannot be accessed for reading and/or writing, therefore, it is an invalid argument. The invalid disk specified was attempted to be blanked from the page. In order to do this, the indicator name corresponding to the disk menu number specified is needed (the menu page sends a message to DAP with this information and then DAP blanks out the appropriate argument). In this case, the indicator name corresponding to the disk menu number specified cannot be obtained and therefore the invalid disk pathname cannot be blanked out. Specify the valid disk pathname by typing the desired disk poke again and then typing the

correct disk pathname in the input field indicated by the blinking cursor. If it is desired to not correct the invalid disk pathname, the invalid pathname displayed should not affect the update (the invalid disk pathname remains on the screen but is ignored by the menu page).

822 When the poke corresponding to the Enter argument that specifies a disk to be updated is requested, an underline (the maximum length that the disk pathname can be) is drawn immediately after the poke number and its description to indicate where the disk argument is to be typed. The cursor is positioned at the beginning of the underline. Because of an internal error, this underline cannot be drawn. The cursor should still be positioned where the underline should have been drawn. This should not affect the outcome of the update. Go ahead and type in the disk pathname where is cursor is positioned.

823 When the poke corresponding to the Enter argument that specifies a sequence option is requested, an underline (the maximum length that the sequence option input can be) is drawn immediately after the poke number and its description to indicate where the sequence option argument is to be typed. The cursor is positioned at the beginning of the underline. Because of an internal error, this underline cannot be drawn. The cursor should still be positioned where the underline should have been drawn. This should not affect the outcome of the update. Go ahead and type in the sequence option argument where is cursor is positioned.

824 When the poke corresponding to the immediately following the poke and its description. An internal error prohibited the movement of the cursor. Use the arrow keys to move the cursor to the desired disk input field. An underline may have been drawn to indicate the appropriate input field. Then type the desired disk pathname.

825 When the poke corresponding to the Enter argument that specifies a sequence option is requested, the cursor is moved to the input field for that sequence option immediately following the poke and its description. An internal error prohibited the movement of the cursor. Use the arrow keys to move the cursor to the desired sequence option input field. An underline may have been drawn to indicate the appropriate input field. Then type the desired sequence option argument.

826 When the poke corresponding to the Enter argument that specifies an update method is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

827 When the poke corresponding to the Enter argument that specified an update method is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the Enter argument is specified, the cursor is moved back up to the CMD< line so that the next Enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()`

function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

828 When the poke corresponding to the Enter argument that specifies a sequence option is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending a cursor down message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

829 When the poke corresponding to the Enter argument that specifies a sequence option is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending a cursor right message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

830 When the poke corresponding to the Enter argument that specifies a sequence option is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the Enter argument is specified, the cursor is moved back up to the CMD< line so that the next Enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

831 When the poke corresponding to the Enter argument that specifies a tape device is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

832 When the poke corresponding to the Enter argument that specifies a tape device is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the Enter argument is specified, the cursor is moved back up to the CMD< line so that the next Enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

SEE PROPRIETARY NOTICE ON COVER PAGE

833 When the poke corresponding to the Enter argument that specifies conditional or unconditional execution is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

834 When the poke corresponding to the Enter argument that specifies conditional or unconditional execution is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the Enter argument is specified, the cursor is moved back up to the CMD< line so that the next Enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the `sendpw()` function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

835 When the `Enter` command is executed, the `Enter` command line is formatted to a form that is suitable for printing on the ROP. While formatting the `Enter` command line, the `malloc()` function is used to allocate space needed for the formatting procedures. The `malloc()` function failed. This should not affect the outcome of the update (the Enter command line that is executing just will not be displayed on the ROP).

836 When the `Enter` command is executed, the `Enter` command line is formatted to a form that is suitable for printing on the ROP. While formatting the Enter command line, the `realloc()` function is used to allocate space needed for the formatting procedures. The `realloc()` function failed. This should not affect the outcome of the update (the `Enter` command line that is executing just will not be displayed on the ROP).

837 The internal buffer array Buffer contains the input command line for the command that was last specified on the System Update menu page. In this case, the `Enter` command line should reside in the Buffer array since it was the last command specified. But, when the `Enter` command line was being formatted to a form that is suitable for displaying on the ROP, the Buffer array was found to contain all blanks. Since the `Enter` command cannot be found in the Buffer array, it cannot be formatted, and therefore cannot be displayed on the ROP. This should not affect the outcome of the update (the `Enter` command that is executing just will not be displayed on the ROP).

System Error Code Numbers *(continued)*

Code(s)	Definition
31	Too many links.
32	Broken pipe.
33	File is "temped."
34	Trap to lower execution level kernel process.
35	No message.
36	Not allocated.
37	Mount audit failure.
38	Mount umount failed due to current audit.
39	First access of logical block.
40	Fmove failed.
41	No extents.
42	Pathname too long.
43	No entries left.
44	Invalid operation.
45	Failure as a result of an audit.
46	Disk limp mode indication.
47	Unable to open `/dev/ecd`.
48	Conflict with current system status.
49-50	Not used at present.
51	Message type not recognized.
53	Library file doesn't exist.
54	All process slots in use (pstart fail).
55	Insufficient memory for kernel process.
56	All sde allocated or no swap space left.
57	Unable to read a pfile or a library file.
58	Segment too big for address space.
59	Can't add shared segment to process.
NOTE:	Some of the system error codes from 60 to 87 may be generated from either the process manager or fault recovery.
60	`FLTRCV`: Invalid emt value for this driver. `PMGR`: Incarnation count too big for one process.
61	`FLTRCV`: Iomap error.
62	`FLTRCV`: Hardware not oos or reserved. `PMGR`: Can't acquire PCB of terminating process.
63	`FLTRCV`: Not pseudo unit. `PMGR`: PMGR faulted, entered fault routine.

SEE PROPRIETARY NOTICE ON COVER PAGE

System Error Code Numbers *(continued)*

Code(s)	Definition
64	FLTRCV: Pointer not valid.
	PMGR: NUB faulted, entered fault routine.
65	FLTRCV: No mate unit.
66	FLTRCV: Not a legitimate start UCB.
67	FLTRCV: Bad eqid entry.
	PMGR: Bad ACK resulting from copyseg OST.
68	FLTRCV: Bad search level entry.
	PMGR: Pfile (LDP output) doesn't exist.
69	FLTRCV: Could not find eqid unit.
70	FLTRCV: Unit not out of service.
	PMGR: Can't open dump file.
71	FLTRCV: Unit already reserved.
72	FLTRCV: No idle MDCT entry.
	PMGR: Can't get capability of working directory.
73	FLTRCV: Backup not available.
	PMGR: Unable to close a file.
74	FLTRCV: UCB type incorrect.
75	FLTRCV: Not a "cu" ucb.
76	FLTRCV: Invalid MCH order.
	PMGR: Message from unauthorized process.
77	FLTRCV: Pcpmd driver busy. Try again later.
	PMGR: Created process has segment index overlay.
78	FLTRCV: Micro-assist code in offline slave failed.
	PMGR: Unable to lock shared library in memory.
79	FLTRCV: Pointer not pointing to a ucb.
	PMGR: Shared library already locked in memory.
80	FLTRCV: Invalid pcpmd driver command.
	PMGR: The term. has already taken place (by proad).
81	FLTRCV: Can't fault the driver.
	PMGR: Pfile calls for PAS, no PAS in system.
82	FLTRCV: CONFIG fail return.
	PMGR: The fork request failed pcreate - super.
83	FLTRCV: Processor not duplexed.
	PMGR: Can't create because in disk limp mode.
84	FLTRCV: Mate processor not active.
	PMGR: Segid and index do not specify same module.

System Error Code Numbers *(continued)*

Code(s)	Definition
85	FLTRCV: Invalid argument. PMGR: Bad pcb index - when EMM index must be less than partition boundary.
86	FLTRCV: MCH hardware error. PMGR: Pfile does not specify pcb segment.
87	FLTRCV: Execmch function didn't process expected number of bytes. PMGR: An ack message was lost or delayed.
88	Kernel function returned fail.
89	Timeout on reading offline.
90	Error in online processor.
91	Failure in offline processor.
92	Is not same in both processors.
93	on-line master processor was specified.
94	Stop DMA routine failed.
95	Start DMA routine failed.
96	Unequipped UCB specified or accessed.
97	Not a top UCB.
98	No match found.
99	Bad tag value.
100	Offline CU MRFed.
101-119	Not used at present.
120	`lla_nsqrid` error.
121	`lla_rdget` error.
122	`lla_uprid` error.
123	`lla_opnsq` error.
124	`lla_attrid` error.
125	`lla_delete` error.
126	`lla_sinfo` error.
127	`lla_get` error.
128	`lla_gtrid` error.
129	Update bit not set.
NOTE:	The system error codes from 130 to 133 are available in Release 6 only.
130	The online CU RID was not provided for update.
131	No DMA RIDS under the CU.
132	Online parity error detected by cpblkp instruction.

System Error Code Numbers *(continued)*

Code(s)	Definition
133	Other store time out during update.
248	Tried to write in a file manager's protected file system.
249	The corresponding fields of an I/O message with duplication do not match.
250	The device being accessed is currently not active, but is equipped.
251	The device being accessed is in disk independent operation.
252	An I/O message type not recognized by the I/O driver.
253	The driver has temporarily failed to process this message; it will be retried.
254	The device has failed to perform the requested I/O. Retrying the I/O request will probably not succeed.

TAPE LIBRARY ERROR APPENDIX

This appendix contains the error codes returned by the functions in the tape library.

-1 E_CLOSE	The close() system call failed. Could not close the tape special device file.
-2 E_INVALTP	Invalid tape special device file input argument.
-3 E_INVALSES	Invalid session input argument.
-4 E_INVALVOL	Invalid volume input argument.
-5 E_LSEEK	The lseek() system call failed.
-6 E_MKNOD	The mknod() system call failed. Could not create a temporary tape special device file.
-7 E_NOMULVOL	Data read is not in multi-volume format.
-8 E_NOSESSION	Specified session is not on tape.
-9 E_NOVOLUME	Specified volume is not on tape.
-10 E_OPENNORWD	The open() system call failed. Could not open the no-rewind tape special device file.
-11 E_OPENRWD	The open() system call failed. Could not open the rewind tape special device file.
-12 E_READ	The read() system call failed. Could not read tape header.
-13 E_SESORDER	Multi-volume tape sessions are not sequential.
-14 E_SETIO	The setio() system call failed.
-15 E_STAT	The stat() system call failed for the tape special device file.
-16 E_UNLINK	The unlink() system call failed. Could not remove the temporary tape special device file.
-17 E_VOLORDER	Multi-volume tape volumes are not in ascending order.

UID	3B NAME	DESCRIPTION
0x0004	/bootfiles/fmprc	file manager
0x0005	/bootfiles/3bpmgr	3B process manager
0x0008	/bootfiles/3bnub	the kernel
0x000f	/prc/cdi	memory driver
0x0010	/bin/getty	set terminal type, modes, speed, and line
0x0011	/prc/unix	UNIX® initialization process
0x0012	/etc/login	sign on
0x0013	/bin/sh	shell, the standard command
0x0014	/etc/update	updates file system every 5 minutes
0x0015	/etc/cron	task scheduler
0x0016	/prc/pkillp	supervisor process to kill other processes
0x0017	/prc/fda	FIFO driver
0x0018	/etc/clrfs	constructs file system
0x0019	/etc/clri	clear inodes
0x001a	/bin/df	report number of free disk blocks
0x001b	/etc/dgnnm	assigns diagnostic file name
0x001c	/etc/fsdb	file system debugger
0x001d	/etc/ichk	file system consistency check
0x001f	/etc/mknod	builds a special file
0x0020	/mount	mounts file system
0x0021	/bin/ps	report process status
0x0022	/etc/udgnnm	generates the file set up by dgnnm
0x0023	/etc/umount	unmounts file system
0x0024	/etc/vcp	volume disk copy process
0x0041	/prc/cdn	ECD manager
0x0042	/diag/dgnc/mira	maintenance input request administrator

UID	3B NAME	DESCRIPTION
0x0043	/cft/shl/cmds/STOP/DMQ	stop diagnostics
0x0044	/cft/shl/cmds/ALW/DMQ	allow diagnostics
0x0045	/cft/shl/cmds/DGN	diagnose hardware unit
0x0046	/cft/shl/cmds1/EX	PDS interactive diagnostic
0x0047	/cft/shl/cmds/INH/DMQ	inhibit diagnostic maintenance
0x0048	/cft/shl/cmds /EX/LDPARM	PDS interactive diagnostic control command
0x0049	/cft/shl/cmds/EX/LOOP	PDS interactive diagnostic control command
0x004a	/cft/shl/cmds/EX/PAUSE	PDS interactive diagnostic control command
0x004b	/cft/shl/cmds/RMV	remove hardware unit
0x004c	/cft/shl/cmds/RST	restore hardware unit
0x004d	/cft/shl/cmds/OP/DMQ	status of diagnostic maintenance
0x004e	/cft/shl/cmds/EX/STEP	PDS interactive diagnostic control command
0x004f	/cft/shl/cmds/EX/STOP	PDS interactive diagnostic control command
0x005f	/diag/dgnc/inhtimer	inhibit diagnostic timer
0x0060	/diag/dgnc/ppdiamon	peripheral diagnostic monitor
0x0062	/diag/dgnc/tlp	trouble location process
0x0063	/diag/dgnc/dfdiag	DFC diagnostics control
0x0064	/diag/dgnc/iodiag	I/O diagnostics control
0x0065	/diag/dgnc/iormv	I/O diagnostics remove process
0x0066	/diag/dgnc/dfrmv	remove process for DFC
0x0067	/diag/dgnc/cudiagc	control unit diagnostics
0x006c	/diag/dgnc/dgntimer	diagnostic timer
0x0082	/prc/cdm	kernel interface hardware user processes
0x0083	/bootfiles/eih	error interrupt handler
0x0084	/cft/misc/rmf	prints error messages and postmortem dumps
0x0085	/bootfiles/pcpaud.g	PCP audit
0x0086	/bootfiles/inhadm	inhibit administration process
0x0087	/etc/adp.af	automatic diagnostic process after fault process
0x0088	/cft/shl/cmds /OP/CFGSTAT	output device status or configuration status
0x008a	/etc/fsmon	file system overflow monitor
0x008b	/prc/ularp	UNIX®-level automatic restart process
0x008f	/etc/adp.ab	automatic diagnostic process after boot branch

UID	3B NAME	DESCRIPTION
0x0090	/cft/shl/cmds/ALW/REX	allow routine exerciser
0x0091	/cft/shl/cmds/INH/REX	inhibit REX on a specified unit
0x0092	/cft/shl/cmds /OP/REXINH	output REX inhibited units
0x0093	/cft/shl/cmds /ALW/CONFLOG	allow configuration log
0x0094	/cft/shl/cmds /INH/ERRCHK	inhibit errint, errsrc, hdwchk and sftchk
0x0095	/cft/shl/cmds /INH/CONFLOG	inhibit configuration log
0x0096	/cft/shl/cmds/SW/CU	switch control units
0x0097	/unixutil/cu/curstrmv	CU restore or remove process
0x0098	/cft/shl/cmds /DUMP/CACHE	dump off-line cache into memory
0x0099	/cft/shl/cmds /OP/MEMERRS	formatted memory error summary
0x00c0	/prc/bdf	IOP driver process
0x00c0	/prc/bdf	IOP driver process
0x00c0	/prc/bdf	IOP driver process
0x00c1	/bootfiles/dkdrv	disk driver
0x00c2	/prc/scsd	SCSD driver
0x00c4	/prc/s_update	disk restore
0x00c9	/cft/shl/cmds/CMPR/MHD	compare moving head disks
0x00ca	/prc/s_dskutil	disk compare
0x00cd	/cft/shl/cmds /OP/MHD/INFO	display moving head disk information
0x00ce	/cft/shl/cmds/INIT/MHD	initialize a moving head driver
0x00ce	/cft/shl/cmds /LOAD/DFC/PUMP	download pumpcode to DFC RAM
0x00cf	/cft/shl/cmds /OP/DFCELOG	dump error log
0x00d0	/cft/shl/cmds /SET/IODRV	sets I/O driver options
0x00d1	/cft/shl/cmds/OP/IODRV	display active I/O driver options
0x00d2	/cft/shl/cmds /SW/PORTSW	port switch
0x00d3	/cft/shl/cmds/ALW/SCSD	allows SCSD points and signal

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x00d3	/cft/shl/cmds /RESET/FANALM	reset fan alarm
0x00d4	/cft/shl/cmds/INH/SCSD	inhibits SCSD function
0x00d5	/cft/shl/cmds/OP/SCSD	display SCSD points
0x00d6	/cft/shl/cmds/ORD/SCSD	set, clear, or flash points
0x00d7	/cft/shl/cmds /DUMP/MHD/VTOC	dumps volume table of contents
0x00d8	/cft/shl/cmds /DUMP/MHD/DEFECT	dumps defect tables
0x00d8	/cft/shl/cmds /LOAD/MHD/DEFECT	loads a defect table
0x00d9	/cft/shl/cmds /DUMP/MHD/BLOCK	dumps a disk block
0x00da	/cft/dap/dkdip	display disk configuration and status
0x0102	/usr/bin/perform	a parser for ucm
0x0102	/cft/shl/cmds1/UPD	invokes a field update action
0x0103	/prc/prchk	tests whether the target process can be reclaimed
0x0104	/prc/dufr	overwrites memory image of non-killable process
0x0105	/prc/kop	overwrites the tv segment
0x0106	/usr/bin/idump	displays information of COFF and tracking problems
0x0106	/prc/oild	creates a new updateable object file
0x0107	/prc/ogen	creates a file to be used by oild and dufr
0x0109	/prc/bldboot	creates boot image
0x010b	/prc/cdcmpr	compares text segments of disk and core image
0x0111	/prc/gspovmon	overload monitor for GRASP
0x0112	/prc/gspac	controls execution of generic access package (GRASP)
0x0113	/cft/shl/cmds/OP/UTIL	lists GRASP breakpoints, status and trace
0x0114	/prc/gspop	outputs GRASP messages

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0117	/prc/pldmon	updates maintenance times in all PMDB maintenance records
0x011d	/etc/mkdsk	make disk
0x011e	/bin/isgen	builds boot image on disk
0x011f	/usr/bin/browse	tool for examining data base
0x0121	/usr/bin/sdpcopy	copies data base files
0x0124	/prc/kopf	times for automatic backout using kop
0x0125	/cft/shl/cmds /IN/REMOTE	monitors SCANS-2 file receive process
0x012b	/prc/bwmint	interface for field update session
0x012d	/prc/filerecv	receives and assembles transmitted files
0x012e	/prc/bwmclr	clear BWM from the field update directory
0x012f	/prc/bwmvfy	verifies check sums
0x0132	/usr/bin/pl_aux	data dictionary for the plant measurements database
0x0133	/usr/bin/ibrowse	active process debugger
0x0134	/usr/bin/lla_audits	audits ECD
0x0162	/cft/shl/cmds/VFY/TAPE	invoke tape verification process
0x0163	/audprc/pmsaud	audits plant measurements database
0x0185	/cft/shl/cmds/OP/FNAME	audit command process
0x0186	/prc/klmon	kernel monitoring process
0x0187	/bootfiles/simprc	system integrity monitor
0x0188	/prc/suovprc	supervisor / user lockout monitor
0x0190	/etc/sdlrtc	synchronous data link restore tool
0x0191	/etc/sdlrtn	synchronous data link restore tool
0x0192	/prc/fsaudit	file system audit
0x01a2	/audprc/ecdaud	ECD audits
0x01c4	/prc/cdq	communicates with spy processes
0x01c5	/bin/cmpr	compares text segments of disk and core image
0x01c6	/prc/ftrc	function trace
0x01c7	/prc/ucm	field update controller
0x01da	/prc/fudisplay	displays specified update or BWM records
0x01db	/prc/fupurge	removes records of official and reclaimed BWMs

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x01dc	/prc/fuomit	omits incomplete update records
0x01dd	/usr/bin/fu_aux	field update database generator
0x0200	/bin/errport	errport user process
0x0202	/cft/dap/cia	critical indicators administrator
0x0203	/cft/dap/dap	display administration process
0x0204	/cft/dap/poker	DAP input process
0x0206	/cft/rts	initialize RTS and receive messages
0x0207	/bin/shlgetty	starts craft shells
0x0208	/cft/bin/cftshl	craftshell
0x0208	/cft/bin/cftshlA	craftshell (without initialization message)
0x0209	/cft/spl/csop	craft spooler out process
0x020b	/cft/spl/sop	spooler output process
0x020d	/bin/cdgetty	starts poker
0x020f	/bin/splgetty	starts spooler
0x0210	/cft/dap/inph	test process for DAP
0x0211	/cft/dap/msgh	test process for DAP
0x0211	/etc/rex	routine diagostic exerciser
0x0212	/etc/ccdate	identify source version of code
0x0214	/cft/shl/cmds/OP/LOG	prints log file entries
0x0216	/cft/dap/starter	start reader on C/D input
0x0217	/cft/shl/cmds1/TST	test command for pdshl
0x0218	/prc/bdg	DAP driver
0x0218	/cft/bin/csdip	craft spooler dialog input process
0x0219	/cft/dap/fmctrl	runs 105 and 106 pages
0x021b	/bin/ciagetty	starts cia process
0x021d	/cft/misc/rpttime	time stamp for log files
0x021e	/cft/shl/cmds /CLR/IMCAT	clears imcatlog from core
0x0220	/bin/dlggetty	starts dialog shell
0x0221	/cft/shl/cmds/DLGAUTH	dialog authority file commands
0x0222	/cft/shl/cmds/VFYAUTH	checks authority file
0x0223	/cft/bin/Adlgshl	asynchronous dialog shell
0x0224	/cft/bin/Sdlgshl	synchronous dialog shell
0x0226	/cft/shl/cmds/CLK	sets or prints system clock
0x0227	/cft/shl/cmds/UPD/OMDB	output messages data base

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0228	/cft/shl/cmds /CLR/ACKDB	acknowledgements data base
0x0241	/bin/banner	prints a banner
0x0242	/bin/pkill	creates a process to kill other processes
0x0243	/bin/pkillp	kills processes executing under pathname
0x0245	/bin/cat	lists and concatenates UNIX® files
0x0246	/bin/chgrp	change group
0x0247	/bin/chmod	change mode of file
0x0248	/bin/chown	change owner of file
0x0249	/bin/cmp	compare two files
0x024b	/bin/cpio	format of cpio archive
0x024c	/bin/cx	core image debugger
0x024d	/bin/crypt	generate encryption file
0x024e	/bin/date	print and set the date
0x024f	/bin/dd	convert and copy a file
0x0250	/bin/diff	differential file comparator
0x0251	/bin/dlsum	sum bytes in field mode
0x0252	/bin/du	summarize disk usage
0x0253	/bin/echo	repeat string
0x0254	/bin/ed	line editor
0x0255	/bin/env	set environment for command execution
0x0256	/bin/expr	evaluate arguments as an expression
0x0257	/bin/falloc	allocate space for an external file
0x0258	/bin/fgrep	search a file for a pattern
0x0259	/bin/find	find files
0x025a	/bin/fmove	move file into contiguous space
0x025b	/bin/fsize	prints size of files
0x025c	/bin/grep	search a file for a pattern
0x025e	/bin/id	print user, group, fair share group IDs and names
0x025f	/bin/kill	send a signal to a process or a group of processes
0x0260	/bin/killp	kill user processes using a full pathname
0x0263	/bin/line	read one line

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0264	/bin/ln	link files
0x0265	/bin/logdir	get login directory
0x0266	/bin/ls	list contents of directory
0x0267	/bin/cp	copy files
0x0267	/bin/mv	move a file
0x0268	/bin/mail	send mail to users or read mail
0x0269	/usr/lib/makekey	generates encryption key
0x026a	/bin/mesg	permit or deny messages
0x026b	/bin/mkdir	make a directory
0x026c	/usr/bin/mop	mount off-line partition
0x026d	/bin/closewd	close window
0x026d	/bin/newgrp	log in to a new group
0x026e	/bin/news	print news items
0x026e	/bin/openwd	open window
0x026f	/bin/nice	change priority of a process
0x0270	/bin/nohup	run a command immune to hangups and quits
0x0271	/bin/od	octal dump
0x0272	/bin/passwd	user information file
0x0273	/bin/pio	I/O to a traced process image
0x0274	/bin/pr	print files
0x027a	/bin/pwd	print working directory name or path
0x027b	/bin/rm	remove files
0x027c	/bin/rmdir	remove directories
0x027e	/bin/run	run kernel processes
0x027f	/bin/sdiff	side-by-side difference program
0x0280	/bin/sleep	suspend execution for interval
0x0281	/bin/sort	sort and/or merge files
0x0282	/bin/split	split a file into pieces
0x0283	/bin/stat	get file status
0x0284	/bin/stty	set the options for a terminal
0x0285	/bin/su	change user ID
0x0286	/bin/sum	print checksum and block count of a file
0x0288	/bin/sync	update super-block
0x0289	/bin/tail	deliver the last part of a file
0x028a	/bin/tee	pipe fitting

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x028b	/bin/time	get time
0x028c	/bin/touch	update access and modification times of a file
0x028d	/bin/tty	terminal device interface
0x028e	/bin/uname	print name of current system
0x028f	/bin/wc	word count
0x0290	/bin/who	who is on the system
0x0291	/bin/write	write on a terminal
0x0292	/bin/sed	stream editor
0x0293	/usr/bin/asa	interpret the asa control character
0x02c0	/cft/shl/cmds /COPY/ACTDISK	copies a file to an OOS disk
0x02c1	/prc/mntfs	mounts file systems in an OOS disk
0x02c3	/usr/bin/PDSed	PDS editor
0x02c4	/cft/shl/cmds /ALW/FILESYS	file system maintenance
0x02c5	/prc/pmdbcopy	copies plant measurements database from core to disk
0x02c6	/cft/shl/cmds/OP/PMCR	invokes pmcrman
0x02c7	/prc/pmcrcol	updates common records
0x02c8	/prc/pmcrrep	generates PMS reports
0x02c9	/prc/pmcrman	process that controls execution of pmcrcol and pmcrrep
0x02ca	/prc/cpspdisk	copies a file to a spool disk
0x02cb	/prc/cpoosf	copies a file from an OOS disk
0x02cc	/cft/shl/cmds /COPY/CPSPDISK	invokes cpspdisk
0x02cd	/cft/shl/cmds /COPY/CPOOSF	invokes cpoosf
0x02ce	/cft/shl/cmds/CLR/PTN	invokes clearptn
0x02d0	/usr/bin/chk_pmdb	checks plant measurements database against ecd database.
0x02cf	/prc/clearptn	clears out a partition
0x02d5	/bin/urun	run user process
0x02d6	/prc/3btpwrt	writes disk image to tape in LDFT format
0x02d7	/cft/shl/cmds /COPY/BKDSK/ACK	invokes tpack
0x02d8	/cft/shl/cmds /STOP/BKDISK	stops the physical disk to tape writer

UID	3B NAME	DESCRIPTION
0x02d9	/cft/shl/cmds /COPY/BKDSK/START	invokes 3btpwrt
0x02da	/prc/tpack	acknowledge 3btpwrt that a tape is mounted
0x02db	/prc/tpstop	stop execution of 3btpwrt
0x02dc	/prc/supr/continue	restarts execution of a system update
0x02dc	/cft/shl/cmds /UPD/GEN/CONTINUE	invoke continue process
0x02dd	/prc/supr/applhook	application process used during system update
0x02de	/prc/supr/readlog	requests output of system update event log
0x02e0	/cft/shl/cmds /UPD/GEN/BACKOUT	invoke backout process
0x02e1	/cft/shl/cmds /UPD/GEN/COMMIT	invoke commit process
0x02e2	/cft/shl/cmds /UPD/GEN/ENTER	invoke enter process
0x02e3	/cft/shl/cmds /UPD/GEN/PROCEED	invoke proceed process
0x02e4	/cft/shl/cmds /OP/GEN/READLOG	invokes readlog
0x02e5	/cft/shl/cmds /UPD/GEN/RESTORE	invoke restore process
0x02e6	/cft/shl/cmds/STOP/GEN	invokes stop process
0x02e7	/prc/supr/stop	stops the system update command in process
0x02e8	/prc/supr/commit	overwrites old generic with new generic
0x02e9	/prc/supr/restore	restores the old generic to the system
0x02e9	/etc/mkstart	make disk acknowledgment program
0x02ea	/prc/supr/backout	backs out of new generic to old generic
0x02eb	/prc/supr/enter	system update process
0x02ec	/prc/supr/proceed	prepares system for booting from the new generic
0x02ed	/bin/prtcp	copies primary/backup partition
0x02ee	/prc/supr/suprint	invoke a system update process
0x02ef	/prc/supr/applproc	application process
0x02f0	/cft/shl/cmds /UPD/GEN/APPLPROC	invoke an application process

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0301	/usr/bin/loadf3b	creates a flatfile from a <> file
0x0302	/bin/sdfinfo	special device file information
0x0303	/prc/psm	power switch monitor
0x0304	/bin/sdfrel	special device file release
0x0307	/cft/shl/cmds/RCV/MENU	DB recent change menu
0x0309	/usr/bin/createecd	creates skeleton of ECD database
0x030a	/usr/bin/rcvecd	recent change and verify ECD from UNIX® terminal
0x030b	/bin/ducb	display UCB in ECD
0x030f	/usr/bin/comparedb	compare databases
0x0310	/usr/bin/fdiff	file differences
0x0311	/usr/bin/keycmp	key compare
0x0312	/usr/bin/keycomm	key common program
0x0313	/usr/bin/keys	keys program
0x0314	/usr/bin/newdb	create a new database
0x0315	/usr/bin/printdb	print database
0x0316	/usr/bin/printfrm	print forms
0x031e	/cft/shl/cmds /RCV/DMTECD	recent change and verify interface for ECD
0x0320	/cft/shl/cmds/OP/ULARP	ularp request processor
0x0322	/cft/shl/cmds/STOP/AUD	audit stop process
0x0323	/cft/shl/cmds/ALW/AUD	allow audit
0x0324	/cft/shl/cmds/AUD	begin audit process
0x0325	/etc/siof	system integrity output formatter
0x0326	/cft/shl/cmds/INH/AUD	audit inhibitor
0x0327	/cft/shl/cmds/OP/AUD	audit report generator
0x032a	/cft/shl/cmds /CLR/EMERDMP	emergency dump
0x032b	/cft/shl/cmds /OP/EMERSTAT	emergency status
0x032c	/etc/op_stat	audit status process
0x032d	/cft/shl/cmds /OP/AUDERR	audit error process
0x032e	/cft/shl/cmds /INIT/ULARP	craft initialization to SIM

UID	3B NAME	DESCRIPTION
0x0334	/cft/shl/cmds/VFY/FILE	verify file
0x0360	/usr/bin/createsg	creates skeleton of SG database
0x0361	/usr/bin/rcvsg	recent change and verify SG from UNIX® terminal
0x0362	/usr/bin/rcvecdmcrt	recent change and verify ECD from MCRT
0x0363	/usr/bin/rcvsgmcrt	recent change and verify SG from MCRT
0x0364	/cft/shl/cmds /RCV/DMTSG	recent change and verify interface for SG
0x0365	/usr/bin/vfydflt	perform default file verification via vfydflt
0x0366	/usr/bin/iopadd.p	addition of IOP
0x0366	/usr/bin/iopdel.p	deletion of IOP
0x0366	/usr/bin/links.p	review linkage orders
0x0366	/usr/bin/mtadd.p	addition of maintenance terminal
0x0366	/usr/bin/mtcadd.p	addition of maintenance terminal controller
0x0366	/usr/bin/mtcdel.p	deletion of maintenance terminal controller
0x0366	/usr/bin/mtdel.p	deletion of maintenance terminal controller
0x0366	/usr/bin/sdladd.p	addition of SCANS distributor linkage
0x0366	/usr/bin/sdlcadd.p	addition of SCANS distributor linkage controller
0x0366	/usr/bin/sdlcdel.p	deletion of SCANS distributor linkage controller
0x0366	/usr/bin/sdldel.p	deletion of SCANS distributor linkage
0x0366	/usr/bin/slots.p	review slot assignments on UCB
0x0366	/usr/bin/ttyadd.p	addition of tty
0x0366	/usr/bin/ttycadd.p	addition of ttyc
0x0366	/usr/bin/ttycdel.p	deletion of ttyc
0x0366	/usr/bin/ttydel.p	deletion of tty
0x0366	/usr/bin/vfydflt.p	perform vfydflt process
0x0379	/bin/rmtgetty	remote dialog shell

UID	3B NAME	DESCRIPTION
0x0004	/bootfiles/fmprc	file manager
0x0005	/bootfiles/3bpmgr	3B process manager
0x0008	/bootfiles/3bnub	the kernel
0x000f	/prc/cdi	memory driver
0x0010	/bin/getty	set terminal type, modes, speed, and line
0x0011	/prc/unix	UNIX® initialization process
0x0012	/etc/login	sign on
0x0013	/bin/sh	shell, the standard command
0x0014	/etc/update	updates file system every 5 minutes
0x0015	/etc/cron	task scheduler
0x0016	/prc/pkillp	supervisor process to kill other processes
0x0017	/prc/fda	FIFO driver
0x0018	/etc/clrfs	constructs file system
0x0019	/etc/clri	clear inodes
0x001a	/bin/df	report number of free disk blocks
0x001b	/etc/dgnnm	assigns diagnostic file name
0x001c	/etc/fsdb	file system debugger
0x001d	/etc/ichk	file system consistency check
0x001f	/etc/mknod	builds a special file
0x0020	/mount	mounts file system
0x0021	/bin/ps	report process status
0x0022	/etc/udgnnm	generates the file set up by dgnnm
0x0023	/etc/umount	unmounts file system
0x0024	/etc/vcp	volume disk copy process
0x0041	/prc/cdn	ECD manager
0x0042	/diag/dgnc/mira	maintenance input request administrator

UID	3B NAME	DESCRIPTION
0x0043	/cft/shl/cmds/STOP/DMQ	stop diagnostics
0x0044	/cft/shl/cmds/ALW/DMQ	allow diagnostics
0x0045	/cft/shl/cmds/DGN	diagnose hardware unit
0x0046	/cft/shl/cmds1/EX	PDS interactive diagnostic
0x0047	/cft/shl/cmds/INH/DMQ	inhibit diagnostic maintenance
0x0048	/cft/shl/cmds /EX/LDPARM	PDS interactive diagnostic control command
0x0049	/cft/shl/cmds/EX/LOOP	PDS interactive diagnostic control command
0x004a	/cft/shl/cmds/EX/PAUSE	PDS interactive diagnostic control command
0x004b	/cft/shl/cmds/RMV	remove hardware unit
0x004c	/cft/shl/cmds/RST	restore hardware unit
0x004d	/cft/shl/cmds/OP/DMQ	status of diagnostic maintenance
0x004e	/cft/shl/cmds/EX/STEP	PDS interactive diagnostic control command
0x004f	/cft/shl/cmds/EX/STOP	PDS interactive diagnostic control command
0x005f	/diag/dgnc/inhtimer	inhibit diagnostic timer
0x0060	/diag/dgnc/ppdiamon	peripheral diagnostic monitor
0x0062	/diag/dgnc/tlp	trouble location process
0x0063	/diag/dgnc/dfdiag	DFC diagnostics control
0x0064	/diag/dgnc/iodiag	I/O diagnostics control
0x0065	/diag/dgnc/iormv	I/O diagnostics remove process
0x0066	/diag/dgnc/dfrmv	remove process for DFC
0x0067	/diag/dgnc/cudiagc	control unit diagnostics
0x006c	/diag/dgnc/dgntimer	diagnostic timer
0x0082	/prc/cdm	kernel interface hardware user processes
0x0083	/bootfiles/eih	error interrupt handler
0x0084	/cft/misc/rmf	prints error messages and postmortem dumps
0x0085	/bootfiles/pcpaud.g	PCP audit
0x0086	/bootfiles/inhadm	inhibit administration process
0x0087	/etc/adp.af	automatic diagnostic process after fault process
0x0088	/cft/shl/cmds /OP/CFGSTAT	output device status or configuration status
0x008a	/etc/fsmon	file system overflow monitor
0x008b	/prc/ularp	UNIX®-level automatic restart process
0x008f	/etc/adp.ab	automatic diagnostic process after boot branch

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0090	/cft/shl/cmds/ALW/REX	allow routine exerciser
0x0091	/cft/shl/cmds/INH/REX	inhibit REX on a specified unit
0x0092	/cft/shl/cmds /OP/REXINH	output REX inhibited units
0x0093	/cft/shl/cmds /ALW/CONFLOG	allow configuration log
0x0094	/cft/shl/cmds /INH/ERRCHK	inhibit errint, errsrc, hdwchk and sftchk
0x0095	/cft/shl/cmds /INH/CONFLOG	inhibit configuration log
0x0096	/cft/shl/cmds/SW/CU	switch control units
0x0097	/unixutil/cu/curstrmv	CU restore or remove process
0x0098	/cft/shl/cmds /DUMP/CACHE	dump off-line cache into memory
0x0099	/cft/shl/cmds /OP/MEMERRS	formatted memory error summary
0x00c0	/prc/bdf	IOP driver process
0x00c0	/prc/bdf	IOP driver process
0x00c0	/prc/bdf	IOP driver process
0x00c1	/bootfiles/dkdrv	disk driver
0x00c2	/prc/scsd	SCSD driver
0x00c4	/prc/s_update	disk restore
0x00c9	/cft/shl/cmds/CMPR/MHD	compare moving head disks
0x00ca	/prc/s_dskutil	disk compare
0x00cd	/cft/shl/cmds /OP/MHD/INFO	display moving head disk information
0x00ce	/cft/shl/cmds/INIT/MHD	initialize a moving head driver
0x00ce	/cft/shl/cmds /LOAD/DFC/PUMP	download pumpcode to DFC RAM
0x00cf	/cft/shl/cmds /OP/DFCELOG	dump error log
0x00d0	/cft/shl/cmds /SET/IODRV	sets I/O driver options
0x00d1	/cft/shl/cmds/OP/IODRV	display active I/O driver options
0x00d2	/cft/shl/cmds /SW/PORTSW	port switch
0x00d3	/cft/shl/cmds/ALW/SCSD	allows SCSD points and signal

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x00d3	/cft/shl/cmds /RESET/FANALM	reset fan alarm
0x00d4	/cft/shl/cmds/INH/SCSD	inhibits SCSD function
0x00d5	/cft/shl/cmds/OP/SCSD	display SCSD points
0x00d6	/cft/shl/cmds/ORD/SCSD	set, clear, or flash points
0x00d7	/cft/shl/cmds /DUMP/MHD/VTOC	dumps volume table of contents
0x00d8	/cft/shl/cmds /DUMP/MHD/DEFECT	dumps defect tables
0x00d8	/cft/shl/cmds /LOAD/MHD/DEFECT	loads a defect table
0x00d9	/cft/shl/cmds /DUMP/MHD/BLOCK	dumps a disk block
0x00da	/cft/dap/dkdip	display disk configuration and status
0x0102	/usr/bin/perform	a parser for ucm
0x0102	/cft/shl/cmds1/UPD	invokes a field update action
0x0103	/prc/prchk	tests whether the target process can be reclaimed
0x0104	/prc/dufr	overwrites memory image of non-killable process
0x0105	/prc/kop	overwrites the tv segment
0x0106	/usr/bin/idump	displays information of COFF and tracking problems
0x0106	/prc/oild	creates a new updateable object file
0x0107	/prc/ogen	creates a file to be used by oild and dufr
0x0109	/prc/bldboot	creates boot image
0x010b	/prc/cdcmpr	compares text segments of disk and core image
0x0111	/prc/gspovmon	overload monitor for GRASP
0x0112	/prc/gspac	controls execution of generic access package (GRASP)
0x0113	/cft/shl/cmds/OP/UTIL	lists GRASP breakpoints, status and trace
0x0114	/prc/gspop	outputs GRASP messages

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0117	/prc/pldmon	updates maintenance times in all PMDB maintenance records
0x011d	/etc/mkdsk	make disk
0x011e	/bin/isgen	builds boot image on disk
0x011f	/usr/bin/browse	tool for examining data base
0x0121	/usr/bin/sdpcopy	copies data base files
0x0124	/prc/kopf	times for automatic backout using kop
0x0125	/cft/shl/cmds /IN/REMOTE	monitors SCANS-2 file receive process
0x012b	/prc/bwmint	interface for field update session
0x012d	/prc/filerecv	receives and assembles transmitted files
0x012e	/prc/bwmclr	clear BWM from the field update directory
0x012f	/prc/bwmvfy	verifies check sums
0x0132	/usr/bin/pl_aux	data dictionary for the plant measurements database
0x0133	/usr/bin/ibrowse	active process debugger
0x0134	/usr/bin/lla_audits	audits ECD
0x0162	/cft/shl/cmds/VFY/TAPE	invoke tape verification process
0x0163	/audprc/pmsaud	audits plant measurements database
0x0185	/cft/shl/cmds/OP/FNAME	audit command process
0x0186	/prc/klmon	kernel monitoring process
0x0187	/bootfiles/simprc	system integrity monitor
0x0188	/prc/suovprc	supervisor / user lockout monitor
0x0190	/etc/sdlrtc	synchronous data link restore tool
0x0191	/etc/sdlrtn	synchronous data link restore tool
0x0192	/prc/fsaudit	file system audit
0x01a2	/audprc/ecdaud	ECD audits
0x01c4	/prc/cdq	communicates with spy processes
0x01c5	/bin/cmpr	compares text segments of disk and core image
0x01c6	/prc/ftrc	function trace
0x01c7	/prc/ucm	field update controller
0x01da	/prc/fudisplay	displays specified update or BWM records
0x01db	/prc/fupurge	removes records of official and reclaimed BWMs

UID	3B NAME	DESCRIPTION
0x01dc	/prc/fuomit	omits incomplete update records
0x01dd	/usr/bin/fu_aux	field update database generator
0x0200	/bin/errport	errport user process
0x0202	/cft/dap/cia	critical indicators administrator
0x0203	/cft/dap/dap	display administration process
0x0204	/cft/dap/poker	DAP input process
0x0206	/cft/rts	initialize RTS and receive messages
0x0207	/bin/shlgetty	starts craft shells
0x0208	/cft/bin/cftshl	craftshell
0x0208	/cft/bin/cftshlA	craftshell (without initialization message)
0x0209	/cft/spl/csop	craft spooler out process
0x020b	/cft/spl/sop	spooler output process
0x020d	/bin/cdgetty	starts poker
0x020f	/bin/splgetty	starts spooler
0x0210	/cft/dap/inph	test process for DAP
0x0211	/cft/dap/msgh	test process for DAP
0x0211	/etc/rex	routine diagostic exerciser
0x0212	/etc/ccdate	identify source version of code
0x0214	/cft/shl/cmds/OP/LOG	prints log file entries
0x0216	/cft/dap/starter	start reader on C/D input
0x0217	/cft/shl/cmds1/TST	test command for pdshl
0x0218	/prc/bdg	DAP driver
0x0218	/cft/bin/csdip	craft spooler dialog input process
0x0219	/cft/dap/fmctrl	runs 105 and 106 pages
0x021b	/bin/ciagetty	starts cia process
0x021d	/cft/misc/rpttime	time stamp for log files
0x021e	/cft/shl/cmds /CLR/IMCAT	clears imcatlog from core
0x0220	/bin/dlggetty	starts dialog shell
0x0221	/cft/shl/cmds/DLGAUTH	dialog authority file commands
0x0222	/cft/shl/cmds/VFYAUTH	checks authority file
0x0223	/cft/bin/Adlgshl	asynchronous dialog shell
0x0224	/cft/bin/Sdlgshl	synchronous dialog shell
0x0226	/cft/shl/cmds/CLK	sets or prints system clock
0x0227	/cft/shl/cmds/UPD/OMDB	output messages data base

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0228	/cft/shl/cmds /CLR/ACKDB	acknowledgements data base
0x0241	/bin/banner	prints a banner
0x0242	/bin/pkill	creates a process to kill other processes
0x0243	/bin/pkillp	kills processes executing under pathname
0x0245	/bin/cat	lists and concatenates UNIX® files
0x0246	/bin/chgrp	change group
0x0247	/bin/chmod	change mode of file
0x0248	/bin/chown	change owner of file
0x0249	/bin/cmp	compare two files
0x024b	/bin/cpio	format of cpio archive
0x024c	/bin/cx	core image debugger
0x024d	/bin/crypt	generate encryption file
0x024e	/bin/date	print and set the date
0x024f	/bin/dd	convert and copy a file
0x0250	/bin/diff	differential file comparator
0x0251	/bin/dlsum	sum bytes in field mode
0x0252	/bin/du	summarize disk usage
0x0253	/bin/echo	repeat string
0x0254	/bin/ed	line editor
0x0255	/bin/env	set environment for command execution
0x0256	/bin/expr	evaluate arguments as an expression
0x0257	/bin/falloc	allocate space for an external file
0x0258	/bin/fgrep	search a file for a pattern
0x0259	/bin/find	find files
0x025a	/bin/fmove	move file into contiguous space
0x025b	/bin/fsize	prints size of files
0x025c	/bin/grep	search a file for a pattern
0x025e	/bin/id	print user, group, fair share group IDs and names
0x025f	/bin/kill	send a signal to a process or a group of processes
0x0260	/bin/killp	kill user processes using a full pathname
0x0263	/bin/line	read one line

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0264	/bin/ln	link files
0x0265	/bin/logdir	get login directory
0x0266	/bin/ls	list contents of directory
0x0267	/bin/cp	copy files
0x0267	/bin/mv	move a file
0x0268	/bin/mail	send mail to users or read mail
0x0269	/usr/lib/makekey	generates encryption key
0x026a	/bin/mesg	permit or deny messages
0x026b	/bin/mkdir	make a directory
0x026c	/usr/bin/mop	mount off-line partition
0x026d	/bin/closewd	close window
0x026d	/bin/newgrp	log in to a new group
0x026e	/bin/news	print news items
0x026e	/bin/openwd	open window
0x026f	/bin/nice	change priority of a process
0x0270	/bin/nohup	run a command immune to hangups and quits
0x0271	/bin/od	octal dump
0x0272	/bin/passwd	user information file
0x0273	/bin/pio	I/O to a traced process image
0x0274	/bin/pr	print files
0x027a	/bin/pwd	print working directory name or path
0x027b	/bin/rm	remove files
0x027c	/bin/rmdir	remove directories
0x027e	/bin/run	run kernel processes
0x027f	/bin/sdiff	side-by-side difference program
0x0280	/bin/sleep	suspend execution for interval
0x0281	/bin/sort	sort and/or merge files
0x0282	/bin/split	split a file into pieces
0x0283	/bin/stat	get file status
0x0284	/bin/stty	set the options for a terminal
0x0285	/bin/su	change user ID
0x0286	/bin/sum	print checksum and block count of a file
0x0288	/bin/sync	update super-block
0x0289	/bin/tail	deliver the last part of a file
0x028a	/bin/tee	pipe fitting

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x028b	/bin/time	get time
0x028c	/bin/touch	update access and modification times of a file
0x028d	/bin/tty	terminal device interface
0x028e	/bin/uname	print name of current system
0x028f	/bin/wc	word count
0x0290	/bin/who	who is on the system
0x0291	/bin/write	write on a terminal
0x0292	/bin/sed	stream editor
0x0293	/usr/bin/asa	interpret the asa control character
0x02c0	/cft/shl/cmds /COPY/ACTDISK	copies a file to an OOS disk
0x02c1	/prc/mntfs	mounts file systems in an OOS disk
0x02c3	/usr/bin/PDSed	PDS editor
0x02c4	/cft/shl/cmds /ALW/FILESYS	file system maintenance
0x02c5	/prc/pmdbcopy	copies plant measurements database from core to disk
0x02c6	/cft/shl/cmds/OP/PMCR	invokes pmcrman
0x02c7	/prc/pmcrcol	updates common records
0x02c8	/prc/pmcrrep	generates PMS reports
0x02c9	/prc/pmcrman	process that controls execution of pmcrcol and pmcrrep
0x02ca	/prc/cpspdisk	copies a file to a spool disk
0x02cb	/prc/cpoosf	copies a file from an OOS disk
0x02cc	/cft/shl/cmds /COPY/CPSPDISK	invokes cpspdisk
0x02cd	/cft/shl/cmds /COPY/CPOOSF	invokes cpoosf
0x02ce	/cft/shl/cmds/CLR/PTN	invokes clearptn
0x02cf	/prc/clearptn	clears out a partition
0x02d0	/usr/bin/chk_pmdb	checks plant measurements database against ecd database.
0x02d1	/cft/shl/cmds /COPY/BKTAPE	copies a multi-volume DAT
0x02d1	/cft/shl/cmds /DUMP/BKTAPE	dumps the first header of the logical volumes on a multi-volume DAT
0x02d5	/bin/urun	run user process
0x02d6	/prc/3btpwrt	writes disk image to tape in LDFT format
0x02d7	/cft/shl/cmds /COPY/BKDSK/ACK	invokes tpack

UID	3B NAME	DESCRIPTION
0x02d8	/cft/shl/cmds /STOP/BKDISK	stops the physical disk to tape writer
0x02d9	/cft/shl/cmds /COPY/BKDSK/START	invokes 3btpwrt
0x02da	/prc/tpack	acknowledge 3btpwrt that a tape is mounted
0x02db	/prc/tpstop	stop execution of 3btpwrt
0x02dc	/prc/supr/continue	restarts execution of a system update
0x02dc	/cft/shl/cmds /UPD/GEN/CONTINUE	invoke continue process
0x02dd	/prc/supr/applhook	application process used during system update
0x02de	/prc/supr/readlog	requests output of system update event log
0x02e0	/cft/shl/cmds /UPD/GEN/BACKOUT	invoke backout process
0x02e1	/cft/shl/cmds /UPD/GEN/COMMIT	invoke commit process
0x02e2	/cft/shl/cmds /UPD/GEN/ENTER	invoke enter process
0x02e3	/cft/shl/cmds /UPD/GEN/PROCEED	invoke proceed process
0x02e4	/cft/shl/cmds /OP/GEN/READLOG	invokes readlog
0x02e5	/cft/shl/cmds /UPD/GEN/RESTORE	invoke restore process
0x02e6	/cft/shl/cmds/STOP/GEN	invokes stop process
0x02e7	/prc/supr/stop	stops the system update command in process
0x02e8	/prc/supr/commit	overwrites old generic with new generic
0x02e9	/prc/supr/restore	restores the old generic to the system
0x02e9	/etc/mkstart	make disk acknowledgment program
0x02ea	/prc/supr/backout	backs out of new generic to old generic
0x02eb	/prc/supr/enter	system update process
0x02ec	/prc/supr/proceed	prepares system for booting from the new generic
0x02ed	/bin/prtcp	copies primary/backup partition
0x02ee	/prc/supr/suprint	invoke a system update process
0x02ef	/prc/supr/applproc	application process
0x02f0	/cft/shl/cmds /UPD/GEN/APPLPROC	invoke an application process

SEE PROPRIETARY NOTICE ON COVER PAGE

UID	3B NAME	DESCRIPTION
0x0301	/usr/bin/loadf3b	creates a flatfile from a <> file
0x0302	/bin/sdfinfo	special device file information
0x0303	/prc/psm	power switch monitor
0x0304	/bin/sdfrel	special device file release
0x0307	/cft/shl/cmds/RCV/MENU	DB recent change menu
0x0309	/usr/bin/createecd	creates skeleton of ECD database
0x030a	/usr/bin/rcvecd	recent change and verify ECD from UNIX® terminal
0x030b	/bin/ducb	display UCB in ECD
0x030f	/usr/bin/comparedb	compare databases
0x0310	/usr/bin/fdiff	file differences
0x0311	/usr/bin/keycmp	key compare
0x0312	/usr/bin/keycomm	key common program
0x0313	/usr/bin/keys	keys program
0x0314	/usr/bin/newdb	create a new database
0x0315	/usr/bin/printdb	print database
0x0316	/usr/bin/printfrm	print forms
0x031e	/cft/shl/cmds /RCV/DMTECD	recent change and verify interface for ECD
0x0320	/cft/shl/cmds/OP/ULARP	ularp request processor
0x0322	/cft/shl/cmds/STOP/AUD	audit stop process
0x0323	/cft/shl/cmds/ALW/AUD	allow audit
0x0324	/cft/shl/cmds/AUD	begin audit process
0x0325	/etc/siof	system integrity output formatter
0x0326	/cft/shl/cmds/INH/AUD	audit inhibitor
0x0327	/cft/shl/cmds/OP/AUD	audit report generator
0x032a	/cft/shl/cmds /CLR/EMERDMP	emergency dump
0x032b	/cft/shl/cmds /OP/EMERSTAT	emergency status
0x032c	/etc/op_stat	audit status process
0x032d	/cft/shl/cmds /OP/AUDERR	audit error process
0x032e	/cft/shl/cmds /INIT/ULARP	craft initialization to SIM

UID	3B NAME	DESCRIPTION
0x0334	/cft/shl/cmds/VFY/FILE	verify file
0x0360	/usr/bin/createsg	creates skeleton of SG database
0x0361	/usr/bin/rcvsg	recent change and verify SG from UNIX® terminal
0x0362	/usr/bin/rcvecdmcrt	recent change and verify ECD from MCRT
0x0363	/usr/bin/rcvsgmcrt	recent change and verify SG from MCRT
0x0364	/cft/shl/cmds /RCV/DMTSG	recent change and verify interface for SG
0x0365	/usr/bin/vfydflt	perform default file verification via vfydflt
0x0366	/usr/bin/iopadd.p	addition of IOP
0x0366	/usr/bin/iopdel.p	deletion of IOP
0x0366	/usr/bin/links.p	review linkage orders
0x0366	/usr/bin/mtadd.p	addition of maintenance terminal
0x0366	/usr/bin/mtcadd.p	addition of maintenance terminal controller
0x0366	/usr/bin/mtcdel.p	deletion of maintenance terminal controller
0x0366	/usr/bin/mtdel.p	deletion of maintenance terminal controller
0x0366	/usr/bin/sdladd.p	addition of SCANS distributor linkage
0x0366	/usr/bin/sdlcadd.p	addition of SCANS distributor linkage controller
0x0366	/usr/bin/sdlcdel.p	deletion of SCANS distributor linkage controller
0x0366	/usr/bin/sdldel.p	deletion of SCANS distributor linkage
0x0366	/usr/bin/slots.p	review slot assignments on UCB
0x0366	/usr/bin/ttyadd.p	addition of tty
0x0366	/usr/bin/ttycadd.p	addition of ttyc
0x0366	/usr/bin/ttycdel.p	deletion of ttyc
0x0366	/usr/bin/ttydel.p	deletion of tty
0x0366	/usr/bin/vfydflt.p	perform vfydflt process
0x0379	/bin/rmtgetty	remote dialog shell
