

DIMENSION[®]PBX
DCTS FEATURE TEST

RECALL

CONTENTS

1. GENERAL
2. TEST SET-UP
3. RECALL TEST
4. RESTORATION

1. GENERAL

- 1.1 This section provides testing information for Recall.
- 1.2 The recall button (R) is to be used for activating Recall feature. This button is standard on all DCTS station sets and provides the time flash function which eliminates the need for the telephone user to depress the switchhook for a specific time interval (the depression of the DCTS station switchhook will always be recognized as a disconnected).
- 1.3 The three-way conference calls on DCTS station sets are established by means of the recall button.

2. TEST SET-UP

- 2.1 Connect three Electronic Telephone Sets (or minimum of one Electronic Telephone set and two non-DCTS station sets are required). These three sets will be referred to as Stations A, B and C (if two non-DCTS station sets were used, refer those two non-DCTS station sets as Stations B and C).

3. RECALL TEST

- 3.1 Establish a station-to-station call between Stations A and B.
- 3.2 Add Station C into a three-way conference call:
 - 3.21 At Station A (DCTS station set), depress the recall button (R).
 - 3.211 Recall dial tone is heard at Station A.
 - 3.22 At Station A, dial station C.

PRIVATE

THE INFORMATION CONTAINED HEREIN SHOULD NOT BE DISCLOSED TO UNAUTHORIZED PERSONS. IT IS MEANT SOLELY FOR USE BY AUTHORIZED BELL SYSTEM EMPLOYEES.

Printed in U.S.A.

3.221 Station C answers (Note: If the called party is busy or does not answer, and the held party is inside the PBX, depress the recall button once to remove the tone and return to the held party).

3.222 Verify that a transmission path exists between Station A and Station C.

3.23 At Station A, depress the recall button again.

3.231 The Station B is added to the connection and a three-way conference among Stations A, B and C is established.

3.24 Go on-hook on three stations.

4. RESTORATION

4.1 Determine requirements of next test(s) and disconnect telephone sets not required.
