

DATA SET 108B

TEST PROCEDURES

1. GENERAL

1.01 The data set 108B is tested only as part of a data transmission system. The system type of testing checks the operation of the data set 108B, data auxiliary set (DAS) 811C, and the connections provided by the J70165A-1 mounting and connecting panel. This testing is done under the control and direction of the serving test center (STC). For information on system test requirements and the procedures used in locating and clearing trouble, refer to the applicable telegraph serviceboard or testboard practices and the section entitled Data Set 108B—Maintenance (312-800-300).

1.02 ▶ This section is reissued to add this notice that the J70165A-1 mounting and connecting panel has been rated manufacture discontinued (MD) and data set 108B and DAS 811C have been rated for additions and maintenance (A & M). Data set 108-type hub installations requiring new mounting space will use data set 108D or 108E, DAS 811K, and the J70165G mounting. Where spare positions are available in existing J70165A-1 mountings, they may be field modified per drawing SD-70955-01, Issue 12B, to mount data sets 108D or 108E and DAS 811K.◀
