COMMON EQUIPMENT
A5 CHANNEL BANK CARRIER SUPPLY
DISTRIBUTING BUS OUTPUT TEST

The J68857A channel carrier distribution unit (Fig. 1) receives, from the J68857B carrier generator and filter unit, 12 channel carrier frequencies at 4-kHz intervals in the range of 64 to 108 kHz. The channel carrier distribution unit contains distributing buses for distribution of the 12 channel carrier frequencies to a maximum of 30 channel banks. Each distributing bus has a test jack (TST CH 1, 2, 3 ... or 12) for measuring the output power of each channel carrier frequency. The channel carrier supply unit and the channel carrier distribution unit are mounted in the same bays as the A5 channel banks.

The purpose of this test is to measure and, if necessary, adjust (by strapping resistors R1, R2, R3 . . . and R6) the output power of each of the 12 channel carrier distributing buses.

The information in this section was previously in Section 356-250-501. It is renumbered in the process of reorganizing the 356 Division of practices. *Equipment Test Lists are affected.*

This material is prepared for Bell System purposes and is for the use of Bell System employees only. Its distribution is in no sense a publication. Neither the material nor any portion thereof is to be reproduced in any form by others without the written permission of the American Telephone and Telegraph Company.

APPARATUS

Receiving Test Equipment (RTE) (Section 356-010-500):

Frequency: 64 to 108 kHz

Power: 0 dBm

Impedance: 135 ohms balanced

Example: 34A TMS

3P17C Cord

STEP	PROCEDURE																																							
1	<p>Unfasten the two twist-lock screws and lower the hinged front-panel cover of the J68857A channel carrier distribution unit to gain access to the distributing buses and test jacks.</p>																																							
2	<p>Verify that all unused bus taps are terminated with 130-ohm load resistors.</p>																																							
3	<p>Adjust the receiving test equipment as follows:</p> <p>Impedance: 135 ohms balanced</p> <p>Frequency: See Table A</p> <p>Power: 0 dBm</p> <p style="text-align: center;">TABLE A</p> <table border="1" data-bbox="332 1251 1481 1393"> <thead> <tr> <th colspan="13">CHANNEL CARRIER FREQUENCIES (KHZ)</th> </tr> <tr> <th>Channel No.</th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> <th>6</th> <th>7</th> <th>8</th> <th>9</th> <th>10</th> <th>11</th> <th>12</th> </tr> </thead> <tbody> <tr> <td>Frequency</td> <td>108</td> <td>104</td> <td>100</td> <td>96</td> <td>92</td> <td>88</td> <td>84</td> <td>80</td> <td>76</td> <td>72</td> <td>68</td> <td>64</td> </tr> </tbody> </table>	CHANNEL CARRIER FREQUENCIES (KHZ)													Channel No.	1	2	3	4	5	6	7	8	9	10	11	12	Frequency	108	104	100	96	92	88	84	80	76	72	68	64
CHANNEL CARRIER FREQUENCIES (KHZ)																																								
Channel No.	1	2	3	4	5	6	7	8	9	10	11	12																												
Frequency	108	104	100	96	92	88	84	80	76	72	68	64																												
4	<p>Connect the RTE to the TST CH() jack of the distributing bus to be tested [patch (1), Fig. 2].</p>																																							
5	<p>Measure the power at the TST CH() jack.</p> <p>Requirement: 0.0 dBm \pm0.25 dB</p>																																							
6	<p>If the requirement of Step 5 is not met, adjust the output power of the distributing bus to meet the requirement. Do this by operating the screw switches indicated in Table B.</p> <p>Note: The screw switches are identified on the inside of the front cover of the J68857A panel.</p>																																							
7	<p>Remove patch (1), Fig. 2.</p>

No. 6 only	3.0 ± 0.3														
8	Repeat Steps 3 through 7 for each channel carrier frequency to be tested.														
9	If it was necessary to adjust a distributing bus, remeasure and, if necessary, readjust each distributing bus to ensure that the requirement of Step 5 is still met.														
10	Raise and fasten the hinged front-panel cover.
