3 TL1 commands - alphabetical order

List of tables

About this document

Purpose

This document describes the external TL1 interface for 1675 LambdaUnite MSS in terms of TL1 command, responses, and notification definitions.

This document does not cover the specification of the TL1 protocol itself or that of underlying protocols of the OSI or IP stack.

Overview of the document

This manual is structured as follows:

- Chapter 1 contains introductory information (TL1 message index and command state diagram) and data type definitions, used to define parameters in TL1 commands or notifications
- Chapter 2 contains AID definitions, used to address entities with TL1 commands or notifications
- Chapter 3 contains the detailed requirements for the TL1 commands listed in alphabetical order
- Chapter 4 to chapter 13 contain the TL1 commands separated by the functional areas:
  - Administration and security
  - Configuration management
  - Fault management
  - Transmission and cross-connect handling
  - Protection
  - Performance monitoring
  - Synchronization
  - Software and database management
  - Data communications network
  - Optical network navigation system (ONNS)

- Chapter 14 contains a list of error codes and links to the corresponding TL1 commands
- Chapter 15 contains a list of TL1 commands and the corresponding user privilege codes in alphabetical order
- Chapter 16 contains a list of amendments related to the current software version

Supported systems

This manual describes 1675 LambdaUnite MSS, Release 11.0. For technical reasons, it is possible that features have been documented that are not available until later software versions. For precise information about the availability of features, consult the Software Release Description. This manual provides details of the status at the time of software delivery.

Intended use

This equipment shall be used only in accordance with intended use, corresponding installation, and maintenance statements as specified in this documentation. Any other use or modification is prohibited.

Optical safety

IEC customer laser safety guidelines

Alcatel-Lucent declares that this product is compliant with all essential safety requirements as stated in IEC 60825-Part 1 and 2 “Safety of laser products” and “Safety of optical fibre telecommunication systems”. Futhermore Alcatel-Lucent declares that the warning statements on labels on this equipment are in accordance with the specified laser radiation class.

Optical safety declaration

Alcatel-Lucent declares that this product is compliant with all essential safety requirements as stated in IEC 60825-Part 1 and 2 “Safety of Laser Products” and “Safety of Optical Fiber Telecommunication Systems”. Furthermore Alcatel-Lucent declares that the warning statements on labels on this equipment are in accordance with the specified laser radiation class.

Optical fiber communications

This equipment contains an Optical Fiber Communications semiconductor laser/LED transmitter. The following Laser Safety Guidelines are provided for this product.

General laser information

Optical fiber telecommunication systems, their associated test sets, and similar operating systems use semiconductor laser transmitters that emit infrared (IR) light at wavelengths between about 800 nanometers (nm) and 1600 nm. The emitted light is above the red end of the visible spectrum, which is normally not visible to the human eye. Although radiant en at near-IR wavelengths is officially designated invisible, some people can see the shorter wavelength energy even at power levels several orders of magnitude below any that have been shown to cause injury to the eye.

Conventional lasers can produce an intense beam of monochromatic light. The term “monochromaticity” means a single wavelength output of pure color that may be visible or invisible to the eye. A conventional laser produces a small-size beam of light, and because the beam size is small the power density (also called irradiance) is very high. Consequently, lasers and laser products are subject to federal and applicable state regulations, as well as international standards, for their safe operation.

A conventional laser beam expands very little over distance, or is said to be very well collimated. Thus, conventional laser irradiance remains relatively constant over distance. However, lasers used in light wave systems have a large beam divergence, typically 10 to 20 degrees. Here, irradiance obeys the inverse square law (doubling the distance reduces the irradiance by a factor of 4) and rapidly decreases over distance.

Lasers and eye damage

The optical energy emitted by laser and high-radiance LEDs in the 400-1400 nm range may cause eye damage if absorbed by the retina. When a beam of light enters the eye, the eye magnifies and focuses the energy on the retina magnifying the irradiance. The irradiance of the energy that reaches the retina is about 105, or 100,000 times more than at the cornea and, if sufficiently intense, may cause a retinal burn.

The damage mechanism at the wavelengths used in an optical fiber telecommunications is thermal in origin, i.e., damage caused by heating. Therefore, a specific amount of energy is required for a definite time to heat an area of retinal tissue. Damage to the retina occurs only when one looks at the light long enough that the product of the retinal irradiance and the viewing time exceeds the damage threshold. Optical energies above 1400 nm cause corneal and skin burns, but do not affect the retina. The thresholds for injury at wavelengths greater than 1400 nm are significantly higher than for wavelengths in the retinal hazard region.

Classification of lasers

Manufacturers of lasers and laser products in the U.S. are regulated by the Food and Drug Administration’s Center for Devices and Radiological Health (FDA/CDRH) under 21 CFR 1040. These regulations require manufacturers to certify each laser or laser product as belonging to one of four major Classes: I, II, lla, IlIa, lllb, or IV. The International Electro-technical Commission is an international standards body that writes laser safety standards under IEC-60825. Classification schemes are similar with Classes divided into Classes 1, 1M, 2, 2M, 3R, 3B, and 4. Lasers are classified according to the accessible emission limits and their potential for causing injury. Optical fiber telecommunication systems are generally classified as Class I/1 because, under normal operating conditions, all energized laser transmitting circuit packs are terminated on optical fibers which enclose the laser energy with the fiber sheath forming a protective housing. Also, a protective housing/access panel is typically installed in front of the laser circuit pack shelves The circuit packs themselves, however, may be FDA/CDRH Class I, IIIb, or IV or IEC Class 1, 1M, 3R, 3B, or 4.

Laser safety precautions for optical fiber telecommunication systems

In its normal operating mode, an optical fiber telecommunication system is totally enclosed and presents no risk of eye injury. It is a Class I/1 system under the FDA and IEC classifications.

The fiber optic cables that interconnect various components of an optical fiber telecommunication system can disconnect or break, and may expose people to laser emissions. Also, certain measures and maintenance procedures may expose the technician to emission from the semiconductor laser during installation and servicing. Unlike more familiar laser devices such as solid-state and gas lasers, the emission pattern of a semiconductor laser results in a highly divergent beam. In a divergent beam, the irradiance (power density) decreases rapidly with distance. The greater the distance, the less energy will enter the eye, and the less potential risk for eye injury. Inadvertently viewing an un-terminated fiber or damaged fiber with the unaided eye at distances greater than 5 to 6 inches normally will not cause eye injury, provided the power in the fiber is less than a few milliwatts at the near IR wavelengths and a few tens of milliwatts at the far IR wavelengths. However, damage may occur if an optical instrument such as a microscope, magnifying glass, or eye loupe is used to stare at the energized fiber end.

Laser safety precautions for enclosed systems

Under normal operating conditions, optical fiber telecommunication systems are completely enclosed; nonetheless, the following precautions shall be observed:

1. Because of the potential for eye damage, technicians should not stare into optical connectors or broken fibers
2. Under no circumstance shall laser/fiber optic operations be performed by a technician before satisfactorily completing an approved training course
3. Since viewing laser emissions directly in excess of Class I/1 limits with an optical instrument such as an eye loupe greatly increases the risk of eye damage, appropriate labels must appear in plain view, in close proximity to the optical port on the protective housing/access panel of the terminal equipment.

Laser safety precautions for unenclosed systems

During service, maintenance, or restoration, an optical fiber telecommunication system is considered unenclosed. Under these conditions, follow these practices:

1. Only authorized, trained personnel shall be permitted to do service, maintenance and restoration. Avoid exposing the eye to emissions from un-terminated, energized optical connectors at close distances. Laser modules associated with the optical ports of laser circuit packs are typically recessed, which limits the exposure distance. Optical port shutters, Automatic Power Reduction (APR), and

Automatic Power Shut Down (APSD) are engineering controls that are also used to limit emissions. However, technicians removing or replacing laser circuit packs should not stare or look directly into the optical port with optical instruments or magnifying lenses. (Normal eye wear or indirect viewing instruments such as Find-R-Scopes are not considered magnifying lenses or optical instruments.)

2. Only authorized, trained personnel shall use optical test equipment during installation or servicing since this equipment contains semiconductor lasers (Examples of optical test equipment are optical time domain reflectometers (OTDRs), Hand-held loss test sets.)
3. Under no circumstances shall any personnel scan a fiber with an optical test set without verifying that all laser sources on the fiber are turned off
4. All unauthorized personnel shall be excluded from the immediate area of the optical fiber telecommunication systems during installation and service.

Consult ANSI Z136.2, American National Standard for Safe Use of Lasers in the U.S.; or, outside the U.S., IEC-60825, Part 2 for guidance on the safe use of optical fiber optic communication in the workplace.

For the optical specifications refer to the chapter “Technical specifications” in the Product Information and Planning Guide.

Conventions used

See “Common data types” (p. 1-9) for detailed information.

Related information

The manuals related to 1675 LambdaUnite MSS are shown in the following table:

Document title	Document code
1675 LambdaUnite MSS Product Information and Planning Guide Presents a detailed overview of the system, describes its applications, gives planning requirements, engineering rules, ordering information, and technical specifications.	109671750 (365-374-195R11.0)
1675 LambdaUnite MSS User Provisioning Guide Provides step-by-step information for use in daily system operations. The manual demonstrates how to perform system provisioning, operations, and administrative tasks by use of *WaveStar*® CIT.	109671776 (365-374-196R11.0)
1675 LambdaUnite MSS Maintenance and Trouble-clearing Guide Gives detailed information on each possible alarm message. Furthermore, it provides procedures for routine maintenance, troubleshooting, diagnostics, and component replacement.	109671768 (365-374-197R11.0)
1675 LambdaUnite MSS Installation and System Turn-up Guide A step-by-step guide to system installation and set up. It also includes information needed for pre-installation site planning and post-installation acceptance testing.	109671792 (365-374-198R11.0)

Technical documentation

The technical documentation as required by the Conformity Assessment procedure is kept at Alcatel-Lucent location which is responsible for this product. For more information, contact your local Alcatel-Lucent representative.

Technical support

For technical support, contact your local Alcatel-Lucent customer support team. See the Alcatel-Lucent Support web site (http://www.alcatel-lucent.com/support/) for contact information.

How to comment

To comment on this information product, go to the Online Comment Form (http://www.lucent-info.com/comments/enus/) or e-mail your comments to the Comments Hotline (comments@alcatel-lucent.com).

1 General information

Overview

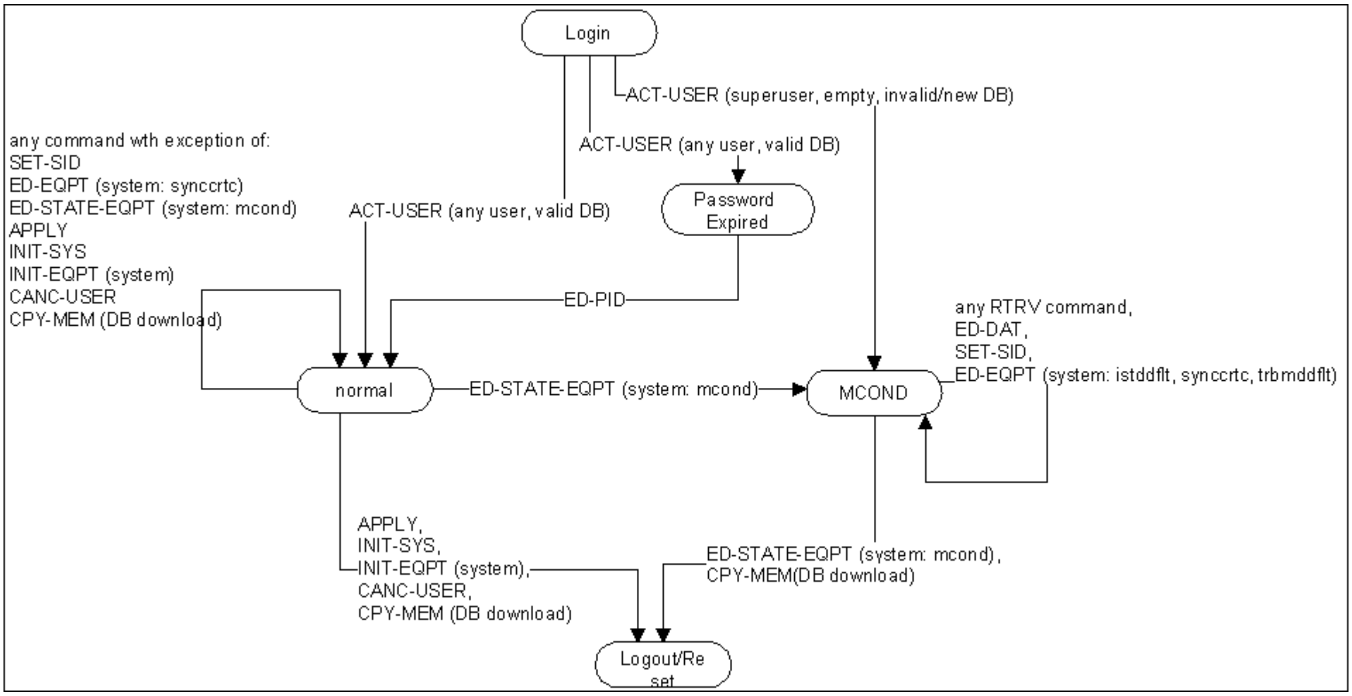
Purpose

This chapter contains introductory information.

Contents

TL1 command state diagram

The following state diagram provides an overview in which system states which TL1 commands are allowed. States and transitions are explained below the figure.



States

- *Login*: initial state, creation of user session
- *Password expired*: entered after login with valid database and when the user password has expired
- *MCOND*: system is in maintenance condition (see parameter *mcond* in RTRV-STATE-EQPT (system))
- *normal*: system is in normal mode (see parameter *mcond* in RTRV-STATE-EQPT (system)
- *Logout/Reset*: termination of a user session through logout or a command which leads to a system or CTL controller reset

Transitions

Transitions between the states are performed upon execution of the TL1 commands on the arrows between the states. An exception is the transitions from the *Login* state. This transition is automatically performed based on the database state (see parameter *dbstate* in RTRV-STATE-EQPT (system)) and the password expiration information (see parameter page in RTRV-USER-SECU).

Generic TL1 command behavior

The purpose of this chapter is to describe TL1 command behavior, which is common for all commands and therefore not stated explicitly for each single command. Deviations from the common behavior are described for each command in the detailed behavior description.

Input/output case sensitivity

For details, refer to *GR-831 section 2.7.3*.

Input syntax format

The input parser of the network element is case insensitive. The commands are recognized regardless of their capitalization. Command codes and parameter names in uppercase, lowercase, or mixed case (combinations of uppercase and lowercase within an input message, a command code, or a parameter name) are allowed.

Output syntax format

The recommended output format is for parameter names always lowercase and for value sets as defined in this document. Derivations may be acceptable.

Edit commands

ED commands modify the parameters as specified in the command. Spec block parameters are optional. Parameters which are not specified in the command remain unchanged.

It is allowed to omit all spec block parameters in the command. Such an empty command does not change any parameter value, and cause an ED notification without spec block parameters.

Data base change notifications

Object creation - ENT notification

The creation/establishment of an entity/instance is reported by means of an ENT (Enter) notification. It consists of:

- entity class name
- instance/identifier/key
- all attribute values of the instance as defined in the notification section; example: ENT-OC48 notification
- entity class name: OC48
- instance/identifier/key: port AID
- attribute values: all attribute values as defined in the corresponding ENT-OC48 notification section.

The attributes for an entity can be classified as follows:

- *input*: the reported attribute value is specified in the corresponding command request
- *modifiable*: the reported attribute value is the specified default value (with semantics of initial value) and the attribute itself is modifiable by means of corresponding ED command
- *state*: the reported attribute value is the specified default value (with semantics of initial value) and the attribute itself is modifiable directly by means of corresponding ED command. The modification can ever be triggered as side affect of a command or by an autonomous event.

Examples for the different attribute classes

- input: 1+1 line/MS protection group: attribute wkg - worker port
- modifiable: 1+1 line/MS protection group: attribute wkg - worker port
- state: port: attribute crstat - Constituent Rates Status list (autonomous change) in case of adaptive mode
- port: attribute: fsflpbkstat - Far Side Facility Loopback Status (side effect of command)

Note: Protection state information is not contained in any db change notification.

Object modification - ED notification

The modification for some attributes of an entity/instance is reported by means of an ED (Edit) notification. It consists of:

- entity class name
- instance/identifier/key

- all attribute values which were modified
  This includes all attributes which came into existence by modifying another attribute. (see example below). This also means, that attributes which are already handled internally but where not applicable up to now and therefore were not reported to the manager, must not be reported to the manager, if they became applicable. Reason: The manager cannot know the internal default values. If an ED command for an (or the) entity/instance attribute does not modify the attribute value, because (for each individual attribute) new_attribute_value = old_attribute_value, no ED notification is sent However, empty notifications, that is, notifications with no attributes and attribute values, can occur. These empty notifications do not affect the managers, but nevertheless should be avoided. Example: **`ED-OC48`** notification
- entity class name: OC48
- instance/identifier/key: port AID
- attribute values: all attribute values which have been modified.
  Thus the corresponding ED notification section describes only the superset of attributes where changes are reported. Which attributes are really contained in a concrete scenario is described either in the detailed behavior section (if the change is triggered by a command) or in autonomous event section (if the changes it triggered by a spontaneous event). Example: ED-OC48 notification of new attributes.
- entity class name: STM16
- instance/identifier/key: port AID
- action: istd is set from SDH to SONET
  This action causes that attributes come into existence by modifying *istd*. In detail this means: - attributes, which are named differently in the two standards - attributes, which are only applicable in one standard must be reported. For example, for the change from SDH to SONET: - *sdthr* (in SDH called *degthr*) - *felpm* (in SDH called *femspm*) - *z0outmode* (new parameter in SONET) must be reported.

Note: Sometimes TL1 uses a different command verb instead of “ED” for modification commands (for example, “SET”). Nevertheless, the statements of this chapter are also valid for these.

Object deletion - DLT notification

The deletion/removal of an entity/instance is reported by means of a DLT (Delete) notification. It consists of:

- entity class name
- instance/identifier/key

Example: DLT-OC48 notification

- entity class name: OC48
- instance/identifier/key: port AID.

Sequence constraints

To allow the manager a proper interpretation of the received notifications, the NE must assure same sequence constraints. This section specifies these sequence constraints.

Report object creation first

The first notification for an entity is the *db change* reporting that a new entity has been created/established. After this *establish* notification, all other types of notifications may be issued for this instance.

Report creation according to AID hierarchy

If several instances of entities are created in the context of one stimulus, the order of the *establish* notification is according to the hierarchy of the AID structure. The *establish* notification for a subordinate entity is not reported before the *establish* notification of a superior entity.

Example: The *establish* notification for a port should be sent before the *establish* notification of a tributary being a member of this port.

Report object deletion last

The last notification for an entity is the *dbchange* reporting that an entity has been deleted/removed.

Report deletion according to AID hierarchy

If several instances of entities are deleted in the context of one stimulus, the order of the *delete* notification is according to the hierarchy of the AID structure. The *delete* notification for a superior entity is not reported before the *delete* notification of a subordinate entity.

Example: The *delete* notification for a tributary should be sent before the *delete* notification of a port containing that tributary.

TL1 command validation principles

This section defines the following principles for the TL1 command validations:

- Validations to be executed
- Order of the validations
- Behavior in the case of multiple failures in a command

General validations to be executed first

On receipt of a TL1 command, the system performs a general TL1 command validation, to check:

- Correct command name
  (includes a check, whether the command is supported by the system)
- Command format
- Completeness of command parameters
- Correct spec block parameter names
  (includes a check, whether the parameter is supported by the system)
- Correct parameter syntax
  (includes a check for the maximum value range)

The error responses for the general validations are defined in the error responses section of the RTRV-HDR command.

Order of TL1 command validations

The TL1 command validations are performed in the order as given by the command parsing and processing. This requirement defines that the validations are executed in the “natural order” as the command parsing and processing steps are done.

An example would be, that the existence of an entity must be checked, before parameter values for the entity can be evaluated.

Immediate error response generation

The system generates the error response immediately after a TL1 command validation failed. This means, that the system does not store the results of several validations and later decide, which error response has to be generated.

This behavior is important, in the case of multiple failure conditions in the command. The error response which will be returned depends on the first failed validation during command processing.

Common data types

The following data types are used in the description of TL1 messages, the definition is given in Backus-Naur Form. Characters of the Backus-Naur Form are enclosed in “ when they are meant as literal in the definition.

<table>
<tr><th>GR-831-CORE Definition</th><th>Name used in TL1 messages</th><th>Definition</th></tr>
<tr><td>nil</td><td>nil</td><td>nil, symbolizes the absence of any other thing</td></tr>
<tr><td>let</td><td>letter</td><td>A | B | … | Z | a | b | … | z</td></tr>
<tr><td>dig</td><td>digit</td><td>0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9</td></tr>
<tr><td>ident</td><td>identifier</td><td><letter> (<letter> | <digit>) *</td></tr>
<tr><td>sym name</td><td>symbolic name</td><td><digit>* ((<letter> | ″+″ | # | %) <digit>*)+</td></tr>
<tr><td>alphanum</td><td>alphanumeric string</td><td>(<letter> | <digit>) +</td></tr>
<tr><td>dec num</td><td>decimal number</td><td>[D″]<digit>* [.] <digit>+</td></tr>
<tr><td>arith exp</td><td>arithmetic expression</td><td>″(″ [″+″ | –] <digit>*[.]<digit>+ ″)″</td></tr>
<tr><td>hex num</td><td>hexadecimal number</td><td>[H″] (<digit> | A | B | C | D | E | F)+</td></tr>
<tr><td>oct num</td><td>octal number</td><td>[O″] (0 | 1 | 2 | 3 | 4 | 5 | 6 | 7)+</td></tr>
<tr><td>bin num</td><td>binary number</td><td>[B″] (0 | 1)+</td></tr>
<tr><td>keyed num</td><td>keyed number</td><td>[K″] (<digit> | A | B | C | D | ″*″ | #)+</td></tr>
<tr><td>num str</td><td>numeric string</td><td><digit>+</td></tr>
<tr><td>integer</td><td>integer</td><td><numeric string> | ″(″ [″+″ | -] <digit>+ ″)″</td></tr>
<tr><td>text str</td><td>text string</td><td>″(\″ | \\ | <any character except ″ or \>)* ″</td></tr>
<tr><td>inner str</td><td>inner string</td><td>\″ (″″ | \\ | <any character except ″ or \>)* \″</td></tr>
<tr><td>aid</td><td>AID</td><td>see Chapter 2, “AID structure”.</td></tr>
<tr><td></td><td>AID list</td><td><AID> (&<AID>)*</td></tr>
<tr><td>tid</td><td>TID</td><td><identifier>(-<identifier>) *|<text string> see also RTRV-HDR for 1675 LambdaUnite MSS specific constraints</td></tr>
<tr><td></td><td>character string</td><td>any character except: ; , : ″</td></tr>
<tr><td></td><td>value set</td><td>set of predefined <character strings></td></tr>
<tr><td></td><td>alphanumeric value set</td><td>set of predefined <alphanumeric strings></td></tr>
<tr><td></td><td>numeric value set</td><td>set of predefined <numeric strings></td></tr>
<tr><td></td><td>AID string</td><td>(letter | digit | _ | - | & | #)+</td></tr>
</table>

Validation of character set restrictions

If any parameter of the type *Text String*, *Inner String*, or *Character String* has a restricted character set, then the system validatse the parameter that only the allowed character set is used. The character set validation ensures that:

- The system function is not impaired
- The interworking with systems of the same type (1675 LambdaUnite MSS) is not disturbed.

The detailed character set restrictions are defined either in the parameter range definition or in specific validation rules of the TL1 commands.

The system does not consider character set restrictions from other NE types, which are intended for interworking, and from management systems or CIT. Restricting the character sets to meet the need of all possible interworking partners would lead to a very limited character set. This would be an unnecessary restriction for users, who usually have only some of the possible NE types in the network and only one type of management system.

It is assumed that management systems, *WaveStar*® CIT and other NE types use the same principles for character set validation, that is, perform validations to ensure their own system function.

Recommended handling of character set restrictions

To avoid network operation impairments caused by violations of character set restrictions, the user shall

- collect the allowed character sets for the provisionable parameters from all NE types in the network and from the management system
- define suitable character sets which meet the restrictions of all NE types.

It is the users task to ensure that the defined character sets are properly used (for example, through trainings within the organization).

IP addresses

During provisioning, IP addresses are not recognized as different in case they only differ in leading zeroes.

In case IP addresses are configured using leading zeroes in any of their fields, during provisioning the system does not recognize IP addresses as equal that differ only by such leading zeroes. When using IP addresses for communication, however, leading zeroes are ignored. As a consequence, it would then be possible, that the same IP address be used in two applications that need different ones, for example L1 RC IP address and ENNI SC PC IP address.

When provisioning IP addresses, do not use leading zeroes.

Definitions

Definition of the directions used for TransMUX

The TransMUX application has two sides:

- Asynchronous side
- Synchronous side

On each side, the egress (outgoing) direction is defined in a way that it points to the other TransMUX application side.

That means:

- The egress (outgoing) direction of the asynchronous side directs to the synchronous side.
- The egress (outgoing) direction of the synchronous side directs to the asynchronous side.

For the ingress (ingoing) direction, the opposite applies.

2 AID structure

Overview

Purpose

This section contains the requirements for Access Identifiers (AID) for the TL1 interface of the 1675 LambdaUnite MSS.

Contents

Introduction

Overview

Purpose

This section defines the names which will be used to identify physical and logical entities for input and output at the TL1 Interface for the 1675 LambdaUnite MSS products.

This document re-uses the general terminology and BWM Access Identifier (AID) Syntax. It is assumed that the reader is familiar with the terms and syntax.

Contents

AID syntax

General

The following specification characters will be used throughout this document as a vehicle for defining the syntax:

<table>
<tr><th>Rule</th><th>Description</th></tr>
<tr><td>::=</td><td>Assignment of a lexical rule to a token or token class.</td></tr>
<tr><td>literal</td><td>Characters which must appear literally as typed appear in typewrite font.</td></tr>
<tr><td>|</td><td>The “exclusive or” token means that exactly one item in the list must be present.</td></tr>
<tr><td>{}</td><td>Items in {} mean that one of the items in the set must be present.</td></tr>
<tr><td>[]</td><td>Items in [] mean that one of the items in the set may optionally be present.</td></tr>
<tr><td>()</td><td>Items in () can be used for grouping to define different precedence for the operators |, ^{n}, and *.</td></tr>
<tr><td>-</td><td>A dash indicates a range of values where any item in the range may be present.</td></tr>
<tr><td>,</td><td>A “,” is used as a list item separator in the specification grammar.</td></tr>
<tr><td>a^*</td><td>A superscript “*” specifies 0 or more repetitions of the previous token that can be present.</td></tr>
<tr><td>a^+</td><td>A superscript “+” specifies 1 or more repetitions of the previous token that can be present.</td></tr>
<tr><td>a^n</td><td>A superscript “n” is a number which specifies the number of repetitions of the previous token that can be present.</td></tr>
<tr><td>“”</td><td>Blanks between tokens in an expression means to concatenate the tokens.</td></tr>
</table>

Access Identifier (AID) syntax

AIDs can be either Simple_AIDs, or Compound_AIDs. AID definitions will use the following syntax:

let ::= {**A-Z**,**a-z**,_}

dig ::= {**0-9**}

AID_field ::= (let (let | dig)*)

Simple_AID ::= (AID_field [Simple_AID]) | **#**

Compound_AID ::= Simple_AID(–Simple_AID)*

The character "–" (dash) will be used as the Simple_AID separator in compound AIDs.

AID_List::=AID_unit(, AID_unit)*

AID_unit::=Simple_AID | Compound_AID

The character "," (comma) will be used as the Simple_AID, Compound_AID separator in AID_Lists.

If a Simple_AID is <null>, the "**#**" character is used to specify a value of <null> for an AID_field.

Groups of entities of the same type can be specified by using the value **all** or *someprefix* **all** in a Simple_AID.

The legal places to use this value are specified in the appropriate commands below. The convention used in the command descriptions is that the value **all** is not allowed unless explicitly stated otherwise.

In general **all** is only allowed for input AIDs, that means, when used in a TL1 request.

For the following requirements see also the definition of compound AIDs below.

The value **all** on bay and shelf level is only allowed for **RTRV-EQPT** on bay and shelf level. It is not allowed on this positions for entities further down in the hierarchy like slot, port, tributary.

Example 1

valid: **all–all**

invalid: **all–all #–#–1–3–1**

The value **all** on the AID field for slot, CP, port or tributary is only allowed

- when it is the last AID field or
- when there is already an **all** on the AID field following the AID field.

Example 2

valid: `1–1–#–#–1–3–all`

valid: `1–1–#–#–1–all`

valid: `1–1–#–#–all–cp`

valid: `1–1–#–#–1–all–all`

invalid: `1–1–#–#–1–all–1`

Examples for lower-order tributaries:

valid: `1–1–#–#–1–3–1–all` (all LO tributaries for one path termination)

valid: `1–1–#–#–all–all–all–all` (all lower-order tributaries)

valid: `1–1–#–#–all–all–all–1`

System level AIDs

Overview

Purpose

This section contains all system level AIDs.

Contents

System AID

To identify the entire system the following AID is used:

SystemAID ::= **`system`**

MDI/MDO

General

The system has miscellaneous discrete outputs and inputs which are named without any hierarchical, positional information in the AID.

The system provides 8 input and 8 output miscellaneous discrete alarm points which can be assigned user-friendly names so that when the user wants to assert an output point, or receives an alarm from one of the input points, a name is used which reflects what the alarm point is physically connected to.

AIDs for MDIs, MDOs

The following AIDs are used to identify the MDIs/MDOs:

Miscellaneous_in_discreteAID ::= **`misc_in`**{**`1-8`**} | **`misc_inall`**
Miscellaneous_out_discreteAID ::= **`misc_out`**{**`1-8`**} | **`misc_outall`**

Timing

AIDs for external timing references

The timing references can come from two external DS1 or E1 (2 MHz or 2 Mbit/s) or 64 kbit/s (future) signals:

External_timing_ref_AID ::= **extref1** | **extref2** | **extrefall** | **NONE**

The value NONE indicates that no external timing reference is available.

In the system, maximal 32 I/O slots are present. Every I/O slot can supply one timing reference signal extracted from the incoming data. Out of those six can be used as line timing input reference.

AIDs for line timing references

The AIDs which can be used for the input selection are:

Line_timing_ref_AID ::= **line**{**1-6**} | **lineall** | **NONE**

The value NONE indicates that no line timing reference is available.

AIDs for timing input ports

The system has two timing input ports. The AIDs for these timing input ports are:

External_Timing_input_port_AID ::= **exttmg0** | **exttmg1** | **exttmgall**

AIDs for timing output ports

The system has two timing output ports. The AIDs for these timing output ports are:

External_Timing_output_port_AID ::= **exttmg0_out** | **exttmg1_out** | **exttmg_outall**

AID for timing output

The AID for timing output is

Timing_Output_AID ::= **outtmg**

For provisioning or retrieving information related to the system clock the SystemAID is to be used.

OSI nodes

AIDs for OSI nodes

The system can support up to 8 OSI nodes, which are used to allow that the system is part in several routing domains.

The AIDs to access the OSI nodes are:

OSI_node_AID ::= **`osinode`**{**`1-8`**} | **`osinodeall`**

SCN node

AID for SCN node

The system shall support one SCN node, which is used to implement the IP stack for SCN communication related to ONNS.

The AID to access the SCN node is:

SCN_node_AID ::= **scnnode**

UNI node

AIDs for UNI node

The system supports one UNI node, which is used to implement the IP stack for UNI communication.

The AID to access the UNI node is:

UNI_node_AID ::= uninode

ENNI node

AID for ENNI Node

The system shall support one ENNI node, which is used to implement the IP stack for ENNI communication.

The AID to access the ENNI node is:

ENNI_node_AID ::= **`OSI_node_AID | SCN_node_AID`**

General node

General Node AID

The system shall support a general node AID, which can be used to address any of the particular node AID types of above.

The general node AID is defined as:

Node_AID ::= **`OSI_node_AID | SCN_node_AID`**

ASTN node

ASTN Node AID

The system shall support a ASTN node AID, which can be used to address a ONNS node.

The ASTN node AID is defined as:

ASTN_Node_AID ::= last 4 bytes of the backpl, seperated by “–” (dash)

Link

The AIDs defined in this chapter are used to identify entities, which are defined by a relationship between two objects. E.g. a communication link, which is defined by the two end points, or a neighborship, which is defined by the two neighboring objects.

Link AID

To identify the entire communication link for ONNS between two nodes the following AID is used:

- Initiator_ASTN_Node_AID ::= ASTN_Node_AID
- Responder_Node_AID ::= ASTN_Node_AID
- LinkAID ::= Initiator_ASTN_Node_AID, Responder_ASTN_Node_AID

RC Neighbor AID

To identify the neighborship between a Routing Controller and a remote Routing Area, the following AID shall be used:

- Neighbor_RA_AID ::=
  4 byte values in the range of 0…255 each, separated by "-" (dash). The values shall be derived from the Remote Routing Area ID.
- RC_Neighbor_AID ::= ASTN_Node_AID,Neighbor_RA_AID
  The RC Neighbor AID identifies an E-NNI link by specifying the ASTN Nnode ID of the node to which the link is attached and the configured peer RA ID.

UNI LAN Control Channel Link AID

To identify the entire UNI control channel link between UNI-N and UNI-C via LAN port, the following AID shall be used:

- UNI_ControlChannel_Destination_AID ::=
  4 byte values in the range of 0…255 each, separated by"-" (dash). The values shall be derived from the destination UNI Node ID.
- UNILANCCLinkAID ::= LanPortAID,UNI_ControlChannel_Destination_AID.

ENNI LAN Control Channel Link AID

To identify the entire ENNI control channel link between ENNI Signaling Protocol controllers via LAN, the following AID shall be used:

- ENNI_Neighbor_Signalling_PC_ID ::=
  4 byte values in the range of 0…255 each, separated by"-" (dash). The values shall be derived from the destination ENNI Node ID.
- ENNILANCCLinkAID ::= LanPortAID,ENNI_Neighbor_Signalling_PC_ID

Hierarchically specified AIDs

Overview

Purpose

Below the system level AIDs, other entities are specified in a hierarchical structure.

Contents

Compound AID syntax overview

The AID structure defined for a compound AID is shown in the next table. For each AID field further information can be found in the subsequent subsections. Examples of compound AIDs can be found in "AID examples" (p. 2-62).

Entity	AID Field						
	Bay/ Rack	**Shelf/ Subrack**	**Prot Grp**	**Side Line**	**Slot**	**CP/ SPort/ NVM**	**STS-1/ AU-3/ VCG Trib**
Bay/Rack	1						
Shelf/ Subrack	1	1

STS-48c/ AU-4-16c Trib	1	1	#	#	Simple_ SlotAID	Simple_ SPortAID	Simple_STS1_ NumAID *

Entity	AID Field						
	Bay/ Rack	Shelf/ Subrack	Prot Grp	Side Line	Slot	CP/ SPort/ NVM	STS-1/ AU-3/ VCG Trib
STS-192c/ AU-4-64c Trib	1	1	#	#	Simple_ SlotAID	Simple_ SPortAID	Simple_STS1_ NumAID *
STS-768c/ AU-4-256c Trib	1	1	#	#	Simple_ SlotAID	Simple_ SPortAID	Simple_STS1_ NumAID *
* See table below							

The STS-3c/AU-4, STS-12c/AU-4-4c, STS-48c/AU-4-16c, STS-192c/AU4-64c, STS-768c/AU4-256c tributaries also use the STS-1/AU-3 AID field. They are identified by the first STS-1/AU-3 number of the signal as indicated by the table below:

Signal	MS2.5G/S3[-x] Adaptation (x in {3c, 12c, 48c})	MS10G/S3[-x] Adaptation (x in {3c, 12c, 48c, 192c})	MS40G/S3[-x] Adaptation (x in {3c, 12c, 48c, 192c, 768c})
S3 (STS-1/AU-3)	1, 2, 3, … , 48	1, 2, 3, … , 192	1, 2, 3, … , 768
S3-3c (STS-3c/AU-4)	1, 4, 7, … , 46	1, 4, 7, … , 190	1, 4, 7, … , 766
S3-12c (STS-12c/AU-4-4c)	1, 13, 25, 37	1, 13, 25, … , 181	1, 13, 25, … , 757
S3-48c (STS-48c/AU-4-16c)	1	1, 49, 97, 145	1, 49, 97, … , 721
S3-192c (STS-192c/AU-4-64c)	n/a	1	1, 193, 385, 577
S3-768c (STS-768c/AU-4-256c)	n/a	n/a	1

AID field lengths

The following table lists the AID field length specifications. The maximum length of an AID, including the separating “–”, must not exceed 23 characters:

Field	AID definitions	Length (char)
Bay (Rack)	BayID	1
Shelf (Subrack)	Simple_ShelfID	1
Slot	Simple_SlotAID	5
CP	Simple_CpAID | Simple_NvmAID	3
Socket	Simple_SocketAID	5
Optical Module	Simple_OmAID	3
Port	Simple_SPortAID | Simple_EPortAID | Simple_VCGAID	2
OTN Port	Simple_OTNPortAID	3

Field	AID definitions	Length (char)
TransMUX Port	Simple_TMuxAPortAID| Simple_TMuxSPortAID	5
Trib	Simple_STS1NumAID | Simple_VCGNumAID	3
HO Path Termination	Simple_PTNumAID	3
HO PTF TransMUX	Simple_TMuxAPTNumAID| Simple_TMuxSPTNumAID	1
LO Trib	Simple_LONumAID	2
LO Path Termination	Simple_TMuxSLONumAID	2
DS1 NIM	Simple_DS1NumAID	3

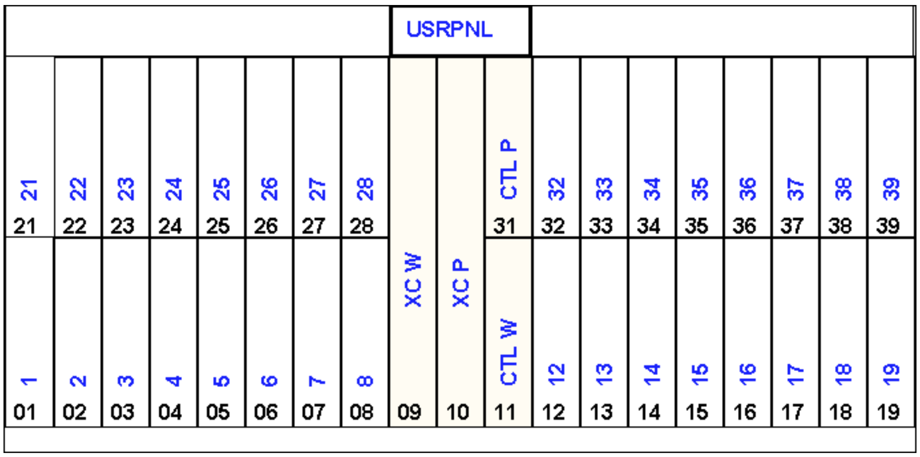
Range specifications

Various TL1 commands allow for the specification of a range of entities as input parameters. These ranges are specified in the AID definitions in this document which allow the use of the term all in one or more AID Fields within a Simple_AID. Details of where these values are allowed is detailed in the AID parameter description per command.

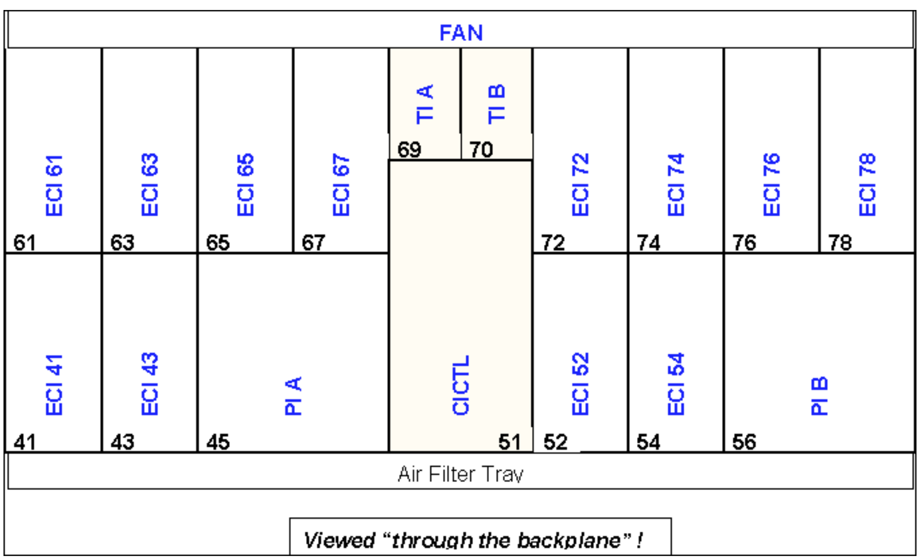
Physical layout

Frontside

The following graphics show the physical layout of the dual unit row (DUR) subrack (frontside) and the naming conventions:



Rearside



Bay (rack) and shelf (subrack)

The 1675 LambdaUnite MSS system uses a single unit row (SUR) subrack in the REG40 configuration or a dual unit row (DUR) subrack in the LXC40 configuration.

Up to two DUR, three SUR or combinations 2 SUR/1DUR, 1SUR/1DUR fit into one rack (bay). From the AID definition this relationship will not become visible.

AID for bay (rack)

The BayAID is used to identify the rack (bay) of the system:

BayAID ::= **1** | **all**

AID for shelf (subrack)

The ShelfAID is used to identify the subrack type (shelf):

Simple_ShelfAID ::= **1** | **all**

ShelfAID ::= BayAID–Simple_ShelfAID

Note: Different configurations will be distinguished by a the parameter *shlftp* in RTRV-EQPT for subrack (shelf).

Fans

AIDs for fan

There is one fan unit in the system. The FanAID is used to identify the fan unit in the subrack:

Simple_FanAID ::= **`fan`** | **`fanall`**

FanAID ::= BayAID–Simple_ShelfAID–Simple_FanID

Power interface

AIDs for power interfaces

There are two power interface units PI(A) and PI(B) in the subrack, which are located at the rear side. The PowerAID is used to identify the power interface in the subrack:

Simple_PowerAID ::= **`pia`** | **`pib`** | **`piall`**

PowerAID ::= BayAID–Simple_ShelfAID–Simple_PowerAID

Backplane

AID for backplane

The subrack has a backplane with an inventory EEPROM. The BackplaneAID is used to identify the backplane in the subrack:

Simple_BackplaneAID ::= **`backpl`**

BackplaneAID ::= BayAID–Simple_ShelfAID–Simple_BackplaneAID

User panel

AID for user panel

There is one user panel in the subrack. The UserPanelAID is used to identify the user panel in the system:

Simple_UserPanelAID ::= **`usrpnl`**

UserPanelAID ::= BayAID–Simple_ShelfAID–Simple_UserPanelAID

CI-CTL

AID for CI-CTL

The system has a connection interface with e.g. LAN and user byte ports (CI-CTL). The CiCtlAID is used to identify the CI-CTL in the subrack:

Simple_CiCtlAID ::= **`cictl`**

CiCtlAID ::= BayAID–Simple_ShelfAID–Simple_CiCtlAID

User byte ports

AIDs for user byte ports

The system has six ports to access user bytes which are located on the CI-CTL. The UserBytePortAID is used to identify a user byte port in the subrack:

Simple_UserBytePortAID ::= **`ubio1`** | **`ubio2`** | **`ubio3`** | **`ubio4`** | **`ubio5`** | **`ubio6`** | **`ubioall`**

UserBytePortAID ::= BayAID–Simple_ShelfAID–Simple_UserBytePortAID

LAN ports

AIDs for LAN ports

The system has four LAN ports which are located on the UPL (LAN1) and CI-CTL (LAN2, LAN3). A LAN4 is currently only HW prepared and has no further functionality. The LanPortAID is used to identify a LAN port in the subrack:

Simple_LanPortAID ::= **`lan1`** | **`lan2`** | **`lan3`** | **`lanall`**

LanPortAID ::= BayAID–Simple_ShelfAID–Simple_LanPortAID

Timing interfaces (TI)

AIDs for timing interfaces

The system has up to two timing interfaces TI(A) and TI(B) located on the rear side of the subrack. The TimingInterfaceAID is used to identify a timing interface in the subrack:

Simple_TimingInterfaceAID ::= **`tia`** | **`tib`** | **`tiall`**

TimingInterfaceAID ::= BayAID–Simple_ShelfAID–Simple_TimingInterfaceAID

Electrical Connector Interface (ECI)

The system has up to 12 electrical connector interfaces (ECI) located on the rear side of the subrack. Note: Only the upper shelf row can be used for EP155 and EP51 configurations.

AIDs for electrical connector interfaces

The EciAID shall be used to identify a electrical connector interface in the subrack:

Simple_EciAID::=
`eci61 |eci63 | eci65 |eci67 | eci72 | eci74 | eci76 | eci78 | eciall`

EciAID::=BayAID–Simple_ShelfAID–Simple_EciAID

Legal Simple_EciAIDs depend on the type of ECI as shown in the following table:

ECI type	Legal ECI AIDs
ECI (for EP155)	eci61 | eci63 | eci65 | eci67 | eci72 | eci74 | eci76 | eci78
ECI51 (for EP51)	eci61 | eci65 | eci72 | eci76

Slot

The 1675 LambdaUnite MSS in a DUR subrack has in total two rows of circuit packs as shown in figure in “Frontside” (p. 2-25). The slots for the cross connect pack (XC) and for the controller pack (CTL) are distinguished from the universal slots (US). The postfix P(rotection) or W(orking) for the XC and CTL indicates its role in the 1+1 equipment protection relationship.

AIDs for universal slots

The UnivSlotAID is used to identify a universal slot in the system:

Simple_UnivSlotAID ::= {**1 … 8**, **12 … 19**, **21 … 28**, **32 … 39**} | **usall** | **all**

UnivSlotAID ::= BayAID–Simple_ShelfAID–#–#–Simple_UnivSlotAID

Note: The us-prefix and leading zeroes have to be removed from Simple_UnivSlotAID. This change is not reflected in all examples below.

Note: The value “**all**” was added as an additional option to iterate over all slots not considering the type of slot.

AIDs for cross-connect slots

The XCSlotAID is used to identify a slot useable for an XC circuit pack in the system:

Simple_XCSlotAID ::= **xcp** | **xcw** | **xcall** | **all**

XCSlotAID ::= BayAID–Simple_ShelfAID–#–#–Simple_XCSlotAID

Note: The value “**all**” was added as an additional option to iterate over all slots not considering the type of slot.

AIDs for controller slots

The CTLSlotAID is used to identify a slot useable for a CTL circuit pack in the system:

Simple_CTLSlotAID ::= **ctlp** | **ctlw** | **ctlall** | **all**

CTLSlotAID ::= BayAID–Simple_ShelfAID–#–#–Simple_CTLSlotAID

Note: The value “**all**” was added as an additional option to iterate over all slots not considering the type of slot.

AIDs for slots

The SlotAID is used to identify a slot in the system:

Simple_SlotAID ::= Simple_UnivSlotAID | Simple_XCSlotAID | Simple_CTLSlotAID | **all**

SlotAID ::= BayAID–Simple_ShelfAID–#–#–Simple_SlotAID

The “#” in the SlotAID were used in the CG to identify protection group information for ports and tributaries. This addressing scheme is not supported.

OP40G slot restrictions

Since the OP40 is four slot wide, only the following Simple_UnivSlotAIDs are allowed:

Simple_SlotAIDOP40 ::= {**`4`**, **`8`**, **`15`**, **`19`**, **`24`**, **`28`**, **`35`**, **`39`**}

SlotAIDOP40 ::= BayAID–Simple_ShelfAID–#–#–Simple_SlotAIDOP40

Circuit pack

AIDs for circuit packs

cp can be used in the port field to identify a circuit pack:

Simple_CpAID ::= **cp**

CpAID ::= SlotAID–**cp**

The AID for circuit packs does not include the LOXC packs.

AIDs for LOXC packs

loxc can be used in the port field to identify a LOXC pack:

Simple_LoxcAID ::= **loxc**

LoxcAID ::= SlotAID–**-loxc**

The special LOXC circuit pack AID is needed to distinguish the LOXC pack from the I/O packs in the universal slots.

AIDs for all circuit packs

cp can be used in the port field to identify a circuit pack independent of the circuit pack type:

Simple_CpAID ::= **cpall**

CpAllAID ::= SlotAID–**-cpall**

The AID for all circuit packs includes the LOXC packs.

Socket

Circuit packs may contain sockets where pluggable interfaces can be plugged in.

AIDs for sockets

The Simple_SockedAID shall be used in the port field to identify a socket contained on a circuit pack which is inserted in a slot.

Simple_SocketAID ::=
sc1 | sc2 | sc3 | sc4 | sc5 | sc6 | sc7 | sc8 | sc9 | scall

SocketAID ::=BayAID-Simple_ShelfAID-#-#-Simple_UnivSlotAID-Simple_SocketAID

Legal Simple_SocketAIDs depend of the CP provisioned for the slot as shown in the following table:

Circuit Pack Type Functional Name / Qualifier	Legal Socket AIDs	Valid in Release
OPLB/PAR8	sc1 | sc2 | sc3 | sc4 | sc5 | sc6 | sc7 | sc8 | scall	4.1 and later
OP2G5D/PAR8	sc1 | sc2 | sc3 | sc4 | sc5 | sc6 | sc7 | sc8 | scall	4 and later
OP10D/PAR2	sc1 | sc2 | scall	4.1 and later
OPT2G5/PAR3	sc1 | sc2 | sc3 | scall	5 and later
OP2G5/PAR4	sc1 | sc2 | sc3 | sc4 | scall	7 and later
GE10PL1/1A8	sc1 | sc2 | sc3 | sc4 | sc5 | sc6 | sc7 | sc8 | sc9 | scall	8 and later

The system supports only a one to one relation between sockets and ports. Example: port no. 1 (1-1-#-#-1-1) is related to a socket no.1 (1-1-#-#-1-sc1) .

SDH/SONET port

AIDs for SDH/SONET ports

The SPortAID is used to identify SDH/SONET ports in the system:

Simple_SPortAID ::= {1 - 36 | all}

SPortAID ::= UnivSlotAID–Simple_SPortAID

Legal Simple_SPortAIDs depend on the type of CP provisioned for the slot as shown in the following table:

Functional Name	Legal Port AIDs	Restrictions
EP155	{**1**, **2**, **3**, **4**, **5**, **6**, **7**, **8**} | **all**	none - valid for all supported qualifiers
OP155	{**1**, **2**, **3**, **4**, **5**, **6**, **7**, **8**, **9**, **10**, **11**, **12**, **13**, **14**, **15**, **16**} | **all**	none - valid for all supported qualifiers
OP622	{**1**, **2**, **3**, **4**, **5**, **6**, **7**, **8**, **9**, **10**, **11**, **12**, **13**, **14**, **15**, **16**} | **all**	none - valid for all supported qualifiers
OPLB	{**1**, **2**, **3**, **4**, **5**, **6**, **7**, **8**} | **all**	none - valid for all supported qualifiers
OP2G5	{**1**, **3**} | **all**	qualifier = PARENT
OP2G5	{**1**, **2**, **3**, **4**} | **all**	qualifier != PARENT
OP2G5D	{**1**, **2**, **3**, **4**, **5**, **6**, **7**, **8**} | **all**	none - valid for all supported qualifiers
OPT2G5	{**1**, **2,3**} | **all**	none - valid for all supported qualifiers
OP10	**1** | **all**	none - valid for all supported qualifiers
OP10D	{**1**, **2**} | **all**	none - valid for all supported qualifiers
OP40	**1** | **all**	none - valid for all supported qualifiers
EP51	{**1 - 36** } | **all**	none - valid for all supported qualifiers

The table above does not take into account the release information when a certain pack is supported.

The number of legal port AIDs shown in the table above does not necessarily reflect the capabilities of the actual circuit pack w.r.t. port numbers. Additional rows are added for the packs if they differ in terms of port numbers. The functional qualifier is then used as identification criteria - see restriction column.

The definition and range of *SPortAID* for OP10 also applies to a 10GE_WANPHY port variant of a OP10 pack due to reasons of simplicity.

OTN ports

AIDs for OTN ports

The OTNPortAID is used to identify OTN ports in the system: Simple_OTNPortAID ::= ot1 | otall

OTNPortAID ::= UnivSlotAID–Simple_OTNPortAID

Legal Simple_OTNPortAIDs depend on the type of CP provisioned for the slot as shown in the following table:

Circuit Pack Type	Legal Port AIDs	Valid for
OP10/XTTL OP10/XTTC	ot1 | otall	R8.0 and later

Adjunct ports

Adjunct (virtual) ports

In order to be able to address the entities of the TransMUX pack:

- 48 adjunct ports are introduced on the *asynchronous* side
- 48 adjunct ports are introduced on the *synchronous* side

AIDs for TransMUX asynchronous adjunct ports

The TMuxAPortAID shall be used to identify the TransMUX asynchronous adjunct ports in the system:

Simple_TMuxAPortAID ::= tma{1 - 48} | all

TMuxAPortAID ::= UnivSlotAID–Simple_TMuxAPortAID

AIDs for TransMUX synchronous adjunct ports

The TMuxSPortAID shall be used to identify the TransMUX synchronous adjunct ports in the system:

Simple_TMuxSPortAID ::= tma{1 - 48} | all

TMuxSPortAID ::= UnivSlotAID–Simple_TMuxSPortAID

Asynchronous ports

AIDs for asynchronous ports

The APortAID is used to identify asynchronous ports in the system: Simple_APortAID ::= { 1 - 36 }| all

APortAID ::= UnivSlotAID–Simple_APortAID

Legal Simple_APortAIDs depend on the type of CP provisioned for the slot as shown in the following table:

Circuit Pack Type	Legal Port AIDs
EP51	{**1 - 36**} | **all**

Circuit Pack Type	Ethernet Port Rate	Legal Port AIDs	Valid in Release
GE1	1 GbE	{1, 2, 3, 4} | all	2 and later
GE10PL1/1A8	1 GbE	{1, 2, 3, 4, 5, 6, 7, 8} | all	8 and later
GE10PL1/1A8	10 GbE	9 | all	8 and later

GbE port

AIDs for Gigabit Ethernet ports

The EPortAID can be used to identify 1 Gigabit and 10 Gigabit Ethernet LANports in the system:

Simple_EPortAID ::= **1** | **2** | **3** | **4** | **5** | **6** | **7** | **8** | **9** | **all**

EPortAID ::= UnivSlotAID–Simple_EPortAID

Legal Simple_EPortAIDs depend on the type of CP provisioned for the slot as shown in the following table:

Circuit Pack Type	Ethernet Port Rate	Legal Port AIDs	Valid in release
GE1	1 GbE	{**1**, **2**, **3**, **4**} | **all**	2 and later
GE10PL1/1A8	1 GbE	{**1**, **2**, **3**, **4**, **5**, **6**, **7**, **8**} | **all**	8 and later
GE10PL1/1A8	10 GbE	**9** | **all**	8 and later

Virtual concatenation group (VCG)

Virtual concatenation groups (VCG) represent the interface between the Ethernet Switch and the Ethernet over SDH/SONET function. Sometimes they are also denoted as WAN ports.

AIDs for VCG

The VCGAID can be used to identify VCG ports in the system:

VCGGrpID ::= { 1, …, 126 } ∪ { 129, …, 254 }

Simple_VCGAID ::= **vvVCGGrpID** | **all**

VCGAID ::= UnivSlotAID–Simple_VCGAID

Legal VCG AIDs depend on the type of CP provisioned for the slot as shown in the following table:

Circuit Pack Type	Port Rate	Legal VCG Port AIDs	Valid in release
GE1	1 GbE	{**v1**, **v2**, **v3**, **v4**} | **vall**	2 and later
OPT2G5	STM16/OC48	{**v1**, **v2**, **v3**} | **vall**	5 and later
GE10PL1/1A8	1 GbE	{**v1**, **v2**, **v3**, **v4**, **v5**, **v6**, **v7**, **v8**} | **vall**	8 and later
GE10PL1/1A8	10 GbE	**v9** | **vall**	8 ans later

AU-3/STS-1 tributary

AIDs for AU-3/STS-1 tributaries

The STS1NumAID can be used to identify SDH/SONET tributaries in the system:

Simple_STS1NumAID ::= { **1**, **2**, … , **768** } | **all**

STS1NumAID ::= SPortAID–Simple_STS1NumAID

Legal Simple_STS1NumAIDs (STS-1/AU-3 numbers) depend on the type of CP provisioned for the slot and may depend on the provisioned pluggable interface as shown in the following table:

Circuit Pack Type	Legal STS-1/AU-3 Number	Restriction
EP51	1	none
EP155	{1 … 3}	none
OP155	{1 … 3}	none
OP622	{1 … 12}	none
OPLB	{1 … 3}	Pluggable Interface = OM155
OPLB	{1 … 12}	Pluggable Interface = OM622
OP2G5	{1 … 48}	none
OP2G5D	{1 … 48}	none
OP10	{1 … 192}	none
OP10D	{1 … 192}	none
OP40	{1 … 768}	none

Virtual concatenation group (VCG) tributary

AIDs for VCG tributaries

The VCGNumAID can be used to identify VCG tributaries in the system:

Simple_VCGNumAID ::= { **1**, … , **192** } | **all**

VCGNumAID ::= VCGAID–Simple_VCGNumAID

VCG tributaries denote a group of X virtually concatenated STSs/VCs which depends on the type of CP provisioned for the slot and the VCG mapping.

- GE1: STS-1-Xv (X ε {1, …, 21} or VC-4-Xv (X ε{1, …, 7})
- OPT2G5: STS-3c-17v/VC-4-17v
- GE10PL1 (1 GbE Port): STS-1-Xv (X = {1 … 21} or STS-3c-Xv/VC-4-Xv (X={1 … 7})
- GE10PL1 (10 GbE Port): STS-1-Xv (X = {1 … 192} or STS-3c-Xv/VC-4-Xv (X={1 … 64})
- ES64U (VCG): STS-1-Xv (X = {1 … 192}

Legal Simple_VCGNumAIDs (VCG numbers) depend on the type of CP provisioned for the slot and the VCG type (mapping) as shown in the following table:

Circuit Pack Type / VCG mapping	Legal VCG Number
GE1/STS1-VC3	{1 … 21}
GE1/STS3c-VC4	{1, 4, 7, 10, 13, 16, 19}
OPT2G5/STS3c-VC4	{1, 4, 7, 10, 13, 16, 19, 22, 25, 28, 31, 34, 37, 40, 43, 46, 49}
GE10PL1 (1 GbE port)	{1 … 21}
GE10PL1 (10 GbE port)	{1 … 192}

Higher-order path terminations

AIDs for higher-order path terminations

The PTNumAID shall be used to identify higher-order path terminations in the system:

Simple_PTNumAID ::= { **1**, **2**, …, **768** } | **all**

PTNumAID ::= SPortAID-Simple_PTNumAID

Legal Simple_PTNumAIDs depend on the type of CP provisioned for the slot and may depend on the provisioned Pluggable Interface as shown in the following table:

Circuit Pack Type / VCG mapping	Legal PT Number	Restrictions
EP51	1	For asynchronous ports only
EP155	1	none
OP155	{1 … 3}	none
OP622	{1 … 12}	none
OPLB	{1 … 3}	Pluggable Interface = OM155
OPLB	{1 … 12}	Pluggable Interface = OM622
OP2G5	{1 … 38}	none
OP2G5D	{1 … 48}	none
OP10	{1 … 192}	none
OP10D	{1 … 192}	none
OP40	{1 … 768}	none

The type of HO path termination depends on the interface standard of the related port:

- STS1 for SONET ports
- VC4 for SDH ports

The VC4 path terminations use the same PTNumAIDs as the STS1 path terminations, but only every 4th PTNumAID is valid. The valid PTNumAIDs for the HO path termination types are:

HO Path Termination Type	Valid PTNumAIDs
STS1	1,2,3,4,5,6 …..
VC4	1, 4, 7, 10, …..

Adjunct higher-order path terminations for TransMUX

Higher-order path terminations

Each adjunct port on the asynchronous and synchronous side of the TransMUX provides one path termination.

The type of TransMUX HO path termination is fixed to STS1.

AIDs for higher-order path terminations of asynchronous TransMUX side

The TMuxAPTNumAID shall be used to identify higher-order path terminations of the asynchronous TransMUX Side in the system:

Simple_TMuxAPTNumAID ::= **`1`** | **`all`**

TMuxAPTNumAID ::= TMuxAPortAID–Simple_TMuxAPTNumAID

AIDs for higher-order path terminations of synchronous TransMUX side

The TMuxSPTNumAID shall be used to identify higher-order path terminations of the synchronous TransMUX Side in the system:

Simple_TMuxSPTNumAID ::= **`1`** | **`all`**

TMuxSPTNumAID ::= TMuxSPortAID–Simple_TMuxSPTNumAID

Lower-order tributaries

The LONumAID shall be used to identify lower-order tributaries in the system.

Simple_LONumAID ::= { **1**, … **63** } | **all**

LONumAID ::= PTNumAID-Simple_LONumAID

Legal Simple_LONumAIDs depend on the type of HO path termination as shown in the following table:

HO Path Termination	Legal LO Tributary Numbers	LO Tributary Type
STS1 (SONET)	{1 … 26}	VT1.5
VC4 (SDH)	{1 … 63}	LO VC3, VC12

The LO VC3 tributaries use the same LONumAIDs as the VC12 tributaries, but only every 21st LONumAID is valid. The valid LONumAIDs for the LO tributaries are:

LO Tributary Type	Valid LONumAIDs
VC 12 (SDH)	1,2,3,4,5,6 ….63
LO VC3 (SDH)	1, 22, 43
VT1.5 (SONET)	1,2,3,4,5,6 …. 28

LO VT1.5 tributaries for TransMUX

AIDs for DS1 tributaries

The TMuxSLONumAID shall be used to identify Lower Order Tributaries of the synchronous side of the TransMUX in the system:

Simple_TMuxSLONumAID ::= {1 … 28} | all

TMuxSLONumAID ::= TMuxSPTNumAID–Simple_TMuxSLONumAID

DS1 tributaries

AIDs for DS1 tributaries

The DS1NumAID shall be used to identify the DS1 NIMs in the system:

Simple_DS1NumAID ::= d{1 - 28} | all

DS1NumAID ::= TMuxAPTNumAID–Simple_DS1NumAID

Generic tributary

AIDs for generic tributaries

In some scenarios the specific tributary type is not of interest. The generic tributary is mainly used in the scenarios of cross-connections.

AIDs for generic tributaries

The GenTribAID is used to identify generic tributaries in the system:

GenTribAID ::= STS1NumAID | STS1NumAID | PTNumAID | VCGNumAID

Generic lower-order tributaries

The generic lower-order tributaries are the set of all types of lower-order tributaries. The generic lower-order tributaries can be used in the definition of TL1 commands when the command is applicable for all 3 types of lower-order tributaries.

Generic lower-order Tributary definition:

GenLOTribAID ::= LONumAID | TMuxSLONumAID

Protection groups

Simple protection group AID

The system supports equipment and transmission protection. The ProtGrpAID can be used to identify equipment and transmission protection groups:

Simple_ProtGrpAID ::= **e**EquipmentProtGrpID | **eall**| {**o**|**n**|**t**|**f**} TransProtGrpID | **oall** | **nall**| **tall**| **fall**| **all**

ProtGrpAID ::= BayAID–Simple_ShelfAID–Simple_ProtGrpAID

The first character in the Simple_ProtGrpAID is denoted as *entity type qualifier*. It determines the type of protection as described in the following table:

Entity Type Qualifier	Protection Type
e (quipment)	1+1 or 1:1 (future) equipment protection group
o (ne plus one)	1+1 linear MSP/APS
n (by one)	1:n linear MSP/APS (including 1:1) – future
t (wo fibre)	2 fibre MS SPRING / BLSR
f (our fibre)	4 fibre MS SPRING / BLSR

The *EquipmentProtGrpID* is described in the following subsections.

Transmission protection group ID

The *TransProtGrpID* is a three digit identifier which will be assigned to the group when it is created by the user:

TransProtGrpID ::= { **001**, … , **999** }

Types of transmission protection AIDs

The following types of transmission protection AIDs are defined according to the rules above:

OnePlusOne_ProtGrpAID ::=

BayAID–Simple_ShelfAID–**o**TransProtGrpID | BayAID–Simple_ShelfAID–**oall**

NByOne_ProtGrpAID ::=

BayAID–Simple_ShelfAID–**-n**TransProtGrpID | BayAID–Simple_ShelfAID–**nall**

TwoFibre_ProtGrpAID ::=

BayAID–Simple_ShelfAID–**t**TransProtGrpID | BayAID–Simple_ShelfAID–**tall**

FourFibre_ProtGrpAID ::=

BayAID–Simple_ShelfAID–`f`TransProtGrpID | BayAID–Simple_ShelfAID–**`fall`**

Path protection group AIDs

The output tributary AID of the associated protected cross-connection is used to identify a path protection group AID.

Switch and timing equipment protection group

AID for switch and timing equipment group

The system can have a 1+1 equipment protection group for the XC320 CP which implements the switch and timing function. The SwitchAndTmgProtGrpAID can be used to identify the 1+1 equipment protection group for the XC circuit pack:

Simple_SwitchAndTmgProtGrpAID ::= **estgrp**

SwitchAndTmgProtGrpAID ::= BayAID–Simple_ShelfAID–**estgrp**

Controller equipment protection group

AID for controller equipment group

The system can have a 1+1 equipment protection group for the CTL CP which implements the system controller function (SCF) and data communications function (DCF).The CtlProtGrpAID can be used to identify the 1+1 equipment protection group for the CTL:

Simple_CtlProtGroupAID ::= **ectlgrp**

CtlProtGroupAID ::= BayAID–Simple_ShelfAID–**ectlgrp**

General equipment protection groups

Equipment Protection Group ID

The *EquipProtGrpID* is a two digit identifier which shall be assigned to the group when it is created by the user:

EquipProtGrpID ::= **`{ 01, …, 99 }`**

AID for EP155 equipment group

The *EP155ProtGrpAID* shall be used to identify the 1+1 equipment protection group for the EP155:

Simple_EP155ProtGroupAID::= **`eep`**EquipProtGrpID

EP155ProtGroupAID::=BayAID–Simple_ShelfAID–**`eep`**EquipProtGrpID

AID for EP51 equipment group

The *EP51ProtGrpAID* shall be used to identify the 1+1 equipment protection group for the EP151:

Simple_EP51ProtGroupAID::=**`eep`**EquipProtGrpID

EP51ProtGroupAID::=BayAID–Simple_ShelfAID–**`eep`**EquipProtGrpID

AID for LOXC equipment group

LOXCProtGrpAID shall be used to identify the 1+1 equipment protection group for the LOXC:

Simple_LOXCProtGroupAID::=eloxc1 (1 stands for number one).

LOXCProtGroupAID::=BayAID–Simple_ShelfAID-Simple_LOXCProtGroupAID

AID for TMUX2G5/1 equipment group

The TMUXProtGrpAID shall be used to identify the 1+1 equipment protection group for the TMUX2G5/1:

Simple_TMUXProtGroupAID ::= etmuxEquipProtGrpID

TMUXProtGroupAID ::= BayAID–Simple_ShelfAID–Simple_TMUXProtGroupAID

AID for ES64U equipment group

The ES64UProtGrpAID shall be used to identify the 1+1 equipment protection group for the ES64U:

Simple_ES64UProtGroupAID ::= ees64uEquipProtGrpID

ES64UProtGroupAID ::= BayAID–Simple_ShelfAID–Simple_ES64UProtGroupAID

Examples

AID examples

The following tables gives examples for the various AIDs described in the previous sections:

Entity	Example AID
Bay/Rack	1
Shelf/Subrack	1–1
Equipment Protection Group (Switch and Timing Function)	1–1–estgrp
Equipment Protection Group (Controller)	1–1–ectlgrp
Equipment Protection Group EP155 or EP51	1–1–eep01
Equipment Protection Group LOXC	1–1–eloxc1
Equipment Protection Group TransMUX	1–1–etmux1
Equipment Protection Group ES64U	1–1–ees64u1
1+1 MSP/APS Protection Group	1–1–o100
Two Fiber MS-SPRing/BLSR Protection Group	1–1–t110
Fan Unit	1–1–fan
PI	1–1–pia
TI	1–1–tia
EI	1–1–eci61
Backplane	1–1–backpl
User Panel	1–1–usrpnl
CI–CTL	1–1–cictl
User Byte Port	1–1–ubio3
LAN Ports	1–1–lan2
Slot	1–1–#–#–2
CP	1–1–#–#–xcw–cp
CP (LOXC)	1–1–#–#–39–loxc
Socket	1–1–#–#–5–sc2
NVM	1–1–#–#–ctlw–nvm
SPort	1–1–#–#–1–3
APort	1–1–#–#–21–4
EPort	1–1–#–#–2–1
TMuxAPort	1–1–#–#–15–tma1
TMuxSPort	1–1–#–#–15–tms1

Entity	Example AID
VCG Port	1–1–#–#–2–v1
OTN Port	1–1–#–#–1–ot1
STS–1/AU–3 Trib	1–1–#–#–1–3–1
VCG Trib	1–1–#–#–2–v1–1
HO Path Termination	1–1–#–#–1–16–3
PTF of Asyn. TransMUX Side	1–1–#–#–15–tma1–1
PTF of Syn. TransMUX Side	1–1–#–#–15–tms1–1
LO Tributary	1–1–#–#–1–16–1–63
TransMUX DS1 NIM	1–1–#–#–15–tma1–1–d28
TransMUX VT1.5 PTF	1–1–#–#–15–tms1–1–28

3 TL1 commands - alphabetical order

Overview

Purpose

This section contains the TL1 commands definition in alphabetical order.

Contents

ACT-L1ROUTING

Overview

The command is used to enable the level 1 routing function on an NE and to establish an ONNS enabled node as the proxy of its own domain in the routing hierarchy level 1. The **ACT-L1ROUTING** command can only be executed in maintenance mode.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command syntax:
ACT-L1Routing:*srcTid:srcAid:ctag:RoutingFunc=routeFunc,RoutingAreaID=routeAreaID,ParentRoutingAreaID=prouteAreaID,L1RoutingControllerID=routeControlID,L1RoutingControllerIPAddr=routeControlIPAddr,AbstractModel=abstractModel,AbstractNodeID=abstractNodeID;*

Input parameters

Command parameters

1. **srcTid**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE. See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set.
2. **srcAid**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Type: AID
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
   Default: snn
3. **ctag**
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages. See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string

Range:
The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing "."). It should be a unique value for each new command.

Routing parameters

1. **`routeFunc`**
   routeFunc defines the level 1 routing controller functionality of the addressed ONNS node.
   Type: Alphanumeric value set.
   Range: PRIMARY (ONNS node is the primary level 1 routing controller)
2. **`routeAreaID`**
   routeAreaID defines the identity of the routing area.
   Type: four dot separated numeric string
   Range: 0 – 255 for each numeric string.
3. **`prouteAreaID`**
   prouteAreaID defines the identity of the parent routing area.
   Type: four dot separated numeric string
   Range: 0 – 255 for each numeric string.
4. **`routeControlID`**
   routeControlID defines the identity of the level 1 routing controller.
   Type: four dot separated numeric string
   Range: 0 – 255 for each numeric string.
5. **`routeControlIPAddr`**
   routeControlIPAddr defines the IP address for this routing controller node as level 1 routing controller address.
   Type: four dot separated numeric string
   Range:
   For first numeric string: 0 … 223
   For second to fourth numeric string: 0 … 255
   The values 0.0.0.0 and 1.1.1.1 are excluded.
6. **`abstractModel`**
   abstractModel defines the abstraction model used by the level 1 routing controller.
   Type: Alphanumeric value set.
   Range: ABSTRACTNODE
7. **`abstractNodeID`**
   abstractNodeID is defined in case the *abstractModel* is ABSTRACTNODE. This parameter specifies the abstract node ID, which is advertised in the level 1 area.
   Type: four dot separated numeric string
   Range: 0 – 255 for each numeric string
   Parameter *abstractNodeID* is optional for *abstractModel* values other then ABSTRACTNODE.

Output format

Normal sytem response format to ACT-L1ROUTING

If the ACT-L1ROUTING request accepted by the system, the following normal completion response format below is returned:

```
  srcTid date time
M  ctag COMPLD
;
```

Output parameters

Command parameters

1. **srcTid**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in “RTRV-HDR: Retrieve header” (p. 3-2417).
   Type: identifier, in addition the special character underscore “_” and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **date**
   Date. The date parameter is set to the date when the output message is generated.
   Type: Value set.
   Range:
   YY-MM-DD, where
   - YY=00-99,
   - MM=01-12,
   - DD=01-31

   Default: current date
3. **time**
   Time. The time parameter is set to the time when the output message is generated.
   See also time in “RTRV-HDR: Retrieve header” (p. 3-2417).
   Type: Value set.
   Range:
   HH:MM:SS, where
   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: current time

4. **`ctag`**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″). It should be a unique value for each new command.
5. **`completion code`**
   Standard TL1 completion code result.
   Type: Value set.
   Range:
   - COMPLD (default): for success
   - DENY: in case of errors

Example input/output

Input/Output example to enable a level 1 Routing Controller

The following example shows the successful completion of a ACT-L1ROUTING command to enable an ONNS node as level 1 Routing Controller:

```
ACT-L1ROUTING:LT-ONNS9:snn:113456:RoutingFunc=PRIMARY,RoutingAreaID=111.234.215.6,
ParentRoutingAreaID=111.214.115.7,L1RoutingControllerID=218.3.45.56,
L1RoutingControllerIPAddr=129.32.19.2,AbstractModel=ABSTRACTNODE,
AbstractNodeID=129.239.4.23;

   LT-ONNS9 2002-07-18 08:00:00
M  113456 COMPLD
;
```

Error responses

Validation rule: level 1 Routing controller in place

It is verified that no other node in the level 0 domain has set the attribute *routeFunc* to PRIMARY.

Error code:

`IDNC – Input, Data Not Consistent, level 1 Routing Controller already in place`

Validation rule: Abstract Node ID missing

If *abstractModel* is set to ABSTRACTNODE then the parameter *abstractNodeID* has to be set, too.

Error code: `IPMS – Input, Parameter MiSsing, abstractNodeID is missing`

Validation rule: Check IP configuration

The IPv4 adress for *routeControlIPAddr* has to be checked on the following values:

- for first numeric string: 0 … 223,
- for second to fourth numeric string: 0 … 255,
- the values 0.0.0.0 and 1.1.1.1 are not allowed

Error code: `SNVS – Status, Not in Valid State, incomplete IP configuration`

Validation rule: Check of SCN availability

The routing controller should be only provisionable if the SCN is available on this NE.

Error code: `IDNC – Input, Data Not Consistent, SCN not enabled`

Validation rule: SCN IP address already in use

The SCN IP address of the routing controller has to be different to the SCN IP address (= ASTN node IP address) and the UNI node ID of the NE.

Error code:
`IDNC – Input, Data Not Consistent, IP address of level 1 Routing Controller already in use`

Validation rule: SCN IP address already in use 2

The SCN IP address of the routing controller has to be different to the E-NNI Signaling Controller Protocol Controller SCN address of the NE.

Error code:
`IDNC – Input, Data Not Consistent, RC PC SCN address must be different from SC PC SCN address`

Validation rule: Check of the maintenance condition

The system must be in maintenance condition (MCOND=YES) for change of *routeControlIPAddr*.

Error code: `SNVS – Status, Not in Valid State`

Related TL1 messages

- "CANC-L1ROUTING" (p. 3-54)
- "REPT L1ROUTING notification" (p. 3-2133)
- "RTRV-NTDR: Retrieve ONNS network topology data repository" (p. 3-2588)

ACT-L1ROUTING notification

The ACT-L1ROUTING notification message reports if an ONNS node is enabled as level 1 Routing Controller. Enabling is caused by a user's TL1 command.

Notification messages resulting from a TL1 command that were caused by the user's own requested changes

If an ONNS node is enabled as level 1 Routing Controller as a result of a TL1 ACT-L1ROUTING command, then a REPT DBCHG message is transmitted to all users provisioned to receive REPT DBCHG messages, including the user that issued the command. Therefore, a management OS must expect to receive messages for changes it caused as well as those made by a CIT user.

Output format

The REPT DBCHG message shall use the following format:

```
   sid date time
A  atag REPT DBCHG
   "TIME=chgtm,DATE=chgdat:ccb:[aid]:[com_block]:[spec_block]"
     ...
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **atag** – Automatic Tag
   The *atag* is used for message sequencing. The *atag* is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Type: decimal number.
   Range: 0 to 999.
   Default: 0
2. **chgtm** – Change Time
   Time when the change is occurred.
   Type: value set.
   Range: HH-MM-SS.
3. **chgdat** – Change Date
   Date when the change occurred
   Type: Value set.
   Range: YY-MM-DD

4. **`ccb`** – Command Code Block
   This field will be set to the TL1 command that causes that database change. The *com_block* and *spec_block* fields will be set according to the parameters that changed.
   Type: Alphanumeric value set verb-modifier[-modifier].
5. **`aid`** – Access Identifier
   AID of the entity for which the change is reported
   Type: AID.
   Range: As defined by the *aid* input parameter of the corresponding command, defined by *ccb*.
6. **`com_block`** – Common Block
   This is a position-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter values are included in this block in the same order as the corresponding TL1 command.
   As exception to this rule are some commands in the protection fragment, where the aliases *rid* and *ppgname* are not reported in the **`REPT DBCHG`** notification.
   If the database change is the result of a TL1 command, then the parameter *ctag* from the TL1 command is not included in the *com_block*.
   Type: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
   Range: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
   Default: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
7. **`spec_block`** – Specific Block
   This is a name-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter names and values are included in this block. Parameters within the specific block are positionally independent and are specified using a name-defined construct of *parameter* = value in a comma-separated list. The parameter names are the same as those for the corresponding TL1 command.
   Type: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.
   Range: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.
   Default: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.

Spec block parameters

1. **`RoutingFunc`**
   routeFunc defines if the *LSAAdvertisedRouter* has level 1 routing controller functionality.
   Type: Alphanumeric value set.
   Range: PRIMARY (ONNS node is the primary level 1 routing controller)
2. **`RoutingAreaID`**
   routeAreaID defines the identity of the routing area.
   Type: four dot separated numeric string
   Range: 0 – 255 for each numeric string.
3. **`ParentRoutingAreaID`**
   prouteAreaID defines the identity of the parent routing area.
   Type: four dot separated numeric string
   Range: 0 – 255 for each numeric string.
4. **`RoutingControlID`**
   routeControlID defines the identity of the level 1 routing controller.
   Type: four dot separated numeric string
   Range: 0 – 255 for each numeric string.
5. **`RoutingControlIPAddr`**
   routeControlIPAddr defines the IP address for this routing controller node as level 1 routing controller address.
   Type: four dot separated numeric string
   Range:
   For first numeric string: 0 … 223
   For second to fourth numeric string: 0 … 255
   The values 0.0.0.0 and 1.1.1.1 are excluded.
6. **`AbstractModel`**
   abstractModel defines the abstraction model used by the level 1 routing controller.
   Type: Alphanumeric value set.
   Range: ABSTRACTNODE
7. **`AbstractNodeID`**
   abstractNodeID is defined in case the *abstractModel* is ABSTRACTNODE. This parameter specifies the abstract node ID, which is advertised in the level 1 area.
   Type: four dot separated numeric string
   Range: 0 – 255 for each numeric string
   Parameter *abstractNodeID* is optional for *abstractModel* values other then ABSTRACTNODE.

Detailed behavior description

The **`REPT DBCHG`** message reports any change in the system database. Changes can be caused by a TL1 user or by an internally-generated state change.

Changes in user provisionable attributes are reported as the equivalent TL1 command that would cause that change.

Changes in non-user provisionable attributes are reported using only the AID and the block parameters, i.e. leaving the *ccb* parameter empty.

System initialization

Any time a command is entered that causes a system reset, a **REPT DBCHG** message is transmitted before the system resets.

AID ranges

If a database change occurs as a result of a TL1 command in which an AID range is entered, the system responds separate **REPT DBCHG** messages for each affected AID.

Messages caused by own changes

If the database change occurs as a result of a TL1 command, a **REPT DBCHG** message is transmitted to users provisioned to receive **REPT DBCHG** messages, including the user which issued the command.

Example input/output

The following is an example of the **REPT DBCHG** command:

```
   UNITE-NE 00-11-08 08:00:00
A  001 REPT DBCHG
   ″TIME=07-59-59,DATE=00-11-08: ENT-EQPT:1-1-#-#-05::nvmname=OP2G5,nvmqual=13SR4″
;
```

The following example shows the output of a REPT L1ROUTING notification caused by a ACT-L1ROUTING TL1 command:

```
   LT-ONNS9 2002-07-18 08:00:00
A  113456 REPT DBCHG
   ″TIME=07-59-59,DATE=2002-08-01:ACT-L1ROUTING:::RoutingFunc=PRIMARY,
RoutingAreaID=111.234.215.6,ParentRoutingAreaID=111.214.115.7,
L1RoutingControllerID=218.3.45.56,L1RoutingControllerIPAddr=129.32.19.2,
AbstractModel=ABSTRACTNODE,AbstractNodeID=129.239.4.23″;
```

Abortable: No

Input format

Command syntax: **ACT-USER**:*tid*:*uid*:*ctag*::*pid*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **uid** – User Identifier
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of *uid* values for the **ACT-USER** command are not allowed. Valid *uid* values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
   Type: Alphanumeric string (case-sensitive)
   Range: 5 – 10 characters
   The *uid* ALL is not allowed in any combination of upper or lower cases.
   Default: not applicable
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **pid** – Password Identifier
   This required parameter is the confidential password authenticator for the given *uid*. Password strings are transmitted in non-encrypted form in the **ACT-USER** command; are encrypted when stored in the NE; and are never transmitted from the NE.
   Type: character string (case-sensitive)
   Range: 6 to 10 legal characters. Valid passwords consist of at least two non-alphabetic characters with at least one special character. The special character can be one of the required non-alpha characters. For example, TEST1+ is a valid password. The first character of a password must be a letter.
   Default: For the two superusers the default password is: UNITE+01 for User ID LUC01 and UNITE+02 for User ID LUC02. For other users: not applicable.

Output format

Normal Completion Message without Customer Proprietary Banner

When a user logs in successfully while *no* customer proprietary has been provisioned, then the following response is returned:

```
   sid date time
M  ctag COMPLD
   "uid:lastdate,lasttime,attempts,systype,release,upc:spec_block"
   /* Alcatel-Lucent 1675 LambdaUnite MSS Release release
   User Privilege Code: upc
   ALCATEL-LUCENT - PROPRIETARY
   THIS SOFTWARE CONTAINS INFORMATION OF ALCATEL-LUCENT
   AND IS NOT TO BE DISCLOSED OR USED EXCEPT IN ACCORDANCE
   WITH APPLICABLE AGREEMENTS.
   NOTICE: THIS IS A PRIVATE COMPUTER SYSTEM.
   USE OF THIS SOFTWARE IS GOVERNED SOLELY AS EXPRESSLY
   AUTHORIZED IN THE RELEVANT AGREEMENT BETWEEN
   ALCATEL-LUCENT AND CUSTOMER.
   UNAUTHORIZED ACCESS OR USE MAY LEAD TO PROSECUTION.
   */

;
```

Normal Completion Message with Customer Proprietary Banner

When a user logs in successfully while *a* customer proprietary has been provisioned, then the following response is returned:

```
   sid date time
M  ctag COMPLD
   "uid:lastdate,lasttime,attempts,systype,release,upc:spec_block"
   /* Alcatel-Lucent 1675 LambdaUnite MSS Release release
   User Privilege Code: upc
   ALCATEL-LUCENT - PROPRIETARY
   THIS SOFTWARE CONTAINS INFORMATION OF ALCATEL-LUCENT
   AND IS NOT TO BE DISCLOSED OR USED EXCEPT IN ACCORDANCE
   WITH APPLICABLE AGREEMENTS.
   NOTICE: THIS IS A PRIVATE COMPUTER SYSTEM.
   USE OF THIS SOFTWARE IS GOVERNED SOLELY AS EXPRESSLY
   AUTHORIZED IN THE RELEVANT AGREEMENT BETWEEN
   ALCATEL-LUCENT AND CUSTOMER.
   UNAUTHORIZED ACCESS OR USE MAY LEAD TO PROSECUTION.
   */
   /*
   <LINE1>
   <LINE2>
    ...
    ...
    ...
   <LINE10>
```

```
   <LINE11>
   */

;
```

Expired password

If the login request would otherwise complete successfully, but the user password has expired or it is the first login, the following partial completion response is returned:

```
   sid date time
M  ctag PRTL
   "uid:lastdate,lasttime,attempts"
   /* Your password has expired. Until you change your password (ED-PID)
      you will not be allowed further access to this Network Element.
   */
;
```

Advance notice of password expiration

If the user password is about to expire, the following line is added at the bottom of the login banner, where 'x' is a number from 1 to 5:

```
   ...
   Your password will expire in x days.
   */
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the **RTRV-HDR** command.

Output parameters

Command parameters

1. **uid** – User Identifier
   This is included in the command by the OS/CIT and repeated by the NE as a confirmation that the given user identifier is successfully logged in.
2. **lastdate** – Last uid Login Date
   This is the date of the last session established by this *uid*.
   Type: value set of the format YY-MM-DD
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
   Default:
   Date of the User Id creation for the first login after the User Id has been created
   Date of the User Id enabling for the first login after the User Id was disabled.

3. **`lasttime`** – Last uid Login Time
   This is the time of the last session established by this *uid*.
   Type: value set of the format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds. The 24 hour format is used.
   Default:
   Date of the User Id creation for the first login after the User Id has been created
   Date of the User Id enabling for the first login after the User Id was disabled.
4. **`attempts`** – Unsuccessful Login Attempts
   This is the number of unsuccessful login attempts since the last successful login session on this ne.
   Type: Integer.
   Range: 0 – 98
5. **`systype`** – System Type
   This specifies the type of system.
   Type: Value set.
   Range: WaveStar_UNITE
   Default: WaveStar_UNITE
6. **`release`** – Release
   This is the software Release number of the system.
   Type: value set in the form xx.yy.zz
   Range: x, y, z are digits. Leading zeros are not suppressed. The version number ranges from 01.00.00 … 99.99.99
   Example: 01.02.03
   Default: 01.00.00
7. **`upc`** – User Privilege Code List
   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands ('&'). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.
   Type: Alphanumeric string; for concatenation "&" is also allowed.
   Range: P***i***, M***i***, T***i***, S***i***, PM***i***, D***i***, C***i***, where ***i*** is an integer ranging from 0 to 5, with ***i*** = 0 implying that there is no authorization for the functional category. S0 is not allowed.
   Default: P1&M1&T1&S1&PM1&C0 except for super users:
   P5&M5&T5&S5&PM5&C5.
   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.
   See also "List of user privilege codes" (p. 15-1).

8. **line1** – Line 1 of the Customer Provisionable Banner.
   Setting *line1* to an empty string will suppress the output of the Customer Provisionable Banner in the response to the **ACT-USER** command.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.
9. **line2 … line11** – Line 2 … Line 11 of the Customer Provisionable Banner.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.

Spec block parameters

1. **sysavst** – System Availability Status
   Because logins are only possible after the system has finished the recovery, the only possible value of sysavst is AVAILABLE.
   Type: Alphanumeric value set.
   Range: AVAILABLE
2. **tmleft** – Time left before password expires
   Time left before password expires. If there are more than 5 days left before the password expires, this parameter is omitted.
   Type: Integer.
   Range: 1 … 5

Detailed behavior description

An active TL1 access login session is required at each NE in order to interact with that NE (including receiving autonomous message output as well as using TL1 commands).

A maximum of one login per active session is allowed. Any subsequent attempt on the same session is denied. But the user can login several times on different sessions.

Until a successful login attempt is complete for a given NE, there is no communication (autonomous or command responses) outbound from the NE except to DENY unsuccessful login attempts.

If a user password has expired upon execution of the **ACT-USER** command, the ACT-USER will be accepted but that user will not be able to perform any function or receive any autonomous message output until the associated password has successfully been modified. This will also occur if the user logs in the first time.

A special banner message will be displayed as part of the command completion response, informing the user that the password has expired and must be updated (see the OUTPUT FORMAT section). The user is allowed to use either ED-PID to update the password identifier or CANC-USER to terminate the session.

When the NE receives an ACT-USER command, the given login ID will initiate a login session on the NE provided that a provisioned login ID and correct password are entered.

When the communication with the NE fails, all active logins to that NE are terminated without notice to the user. Similarly, all active logins to a targeted NE are terminated if a communication failure occurs between the local NE and that remote NE or if an intermediate NE is reset or initialized.

The **ACT-USER** command does not generate a **REPT DBCHG** message. Each ACT-USER TL1 command is entered in the Security Information Log.

The Customer Provisionable Banner is displayed only if LINE1 of the Customer Provisionable Banner is not an empty string; otherwise the Customer Provisionable Banner is omitted.

Example input/output

The following example shows a successful login session initiation attempt with no Customer Provisionable Banner.

ACT-USER:UNITE-123:nbguser1:123456::kj5lee+3;

```
   UNITE-123 07-12-21 08:00:00
M  123456 COMPLD
   ”nbguser1:07-12-20,09-00-00,1,WaveStar_UNITE,10.00.00,P3&M3:sysavst=AVAILABLE”
   /* Alcatel-Lucent 1675 LambdaUnite MSS Release 10.00.00
   User Privilege Code: P3&M3
   ALCATEL-LUCENT - PROPRIETARY
   THIS SOFTWARE CONTAINS INFORMATION OF ALCATEL-LUCENT
   AND IS NOT TO BE DISCLOSED OR USED EXCEPT IN ACCORDANCE
   WITH APPLICABLE AGREEMENTS.
   NOTICE: THIS IS A PRIVATE COMPUTER SYSTEM.
   USE OF THIS SOFTWARE IS GOVERNED SOLELY AS EXPRESSLY
   AUTHORIZED IN THE RELEVANT AGREEMENT BETWEEN
   ALCATEL-LUCENTAND CUSTOMER.
   UNAUTHORIZED ACCESS OR USE MAY LEAD TO PROSECUTION.
   */

;
```

The following example shows a partial completion response to a login session initiation attempt:

ACT-USER:LT-UNITE-123:nbguser1:123456::kj5lee+3;

```
   LT-UNITE-123 01-01-01 08:00:00
M  123456 PRTL
   ”nbguser1:00-12-31,09-00-00,23”
   /* Your password has expired. Until you change your password (ED-PID)
    you will not be allowed further access to this Network Element */
```

;

Note: A blank line in front of the terminator ″;″ can be ignored.

Error responses

Validation rule: Maximum logins exceeded

If a user attempts to login after the maximum number of login sessions has been reached, the following error message will be displayed.

Error code: `SARB – Status, All Resources Busy`

Validation rule: Invalid uid and/or pid

If the NE receives an ACT-USER command with an invalid *uid* (*uid* not in the NE database or *uid* syntactically incorrect), invalid *pid* or both.

Error code: `IDNV – Input, Data Not Valid`

Validation rule: Disabled User ID

If a user attempts to log in using a disabled User ID, the login is denied and the following error message will be displayed:

Error code: `IDNV – Input, Data Not Valid`

Validation rule: Expired password and unsuccessful change of password

The user will be allowed three attempts to change their password. If the third attempt fails, the user will be logged out and the association dropped. The execution of any command prior to the successful change of the password will be counted as one of the three attempts to change the password. This includes failures of the **ED-PID** command due to incorrect data, attempts to execute valid commands other than the **ED-PID** command, or invalid commands, possibly due to a data entry error. In all cases, the system will return the following error response.

Error code: `IDNV – Input, Data Not Valid`

Validation rule: Login on established session

If the system receives an ACT-USER command on an already established session the system responds with the following error response:

Error code: `ICNV – Input, Command Not Valid`

Validation rule: Maximum number of user sessions via T-TD on Gateway NE

If a user session is established via T-TD on a Gateway NE with CTL/- or CTL/2 with 20 TCP sessions and while already 300 user sessions are existing through the T-TD, then the following error response is sent:

Error code:

`SSRE – Status, System Resources Exceeded (sent by T-TD, TL1_TTD)`

This error response is sent by the Gateway NE, but contains the TID from the ACT-User command.

Validation rule: Maximum number of user sessions via T-TD on Gateway NE with CTL/4

If a user session is established via T-TD on a Gateway NE with CTL/4T or CTL/4S with 20 TCP sessions and while already 300 user sessions are existing through the T-TD, then the following error response is sent::

Error code:

`SSRE – Status, System Resources Exceeded (sent by T-TD, TL1_TTD)`

This error response is sent by the Gateway NE, but contains the TID from the ACT-User command.

Validation rule: Maximum number of user sessions via T-TD on Gateway NE

If a user session is established via T-TD on a Gateway NE with CTL/3 with 20 TCP sessions and while already 600 to 603 user sessions are existing through the T-TD, then the following error response is sent:

Error code:

`SSRE – Status, System Resources Exceeded (sent by T-TD, TL1_TTD)`

This error response is sent by the Gateway NE, but contains the TID from the ACT-User command.

Validation rule: maximum number of user sessions via T-TD on Gateway NE per TCP connection

If a user session is established via T-TD on a Gateway NE using a TCP connection on which already 300 user sessions are existing, then the following error response is sent:

Error code:

`SSRE – Status, System Resources Exceeded (sent by T-TD, TL1_TTD)`

This error response is sent by the Gateway NE, but contains the TID from the ACT-User command.

ALW-MSG: Allow message

The **ALW-MSG** command allows the NE to resume the forwarding of autonomous messages previously suspended with the **INH-MSG** command.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: no

Input format

Command syntax: **ALW-MSG-ALL**:*tid*::*ctag*[::,,,,*sessions*];

The purpose of the commas in case the optional parameter *sessions* is present is that the format is compliant with non-supported position defined parameters in GR-833.

Input parameters

Command parameters

1. **tid** – Target Identifier
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **sessions** – Affected sessions
Refer to the definition of output parameter *sessions* in "RTRV-ATTR-MSG: Retrieve attribute message" (p. 3-2260).

Output format

If the ALW-MSG request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command enables autonomous message reporting for *sessions*.

If this command is executed when autonomous messages are already being transmitted, it is complete successfully.

Example input/output

The following is an example of the **INH-MSG** command:

```
ALW-MSG-ALL:LT-UNITE::123456;

   LT-UNITE 00-11-15 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ALW-MSG** command.

Related TL1 messages

- “INH-MSG: Inhibit message” (p. 3-2021)
- “RTRV-ATTR-MSG: Retrieve attribute message” (p. 3-2260)

References

GR-833-CORE

APPLY: Apply software generic or activate a downloaded database

The **APPLY** command can be used to

- install a copy of a software generic stored in the NE, overwriting the currently executing software. Installation of the software causes the system to reset.
- activate a previously downloaded database. Activation causes the system to reset.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 2

Abortable: No

Input format

Command syntax: **APPLY**:*tid*::*ctag*::*[,,qualifier]*;

The two commas before *qualifier* are kept for compatibility reasons for products, for which scheduling of an APPLY command is possible.

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **qualifier**

   Description: The *qualifier* selects the software generic to be installed.

   - INSTALL causes the software download to be installed. This is the default action if no value is specified for *qualifier*. Prior to installation, the software state must be equal to DOWNLOADED. The software state can be retrieved by **RTRV-PRMTR-SFTWR**.
   - TRIAL causes the downloaded software to be installed in a trial phase. During the trial phase, it is possible to switch back to the previously installed software and database. Prior to installation, the software state must be equal to DOWNLOADED. The software state can be retrieved by **RTRV-PRMTR-SFTWR**.

- COMMIT terminates the trial phase of a newly installed software. When the trial phase is terminated, a switch back to the previously installed software and database is no longer possible. The termination of the trial phase is allowed with any state of the previous SW generic and the previous database.
- REVERT forces the system to switch back to the previously installed software and database. The switch back is only possible during trial phase. All provisioning done during the trial phase will be lost. Prior to the switch back, the state of the previous SW generic and the state of the previous database must be PRESERVED. The software and database states can be retrieved by **RTRV-PRMTR-SFTWR** and **RTRV-PRMTR-DATA**.
- DATABASE causes the downloaded database to be installed as working database. Prior to installation, the database state in the previous NVM must be equal to DOWNLOADED.

  The database state can be retrieved by **RTRV-PRMTR-DATA**. The **APPLY** command with the qualifier DATABASE shall compare the system backplane serial number with the serial number stored in previously downloaded database. The command is only executed, if the serial numbers are equal.
- DBFORCED causes the downloaded database to be installed as working database. Prior to installation, the database state in the previous NVM must be equal to DOWNLOADED or MISMATCH.

  The database state can be retrieved by **RTRV-PRMTR-DATA**.

  The **APPLY** command with the qualifier DBFORCED **does not** overwrite the serial number in the downloaded database with the system serial number.

  After the **APPLY** of the new database, the system will start up in maintenance mode where the operator needs to commit to overwrite the serial number of the database with the system serial number.

  The purpose of the qualifier DBFORCED is to install a database which has been backed up from another system, for example, to replace a complete system (including the subrack).

Type: Alphanumeric value set.
Range: INSTALL, TRIAL, COMMIT, REVERT, DATABASE, DBFORCED.
Default: INSTALL.

Output format

Normal completion message

If the NE fully complies with the **APPLY** command successfully, then the following completion response is given:

```
   sid date time
M  ctag COMPLD
   /* New software generic installation in progress */
;
```

Completion message if ES64U databases missing or superfluous

If ES64U databases are missing or superfluous in the database generic and the user has applied the generic with DBFORCE, then the following completion response is given:

```
   sid date time
M  ctag COMPLD
   /* ES64U databases for following slots are missing or superfluous:<List>*/
;
```

The <List> shall be a simple list of slot-numbers separated by commas.

Completion message if previous ES64U databases cannot be restored

If the command with qualifier REVERT could not restore the previous databases for all ES64U packs in the system, then the following completion response is given:

```
   sid date time
M  ctag COMPLD
   /* Previous ES64U databases for following slots are not restored:<List>*/
;
```

The <List> shall be a simple list of slot-numbers separated by commas.

Detailed behavior description

APPLY being denied during installation

If an installation is already in progress, then another request for an installation will be denied.

APPLY during duplex control recovery

A request for installation will be denied if a second system controller is in recovery.

Indication of COMPLD

The **APPLY** command shall report COMPLD before the command causes the system to be reset. When the system is reset, the DCN communication will fail. The command will indicate completion before that occurs. This does not guarantee, that the COMPLD indication is sent successfully. The COMPLD indication may be lost.

Generation of REPT DBCHG message

The **APPLY** command generates a **REPT DBCHG** message. This message will be generated before the command causes the system to be reset. This does not guarantee, that the REPT DBCHG message is sent successfully. The REPT DBCHG message may be lost.

Installation recorded in history log

The initiation of an installation is recorded in history log.

Reactions after installation completed

When a NE receives an **APPLY** command and as a result successfully installs a new software generic, the NE loses any command messages that were pending and all alarms are cleared. All performance monitoring bins are cleared, and any conditions are cleared.

When a NE receives an **APPLY** command and as a result successfully installs a downloaded database, the NE loses any command messages that were pending and performance monitoring bins are cleared are cleared.

The system performs a CTL controller reset to finalize the installation.

SW Generic Installation with Trial Phase

The qualifier value TRIAL shall prepare the installation of the downloaded SW generic in trial phase. With the trial phase, the user keeps the option to switch back to the previous software and database. The trial phase must be explicitly invoked with qualifier TRIAL. If the qualifier is omitted, or INSTALL, the system does not enter the trial phase and a switch back to the previous software is not possible.

SW Generic Running in Trial Phase - Software and database state during trial phase

During trial phase, the software and database state is:

- SW state in current NVM: RUNNING
- SW state in previous NVM: PRESERVED
- DB state in current NVM: RUNNING
- DB state in previous NVM: PRESERVED.

Any other combination of state values is not considered as trial phase. If the system detects during start up that only one of the previous NVM states is PRESERVED, then the state PRESERVED is modified to PREVIOUS.

SW Generic Running in Trial Phase - Commands not allowed in trial phase

As long as the software is running in trial phase, the system shall not allow to execute commands that will make a switch back to the previous software impossible. The commands not allowed in trial phase are:

- Software Download via CPY-MEM or COPY-RFILE
- Database Restoration via CPY-MEM or COPY-RFILE
- Activation of ONNS with ED-EQPT (System).

SW Generic Running in Trial Phase - Termination of the trial phase

The qualifier value COMMIT shall terminate the trial phase. The SW state and DB state in previous NVM is set to PREVIOUS. After the trial phase is terminated, the system shall allow the exection of TL1 commands for Software Download, Database Restoration and ONNS activation.

An attempt to terminate a trial phase shall always succeed, independent, whether the system is in trial phase or not. If the system is not in trial phase, and either the SW state or the DB state of the previous NVM is still PRESERVED, then the system shall only set this state from PRESERVED to PREVIOUS.

The SW is in trial phase, as long as the SW and the DB state of the previous NVM is PRESERVED. If only one of the states is PRESERVED, while the other is PREVIOUS, the trial phase is assumed to be terminated. When the **APPLY** command with the qualifier COMMIT is executed, the remaining PRESERVED state is also changed to PREVIOUS. This clean-up action removes the inconsistent SW or DB state.

SW Generic Running in Trial Phase - Switch back to the previous software and database

As long as the newly installed software is in trial phase, the system shall allow to switch back to the previously installed software and database. The qualifer value REVERT forces the system to swap current and previous NVM for software and database.

After the switch back to the previous software and database has been performed, the software and database state is:

- SW state in current NVM: RUNNING
- SW state in previous NVM: PREVIOUS
- DB state in current NVM: RUNNING
- DB state in previous NVM: PREVIOUS.

With the switch back to the previous software and database, any provisioning done during the trial phase will be lost.

Switch back to the previous software and database for ES64U

SW fallback is fully traffic affecting for the ES64U.

Example input/output

The following example shows an APPLY command requesting installation of a new generic:

```
APPLY:LT-UNITE::123456;
   LT-UNITE 00-11-01 09:45:28
M  123456 COMPLD
   /* New Software generic installation in progress */
;
```

Error responses

Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command error response section. The error responses listed there also apply to the **APPLY** command. Additional error responses that specifically apply to this command are defined in the following:

Validation rule: Temporary system exhaustion

If the system is experiencing temporary exhaustion of allocated resources, the system responds with:

Error code: `SARB – Status, All Resources Busy, system limit exceeded`

Validation rule: APPLY already in progress

If an APPLY request is issued and an installation is already in progress or a resource is busy for other reasons, the system responds with:

Error code: `SARB – Status, All Resources Busy`

Validation rule: Non-Hardware system difficulties

If the command cannot be completed due to system difficulties other than hardware or equipment, the system responds with:

Error code: `SROF – Status, Requested Operation Failed`

The following list identifies conditions that will cause an SROF error response:

- Install failure

Validation rule: Generic not available

If the command failed because the generic is not available, the following error response is returned:

Error code: `ENSG – Equipage, Not Software Generic, generic not available`

Validation rule: APPLY applied on corrupted software

If an APPLY request is entered with qualifier INSTALL or TRIAL the state of the download software is different from DOWNLOADED, then the following error response is given:

Error code:
`SNVS – Status, Not in Valid State, Software generic corrupt or not available`

This applies for the following software states: CORRUPT, INITIAL, INPROGRESS, PREVIOUS, PRESERVED and RUNNING.

Validation rule: Second APPLY on same software

If an APPLY request is entered and the software copy has been previously installed (that is, its state is PREVIOUS), then the following error response is given:

Error code: `SNVS – Status, Not in Valid State`

Validation rule: No SW installation during DB backup, DB download or DB restore

The system denies an attempt to install a new or previos SW generic, i.e. qualifier is INSTALL, TRIAL, REVERT or omitted, while a DB backup, DB download, or DB restore is in progress.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: No SW installation during Duplex Control Recovery

The system rejects an attempt to APPLY a new software while the Duplex Control Protection Group is in recovery with the following error code:

Error code:
`SNVS – Status, Not in Valid State. Duplex Control Recovery in progress`

Validation rule: No DB activation during Duplex Control Recovery

The system shall reject an attempt to APPLY a downloaded database while the Duplex Control Protection Group is in recovery with the following error code:

Error code:
`SNVS – Status, Not in Valid State, Duplex Control Recovery in progress`

Validation rule: File inappropriate

If the type of file is inappropriate for installation to the NE, then the following error response is given:

Error code: `SDNC – Status, Data Not Consistent`

Validation rule: SW installation in trial phase while ONNS is active

Execution of the command with qualifier = TRIAL is not allowed if the parameter xcsetup has the value ″SWISS″.

Error code: `SNVS – Status, Not in Valid State, ONNS is active`

Validation rule: Switch back to previous SW only during trial phase

The switch back to the previously installed software and database is only allowed while the system is in trial phase, i.e. the software has been installed using the qualifer value TRIAL and the trial phase has not been terminated with COMMIT.

Error code:
`SNVS – Status, Not in Valid State, switch back to previous software only allowed in trial phase`

Validation rule: Second APPLY on previous database

If an APPLY request is entered with qualifier DATABASE or DBFORCED and the database has been previously installed (that is, its state in the previous NVM is PREVIOUS), then the following error response is given:

Error code: `SNVS – Status, Not in Valid State, Database already installed`

Validation rule: APPLY applied on corrupted database

If an APPLY request is entered with qualifier DATABASE or DBFORCED and the database in the related NVM is in a state different from DOWNLOADED and PREVIOUS, then the following error response is given:

Error code:

`SNVS – Status, Not in Valid State, database corrupt or not available`

Validation rule: Serial number in the database not equal to system backplane serial number

If an APPLY request is entered with the qualifier DATABASE and the serial number stored in the downloaded database does not match the system backplane serial number, then the following error response is given:

Error code:

`SNVS – Status, Not in Valid State, Backplane serial number mismatch`

Validation rule: NVM contains DB for NOT existing ES64U pack

If an **`APPLY`** request is entered with qualifier DATABASE and the database generic contains a database for a not existing ES64U AND the validation rule “NVM NOT contains DB for a existing ES64U Pack” does not apply , then the following error response is given:

Error code:

`SNVS – Status, Not in Valid State, NVM contains DB for not existing ES64U packs`

Validation rule: NVM NOT contains DB for existing ES64U packs

If an **`APPLY`** request is entered with qualifier DATABASE **and** the database generic does **not** contain databases for existing ES64U packs, then the following error response is given:

Error code:

`SNVS – Status, Not in Valid State, NVM contains no DB for existing ES64U packs`

Validation rule: Not all databases of ES64U preserved for trial phase

If the command is executed with *qualifier* = TRIAL in a system with ES64U packs provisioned, then the command shall only successfully complete if the databases of all provisioned ES64U packs can be preserved. The command is denied if not all ES64U databases can be preserved.

Error code:

`SROF – Status, Requested Operation Failed, not all ES64U databases preserved`

Related TL1 messages

- "CPY-MEM: Copy memory" (p. 3-114)
- "RTRV-PRMTR-DATA: Retrieve parameter data" (p. 3-2744)
- "RTRV-PRMTR-SFTWR: Retrieve parameter software" (p. 3-2753)

APPLY notification

Syntax

The APPLY notification has the following specific syntax:

Command syntax: **`APPLY`**:,,*qualifier*;

The output parameters *sid*, *date*, *time*, and *atag* are described in the REPT DBCHG notification.

Output parameters

Command parameters

1. **`qualifier`**

   Description: The *qualifier* selects the software generic to be installed.

   - INSTALL causes the software download to be installed. This is the default action if no value is specified for *qualifier*. Prior to installation, the software state must be equal to DOWNLOADED. The software state can be retrieved by **`RTRV-PRMTR-SFTWR`**.
   - TRIAL causes the downloaded software to be installed in a trial phase. During the trial phase, it is possible to switch back to the previously installed software and database. Prior to installation, the software state must be equal to DOWNLOADED. The software state can be retrieved by **`RTRV-PRMTR-SFTWR`**.
   - COMMIT terminates the trial phase of a newly installed software. When the trial phase is terminated, a switch back to the previously installed software and database is no longer possible. The termination of the trial phase is allowed with any state of the previous SW generic and the previous database.
   - REVERT forces the system to switch back to the previously installed software and database. The switch back is only possible during trial phase. All provisioning done during the trial phase will be lost. Prior to the switch back, the state of the previous SW generic and the state of the previous database must be PRESERVED. The software and database states can be retrieved by **`RTRV-PRMTR-SFTWR`** and **`RTRV-PRMTR-DATA`**.
   - DATABASE causes the downloaded database to be installed as working database. Prior to installation, the database state in the previous NVM must be equal to DOWNLOADED.

     The database state can be retrieved by **`RTRV-PRMTR-DATA`**. The **`APPLY`** command with the qualifier DATABASE shall compare the system backplane serial number with the serial number stored in previously downloaded database. The command is only executed, if the serial numbers are equal.
   - DBFORCED causes the downloaded database to be installed as working database. Prior to installation, the database state in the previous NVM must be equal to DOWNLOADED.

     The database state can be retrieved by **`RTRV-PRMTR-DATA`**.

The **APPLY** command with the qualifier DBFORCED **does not** overwrite the serial number in the downloaded database with the system serial number.

After the **APPLY** of the new database, the system will start up in maintenance mode where the operator needs to commit to overwrite the serial number of the database with the system serial number.

The purpose of the qualifier DBFORCED is to install a database which has been backed up from another system, for example, to replace a complete system (including the subrack).

Type: Alphanumeric value set.
Range: INSTALL, TRIAL, COMMIT, REVERT, DATABASE, DBFORCED.
Default: INSTALL.

Example output

The following is an example for an **APPLY** notification using the qualifier INSTALL:

```
   LT-UNITE 00-11-01 15:00:00
A  000 REPT DBCHG
   ”TIME=15-00-00,DATE=00-11-03:APPLY::,,INSTALL”
;
```

AUD: Perform audit data

Overview

The **AUD**-mod command requests ONNS data to be compared either with local host NE or with the rest of network for audit. Any discrepancies in data is notified as a result in the response. The audit results provide users with information to perform synchronization (either manually or automatically by NN) to improve overall integrity of NN data.

The targeted NN data for audit process are cross-connect map, port object, and path data. The modifier of the **AUD**-mod command indicates the scope of data to be checked.

AUD-LOCAL

AUD-LOCAL triggers local data-audit that is to identify any differences in local NN data from host NE data with respect to port object and cross-connect map. Depending on the result, if any discrepancies found, user can **ED-SYNCDATA-LOCAL** command to request automated data synchronization process by ONNS.

The **AUD-LOCAL** command requests to perform an audit for local host/NN data comparison.

AUD-PATHNBR

AUD-PATHNBR triggers path neighbor data-audit that is to identify any differences in path data kept locally with the neighboring nodes. NN will exchange the current path information with its neighboring NN nodes (in terms of transport network topology) about the NN paths that traverse through this node. For this cross multiple-NE process, NN provides only data-audit without automated process for synchronization. However, based on the result of data-audit, user can fix pathID via **ED-SYNCDATA-PATH** command only if the correct value is clearly known.

The **AUD-PATHNBR** command requests to perform an audit for local path data with neighbor node path data comparison.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Abortable: No

Input format

Command syntax:

AUD-LOCAL:*srcTid:srcAid:ctag;*

AUD-PATHNBR:*srcTid:srcAid:ctag;*

Input parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **`ctag`**
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

Output format

The output shows any mismatched port objects and mismatched cross connect information in comparing NN data and host NE data.

For mismatched port objects, the cases may occur are as follows:

- port object exists only in NN data, but not in host NE data (ExtraPortIDs)
- port object exists only in host NE data, but not in NN.

The cases in the response represent the mismatched port objects or mismatched cross connect information as follows:

- ExtraPortIDs – port object exists only in NN data, but not in host NE data
- MissingPortIDs – pport object exists only in host NE data, but not in NN data
- ExtraNNXcons – NN owned cross-connect exists only in NN data, but not in host NE
- MissingNNXcons – NN owned cross-connect exists only in host NE data, but not in NN data

- ExtraNonNNXcons – non-NN owned cross-connect exists only in NN data, but not in host NE
- MissingNonNNXcons – non-NN owned cross-connect exists only in host NE data, but not in NN data.

The symbol (-X-) indicates that a cross-connection is present between the connPtIDs on an output line.

The output shall show any mismatched path data in comparing path information at a local NN with its neighboring nodes.

The cases in the response represent the mismatched path information as follows:

- When all the parameters have valid values – local node and neighboring node have different pathIDs for the same path.
- When the parameter for pathID at neighboring node (nbrpathID) is empty – local node has a cross-connect that is connected to a neighboring node, but the neighboring node does not have the corresponding cross-connect or path information.
- When the parameter for pathID at local node (localpathID) is empty – neighboring node has a cross-connect that is connected to a local node, but the local node does not have the corresponding cross-connect or path information.

The symbol (-X-) indicates that a cross-connection is present between the connPtIDs on an output line.

All neighbor nodes which are not reachable are be listed. For these neighbor nodes is was not possible to retrieve information for comparison of the ONNS path data.

Output parameters

Command parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the section "Output parameters" of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698) command.

1. **pathID**
   The PathID of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0…255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65111
2. **localpathID**
   The PathID of the local node of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0…255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65535
3. **nbrpathID**
   The PathID of the neighbor node of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0…255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65111
4. **nbrnodeID**
   ONNS node Network Access identifier (nodeID) of the neighbor node. *nodeID* is not changable and may be different from Signaling network IP address.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0…255.
5. **bandwidth**
   ONNS bandwidth is equal to or greater than the minimum cross connect rate (minXCrate) of the port type. Note: Only SONET switching levels in enumeration. For actual cross-connections ONNS adapts to SDH formats automatically if the ingress port is SDH.
   Values: STS1, STS3, STS12, STS48, STS192.
6. **portID**
   portID of port object discrepancy between NN data and NE data. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # . ONNS assumes a bidirectional port pair.
   Type: dash-separated list of 5 numeric strings.

Example: 1-1-3-1-4
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. This range is valid for protecting connections in M:N connection groups

7. **connPtID1**
ONNS connection point identifier (connPtID1) for the ingress RX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
Type: dash-separated list of 5 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
Range: Bay/Frame #(1), Shelf #(1), Slot/Pack ##, Port ##, Tributary ##
Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.
Range: Slot/Pack #*, Port #*, Tributary #*
Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.
Range:Slot/Pack #@, Port #@, Tributary #@
Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

8. **connPtID2**
ONNS connection point identifier (connPtID2) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
Type: dash-separated list of 5 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
Range: Bay/Frame #(1), Shelf #(1), Slot/Pack ##, Port ##, Tributary ##
Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.
Range: Slot/Pack #*, Port #*, Tributary #*
Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.
Range:Slot/Pack #@, Port #@, Tributary #@
Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

9. **connPtID3**
   ONNS connection point identifier (connPtID3) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
   Type: dash-separated list of 5 numeric strings.
   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
   Range: Bay/Frame #(1), Shelf #(1), Slot/Pack ##, Port ##, Tributary ##
   Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.
   Range: Slot/Pack #*, Port #*, Tributary #*
   Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.
   Range:Slot/Pack #@, Port #@, Tributary #@
   Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.
10. **connPtID4**
   ONNS connection point identifier (connPtID4) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
   Type: dash-separated list of 5 numeric strings.
   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
   Range: Bay/Frame #(1), Shelf #(1), Slot/Pack ##, Port ##, Tributary ##
   Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.
   Range: Slot/Pack #*, Port #*, Tributary #*
   Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.
   Range:Slot/Pack #@, Port #@, Tributary #@
   Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

Example input/output

The following example shows a successful completion of a **AUD-LOCAL** command for local ONNS data audit operation by the NE with all data in-sync:

```
AUD-LOCAL:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   ″ExtraPortIDs=NONE″
   ″MissingPortIDs=NONE″
   ″ExtraNNXcons=NONE″
   ″MissingNNXcons=NONE″
   ″ExtraNonNNXcons=NONE″
   ″MissingNonNNXcons=NONE″
   ″MultipleNNXcons=NONE″
;
```

The following example shows a successful completion of a **AUD-LOCAL** command for local ONNS data audit operation by the NE with several data not in sync:

```
AUD-LOCAL:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   ″ExtraPortIDs=1-1-20-3-5″
   ″MissingPortIDs=NONE″
   ″ExtraNNXcons=1-6-5-3-1,-X-,1-2-4-3-1,sts48,29.13.196.203-43216
   :1-1-4-4-1,-X-,1-2-1-3-1,sts12,29.13.18.23-12345″
   ″MissingNNXcons=1-1-8-10-2,-X-,1-1-3-3-4,sts48″
   ″ExtraNonNNXcons=NONE″
   ″MissingNonNNXcons=NONE″
   ″MultipleNNXcons=NONE″
;
```

The symbol (-X-) indicates that a cross-connection is present between the connPtIDs on an output line.

The following example shows a successful completion of a **AUD-PATHNBR** command for ONNS path neighbor data audit operation by the NE with all data in sync:

```
AUD-PATHNBR:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2006-01-01 08:00:00
M  123456 COMPLD
   ″MismatchedPathIDs=NONE″
   ″NotReachedNeighborNodes=NONE″
;
```

The following example shows a successful completion of a **AUD-PATHBR** command for ONNS path neighbor data audit operation by the NE with some data out of sync:

```
AUD-PATHNBR:LT-ONNS-789:snn:123456;
```

```
   LT-ONNS-789 2006-01-01 08:00:00
M  123456 COMPLD
   ″MismatchedPathIDs=1-1-4-4-1,-X-,1-2-1-3-1,sts12,29.13.18.23-
      00000,29.16.29.111,29.14.196.203-32165
   :1-1-7-4-2,-X-,1-1-3-5-1,sts48,,29.13.18.23,29.14.196.109-12164″
   ″NotReachedNeighborNodes=29.13.18.24,29.18.24.30″
;
```

The symbol (-X-) indicates that a cross-connection is present between the connPtIDs on an output line.

Error responses

Response specific to AUD:

Error code: `E650 – AAIP – Status, Audit Already In Progress`

Related TL1 messages

- “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698)
- “ED-SYNCDATA: Synchronization of ONNS data” (p. 3-1198)
- “RTRV-AUDLOG: Retrieve audit result log for ONNS connection data” (p. 3-2263)

Possible issues when widely using unidirectional ONNS connections

When in an ONNS network unidirectional ONNS connections are widely used, the following misbehavior may occur:

1. Local audit erroneously reports extra NN cross-connections: **AUD-LOCAL** and **RTRV-AUDLOG** may erroneously report extra NN cross-connections, if two unidirectional ONNS connections of differing bandwidth are traversing a node in opposite directions, but with connecting the same timeslots, for example, one connection from timeslot A to timeslot B and the other one from timeslot B to timeslot A.
2. Free bandwidth generally advertised on an INNI link, although no more bandwidth for bidirectional ONNS connections available: Setup of a bidirectional ONNS connection via an INNI link may fail, although for this link enough free bandwidth is generally advertised for example, via **RTRV-NTDR**. This is the case, if the corresponding link is nearly totally filled with a major part being unidirectional connections. The advertised free bandwidth may then refer to differing timeslots for both directions, thus not allowing bidirectional connections to be setup.

CANC-L1ROUTING

Overview

The command **`CANC-L1ROUTING`** is used to remove an ONNS enabled node as the proxy of its own domain in the routing hierarchy level 1. The command **`CANC-L1ROUTING`** can only be executed in maintenance mode.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command syntax: **`CANC-L1Routing:`***srcTid:srcAid:ctag;*

Output format

Normal sytem response format to CANC-L1ROUTING

If the CANC-L1ROUTING request accepted by the system, the following normal completion response format below is returned:

```
  srcTid date time
M  ctag COMPLD
;
```

Output parameters

Command parameters

1. **`srcTid`**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`date`**
   Date. The date parameter is set to the date when the output message is generated.
   Type: Value set.
   Range:

YY-MM-DD, where

- YY=00-99,
- MM=01-12,
- DD=01-31

Default: current date

3. **`time`**
   Time. The time parameter is set to the time when the output message is generated.
   See also time in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Value set.
   Range:
   HH:MM:SS, where
   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: current time
4. **`ctag`**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing "."). It should be a unique value for each new command.
5. **`completion code`**
   Standard TL1 completion code result.
   Type: Value set.
   Range:
   - COMPLD (default): for success
   - DENY: in case of errors

Example input/output

Input/Output example to disable a level 1 Routing Controller

The following example shows the successful completion of a CANC-L1ROUTING command to disable an ONNS node as level 1 Routing Controller:

```
CANC-L1ROUTING:LT-ONNS9:snn:113456;

   LT-ONNS9 2002-07-18 08:00:00
M  113456 COMPLD
```

;

Error responses

Validation rule: level 1 Routing controller does not exist

If there is no level 1 Routing Controller provisioned on the addressed node, the following error response is returned:

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Neighboring routing controller still exists

If the neighboring routing controller still exists (via DLT-RC-NEIGHBOR), then the command is denied.

Error code: `SNVS – Status, Not in Valid State, RC neighbor still exists`

Validation rule: Check of the maintenance condition

The system must be in maintenance condition (MCOND=YES) to remove an ONNS enabled node as the proxy of its own domain in the routing hierarchy level 1.

Error code: `SNVS – Status, Not in Valid State`

Related TL1 messages

- "ACT-L1ROUTING" (p. 3-15)
- "REPT L1ROUTING notification" (p. 3-2133)
- "RTRV-NTDR: Retrieve ONNS network topology data repository" (p. 3-2588)

CANC-L1ROUTING notification

The **`CANC-L1ROUTING`** notification message reports if an ONNS node is disabled as level 1 Routing Controller. Disabling is caused by a user's TL1 command.

Notification messages resulting from a TL1 command that were caused by the user's own requested changes

If an ONNS node is enabled as level 1 Routing Controller as a result of a TL1 CANC-L1ROUTING command, then a REPT DBCHG message is transmitted to all users provisioned to receive REPT DBCHG messages, including the user that issued the command. Therefore, a management OS must expect to receive messages for changes it caused as well as those made by a CIT user.

Output format

The REPT DBCHG message shall use the following format:

```
   sid date time
A  atag REPT DBCHG
   ″TIME=chgtm,DATE=chgdat:ccb:[aid]:[com_block]:[spec_block]″
     ...
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

1. **`atag`** – Automatic Tag
   The *atag* is used for message sequencing. The *atag* is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Type: decimal number.
   Range: 0 to 999.
   Default: 0
2. **`chgtm`** – Change Time
   Time when the change is occurred.
   Type: value set.
   Range: HH-MM-SS.
3. **`chgdat`** – Change Date
   Date when the change occurred
   Type: Value set.
   Range: YY-MM-DD

4. **`ccb`** – Command Code Block
   This field will be set to the TL1 command that causes that database change. The *com_block* and *spec_block* fields will be set according to the parameters that changed.
   Type: Alphanumeric value set verb-modifier[-modifier].
5. **`aid`** – Access Identifier
   AID of the entity for which the change is reported
   Type: AID.
   Range: As defined by the *aid* input parameter of the corresponding command, defined by *ccb*.
6. **`com_block`** – Common Block
   This is a position-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter values are included in this block in the same order as the corresponding TL1 command.
   As exception to this rule are some commands in the protection fragment, where the aliases *rid* and *ppgname* are not reported in the **`REPT DBCHG`** notification.
   If the database change is the result of a TL1 command, then the parameter *ctag* from the TL1 command is not included in the *com_block*.
   Type: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
   Range: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
   Default: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
7. **`spec_block`** – Specific Block
   This is a name-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter names and values are included in this block. Parameters within the specific block are positionally independent and are specified using a name-defined construct of *parameter* = value in a comma-separated list. The parameter names are the same as those for the corresponding TL1 command.
   Type: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.
   Range: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.
   Default: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.

Detailed behavior description

The **`REPT DBCHG`** message reports any change in the system database. Changes can be caused by a TL1 user or by an internally-generated state change.

Changes in user provisionable attributes are reported as the equivalent TL1 command that would cause that change.

Changes in non-user provisionable attributes are reported using only the AID and the block parameters, i.e. leaving the *ccb* parameter empty.

System initialization

Any time a command is entered that causes a system reset, a **REPT DBCHG** message is transmitted before the system resets.

AID ranges

If a database change occurs as a result of a TL1 command in which an AID range is entered, the system responds separate **REPT DBCHG** messages for each affected AID.

Messages caused by own changes

If the database change occurs as a result of a TL1 command, a **REPT DBCHG** message is transmitted to users provisioned to receive **REPT DBCHG** messages, including the user which issued the command.

Example input/output

The following is an example of the **REPT DBCHG** command:

```
   UNITE-NE 00-11-08 08:00:00
A  001 REPT DBCHG
   ″TIME=07-59-59,DATE=00-11-08: ENT-EQPT:1-1-#-#-05::nvmname=OP2G5,nvmqual=13SR4″
;
```

The following example shows the output of a REPT L1ROUTING notification caused by a CANC-L1ROUTING TL1 command:

```
   LT-ONNS9 2002-07-18 08:00:00
A  113456 REPT DBCHG
   ″TIME=07-59-59,DATE=2002-08-01:CANC-L1ROUTING″;
```

GR-199-CORE

CANC-USER: Cancel user

The **CANC-USER** command can be initiated to terminate the login session of the user with the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): Any

Priority: 1

Abortable: No

Input format

Command syntax: **CANC-USER**:*tid*:[*uid*]:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **uid** – User Identifier
   This is the user identifier that was used in the **ACT-USER** command that initiated this session. This is an optional parameter; if it is not specified, it defaults to the user identifier of this session.
   The uid is not really needed in this command, because always the own session will be canceled. But this parameter is in because of telcordia requirements.
   This is the unique user login identifier for which the this command is intended.
   Grouping and/or ranging of *uid* values for the **ACT-USER** command are not allowed.
   Valid *uid* values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
   Type: Alphanumeric string (case-sensitive)
   Range: 5 – 10 characters. The *uid* ALL is not allowed in any combination of upper or lower cases.
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output format

If the logout request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

When the NE receives a CANC-USER command, the login session on the NE will be terminated provided that the user is currently active on the NE. Only the users own session can be terminated.

The **`CANC-USER`** command does not generate a **`REPT DBCHG`** message.

Example input/output

The following example shows a successful command completion and login session termination:

```
CANC-USER:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: not the own uid specified

Only the own *uid* must be specified. There is not so.

Error code: `IDNC – Input, Data, Not Consistent, not own uid`

CANC-USER-SECU: Cancel user security

The execution of this command on a NE by an security administrator terminates all login sessions of a particular user or of all non-superusers/non-MEMADMIN-users within the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: No

Input format

Command syntax: **`CANC-USER-SECU`**:*tid:[uid]:ctag;*

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`uid`** – User Identifier
   This is the *uid* of the user whose sessions are being terminated. If an security administrator wants to force log out another user, then the security administrator could do so by specifying that *uid*. An privileged user could log out any other user including super-users and users of *uidclass* MEMADMIN.
   If an security administrator wants to force log out all the users that are currently logged in, then the security administrator could do so by omitting the *uid*. Logging out all users by omitting the *uid* does not include the super-users or MEMADMIN-users logins.
3. **`ctag`** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

If the logout request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **CANC-USER-SECU** command can be only executed by the security administrator (UPC S5). She/he can terminate the sessions of other users by supplying his/her *uid*. If a user has established more than one sessions then all sessions will be terminated. The own session will not be affected this command.

The **CANC-USER-SECU** command does not generate a **REPT DBCHG** message.

Example input/output

The following example shows a successful command completion and login session termination:

```
CANC-USER-SECU:LT-UNITE-123:nbguser1:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: uid not in NE data base

The *uid* is not contained in the NE’s data base.

Error code: `IDNV – Input, Data Not Valid, uid not in NE data base`

Validation rule: user with uid not logged in

A user with the specified *uid* is not currently logged in.

Error code: `SRQN – Status, invalid request, uid not logged in`

Validation rule: uid must not be the own uid

If the own uid matches *uid* the command should be denied.

Error code: `IDNV – Input, Data Not Valid, uid must not be the own uid`

CHG-ACCMD: Change access mode

General

The **CHG-ACCMD** command is used to change the test access mode of a test session in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T4

Priority: 1

Abortable: No

Input format

Command syntax: **CHG-ACCMD**-*modifier:tid:tatrib1:ctag:::spec_block;*

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection rate on which the connect test access command is to act. Type: Alphanumeric value set.
   Range:
   - SDH modifier: VC3, VC4, VC44C, VC416C, VC464C
   - SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.
2. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **tatrib1** – primary Test Access tributary
   AID of the primary Test Access tributary. The keyword **all** is not allowed on any level.
   Type: AID
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.
4. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **tstmde** – Test Access Mode
   Type: Alphanumeric value set.

Range: Allowed values:

- MONE – Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.
- MONF- Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.
- MONEF – Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a two-way cross-connection.
- SPLTE – Split access E-end mode of test access. This test access mode splits the connection between the E end and F end of a one-way cross-connection or a leg of two-way cross-connection. Can also be used in an idle tributary.
- SPLTF – Split access F-end mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing at the F-end.
- SPLTEF – Split E-end and F-end mode of test access. This test access mode splits both directions of a two-way cross-connection to allow testing at both the E end and F end.

Output format

The NE returns the following normal completion response to a successful CHG-ACCMD command if there are no failure conditions to report:

```
   sid date time
M  ctag COMPLD
;
```

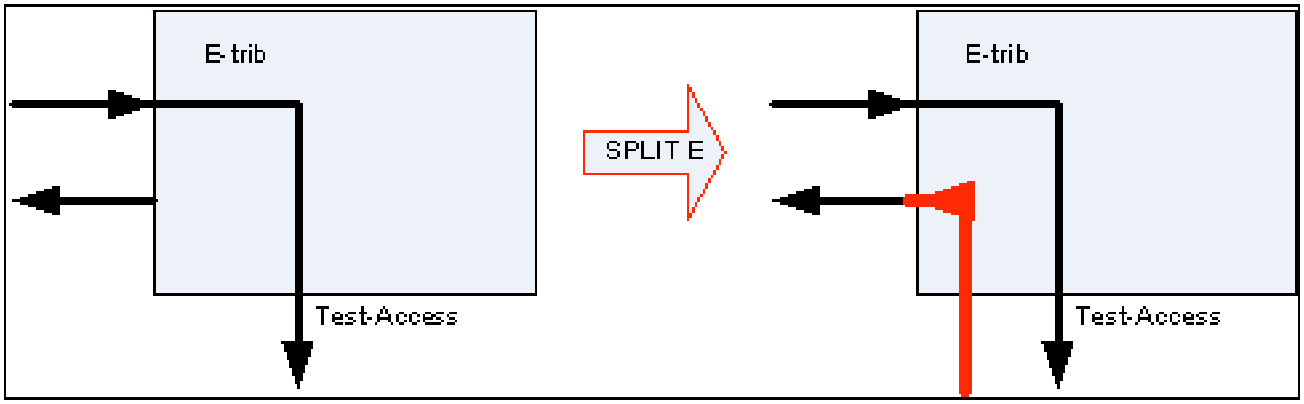
Detailed behavior description

The function of the **CHG-ACCMD** command is to change the test access mode without terminating the test access session.

The test access mode changes are restricted to test modes belonging to the same group. (See the definition of the groups in the general description.) It is not allowed to change the mode from single to dual test tributary modes or from dual to single test tributary modes.

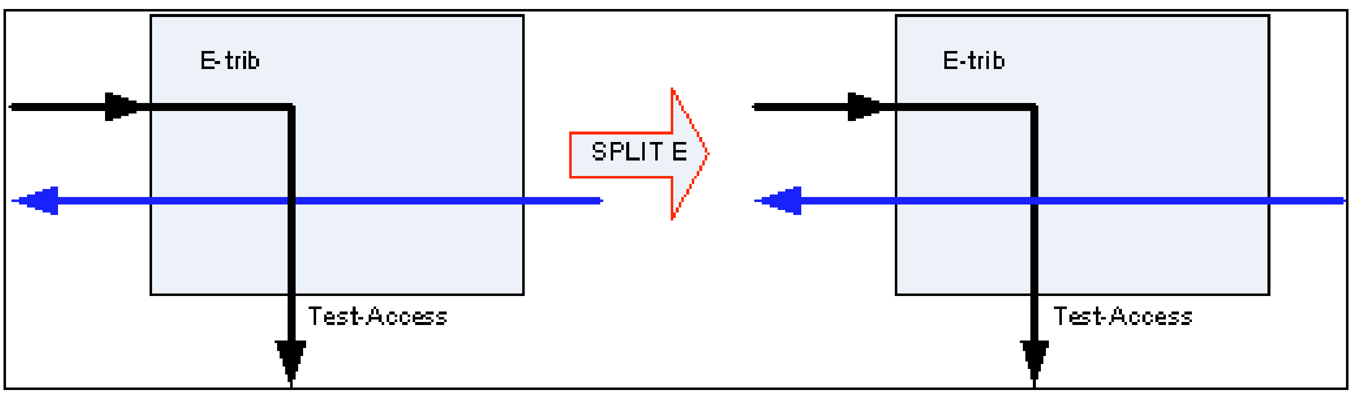
Idle tributary 1

If the “Split E” (SPLTE) mode is applied on an idle tributary which is also not the destination of a cross-connection- then the test access signal is connected from the test access tributary to the E-tributary.



Idle tributary 2

If the “Split E” (SPLTE) mode is applied on an idle tributary which is the destination of a cross-connection, then the test access signal is not connected from the test access tributary to the E-tributary. There is no cross-connection to be created.



Example input/output

```
CHG-ACCMD-STS1:LT-UNITE:1-1-#-#-6-1-1:123456:::TSTMDE=SPLTA;
   LT-UNITE 02-10-01 19:17:53
M  123456 COMPLD
;
```

For lower-order test access sessions:

```
CHG-ACCMD-LOVT1:LT-UNITE:1-1-#-#-6-1-1-28:123456:::TSTMDE=SPLTA;
   LT-UNITE 02-10-01 19:17:53
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **CHG-ACCMD** command.

Validation rule: No test access session on the test tributary

If the NE receives a **CHG-ACCMD** command when there is no test access session set up on the test tributary specified, the following error response is returned:

Error code:
`SNVS – Status, Not in Valid State, no test access session on the test tributary`

Validation rule: Invalid test access mode change request

If the NE receives a **CHG-ACCMD** command with a test access mode which is not a member of the same group, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State, invalid test access mode`

Validation rule: Underlying cross connection is not two-way

If the network element receives a **CHG-ACCMD** command which changes the tributary under test from tributary E to tributary F and the underlying cross-connection is not two-way, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State, invalid test access mode`

Validation rule: Underlying cross connection belongs to BLSR/MS-SPRing

If the network element receives a **CHG-ACCMD** command which requests any kind of Split mode (SPLT) and the underlying cross-connection is a HO BLSR/MSSPRing intra-ring through cross-connection, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State, invalid test access mode`

Validation rule: Inconsistent tributary rate

If the NE receives an **CHG-ACCMD** command which does not match the test access connection rate, the following error response is returned:

Error code:
`IPNC – Input, Parameter Not Consistent, Rate inconsistent with crossconnection rate`

Validation rule: Not Supported for Low-Order Test Access Rate

If the network element receives an **CHG-ACCMD** command with modifier LOVT1 the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, Command not supported for test access rate LOVT1.5`

Note: Wrong error code may occure:

When it is tried to change the test mode of a LO test access session with the command **CHG-ACCMD**, then the command is denied witht the wrong error code:

```
SROF – Status, Requested Operation Failed
```

CHG-ACCMD notification

Output format

The **`CHG-ACCMD`** notification has the following specific syntax:
`CHG-ACCMD`-*modifier:tatrib1::spec_block;*

Output parameters

Command parameters

1. **`modifier`**
   This parameter indicates the cross-connection rate on which the connect test access command is to act. Type: Alphanumeric value set.
   Range:
   - SDH modifier: LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C
   - SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.
2. **`tatrib1`** – primary Test Access tributary
   The keyword **`all`** is not allowed on any level.
   Type: AID
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **`all`** or **`usall`** or **`vall`**-values at any position of the aid is not allowed.

Spec block parameters

1. **`eomode`** – output mode of the E-tributary
   This parameter is only present if the test session is created on a two-way cross-connection. The parameter is omitted for test sessions on one-way cross-connections or on idle E-tributaries.
   Type: Alphanumeric value set.
   Range:
   - NORM: this is the normal output i.e. the signal from the F-tributary is passed through to the E-tributary
   - AIS: this mode outputs an AIS signal.

   Default:
   - NORM, if the referring Ttest mode does not disconnect the output of the original cross-connection to this tributary
   - AIS, in all other case.
2. **`fomode`** – output mode of the F-tributary
   This parameter is only present if the test session is created on a one-way or two-way cross-connection. The parameter is omitted for test sessions on idle E-tributaries.
   Type: Alphanumeric value set.

Range:

- NORM: this is the normal output i.e. the signal from the E-tributary is passed through to the F-tributary
- AIS: this mode outputs an AIS signal.

Default:

- NORM, if the referring test mode does not disconnect the output of the original cross-connection to this tributary
- AIS, in all other cases.

3. **`tstmde`** – Test Access Mode
   Type: Alphanumeric value set.
   Range: Allowed values:
   - MONE – Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.
   - MONF- Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.
   - MONEF – Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a two-way cross-connection.
   - SPLTE – Split access E-end mode of test access. This test access mode splits the connection between the E end and F end of a one-way cross-connection or a leg of two-way cross-connection. Can also be used in an idle tributary.
   - SPLTF – Split access F-end mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing at the F-end.
   - SPLTEF – Split E-end and F-end mode of test access. This test access mode splits both directions of a two-way cross-connection to allow testing at both the E end and F end.

Example input/output

```
CHG-ACCMD-STS1:LT-UNITE:1-1-#-#-6-1-1:123456:::TSTMDE=SPLTA;

   LT-UNITE 02-10-01 19:17:53

    TSTMDE=SPLTA:”
;
```

CNVT-CCT: Convert cross-connection topology

General

The **CNVT-CCT**-modifier command can be initiated by a user to convert between a 1-way point-to-point cross-connection and a path-protected cross-connection.

For a 1-way Point-to-Point to a path-protected conversion, the existing point-to-point cross-connection leg is converted into a single atomic path-protected cross-connection between the logical input AID of the existing point-to-point cross-connection, the specified protection logical input AID and logical output AID of the existing point-to-point cross-connection. The leg comprised of the AIDs of the existing point-to-point cross-connection is designated as the path protection group working leg at the time the cross-connection is converted.

If the command is applied to a 2-way cross-connection it will be split up automatically in two 1-way cross-connections. The command will be executed on the specified in_aid to out_aid direction, the reverse direction will remain unprotected. Refer also to chapter Detailed behavior for more.

For a path-protected to a 1-way point-to-point conversion, it can be selected, which logical input AID of the existing legs (working leg or the protection leg) of the path-protected cross-connection shall stay as logical input AID of the created point-to-point cross-connection. This can be done by specifying the surviving leg of the existing path protection group as working leg at the time the cross-connection is converted.

The tributaries involved do not need to be free of alarms/failure conditions – no check in advance will be made. The cross-connection will thus be established also in case of AIS-P, LOP-P, UNEQ etc. as is the case with a normal ENT-CRS command as well.

The *modifier* in the **CNVT-CCT** command indicates the cross-connection rate of the tributary for which the command is applied to. The same rules as for ENT-CRS for path-protected cross-connections apply.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 3

Abortable: No

Input format

Command syntax: **CNVT-CCT**-*modifier*:*tid*:*in_aid,out_aid:ctag::[in_aid2]:spec_block;*

Input parameters

Command parameters

1. **`modifier`**
   This parameter indicates the cross-connection on which the **`CNVT-CCT`** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command.
   Type: Alphanumeric value set.
   Range:
   - LOVC12
   - LOVC3
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - LOVT1
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192.

   No use of the **`all`** value is allowed.
2. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`in_aid`** – Input Access Identifier
   This parameter specifies
   - 1-way Point-to-Point to a Ppath-protected conversion: the source of the unprotected cross-connection respectively
   - Path-protected to a 1-way point-to-point conversion: the AID of the input leg which shall stay as source of the created unprotected cross-connection.

   Type: AID
   Range: GenTribAID or GenLOTribAID. No use of the *all* or *usall* or *vall* values are allowed.
   No use of the **`all`** value within the in_aid2 is allowed.
   VCGNumAID is excluded from the value range by validation rule.

4. **`out_aid`** – Output Access Identifier
   This parameter specifies the sink of the cross-connection. See definition of parameter *out_aid* in “RTRV-CRS: Retrieve cross-connection” (p. 3-2306).
   Type: AID
   Range: GenTribAID or GenLOTribAID.No use of the *all* or *usall* or *vall* values within the out_aid is allowed.
5. **`ctag`** – Correlation Tag
   See definition of *ctag* in “RTRV-HDR: Retrieve header” (p. 3-2417).
6. **`in_aid2`** – Input2 Access Identifier
   2nd Input Access Identifier. For a Path-Protected to a 1-way Point-to-Point conversion, the parameter in_aid2 specifies the input leg which is dropped.
   For a 1-way Point-to-Point to a Path-Protected conversion, the parameter has to be omitted.
   Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID
   Range: No use of the *all* or *usall* or *vall* values are allowed.
   Default: a valid value is needed on case of a path-protected cross-connection – no default is defined.

Spec block parameters

1. **`cct`** – CrossConnect Topology
   The parameter *cct* specifies the new cross-connection topology.
   Type: Alphanumeric value set.
   Range: 1WAY for one-way unprotected cross-connection; 1WAYPPROT for one-way path-protected cross-connection.
2. **`htmr`** – Hold-Off Time
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine. Type: numeric string [ms].
   Type: numeric string [ms]
   Range: For high order path protection groups, the range is: 0 – 99 ms in 1 ms steps and 100 – 10000 ms in100 ms steps. For low order path protection groups, the range is: 0, 25, 50, 75 ms (thus in steps of 25 ms) and 100 – 10000 ms in 100 ms steps.
3. **`newinaid`** – New Input Access Identifier
   This parameter specifies the source aid of the new leg when converting from a point-to-point to a path-protected cross-connect. For removing the path-protection this parameter does not apply and is omitted.
   Type: AID.
   Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID
   No use of the **`all`** or **`usall`** values are allowed.
4. **`newloca`** – New Location-a
   This parameter specifies the new source TID if the *newinaid* is in a BLSR protection group. It specifies that add node which is related to the protection leg input. *newloca* will be stored as the *loca2* parameter.
   The parameter is mandatory, if *in_aid2* is at a BLSR/MS-SPRing protection group

with Automatic Squelch Map Calculation disabled.
The parameter *loca2* (location-a-2) specifies the TID associated with *in_aid2* of the protection leg of a path-protected cross-connection. For the syntax, range and default definition refer to *loca* in “ENT-CRS: Enter cross-connection” (p. 3-1464).
Note that the *loca-2* parameter is omitted if no *in_aid2* has been specified or for non-BLSR cross-connection.
Additional information for this parameter is provided in “RTRV-CRS: Retrieve cross-connection” (p. 3-2306).
Type: TID
Range: 1 to 20 characters

5. **occt** – Original CrossConnect Topology
The parameter cct specifies the original cross-connection topology.
Type: Alphanumeric value set.
Range: 1WAY for one-way unprotected cross-connection. 1WAYPPROT for one-way path-protected cross-connection.
6. **ppgname** – Path Protection Group Name
This parameter specifies the name of the path protection group to be established. For removing the path-protection this parameter does not apply and is omitted. See definition of *ppgname* parameter in “RTRV-CRS: Retrieve cross-connection” (p. 3-2306).
7. **rme** – Protection Reversion
The parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group. The value ENABLE is used if the protection group operates in revertive mode. The value DISABLE is used if the protection group operates in non-revertive mode.
Type: Alphanumeric value set Range: DISABLE in case of protype = 1+1; ENABLE in case of protype = 1xNOPT.
Default: DISABLE, in case of protype = 1+1; ENABLE, in case of protype = 1xNOPT (i.e. protection type 1:1) The protocol = OPTM can only be chosen in case of protype = 1+1, thus default is DISABLE then.
8. **snctype** – SNC Protection Type
This parameter specifies the type of the path protection w.r.t. switch criteria used by the protection state machine. The value SNCI (Inherent) is used if server signal fail is used as switch criteria. The value SNCN (Non-Instrusive) is used if server signal fail and defects supervised by a non-intrusive path monitor are used as switch criteria. The value NA is used if one of the tributary inputs is related to a port operating in SONET mode.
Type: Alphanumeric value set.
Range: SNCI, SNCN, NA.
9. **wtr** – Wait To Restore Time
This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.
Type: numeric string [minute].
Range: 0 – 60.

10. **xcappl** – cross-connection application
    This parameter is a numeric value which indicates the application for which the cross-connection is used in the context of compound cross-connection topologies. The parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection.
    The numeric values are assigned to appropriate text strings (see Range below) and the manager should display these value in case of a "RTRV-CRS: Retrieve cross-connection" (p. 3-2306).

    As a possible assignment proposal the following may serve:

    - 0) Unknown
    - 1) 1-Way Point-to-Point
    - 2) 1-Way Path-Protected
    - 3) 1-Way Adjunct Path-Protected
    - 4) 1-Way Conversion Cross-Connection
    - 10) 2-Way Point-to-Point
    - 11) 2-Way Conversion Cross-Connection
    - 20) UPSR (or SNCP Ring) Add, Drop
    - 21) UPSR (or SNCP) Ring-to-Ring, Single Node Interconnection, Same NE
    - 22) UPSR (or SNCP) Drop, 1-Way Broadcast
    - 23) UPSR (or SNCP Ring) Add, Drop connection (Broadcast)
    - 30) Logical Ring (or SNCP) Add, Drop
    - 40) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Node
    - 41) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Nodes in same NE
    - 42) Ring Interworking, Dual Transmit, BLSR (or MS-SPRing) Terminating Node
    - 50) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring)
    - 51) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring) Nodes in same NE
    - 60) 1-Way Broadcast -- note: this is with N greater than or equal to 2.

    Type: numerical value set.
    Range: {0, 1, 2,…, 255}.
    Default: The default value is 0.
11. **xcnum** – cross-connection number
    This parameter is a multiple digit number, identifying each leg in a specific compound cross-connection. (Compound cross-connection are a composition of several atomic cross-connection in order to form complex scenarios like e.g. described in ″Example input/output″ section of the **RTRV-CRS** command like UPSR,

DRI etc.).

Like the *xcappl* parameter the *xcnum* parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection. It may be used by a manager to characterize and group cross-connections belonging to complex cross-connection topology (e.g. compound cross-connections as used in ring interworking scenarios).

The following format for the twelve digits is recommended:

- two digits for the bay
- one digit for the shelf
- two digits for the slot
- two digits for the port
- three digits for the high-order tributary
- two digits for the low-order tributary.

If a high-order tributary is addressed then the last two digits are set to 00. The digits values pertain to the *out_aid*.

Type: numeric value set (12 digit).

Range: 000000000000 … 999999999999.

Default: The default value is 000000000000.

Output format

If the **CNVT-CCT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Notification of cross-connection related changes

Because the CNVT-CCT can be understood as a sequence consisting of a DLT-CRS operation followed by an ENT-CRS operation, a (separate) CNVT-CCT notification does not exist. Instead a DLT-CRS notification is sent, followed by an ENT-CRS notification.

Refer also to the section detailed behavior of DLT-CRS and ENT-CRS.

Keep in mind that the attribute *in_aid2* is a part of the key / identifier for the path-protection group, and therefore the above described deletion and creation sequence is a proper approach in order to notify the performed DB changes.

The ENT-CRS notification includes already information about the changed *repleg* status.

Notification of protection group related changes

The ENT-CRS operation affects subsequently also the protection area, i.e.in case of entering a path-protected cross-connection a path protection group will be established. Thus two independent notifications are generated: ENT-CRS notification and a ENT-PROTN-GRP notification.

The DLT-CRS operation affects subsequently also the protection area, i.e. in case of removing a path-protected cross-connection a path protection group will be deleted. Thus two independent notifications are generated: DLT-CRS notification and a DLT-PROTN-GRP notification.

Transaction behavior

For the **`CNVT-CCT`** command the validation is performed before the COMPLD is returned. This means it has to be checked if the DLT-CRS as well as the following ENT-CRS can be performed successfully, before the entire command is executed. With this approach it is guaranteed that the command either is rejected or succeeds as a whole by executing the deletion- AND the entering-operation.

For the detailed validation rules refer to the chapter ’error responses’ below.

Updated affected entities: 1way, 2way cross-connection, path-protected cross-connection

The establishing of a path-protection group on a possibly existing 2-way cross-connection leads to a conversion to a 1-way path-protected cross-connection plus a separate 1-way cross-connection for the return direction. A similar split-up happens when deleting one direction of a 2-way cross-connection. Therefore refer to section ″Detailed behavior description″ of the DLT-CRS notification.

After deletion of a path-protection group the remaining 1-way cross-connection may have an equivalent return leg. Then both will be merged in a 2-way cross-connection. A similar merge happens when a cross- connection is established to which already an equivalent return leg is existing. Therefore refer to section ″Detailed behavior description″ of the ENT-CRS notification.

Auto-substructuring and auto-desubstructuring of HO tributaries

If a leg of a low-order cross-connection is being created or deleted due to a topology conversion command then:

- in the case of cross-connection leg creation: the related HO tributary gets properly auto-substructured if the HO tributary is not already substructured. HO PTFs which support only LO but no HO connectivity are not explicitly substructured
- in the case of cross-connection leg deletion: the related HO tributary gets properly auto-desubstructured if the HO tributary has been auto-substructured (i.e. substr = YES). HO PTFs which support only LO but no HO connectivity are not desubstructured. Cross-connection leg creation occurs during conversion to 1WAYPROT, deletion during conversion to 1WAY.

Auto-reconfiguration of the PTF substructure (SDH only)

If a leg of a low-order SDH cross-connection is being created due to a topology change (to 1WAYPROT) such that a new third of substructured HO tributary gets involved which does not match the rate, then this third of the substructure gets adapted as specified in section"Low-order cross-connection specific behavior - Auto-reconfiguration of the PTF substructure (SDH only)" (p. 3-1478) of "ENT-CRS: Enter cross-connection" (p. 3-1464). It does not matter whether the new third is part of the same HO tributary or not. Pre-condition for this auto-adaption is still that all affected LO tributaries are not yet involved in a cross-connection before the topology conversion command is executed.

Mandatory, optional and not allowed parameters

- for converting to a higher-order non-pathprotected cross-connection
  - the following parameters must be present: *in_aid2*, *cct*, *occt*
  - the following parameters must not be present: *htmr*, *newloca*, *rme*, *snctype*, *wtr*
  - the following parameters may be present: *newinaid*, *ppgname*
- for converting to a lower-order non-pathprotected cross-connection
  - the following parameters must be present: *in_aid2*, *cct*, *occt*
  - the following parameters must not be present: *htmr*, *newloca*, *rme*, *snctype*, *wtr*, *pgname*, *newinaid*
- for converting to a higher-order pathprotected cross-connection with *newinaid* at a port that is **not** in a BLSR/MS-SPRing protection group,
  - the following parameters must be present: *cct*, *htmr*, *newinaid*, *occt*, *rme*, *snctype*, *wtr*
  - the following parameter must not be present: *in_aid2*, *newloca*
  - the following parameter may be present: *ppgname*

- for converting to a higher-order pathprotected cross-connection with *newinaid* at a port that is part of a BLSR/MS-SPRing protection group,
  - the following parameters must be present: *cct*, *htmr*, *newinaid*, *occt*, *rme*, *snctype*, *wtr*, *newloca* (only mandatory if Automatic Squelch Map Calculation is disabled)
  - the following parameter must not be present: *in_aid2*
  - the following parameter may be present: *ppgname*
- for converting to a low-order pathprotected cross-connection without nesting BLSR/MS-SPRing
  - the following parameters must be present: *cct*, *htmr*, *newinaid*, *occt*, *rme*, *snctype*, *wtr*
  - the following parameters must not be present: *in_aid2*, *newloca*, *ppgname*
- for converting to a low-order pathprotected cross-connection with nesting BLSR/MS-SPRing
  - the following parameters must be present: *cct*, *htmr*, *newinaid*, *newloca*, *occt*, *rme*, *snctype*, *wtr*
  - the following parameters must not be present: *in_aid2*, *ppgname*

Example input/output

Example 1:

Suppose the following existing non-BLSR 1way vc3-cross-connection

1-1-#-#-1-1-3 -> 1-1-#-#-5-1-17

is protected by the new leg

1-1-#-#-2-1-3 -> 1-1-#-#-5-1-17

also being a non-BLSR cross-connection. This would be accomplished via:

```
CNVT-CCT-VC3:UNITE-NE:1-1-#-#-1-1-3,1-1-#-#-5-1-17:123456:::
occt=1WAY,cct=1WAYPPROT,newinaid=1-1-#-#-2-1-3,
ppgname=”group018”,rme=ENABLE,snctype=SNCN,htmr=100,wtr=5;
```

```
   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 2:

Suppose the following existing path-protected vc3-cross-connection:

1-1-#-#-1-1-3 -> 1-1-#-#-5-1-17 working leg

1-1-#-#-2-1-3 -> 1-1-#-#-5-1-17 protection leg is changed into an unprotected cross-connection via the working leg. This would be accomplished via:

```
CNVT-CCT-VC3:UNITE-NE:1-1-#-#-1-1-3,1-1-#-#-5-1-17:123456::1-1-#-#-2-1-
      3:occt=1WAYPPROT,cct=1WAY;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 3:

Suppose the following existing path-protected vc3-cross-connection:

1-1-#-#-1-1-3 -> 1-1-#-#-5-1-17 working leg

1-1-#-#-2-1-3 -> 1-1-#-#-5-1-17 protection leg

is changed into an unprotected cross-connection via the protection leg. This would be accomplished via:

```
CNVT-CCT-VC3:UNITE-NE:1-1-#-#-2-1-3,1-1-#-#-5-1-17:123456::1-1-#-#-1-1-
      3:occt=1WAYPPROT,cct=1WAY;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example3 Notification behavior:

First the deletions of the path protected cross-connection and the protection group are notified, then the creation of the 1WAY cross-connection is notified with the previous protection leg as input tributary:

DLT-CRS-VC3:1-1-#-#-1-1-3,1-1-#-#-5-1-17:1WAYPPROT,1-1-#-#-2-1-3;

DLT-PROTN-GRP:1-1-#-#-5-1-17:PATHDRI;

ENT-CRS-VC3::1-1-#-#-2-1-3,1-1-#-#-5-1-17:1WAY, …

Example 4:

The following lower order 1way vc3-cross-connection:

1-1-#-#-1-2-1-1 -> 1-1-#-#-5-2-16-22 is protected by the new leg

1-1-#-#-2-2-4-1 -> 1-1-#-#-5-2-16

Example 43 Notification behavior:

If the cross-connection conversion at LOVC3 rate causes the auto-substructuring of a HO NIM entity then first the creation of the default substructure (6312) will be reported. After then, an auto-reconfiguration of the PTF substrcuture will take place in order to adapt the affected third to LOVC3. This causes the following notifications:

ED-VC3:1-1-#-#-2-2-4::substr=YES;

ENT-PTF:1-1-#-#-2-2-4::inputsig=6312,unequiposig=6312,…

ENT-LONIM:1-1-#-#-2-2-4-1&&-63::pmlpfeses=600,pmlpneses=600,…

ED-PTF:1-1-#-#-2-2-4::inputsig=13-4212;

ED-LONIM:1-1-#-#-2-2-4-1::pmlpfeses=2400,pmlpneses=2400;

The following notifications are for cross-connection deletion/creation caused by the **CNVT-CCT** command:

DLT-CRS-LOVC3::1-1-#-#-1-2-1-1,1-1-#-#-5-2-16-22:::1WAY;

ENT-CRS-LOVC3::1-1-#-#-1-2-1-1,1-1-#-#-5-2-16-22:::1WAYPROT,1-1-#-#-2-2-4-1:

repleg=1WAYPSW …

ENT-CRS-LOVC3::1-1-#-#-2-2-4-1,1-1-#-#-5-2-16-22:::1WAYPROT,1-1-#-#-1-2-1-1:

repleg=1WAYPSP …

and for protection group creation: ENT-PROTN-GRP:1-1-#-#-5-2-16-22::PATHDRI:protn=1-1-#-#-2-2-4-1,wkg=1-1-#-#-1-2-1-1, …

Error responses

The **CNVT-CCT** procedure can be conceptually understood as a sequence consisting of a **DLT-CRS** operation followed by an **ENT-CRS** operation. Therefore some of the validation rules of **DLT-CRS** and **ENT-CRS** shall apply also here. This means also that if one of the below listed **CNVT-CCT** validation rules would fail to meet a criteria the same or at least a similar command denial as specified in “DLT-CRS: Delete cross-connection” (p. 3-145) and “ENT-CRS: Enter cross-connection” (p. 3-1464) section will be the consequence.

Validation rules relevant for path-protection which differ:

- check of provisioned topology parameters against existing atomic topology,
- check of existence of an cross-connection via the (future respectively current) working leg.

Adaptation of validation rules

In general the validation rules of **DLT-CRS** (as stated in “DLT-CRS: Delete cross-connection” (p. 3-145)) and **ENT-CRS** (as stated in “ENT-CRS: Enter cross-connection” (p. 3-1464)) apply. However, if an atomic cross-connection will remain finally unchanged then for this part no validation rule must be performed. The full list of validation rules from the **DLT-CRS** / **ENT-CRS** area is given in the following requirements.

In general, the validation rules of **DLT-CRS** apply in case of removing a path-protection. However the check shall skip that the cross-connection of the working leg should have been removed before.

In general, the validation rules of **ENT-CRS** apply in case of establishing a path-protection. However the check shall allow that a cross-connection via the working leg has already been set up.

Validation rule: No HO cross-connections while LO cross-connections, substructure or conversion cross-connections exist

If the high-order tributaries specified in the high-order cross-connection command are substructured or LO cross-connections or conversion cross-connections exist at the HO tributaries, then the command is denied.

Error code:
`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: *newinaid* must not be involved in conversion cross-connections

If the parameter *newinaid* specifies

- a LO tributary which is used for a conversion cross-connection or
- a LO tributary which is related to a PTF where already another LO tributary is used for a conversion cross-connection, then the command is denied.

Error code:
`SNVS – Status, Not in Valid State, conversion cross-connections are still existing`

Validation rule: HO tributaries must exist

Cross-connection command processing shall verify the logical tributaries specified in the command do exist.

Error code:
`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

Note the equivalence to the related ENT-CRS and DLT-CRS validation rules.

Validation rule: LO tributary must exist/be creatable

Cross-connection command processing shall verify that the low-order tributaries specified in the command do exist or can be properly created. For modifier LOVC3 a tributary boundary check is included, i.e. only the LO tributary numbers 1, 22, 43 are allowed.

Error code:

`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

A connectable low-order entity may exist or not.

The existence is verified if:

- the LO NIM entity
- the HO PTF entity has a matching *inputsig* parameter (if used as input),
- the HO PTF entity has a matching *unequiposig* parameter (if used as output).

The possibility to create a related entity is verified if:

- the interface standard of the related port and the rate of the related HO NIM or HO PTF matches the cross-connect modifier (SDH/VC4 in case of LOVC3, LOVC12; SONET/STS1 in case of LOVT1)
- the HO NIM or HO PTF is not yet involved in any type of HO cross-connection*)
- the HO NIM is not yet substructured (parameter *substr* = NO)

The already cross-connected LO tributaries must exist. A newly added LO tributary may exist or may be creatable (thus not yet existing). Refer to "ENT-CRS: Enter cross-connection" (p. 3-1464) for examples.

*) this means:

- neither cross-connected, nor looped back, nor involved in a remote test access session.

Validation rule: Entity must be adaptable for LO cross-connections

Cross-connection command processing shall verify that the low-order tributary specified in newinaid can be properly created by adaptation of the existing substructure. For modifier LOVC3 a tributary boundary check is included, i.e. only the LO tributary numbers 1, 22, 43 are allowed.

Error code:

`IENE – Input, Entity Not Exists, Substructure cannot be adapted`

Validation rule: Entity (cross-connection) must exist

Cross-connection command processing shall verify that the specified cross-connection exists. This includes the check that the cross-connection rate matches the specified rate.

Error code:

`IENE – Input, Entity Not Exists, Specified crossconnection does not exist`

Note the equivalence to the related ENT-CRS and DLT-CRS validation rules.

Validation rule: LO cross-connection with specified topology must exist

Cross-connection command processing shall verify for lower order cross-connections that a lower order cross-connection with the specified topology (parameter occt)exists.

Error code:

`IENE – IENE – Input, Entity Not Exists, Specified crossconnection does not exist`

Note the equivalence to the related ENT-CRS and DLT-CRS validation rules.

Validation rule: Topology conversion command must be consistent

The spec block parameters *occt* and *cct* must be both provided and different.

Error code:

`IDNC – Input, Data, Not Consistent, no allowed topology conversion`

Validation rule: Only those parameter present which are needed

Cross-connection command processing shall verify according to the given context only those parameter are present which are needed for that context.

This means that

- for converting to a higher-order non path-protected cross-connection the following parameter must not be present:
  htmr, *newloca*, *rme*, *snctype*, *wtr*
- for converting to a lower-order non path-protected cross-connection the following parameter may be present:
  htmr, *newloca*, *rme*, *snctype*, *wtr*, *ppgname*, *newinaid*
- for converting to a higher-order path-protected cross-connection with *newinaid* at a port that is **not** in a BLSR/MS-SPRing protection group, the following parameters must not be present:
  in_aid2, *newloca*
- for converting to a higher-order path-protected cross-connection with *newinaid* at a port that is part of a BLSR/MS-SPRing protection group, the following parameters must not be present:
  in_aid2
- for converting to a lower-order path-protected cross-connection **without** nesting BLSR/MS-SPRing, the following parameters must not be present:
  in_aid2, *newloca*, *ppgname*
- for converting to a lower-order path-protected cross-connection **with** nesting BLSR/MS-SPRing, the following parameters must not be present:
  in_aid2, *ppgname*

Error code:

`SNVS – Status, Not in Valid State, Parameter(s) present which are not allowed`

CNVT-CCT: *ppgname* usage:

It is not possible for CNVT-CCT to identify the high-order path-protection group by the *ppgname* only. It has been excluded here. Reason: at least for a CNVT-CCT command with the order to create a protection group this is not sufficient to restrict it to a single cross-connection, as the *ppgname* may not be uniquely defined and therefore this might result in actions not desired by the operator.

Validation rule: New tributary rate validity

If converting to a path-protected cross-connection then the cross-connection command processing shall verify that the specified cross-connection rate is equivalent to the provisioned signal rate of the new input tributary identified by newinaid, as determined by the tributary input signal rate parameter.

Error code:

`IDNC – Input, Data, Not Consistent, Specified new Tributary does not support the indicated rate`

Note that for HO cross-connections it does not matter if the tributary signal rate is given for the SONET- (STS1/STS3/…) or the SDH-interface standard (VC3/VC4).

As an example: It is possible to enter a cross-connection via ENT-CRS-VC4… between two tributaries related to tributary signal rates given by VC4/VC4 or by VC4/STS3 or by STS3/STS3; Thus the inputsig/unequiposig-values for SDH (3, 4, 4c, 16c, 64c) are identical to those of SONET (1,3,12,48,192) seen from a cross-connection perspective.

For simplicity also the full validation rule of ENT-CRS may be executed.

For LO cross-connections, this validation is covered by the check, whether the LO substructure is adaptable to the new input tributary rate.

Validation rule: path-protected cross-connection has unique input AIDs

If converting to a path-protected cross-connection then the cross-connection command processing shall verify that for path-protected cross-connections the new input tributary identified by newinaid is different from *in_aid*.

Error code:

`IDNV – Input, Data Not Vaild, Both input tributaries are identical`

Note the equivalence to the related ENT-CRS validation rule.

Validation rule: Restrictions for conversion to LO path protection

If a low-order 1WAY cross-connection is converted to a path protected cross-connection, and the input tributary of the 1WAY cross-connection (in_aid) is already used as input tributary for another, already existing path protection, then the conversion is only allowed if: the specified input tributary (in_aid) of the 1WAY cross-connection is the working input tributary of the existing path protection AND the specified new input tributary (newinaid) is the protection input tributary of the existing path protection.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: Restrictions for LOXC cross-connection sources

If converting to a pathprotected cross-connection then the cross-connection command processing shall verify that the new input tributary identified by newinaid shall not reside: on the OPT2G5 pack, on the EP51 pack (DS3 and EC1 interfaces), on the GE1 pack, on the GE10PL1 pack, on the ES64U pack, at a port of any pack not being configured with portClass as TRADITIONAL or EDGE.

Error code:

`IDNC – Input, Data Not Consistent, Specified Tributary cannot be used for LOXC connections`

Validation rule: Spare capacity for HO cross-connection legs on LOXC

If converting to a pathprotected cross-connection then the cross-connection command processing shall deny the command if the new input low-order tributary belongs to a HO tributary which cannot be connected to the LO switch matrix as part of its substructuring.

Error code:

`IDNC – SARB – Status, All Resources Busy, LOXC capacity exhausted`

Validation rule: path-protected cross-connection has inputs from ports with same interface standard

If converting to a path-protected cross-connection then the according validation rule of ENT-CRS is executed.

Error code:

`SNVS – Status, Not in Valid State, Different interface standards for input tributaries`

Validation rule: No trib of any MSP port as *newinaid* for LO pathprotected cross-connection

If converting to a lower order pathprotected cross-connection, the command processing shall verify that the old tributary identified by *in_aid* and the new tributary identified by as *newinaid* do not belong to a 1+1 or 1:1 multiplex section/line protection group.

Error code:

`SNVS – Status, Not in Valid State, trib of MSP 1+1/1x1 port as input-trib in pathprotected LO cross-connection`

For simplicity also the full validation rule of ENT-CRS may be executed.

Validation rule: No trib of any MSP 1x1 protection port as *newinaid* for HO pathprotected cross-connection

If converting to a higher order path protected cross-connection, the cross-connection command processing shall verify that the old tributary identified by *in_aid* and the new tributary identified by as *newinaid* do not belong to a protection port of a 1:1 multiplex section/line protection group.

Error code:

`SNVS – Status, Not in Valid State, trib of 1x1 protection port as input-trib in pathprotected cross-connection`

Validation rule: no multiple added XCs for MS-SPRing TOP

If converting to a path-protected cross-connection then the according validation rule of ENT-CRS is executed.

Error code:

`SNVS – Status, Not in Valid State, multiple added XCs for MS-SPRing TOP`

Validation rule: Supported MS-SPRing/BLSR DNI/DRI

If converting to a path-protected cross-connection then the according validation rule of ENT-CRS is executed.

Error code:

`SNVS – Status, Not in Valid State, unsupported MS-SPRing/BLSR DNI/DRI`

Validation rule: path-protected cross-connection: parameters missing

Cross-connection command processing shall deny the conversion to a pathprotected cross-connection if one of the mandatory parameters *htmr*, *newinaid*, *rme*, *snctype* or *wtr* is missing.

Error code: `IPMS -Input, Parameter Missing, <parameter name> missing`

Validation rule: No cross-connection loopback existing

If executing the **`CNVT-CCT`** command in order to establish a path protection then the new leg identified by the tributary newinaid must not have an existing cross-connection loopback.

Error code:

`SNVS – Status, Not in Valid State, new Tributary has existing loopback`

NOTE: There is no command validation concerning facility loopback i.e. the cross-connection establishing is possible even with a facility loopback present.

Validation rule: Tributaries not used in a test access session

If executing the **`CNVT-CCT`** command in order to establish a path protection then the new leg identified by the tributary newinaid and the tributaries involved in the existing cross-connection must not be used in a test access session either as tributary under test or as test access tributary.

Error code:
`SNVS – Status, Not in Valid State, tributaries used in test access session`

Validation rule: Restrict number of cross-connection using same input tributary

If converting to a path-protected cross-connection then the according validation rule of **`ENT-CRS`** is executed.

Error code:
`SNVS – Status, Not in Valid State, Too many crossconnection originating from same tributary`

Validation rule: BLSR/MS-SPRing protection access (Extra Traffic)

If converting to a path-protected cross-connection then the according validation rule of **`ENT-CRS`** is executed.

Error code:
`SNVS – Status, Not in Valid State, Command refers to protection tributaries of a BLSR/MS-SPRing protection`

Validation rule: *newloca* not provisionable for Extra Traffic

Cross-connection command processing shall deny commands, if cross-connections have protection tributaries of ports in BLSR/MSSPRing protection groups involved (Extra Traffic), and *newloca* is specified in the command.

Error code:
`IDNC – Input, Data Not Consistent, It is not allowed to specify loca/locz for EXTRA TRAFFIC`

Validation rule: No connections between BLSR/MS-SPRing working and protection tribs

If converting to a path-protected cross-connection then the according validation rule of **`ENT-CRS`** is executed.

Error code:
`IDNC – Input, Data Not Consistent, Connections between BLSR/MS-SPRing working and protection tributaries are not allowed`

Validation rule: No low-order connection with 4 fiber BLSR/MS-SPRing ports

If converting to a path-protected cross-connection then the according validation rule of **`ENT-CRS`** is executed.

Error code:
`IDNC – Input, Data Not Consistent, No low-order path protection with input tributaries from 4-fiber BLSR/MS-SPRing ports`

Validation rule: No low-order path protection input tributaries from the protection bandwith of 2-fiber MS-SPRing/BLSR protection

If converting to a path-protected cross-connection then the according validation rule of **ENT-CRS** is executed.

Error code:

`IDNC – Input, Data Not Consistent, No low-order path protection with input tributaries from 2 fiber MS-SPRing/BLSR protection`

Validation rule: SNC type compliance

If converting to a path-protected cross-connection then the according validation rule of **ENT-CRS** is executed.

Error code:

`IDNC – Input, Data, Not Consistent, SNC Type not compliant with existing pathprotected crossconnection`

Validation rule: No VCG-trib as *in_aid* (for pathprotected cross-connection)

If converting to a path-protected cross-connection then the according validation rule of **ENT-CRS** is executed.

Error code:

`IDNC – Input, Data, Not Consistent, VCG-trib as input-trib in pathprotected crossconnection`

Validation rule: Maximum number of *ppgnames* exceeded

If changing or entering the parameter *ppgname* then the according validation rule of **ENT-CRS** is executed.

Error code:

`SSRE – Status, System Resources Exceeded, limit of ppgnames exceeded`

Validation rule: No lower order TransMUX cross-connections when LO switch capacity is lower than 40G

When creating lower-order TransMUX cross-connections, the command processing shall verify that the low-order switching capacity of the LOXC pack in the system is greater or equal to 40 Gbit/s.

Error code:

`SNVS – SNVS – Status, Not in Valid State, LOXC switch capacity invalid`

Validation rule: Cross-connection must not be of *xconcls* NN

Cross-connection command processing shall verify, that the cross-connection is not of *xconcls* = NN.

Error code:

`SNVS – Status, Not in Valid State, Cross-connection must not be of xconcls NN`

Validation rule (ONNS specific): Tributaries must not belong to ports of *portClass* INNI

Cross-connection command processing shall verify, that a new input tributary does not belong to a port of *portClass* INNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass INNI`

Validation rule (ONNS specific): LO Tributaries must not belong to ports of *portClass* INNI

For low-order cross-connections, cross-connection command processing shall verify that a new input tributary does not belong to a port of *portClass* INNI.

Error code:

`IDNC – Input, Data Not Consistent, Tributaries must not be on ports of portClass INNI`

Validation rule (ONNS specific): Tributaries must not belong to ports of *portClass* UNI

Cross-connection command processing shall verify, that a new input tributary does not belong to a port of *portClass* UNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass UNI`

Validation rule (ONNS specific): LO Tributaries must not belong to ports of *portClass* UNI

For low-order cross-connections, cross-connection command processing shall verify that a new input tributary does not belong to a port of *portClass* UNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass UNI`

Validation rule (ONNS specific): Tributaries must not belong to ports of *portClass* ENNI

Cross-connection command processing shall verify, that a new input tributary does not belong to a port of *portClass* ENNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass ENNI`

Validation rule (ONNS specific): LO Tributaries must not belong to ports of *portClass* ENNI

For low-order cross-connections, cross-connection command processing shall verify that a new input tributary does not belong to a port of *portClass* ENNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass ENNI`

Validation rule (ONNS specific): Restrict number of crossconnection using same input tributary on EDGE port

Cross-connection command processing shall verify that the number of cross-connections originating from the same tributary is restricted to two, if the affected port is of port class EDGE.

Error code:

`SNVS – Status, Not in Valid State, Too many crossconnection originating from same tributary`

CONN-TACC: Connect test access

General

The **CONN-TACC** command is used to initiate a test access session and to connect the test access tributaries.

Remote test access is *not* supported for

- SDH lower-order tributaries (VC-12, and lower-order VC-3).
- 1+1 MSP/APS, SNCP/UPSR and MS-SPRing/BLSR protection schemes

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T4

Priority: 1

Abortable: No

Input format

Command syntax: **CONN-TACC**-*modifier:tid:tatrib1:ctag:::spec_block;*

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection rate on which the connect test access command is to act.
   Type: Alphanumeric value set.
   Range:
   - SDH modifier: VC3, VC4, VC44C, VC416C, VC464C
   - SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.
2. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **tatrib1** – primary Test Access tributary
   AID of the primary Test Access tributary. The keyword **all** is not allowed on any level.
   Type:AID
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.
4. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`etrib`** – AID of the E-tributary
   AID of the E-tributary for the test session.
   Type: AID.
   Range: GenTribAID or GenLOTribAID
   The usage of **`all`** or **`usall`** or **`vall`**-values at any position of the aid is not allowed.
2. **`ftrib`** – AID of the F-tributary
   AID of the F-tributary for the test session. If there is no cross-connection at the E-tributary, this parameter is omitted.
   Type: AID.
   Range: GenTribAID or GenLOTribAID.
   The usage of **`all`** or **`usall`** or **`vall`**-values at any position of the aid is not allowed.
3. **`tatrib2`** – secondary Test Access Tributary
   AID of the secondary test access tributary. In the case of test access modes with single test tributary the parameter is omitted.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **`all`** or **`usall`** or **`vall`**-values at any position of the aid is not allowed.
4. **`tstmde`** – Test Access Mode
   Type: Alphanumeric value set.
   Range: Allowed values:
   - MONE – Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.
   - MONF – Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.
   - MONEF – Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a two-way cross-connection.

Output format

The NE returns the following normal completion response to a successful **`CONN-TACC`** command if there are no failure conditions to report:

```
   sid date time
M  ctag COMPLD
;
```

Detailed behavior description

The **`CONN-TACC`** command is used to establish a test access(es) connection to a tributary or tributaries in the NE.

If the test access session is established as MONE or MONF, the primary test tributary is used. If the test access session is established as MONEF, the primary test tributary is designated for accessing E-end incoming signal and the secondary test tributary is designated for accessing F-end incoming signal.

If there is no connection on E-end tributary, the F-end tributary AID parameter is omitted.

If there are one or more cross-connections established on E tributary, the F-end tributary AID parameter is required to be entered.

In addition to the **`CONN-TACC`** notification, an **`ED-CRS`** notification is sent to report the changed parameter values *taccstat* and *rtntaccstat*.

Update of affected entities when establishing a LO-test access session

When establishing a LO-test access session it may happen that the involved tributaries (LO test access tributaries or E-tributary or F-tributary) are not yet existing due to either a non-fitting substructure of the related HO-tributary or a missing HO-PTF.

In this case the **`CONN-TACC`** command shall create the necessary substructure or adapt an already existing substructure. For these side effects the same rules as for creating a LO-cross-connection is applied.

Note: Wrong error code when setting up a LO Remote Test Access session where not all involved tributaries are different.

Setting up a LO Remote Test Access (RTA) session is rejected if some or all of the AIDs of the primary and secondary test access tributary and the E-trib and F-trib are identical. The NE rejects such requests but uses a wrong error code. Instead of

`IDNV – Input, Data Not Valid, all tributaries must be different`

it returns

`IEAE – Input, Entity Already Exists, cross-connection exists on test tributary`

Example input/output

```
CONN-TACC-STS1:LT-UNITE:1-1-#-#-4-1-1:123456:::ETRIB=1-1-#-#-15-1-1,FTRIB=1-1-#-#-16
      -1-1,TSTMDE=MONE;
   LT-UNITE 02-10-01 16:39:52
M  123456 COMPLD
;
```

LO test session invocation:

```
CONN-TACC-LOVT1:LT-UNITE:1-1-#-#-4-1-1-28:123456:::\
ETRIB=1-1-#-#-15-1-1-28,FTRIB=1-1-#-#-16-1-1-28,TSTMDE=MONE;
   LT-UNITE 02-10-01 16:39:52
M  123456 COMPLD
```

;

Error responses

Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417)command error responses section. The error responses listed there also apply to the **CONN-TACC** command.

Validation rule: Missing F tributary

If the NE receives a **CONN-TACC** command in which there are one or more cross-connection using the E tributary as input and *ftrib* is not specified, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid, missing F tributary`

Validation rule: E tributary and F tributary not cross-connected

If the NE receives a **CONN-TACC** command with an F tributary specified and there is no cross-connection between the E and the F tributaries, the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, E and F tributaries not cross-connected`

Validation rule: MONF or MONEF test access mode not allowed on a one-way cross-connection from E to F tributary

If the NE receives a **CONN-TACC** command with MONF or MONEF as test access mode when there is a one-way cross-connection on E to F tributaries, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid, invalid test access mode`

Validation rule: Cross-connection exists on the test tributary

If the NE receives a **CONN-TACC** command with a test tributary that has an existing cross-connection, the following error response is returned:

Error code:
`IEAE – Input, Entity Already Exists, cross-connection exists on test tributary`

Validation rule: Test tributary already connected

If the NE receives a **CONN-TACC** command with a test tributary that has an existing test access connection (to E and/or F tributary(s)) or if the **CONN-TACC** command is executed again with same or different attributes on the same test tributary, the following error response is returned:

Error code:
`IEAE – Input, Entity Already Exists, test access connection exists`

Validation rule: No test access session

Test Access command processing shall deny commands requesting to setup a test access session with a test tributary or E tributary or F tributary which is already used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, Tributary used in test access session`

Validation rule: Test tributary or E or F tributary in a loopback

If the NE receives a **`CONN-TACC`** command with a test tributary or E or F tributary currently in a loopback, the following error response is returned:

Error code:

`SNVS – Status, Not in Valid State, Tributary has existing loopback`

Validation rule: Secondary test tributary not needed for MONE test modes

If the NE receives a **`CONN-TACC`** command with a secondary test tributary value for a MONE test access mode, the following error response is returned:

Error code:

```
INUP – Input, Non-null Unimplemented Parameter, secondary test
tributary not allowed
```

Validation rule: Pack restrictions for primary and secondary HO test access tributary

Test access command processing shall verify that the specified primary and secondary HO test access tributaries do not reside on:

- the OPT2G5 pack
- the OP40 pack
- the GE1 pack
- the GE10PL1 pack
- the TMUX2G5 pack
- the ES64U pack

Error code:

```
IDNC – Input, Data Not Consistent, primary/secondary test access
tributary not supported by that pack
```

Validation rule: Pack restrictions for primary and secondary LO test access tributary

Test access command processing shall verify that the specified primary and secondary LO test access tributaries do not reside on:

- the OPT2G5 pack
- the OP40 pack

- the EP51 pack (DS3 and EC1 interfaces)
- the GE1 pack
- the GE10PL1 pack
- an asynchronous ACG port of the TMUX2G5 pack
- the ES64U pack

Error code:

`IDNC – Input, Data Not Consistent, primary/secondary test access tributary not supported by that pack`

Validation rule: Pack restrictions for LO tributaries under test

The test access command processing verify that the specified primary and secondary LO test access tributaries do not reside on:

- the OPT2G5 pack
- the EP51 pack (DS3 and EC1 interfaces)
- the GE1 pack
- the GE10PL1 pack
- an asynchronous ACG port of the TMUX2G5 pack
- the ES64U pack

Error code:

`IDNC – Input, Data Not Consistent, LO tributary not supported by that pack`

Validation rule: Tributaries must exist for HO TACC sessions

If the network element receives a **CONN-TACC** command with a high-order test tributary E or F that does not exist, the following error response is returned:

Error code:

`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: No HO TACC sessions while LO cross-connection, substructure or conversion cross-connection exists

If the high-order tributaries specified in the high-order test access command are substructured or LO cross-connections or conversion cross-connections exist at the tributaries, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Entities must fit LOXC interface standard

Test access command processing shall verify that the specified modifier and the given aid's fit to the LOXC overall interface standard, i.e. the value of the parameter lostd related to the active LOXC pack.

Error code:

`IDNV – Input, Data Not Valid, Low-order test access sessions of this interface standard not supported`

Validation rule: Restrictions for LO SONET test access rates

For low-order SONET test access sessions command processing shall verify that the rates of the HO NIM/PTFs fit to the modifier parameter as follows: LOVT1 requires STS1 HO NIMs or TMSSTS1 HO PTFs.

Error code:

`IDNC – Input, Data Not Consistent, Specified Tributary does not support the indicated rate`

The existence of an STS1 HO NIM can be verified by checking the *inputsig*, *unequiposig* and *istd* parameters of the related port. Example: If the first HO NIM of a port needs to be successfully checked then the related port parameters should read as follows:

- *inputsig* starting with N1-… (N is a number of STS1 signals),
- *unequiposig* starting with N1-… (N is a number of STS1 signals),
- *istd* equals SONET.

The TMASTS1 HO PTFs exists on the TransMUX, if the parameter *tmuxcap* > 0.

Validation rule: HO tributaries must exist for LO TACC sessions

Cross-connection command processing shall verify that the high-order tributaries specified in the low-order CONN-TACC command do exist.

Error code:

`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

The validation includes the check for provisioned circuit pack, optical module and port.

Validation rule: LO TACC sessions not at HO tributaries used in HO cross-connection

If the network element receives a **`CONN-TACC`** command with a low-order test tributary or E tributary or F tributary relating to a HO tributary which is involved in a HO cross-connection, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State, HO cross-connection exists`

Validation rule: AID boundary and rate consistency

If the NE receives a **`CONN-TACC`** command with a test tributary or E or F tributary that is not consistent with the test access rate, the following error response is returned:

Error code:`IDNC – Input, Data, Not Consistent, Tributary boundary is inconsistent with the indicated rate`

Consistency implies the following condition:

- The boundary of the specified tributary is consistent with the specified rate
- STS-1/VC-3 payloads can start at any position
- The first (STS-1 equivalent) tributary of an STS-3/VC-4 rate cross-connection must be on a mod3 + 1 boundary (1, 4 ,7, …)
- The first STS-1 of an STS-12/VC-4-4c rate cross-connection must be on a mod12 + 1 boundary (1, 13, 25, …)
- The first STS-1 of an STS-48/VC-4-16c rate cross-connection must be on a mod48 + 1 boundary (1, 49, 97, …)
- The first STS-1 of an STS-192/VC-4-64c rate cross-connection must be on a mod192 + 1 boundary (1, 193, 385, …).

Validation rule: Tributary provisioning and rate consistency

Test access command processing shall verify that:

- if the port identified by logical input AID is provisioned to operate in the fixed signal rate mode, as determined by the tributary mode parameter, then the specified cross-connection rate is equivalent to the provisioned signal rate of the input tributary, as determined by the tributary input signal rate parameter.
- if the port identified by logical output AID is provisioned to operate in the fixed signal rate mode, as determined by the tributary mode parameter, then the specified cross-connection rate is equivalent to the provisioned signal rate of the output tributary, as determined by the tributary unequipped output signal rate parameter.

Note that in both cases it does not matter whether the connected tributaries are SONET (STS1/STS3/…) or SDH (VC3/VC4/…) signals with the same transmission rate.

Error code:

`IDNC – Input, Data Not Consistent, Specified Tributary does not support the indicated rate`

Validation rule: XC pack is (pre-)provisioned

If the NE receives a **`CONN-TACC`** command while no XC pack is pre-provisioned or provisioned, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State, XC Pack not provisioned`

Validation rule: LOXC pack with more than 0G switch capacity

If the network element receives a **CONN-TACC** command for a low-order TACC session while no LOXC pack is provisioned with more than 0G LO switch capacity, then the following error response is returned:

Error code:

`SNVS – Status, Not in Valid State, LOXC switch capacity invalid`

Validation rule: Not allowed for path protected tributaries

If the network element receives a **CONN-TACC** command with E- or F tributary AID belonging to a path protection, the following error response is returned:

Error code:

`SNVS – Status, Not in Valid State, Test Access not allowed with path protected tributaries`

Validation rule: Port used for MS-SPRing/BLSR

If the NE receives a **CONN-TACC** command with a test access tributary on a port which is used in an MS-SPRing/BLSR protection group, the following error response is returned:

Error code:

`SNVS – Status, Not in Valid State, port used for MS-SPRing/BLSR`

Validation rule: Port used for Linear MSP

If the NE receives a **CONN-TACC** command with a test access tributary on a port which is used in a Linear MSP protection group, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State, port used for Linear MSP`

Validation rule: Not allowed for bridged cross-connections

If the network element receives a **CONN-TACC** command with E- or F-tributary used in a bridged cross-connection, the following error response is returned:

Error code:

`IEAE – Input, Entity Already Exists, cross-connection exists on test tributary`

Validation rule: Inconsistent tributary rate

If the NE receives a **CONN-TACC** command which does not match the connection rate of the connection between E and F, the following error response is returned:

Error code:

`IPNC – Input, Parameter Not Consistent, Rate inconsistent with crossconnection rate`

Validation rule: Port used for ONNS application

If the NE receives a **CONN-TACC** command with a test access tributary or a E or F tributary on a port with portClass other than TRADITIONAL the following error response is returned:

Error code:

`SNVS – Status, Not in Valid State, port used for NN application`

Validation rule: All tributaries must be different

If the NE receives a **CONN-TACC** command where two or more of the specified tributaries (test access tributaries, E or F tributary) are identical, the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, all tributaries must be different`

Validation rule: Spare capacity for HO cross-connection legs on LOXC

If the network element receives a **CONN-TACC** command for a low-order TACC session where at least one of the specified tributaries (test access tributaries, E or F tributary) requires a HO tributary to be a newly substructured and this HO tributary cannot be connected to the LO switch matrix because the limit of connectable VC4/STS1 connections is already reached, then the following error response is returned:

Error code: `SARB – Status, All Resources Busy, LOXC capacity exhausted`

Validation rule: No low-order TACC sessions with LOXC/1

If the network element receives a **CONN-TACC** command for a low-order TACC session, it shall verify that the low-order switching pack currently used by the system is not of type LOXC/1.

Error code:

`SNVS – Status, Not in Valid State, low-order test-access sessions not allowed with LOXC/1`

CONN-TACC notification

Output format

The **CONN-TACC** notification has the following specific syntax:
CONN-TACC-*modifier:tatrib1::spec_block;*

Output parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection rate on which the connect test access command is to act.
   Type: Alphanumeric value set.
   Range:
   - SDH modifier: VC3, VC4, VC44C, VC416C, VC464C
   - SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.
2. **tatrib1** – primary Test Access Tributary
   AID of the primary Test Access tributary. The keyword **all** is not allowed on any level.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.

Spec block parameters

1. **etrib** – AID of the E-tributary
   AID of the E-tributary for the test session.
   Type: AID.
   Range: GenTribAID or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.
2. **ftrib** – AID of the F-tributary
   AID of the F-tributary for the test session. If there is no cross-connection at the E-tributary, this parameter is omitted.
   Type: AID.
   Range: GenTribAID or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.
3. **tatrib2** – secondary Test Access Tributary
   AID of the secondary Test Access Tributary. In the case of test access modes with single test tributary the parameter is omitted.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.
4. **tstmde** – Test Access Mode
   Type: Alphanumeric value set.

Range:

- MONE (default): Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.
- MONF: Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.
- MONEF: Monitor E-end and F-end mode of test access. This test access mode monitors (E-end and F end) both directions of a two-way cross-connection.

;
```

COPY-RFILE: Copy remote file

The **COPY-RFILE** command can be used to initiate remotely a file transfer to/from an NE. The file transfer is intended to download a new software generics to the NE.

The actual file transfer can use the following file transfer applications:

- FTAM
- FTP
- FT-TD (file transfer translation device)
  and is determined by the use of the *src* and *fttd* parameters.

The **COPY-RFILE** was introduced on customer request. The differences to **CPY-MEM** are:

- A confirmation or rejection message is immediately returned by the system
- The progress and the result of the remote file transfer are reported by the autonomous message **REPT EVT FXFR**

The **COPY-RFILE** command can be used to download a database (DB DOWNLOAD). It can be activated in a separate step with the **APPLY** command.

Note: The support of a certain file transfer application is release specific and additionally dependent on the network configuration (e.g. when one GNE is configured to be a FT-TD, FT-TD can be used for file transfers to/from remote NEs).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 2

Abortable: No.

Input format

Command syntax: **CPY-RFILE***:tid::ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **type** – type and direction of the file transfer

This parameter pecifies the type and direction of the file transfer. The following file transfer types are supported:

- SWDL: SW download
- DBDL: Database download
- RFR: Remote file restore, restore the database from a backup location
- RFBU: Remote file backup, copy the database to a backup location

Type: Alphanumeric value set.
Range: SWDL, DBDL, RFR, RFBU.

2. **`src`** – the source of the file
   src is the source where the database or software is being transferred from.
   Type: text string;
   Range: 1 to 128 characters, format is a FTP URL or FTAM URL address on the system (EMS or CIT) from which the file is transferred
   The FTP URL must be in the format:
   ftp://[<login>[:<password>]@]<host>[:<port>]/<path_name>
   - <login>: default value: ″anonymous″
   - <password>: default for <login> ″anonymous″ is ″″ (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
   - <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0…255.
   - <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
   - <path_name>: The complete path name, where the files are located.

   The FTAM URL must be in the format: ftam://[<nsap_address>/<path_name>
   - <nsap_address>: network service access point address of the host, which consists of 20 bytes (40 hex characters)
   - <path_name>: The complete path name, where the files are located.

   Examples of valid path name are: ″/bwm/generic/01_02_15″, ″C:\\Program Files\\Alcatel-Lucent\\WaveStar″
3. **`dest`** – destination of the file
   dest is the destination where the database is being transferred to. The parameter is omitted if *type* = SWDL, DBDL, or RFR.
   src is the source where the database or software is being transferred from.
4. **`ovwrt`**
   This parameter indicates whether or not the files should overwrite an existing file located at the destination.
   Type: Alphanumeric value set.
   Range: YES (default)- Overwrite existing file of same directory location and filename. NO – Do not overwrite file, fail the file transfer if file already exists.

5. **`fttd`** – file transfer translation device
   This parameter specifies the file transfer translation device (FTTD).
   Type: text string.
   Range: 1 to 128 characters, format is a FTTD gateway address.
   The FTTD address must be in the format:
   - fttd://<nsap_address>
     <nsap_address>: network service access point address of the host, which consists of 20 bytes (40 hex characters). There can only be an even number of hex characters since they are generated from bytes and each byte corresponds to 2 hex characters.

Output format

The NE sends the following normal completion response just prior to initiating the requested file transfer:

```
   sid date time
M  ctag COMPLD
;
```

Completion message if ES64U databases missing in backup

If one or more ES64U database backups could not be copied from the ES64U packs to the NVM before the complete database generic of the system are transferred to the management system, then the following completion response is given:

```
   sid date time
M  ctag COMPLD
   /* ES64U databases for following slots are missing: <List>*/
;
```

The <List> shall be a simple list of slot-numbers separated by commas.

Output parameters

Refer to the "Output parameters" section of the "RTRV-HDR: Retrieve header" (p. 3-2417) command for a normal completion response. The output parameters listed there also apply to the **`COPY-RFILE`** command.

Detailed behavior description

Generation of REPT DBCHG message

No **`REPT DBCHG`** message is generated. Instead, **`REPT EVT FXFR`** notification is generated.

Program download capability

The **COPY-RFILE** command can be used to download software generics. The DOWNLOAD option of **COPY-RFILE** is used to download new generics which are stored in the previous region of NVM. A directory or URL is specified for the source (see *srcurl* parameter).

When the **COPY-RFILE** command is received by the NE, a confirmation or rejection must be returned immediately. The NE must ensure it recognizes the file/s it will be downloading and, when applicable, that there is enough space to store, uncompress, and install the file/s. So, the initial response will indicate the NEs imminent actions.

As an FTP client, the network element will use the information included in the TL1 command to establish an FTP session with Transport Element Activation Manager, being the FTP server.

Installation via **APPLY** causes the contents of previous NVM to be installed. Following installation, a ″pointer″ is changed so that what is identified as current NVM contains the currently executing generic and previous NVM contains the previous generic.

Database backup and restore capability

The **COPY-RFILE** command can be used to backup and restore the configuration database. The RFBU option of **COPY-RFILE** is used to backup the database, the RFR option is used to restore the database. A directory or URL is specified for the source (see *src* parameter) in the case of RFR or for the destination (see *dest* parameter) in the case of RFBU.

Backup with ES64U packs

All database of the ES64U cards shall first be copied from the ES64U packs to the NVM, then the complete database generic of the system shall be transferred to the management system . By this, the system shall first check if all ES64U databases could be retrieved. If this is not the case, the appropriate error message shall be added to the complete message.

Database download capability

The DBDL option of the **COPY-RFILE** command can be used to download a database from a source at the *WaveStar*® CIT or the management system. A directory or URL is specified for the source (see *src* parameter).

The database is copied from a file store into previous region of NVM.

After successful completion of the database download the system checks if ES64U databases are related to slots which are actually provisioned with ES64U packs. If this is the case, the state of the database in the previous NVM is DOWNLOADED. If this is not the case, the state is MISMATCH. If the DB Download does not successfully complete, then the state of the database in the previous NVM is CORRUPT.

The installation of the database from NVM to working memory has to be initiated after the download manually using the **APPLY** command.

File transfer requires a checksum

A file that is transferred via the **COPY-RFILE** command should contain one or more checksums to help validate that the file has not been corrupted.

Example input/output

The following examples show input and output of **COPY-RFILE** commands:

The following example shows a **COPY-RFILE** request that downloads a new generic from the manager to NVM of the NE by FTP with the help of a FTTP device. To start execution, the **APPLY** command must be used.

```
COPY-RFILE:LT-UNITE::123456:::TYPE=SWDL,
SRC=”ftp://user:pwd@128.218.128.281:21/vender/model/release1”,FTTD=”fttd://39840f80000000000000
OVWRT=YES;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
;
```

The following example shows a **COPY-RFILE** request that downloads a new generic from the manager to NVM of the NE by FTAM. To start execution, the **APPLY** command must be used.

```
COPY-RFILE:LT-UNITE::123456:::TYPE=SWDL,
SRC=”ftam://39840F80000000000000000000010a4fabc861d/C:\\Program Files\\Lucent
      Technologies\\WaveStar CIT\\generics\\susi030042”,OVWRT=YES;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
;
```

The following example shows a **COPY-RFILE** command that performs a database backup from the NE by FTP via FTTD to a Windows based FTP server.

```
COPY-RFILE:UNITE-NE::123456:::TYPE=RFBU,
DEST=”ftp://user:pwd@128.218.128.281:21/backups\\UNITE-
      NE\\080102”,FTTD=”fttd://39840f800000000000000000000601D0D50E01d”,
OVWRT=YES;
   UNITE-NE 08-01-02 08:00:00
M  123456 COMPLD
;
```

The following example shows a **COPY-RFILE** request that downloads a new generic from the manager to NVM of the NE by FTAM. To start execution, the **APPLY** command must be used.

```
COPY-RFILE:LT-UNITE::123456:::TYPE=SWDL,
SRC=”ftam://39840F80000000000000000000010a4fabc861d/C:\\Program Files\\Lucent
      Technologies\\WaveStar CIT\\generics\\susi030042”,OVWRT=YES;
```

```
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
;
```

The following example shows a **COPY-RFILE** request that downloads a database from the manager to NVM of the NE by FTP with the help of a FTTP device. To cause the installation as working database, the **APPLY** command must be used.

```
COPY-RFILE:LT-UNITE::123456:::TYPE=DBDL,
SRC=”ftp://user:pwd@128.218.128.281:21/configuration/backups/051215”,FTTD=”fttd://39840f80000
OVWRT=YES;
   LT-UNITE 05-12-16 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command error response section. The error responses listed there also apply to the **COPY-RFILE** command. Additional error responses that specifically apply to this command are defined in the following:

Validation rule: Input parameters not specified

If any one or more of the input parameter values are not valid, the system responds with:

Error code: `IDNV – Input, Data Not Valid`

Validation rule: Insufficient file space

If the command failed due to insufficient file space, the system responds with:

Error code: `ENEQ – Equipage, Not Equipped, insufficient file space`

Validation rule: Temporary exhaustion of resources

If the system is experiencing temporary exhaustion of allocated resources because

- all resources are busy or
- a **CPY-MEM** request is issued and a previous **CPY-MEM** has not finished or a resource is busy for other reasons,

the system responds with:

Error code: `SARB – Status, All Resources Busy`

Validation rule: Directory/URL not specified

If **COPY-RFILE** specifies an SWDL and no directory/URL is specified by *src*, then the following error response is given:

Error code:

`ICNV – Input, Command Not Valid, directory/URL must be specified`

Validation rule: Directory/URL not specified for restoration

If **`COPY-RFILE`** specifies an RFR and no directory/URL is specified by *src*, then the following error response is given:

Error code:
`ICNV – Input, Command Not Valid, directory/URL must be specified`

Validation rule: Directory/URL not specified for backup

If **`COPY-RFILE`** specifies an RBU and no directory/URL is specified by *dest*, then the following error response is given:

Error code:
`ICNV – Input, Command Not Valid, directory/URL must be specified`

Validation rule: Directory/URL not specified for database download

If **`COPY-RFILE`** specifies a DBDL and no directory/URL is specified by *src*, then the following error response is given:

Error code:
`ICNV – Input, Command Not Valid, directory/URL must be specified`

Validation rule: FT-TD device not specified

If **`COPY-RFILE`** used FTP for SWDL and no FT-TD device (nsap) is specified by *fttd*, then the following error response is given:

Error code: `ICNV – Input, Command Not Valid, FTTD must be specified`

Validation rule: Additional directory/URL specified

If **`COPY-RFILE`** specifies an SWDL and *dest* is not empty:

Error code: `SDNC – Status, Data Not Consistent`

Validation rule: Additional directory/URL specified for restoration

If **`COPY-RFILE`** specifies an RFR and *dest* is not empty:

Error code: `SDNC – Status, Data Not Consistent`

Validation rule: Additional directory/URL specified for backup

If **`COPY-RFILE`** specifies an SWDL and *src* is not empty:

Error code: `SDNC – Status, Data Not Consistent`

Validation rule: Additional directory/URL specified for database download

If **`COPY-RFILE`** specifies a DBDL and *dest* is not empty:

Error code: `SDNC – Status, Data Not Consistent`

Validation rule: No SW download, DB download, or DB restore during trial phase

If **`COPY-RFILE`** specifies an SWDL, RFR, or DBDL and a newly applied SW generic is still in trial phase (previous SW generic state and database state = PRESERVED), the command is denied:

Error code:
`SNVS – Status, Not in Valid State, SW generic is in trial phase`

Validation rule: No DB restore with incompatible database

If **`COPY-RFILE`** specifies an RFR or DBDL, the system verifies that the database to be restored is compatible with the currently running SW generic and the actual HW equipage. The attempt to restore an incompatible database is denied with:

Error code: `SNVS – Status, Not in Valid State, database not compatible`

Validation rule: No DB restore with ES64U pack

If **`CPY-RFILE`** specifies a DB restore by RFR, the system verifies that ES64U pack is (pre-)provisioned in the system. If a ES64U pack is (pre-)provisioned in the system the NE refuses the command.

Error code:
`SNVS – Status, Not in Valid State, No restore (RFR) with ES64U pack`

Related TL1 messages

CPY-MEM: Copy memory

The **`CPY-MEM`** command can be used to initiate a file transfer to/from an NE. The file transfer is intended to

- download a new software generics to the NE (SW download), or
- to backup the NE database (DB backup), or
- to restore the NE database (DB restore).

The actual file transfer can use one of the following file transfer applications:

- FTAM
- FTP
- FT-TD (file transfer translation device).

and is determined by the use of the *from* and *to* parameters.

The command **`CPY-MEM`** was the original command for file transfer to/from an NE. The differences to **`COPY-RFILE`** are:

- The confirmation or rejection message is returned by the system **after** the transfer.
- The interim progress of the remote file transfer are **NOT** reported by autonomous messages.

The **`CPY-MEM`** command can be used to download a database (DB download). The database can then be activated in a separate step with the **`APPLY`** command.

`CPY-MEM` utilizing the Transport Service Bridge (TSB) is not supported.

Note: The support of a certain file transfer application is release specific and additionally dependent on the network configuration (e.g. when one GNE is configured to be a FT-TD, FT-TD can be used for file transfers to/from remote NEs).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 2

Abortable: No

Input format

Command syntax: **`CPY-MEM`**:*tid*::*ctag*::*from*,[*src*],*to*,[*dst*],*class*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **`ctag`** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **`from`** – from memory type
   This parameter specifies the memory where the data is being transferred from.
   Type: text string.
   Range:
   - ″PRI″, PRImary NVM of the NE. Although there is no secondary NVM, PRI is used for compatibility reasons
   - ″CIT, *psel*, *ssel*, *tsel*, *sap*″, CIT means Craft Interface Terminal (CIT)
   - ″EMS, *psel*, *ssel*, *tsel*, *nsap*″, EMS means Element Management System (EMS)
   - ″FTTD, *psel*, *ssel*, *tsel*, *nsap*″ FTTD (file transfer translation device)
     sel, *ssel*, *tsel*, and *nsap* are part of the from (and to) parameter and specify NSAP and selectors of the CIT or EMS or the GNE in case of FTTD. The sizes of *sel*, *ssel*, *tsel*, and *nsap* are as follows: *psel* (path selector): 0-4 bytes (0-8 hex characters); *ssel* (session selector): 0-4 bytes (0-8 hex characters); *tsel* (transport selector): 0-16 bytes (0-32 hex characters); *nsap* (network service access point): 20 bytes (40 hex characters).

   There can only be an even number of hex characters since they are generated from bytes and each byte corresponds to 2 hex characters.
4. **`src`** – source
   This parameter specifies the source where the database or software is being transferred from. The parameter is omitted or specified as empty string ("") if *class* = BACKUP.
   Type: text string
   Range: 1 to 128 characters, format is a valid complete directory name , or an FTP URL on the system (EMS or CIT) from which the file is transferred.
   The FTP URL must be in the format:
   ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>
   - <login>: default value: ″anonymous″
   - <password>: default for <login> ″anonymous″ is ″″ (empty).For security reasons, the <password> portion of the FTP URL format must be masked prior to generating any autonomous messages or entries in the Notification Log.
   - <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0…255.

- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

Because backslash (\) is the TL1 escape character, to include a backslash as part of a directory name, it must be entered as a double backslash. A double backslash counts as only one character. Craft personnel will not have to type the double backslash for the GUI. The second backslash is automatically generated.
Examples of valid file names are: ″d:\\bwm\\data\\file1.dat″ or ″/bwm/generic/01_02_15.prog″.

5. **`to`** – to memory type
   This parameter specifies the memory where the data is being transferred to.
   Type: text string.
   Range:
   - ″PRI″, PRImary NVM of the NE. Although there is no secondary NVM, PRI is used for compatibility reasons
   - ″CIT,*psel*,*ssel*,*tsel*,*sap*″, CIT means Craft Interface Terminal (CIT)
   - ″EMS,*psel*,*ssel*,*tsel*,*nsap*″, EMS means Element Management System (EMS)
   - ″FTTD, *psel*, *ssel*, *tsel*, *nsap*″, FTTD (file transfer translation device).

     sel, *ssel*, *tsel*, and *nsap* are part of the from (and to) parameter and specify NSAP and selectors of the CIT or EMS or the GNE in case of FTTD. The sizes of *sel*, *ssel*, *tsel*, and *nsap* are as follows: *psel* (path selector): 0-4 bytes (0-8 hex characters); *ssel* (session selector): 0-4 bytes (0-8 hex characters); *tsel* (transport selector): 0-16 bytes (0-32 hex characters); *nsap* (network service access point): 20 bytes (40 hex characters).

     There can only be an even number of hex characters since they are generated from bytes and each byte corresponds to 2 hex characters.
6. **`dst`** – destination directory name
   This parameter reflects the destination where the database is being transferred to.
   The parameter is omitted or specified as empty string (“”) if *class* = DOWNLOAD, RESTORE, or DBDOWNLOAD.
   See parameter *src*. Those requirements also apply to this parameter *dst*.
7. **`class`** – Class Of The Copy
   Specifies the class of the copy.
   Supported classes:
   - DOWNLOAD: download an SW generic
   - BACKUP: copy the database to a backup location
   - RESTORE: restore the database from a backup location
   - DBDOWNLOAD: download a database from a backup location

   Type: Alphanumeric value set.

Range:

- DOWNLOAD: download an SW generic
- BACKUP: copy the database to a backup location
- RESTORE: restore the database from a backup location
- DBDOWNLOAD: download a database from a backup location

Output format

If the NE fully complies with the **CPY-MEM** command, then the NE sends the following normal completion response after the copy has been completed:

```
   sid date time
M  ctag COMPLD
;
```

Completion message if ES64U databases missing or superfluous

If ES64U databases are missing or superfluous in the database generic and the user has performed a DBDOWNLOAD or BACKUP command, then the following completion response is given:

```
   sid date time
M  ctag COMPLD
   /* ES64U databases for following slots are missing or superfluous:<List>*/
;
```

The <List> shall be a simple list of slot-numbers separated by commas. Note: This message is sent when DB state goes to MISMATCH.

Output parameters

Refer to the "Output parameters" section of the "RTRV-HDR: Retrieve header" (p. 3-2417) command for a normal completion response. The output parameters listed there also apply to the **CPY-MEM** command.

Detailed behavior description

Generation of `REPT DBCHG` message

The **CPY-MEM**command generates a **REPT DBCHG** message.

Program download capability

The **CPY-MEM** command can be used to download software generics. The DOWNLOAD option of CPY-MEM is used to download new generics which are stored in the previous region of NVM.

A directory or URL is specified for the source (see *src* parameter).

Installation via APPLY causes the contents of previous NVM to be installed. Following installation, a ″pointer″ is changed so that what is identified as current NVM contains the currently executing generic and previous NVM contains the previous generic.

Backup capability

The BACKUP option of the **`CPY-MEM`** command can be used to backup the database from the current region of NVM to a destination which is located at the CIT or EMS.

A directory or URL is specified for the destination (see *dst* parameter).

If database of available ES64U packs cannot be backed upd for any reason, the “Completion Message, if ES64U Databases missing or superfluous” is used.

Restore capability

The RESTORE option of the **`CPY-MEM`** command can be used to restore the database from a source at the CIT or EMS.

A directory or URL must be specified for the source (see *src* parameter).

The database is copied from a file store into previous region of NVM and then installed as the working database.

There are two phases to database restoration: copying the database from the source (e.g. the CIT) to NVM and then installing the database from NVM to working memory. The first phase takes much longer than the second.

CPY-MEM with *class* RESTORE can only be executed in maintenance mode.

Restore causes database installation

If CPY-MEM is used to restore a database to NVM, the NE will return COMPLD before the CTL controller reset.

The automatic installation of the database for a RESTORE is in contrast with the manual installation (via APPLY) of software required after a DOWNLOAD.

After the database has been installed to working memory, the working database contains provisioning that was in the restoration directory.

Restore clears logs

The system shall clear all Logs except the Security Activity Log when a database is successfully restored.

File transfer requires a checksum

A file that is transferred via the **`CPY-MEM`** command should contain one or more checksums to help validate that the file has not been corrupted.

Restore uses previous NVM

When CPY-MEM is used to restore a database, the previous region of NVM is used as an intermediate storage.

This minimizes the effect of copying to NVM since the current region of NVM is still available for database updates. Also, if communications fail during the copy to previous NVM, the current database is still available.

Provisioned vs. actual configuration

After a database restoration, if there is a discrepancy between the actual and provisioned CPs, then an alarm will be issued telling the craft about the discrepancy, but the NVM will not be altered automatically.

Example of discrepancy: The hardware indicates that an OC-48 pack is in slot 6, while the provisioned values in NVM indicate that a OC-192 pack should be in that slot. A CP mismatch alarm will be raised.

Database download capability

The DBDOWNLOAD option of the **CPY-MEM** command can be used to download a database from a source at the CIT or EMS. A directory or URL must be specified for the source (see *src* parameter). The database is copied from a file store into previous region of NVM.

After successful completion of the database download, the system checks if ES64U databases are contained in the database generic or ES64U packs are available in the system.

Afterwards the system checks if the contained ES64U data bases fit to the current configuration. If this is the case, the state of the database in the previous NVM is DOWNLOADED and the “Normal completion message” is used. If this is **NOT** the case, the state is MISMATCH and “Completion Message, if ES64U Databases missing or superfluous” is used.

If the DB download does not successfully complete, then the state of the database in the previous NVM is CORRUPT,.

The installation of the database from NVM to working memory has to be initiated after the download manually using the **APPLY** command.

Example input/output

The following examples show input and output of **CPY-MEM** commands.

The following example shows a **CPY-MEM** request that downloads a new generic from the EMS to PRI. To cause *prgm* to execute, the **APPLY** command must be used.

```
CPY-MEM:LT-
      UNITE::123456::”EMS,02,04,02,39840F80000000000000000000008006A19784500”,”/unite/release1
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
;
```

The following example shows a **CPY-MEM** command that downloads a database from a directory of the CIT PC to PRI:

```
CPY-MEM:LT-
      UNITE::123456::”CIT,01,01,03,39840F80000000000000000000008006A13244500”,”\\data\\00_11_01”,
   LT-UNITE 00-11-02 08:00:00
M  123456 COMPLD
;
```

The following example shows a **CPY-MEM** command that backups the database in NVM to the CIT and stores it in a directory named data in a location named 00_11_01.

```
CPY-MEM:LT-
      UNITE::123456::”PRI”,,”CIT,01,01,03,39840F80000000000000000000008006A13244500”,”\\data\\00_
   LT-UNITE 00-11-02 08:00:00
M  123456 COMPLD
;
```

The following example shows a **CPY-MEM** command that restores the database from the CIT:

```
CPY-MEM:LT-
      UNITE::123456::”CIT,01,01,03,39840F80000000000000000000008006A13244500”,”\\data\\00_11_01”,
   LT-UNITE 00-11-02 08:00:00
M  123456 COMPLD
;
```

The following example shows a **CPY-MEM** command used for performing a database backup via the FT-TD to an FTP server (UNIX). The *psel*, *ssel*, *tsel*, *nsap* values identify the GNE which runs the FT-TD function:

```
CPY-MEM:LT-UNITE::123456::
      ”PRI”,,”FTTD,01,01,03,39840F80000000000000000000008006A132445500”,”ftp://johndoe:passwd@ftp
   LT-UNITE 00-11-02 08:00:00
M  123456 COMPLD
;
```

The following example shows a **CPY-MEM** command used for performing a software download via the FT-TD from an FTP server (UNIX). The *psel*, *ssel*, *tsel*, *nsap* values identify the GNE which runs the FT-TD function:

```
CPY-MEM:LT-UNITE::123456::
      ”FTTD,01,01,03,39840F80000000000000000000008006A132445500”,,”PRI”,”ftp://johndoe:passwd@ftp
   LT-UNITE 00-11-02 08:00:00
M  123456 COMPLD
;
```

The following example shows a **CPY-MEM** command used for performing a database download via the FT-TD from an FTP server (Windows). The *psel*, *ssel*, *tsel*, *nsap* values identify the GNE which runs the FT-TD function:

```
CPY-MEM:UNITE-NE::123456::
      ”FTTD,01,01,03,39840F80000000000000000000008006A132445500”,,”PRI”,”ftp://johndoe:passwd@f
   LT-UNITE 08-01-02 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command error response section. The error responses listed there also apply to the **CPY-MEM** command. Additional error responses that specifically apply to this command are defined in the following:

Validation rule: Input parameters not specified

If any one or more of the input parameter values are not valid, the system responds with:

Error code: `IDNV – Input, Data Not Valid`

The following parameter combinations are allowed based on the file transfer application:

	class	from	src	to	dst
FTAM	DOWNLOAD	”CIT,psel,ssel,tsel,nsap”; ”EMS,psel,ssel,tsel,nsap”	<dir>	”PRI”	-
	BACKUP	”PRI”	-	”CIT,psel,ssel,tsel,nsap”; ”EMS,psel,ssel,tsel,nsap”	<dir>
	RESTORE	”CIT,psel,ssel,tsel,nsap” ”EMS,psel,ssel,tsel,nsap”	<dir>	”PRI”	-
FT-TD	DOWNLOAD	”FTTD,psel,ssel,tsel,nsap”	<URL>	”PRI”	-
	BACKUP	”PRI”	-	”FTTD,psel,ssel,tsel,nsap”;	<URL>
	RESTORE	”FTTD,psel,ssel,tsel,nsap”	<URL>	”PRI”	-

The parameter combinations allowed for the class RESTORE are also valid for the option DBDOWNLOAD.

Validation rule: Invalid file or directory name

If the command failed due to

- an invalid directory or
- an invalid source file or
- file store not found or
- file access denied,

the system responds with:

Error code: `SDNC – Status, Data Not Consistent, invalid file or directory`

Validation rule: Source product type does not match network product type

If a product type of the source does not match the product type of the NE, the system responds with:

Error code: `SDNC – Status, Data Not Consistent`

Validation rule: Insufficient file space

If the command failed due to insufficient file space, the system responds with:

Error code: `ENEQ – Equipage, Not Equipped, insufficient file space`

Validation rule: Product mismatch

If the command failed due to a product mismatch in a retrieved file (file does not belong to NE type), the system responds with:

Error code:
`SRAC – Status, Requested Access Configuration invalid, retrieved file NE mismatch`

Validation rule: Temporary exhaustion of resources

If the system is experiencing temporary exhaustion of allocated resources because

- all resources are busy or
- a CPY-MEM request is issued and a previous CPY-MEM has not finished or a resource is busy for other reasons,

the system responds with:

Error code: `SARB – Status, All Resources Busy`

Validation rule: External communication failure

If the command failed due to an external communications failure, the system responds with:

Error code:
`SROF – Status, Requested Operation Failed, external communications failure`

The following list identifies conditions that will cause an SROF error response as given above:

- FTAM error
- External communication failure
- Unsuccessful file transfer

Validation rule: Backup failed after unsuccessful retransmission of files

If during a database backup a transaction log overflow occurs, and the retransmission of database files fails, then the command terminates with the error:

Error code:
`SROF – Status, Requested Operation Failed, unsuccessful file retransmission`

During database backup all database changes caused by provisioning activities are stored temporarily in a transaction log. This prevents changes of the database while the backup is running. Excessive provisioning during database backup may cause an overflow of the transaction log. In this case, the changes are written to the database and the affected database files are retransmitted. In the case that the retransmission fails, the backup is terminated with an error message.

Validation rule: Generic not available

If the command failed because the generic is not available, the system responds with:

Error code: `ENSG – Equipage, Not Software Generic, generic not available`

The following condition will cause this ENSG error response:

- Not a software generic file.

Validation rule: Directory not accessible

If a directory is specified that cannot be found or cannot be accessed due to improper privileges, the system responds with:

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Deemed source file

If a source file is deemed invalid for miscellaneous reasons such as incorrect checksum, invalid control information, etc., the system responds with:

Error code: `SNVS – Status, Not in Valid State`

Validation rule: Directory/URL not specified

If **`CPY-MEM`** specifies a DOWNLOAD, RESTORE, or DBDOWNLOAD and no directory/URL is specified in *src* or if it specifies a BACKUP and no directory/URL is specifies in *dst*, then the following error response is given:

Error code: `ICNV – Input, Command Not Valid, file must be specified`

Validation rule: No SW download, DB download or DB restore during trial phase

If **`CPY-MEM`** specifies a DOWNLOAD, RESTORE, or DBDOWNLOAD and a newly applied SW generic is still in trial phase (previous SW generic state and database state = PRESERVED), the command is denied:

Error code:

`SNVS – Status, Not in Valid State, SW generic is in trial phase`

Validation rule: No DB restore with incompatible database

If **`CPY-MEM`** specifies a RESTORE or DBDOWNLOAD, the system verifies that the database to be restored is compatible with the currently running SW generic and the actual HW equipage. The attempt to restore an incompatible database is denied with:

Error code: `SNVS – Status, Not in Valid State, database not compatible`

Validation rule: No DB restore with ES64U Pack

If **`CPY-MEM`** specifies a RESTORE, the system verifies that no ES64U pack is (pre-)provisioned in the system. If an ES64U pack is (pre-)provisioned in the system, the NE refuses the command.

Error code: `SNVS – Status, Not in Valid State, No restore with ES64U pack`

CPY-MEM notification

Output format

Command syntax: **CPY-MEM**::*from*,[*src*],*to*,[*dst*],*class*;

Output parameters

Command parameters

1. **from** – from memory type
   Specifies the memory where the data is being transferred from.
   Type: text string.
   Range:
   - ″PRI″, PRImary NVM of the NE. Although there is no secondary NVM, PRI is used for compatibility reasons
   - ″CIT, *psel*, *ssel*, *tsel*, *sap*″, CIT means Craft Interface Terminal (CIT)
   - ″EMS, *psel*, *ssel*, *tsel*, *nsap*″, EMS means Element Management System (EMS)
   - ″FTP″, FTP means FTP Server
   - ″FTTD, *psel*, *ssel*, *tsel*, *nsap*″ FTTD (file transfer translation device)
     sel, *ssel*, *tsel*, and *nsap* are part of the from (and to) parameter and specify NSAP and selectors of the CIT or EMS or the GNE in case of FTTD. The sizes of *sel*, *ssel*, *tsel*, and *nsap* are as follows: *psel* (path selector): 0-4 bytes (0-8 hex characters); *ssel* (session selector): 0-4 bytes (0-8 hex characters); *tsel* (transport selector): 0-16 bytes (0-32 hex characters); *nsap* (network service access point): 20 bytes (40 hex characters).

   There can only be an even number of hex characters since they are generated from bytes and each byte corresponds to 2 hex characters.
2. **src** – source
   This parameter reflects the source where the database or software is being transferred from. The parameter is omitted or specified as empty string (“”) if *class* = BACKUP.
   Type: text string
   Range: 1 to 128 characters, format is a valid complete directory name, or an FTP URL on the system (EMS or CIT) from which the file is transferred.
   The FTP URL must be in the format:
   ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>
   - <login>: default value: ″anonymous″
   - <password>: default for <login> ″anonymous″ is ″″ (empty).For security reasons, the <password> portion of the FTP URL format must be masked prior to generating any autonomous messages or entries in the Notification Log.
   - <host>: the <host> portion is an internet address of the form a.b.c.d. with a, b, c and d in the range of 0…255.

- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

Because backslash (\) is the TL1 escape character, to include a backslash as part of a directory name, it must be entered as a double backslash. A double backslash counts as only one character. Craft personnel will not have to type the double backslash for the GUI. The second backslash is automatically generated.
Examples of valid file names are: ″d:\\bwm\\data\\file1.dat″ or ″/bwm/generic/01_02_15.prog″.

3. **`to`** – to memory type
Specifies the memory where the data is being transferred to.
Type: text string.
Range:
   - ″PRI″, PRImary NVM of the NE. Although there is no secondary NVM, PRI is used for compatibility reasons
   - ″CIT,*psel*,*ssel*,*tsel*,*sap*″, CIT means Craft Interface Terminal (CIT)
   - ″EMS,*psel*,*ssel*,*tsel*,*nsap*″, EMS means Element Management System (EMS)
   - FTTD, *psel*, *ssel*, *tsel*, *nsap*″, FTTD (file transfer translation device)
   - ″FTP″, FTP means FTP Server.

     sel, *ssel*, *tsel*, and *nsap* are part of the *from* (and to) parameter and specify NSAP and selectors of the CIT or EMS or the GNE in case of FTTD. The sizes of *sel*, *ssel*, *tsel*, and *nsap* are as follows:
     psel (path selector): 0-4 bytes (0-8 hex characters);
     ssel (session selector): 0-4 bytes (0-8 hex characters);
     tsel (transport selector): 0-16 bytes (0-32 hex characters);
     nsap (network service access point): 20 bytes (40 hex characters).
     There can only be an even number of hex characters since they are generated from bytes and each byte corresponds to 2 hex characters.
4. **`dst`** – destination directory name
Reflects the destination where the database is being transferred to.
The parameter is omitted or specified as empty string (“”) if *class* = DOWNLOAD or RESTORE.
src is the source where the database or software is being transferred from.
Type: text string
Range: 1 to 128 characters, format is a valid complete directory name, or an FTP URL on the system (EMS or CIT) from which the file is transferred.
The FTP URL must be in the format:
ftp://[<login>[:<password>]@]<host>[:<port>]/<file name>
   - <login> – default value: ″anonymous″
   - <password> default for <login> ″anonymous″ is ″″ (empty).

     For security reasons, the <password> portion of the FTP URL format is masked prior to generating any autonomous messages or entries in the Notification Log.

- <host> – The <host> portion is an internet address of the form a.b.c.d with a,b,c and d in the range of 0…255.
- <port> - This is the port number of the FTP server, given when deviating from the standard port number 21.
- <file name> – The complete path name of the file. Because backslash (\) is the TL1 escape character, to include a backslash as part of a directory name, it must be entered as a double backslash. A double backslash counts as only one character. Craft personnel will not have to type the double backslash for the GUI. The second backslash is automatically generated.

  Examples of valid file names are : ″d:\\bwm\\data\\file1.dat″ or ″/bwm/generic/01_02_15.prog″

5. **`class`** – class of the copy
   Specifies the class of the copy.

   The supported classes are:

   - DOWNLOAD: download the program
   - BACKUP: copy the database to a backup location
   - RESTORE: restore the database from a backup location

   Type: Alphanumeric value set.
   Range: DOWNLOAD, BACKUP or RESTORE

Example output

The following is an example for a CPY-MEM notification after a software download:

```
   LT-UNITE 00-11-01 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:CPY-
      MEM::\″EMS,02,04,02,39840F80000000000000000000008006A19784500\″,\″/unite/release1/prgm\″
;
```

The following is an example for a CPY-MEM notification after a DB restore (before the NE resets):

```
   LT-UNITE 00-11-01 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:CPY-
      MEM::\″CIT,01,01,03,39840F80000000000000000000008006A13244500\″,\″\\data\\00_11_
      01\″,\″PRI\″,,RESTORE″
;
```

The following is an example for a CPY-MEM notification after a DB backup via the FT-TD:

```
   LT-UNITE 00-11-01 15:00:00
A  000 REPT DBCHG
```

```
  ”TIME=15-00-00,DATE=00-11-03:CPY-
     MEM::\”PRI\”,,\”FTTD,01,01,03,39840F80000000000000000000008006A132445500\”,\”ftp://johndoe:
;
```

DISC-TACC: Disconnect test access

General

The **DISC-TACC** command is used to remove the test access connection and terminate the test access session on the test access tributary in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T4

Priority: 1

Abortable: No

Input format

Command syntax: **DISC-TACC-modifier***:tid:tatrib1:ctag;*

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection rate on which the connect test access command is to act.
   Type: Alphanumeric value set.
   Range:
   - SDH modifier: VC3, VC4, VC44C, VC416C, VC464C
   - SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.
2. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **tatrib1** – primary Test Access tributary
   AID of the primary Test Access tributary. The keyword **all** is not allowed on any level.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.
4. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

The NE returns the following normal completion response to a successful DISC-TACC command if there are no failure conditions to report:

```
   sid date time
M  ctag COMPLD
;
```

Detailed behavior description

The **DISC-TACC** command is used to terminate a test access session. All s to the test access tributaries will be removed and the cross-connections between the E and F tributaries are reestablished.

In addition to the DISC-TACC Notification an ED-CRS notification is sent to report the changed parameter values *taccstat* and *rtntaccstat*.

Update of affected entities when removing a LO-test access session

When removing a LO-test access session it may happen that the HO-tributaries related to the involved LO-tributaries (LO test access tributaries or E-tributary or F-tributary) have to be de-substructured again. In this case the **DISC-TACC** command shall remove the substructure following the same rules as when deleting the last lower-order cross-connection.

Example input/output

```
DISC-TACC-STS1:LT-UNITE:1-1-#-#-4-1-1:123456;
   LT-UNITE 02-10-01 17:15:08
M  123456 COMPLD
;
```

For lower-order test access sessions:

```
DISC-TACC-LOVT1:LT-UNITE:1-1-#-#-4-1-1-28:123456;
   LT-UNITE 02-10-01 17:15:08
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **DISC-TACC** command.

Validation rule: No test access session on the test tributary

If the NE receives a DISC-TACC command when there is no test access session set up on the test tributary specified, the following error response is returned:

Error code:

`SNVS – Status, Not in Valid State, no test access session on the test tributary`

Validation rule: Inconsistent tributary rate

If the NE receives an DISC-TACC command which does not match the test access connection rate, the following error response is returned:

Error code:

```
IPNC – Input, Parameter Not Consistent, Rate inconsistent with
crossconnection rate
```

Related TL1 messages

DISC-TACC notification

Output format

The **DISC-TACC** notification has the following specific syntax:
DISC-TACC-*modifier:tatrib1::spec_block;*

Output parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection rate on which the connect test access command is to act.
   Type: Alphanumeric value set.
   Range:
   - SDH modifier: VC3, VC4, VC44C, VC416C, VC464C
   - SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.
2. **tatrib1** – primary Test Access tributary
   AID of the primary Test Access tributary. The keyword **all** is not allowed on any level.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.

Spec block parameters

1. **etrib** – AID of the E-tributary
   AID of the E-tributary for the test session.
   Type: AID.
   Range: GenTribAID or GenLOTribAID
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.
2. **ftrib** – AID of the F-tributary
   AID of the F-tributary for the test session. If there is no cross-connection at the E-tributary, this parameter is omitted.
   Type: AID.
   Range: GenTribAID or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.
3. **tatrib2** – secondary Test Access Tributary
   AID of the secondary Test Access Tributary. In the case of test access modes with single test tributary the parameter is omitted.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.

Example input/output

```
DISC-TACC-STS1:LT-UNITE:1-1-#-#-4-1-1:123456;

   LT-UNITE 02-10-01 17:15:08
M  123456 COMPLD
;

   LT-UNITE 02-10-01 17:15:38

    ETRIB=1-1-#-#-15-1-1-28,FTRIB=1-1-#-#-16-1-1-28:"
;
```

DLT-ASAP-PROF: Delete alarm severity assignment profile

The **DLT-ASAP-PROF** command is used to delete an ASAP. Default ASAP's cannot be deleted.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-ASAP-PROF**:*tid*::*ctag*::*pftype*,*pfname*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **pftype** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen ("-") is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN

- SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

4. **`pfname`** – ASAP Profile Name
   The name distinguishes ASAPs of the same ASAP type specified by *pftype*. That means the same name can be used for several ASAP types.
   Type: alphanumeric character string. A hyphen ("-") is allowed in the name additionally.
   Range: length 1-24 characters.
   For predefined ASAPs is the value of *pfname* ″DEFAULT″, but it is no default name in general.

Output format

The following example shows the successful completion of the **`DLT-ASAP-PROF`** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **`DLT-ASAP-PROF`** command deletes the ASAP specified by pftype and pfname. A profile must not be used when it will be deleted.

The modification is reported via the DLT-ASAP-PROF notification.

Example input/output

The following example shows the successful completion of the **`DLT-ASAP-PROF`** command by the NE if the pfname will be changed:

```
DLT-ASAP-PROF:LT-UNITE-123::123456::PORT,NUERNBERG;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **DLT-ASAP-PROF** command.

Validation rule: *pfname* does not exist

An ASAP with the name *pfname* does not exist.

Error code:
`SDNC – Status, Data Not Consistent, invalid instance of profile`

Validation rule: ASAP in use

The addressed ASAP is still in use.

Error code: `SDNC – Status, Data Not Consistent, profile in use`

Validation rule: *pfname* is default

The addressed ASAP is a default one which can not be deleted.

Error code: `IDNC – Input, Data, Not Consistent, default profile`

DLT-ASAP-PROF notification

Output format

Syntax: The **`DLT-ASAP-PROF`** notification has the following specific syntax:

`DLT-ASAP-PROF`::*pftype*,*pfname*

Output parameters

Command parameters

1. **`pftype`** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen (“-”) is allowed for the alphanumeric values additionally.

   Range:

   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN
   - SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring

- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

2. **pfname** – ASAP Profile Name
The name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.
Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
Range: length 1-24 characters.
For predefined ASAPs is the value of *pfname* ″DEFAULT″, but it is no default name in general.

Example output

The following example shows a normal notification after a **DLT-ASAP-PROF** command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:DLT-ASAP-PROF::ENET,NUERNBERG″
;
```

DLT-CONN: Delete network connection

Overview

The **DLT-CONN** command is used for a graceful deletion of a network connection.

Graceful network connection deletion

The **DLT-CONN** command allows a graceful network connection deletion from the originator node. This command shall trigger the release of all resources of one or multiple network connections via all impacted domains. A forced deletion can be done via **DLT-PATH**.

Graceful network connection deletion by connID

A defined *connID* shall trigger a graceful deletion of the network connection associated with the defined identity.

Graceful network connection deletion by callID

A defined *callID* without defining *connID* shall trigger a graceful deletion of all network connections associated with the selected *callID*. A defined *callID* together with a defined *connID* shall trigger a graceful deletion of the network connection associated with the selected *connID*.

Graceful deletion only from originator node

The **DLT-CONN** command is only allowed on the originator node of the affected network connection.

A REPT CONNCHG notification is generated

The **DLT-CONN** command shall generate a **REPT CONNCHG** message for every removed Network Connection.

A REPT PTHCHG notification is generated

The **DLT-CONN** command shall generate a **REPT PTHCHG** message for every removed ONNS Connection.

Note

In case setup or deletion of many network connections over several domains are running and reboots of ingress or egress nodes in affected domains occur at the same time, some remaining network connection segments may be left over.

In case during graceful deletion of a network connection over several domains some of the following unexpected events occur, some pieces of the network connection may remain undeleted:

- Failures of ENNI signalling channels between affected domains
- Reboots of ingress or egress nodes in affected domains

Remaining network connection segments can be identified by applying "RTRV-CONN: Retrieve data relevant for network connections" (p. 3-2294) or "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698) commands to affected ingress nodes. Such pieces then can be removed by applying a forced deletion via "DLT-PATH: Delete ONNS path connection" (p. 3-222) in one or all domains affected.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: NA

Abortable: No

Input format

Command syntax: **`DLT-CONN`**:*srcTid:srcAid:ctag:[callID]:[connID][:specBlock];*

Input parameters

Command parameters

1. **`srcTid`**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **`srcAid`**
   Source node ONNS application access identifier *srcAid* of the ONNS controller OS command interface port.
   Type: AID.
   Range: snn
   Default: n/a.

3. **`ctag`**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing "."). It should be a unique value for each new command.

4. **`callID`**
   The *callID* indicates a call of a logical call / connection separation (call capability). This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).
   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.
   Range: string with 24 hexadecimal numbers (0 … F).
5. **`connID`** – Connection ID
   Connection ID for an existing ONNS connection segment of a UNI or Network connection. *ConnID* is formed from the *SrcNodeID*, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.

Output format

Normal system response to DLT-CONN for a network connection

If the **`DLT-CONN`** request is accepted by the system, the normal completion response is returned as shown below:

```
   srcTid date time
M  ctag COMPLD
   ″CallID=called[,ConnID=connID]″
;
```

Output parameters

Command parameters

1. **`srcTid`**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`date`**
   Date. The date parameter is set to the date when the output message is generated.
   Type: Value set.
   Range:
   YY-MM-DD, where
   - YY=00-99,
   - MM=01-12,
   - DD=01-31

   Default: current date

3. **`time`**
   Time. The time parameter is set to the time when the output message is generated. See also time in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Value set.
   Range:
   HH:MM:SS, where
   - HH=00-23,
   - MM=00-59,
   - SS=00-59
   Default: current time
4. **`ctag`**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″). It should be a unique value for each new command.
5. **`completion code`**
   Standard TL1 completion code result.
   Type: Value set.
   Range:
   - COMPLD (default): for success
   - DENY: in case of errors
6. **`callID`**
   The *callID* indicates a call of a logical call / connection separation (call capability). This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).
   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.
   Range: string with 24 hexadecimal numbers (0…F).
7. **`connID`** – Connection ID
   Connection ID for an existing ONNS connection segment of a UNI or Network connection. *ConnID* is formed from the *SrcNodeID*, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.
   The output parameter*connID* is optional. It is omitted in case of multiple connections deleted under one *callID* with a single **`DLT-CONN`** command.

Example input/output

Input/output example of deleting a Network Connection

The following example shows the response of an accepted DLT-CONN command:

```
DLT-CONN:LT_ONNS_789:snn:433456:A123B3EF134A123B3EF13455:135.7.9.2-46:
192.1.165.12&1-6-5-3-1&1;

   LT-ONNS-789 2002-07-01 08:00:00
M  433456 COMPLD
   ″CallID=A123B3EF1345A123B3EF1345,ConnID=192.1.165.12&1-6-5-3-1&1″
;
```

Error responses

Validation rule: Input Parameter *connID* not valid

If the value for the input parameter *connID* is not valid, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid, invalid connection ID`

Validation rule: Input Parameter *callID* not valid

If the value for the input parameter *callID* is not valid, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid, invalid callID`

Validation rule: Input Parameters not matching

If the value for the input parameters *connID* and *callID* are not matching, the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, input parameters are not matching`

DLT-CRS: Delete cross-connection

The **DLT-CRS.***modifier* command can be initiated by a user to delete a cross-connection in the NE.

The *modifier* in the **DLT-CRS** command indicates the cross-connection rate of the tributary for which the command is applied to.

There is no difference if the rate is specified as a SONET rate (STS1, STS3,…) or as SDH-rate (VC3, VC4,…) for the deletion of the cross-connection i.e. the DLT-CRS-<*sonet-rate*> yields to the same physical and logical behavior as DLT-CRS-<*sdh-rate*>.

No check is made if the modifier matches the interface-standard of the port i.e. if the port is provisioned as SONET (resp. SDH) and the rate is a SONET (resp. SDH) rate.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No

Input format

Command syntax: **DLT-CRS**-*modifier*:*tid*:*in_aid*,*out_aid*:*ctag*::[*cct*],[*in_aid2*];

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection on which the **DLT-CRS** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command.
   Type: Alphanumeric value set.
   Range:
   - LOVC12
   - LOVC3
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - LOVT1

- STS1
- STS3
- STS12
- STS48
- STS192
- AU3TU3
- TU3AU3

No use of the *all* value is allowed.

2. **tid** – Target Identifier
   Target Identifier. Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.
3. **in_aid** – Input Access Identifier
   This parameter specifies the source of the cross-connection.
   In case of a 1-way cross-connection the source of a cross-connection is unambiguous. In this case the cross-connection will be retrieved by the RTRV-CRS, which has the identical *in_aid*.
   In case of a 2-way cross-connection the source is not defined (the source could be the *in_aid* or the *out_aid* of the cross-connection). In this case both aids (*in_aid* or *out-aid*) of the cross-connection can be used as the *in_aid* parameter of the **RTRV-CRS** command. The **RTRV-CRS** command will then return the *in_aid* – parameter used in the **RTRV-CRS** command as the *in_aid* of the RTRV-CRS reply.
   Example:
   ENT-CRS-VC4:NEname:1-1-#-#-1-1-1,1-1-#-#-2-1-1:123456:2way;
   RTRV-CRS-VC4:NEname:1-1-#-#-2-1-1:123457;
   M 123457 COMPLD ″1-1-#-#-1-1-,1-1-#-#-2-1-1:vc4…;
   Type: GenTribAID.
   Range: The **all**-parameter is accepted for the slot-, port- and trib-part of the AID. For the port the all-parameter is to be distinguished between **all** when referring OP***n*** packs and GE***n*** **vall** when referring the GE***n***.
   For example the following *in_aids* are valid:
   - 1-1-#-#-all-all-all specifying all tributaries and all ports in the whole shelf
   - 1-1-#-#-2-1-all specifying all tributaries of the first port of the pack in slot-number=02
   - 1-1-#-#-3-vall-all specifying all tributaries of the first port of the (GE***n***) pack in slot-number=03
4. **out_aid** – Output Identifier
   This parameter specifies the tributary which is the sink of the cross-connection.
   Type: STS1NumAID (when using OP***n*** packs) or VCGNumAID (when using GE***n***).
   Range: n.a. (**all** values shall never occur as part of an output parameter).
5. **ctag** – Correlation Tag
   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).

6. **`cct`** – cross-connection Topology
   This parameter specifies the topology of the cross-connection to be established via the **`ENT-CRS`** command.
   The topology defines
   - the number of legs of the cross-connection
   - whether both legs belong to the same tributary
   - whether a path protection is included.

   The following values are possible:
   - 1WAY: the cross-connection consists of one leg given by the *in_aid* to the *out_aid*
   - 2WAY: the cross-connection consists of two legs given by the *in_aid* to the *out_aid* and the return leg given by the *out_aid* to the *in_aid*
   - 1WAYPPROT: the cross-connection consist of one leg (the worker leg) given by *in_aid* to *out_aid* and another leg (the protection leg) given by *in_aid2* to the *out_aid*. The path selector function is associated with the tributary of *out_aid*.

   Type: Alphanumeric value string.
   Range:
   - 1WAY
   - 2WAY (default)
   - 1WAYPPROT.
7. **`in_aid2`** – Input Access Identifier 2
   This parameter is applicable to path-protected cross-connections only and specifies the source of the protection leg.
   Thus *in_aid* and *out_aid* specify the working leg while *in_aid2* and *out_aid* specify the protection leg of a path-protected cross-connection. For non path-protected cross-connection the parameter *in_aid2* must be omitted.
   Both input aids (*in_aid* and *in_aid2*) have to be related to ports with the same interface mode being either SDH or SONET. This is due to different switch criteria for SONET and SDH.
   Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID.
   STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs; TMuxAPTNumAID are used for asynchronous high-order tributaries on TransMUX packs, GenLOTribAID are used for low-order tributaries on e.g. OP***n***, EP155.
   Range: No use of the **`all`** value within the *in_aid2* is allowed.
   Default: None (a valid value is needed on case of a path-protected cross-connection – no default is defined).

Output format

If the **`DLT-CRS`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

Cross-connection can be deleted via the **DLT-CRS** command when *xconcls* = TRADITIONAL.

Deletion of 2WAY cross-connections

Please note that the 2 legs of a 2-way cross-connection can be deleted either via a single DLT-CRS command (with *cct*=2WAY) or via 2 separate DLT-CRS commands (each with *cct*=1WAY). In the latter case an additional *repleg* status change will be notified via an ED-CRS notification.

When deleting a cross-connection the cross-connection entity will be deleted as well. This deletion is notified via a DLT-CRS notification.

Updated affected entities: General

In case of deleting a path-protected cross-connection the command deletes in addition the entity of type protection group being related to that path-protected cross-connection. This deletion is notified via a DLT-PROTN-GRP notification. Please refer to the “DLT-PROTN-GRP notification” (p. 3-243) section for details.

In case the *repleg* state is changed by deleting a cross-connection an ED-CRS notification is used to notify the updated *repleg* value.

Updated affected entities: 1-way cross-connection, when not part of 2 way cross-connection

In case a 1-way cross-connection is deleted where no ″equivalent return-leg″ (see below) is already existing the affected instance of the cross-connection is deleted. This is reported by means of an DLT-CRS notification.

An ″equivalent return-leg″ means: for a 1-way cross-connection with rate N from in_trib to out_trib a return-leg would be given by

- a 1-way cross-connection from out_trib to in_trib
- with the same rate N
- and in (case of BLSR only) the same *loca* and *locz* values.

Example:

DLT-CRS-vc3:NameOfNE:1-1-#-#-6-1-1,1-1-#-#-1-1-1:88::1way;

REPT DBCHG

DLT-CRS-VC3:1-1-#-#-6-1-1,1-1-#-#-1-1-1:1WAY;

Updated affected entities: 1-way cross-connection, when part of a 2-way cross-connection

In case a 1-way cross-connection is deleted where an ″equivalent return-leg″ (see below) exists the instance of type cross-connection, which represents the leg as specified in the **`DLT-CRS`** command is deleted.

This is reported by means of an DLT-CRS notification.

Furthermore the altered *repleg* status is reported via an ED-CRS notification.

An ″equivalent return-leg″ means: when entering a 1-way cross-connection with rate N from in_trib to out_trib a return-leg would be given by

- a 1-way cross-connection from out_trib to in_trib
- with the same rate N
- and in (case of BLSR only) the same *loca* and *locz* values.

Example (Precondition: 2-way cross-connection:1-1-#-#-7-3-1 ↔ 1-1-#-#-3-4-1):

DLT-CRS-vc4:NEname:1-1-#-#-7-3-1,1-1-#-#-3-4-1:587::1way;

`REPT DBCHG`

DLT-CRS-VC4:1-1-#-#-7-3-1,1-1-#-#-3-4-1:1WAY;

`REPT DBCHG`

ED-CRS-VC4:1-1-#-#-3-4-1,1-1-#-#-7-3-1::repleg=1WAY;

Updated affected entities: 2-way cross-connection

In case a 2-way cross-connection is deleted its related instance of type cross-connection will be deleted as well.

This is reported by means of an DLT-CRS notification.

Example:

DLT-CRS-vc3:NameOfNE:1-1-#-#-6-1-1,1-1-#-#-1-1-1:88::2way;

`REPT DBCHG`

DLT-CRS-VC3:1-1-#-#-6-1-1,1-1-#-#-1-1-1:2WAY;

Updated affected entities: path-protected cross-connection

In case a path-protected cross-connection is deleted the related instance of type cross-connection will be deleted as well. This is reported by means of one DLT-CRS notification where *in_aid*, *in_aid2* can be chosen as in the delete request or flipped.

Furthermore the related instance of protection group will be deleted as well.

This is reported by means of an DLT-PROTN-GRP notification.

For details on protection group please refer to the protection group section.

Example:

DLT-CRS-vc3:NameOfNE:1-1-#-#-1-1-1,1-1-#-#-15-1-1:92::1WAYPPROT,1-1-#-#-14-1-1;

REPT DBCHG

DLT-PROTN-GRP:1-1-#-#-15-1-1:PATHDRI;

REPT DBCHG

DLT-CRS-VC3:1-1-#-#-1-1-1,1-1-#-#-15-1-1:1WAYPPROT,1-1-#-#-14-1-1;

Identification of VCG tributaries

The system shall allow to delete cross-connections at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading ″v″.

Specific behavior of low-order cross-connection deletion - Auto-desubstructuring of high-order tributaries

If the last low-order cross-connection is going to be removed from auto-substructured low-order entities (i.e. related to a HO-NIM entity with *substr* = YES or a HO PTF located on TransMUX) then the whole substructure is deleted:

- any performance monitoring point related to those LONIM entities,
- all LONIM entities,
- the related PTF entity.

The deletion of the latter two items are notified (by DLT-LONIM and DLT-PTF notifications).

In addition the HO NIM shall indicate that it is not substructured by setting the parameter substr to NO which is notified by a ED-rr notificiation.

In the case of TransMUX, only the LOXC related entities will be deleted. The LO path terminations (TMSVT) and the related PTF (TMSSTS1) remain unchanged.

None of the deleted settings are longer maintained. A new cross-connection will cause a creation of new substructure with default values.

Specific behavior of conversion cross-connection deletion - Auto-desubstructuring of high-order tributaries

If the last conversion cross-connection is going to be removed from auto-substructured low-order entities (i.e. related HO-NIM entity has *substr*==CNVSUB) then the whole substructure is deleted:

- any performance monitoring point related to those LONIM entities,
- all LONIM entities,
- the related PTF entity.

The deletion of the latter two items are notified (by DLT-LONIM and DLT-PTF notifications).

In addition the HO tributary shall indicate that it is not substructured by setting the parameter *substr* to NO which is notified by a ED-VC3 notificiation.

Specific behavior of conversion cross-connection deletion - Auto-configuration of the HO NIM/PTF entity related to the HO side

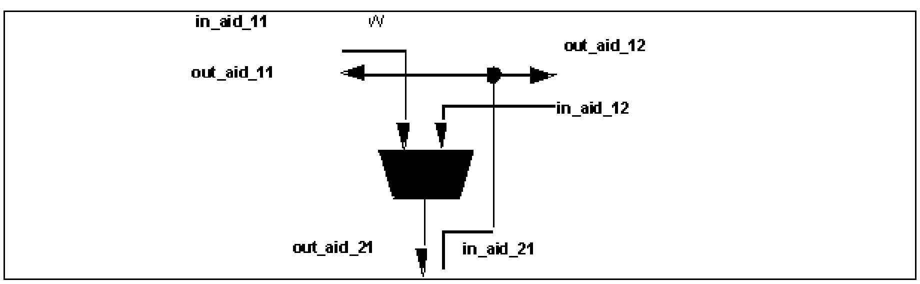
When the last conversion cross-connection is removed from a higher-order tributary, then the following parameter values of the HO NIM or HO PTF is automatically configured:

- *substr* is set to NO

This are notified with a ED-STS1 or ED-PTF notification.

Example input/output

Suppose the following compound cross-connection as depicted below is deleted: This would require the following DLT-CRS commands:



```
DLT-CRS-VC4:UNITE-NE:in_aid_11,out_aid_21:123456::1WAYPROT,in_aid_12;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;

DLT-CRS-VC4:UNITE-NE:in_aid_21,out_aid_12:123457::1way;
```

```
   UNITE-NE 00-11-14 12:01:00
M  123457 COMPLD
;
```

```
DLT-CRS-VC4:UNITE-NE:in_aid_21,out_aid_11:123458::1way;
```

```
   UNITE-NE 00-11-14 12:02:00
M  123458 COMPLD
;
```

The first command will delete the path-protected cross-connection, while the following two commands delete the bridge.

Error responses

Validation rule: Valid topology

Cross-connection command processing verifies for higher order cross-connections that the value of the topology parameter is consistent with the atomic cross-connection topology and the leg status of the existing cross-connection in accordance with the following table. Failure to meet this criteria (Validation Response = Deny) results in command rejection.

Error code: `SNVS – Status, Not in Valid State, Invalid topology`

Topology in Remove cross-connection Command (TL1 parameter: *cct*)	Topology of Existing Atomic cross-connection (internal parameter: ″Atomic cross-connection topology″ as described in the RTRV-CRS section in the *repleg* context)	Leg Status of Existing Atomic cross-connection (internal parameter: ″Leg status″ as described in the RTRV-CRS section in the *repleg* context)	Validation Response (″Accept″ means that the command is replied by a COMPLD, ″Deny″ means, that the command is rejected with the Error Code as stated above)
1WAY	point-to-point	1-way	Accept
	point-to-point	2-way	Accept
	path-protected	1-way	Deny
2WAY	point-to-point	1-way	Deny
	point-to-point	2-way	Accept
	path-protected	1-way	Deny
1WAYPPROT	point-to-point	1-way	Deny
	point-to-point	2-way	Deny
	path-protected	1-way	Accept

This table should be understood as follows:

- 1. line: suppose a 1-way cross-connection exists with a point-to-point topology – then this cross-connection can be deleted with the **`DLT-CRS`** command including the input parameter *cct*=1WAY i.e. the command will be accepted and executed;
- 2. line: suppose a 2-way cross-connection exists with a point-to-point topology – then a DLT-CRS with *cct*=1WAY will be accepted and one leg will be deleted (the other in the return direction will still exist);
- 3. line: suppose a path-protected cross-connection exists which (also) has a leg status 1-WAY – then a DLT-CRS with *cct=1way* will be denied with the Error Code `SNVS – Status, Not in Valid State, Invalid topology`; to delete this cross-connection properly the last line has to be considered, where the *cct* is compliant with the atomic cross-connection topology and the leg status.

Validation rule: Entities (tributaries) must exist

Cross-connection command processing verifies the logical tributaries specified in the command do exist.

Error code:

`IENE – Input Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: Entity (cross-connection) must exist

Cross-connection command processing verifies that the specified cross-connection exists.

Error code:

`IENE – Input Entity Not Exists, Specified cross-connection does not exist`

Validation rule: LO cross-connection with specified topology must exist

Cross-connection command processing shall verify for lower order cross-connections that a lower order cross-connection with the specified topology exists.

Error code:

`IENE – Input, Entity Not Exists, Specified cross-connection does not exist`

Validation rule: Conversion cross-connection with specified topology must exist

Cross-connection command processing shall verify for conversion cross-connections that the conversion cross-connection exists and that the specified topology (parameter *cct*) is valid.

Error code:

`IENE – Input, Entity Not Exists, Specified crossconnection does not exist`

Validation rule: Valid rate

Cross-connection command processing verifies that the specified rate is equivalent to the rate of the existing cross-connection. Hereby the SONET-rates are treated identical to the SDH-rates (i.e. sts1/vc3, STS3/vc4 etc.)

Error code:

`IDNC – Input Data Not Consistent, Rate is inconsistent with existing cross-connection`

Validation rule: No cross-connection loopback existing

Cross-connection command processing denies commands requesting a cross-connection to a tributary with an existing cross-connection loopback.

Error code:

`SNVS – Status, Not in Valid State, Tributary has existing loopback`

Note: As in the **`ENT-CRS`** command there is no command validation concerning facility loopback i.e. the cross-connection deletion will be possible even with a facility loopback present.

Validation rule: No test access session

Cross-connection command processing shall deny commands requesting a cross-connection to a tributary which is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, Tributary used in test access session`

Validation rule: Cross-connection must not be of *xconcls* NN

Cross-connection command processing shall verify, that the cross-connection is not of xconcls NN.

Error code:

`SNVS – Status, Not in Valid State, Cross-connection must not be of xconcls NN`

DLT-CRS-FECOM: Delete transparent DCC cross-connection

The DLT-CRS-FECOM can be initiated by the users to delete a transparent DCC cross-connection.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 3

Abortable: No.

Input format

Command syntax: **DLT-CRS-FECOM**:*tid:port_aid1,port_aid2,dcctype:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **port_aid1** – DCC port 1
   This parameter indicates one (first) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a Transparent DCC Cross Connection.
   Type: AID
   Range: SPortAID. The keyword **all** is allowed not.
4. **port_aid2** – DCC port 2
   This parameter indicates one (second) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a Transparent DCC Cross Connection.
   Type: AID
   Range: SPortAID. The keyword **all** is not allowed in the aid.
5. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS Transparent DCC Cross Connection parameters of the OP***n*** port is reported by the command.
   Type: Alphanumeric value set Range – LINE – SECTION
   Range: LINE, SECTION

Output format

In response to a valid DLT-CRS-FECOM command, the following output is returned:

```
    sid date time
 M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **DLT-CRS-FECOM** command deletes a transparent DCC cross-connection specified by *port_aid1*, *port_aid2* and *dcctype*.

The system supports only bidirectional transparent DCC cross-connections.

Update affected entities

The deletion of the transparent DCC cross-connection will be reported via DLT-CRS-FECOM notification reporting the deleted transparent DCC cross-connection.

The update of the dccstat parameter of the two involved ports will be reported via ED-FECOM notification for each port reporting the changed *dccstat* = DISABLED and *scn_dccstat* = DISABLED and *uni_dccstat* = DISABLED and *enni_dccstat* = DISABLED.

Example input/output

The following example shows DLT-CRS-FECOM commands there two transparent DCC cross-connections are deleted one for *dcctype* = SECTION and one for *dcctype* = LINE:

```
DLT-CRS-FECOM:NE-UNITE:1-1-#-#-1-1,1-1-#-#-2-1,LINE:12345;
    NE-UNITE 00-12-24 12:00:00
 M  123456 COMPLD
;
DLT-CRS-FECOM:NE-UNITE:1-1-#-#-1-1,1-1-#-#-2-1,SECTION:12345;
    NE-UNITE 00-12-24 12:00:00
 M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **DLT-CRS-FECOM** command.

Validation rule: Entity (transparent DCC cross-connection) must exist

The specified transparent DCC cross-connection must exist on both specified ports.

Error code:

`IENE – Input Entity Not Exists, Specified Transparent DCC Cross Connection does not exist`

Related TL1 messages

DLT-CRS-FECOM notification

Output format

Command syntax: **DLT-CRS-FECOM**:*port_aid1*,*port_aid2*,*dcctype*

Output parameters

Command parameters

1. **port_aid1** – DCC port 1
   This parameter indicates one (first) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a Transparent DCC Cross Connection.
   Type: AID
   Range: SPortAID. The keyword **all** is allowed not.
2. **port_aid2** – DCC port 2
   This parameter indicates one (second) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a Transparent DCC Cross Connection.
   Type: AID
   Range: SPortAID. The keyword **all** is not allowed in the aid.
3. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS Transparent DCC Cross Connection parameters of the OP***n*** port is reported by the command.
   Type: Alphanumeric value set Range – LINE – SECTION
   Range: LINE, SECTION

Example output

The following example shows DLT-CRS-FECOM notifications reporting the deletion of transparent DCC cross-connections:

```
   UNITE-NE 00-12-24 12:00:00
 A  000 REPT DBCHG
   ″TIME=12:00:00,DATE=00-12-24:DLT-CRS-FECOM::1-1-#-#-1-1,1-1-#-2-1,LINE″
;

   UNITE-NE 00-12-24 12:00:00
 A  000 REPT DBCHG
   ″TIME=12:00:00,DATE=00-12-24:DLT-CRS-FECOM::1-1-#-#-1-1,1-1-#-2-1,SECTION″
;
```

DLT-CRS notification

Output format

Syntax: **DLT-CRS**-*modifier*:*in_aid*,*out_aid*:*cct*,[*in_aid2*];

Output parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection on which the **DLT-CRS** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command.
   Type: Alphanumeric value set.
   Range:
   - LOVC12
   - LOVC3
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - LOVT1
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - AU3TU3
   - TU3AU3

   No use of the *all* value is allowed.
2. **in_aid** – Input Access Identifier
   This parameter specifies the source of the cross-connection.
   In case of a 1-way cross-connection the source of a cross-connection is unambiguous. In this case the cross-connection will be retrieved by the RTRV-CRS, which has the identical *in_aid*.
   In case of a 2-way cross-connection the source is not defined (the source could be the *in_aid* or the *out_aid* of the cross-connection). In this case both aids (*in_aid* or *out-aid*) of the cross-connection can be used as the *in_aid* parameter of the **RTRV-CRS** command. The **RTRV-CRS** command will then return the *in_aid* –

parameter used in the **RTRV-CRS** command as the *in_aid* of the RTRV-CRS reply.
Example:
ENT-CRS-VC4:NEname:1-1-#-#-1-1-1,1-1-#-#-2-1-1:123456:2way;
RTRV-CRS-VC4:NEname:1-1-#-#-2-1-1:123457;
M 123457 COMPLD ″1-1-#-#-1-1-,1-1-#-#-2-1-1:vc4….. ;
Type: GenTribAID.
Range: The **all**-parameter is accepted for the slot-, port- and trib-part of the AID. For the port the all-parameter is to be distinguished between **all** when referring OP***n*** packs and GE***n*** **vall** when referring the GE***n***.

For example the following *in_aids* are valid:

- 1-1-#-#-all-all-all specifying all tributaries and all ports in the whole shelf
- 1-1-#-#-2-1-all specifying all tributaries of the first port of the pack in slot-number=02
- 1-1-#-#-3-vall-all specifying all tributaries of the first port of the (GE***n***) pack in slot-number=03

3. **out_aid** – Output Identifier
This parameter specifies the tributary which is the sink of the cross-connection.
Type: STS1NumAID (when using OP***n*** packs) or VCGNumAID (when using GE***n***).
Range: n.a. (**all** values shall never occur as part of an output parameter).

4. **cct** – cross-connection Topology
This parameter specifies the topology of the cross-connection to be established via the **ENT-CRS** command.
The topology defines
   - the number of legs of the cross-connection
   - whether both legs belong to the same tributary
   - whether a path protection is included.

   The following values are possible:
   - 1WAY: the cross-connection consists of one leg given by the *in_aid* to the *out_aid*
   - 2WAY: the cross-connection consists of two legs given by the *in_aid* to the *out_aid* and the return leg given by the *out_aid* to the *in_aid*
   - 1WAYPPROT: the cross-connection consist of one leg (the worker leg) given by *in_aid* to *out_aid* and another leg (the protection leg) given by *in_aid2* to the *out_aid*. The path selector function is associated with the tributary of *out_aid*.

   Type: Alphanumeric value string.
   Range:
   - 1WAY
   - 2WAY (default)
   - 1WAYPPROT.

5. **`in_aid2`** – Input Access Identifier 2
   This parameter is applicable to and is present for path-protected cross-connections only and specifies either the source of the protection leg or the source of the working leg.
   This depends on the value of the *repleg* parameter:
   - E.g. for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSW the worker leg is given by IN1 -> OUT and the protection leg is given by IN2 -> OUT;
   - for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSP the worker leg is given by IN2 -> OUT and the protection leg is given by IN1 -> OUT.

   Thus *in_aid* and *out_aid* specify one leg of the legpair of a path-protected cross-connection, while *in_aid2* and *out_aid* specify the second leg.
   Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID.
   STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs; TMuxAPTNumAID are used for asynchronous high-order tributaries on TransMUX packs, GenLOTribAID are used for low-order tributaries on e.g. OP***n***, EP155.
   Note: Using VCGNumAID (when using e.g. GE***n*** packs) is NOT applicable as those packs can not be the input to a path-protected cross-connection. Therefore specific AID types are mentioned instead of GenTribAID.
   Range: n.a. (**`all`** and **`usall`** values shall never occur as part of an output parameter).

Example output

Refer to the ″Detailed behavior description″ in “DLT-CRS: Delete cross-connection” (p. 3-145).

DLT-EC1 notification

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID
   Range: EC1 port AID

Example Output

```
   UNITE-NE 04-12-23 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=04-12-23:DLT-EC1:1-1-#-#-21-1”
;
```

DLT-ENNIMANROUTE: Delete manual route from the E-NNI node

The **DLT-ENNIMANROUTE** command is used to delete manual routes, previously entered via ENT-ENNIMANROUTE, from the E-NNI node.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-ENNIMANROUTE**-modifier*:tid::ctag:::[spec_block];*

Input parameters

Command parameters

1. **modifier**
The parameter modifier indicates whether the manual route is used to reach a signaling controller (SC) or a routing controller (RC) subnet.
Type: Alphanumeric value set.
Range: SC or RC
2. **tid** – Target Identifier
See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **ctag** – Correlation Tag
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Type: Alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters.
Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **neighborSIGPCIPAddress** – Neighbor Signaling Controller IP Address
This parameter is used to indicate the IP address of a neighboring signaling controller that is connected via a LAN interface.
The term "neighbor" refers to logical neighborship. The neighboring SC is not necessarily a physical neighbor.
The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.

Type: Four dot separated numeric strings.
Range: Each numeric string: 0 .. 255.
The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.

2. **`neighborSIGPCID`** – Neighbor Signaling Controller Identifier
   This parameter is used to indicate the identifier of a neighboring signaling controller that is connected via a LAN interface.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.
3. **`neighborRCIPAddress`** – Neighbor Route Controller IP Address
   This parameter is used to indicate the IP address of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
4. **`neighborRCIPSubnetMask`** – Neighbor Route Controller IP Subnet Mask
   This parameter is used to indicate the subnet mask of the IP subnet of a neighboring route controller.
   The IP subnet that can be reached via the manual route is described by the tuple neighborRCIPAddress + neighborRCIPSubnetMask.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
5. **`if_id`** – interface id
   This parameter is used to indicate the interface associated with the manual route.
   Type: AID
   Range: SPortAID or LanPort AID (the keyword “all” is not used)
6. **`dcctype`** – DCC type
   This parameter is used to further specify the DCC type, in case the *if_id* refers to a DCC channel.
   Type: Alphanumeric value set.
   Range: LINE or SECTION
   Optional parameter: This parameter must be present if the interface *if_id* is a DCC. It must not be present, if the interface *if_id* is no DCC.

Output format

If the DLT-ENNIMANROUTE is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the “RTRV-HDR: Retrieve header” (p. 3-2417) command.

Detailed behavior description

The **DLT-ENNIMANROUTE** command shall delete a manual route entry from the E-NNI node. The deletion of the manual route is notified with DLT-ENNIMANROUTE Notifications.

Example input/output

The following example shows the result of a DLT-ENNIMANROUTE command:

```
DLT-ENNIMANROUTE-SC:LT-UNITE::123456::: neighborSIGPCIPAddress=30.24.15.10,
      neighborSIGPCID=0.0.0.42, if_id=1-1-lan2;

   LT-UNITE 06-10-09 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **DLT-ENNIMANROUTE** command.

Validation rule: Parameter Combinations

The command is rejected if the combination of modifier and parameters is not one of the following:

- modifier==SC and interface type is point-to-multipoint and list of parameters is: *neighborSIGPCIPAddress*, *neighborSIGPCID*, *lan_nh_ifipad*, *if_id*
- modifier==RC and interface is a LAN and list of parameters is: *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *lan_nh_ifipad*, *if_id*, where *if_id* refers to a LAN interface
- modifier==RC and interface is a point-to-point interface and list of parameters is: *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *if_id*, *dcctype*, where *if_id* refers to a DCC

Error code:

`IDNV – Input, Data Not Valid, Combination of Modifier/Parameters not allowed`

Note that the parameter *lan_nh_ifipad* is by intention not part of the command, as it is not allowed to enter manual routes to the same destination via the same LAN but via different gateways. Therefore the *lan_nh_ifipad* is irrelevant for deleting an entry.

Validation rule: Port not used for ENNI

If the *if_id* and *dcctype* (in case of a DCC) is not in use for ENNI, i.e. is not assigned to the enninode, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, port not in use for ENNI`

Validation rule: Manual Route entry must exist

If the given manual route does not exist, the command is rejected.

A manual route exists if one of the following conditions is fulfilled:

- an entry with identical *neighborSIGPCIPAddress*, *neighborSIGPCID*, *lan_nh_ifipad* and *if_id* is already provisioned
- an entry with identical *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *lan_nh_ifipad*, and *if_id* is already provisioned, where *if_id* refers to a LAN interface
- an entry with identical *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *if_id*, and *dcctype* is already provisioned, where *if_id* refers to a DCC

Error code:

`IDNV – Input, Data Not Valid, Manual route entry does not exist`

Related TL1 messages

- "RTRV-ENNIMANROUTE: Retrieve all manual routes of the E-NNI node" (p. 3-2348)
- "DLT-ENNIMANROUTE: Delete manual route from the E-NNI node" (p. 3-164)

DLT-ENNIMANROUTE notification

Output format

The DLT-ENNIMANROUTE notification has the following specific syntax:

`DLT-ENNIMANROUTE`-modifier*:::spec_block*

Output parameters

Command parameters

1. **`modifier`**
   The **`DLT-ENNIMANROUTE`** command is used on ASON domain border NEs, i.e. NEs that have ENNI interfaces to other ASON domains, to enter (add) manual routes to other ASON domains into the forwarding table of the E-NNI node.

   There are two types of manual routes:

   - manual routes to neighboring signaling controllers
   - manual routes to neighboring routing controllers

   The command modifier is used to distinguish these two types of manual routes.
   Note that this command cannot be used to enter manual routes to neighboring signaling controllers that are connected via point-to-point interfaces, as these manual routes are implicitely added upon port provisioning.
   Refer to the Example Input/Output section for provisioning examples.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **`DLT-ENNIMANROUTE`**-modifier*:tid::ctag:::[spec_block];*

Input parameters

Command parameters

1. **`modifier`**
   The parameter modifier indicates whether the manual route is used to reach a signaling controller (SC) or a routing controller (RC) subnet.
   Type: Alphanumeric value set.
   Range: SC or RC
2. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **`neighborSIGPCIPAddress`** – Neighbor Signaling Controller IP Address
   This parameter is used to indicate the IP address of a neighboring signaling controller that is connected via a LAN interface.
   The term "neighbor" refers to logical neighborship. The neighboring SC is not necessarily a physical neighbor.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.
2. **`neighborSIGPCID`** – Neighbor Signaling Controller Identifier
   This parameter is used to indicate the identifier of a neighboring signaling controller that is connected via a LAN interface.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.

3. **`neighborRCIPAddress`** – Neighbor Route Controller IP Address
   This parameter is used to indicate the IP address of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
4. **`neighborRCIPSubnetMask`** – Neighbor Route Controller IP Subnet Mask
   This parameter is used to indicate the subnet mask of the IP subnet of a neighboring route controller.
   The IP subnet that can be reached via the manual route is described by the tuple neighborRCIPAddress + neighborRCIPSubnetMask.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
5. **`lan_nh_ifipad`** – Next Hop Interface IP Address for LAN Interfaces
   This parameter is used to indicate the interface IP address of the next hop of a manual route using a LAN. This parameter is insignificant for point-to-point interfaces.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the interface referred by *if_id* is a LAN.
6. **`if_id`** – interface id
   This parameter is used to indicate the interface associated with the manual route.
   Type: AID
   Range: SPortAID or LanPort AID (the keyword “all” is not used)
7. **`dcctype`** – DCC type
   This parameter is used to further specify the DCC type, in case the *if_id* refers to a DCC channel.
   Type: Alphanumeric value set.
   Range: LINE or SECTION
   Optional parameter: This parameter must be present if the interface *if_id* is a DCC. It must not be present, if the interface *if_id* is no DCC.

Output format

If the **`DLT-ENNIMANROUTE`** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Detailed behavior description

The **DLT-ENNIMANROUTE** command shall add a manual route entry to the E-NNI node. The update of the manual routes are notified with DLT-ENNIMANROUTE Notifications.

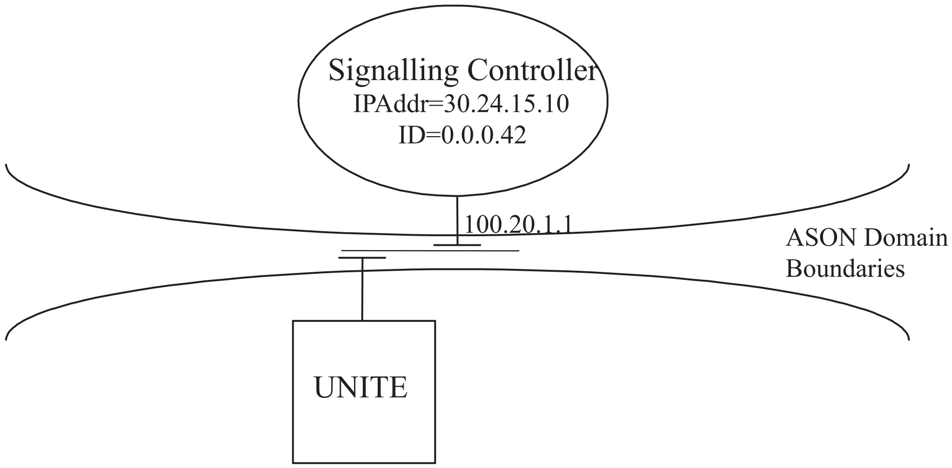
Example input/output

```
ENT-ENNIMANROUTE-RC:LT-UNITE::123456:::neighborRCIPAddress=95.22.10.1,
      neighborRCIPSubnetMask=255.255.255.0, lan_nh_ifipad=100.20.1.1, if_id=1-1-
      lan2;

   LT-UNITE 06-10-09 08:00:00
M  123456 COMPLD
;
```

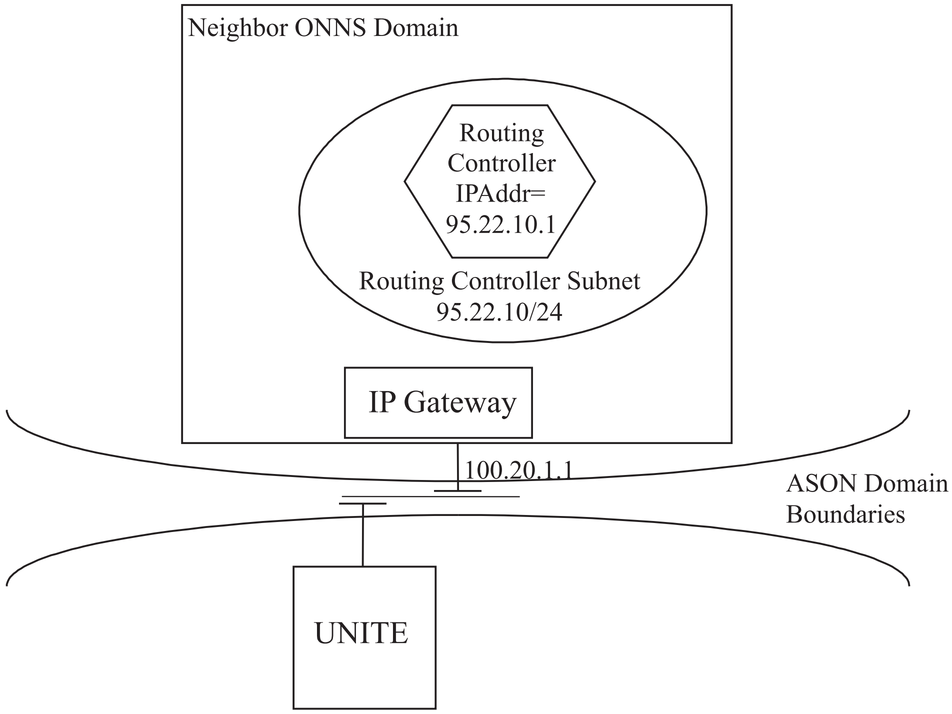
Signaling Controller Provisioning Example

```
ENT-ENNIMANROUTE-SC:LT-
UNITE::123456:::neighborSIGPCIPAddress=30.24.15.10,
neighborSIGPCID=0.0.0.42, lan_nh_ifipad=100.20.1.1,
if_id=1-1-lan2;
```



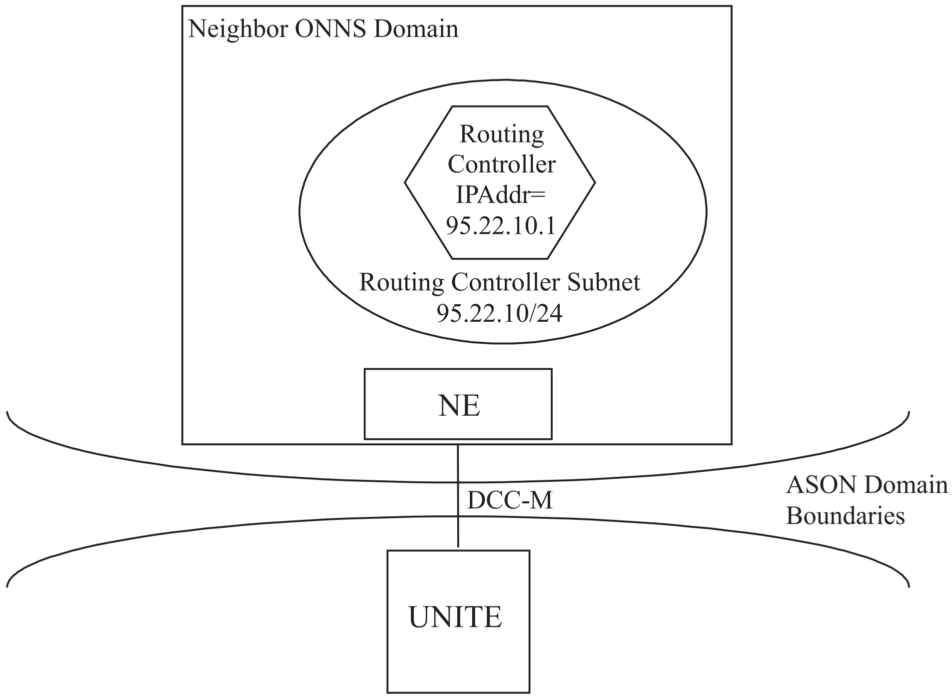
Routing Controller Provisioning Example P2MP

```
ENT-ENNIMANROUTE-RC:LT-
UNITE::123456:::neighborRCIPAddress=95.22.10.1,
neighborRCIPSubnetMask=255.255.255.0,
lan_nh_ifipad=100.20.1.1, if_id=1-1-lan2;
```



Routing Controller Provisioning Example P2P

```
ENT-ENNIMANROUTE-RC:LT-
UNITE::123456:::neighborRCIPAddress=95.22.10.1,
neighborRCIPSubnetMask=255.255.255.0, if_id=1-1-#-#-5-3,
dcctype=LINE;
```



Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **DLT-ENNIMANROUTE** command.

Validation rule: Parameter Combinations

The command is rejected if the combination of modifier and parameters is not one of the following:

- modifier==SC and if is a LAN and list of parameters is: *neighborSIGPCIPAddress*, *neighborSIGPCID*, *lan_nh_ifipad*, *if_id*
- modifier==RC and interface is a LAN and list of parameters is: *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *lan_nh_ifipad*, *if_id*
- modifier==RC and interface is a point-to-point interface and list of parameters is: *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *if_id*, *dcctype*

Error code:

`IDNV – Input, Data Not Valid, Combination of Modifier/Parameters not allowed`

Validation rule: Not allowed to use LAN1 for E-NNI

If LAN1 is specified in the AID, then the command is denied.

Error code: `IDNV – Input, Data Not Valid, LAN1 not allowed for ENNI`

Validation rule: LAN port not used for E-NNI

If the LAN port specified in the AID is not in use for E-NNI, i.e. is not assigned to the enninode, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LAN port not in use for ENNI`

Validation rule: DCC port not used for E-NNI

If the DCC specified in the AID is not in use for E-NNI, i.e. is not assigned to the enninode, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, DCC not in use for ENNI`

Validation rule: No duplicate Manual Route entries

The command is denied, if a duplicate manual route entry is entered.

A manual route is considered to be duplicate if one of the following conditions is fulfilled:

- an entry with identical *neighborSIGPCIPAddress*, *neighborSIGPCID*, and *if_id* is already provisioned
- an entry with identical *neighborRCIPAddress*, *neighborRCIPSubnetMask*, and *if_id* is already provisioned, where *if_id* refers to a LAN interface
- an entry with identical *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *if_id*, and *dcctype* is already provisioned, where *if_id* refers to a DCC

Error code:

`IDNV – Input, Data Not Valid, Manual route entry already exists`

Note that the *lan_nh_ifipad* is by intention not considered, as it is not allowed to have more than one gateway to one destination on one and the same LAN.

Validation rule: Check if limit of 20 Manual Routes per LAN port exceeded

The addition of a manual route entry for a LAN port is denied, if already 20 manual route entries exist for the LAN port.

Error code:

`SSRE – Status, System Resources Exceeded, limit of manual route entries exceeded`

Validation rule: Check if limit of 64 Manual Routes per ENNI Node exceeded

The addition of a manual route entry is denied, if already 64 manual route entries exist for the ENNI node.

Error code:

`SSRE – Status, System Resources Exceeded, ENNI limit of manual route entries exceeded`

This requirement is independent from the type of interface (LAN or point-to-point).

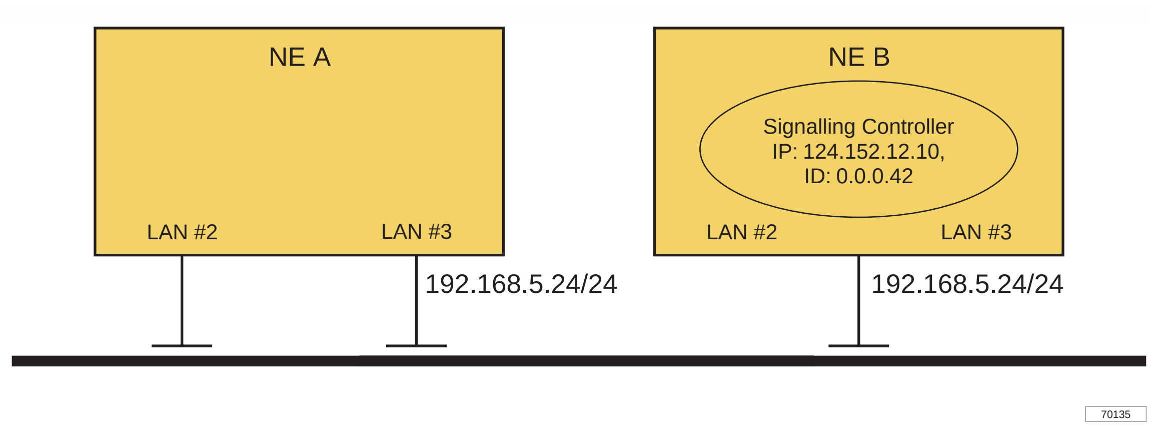
Validation rule: No more than one LAN connected to same next hop

The command is rejected if the provided *lan_nh_ifipad* is already provisioned for any other LAN interface.

Error code:

`IDNV – Input, Data Not Valid, Next Hop IP Address already assigned to other LAN`

This requirement prevents a configuration as shown below, which is desirable, but currently not supported:



Related TL1 messages

DLT-EPORT notification

Output format

The **DLT-EPORT** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

The **DLT-EPORT** notification has the following specific syntax:

DLT-EPORT:*aid;*

Output parameters

Command parameters

aid – Access Identifier

The access identifier specifies the Ethernet port to be operated on.

Type: AID

Range: EPortAID as defined in AID structure. The usage of the following values are excluded:

- *all* in the BayAID definition
- *all* in the Simple_ShelfAID definition
- *usall* in the Simple_UnivSlotAID definition
- *all* in the Simple_UnivSlotAID definition
- *all* in the Simple_EPortAID definition.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ”TIME=11-10-30,DATE=00-11-11:DLT-EPORT:1-1-#-#-1-1:::”
;
```

DLT-EQPT (slot): Delete equipment (slot)

The **DLT-EQPT** command deletes equipment that has been previously created with the **ENT-EQPT** command or via CP plug-in (auto-provisioning).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-EQPT**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The CTL cannot be deprovisioned.
   The AID of a slot.
   Type: AID
   Range:
   - SlotAID
   - UnivSlotAID
   - XCSlotAID
   - CTLSlotAID.

   The keyword **usall** is allowed for Simple_UnivSlotAID.
   The keyword **xcall** is allowed for Simple_XCSlotAID.
   The keyword **ctlall** is allowed for Simple_CTLSlotAID.
   The keyword **all** is allowed for Simple_SlotAID.
   The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the **DLT-EQPT** command completes successfully, then the following normal completion response is returned:

```
sid date time
```

```
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command deletes a circuit pack for a specified slot.

The deletion is reported by means of an DLT-EQPT notification for circuit pack.

For de-provisioning of a slot some conditions must be fulfilled.

Behavior of *actlname* during deprovisioning

When a circuit pack is deleted from the specified slot, then the actlname of the slot is modified and contain all allowed functional names for provisioning, according to the current provisioning status of the system.

Behavior of deprovisioning for multislot circuit packs

The attribute *actlname* of the neighbor slots which were covered by the multislot circuit pack (e.g. OP40, LOXC40G2S, LOXC40G3S) is modified and set from empty to the list of accepted packs.

The attributes *nvmname*, *nvmqual* of the neighbor slots which were covered by the multislot circuit pack (e.g. OP40, LOXC40G2S, LOXC40G3S) are modified and set to UNDEFINED, UNDEF.

The update is reported by means of an **`ED-EQPT`** notification for this slot.

Update affected entities

The command deletes in addition a set of entities of different types depending on the provisioned circuit pack

1. One instance of type circuit pack is deleted with attribute *aid*. This is reported by means of DLT-EQPT notification for the CP.
2. The instances of port STM-16 is deleted if *nvmname* of the addressed circuit pack equals *OP2G5* and the port attribute *istd* equals *SDH*. This is reported by means of DLT-STM16 notification of port. The number of port instances to be deleted depends on the capabilities of the actual circuit pack.
3. The instances of port OC-48 are deleted if *nvmname* of the addressed circuit pack equals *OP2G5* and the port attribute *istd* equals *SONET*. This is reported by means of DLT-OC48 notification of port. The number of port instances to be deleted depends on the capabilities of the actual circuit pack.

4. One instance of port STM-64 is deleted if *nvmname* of the addressed circuit pack equals *OP10* and the port attribute *istd* equals 'SDH'. This is reported by means of DLT-STM64 notification of port.
5. One instances of port OC-192 is deleted if *nvmname* of the addressed circuit pack equals *OP10* and the port attribute *istd* equals *SONET*. This is reported by means of DLT-OC192 notification of port.
6. One instance of port STM-256 is deleted if *nvmname* of the addressed circuit pack equals *OP40* and the port attribute *istd* equals *SDH*. This is reported by means of DLT-STM256 notification of port.
7. One instances of port OC-768 is deleted if *nvmname* of the addressed circuit pack equals *OP40* and the port attribute *istd* equals *SONET*. This is reported by means of DLT-OC768 notification of port.
8. 48, 192, 768 VC3 tributaries are deleted for each existing SDH port. This is reported by means of DLT-VC3 notifications for tributary.
9. 48, 192, 768 STS1 tributaries are deleted for each existing SONET port. This is reported by means of DLT-STS1 notifications for tributary.
10. The dcc channel entities are deleted for each existing SDH/SONET port. This is reported by means of DLT-FECOM notification for dcc channel.
11. One instance of 1+1 equipment protection group is deleted if nvmname of the addressed circuit pack equals 'to one out of {XC160, XC32 – , XC640} (not all variants are supported in all releases) and another XC circuit pack with the same nvmname exists. This are reported by means of DLT-PROTNGRP notification for the 1+1 protection group.
12. The parameters *nvmname, nvmqual* of the slot will be set to UNDEFINED, UNDEF, which will be reported by an ED-EQPT notification for slot.

Update affected entities - GE1

In addition to the rules listed above the command deletes the following entities if *nvmname* equals GE1:

- all instances of the entity EPORT owned by this circuit pack are deleted. This is reported by means of DLT-EPORT notification
- all instances of the entity VCG owned by this circuit pack are deleted. This is reported by means of DLT-VCG notification.
- For each VCG to be deleted all tributaries owned by this VCG are deleted. This is reported by means of DLT-VCGTRIB notification.

Update affected entities - Port Entities of OP622

In addition to the rules listed above the command deletes the following entities if *nvmname* equals OP622:

- 12 VC3 tributaries are deleted for each existing SDH ports. This is reported by means of DLT-VC3 notifications for tributary.
- 12 STS1 tributaries are deleted for each existing SONET port. This is reported by means of DLT-STS1 notifications for tributary.
- The instances of port STM-4 are deleted if the port attribute *istd* of the node equals ’SDH’. This is reported by means of DLT-STM4 notification for port. The number of port instances to be deleted depends on the capabilities of the actual circuit pack.
- The instances of port OC-12 are deleted if the port attribute *istd* of the node equals ’SONET’. This is reported by means of DLT-OC12 notification for port. The number of port instances to be deleted depends on the capabilities of the actual circuit pack.

Update affected entities - Port Entities of OP155

In addition to the rules listed above the command deletes the following entities if *nvmname* equals OP155:

- 3 VC3 tributaries are deleted for each existing SDH ports. This is reported by means of DLT-VC3 notifications for tributary.
- 3 STS1 tributaries are deleted for each existing SONET port. This is reported by means of DLT-STS1 notifications for tributary.
- The instances of port STM-1 are deleted if the port attribute *istd* of the node equals SDH. This will be reported by means of DLT-STM1 notification for port. The number of port instances to be deleted depends on the capabilities of the actual circuit pack.
- The instances of port OC-3 are deleted if the port attribute *istd* of the node equals SONET. This will be reported by means of DLT-OC3 notification for port. The number of port instances to be deleted depends on the capabilities of the actual circuit pack.

Update affected entities - Port Entities of EP155

In addition to the rules listed above the command shall delete the following entities if *nvmname* equals EP155:

- All tributaries are deleted for each existing SDH ports. This are reported by means of DLT-VC3 notifications for tributary.
- 8 STM-1E port instances of the actual circuit pack is deleted. This are reported by means of DLT-STM1E notification for port.

Update affected entities - GE1-VRTSW Entity

If nvmname is GE1 the command has the following additional side effects:

- If *vlantgmd* is 802.1tag the command shall delete the instance of entity *vrtsw*. This is notified by a DLT-VRTSW notification.

Update affected entities - OPLB

The command shall delete in addition following entities:

- Some instances of type socket is deleted for each socket contained on the circuit pack one. This are reported by means of DLT-EQPT notifications for sockets.
- one instance of type circuit pack is deleted. This are reported by means of an DLT-EQPT notification for circuit pack.

If optical modules are provisioned when the OPLB circuit pack will be de provisioned implicit also the optical modules will be de provisioned at first. The actions described in the DLT-EQPT (socket) command for de provisioning of modules will be performed in this case.

Update affected entities - OP2G5D

The command shall delete in addition following entities:

- Some instances of type socket is deleted for each socket contained on the circuit pack one. This are reported by means of DLT-EQPT notifications for sockets.
- one instance of type circuit pack is deleted. This are reported by means of an DLT-EQPT notification for circuit pack.

If optical modules are provisioned when the OP2G5D circuit pack will be de provisioned implicit also the optical modules will be de provisioned at first. The actions described in the DLT-EQPT (socket) command for de provisioning of modules will be performed in this case.

Update affected entities - OP10D

The command shall delete in addition following entities:

- Some instances of type socket is deleted for each socket contained on the circuit pack one. This are reported by means of DLT-EQPT notifications for sockets.
- One instance of type circuit pack is deleted. This are reported by means of an DLT-EQPT notification for circuit pack.

If optical modules are provisioned when the OP10D circuit pack will be de provisioned implicit also the optical modules will be de provisioned at first. The actions described in the DLT-EQPT (socket) command for de provisioning of modules will be performed in this case.

Update affected entities - OPT2G5

The command deletes in addition following entities:

- All instnces of VC-4 or STS-3c tributaries are deleted. This are reported by means of DLT-VCGTRIB notification.
- All instance of entity VCG-TRANS is deleted. This are reported by means of DLT-VCG-TRANS notification.
- All instances of type socket is deleted (one for each socket contained on the circuit pack). This are reported by means of DLT-EQPT notifications for sockets.
- one instance of type circuit pack is deleted. This are reported by means of an DLT-EQPT notification for circuit pack.

If optical modules are provisioned when the OPT2G5 circuit pack will be de provisioned implicit also the optical modules will be de provisioned at first. The actions described in the DLT-EQPT (socket) command for de provisioning of modules will be performed in this case.

Update affected entities - LOXC

The command deletes the following entities:

- one instance of type circuit pack is deleted. This are reported by means of an DLT-EQPT notification for circuit pack.

Update affected entities - EP51

The command deletes the following entities if nvmname equals EP51:

- 1 STS1 path termination is deleted for each existing T3 port. This are reported by means of DLT-PTF-STS notifications.
- 1 STS1 tributary is deleted for each existing EC1 port. This are reported by means of DLT-STS1 notification.
- All instances of port T3 is deleted. This are reported by means of DLT-T3 notification for port. The number of port instances to be deleted depends on the actual provisioned port types.
- one instance of type circuit pack is deleted. This are reported by means of an DLT-EQPT notification for circuit pack.

On the EP51 pack, each port can be individually provisioned as T3 or EC1 port. Depending on the port provisioning status, one portion of the 36 ports may be of type T3 while the other ports are EC1.

Update affected entities - TransMUX

The command shall delete the following entities if *nvmname* equals TMUX2G5:

The instance of type circuit pack is deleted. This is reported by means of a **`DLT-EQPT`** notification for circuit pack.

Update affected entities - ES64U

The command shall delete the following entities if *nvmname* equals ES64U:

The instance of type circuit pack is deleted. This is reported by means of a **DLT-EQPT** notification for circuit pack.

Changes for slots allowing to carry a TransMUX pack when deprovisioning a TransMUX pack

When deprovisioning the TransMUX pack, the attribute *actlname* of slots which are allowed to carry TransMUX packs is modified. The update is reported by means of an **ED-EQPT** notification for the affected slots.

Changes for slots allowing to carry a ES64U pack when deprovisioning an ES64U pack

When deprovisioning the ES64U pack, the attribute *actlname* of slots which are allowed to carry ES64U packs is modified. The update is reported by means of an **ED-EQPT** notification for the affected slots.

Update affected entities - OP10/XTTC and OP10XTTL

The command deletes the following entities:

- 192 VC3 tributaries are deleted for the existing SDH port. This are reported by means of a DLT-VC3 group notification for tributary
- 192 STS1 tributaries are deleted for the existing SONET port. This are reported by means of a DLT-STS1 group notification for tributary.
- Two dcc channels entities are deleted (one per type section/dccr and one type line/dccm) for the existing SDH/SONET port. This are reported by means of DLT-FECOM notifications for dcc channels.
- The existing STM-64 port is deleted. This are reported by means of a DLT-STM64 notification for port.
- The existing OC-192 port is deleted. This are reported by means of a DLT-OC192 notification for port.
- The existing OTN port of type OTU2 is deleted. This are reported by means of a DLT-OTU2 notification for OTN port.
- One instance of type circuit pack is deleted. This are reported by means of a DLT-EQPT notification for circuit pack.

On the EP51 pack, each port can be individually provisioned as T3 or EC1 port. Depending on the port provisioning status, one portion of the 36 ports may be of type T3 while the other ports are EC1.

Update affected entities - GE10PL1

The command shall delete in addition following entities:

- Nine instances of type socket is deleted for each socket contained on the circuit pack one. This are reported by means of DLT-EQPT notifications for sockets.
- one instance of type circuit pack is deleted. This are reported by means of an DLT-EQPT notification for circuit pack.

If optical modules are provisioned when the GE10PL1 circuit pack will be deprovisioned then at first also the optical modules will be deprovisioned implicitly. The actions described in the DLT-EQPT (socket) command for de provisioning of modules will be performed in this case.

Group notification for STS-1/AU-3 tributaries

Example: The AID field in a group notification for a tributaries related to port 1 for a OP10 pack in slot 1 looks like: 1-1-#-#-1-1-1&&-192.

Group notification for VCG tributaries

Example: The AID field in a group notification for a VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like: 1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping) 1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping).

Disabling of PM monitor

See Detailed behavior of the “ED-STM16: Edit STM16 port” (p. 3-1035) w.r.t PM impact as side of effect of port/tributary deletion.

Example input/output

```
DLT-EQPT:LT-UNITE:1-1-#-#-1:123456;

   LT-UNITE 00-11-14 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **DLT-EQPT** command.

Validation rule: No cross-connections allowed

Check of cross-connections involving the circuit pack to be removed.

Error code:

```
SNVS – Status, Not in Valid State, cross-connections are still existing
```

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure allowed

Check if lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure exist which involve the circuit pack to be removed. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, but no higher order cross-connections are present, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: No XC loopbacks allowed

Check of XC loopbacks involving the circuit pack to be removed.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: No protection groups allowed

Check of protection groups involving the circuit pack to be removed.

Error code:

`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: No transparent DCC connections

Check of used transparent DCC connections involving the circuit pack to be removed.

Error code:

`SNVS – Status, Not in Valid State, transparent DCC connections are still existing`

Validation rule: Not used as timing reference

Check of that none of the ports of the involving circuit pack is used as timing reference

Error code:

`SNVS – Status, Not in Valid State, at least one port used as timing reference`

Validation rule: Not used for OW

Check of that no connection to a OW port exists.

Error code:

`SNVS – Status, Not in Valid State, connection to OW port exists`

Validation rule: CP must be plugged out

Check of that the involved circuit pack is plugged out.

Error code: `SNVS – Status, Not in Valid State, the CP is not plugged out`

Validation rule: Check whether system is maintenance condition

Preprovisioning is not allowed, when the system in maintenance condition (see "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400)).

Error code:
`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: Reject Request for CTL slots

If *ctlw* or *ctlp* is specified as Simple_CTLSlotAID the command is rejected.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Check if related port are not in use by ONNS

If the provisioned circuit pack has ports with portClass = INNI or portClass = EDGE with networkTNAType=IPV4 and networkTNAAddress=0.0.0.0, the following must be fulfilled:

1. No cross-connection may exist on any tributary of the port.
2. portControl must be LOCKOUT.

Error code:
`SNVS – Status, Not in Valid State, Port is still in use by ONNS`

Validation rule: Check if related port are not in use by ONNS

De-provisioning is not allowed if the provisioned circuit pack has ports with portClass=UNI or portClass=eNNI or portClass = EDGE with networkTNAAddress≠default value.

Error code:
`SNVS – Status, Not in Valid State, Port is still in use by ONNS`

Validation rule: Deletion of XC circuit packs while ONNS is active

De-provisioning of worker XC pack is not allowed if the parameter xcsetup has the value ″SWISS″.

Error code: `SNVS – Status, Not in Valid State, ONNS is active`

Validation rule: Check whether LOXC pack is in use

If an attempt is made to deprovision an LOXC pack with *loswcap* not set to 0 while LO cross-connections, conversion cross-connections, cross-connection loopbacks, or LO substructure exist at one or more HO tributaries, then the command is denied.

Error code:
`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Check whether TransMUX pack is in use

If an attempt is made to deprovision a TransMUX pack while higher-order or lower-order cross-connections exist for the pack, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, HO or LO cross-connections still exist`

Validation rule: Check whether ES64U circuit pack is in use

If an attempt is made to deprovision an ES64U pack while higher-order cross-connections exist at the ES64U, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

GR-199-CORE

DLT-EQPT (socket): Delete equipment (socket)

Output format

The **DLT-EQPT** command shall delete module that has been previously created with the **ENT-EQPT** command or via module plug-in (autoprovisioning).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no.

Input format

Command syntax: **DLT-EQPT***:tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a socket.
   Type: AID
   Range: SocketAID. The keywords *all*, *usall*, *scall* is not allowed on any level.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the **DLT-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the “RTRV-HDR: Retrieve header” (p. 3-2417) command.

Detailed behavior description

The command shall delete a module for a specified socket. Since the creation of the module is not reported no DLT-EQPT notification for module will be reported.

Update acceptable modules list

If the command leads to a change of the Acceptable Modules List (list of actlname/actlqual), then the change is reported by means of an **`ED-EQPT`** notification.

Update affected entities

The command updates / deletes in addition a set of entities of different types depending on the provisioned optical module:

1. 3, 12, 48, 192 VC3 tributaries are deleted for each existing SDH port. This are reported by means of DLT-VC3 notifications for tributary.
2. 3, 12, 48, 192 STS1 tributaries are deleted for each existing SONET port. This are reported by means of DLT-STS1 notifications for tributary.
3. The dcc channel entities are deleted for each existing SDH/SONET port. This are reported by means of DLT-FECOM notification for dcc channel.
4. One instance of port STM-1 is deleted if *nvmname* of the addressed optical module equals *OM155* and the port attribute *istd* equals SDH. This are reported by means of DLT-STM1 notification of port.
5. One instances of port OC-3 is deleted if *nvmname* of the addressed optical module equals OM155 and the port attribute *istd* equals SONET. This are reported by means of DLT-OC3 notification of port.
6. One instance of port STM-4 is deleted if *nvmname* of the addressed optical module equals OM622 and the port attribute *istd* equals SDH. This are reported by means of DLT-STM4 notification of port.
7. One instances of port OC-12 is deleted if *nvmname* of the addressed optical module equals OM622 and the port attribute *istd* equals SONET. This are reported by means of DLT-OC12 notification of port.
8. One instance of port STM-16 is deleted if nvmname of the addressed optical module equals ’OM2G5’ and the port attribute istd equals ’SDH’. This are reported by means of DLT-STM16 notification of port.
9. One instances of port OC-48 is deleted if *nvmname* of the addressed optical module optical equals OM2G5 and the port attribute *istd* equals SONET. This are reported by means of DLT-OC48 notification of port.
10. One instance of port STM-64 is deleted if if *nvmname* of the addressed optical module equals OM10 and the port attribute *istd* equals SDH. This are reported by means of DLT-STM64 notification of port.

11. One instances of port OC-192 is deleted if *nvmname* of the addressed optical module equals OM10 and the port attribute *istd* equals SONET. This are reported by means of DLT-OC192 notification of port.
12. The parameters *nvmname*, *nvmqual* of the slot will be set to UNDEFINED, UNDEF, which will be reported by an ED-EQPT notification for slot.

Update affected entities - GE10PL1

The command shall update / delete in addition a set of entities of different types depending on the provisioned optical module:

1. All related tributaries are deleted for the VCG port related to the optical module. This are reported by means of DLT-VCGTRIB notifications.
2. The VCG related to the optical module is deleted. This are reported by means of a DLT-VCG notification.
3. The Ethernet port related to the optical module is deleted. This are reported by means of a DLT-EPORT notification.
4. The parameters nvmname, nvmqual of the socket will be set to UNDEFINED, UNDEF, which will be reported by an ED-EQPT notification for slot.
5. If the last optical module is de-provisioned from the GE10PL1 pack, then the acceptable module lists of all sockets on the pack shll be updated to the full range of allowed optical modules.

Group notification for STS-1/AU-3 tributaries

For efficiency reasons the notifications for tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to 1&&-<N>, with N is maximal legal STS-1/AU-3 number.

Example: The AID field in a group notification for a tributaries related to port 1 for a OP10 pack in slot 1 looks like: 1-1-#-#-1-1-1&&-192.

Disabling of PM monitor

See Detailed behavior specification in "ED-STM16: Edit STM16 port" (p. 3-1035) w.r.t PM impact as side of effect of port/tributary deletion.

Example input/output

This example shows a DLT-EQPT command de provisioning a socket:

```
DLT-EQPT:UNITE-NE:1-1-#-#-5-sc2:123456;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **DLT-EQPT** command.

Validation rule: No cross-connections allowed

Check of cross-connections involving the module to be removed.

Error code:

`SNVS – Status, Not in Valid State, cross-connections are still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure allowed

Check if lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure exist which involve the module to be removed. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, but no higher order cross-connections are present, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: No XC loopbacks allowed

Check of XC loopbacks involving the module to be removed.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: No facility loopbacks allowed

Check of facility loopbacks involving the module to be removed.

Error code:

`SNVS – Status, Not in Valid State, facility loopbacks still exist`

Validation rule: No protection groups allowed

Check of protection groups involving the module to be removed.

Error code:

`SNVS – Status, Not in Valid State, protection group still exist`

Validation rule: No transparent DCC connections

Check of used transparent DCC connections involving the module to be removed.

Error code:

`SNVS – Status, Not in Valid State, transparent DCC connections are still existing`

Validation rule: Not used as timing reference

Check of that none of the ports of the involving module is used as timing reference.

Error code:

`SNVS – Status, Not in Valid State, at least one port used as timing reference`

Validation rule: Not used for OW

Check of that no connection to a OW port exists.

Error code:

`SNVS – Status, Not in Valid State, connection to OW port exists`

Validation rule: module must be plugged out

Check of that the no module is plugged into the involved socket.

Error code:

`SNVS – Status, Not in Valid State, the Module is not plugged out`

Validation rule: Check whether system is in maintenance condition

Deprovisioning is not allowed, when the system in is maintenance condition.

Error code:

`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: Check if related ports are not in use by ONNS

If the provisioned module has ports with *portClass* = INNI or *portClass* = EDGE with *networkTNAType* = IPV4 and *networkTNAAddress*=0.0.0.0 the following must be fulfilled:

1. No cross-connection may exist on any tributary of the port.
2. *portControl* must be LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port is still in use by ONNS`

Validation rule: Check if related ports are not in use by ONNS

De-provisioning is not allowed if the provisioned module has ports with *portClass* = UNI or *portClass* = eNNI or *portClass* = EDGE with *networkTNAAddress*≠default value.

Error code:

`SNVS – Status, Not in Valid State, Port is still in use by ONNS`

Validation rule: No test access session

De-provisioning is not allowed if one or more tributaries on the port related to the socket are used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, Tributary used in test access session`

Validation rule: Socket must be provisioned

When de-provisioning a module it is checked whether the socket is provisioned (i.e. *nvmname*/*nvmqual* is different from UNDEFINED/UNDEF).

Error code: `SNVS – Status, Not in Valid State, socket is not provisioned`

Validation rule: Equipage status and inventory data of module must be accessible

If the equipage status or inventory data of a module is not accessible (e.g. due to the parent pack being in recovery) de-provisioning of the socket is not allowed.

Error code: `SNVS – Status, Not in Valid State, unknown module equipage`

DLT-EQPT (CP) notification

Output format

Syntax **DLT-EQPT**:*aid*::

Output parameters

Command parameters

1. **aid** – Access Identifier
   Description: AID of the deleted circuit pack.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for circuit pack in any slot
   - LoxcAID: ::= UnivSlotAID-loxc for LOXC pack in universal slots

   The keyword **usall** is not allowed for Simple_UnivSlotAID. The keyword **xcall** is not allowed for Simple_XCSlotAID. The keyword **ctlall** is not allowed for Simple_CTLSlotAID. The keyword **all** is not allowed for Simple_SlotAID.

Example output

```
DLT-EQPT:UNITE-NE:1-1-#-#-1:123456;

   UNITE-NE 00-11-20 08:00:00
M  123456 COMPLD

;
```

DLT-EQPT (socket) notification

Output format

Command syntax: **`DLT-EQPT`***:aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keywords all / usall / scall shall are not allowed on any level.

Example output

This example shows a DLT-EQPT notification reporting the deletion of a socket:

```
   UNITE-NE 00-11-14 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-14:DLT-EQPT:1-1-#-#-5-sc2”
;
```

DLT-FECOM notification

Output format

The **DLT-FECOM** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

The **DLT-FECOM** notification has the following specific syntax:

DLT-FECOM::*port*,*dcctype*:*spec_block*

Output parameters

Command parameters

1. **port**
   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel.
   Type: AID
   Range: SPortAID. The keyword 'all' is not allowed.
2. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS DCC of the port is affected by the command.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.
   Default:
   - SECTION: if dccstat is set to ENABLE
   - no default (i.e. parameter is mandatory) if scn_dccstat or uni_dccstat is ENABLE.

Spec block parameters

1. **osinode**
   Assignment of a DCC channel to an MCN node in the NE. The parameter is omitted when dccstat != ENABLE.
   An UNITE NE can have up to 8 instances of the OSI stack. Node-1 is default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00). Nodes 2-8 can be created and configured, see command **ENT-ULSDCC-L3**.
   Type: AID
   Range: osinode1-8.

Example output

```
   NE-UNITE 01-01-08 01:10:11
A  000 REPT DBCHG
   ″TIME=01-01-09,DATE=00-00-13:DLT-FECOM::1-1-#-#-5-1,LINE:osinode1″
;
```

DLT-IP-MAP: Delete TCP/IP map

The **DLT-IP-MAP** command can be used to delete one entry in the TCP/IP application context ID map which was created via ENT-IP-MAP. The tl1tcpipgw parameter in the **ED-NE** command enables or disables the mapping feature.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-IP-MAP**:*tid::ctag:::spec_block;*

Input Parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: TID.
2. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: CTAG.

Spec block Pparameters

1. **ip** – IP address
   This parameter is optional. If it is omitted the mapping is not changed and a normal COMPLD message is returned.

Output format

If the DLT-IP-MAP request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command shall delete the mapping entry if the ip parameter was specified and could be found in the TCP/IP application context ID mapping.

Example input/output

The following example shows the result of an DLT-IP-MAP command:

```
DLT-IP-MAP:LT-UNITE::123456:::ip=198.78.46.8;

   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`DLT-IP-MAP`** command.

Validation rule: Check for known IP address

The removal of an entry from the IP map is only allowed if entries with the specified IP address are used within the IP map.

Error code:

`SNVS – Status, Not in Valid State, unknown IP address within MAP`

Related TL1 Messages

- “RTRV-IP-MAP: Retrieve TCP/IP map” (p. 3-2436)
- “ENT-IP-MAP: Enter TCP/IP map” (p. 3-1594).

DLT-IP-MAP notification

Output format

The **`DLT-IP-MAP`** command shall not generate a REPT DBCHG notification. This is due to a potential security hazard: any listening manager who receives this notification could otherwise fake its own IP address to get access to the T-TD.

DLT-LONIM notification

Output format

Command syntax:

ED-LONIM :*aid*;

Output parameters

Command parameters

1. **aid** – Access Identifier
   The access identifier specifies a low-order tributary to be operated on.
   Type: AID
   Range: GenLOTribAID, DS1NumAID.
   The following values are not used:
   - *all*, *usall* in Simple_UnivSlotAID,
   - *all* in Simple_SPortAID, Simple_TMuxAPortAID, Simple_TMuxSPortAID
   - *all* in Simple_PTNumAID, Simple_TMuxAPTNumAID, Simple_TMuxSPTNumAID
   - *all* in Simple_LONumAID, Simple_DS1NumAID, Simple_TMuxSLONumAID

   Default: None.

Example output

Example of a DLT-LONIM notification removing a SDH subtructure:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   "TIME=11-10-30,DATE=00-11-11:DLT-LONIM:1-1-#-#-39-16-1-1&&-63"
;
```

Example of a DLT-LONIM notification removing a SONET subtructure:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   "TIME=11-10-30,DATE=00-11-11:DLT-LONIM:1-1-#-#-39-16-3-1&&-28"
;
```

DLT-LOPTF notification

Output format

Command syntax: **`DLT-LOPTF`**:*aid*:;

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The access identifier specifies the low-order tributary whose attributes are reported.
   Type: AID
   Range: TMuxSLONumAID.
   The following values are not used:
   - **`all`**, **`usall`** for Simple_UnivSlotAID
   - **`all`** for Simple_UnivSlotAID
   - **`all`** for Simple_TMuxSPTNumAID
   - **`all`** for Simple_TMuxSLONumAID

   No wildcards are allowed.
   Default: None.

Example input/output

Example of a **`DLT-LOPTF`** notification removing a SONET substructure:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   "TIME=11-10-30,DATE=00-11-11:DLT-LOPTF:1-1-#-#-39-tms16-1-1&&-28"
;
```

DLT-MANROUTE-LAN: Delete manual route at LAN port

The **DLT-MANROUTE_LAN** command is used to delete manual routes at LAN ports, which are used as UNI control channels.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-MANROUTE-LAN**:*tid*:*aid*:*ctag*:::[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*.

Spec block parameters

1. **ip_ad** – destination IP Address
   This parameter is used to indicate the destination IP address to which a manual route is created. This is the LAN i/f address of UNI-C
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **ip_ad_uni** – Node ID of UNI-C
   This parameter is used to indicate the router ID of the UNI-C to which a manual route is created.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255. The values 0.0.0.0 and 1.1.1.1 are not allowed.
3. **osinode**
   This parameter is used toindicate the OSI node assigned to the LAN port.
   Type: AID.
   Range: uninode.

Output format

If the **DLT-MANROUTE-LAN** request is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **DLT-MANROUTE-LAN** command deletes a manual route entry for a LAN port, which is used as control channel for UNI.

The deletion of the manual route is notified with a **DLT-MANROUTE-LAN** notification.

Example input/output

The following example shows the result of **DLT-MANROUTE-LAN**:

```
   NE-UNITE 06-06-30 09:00:01
A  000 REPT DBCHG
   ″TIME=09-00-01,DATE=06-06-30:DLT-MANROUTE-LAN:1-1-lan2::ip_ad=135.248.206.64, ip_
      ad_uni=135.248.206.64″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **`DLT-MANROUTE-LAN`** command.

Validation rule: Not allowed to use LAN1 for UNI

If LAN1 is specified in the AID, then the command is denied.

Error code: `IDNV – Input, Data Not Valid, LAN1 not allowed for UNI`

Validation rule: LAN port not used for UNI

If the LAN port specified in the AID is not in use for UNI, i.e. is not assigned to the uninode, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, LAN port not in use for UNI`

Validation rule: Manual Route entry must exist

If the manual route entry specified by *ip_ad* and *ip_ad_uni* does not exist for the LAN port, then the command is denied.

Error code:
`IDNV – Input, Data Not Valid, Manual route entry does not exist`

Related TL1 messages

- "ENT-MANROUTE-LAN: Enter manual route at LAN port" (p. 3-1610)

DLT-MANROUTE-LAN notification

Output format

Command syntax: **`DLT-MANROUTE-LAN`**:*aid*::*spec_block*;

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.

Spec block parameters

1. **`ip_ad`** – destination IP Address
   This parameter is used to indicate the destination IP address to which a manual route is created. This is the LAN i/f address of UNI-C
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **`ip_ad_uni`** – Node ID of UNI-C
   This parameter is used to indicate the router ID of the UNI-C to which a manual route is created.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0 and 1.1.1.1 are not allowed.

Example input/output

The following example shows the result of DLT-MANROUTE-LAN:

```
   NE-UNITE 06-06-30 09:00:01
A  000 REPT DBCHG
   "TIME=09-00-01,DATE=06-06-30:DLT-MANROUTE-LAN:1-1-lan2::ip_ad=135.248.206.64, ip_
      ad_uni=135.248.206.64"
;
```

DLT-MANROUTE-MCN: Delete one manual MCN IP route entry

The **DLT-MANROUTE_MCN** command is used to delete a manual MCN IP route entry.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: Yes.

Input format

Command syntax: **DLT-MANROUTE-MCN**:*tid*:*aid*:*ctag*:::[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   The keyword "lanall" is allowed for Simple_LANPortAID.
   Default: Omitting this field has the same effect as the keyword "lanall", that means, the report will display the manual MCN route entries of all possible LAN ports assigned to the MCN.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **dest_ipad** – Destination IP Address
   The IP address of an IP node which can be reached via one of the LAN ports.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.
   Default: None.

Output format

If the **DLT-MANROUTE-LAN** request is successful, the following normal completion response is returned:

```
sid date time
```

```
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **DLT-MANROUTE-MCN** command deletes a manual MCN IP route entry from the system.

The deletion of the manual route is notified with a **DLT-MANROUTE-MCN** notification.

Example input/output

The following example shows the result of **DLT-MANROUTE-MCN**:

```
DLT-MANROUTE-MCN:UNITE-NE:1-1-lan2:123456:::dest_ipad=192.168.90.4;

   UNITE-NE 08-06-27 17:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **DLT-MANROUTE-MCN** command.

Validation rule: Manual MCN IP Route entry must exist

The command is denied if a manual MCN IP route entry which has the same value in the parameter *dest_ipad* does not exist for the specified LAN port.

Error code:

`IDNV – Input, Data Not Valid, Manual route entry does not exist`

Related TL1 messages

DLT-MANROUTE-MCN notification

Output format

Command syntax: **DLT-MANROUTE-MCN**:*aid*::*spec_block*;

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   The keyword "lanall" is allowed for Simple_LANPortAID.
   Default: Omitting this field has the same effect as the keyword "lanall", that means, the report will display the manual MCN route entries of all possible LAN ports assigned to the MCN.

Spec block parameters

1. **dest_ipad** – Destination IP Address
   The IP address of an IP node which can be reached via one of the LAN ports.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.
   Default: None.
2. **dest_ipmask** – Destination IP Subnet Mask
   The IP subnet mask of the IP node which can be reached via the LAN port.
   Type: Four dot separated numeric strings
   Range: Each numeric string: 0 … 255.
   Default: None.
3. **nexthop_ipad** – Next Hop IP Address
   The IP address of the next hop routing node via which the Destination IP Address can be reached.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The value 0.0.0.0 is used if the IP node defined by *dest_ipad* is connected to the LAN port directly. The values 1.1.1.1 and 127.0.0.1 are not allowed.
   Default: None.

Example input/output

The following example shows the result of **DLT-MANROUTE-MCN**:

```
   UNITE-NE 08-06-27 17:00:02
A  000 REPT DBCHG
   "TIME=17-00-00,DATE=08-06-27:DLT-MANROUTE-MCN:1-1-lan2::dest_
      ipad=192.168.90.4,nexthop_ipad=192.168.2.4,nexthop_ipmask=255.255.255.0"
```

;

DLT-OC3 notification

Output format

The **DLT-OC3** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **DLT-OC3**:*aid*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID
   Range: OC3 port AID

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-OC3:1-1-#-#-4-1
;
```

DLT-OC12 notification

Output format

The **DLT-OC12** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **DLT-OC12**:*aid*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID
   Range: OC12 port AID

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ”Time=8-00-30,DATE=00-11-20:DLT-OC12:1-1-#-#-4-1
;
```

DLT-OC48 notification

Output format

The **DLT-OC48** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **DLT-OC48**:*aid*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID
   Range: OC-48 port AID

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-OC48:1-1-#-#-4-1
;
```

DLT-OC48T notification

Output format

Syntax

`DLT-OC48T`*:aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID
   Range: OC-48 port AID

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-OC48T:1-1-#-#-4-1
;
```

DLT-OC192 notification

Output format

Syntax: **`DLT-OC192`**:*aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID
   Range: SPortAID of OC192 port. The keyword **`all`** is not allowed.

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ”Time=8-00-30,DATE=00-11-20:DLT-OC192:1-1-#-#-4-1”
;
```

DLT-OTU2 notification

Output format

Command syntax: **`DLT-OTU2`**:*aid*

Output parametes

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of an OTU2 port.
   Type: AID
   Range: OTNPortAID of OTU2 port.
   The keyword ″otall″ is not allowed.

Example output

```
   UNITE-NE 06-06-30 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=06-06-30:DLT-OTU2:1-1-#-#-4-1″
;
```

DLT-OUC: Delete ONNS to UPSR/SNCP constructs

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax:

DLT-OUC:*tid:wrk_aid:ctag[::ouc_dir];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **wrk_aid** – Working Tributary Access Identifier
   This parameter specifies the working tributary of the OUC.
   Type: STS1NumAID
   Range: n.a. (**all** values shall never occur as part of an output parameter)
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
4. **ouc_dir** – OUC Directionality
   This parameter specifies the directionality of the OUC to be deleted via the **DLT-OUC** command. This parameter will be needed especially, if one of two existing unidirectional OUCs are deleted.
   Type: Alphanumeric value set.
   Range:
   - BIDIR (default)
   - UNIDIR-ADD
   - UNIDIR-DROP.

Output format

If the **DLT-OUC** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Example input/output

A bidirectional OUC between working tributary 4 of a 10G SDH EDGE port in slot 01 and protection tributary 7 of a 2G5 SDH EDGE port 3 in slot 34 will be deleted by the following command:

```
DLT-OUC:UNITE-NE:1-1-#-#-1-1-4:123456::BIDIR;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

A unidirectional drop OUC between working tributary 4 of 2G5 SONET EDGE port 1 in slot 10 and protection tributary 7 of a 2G5 SONET EDGE port 3 in slot 34 will be deleted by the following command:

```
DLT-OUC:UNITE-NE:1-1-#-#-10-1-4:123456::UNIDIR-DROP;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Entity (OUC) must exist

OUC command processing shall verify that the specified OUC exists.

Error code: `IENE – Input, Entity Not Exists, Specified OUC does not exist`

Validation rule: No forced XC loopback must exist on EDGE-wrk or EDGE-prt tributary

OUC command processing shall deny requests to delete an OUC if, on the EDGE-wrk or EDGE-prt tributary, a forced cross-connection loopback exists.

Error code:

`SNVS – Status, Not in Valid State, XC loopback exists on EDGE-wrk or EDGE-prt tributary`

DLT-OUC notification

The DLT-OUC notification will notify only the deletion of the OUC itself. cross-connections and path protection groups that are deleted implicitly via an OUC deletion is notified via corresponding DLT-CRS-modifier and DLT-PROTN-GRP notifications.

Output format

Syntax:

`DLT-OUC`:*wrk_aid,prt_aid:ouc_dir;*

Output parameters

Command parameters

1. **`wrk_aid`** – Working Tributary Access Identifier
   This parameter specifies the working tributary of the OUC.
   Type: STS1NumAID
   Range: n.a. (**`all`** values shall never occur as part of an output parameter)
2. **`prt_aid`** – Protection Tributary Access Identifier
   Protection Tributary Access Identifier. Specifies the protection tributary of the OUC.
   Type: STSNumAID
   Range: n.a. (**`all`** values shall never occur as part of an output parameter)
3. **`ouc_dir`** – OUC Directionality
   Directionality of the OUC
   Type: Alphanumeric value set.
   Range:
   - BIDIR (default)
   - UNIDIR-ADD
   - UNIDIR-DROP.

Example input/output

```
   LT-UNITE-123 00-01-01 08:00:50
A  815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:DLT-OUC:1-1-#-#-1-1-1,
   1-1-#-#-2-1-1:BIDIR″
;

   LT-UNITE-123 00-01-01 08:00:50
A  815 REPT DBCHG

   1-1-#-#-2-1-1:UNIDIR-ADD″
;
```

```
   LT-UNITE-123 00-01-01 08:00:50
A  815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:DLT-OUC:1-1-#-#-1-1-1,\
   1-1-#-#-2-1-1:UNIDIR-DROP″
;
```

DLT-PATH: Delete ONNS path connection

Overview

The **DLT-PATH** command can be used to delete all members of a connection group with one single command.

An ONNS connection may include multiple paths as in the case of a network 1+1 connection that contains an active path and a standby path, each with its own *pathID*. A path connects 2 client Edge ports (or *connPoints*) through a series of NE nodes from a source node to a destination node to provide a communication service.

The **DLT-PATH** command deletes all paths associated with a *connID* or alternatively specified by its *connAlias*. The ONNS connection must begin at the node to which the message was addressed. The NEs along the path controlled by ONNS shall remove the local cross-connection and return resources to the available pool.

The **DLT-PATH** command deletes the worker path associated with a *connID* or alternatively specified by its *connAlias*. The ONNS connection must begin at the node to which the message was addressed. The Network Elements along the path controlled by ONNS shall remove the local cross-connection and return resources to the available pool. A protection path as part of the associated protection connection or of the worker connection of the deleted working connection might be also removed depending on the needed protection paths of the current M:N protected connection group.

The **DLT-PATH** command for connection groups generates one separate **REPT-PTHCHG** message for each connection successfully deleted.

Successful connection deletion with forced cross-connection loopbacks existing

If the network element receives a **DLT-PATH** command for a connection and on top of this connection a forced cross-connection loopback exists in the A- or Z-node, deletion of the connection shall be performed as usual with keeping the existing forced cross-connection loopback up as normal loopback on the corresponding tributary.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Abortable: No

Input format

Command Syntax of DLT-PATH to delete a path from a connection:
DLT-PATH:*srcTid:[srcAid]:ctag::[srvID]:[connID][:specBlock];*

A user defined connection alias (an alternate name) may be optionally specified with the **DEL-PATH** command. The alias is specified in the spec block as *connAlias*.

If no *connAlias* is specified, the *connID* is used as the key. If both *connAlias* and *connID* are specified then *connID* is used as the key. If neither of the two is specified the command is denied.

The *connAlias* is returned as an output parameter in the response along with all the other parameters. If it not defined, a NULL is returned.

Deletion of a whole connection group is not possible using a connection alias as input.

Deletion of single worker connection being member of a M:N protected connection group is allowed by specifying the *connID* or the *connAlias* as the key. Deletion of a protection connection is denied.

Deletion of single connections being member of a switched VCG connection group (VCG connection group initiated by UNI) is rejected.

Deletion of a whole GbE group of connections shall be rejected, if the affected VCG has port class EDGE and at least one of the affected connections has connControl value EXT.

Input parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **`ctag`** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing "."). It should be a unique value for each new command.

4. **`srvID`** – Service Identifier
   This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
   The *srvID* parameter is an integer value range = 1 – 20,000,000. Only one *srvID* is accepted. ALL is not supported.

5. **`connID`** – Connection ID
   Connection ID for an existing ONNS path connection service. Reports only the connections originating at the specified source node. *ConnID* is formed from the *SrcNodeID*, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.
   Type: Character string of length up to 39.
   Range: *ALL* **–** special value to retrieve all connection records

   Range: *nodeID&Tributary AID&Index* - to retrieve a specific entry, with

   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1..39), Port # (1..16), Tributary # (1..192)
   - Index: Numeric string 0-4294967295

   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x. Example: 29.13.196.203&1-1-13-15-1&271584.

   Range: *nodeID&Tributary AIDrange* - if port # specifies a VCG to retrieve a connection group, with

   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1..39), Port # (1..9), Tributary # ALL- special value to retrieve all connection records associated with the port ID.

   As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG. The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203&1-5-13-7-ALL.
   The port AID 1-5-13-7 must denote a VCG.

   Range: *nodeID&default Tributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with

   - nodeID: four dot separated numeric strings: each string 0..255
   - defaultTributary AID: five dash separated numeric strings with: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##
   - Index: Numeric string 0-4294967295.

   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Range: *nodeID&proupIndex* - to retrieve all connections belonging to an M:N protected connection group, with:

- nodeID (four dot separated numeric strings: each string 0..255)
- groupIndex (integer value specifying a connection group within nodeID 0-65535.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Spec block parameters

1. **`connAlias`**
   This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
   Type: Character string up to length 83.
   Range The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.

Output format

Normal system response to DLT-PATH for an NN connection of any of the supported protection types

If the **`DLT-PATH`** request completes successfully, the normal completion response is returned as shown below:

```
DLT-PATH:srcTid:srcAid:ctag::[srvID]:connID;

   srcTid date time
M  ctag COMPLD
   ″ConnID=connID,ConnStatus=DLT,,,,
   [ConnAlias=connAlias,]
   ,[SrvID=srvID],,,,,,,
   ,,,″
;
```

System response format to DLT-PATH when deleting groups of connections

For the **DLT-PATH** request for deleting a group of connections the response is as follows: down response for connection group:

- If the command as a whole is denied due to e.g. syntax or input failure, the command is denied simply giving completion code DENY together with the error reason
- If deletion of all connections of the group succeeded, the command is completed giving completion code COMPLD and all connections of the group is listed. For each connection the parameters are given as would be given in a reply to a successful **DLT-PATH** command for a single connection.
- If not all connections could be deleted successfully, but the deletion of a number of connections failed, the command is completed giving completion code PRTL and giving a list of the following informations: For each connection whose deletion succeeded the parameters are given as would be given in a reply to a successful **DLT-PATH** command for a single connection. For each connection whose deletion failed the connection ID is given together with the error reason for the failure as would be given in a reply to a failed **DLT-PATH** command for a single connection. This shall also hold, if the deletion of all connections failed individually.

System response format to DLT-PATH when deleting a single worker connection of a M:N protection group

For the **DLT-PATH** request for deleting a single worker connection of a M:N protection group the response is as follows:

- If the command as a whole is denied due to e.g. syntax or input failure, the command is denied simply giving completion code DENY together with the error reason
- If deletion of the group worker connection and a possible protection connection succeeded, the command is completed giving completion code COMPLD and both connections are listed. For both connections the parameters are given as would be given in a reply to a successful **DLT-PATH** command for a single connection.
- If the worker connection could be deleted successfully, but a possible deletion of the protection connection failed or vice versa, the command is completed giving completion code PRTL and giving a list of the following informations: For he connection whose deletion succeeded the parameters are given as would be given in a reply to a successful **DLT-PATH** command for a single connection. For the connection whose deletion failed the connection ID is given together with the error reason for the failure as would be given in a reply to a failed **DLT-PATH** command for a single connection.
  This shall also hold, if the deletion of both connections failed individually.

In case of an M:N protection connection group a partial completion of the deletion of the group in detail means the following:

- The protection group does not work any more
- For connections that could not be deleted M:N protection group related parameters may still indicate valid values for group operation
- For such connections the parameter connStatus will indicate that the group is not working any more
- As for all types of connections deletion will be retried regularly until deletion finally succeeds.

The **`DLT-PATH`** command for grouped connection deletion shall send a maximum of 8 connection records per block. On all large output message blocks but the last, the continuation completion code COMPLD, PRTL or DENY is used depending on the outcome for the whole command and the semicolon(;) is replaced with a (>) terminator. Then on the last record block, the COMPLD completion code COMPLD, PRTL or DENY is used depending on the outcome for the whole command with the final semicolon (;) data block terminator.

Note: This **`DLT-PATH`** command for grouped connection deletion can produce large amounts of data. This will require proper sizing of the receive buffer of the OS system.

Output parameters

Command parameters

1. **`srcTid`**
   See the input parameter description above.
2. **`date`**
   This parameter is set to the date when the output message is generate: YY-MM-DD where YY=00-99, MM=01-12, DD=01-31.
3. **`time`**
   This parameter is set to the time when the output message is generated: HH:MM:SS where HH=00-23,MM=00-59, SS=00-59.
4. **`ctag`** – Correlation Tag
   See the parameter description in the Input parameters section above.
5. **`completionCode`**
   Standard TL1 completion code result.
   Type: Value set.
   Range:
   - COMPLD: for success (default)
   - PRTL: for partial success / failure, see section ERROR RESPONSES for details
   - DENY: in case of errors, see section ERROR RESPONSES for details.

6. **`connID`**
   See the parameter description in the Input parameters section above.
7. **`connAlias`**
   See the parameter description in the Input parameters section above.
8. **`connStatus`**
   ConnStatus = pst&sst(&tst) Connection status is the overall status of the connection connID which may be different than the status of an individual *pathID* in that connection.

   connStatus is composed out of

   - pst (PrimaryState)
   - sst (SecondaryState)
   - tst (TertiaryState, optional).

   Type: up to three &-separated value sets.

   Range *pst* values:

   - CON: Connected
   - DLT: Deleted
   - NOCON: Not Connected
   - MAINT: Maintenence Mode
   - UNKNOWN: Conn state unknown.

   Range *sst* & *tst* values

   - OK: Conn good
   - FAILED: Conn failed
   - SETUP: Conn SetUp occurring
   - TRDOWN: Conn teardown occurring
   - NO-IN: Conn failed, signal in bad
   - RSTOR: path restore occurring
   - RSTRD: Conn restored
   - RSTRFL: Conn restore failed
   - DLT-FL: Delete operation Failed
   - UNKNOWN: Conn state unknown
   - WTORSTR: Waiting to restore path
   - PREMPT: Path pre-empted
   - SETUPFL: Connection SetUp Failed
   - FL-NVM: Not saved in NVM
   - WTORV: Waiting to revert path
   - EPRTFL: EDGE Port Failed

- BAD-IN Conn failed, Bad signal in
- BRDGD Path bridged

Note: Some states listed in this list will only occur within a DLT-PATH command response or within a REPT PTHCHG or REPT PTHEVT notification message.

Range *sst* values

- STBY: Standby (for protecting connections within an M:N protection group, when connection is not protecting a working connection).
- USED: Used (for protecting connections within an M:N protection group, when connection is currently protecting a working connection).

Range *tst* values

- DEGRADED: Non-revertive restoration was not possible if the worker or protection path of a permanent 1+1 protected connection fails

9. **`srvID`** – Service Identifier
   See the input parameter description above.

Example input/output

Input/output example of deleting a single NN connection of any protection type

The following example shows the successful completion of a single NN connection deletion by a **`DLT-PATH`** command:

```
DLT-PATH:LT_ONNS_789:snn:433456::135.7.9.2-46:192.1.165.12&1-6-5-3-1&1;

   LT-ONNS-789 2002-07-01 08:00:00
M  433456 COMPLD
   ″ConnID=192.1.165.12&1-6-5-3-1&1,ConnStatus=DLT,,,,
   ConnAlias=AEXP-NY-BOS-ckt,
   ,,,,,,,,
   ,,,″
;
```

Input/output example of deleting a single M:N worker connection

The following example shows the successful completion of a single M:N worker connection deletion with an implicit M:N protection connection deletion by a **`DLT-PATH`** command:

```
DLT-PATH:LT_ONNS_789:snn:433456::135.7.9.2-46:135.13.196.203&1-1-13-4-1&1;

   LT-NN-789 2002-09-18 08:00:00
M  973456 COMPLD

   ″ConnID=135.13.196.203&1-1-13-4-1&1,ConnStatus=DLT,,,,
   ConnAlias=AmericanExp-NY-BOS-ckt_wrk_001,
   ,,,,,,,,
```

```
   ,,,"

   "ConnID=135.13.196.203&1-1-#-#-#&3,ConnStatus=DLT,,,,
   ConnAlias=AmericanExp-NY-BOS-ckt_prt_001,
   ,,,,,,,,
   ,,,"
;
```

Connection deletion, deletion in the network failed

If the NE receives a **DLT-PATH** command for a connection and this connection specified is not deleted in the network due to signaling problems, ONNS will not remove this connection from the ONNS data repository, but nevertheless return the following positive reply. In case of multiple connections affected by the **DLT-PATH** command for each connection that failed to be deleted a corresponding entry is contained in the response besides the entries for the connections that succeeded.

```
   srcTid 2001-07-01 08:00:00
M  ctag CMPLD

   "ConnID=135.13.196.203&1-1-13-4-1&1,ConnStatus=DLT-FL,,,,
   ConnAlias=AmericanExp-NY-BOS-ckt,
   ,,,,,,,,
   ,,,"
;
```

Additionally for each connection, the deletion of which failed, a **PTHCHG** notification for the state change to **DLT-FL** will be sent. The **DLT-PATH** command is accepted in such cases, because an affected ONNS connection will be automatically deleted when signaling is possible again. No further activity by the operator is necessary.

Error responses

Validation rule: Path *ConnectionID* does not exist

If the Source Node ONNS receives a DLT-PATH command when the specified connection path does not exist, then the following error response is returned:

Error code: `E220 – 135.13.7.9-48 – Input,ConnectionID Non-Existent`

The following list shows conditions that will cause similar error responsse:

Error code: `E037 – Input, Neither ConnID nor ConnAlias Specified`

Error code: `E221 – IANE Error – Input, connAlias Non Existant`

Error code: `E038 – IICS – Input, Inconsistent connAlias Specified`

Validation rule: Connection is member of an M:N protected connection group

If the Source Node ONNS receives a DLT-PATH command with the specified connection ID denoting a working or protecting connection of an M:N protected connection group, then the following error response is returned:

Error code:

`E222 – IIDM srvID - Input, Invalid deletion of connection of protection`

Validation rule: Protection connection of an M:N protection group in use

If the source node ONNS receives a DLT-PATH command with the specified connection ID denoting a working connection of a M:N protection group which also would lead to a implicit tear down of a protection connection currently used by another working connection than the addressed one is denied:

Error code:

`E223 – SPCU 135.7.9.2-35 – Status, Protection Connection in Use, removal of the M:N worker connection aborted`

Validation rule: Connection is member of a switched VCG connection group

If the Source Node ONNS receives a DLT-PATH command with the specified connection ID denoting a connection of a switched VCG connection group (VCG connection group initiated by UNI), then the following error response is returned:

Error code:

`E224 – IIDC srvID – Input, Invalid Deletion of a Connection of a switched connection group`

The following list identifies conditions that will cause error responses specific to DLT-PATH commands to delete groups of connections:

Error code:

`E050 – IICG – Input, Invalid connection ID for connection group/connID`

Validation rule: Grouped connection deletion on VCG EDGE affects EXT Connection

If the Source Node ONNS receives a DLT-PATH command requesting a GbE group deletion on an EDGE VCG affecting an ONNS connection with EXT connControl, then the following error response is returned:

??? Error code:

`E225 - IIGD srvID - Input, Invalid Grouped Deletion of EXT Connection`

The following list identifies conditions that will cause error responses specific to DLT-PATH commands to delete groups of connections:

Error code:

`E050 – IICG – Input, Invalid connection ID for connection group/connID`

DLT-PROTN-GRP: Delete protection group

The **DLT-PROTN-GRP** command allows to delete protection groups which were previously created via **ENT-PROTN-GRP**.

Some types of protection groups are deleted in the context with another stimuli. **DLT-PROTN-GRP** cannot be used to delete the following types of protection groups:

- switching and controller equipment protection group (deleted as part of delete circuit pack)
- path protection group (deleted as part of **DLT-CRS** for path-protected XC).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 1

Abortable: No

Input format

Equipment protection group

The command **DLT-PROTN-GRP** is applicable for the EP155, EP51, LOXC, TransMUX, and ES64U equipment protection.

Command syntax: **DLT-PROTN-GRP**:*tid*:*aid*:*ctag*::*protype*;

Multiplex section/line protection group

Command syntax: **DLT-PROTN-GRP**:*tid*:*aid*:*ctag*::*protype*;

2-/4-fibre MS-SPRing/BLSR protection group

Command syntax: **DLT-PROTN-GRP**:*tid*:*[aid]*:*ctag*::*protype*, *[rid];*

Input parameters

Command parameters (1+1 equipment protection group)

1. **tid** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the aid of the equipment protection group.
   Type: AID
   Range: EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID or TMUXProtGroupAID or ES64UProtGroupAID.
3. **ctag** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).

4. **`protype`** – Protection Type
   The parameter evaluation is case sensitive.
   This parameter specifies the type of the protection group.
   Type: Alphanumeric value set.
   Range:
   - EQPTSWFBR (if *aid* is SwitchAndTmgProtGrpAID)
   - EQPTCTL (if *aid* is CtlProtGroupAID)
   - EQPTEP155 (if *aid* is EP155ProtGroupAID)
   - EQPTEP51 (if *aid* is EP51ProtGroupAID).
   - EQPTLOXC (if *aid* is LOXCProtGroupAID)
   - EQPTTMUX (if *aid* is TMUXProtGroupAID)
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

Command parameters (multiplex section/line protection group)

1. **`tid`** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies the aid of a 1+1 multiplex section/line protection group or the aid of a 1:1 multiplex section/line protection group (only R3.0 and later) or an port aid being a member of the group.
   Type: AID
   Range: OnePlusOne_ProtGrpAID (not ranged) or NByOne_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **`ctag`** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **`protype`** – Protection Type
   This parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1xNOPT (only R3.0 and later).
   Type: value set.
   Range: 1+1 or 1xNOPT.

Command parameters (2-/4-fibre MS-SPRing/BLSR protection group)

1. **`tid`** – Target Identifier
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged).
3. **`ctag`** – Correlation Tag
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
4. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: 2F or 4F.
5. **`rid`** – Ring Identification
   The parameter specifies the ring identification name. Storage and retrieval of the rid is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Option: If *aid* is specified, then *rid* can be omitted.

Output format

After receiving the **`DLT-PROTN-GRP`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

Refer to the “Output parameters” section of the “RTRV-HDR: Retrieve header” (p. 3-2417) command for a normal completion response.

Detailed behavior description

LOXC 1+1 equipment protection group

The command removes/deletes the specified LOXC protection group if protype equals EQPTLOXC. The deletion of the protection group is notified by means of a DLT-PROTN-GRP notification. In addition, the low order switch capacity of the protection unit is set back to 0 GBit/s and the LO tributary standard is set to UNDEFINED, which causes a referring ED-EQPT notification.

The existence of transmission entities is not influenced by the deletion of the LOXC EQP group since they will be only controlled by low-order cross-connection commands.

Precondition for that is that the worker LOXC pack is active. If the protection LOXC pack is active, then the LOXC protection group can only be deleted if no transmission entity is still present.

TransMUX 1+1 equipment protection group

The command removes/deletes the specified TransMUX protection group if *protype* equals EQPTTMUX. The deletion of the protection group is notified by means of a **`DLT-PROTN-GRP`** notification. In addition, the TransMUX switch capacity of the protection unit is set back to 0 GBit/s. This are notified via **`ED-EQPT`** notification for the circuit pack.

Precondition for that is that the worker TransMUX pack is active. If the protection TransMUX pack is active, then the TransMUX protection group can only be deleted if no HO or LO cross-connection is still present.

ES64U 1+1 equipment protection group

The command removes/deletes the specified ES64U protection group if *protype* equals EQPTES64U. The deletion of the protection group is notified by means of a **`DLT-PROTN-GRP`** notification. In addition, the ES64U switch capacity of the protection unit is set back to 0 GBit/s. This are notified via **`ED-EQPT`** notification for the circuit pack.

Note: The IP address of ES64U protection pack *dcn_ipad* is not changed when deleting the group.

Precondition for that is that the worker ES64U pack is active. If the protection ES64U pack is active, then the ES64U protection group can only be deleted if no HO cross-connection is still present.

EP155 1+1 equipment protection group

The command removes/deletes the protection group of type as specified by means of parameter protype. If *protype* equals ’EQPTEP155’, then one instance of EP155 equipment protection group is deleted. The deletion of the protection group is reported by means of an **`DLT-PROTN-GRP`** notification.

EP155 equipment protection group - port impact due to EP155 protection group deletion

Ports related to the protection card of the protection group is recreated with default values, because they had been deleted at the enter time of the protection group. This creation is reported by means of a set of **ENT-STM1E** notifications.

EP155 equipment protection group - tributary creation due to EP155 protection group deletion

ributaries related to the protection card of the protection group is recreated with default values, because they had been deleted at the enter time of the protection group. This creation is reported by means of a set of ENT-VC3 notifications if the protection port is an SDH port.

The number of tributaries to be created is derived from the port rate. For efficiency reasons the notifications for tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to 1&&-<N> with N is maximal legal STS-1/AU-3 number.

EP155 equipment protection group - AID range for group notification

See STS-1/AU-3 Tributaries AID w.r.t. range for legal STS-1/AU-3 number.

Example: The AID field in a group notification for a tributaries related to port 1 for a OP10 pack in slot 1 looks like: 1-1-#-#-1-1-1&&-192

EP51 equipment protection group - 1+1 Equipment Protection Group

The command removes/deletes the protection group of type as specified by means of parameter protype. If protype equals 'EQPTEP51', then one instance of EP51 equipment protection group is deleted. The deletion of the protection group is reported by means of an DLT-PROTN-GRP notification.

EP51 equipment protection group - port impact due to EP51 protection group deletion

36 DS3 ports related to the protection pack of the protection group is created with default values. This creation is reported by means of a set of **ENT-T3** notifications

EP51 equipment protection group - tributary creation due to EP51 protection group deletion

Tributaries related to the ports of the protection pack of the protection group is created with default values. This creation is reported by means of a set of ENT-PTF-STS notifications

General transmission protection group - 1+1, 2F protection group

The command removes/deletes the protection group of type as specified by means of parameter protype. If *protype* equals ’1+1’, then one instance of 1+1 MS/line protection group is deleted. If *protype* equals ’2F’, then one instance of type 2-fibre MS-SPRing/BLSR protection group will be deleted.

The deletion of the protection group is reported by means of an DLT-PROTN-GRP notification.

General transmission protection group - 1:1 protection group

The command removes/deletes the protection group of type as specified by means of parameter protype. If protype equals ’1xNOPT’, then one instance of 1:1 MS/line protection group is deleted.

The deletion of the protection group is reported by means of an DLT-PROTN-GRP notification.

General transmission protection group - 4F protection group

The command removes/deletes the protection group of type as specified by means of parameter protype. If *protype* equals 4F’, then one instance of type 4 fibre MS-SPRing/BLSR protection group is deleted.

The deletion of the protection group is reported by means of an DLT-PROTN-GRP notification.

Multiplex section/Line protection group - DCC protection as part of 1+1 multiplex section/line protection

If DCC protection is enabled for section/rs dcc channels (value of dccsrsprotmd equals ENABLE), then following updates for DCC channels are done.

1. The dcc channel of type ’SECTION’ associated with the protection port is created This update is reported by means of a ENT-FECOM notification.
2. The protection mode (attribute dccprottp) of the dcc channel of type ’SECTION’ associated with the worker port is set to ’0X1’ unprotected. This update is reported by means of a ENT-FECOM notification for the changed attribute.

If DCC protection is enabled for line/ms dcc channels (value of dcclmsprotmd equals ENABLE), then following updates for DCC channels are done.

1. The dcc channel of type ’LINE’ associated with the protection port is created. This update is reported by means of a ENT-FECOM notification.
2. The protection mode (attribute dccprottp) of the dcc channel of type ’LINE’ associated with the worker port is set to ’0X1’ unprotected. This update is reported by means of a ENT-FECOM notification for the changed attribute.

Multiplex section/Line protection group - tributary impact due to 1+1 protection group - port redefinition due to 1+1 MSP protection group deletion

Tributaries signal rates of the protection port is set to default values (parameters inputsig, unequiposig), because they had been deleted at the enter time of the MSP 1+1 protection group.

As a side effect, the value of parameter crstat may also change if the port is operating in fixed mode

The update of the mentioned parameters are reported by means of:

- a ED-STM<n> notification if the protection port is an SDH port
- a ED-OC<n> notification if the protection port is an SONET port

The value for <n> is derived from the port rate.

Multiplex section/Line protection group - tributary impact due to 1+1 protection group - tributary creation due to 1+1 MSP protection group deletion

Tributaries related to the protection port of the protection group is recreated with default values, because they had been deleted at the enter time of the MSP 1+1 protection group.

This creation is reported by means of:

- a set of ENT-VC3 notifications if the protection port is an SDH port
- a set of ENT-STS1 notifications if the protection port is an SONET port

The number of tributaries to be created is derived from the port rate.

For efficiency reasons the notifications for tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to [2] 1&&-<N>, with N is maximal legal STS-1/AU-3 number .

Example: The AID field in a group notification for a tributaries related to port 1 for a OP10 pack in slot 1 looks like: 1-1-#-#-1-1-1&&-192.

2/4 fibre MS-SPRING/BLSR protection group

If the related ports are of portClass = EDGE any existing information in the loca, locz parameters of the related tributaries are deleted (i.e. set to the default value). This are reported by means of an ED-STS1 (istd=SONET) or ED-VC3 (istd=SDH) notification.

Example input/output

Equipment protection group

The following example deletes EP155 equipment protection group:

```
DLT-PROTN-GRP:LT-UNITE:1-1-eep01:123456::EQPTEP155;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
```

```
;
```

Multiplex section/line protection group 1+1

The following example deletes 1+1 multiplex section/line protection group:

```
DLT-PROTN-GRP:LT-UNITE:1-1-o001:1+1:123456::1+1;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

2 fibre MS-SPRing/BLSR protection group

The following example deletes 2F MS-SPRing/BLSR protection group:

```
DLT-PROTN-GRP:LT-UNITE:1-1-t001:123456::2F;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

4 fibre MS-SPRing/BLSR protection group

The following example deletes 4F MS-SPRing/BLSR protection group:

```
DLT-PROTN-GRP:LT-UNITE:1-1-f001:123456::4F;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses (LOXC equipment protection group)

Validation rule: protection unit is active and LO transmission entities

If the protecting unit is the active unit and low-order tributaries still exist, then the following error response is returned.

Error code:

`SNVS – Status, Not in Valid State, low-order transmission entities present`

It does not matter how the low-order transmission entities have been created (either implicitly by creating low-order cross-connections or by substructuring a high-order tributary). Even if no low-order cross-connections exist, low-order transmission entities may exist due to prior substructuring. The latter case will be corrected by deletion of substructures (**ED-SUBS** command) or low-order cross-connections must be deleted (**DLT-CRS** command).

In any case it is the better advise to activate the worker LOXC pack since the low-order transmission entities need not to be removed in this case.

Error responses (TransMUX equipment protection group)

Validation rule: protection unit is active and transmission entities exist

If the protection unit is active, and HO/LO cross-connections or cross-connection loopbacks or test access sessions exist which involve tributaries located at TransMUX packs in the protection group, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, protection unit is active`

Error responses (ES64U equipment protection group)

Validation rule: protection unit is active and transmission entities exist

If the protection unit is active, and HO cross-connections or cross-connection loopbacks or test access sessions exist which involve tributaries located at ES64U packs in the protection group, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, protection unit is active`

Error responses (general)

Validation rule: no test access session active

Tributaries related to ports being a member of the specified protection group must not be used in a test access session either as tributaries under test or as test access tributaries.

Error code:
`SNVS – Status, Not in Valid State,tributary used in test access session`

Error responses (2-fibre MS-SPRing/BLSR protection group)

Validation rule: consistent *aid* and *rid*

If both an *aid* and a *rid* are specified as input parameters and they are inconsistent, then the following error response is returned.

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

Validation rule: No HO/LO cross-connection or LO substructure at tributaries

There shall exist no HO or LO cross-connection or LO substructure on tributaries related to ports being a member of the specified protection group.

Error code:
`SNVS – Status, Not in Valid State, cross-connections or substructure still exist`

Validation rule: no XC loopback on tribs

There shall exist no cross-connection loopbacks on tributaries related to ports being a member of the specified protection group:

Error code:
`SNVS – Status, Not in Valid State, Tributary is used in cross-connection loopback`

Error responses (4-fibre MS-SPRing/BLSR protection group)

Validation rule: consistent aid and rid

If both an aid and an rid are specified as input parameters and they are inconsistent, then the following error response is returned.

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

Validation rule: No HO/LO cross-connection or LO substructure at tributaries

There shall exist no HO or LO cross-connection or LO substructure on tributaries related to ports being a member of the specified protection group.

Error code:
`SNVS – Status, Not in Valid State, cross-connections or substructure still exist`

This validation includes coss connections and LO substructure at worker and protection ports, i.e. extra traffic cross-connections.

Validation rule: no XC loopback on tribs

There shall exist no cross-connection loopbacks on tributaries related to ports being a member of the specified protection group:

Error code:
`SNVS – Status, Not in Valid State, Tributary is used in cross-connection loopback`

DLT-PROTN-GRP notification

Output format

Command syntax: **DLT-PROTN-GRP**:*aid*:*protype*;

Output parameters

Command parameters (1+1 equipment protection group)

1. **aid** – Access Identifier
   This parameter specifies the aid of the 1+1 equipment protection group.
   Type: AID
   Range: EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID or TMUXProtGroupAID or ES64UProtGroupAID.
2. **protype** – Protection Type
   The parameter specifies the type of the protection group.
   Type: Alphanumeric value set.
   Range:
   - EQPTSWFBR (if *aid* is SwitchAndTmgProtGrpAID)
   - EQPTCTL (if *aid* is CtlProtGroupAID)
   - EQPTEP155 (if *aid* is EP155ProtGroupAID)
   - EQPTEP51 (if *aid* is EP51ProtGroupAID).
   - EQPTLOXC (if *aid* is LOXCProtGroupAID)
   - EQPTTMUX (if *aid* is TMUXProtGroupAID)
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

Command parameters (multiplex section/line protection group)

1. **aid** – Access Identifier
   This parameter specifies:
   - the aid of a 1+1 multiplex section/line protection group or
   - the aid of a 1:1 multiplex section/line protection group (only R3.0 and later).
   Type: AID.
   Range: OnePlusOne_ProtGrpAID or NByOne_ProtGrpAID.
2. **protype** – Protection Type
   The parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1x***N***OPT (only R3.0 and later).
   In mind the ***N*** in “1x***N***OPT” is considered to be always equal “1”.
   Type: Alphanumeric value set.
   Range: 1+1 (default) or 1xNOPT.
   Default: 1+1

Command parameters (2-fibre MS-SPRing/BLSR protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the 2 fibre MS-SPRing/BLSR protection group.
   Type: AID.
   Range: TwoFibre_ProtGrpAID.
2. **`protype`** – Protection Type
   This parameter specifies the type of the protection group. The value for the 2-fibre MS-SPRing/BLSR protection group is 2F.
   Type: Alphanumeric value set.
   Range: 2F (default).

Command parameters (4-fibre MS-SPRing/BLSR protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the 4 fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: FourFibre_ProtGrpAID
2. **`protype`** – Protection Type
   This parameter specifies the type of the protection group. The value for the 4-fibre MS-SPRing/BLSR protection group is 4F.
   Type: Alphanumeric value set.
   Range: 4F.

Command parameters (Path protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the path protection group.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.
   The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.
2. **`protype`** – Protection Type
   Thise parameter specifies the type of the protection group. The value for the path protection group is PATHDRI.
   Type: Alphanumeric value set.
   Range: PATHDRI.

Example output

1+1 Equipment protection group

The following example reports the deletion of an 1+1 equipment protection group:

```
   LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ”TIME=15-00-00,DATE=00-11-03:DLT-PROTN-GRP:1-1-estgrp:EQPTSWFBR”
;
```

Multiplex section/line protection group (1+1)

The following example reports the deletion of an 1+1 multiplex section/line protection group:

```
   LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:DLT-PROTN-GRP:1-1-o001:1+1″
;
```

2 fibre MS-SPRing/BLSR protection group

The following example reports the deletion of an 2F MS-SPRing/BLSR protection group:

```
   LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:DLT-PROTN-GRP:1-1-t001:2F″
;
```

4 fibre MS-SPRing/BLSR protection group

The following example reports the deletion of an 4F MS-SPRing/BLSR protection group:

```
   LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:DLT-PROTN-GRP:1-1-f001:4F″
;
```

Path protection group

The following example reports the deletion of a path protection group:

```
   LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:DLT-PROTN-GRP:1-1-#-#-10-1-25:PATHDRI″
;
```

DLT-PTF notification

Output format

Syntax

`DLT-PTF`:*aid;*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The access identifier specifies the PTF tributary whose attributes are reported.
   Type: AID
   Range:
   - PTNum for modifier: STS, HOSTS1, HOVC4, ALL
   - TMuxAPTNumAID for modifier: TMASTS1, ALL
   - TMuxSPTNumAID for modifier: TMSSTS1, ALL

   as defined in AID structure with exception of value *all*.
   Default: None.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   "TIME=11-10-30,DATE=00-11-11:DLT-PTF:1-1-#-#-21-1-1"
;
```

DLT-RC-NEIGHBOR: Delete a routing controller from the list of neighboring routing controllers

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-RC-NEIGHBOR**:*tid*::*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **remrcid** – Remote Routing Controller Identifier
   This parameter is used to indicate the Id of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.

Output format

If the **DLT-RC-NEIGHBOR** command is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″[rate]:thru[,lpaid]:spec_block″
   ...
   ″[rate]:thru[,lpaid]:spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Detailed behavior description

The **DLT-RC-NEIGHBOR** command removes a routing controller from the list of neighboring routing controllers.

Example input/output

The following example shows the result of a DLT-RC-NEIGHBOR command:

```
RTRV-MAP-NEIGHBOR:LT-UNITE::123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   "STM256:DCC,1-1-#-#-1-1:
nsap=39840F80000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-
      UNITE2,dcctype=SECTION"
   "STM256:DCC,1-1-#-#-1-1:
nsap=39840F80000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-
      UNITE2,dcctype=LINE"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **DLT-RC-NEIGHBOR** command.

Validation rule: RC must be created

If the RC is not created (via ACT-L1ROUTING), then the command is denied.

Error code: `IDNV – Input, Data Not Valid, RC node not created`

Validation rule: RC must be in Neighboring List

The command is denied if the routing controller identified by remrcid is not in the neighboring RC list.

Error code: `IDNV – Input, Data Not Valid, RC unknown`

Related TL1 messages

- "RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers" (p. 3-2816)
- "ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers" (p. 3-1792)

DLT-RC-NEIGHBOR notification

Output format

The DLT-RC-NEIGHBOR notification has the following specific syntax:

DLT-RC-NEIGHBOR:::*spec_block*

Output parameters

Spec block parameters

1. **remrcid** – Remote Routing Controller Identifier
   This parameter is used to indicate the Id of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
2. **remrcscn** – Remote Routing Controller SCN IP Address
   This parameter is used to indicate the IP address of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
3. **remrcraid** – Remote Routing Controller Routing Aread ID
   This parameter is used to indicate the routing area ID of the level 0 area of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   0.0.0.0 is not allowed.

Example output

```
RTRV-MAP-NEIGHBOR:LT-UNITE::123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   ″STM256:DCC,1-1-#-#-1-1:
nsap=39840F800000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-
      UNITE2,dcctype=SECTION″
   ″STM256:DCC,1-1-#-#-1-1:

      UNITE2,dcctype=LINE″
;
```

DLT-STM1 notification

Output format

Syntax: **`DLT-STM1`**:*aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID
   Range: SPortAID of STM1 port.

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-STM1:1-1-#-#-4-1″
;
```

DLT- STM1E notification

Output format

The DLT-STM1E notification uses the general format of a REPT DBCHG (Report Database Change) notification.

Syntax: **`DLT-STM1`***:aid*

Output parameter

Command parameters

1. **`aid`** – Access Identifier
   Type: AID
   Range: SPortAID of STM1E port

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-STM1E:1-1-#-#-4-1″
;
```

DLT-STM4 notification

Output format

Syntax: **`DLT-STM4`**:*aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: SPortAID of STM4 port.

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ”Time=8-00-30,DATE=00-11-20:DLT-STM4:1-1-#-#-4-1”
;
```

ED-STM16T autonomous notification

LOS for transmission port STM16T clears

If LOS is cleared and current port mode is AUTO, then *pmode* is updated (new value: MON). This update is reported via ED-STM16T notification with parameter *pmode*.

DLT-STM16 notification

Output format

Syntax: **`DLT-STM16`**:*aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID
   Range: SPortAID of STM-16 port. The keyword **`all`** is not allowed.

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ”Time=8-00-30,DATE=00-11-20:DLT-STM16:1-1-#-#-4-1”
;
```

DLT-STM16T notification

Output format

Syntax

`DLT-STM16T`:*aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **`all`** is not allowed.

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-STM16T:1-1-#-#-4-1″
;
```

DLT-STM64 notification

Output format

The DLT-STM64 notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **DLT-STM64**:*aid*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID
   Range: STM-64 port AID.

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-STM64:1-1-#-#-4-1″
;
```

DLT-STS1 notification

Output format

Syntax **`DLT-STS1`**:*aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   AID of the SONET tributary. The keyword **`all`** is not allowed on any level.
   Type: AID
   Range: STS1NumAID

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  612 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-STS1:1-1-#-#-4-1-1&&-768″
;
```

DLT-T3 notification

Output format

Syntax

`DLT-T3`:*aid*

Output parameters

Command parameters

1. **`aid`** – access identifier of a DS3 port
   Type: AID
   Range: APortAID of DS3 port
   The keyword **`all`** is allowed up to shelf level.
   Default: None.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-28:DLT-T3:1-1-#-#-21-1”
;
```

DLT-TCA-PROF: Delete TCA profile

General

The **DLT-TCA-PROF** command can be initiated by users to remove a Performance Monitoring (PM) threshold profile from the system memory. The system supports two default sets of profiles called ″Default″ and ″Default0″. The system default profiles cannot be deleted.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM3

Priority: 1

Abortable: No

Input format

Command syntax: **DLT-TCA-PROF**:*tid::ctag::pftype,pfname;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
4. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Output format

If the NE fully complies with the DLT-TCA-PROF request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

TCA Profile deletion

The command shall delete the existing performance monitoring Threshold Crossing Alert (TCA) profile.

The deletion of the TCA profile is reported by means of an DLT-TCA-PROF notification.

Example input/output

The following example shows the successful completion of a DLT-TCA-PROF command by the NE:

```
DLT-TCA-PROF:UNITE-NE::123456::section-line,att;
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **`DLT-TCA-PROF`** command.

Validation rule: profile name does not exist

If the profile name specified does not exist

Error code: `IDNV – Input, Data Not Valid, profile name does not exist`

Validation rule: deleting assigned profile

If a user requests to delete a profile name and there are ports or tributaries in the system that are provisioned to use the given profile for thresholding, the following error response is returned.

Error code: `SNVS – Status, Not in Valid State, TCA profile assigned`

Validation rule: deleting the system default profile

If a user requests to delete the system default profiles (Default and Default0), the following error response is returned.

Error code: `IDNC – Input, Data Not Consistent, default profile`

Related TL1 messages

- “RTRV-TCA-PROF: Retrieve TCA profile” (p. 3-2982)
- “ENT-TCA-PROF: Enter TCA Profile” (p. 3-1894)
- “ED-TCA-PROF: Edit TCA profile” (p. 3-1214).

DLT-TCA-PROF notification

Output format

Command syntax: **`DLT-TCA-PROF`***::pftype,pfname*

Output parameters

Command parameters

1. **`pftype`** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
2. **`pfname`** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **`ENT-TCA-PROF`**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Example output

The following example shows the successful completion of a DLT-TCA-PROF command by the NE:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:DLT-TCA-PROF::RS-MS,DTAG″
;
```

DLT-TMAT3 notification

Output format

Command syntax: **DLT-TMAT3**::*aid*;

Output parameters

Command parameters

1. **aid** – Access Identifier of a TransMUX asynchronous adjunct port.
   Type: AID
   Range: TMuxAPortAID
   The keyword **all** is allowed up to shelf level.
   Default: None.

Example input/output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:DLT-TMAT3:1-1-#-#-21-tma1″
;

DLT-TMST3 notification

Output format

Syntax:

Command syntax: **`DLT-TMST3`**::*aid*;

Output parameters

Command parameters

1. **`aid`** – Access Identifier of a TransMUX virtual synchronous adjunct port.
   Type: AID
   Range: TMuxSPortAID
   The keyword **`all`** is allowed up to shelf level.
   Default: None.

Example input/output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:DLT-TMST3:1-1-#-#-21-tms1"
;
```

DLT-ULSDCC-L3: Delete a node ID other than node-1

The command **DLT-ULSDCC-L3** is used to delete a node ID (osinode) in a UNITE NE which was created via ENT-ULSDCC-L3.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-ULSDCC-L3**:*tid*::*ctag*::*osinode*;

Input parameters

Command parameters

1. **tid** – Target Identifier
Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **osinode**
A 1675 LambdaUnite MSS NE has up to 8 instances of the OSI stack. Node-1 (osinode1) is default. Node 2-8 (osinode{2-8}) can be created and configured and deleted.
Type: AID
Range: osinode{2-8}.

Output format

If the DLT-ULSDCC-L3 is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command deletes a node ID (AID value of parameter osinode) at a NE. Only node IDs created via ENT-ULSDCC-L3 command can be deleted. The result should be an update of the OSI stack.

The command leads to a reset of the DCF controller and disconnection of management communication.

The update is reported by means of DLT-ULSDCC-L3 notification.

Example input/output

The following example shows the result of DLT-ULSDCC-L3:

```
DLT-ULSDCC-L3:NE-UNITE::0962415::osinode2;
   NE-UNITE 01-02-15 09:11:51
M  4744843 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the DLT-ULSDCC-L3 command.

Validation rule: Reject deletion when node is assigned to LAN or DCC

The command is rejected when a node is disabled to which DCC and/or LAN channel are assigned (via **ENT-FECOM**/**ENT-FECOM-LAN**).

Error code: `SNVS – Status, Not in Valid State, DCC/LAN channels assigned`

Validation rule: Reject deletion when node is used as RA destination node by OSI node 1

The command is rejected when a node is used as RA destination node by OSI node 1 (l3radesnode = 0).

Error code:

`SNVS – Status, Not in Valid State, node in use as RA destination node`

Validation rule: osinode must be in the created state

The osinode parameter for which changes should be applied must be in the created state, i.e. the value must be either osinode1 or the node must be successfully created via **ENT-ULSDCC-L3**.

Error code:

`SNVS – Status, Not in Valid State, osinode not in created state`

DLT-ULSDCC-L3 notification

Output format

The DLT-ULSDCC-L3 notification uses the general format of a REPT DBCHG (Report Database Change) notification.

The DLT-ULSDCC-L3 notification has the following specific syntax:

`DLT-ULSDCC-L3`::*osinode*

Output parameters

Command parameters

1. **`osinode`**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack. Node-1 is created by start up of the 1675 LambdaUnite MSS NE as default. Node 2-8 can be created and configured and deleted.
   Type: AID.
   Range: osinode{2-8}.

Example output

```
   NE-UNITE 01-02-15 09:18:27
A  000 REPT DBCHG
   ”TIME=09-27-36,DATE=01-02-15:DLT-ULSDCC-L3::osinode8”
;
```

DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack

The command **DLT-ULSDCC-L4** is used to delete one TARP manual adjacent NSAP address in the specified OSI node. The address to be deleted is specified by the system ID in the *spec_block* part of the command line.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-ULSDCC-L4**:*tid*::*ctag*::*osinode*:[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack. Node-1 is created by start up of the 1675 LambdaUnite MSS NE as default. Node 2-8 can be created and configured and deleted.
   Type: AID.
   Range: osinode{1-8}.

Spec block parameters

1. l4ajsys – New Manual Adjacency: NET System Identifier
   This system parameter of the NSAP is set by the Equipment Manufacturer. The value is fix and globally unique among all NEs. For values of NSAP/NET system parameter.
   Type: Hexadecimal number.
   Range: 000000000000 – FFFFFFFFFFFF.

Output format

If the DLT-ULSDCC-L4 is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command deletes one NSAP address from the TARP Manual Adjacency list in layer 4 of a OSI stack. Result should be an update of the OSI stack. Multiple Manual Adjacent NEs are deleted using multiple occurrences of the DLT-ULSDCC-L4 command.

The update is reported by means of DLT-ULSDCC-L4 notification.

Example input/output

The following example shows the result of DLT-ULSDCC-L4:

```
DLT-ULSDCC-L4:NE-UNITE::4744843::osinode1:l4ajsys=08006A112345;
   NE-UNITE 01-01-18 10:09:52
M  4744843 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the DLT-ULSDCC-L4 command.

Validation rule: Check for existing TARP manual adjacent NSAP

The removal of a TARP manual adjacency is only allowed if an entry with the specified TARP manual adjacent NSAP exists for the *osinode*.

Error code:

`SNVS – Status, Not in Valid State, unknown TARP Manual Adjacent NSAP`

Related TL1 messages

- "RTRV-ULSDCC-L4: Retrieve OSI layer 4 related parameters" (p. 3-3055)
- "ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)

DLT-ULSDCC-L4 notification

Output format

The DLT-ULSDCC-L4 notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

The DLT-ULSDCC-L4 notification has the following specific syntax:

DLT-ULSDCC-L4::*osinode*:*spec_block*

Output parameters

Spec block parameters

1. **l4ajsys** – New Manual Adjacency: NET System Identifier
   This system parameter of the NSAP is set by the Equipment Manufacturer. The value is fix and globally unique among all NEs. For values of NSAP/NET system parameter.
   Type: Hexadecimal number.
   Range: 000000000000 – FFFFFFFFFFFF.

Example output

```
   NE-UNITE 01-01-19 04:29:01
A  000 REPT DBCHG
   "TIME=04-29-00,DATE=01-01-19:DLT-ULSDCC-L4::osinode1:l4ajsys=08006A112345"
;
```

DLT-USER-SECU: Delete user security

The **DLT-USER-SECU** command is used by an administrator to remove a non-administrator type user from the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: No.

Input format

Command syntax: **DLT-USER-SECU**:*tid*:*uid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **uid** – User ID
   This parameter specifies the *uid* which should be deleted. Only a single uid is supported in the command.
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of uid values for the **ACT-USER** command are not allowed. Valid uid values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in theNE.
   Type: Alphanumeric string (case-sensitive).
   Range: 5 – 10 characters. The uid ALL is not allowed in any combination of upper or lower cases..
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output format

After receiving the **DLT-USER-SECU** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Description: The **DLT-USER-SECU** command is used by an appropriate administrator to delete a user id specified by *uid* from the NE. The **DLT-USER-SECU** command is applicable where a user account has to be deleted from the NE. The user data stored in the NE will be updated.

It will be reported via the corresponding "DLT-USER-SECU notification" (p. 3-275) section.

It is not possible to delete the user id of one of the predefined super-users.

NOTE: If the user with the specified *uid* is currently logged into the NE when this command is executed, the user session identified by this *uid* is **not** terminated. That means the user can continue to execute TL1 commands. To terminate the session manually, the "CANC-USER-SECU: Cancel user security" (p. 3-62) command has to be used.

Example input/output

The following example shows the successful completion of the **DLT-USER-SECU** command by the NE:

DLT-USER-SECU:LT-UNITE-123:nbguser1:123456;

```
   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Invalid *uid*

If the NE receives a DLT-USER-SECU command with a invalid (unknown) *uid*.

Error code: `IDNV – Input, Data Not Valid, invalid UID`

Validation rule: Attempt to delete administrator's *uid*

Attempt to delete administrator's *uid*.

Error code:

`IDNV – Input, Data Not Valid. Attempting to delete an administrator login. Two administrator user logins are required at all times`

DLT-USER-SECU notification

Output format

The **DLT-USER-SECU** notification has the following specific syntax:

DLT-USER-SECU:*uid*

Output parameters

Command parameters

1. **uid** – User ID
This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of uid values for the **ACT-USER** command are not allowed. Valid *uid* values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
Type: Alphanumeric string (case-sensitive).
Range: 5 – 10 characters. The uid ALL is not allowed in any combination of upper or lower cases.

Example output

The example shows a normal notification after an DLT-USER-SECU command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ”TIME=08-00-12,DATE=00-01-01:DLT-USER-SECU:nbguser1”
;
```

DLT-VC3 notification

Output format

Syntax: **DLT-VC3**:*aid*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Description: AID of the SDH tributary. The keyword **all** is not allowed on any level.
   Type: AID
   Range: STS1NumAID

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  612 REPT DBCHG
   "Time=8-00-30,DATE=00-11-20:DLT-VC3:1-1-#-#-4-1-1&&-768"
;
```

DLT-VCG – Enter virtual concatenation group

The **DLT-VCG** command provisions a virtual concatenation group of an ES64U together with all VCGTRIBs belonging to it.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

DLT-VCG-*modifier:tid:aid:ctag;*

Input parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the virtual concatenation group of the unit. Implicit, it indicates the transmission rate for which VCG related data will be retrieved.
   The parameter *modifier* must be given if a virtual concatenation group on a GE10PL1 or ES64U pack shall be addressed. Otherwise this parameter has to be omitted.
   Type: Alphanumeric value set.
   Range:
   - 1GEPL representing a 1 GE port on the GE10PL1 pack
   - 10GEPL representing a 10 GE port on the GE10PL1 pack
   - ES64U representing a VCG port at an ES64U subsystem

   Default: None.
   The command is only allowed for *modifier* = ES64U.
2. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **aid** – Access Identifier
   The access identifier specifies the virtual concatenation group (VCG) port number to be deleted.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values
   - **vall** for Simple_VCGAID
   - **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID

- **`all`** for Simple_ShelfAID and
- **`all`** for BayAID

are excluded.
Default: None.

4. **`ctag`** – Correlation Tag
This parameter is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Type: Alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters

Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

Default: None

Output format

If the network element fully complies with the **`DLT-VCG`** request, the following normal completion response shall be returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **`DLT-VCG`** command generates a **`REPT DBCHG`** message for the deletion of the VCG together with a **`REPT DBCHG`** message for the deletion of the VCG tributaries (**`DLT-VCGTRIB`** notification).

The command delete a virtual concatenation group together with the virtual concatenation group tributaries belonging to it according to the parameters given with this command. The virtual concatenation group tributary number range is from 1 up to the number of tributaries given by the parameter *inputsig*.

The modification is reported by means of an **`DLT-VCG`** notification and a **`DLT-VCGTRIB`** notification.

Example input/output

```
DLT-VCG-ES64U:UNITE-NE:1-1-#-#-22-v9:123456;

  UNITE-NE 00-11-11 11:11:00
A  001 REPT DBCHG
   "TIME=11-10-30,DATE=00-11-11:DLT-VCG:1-1-#-#-22-v9"
;
  UNITE-NE 00-11-11 11:11:00
A  001 REPT DBCHG
   "TIME=11-10-30,DATE=00-11-11:DLT-VCGTRIB:1-1-#-#-22-v9-1&&-12"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **`DLT-VCG`** command.

Validation rule: Command only allowed for VCG on ES64U circuit pack

If the command is not applied to a VCG on a ES64U pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: no crossconnection

The command is denied if there is still a cross-connection applied to any tributary of the whole VCG port. Whole port means all tributaries of a port independent of their configured membership.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: no loopbacks

The command is denied when a cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

DLT-VCG notification

Output format

The **DLT-VCG** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

The **DLT-VCG** notification has the following specific syntax:

DLT-VCG:*aid;*

Output parameters

Command parameter

aid – Access Identifier

This parameter specifies the VCG to be operated on.

Type: AID.

Range: VCGAID as defined in AID structure. The values

- *vall* for Simple_VCGAID
- *usall* for Simple_UnivSlotAID
- *all* for Simple_UnivSlotAID
- *all* for Simple_ShelfAID and
- *all* for BayAID

is excluded.

Example output

```
   UNITE-NE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:DLT-VCG:1-1-#-#-22-v1″
;
```

DLT-VCG-TRANS notification

Output format

The **DLT-VCG-TRANS** notification uses the general format of a REPT DBCHG notification.

Syntax

DLT-VCG-TRANS*:aid;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the VCG to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure with the exception of the value *vall*.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:DLT-VCG-TRANS:1-1-#-#-1-V1″
;
```

DLT-VCGTRIB notification

Output format

The **DLT-VCGTRIB** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

The **DLT-VCGTRIB** notification has the following specific syntax:

DLT-VCGTRIB:*aid;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the VCG tributary whose attributes are reported.
   Type: AID.
   Range: VCGNumAID as defined in AID structure with exception of value all.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ”TIME=11-10-30,DATE=00-11-11:DLT-VCGTRIB:1-1-#-#-1-V1-1&&-21”
;
```

DLT-VRTSW notification

Output format

The **`DLT-VRTSW`** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

Command syntax: **`DLT-VRTSW`***:aid:vrtswid;*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The access identifier specifies the slot containing a GE1 pack.
   Type: AID.
   Range: UnivSlotAID as defined in AID structure.
   The values
   - *all* and
   - *usall* for Simple_UnivSlotAID

   are accepted.
2. **`vrtswid`** – Virtual Switch Identifier
   This parameter identifiers the instance of the virtual switch.
   - A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
   - There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

   Type: Integer.
   Range: 1 – Currently this is the only allowed value.
   Default: 1.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:DLT-VRTSW:1-1-#-#-1:1″
;
```

ED-ASAP-PROF: Edit alarm severity assignment profile

The **`ED-ASAP-PROF`** command is used to change the name or parameter values for an ASAP.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command syntax: **`ED-ASAP-PROF`**:*tid*::*ctag*::*pftype*,*pfname*:*spec_block*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`ctag`** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`pftype`** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen ("-") is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN

- SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

4. **`pfname`** – ASAP Profile Name
   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.
   Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
   Range: length 1-24 characters. For predefined ASAPs is the value of pfname “DEFAULT”, but it is no default name in general.

Spec block parameters

1. **`newname`** – New Profile Name
   This parameter specifies the new ASAP name of the ASAP specified by *pftype* and *pfname*. The name of any default ASAP can not be changed.
   See definition of *pfname* in the input parameters above
2. Alarm Severity Profile parameters
   The spec block contains ASAP parameters. Each ASAP parameter defines for a probable cause (condtype) the assigned severity which will be reported when the alarm appears. If for one specific probable cause a service affecting (sa) or non service affecting (nsa) alarm can be reported then for each the sa-alarm and nsa-alarm an ASAP parameter exists.
   The severity indicates the urgency of an alarm. The severity of a sa-alarm must be more urgent that of a nsa-alarm for the same condtype.
   The description of the ASAP parameters, the relation to the profile types and the default values are described in: “Alarms, events, ASAPs” (6-4).
   All parameters have the same type and value range. Range: · · · · ·
   Type: Alphanumeric value set.
   Range:
   - CR – Critical (ITU / Telcordia)
   - MJ – Major (ITU / Telcordia)
   - MN – Minor (ITU / Telcordia)
   - NA – Warning (ITU) / Not-Alarmed (Telcordia)
   - NR – Non-Alarmed (ITU) / Not-Reported (Telcordia).

   Example: Concrete ASAP parameters are *sa_eqpt* and *nsa_eqpt*. Both refers to the probable cause (*condtype*) EQPT and ASAP type EQUIPPROT. *sa_eqpt* contains the assigned severity for the service affecting alarm of probable cause EQPT and *nsa_eqpt* for the non service affecting alarm. *sa_eqpt* can have the concrete value CR and *nsa_eqpt* MN.

Output format

The following example shows the successful completion of the **ED-ASAP-PROF** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

If *newname* is specified the ASAP name will be changed to this new profile name. The specified ASAP parameters will be updated to its new severities.

If a ASAP parameter is not specified as part of the *spec_block*, then its value remains unchanged.

The default ASAP parameter values of the profiles named DEFAULT can be modified.

The modification is reported via the ED-ASAP-PROF notification.

Note: ED-ASAP-PROF notification includes all parameters instead of only changed parameters.

Update affected entities

The new ASAP name (if specified) will be updated in all ASAP pointer attributes of other entities of the system. Notice: No **REPT DBCHG** message will be sent reporting this change.

Note: There will be notifications generated for the affected entities.

Example input/output

The following example shows the successful completion of the **ED-ASAP-PROF** command by the NE if the *pfname* will be changed:

```
ED-ASAP-PROF:LT-UNITE-123::123456:PORT,NUERNBERG:newname=CHEMNITZ;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

The following example shows the successful completion of the ED_ASAP-PROF command by the NE if assigned severities will be changed:

```
ED-ASAP-PROF:LT-UNITE-123::123456::PORT,NUERNBERG:sa_los=MJ,sa_lof=MJ,sa_eber=MJ;

   LT-UNITE-123 00-01-01 08:00:00
```

```
M  123456 COMPLD
;
```

The following example shows the successful completion of the ED_ASAP-PROF command by the NE if assigned severities and the ASAP name will be changed:

```
ED-ASAP-PROF:LT-UNITE-123::123456::PORT,NUERNBERG:newname= CHEMNITZ,sa_los=MJ,sa_
      lof=MJ,sa_eber=MJ;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **`ED-ASAP-PROF`** command.

Validation rule: *pfname* does not exist

An ASAP with the name *pfname* does not exist.

Error code:

`SDNC – Status, Data Not Consistent, invalid instance of profile`

Validation rule: Rename of default ASAP

A new profile name is specified for a default profile.

Error code:

`IDNC – Input, Data Not Consistent, new name for default profile`

Validation rule: Inconsistent severity level

An ASAP parameter value has severity level inconsistency (for example, the Non Service Affecting value of a parameter is CR and the Service Affecting value is MJ).

Error code:

`IDNC – Input, Data Not Consistent, NSA severity is higher than SA severity`

Validation rule: Duplicate *newname*

The *newname* is already used for the specified *pftype*.

Error code: `IEAE – Input, Entity Already Exists, duplicate profile name`

ED-ASAP-PROF notification

Output format

Syntax: The **ED-ASAP-PROF** notification has the following specific syntax:

ED-ASAP-PROF::*pftype*,*pfname*:*spec_bloc*

Output parameters

Command parameters

1. **pftype** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen (“-”) is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN
   - SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
   - TIMING: System Timing
   - TRANSPARENCY: Fully Transparent Service

   Default Value: There is no default value. The *pftype* does not change.
2. **pfname** – Profile Name
   This is the profile name. It is the previous profile name in case the profile name was changed with *newname*.

Spec block parameters

1. **`newname`** – New Profile Name
   This parameter specifies the new ASAP name of the ASAP specified by *pftype* and *pfname*. The name of any default ASAP can not be changed.
   This indicates the name of the ASAP.
   The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.
   Type: Alphanumeric character string A hyphen (“-”) is allowed in the name additionally.
   Range: length 1-24 characters
   Default: none. For predefined ASAPs is the value of pfname ″DEFAULT″, but it is no default name in general.
2. Alarm Severity Profile parameters
   The spec block contains ASAP parameters. Each ASAP parameter defines for a probable cause (condtype) the assigned severity which will be reported when the alarm appears. If for one specific probable cause a service affecting (sa) or non service affecting (nsa) alarm can be reported then for each the sa-alarm and nsa-alarm an ASAP parameter exists.
   The severity indicates the urgency of an alarm. The severity of a sa-alarm must be more urgent that of a nsa-alarm for the same condtype.
   The description of the ASAP parameters, the relation to the profile types and the default values are described in: “Alarms, events, ASAPs” (6-4).
   All parameters have the same type and value range. Range: · · · · ·
   Type: Alphanumeric value set.
   Range:
   - CR – Critical (ITU / Telcordia)
   - MJ – Major (ITU / Telcordia)
   - MN – Minor (ITU / Telcordia)
   - NA – Warning (ITU) / Not-Alarmed (Telcordia)
   - NR – Non-Alarmed (ITU) / Not-Reported (Telcordia).

   Example: Concrete ASAP parameters are *sa_eqpt* and *nsa_eqpt*. Both refers to the probable cause (*condtype*) EQPT and ASAP type EQUIPPROT. *sa_eqpt* contains the assigned severity for the service affecting alarm of probable cause EQPT and *nsa_eqpt* for the non service affecting alarm. *sa_eqpt* can have the concrete value CR and *nsa_eqpt* MN.

Example output

The example shows a normal notification after an ED-ASAP-PROF command if the ASAP name was changed:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:ED-ASAP-PROF::ENET,NUERNBERG:newname=CHEMNITZ″
```

```
;
```

The example shows a normal notification after an ED-ASAP-PROF command if severities was changed:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:ED-ASAP-PROF::ENET,NUERNBERG:sa_vcg_loa=MJ,nsa_vcg_
      loa=MN,sa_vcg_ssf=MJ,nsa_vcg_ssf=MN″
;
```

The example shows a normal notification after an ED-ASAP-PROF command if the ASAP name and severities was changed:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:ED-ASAP-PROF::ENET,NUERNBERG:newname=FUERTH,sa_vcg_
      loa=MJ,nsa_vcg_loa=MN,sa_vcg_ssf=MJ,nsa_vcg_ssf=MN″
;
```

ED-CRS: Edit cross-connection

The **ED-CRS**-modifier command can be initiated by a user to modify the following cross-connection parameters:

- *loca/locz* in specifying the source-/destination TID associated with *in_aid/out_aid*
- *omode* specifying the output-mode of the cross-connection
- *xcappl* specifying the cross-connection application number of the cross-connection
- *xcnum* specifying the cross-connection number of the cross-connection.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No

Input format

Command syntax: **ED-CRS**-*modifier*:*tid*:*in_aid*,*out_aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection on which the **ED-CRS** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command.
   Type: Alphanumeric value set.
   Range:
   - LOVC12
   - LOVC3
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - LOVT1
   - STS1
   - STS3
   - STS12
   - STS48

- STS192
- AU3TU3
- TU3AU3

No **all** value is supported.

2. **tid** – Target Identifier
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.
3. **in_aid** – Input Access Identifier
This parameter specifies the source of the cross-connection.
For a detailed description please refer to the in_aid input parameter in "RTRV-CRS: Retrieve cross-connection" (p. 3-2306).
Type: GenTribAID or GenLOTribAID.
Range: No use of the **all** or **usall** or **vall** values within the *out_aid* is allowed.
4. **out_aid** – Output Access Identifier
This parameter specifies the tributary which is the sink of the cross-connection.
For a detailed description please refer to the out_aid output parameter in "RTRV-CRS: Retrieve cross-connection" (p. 3-2306).
Type: GenTribAID or GenLOTribAID
Range: n.a. No use of the **all** or **usall** or **vall** values within the *out_aid* is allowed.
5. **ctag** – Correlation Tag
This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
Type: Alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **loca** – Location-a
This parameter specifies the TID of the node at which service is added to the BLSR.
This parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections, if the Automatic Squelch Map Calculation function is disabled.
The parameter *loca* can be specified for BLSR THROUGH, INTER-BLSR and DROP connections while the Automatic Squelch Map Calculation function is enabled to do a user override. The *loca* parameter value has to be omitted for ADD, non-BLSR connections.
A 2-way cross-connection is considered to be a DROP if the *out_aid* is a non BLSR tributary.
For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides. If there is no such function in an upstream ring

node then *loca* is the TID of the node where the related HO circuit is first added to the ring. Refer to the figure "Lower-order cross-connections" (p. 3-2322) for further explanation.
At the lower-order side of a conversion cross-connection, the same rules for *loca* hall be applicable as for lower-order cross-connections.

Additional information are given for this parameter in the RTRV-CRS section with respect to:

- figure illustrating BLSR connections,
- inter-ring cross-connections with collapsed nodes,
- extra traffic handling.

Type: TID or empty string.
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string "":
Note: In output direction the empty string appears as \"\".

2. **locz** – Location-z

   This parameter specifies the TID of the node at which service is dropped from the BLSR.
   This parameter is required for BLSR THROUGH, INTER-BLSR and ADD connections, if the Automatic Squelch Map Calculation function is disabled.
   The parameter *locz* can be specified for BLSR THROUGH, INTER-BLSR and ADD connections while the Automatic Squelch Map Calculation function is enabled to do a User Override.
   The *locz* parameter value has to be omitted for DROP and non-BLSR connections.
   A 2-way cross-connection is considered to be a ADD if the *in_aid* is a non BLSR tributary.
   For lower-order cross-connections the parameter *locz* is the TID of that ring node in the direction towards the specified output tributary (downstream), where the HO path termination sink function resides. If there is no such function in a downstream ring node then *locz* is the TID of the node, where the related HO circuit is last dropped from the ring.
   Refer to the figure in "Lower-order cross-connections" (p. 3-2322) for further explanation.
   At the lower-order side of a conversion cross-connection, the same rules for *locz* is applicable as for lower-order cross-connections.

   Additional information are given for this parameter in the RTRV-CRS section with respect to:

   - figure illustrating BLSR connections,
   - inter-ring cross-connections with collapsed nodes,
   - extra traffic handling.

   Type: TID.
   Range: 1 to 20 characters. Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.

3. **`omode`** – Output Mode

   This parameter specifies the output mode of the cross-connection:

   - for a 1-way cross-connection the output is clearly defined by the destination (*out_aid*)
   - for a 2-way cross-connection the output is defined as the source-to-destination direction (*in_aid* to *out_aid*)
   - NORM: this is the normal output i.e. the signal from the *in_aid* is passed through to the *out_aid*;
   - IDLE/UNEQ: this mode outputs an unequipped signal;
   - AIS: this mode outputs an AIS signal.

   omode and adaptive-mode: In case a SONET-port is provisioned to adaptive-mode setting the *omode* to IDLE/UNEQ or AIS will be lead to transmitting the corresponding signal (UNEQ or AIS) on STS1 base for all the STS1 tributary comprising the STS-N signal. Thus for an output of an STS3 cross-connection, if either AIS or IDLE/UNEQ is selected each of the 3 STS1 will output the AIS or IDLE/UNEQ signal. When switching the *omode* back to NORM the original STS3 cross-connection-signal will re-appear again.
   omode in case of path-protected cross-connection: In case of a path-protected cross-connection the *omode* affects the output of the path selector and is thus not setable on a per leg base. In other words the *omode* insertion is done after (downstream direction) the selector function.
   Type: Alphanumeric value set.

   Range:

   - NORM (default)
   - IDLE/UNEQ
   - AIS

4. **`xcappl`** – cross-connection application

   This parameter is a numeric value which indicates the application for which the cross-connection is used in the context of compound cross-connection topologies. The parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection.

   As a possible assignment proposal the following may serve:

   - 0) Unknown
   - 1) 1-Way Point-to-Point
   - 2) 1-Way Path-Protected
   - 3) 1-Way Adjunct Path-Protected
   - 4) 1-Way Conversion Cross-Connection
   - 10) 2-Way Point-to-Point
   - 11) 2-Way Conversion Cross-Connection

- 20) UPSR (or SNCP Ring) Add, Drop
- 21) UPSR (or SNCP) Ring-to-Ring, Single Node Interconnection, Same NE
- 22) UPSR (or SNCP) Drop, 1-Way Broadcast
- 23) UPSR (or SNCP Ring) Add, Drop connection (Broadcast)
- 30) Logical Ring (or SNCP) Add, Drop
- 40) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Node
- 41) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Nodes in same NE
- 42) Ring Interworking, Dual Transmit, BLSR (or MS-SPRing) Terminating Node
- 50) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring)
- 51) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring) Nodes in same NE
- 60) 1-Way Broadcast -- note: this is with N greater than or equal to 2.

Type: numerical value set.
Range: {0, 1, 2,…, 255}.
Default: The default value is 0.

5. **`xcnum`** – cross-connection number
This parameter is a 12 digit number, identifying each leg in a specific compound cross-connection. (Compound cross-connection are a composition of several atomic cross-connection in order to form complex scenarios like e.g. described in ″Example input/output″ section of the **`RTRV-CRS`** command like UPSR, DRI etc.). Like the *xcappl* parameter the *xcnum* parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection. It may be used by a manager to characterize and group cross-connections belonging to complex cross-connection topology (e.g. compound cross-connections as used in ring interworking scenarios).
The following format is recommended:
two digits for the bay, one digit for the shelf, two digita for the slot, two digits for the port, three digits for the high-order tributary, and two digits for hte low-order tributary.
Type: numeric value set (12 digit).
Range: 000000000000 .. 999999999999.
Default: The default value is 000000000000.

Output format

If the **`ED-CRS`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
```

;

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of the "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

A cross-connection can be modified via the **ED-CRS** command when *xconcls* = TRADITIONAL or when only the parameters loca, locz are modified.. A privileged user may change *xconcls* to TRADITIONAL via ED-NNCRS.

The affected parameter, as listed in the *spec_block* parameters part of this command, will be updated in the corresponding cross-connection entity.

For updates in more complex scenarios the following holds: -update of *omode* of one leg for a path-protected XC will also update *omode* of the second leg – thus 2 ED-CRS notifications will be sent; -update of *locz* of one leg within a path-protected XC will also update *locz* of the second leg -update of *loca* of one leg will also update *loca* of all other XCs sharing *in_aid* as input.

Furthermore the *repleg* status will be updated to *loca/locz* change (conversion from 1-way to 2-way or vice versa).

Update *loca*/*locz* of low-order cross-connections

If the *loca*/*locz* information is changed for a low-order cross-connection at an MS-SPRING port, then *loca*/*locz* of all low-order cross-connections using the same HO PTF at the MS-SPRING port is updated to the same value.

Update *loca*/*locz* of conversion cross-connections

If the *loca*/*locz* information is changed for a conversion cross-connection at an MS-SPRing port, then *loca/locz* of all conversion cross-connections using the same HO PTF at the MS-SPRing port is updated to the same value.

Identification of VCG tributaries

The system shall allow to edit cross-connections at VCG tributaries using the AID format of an AU-3/STS-1 tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading ″v″.

Example input/output

Example: For an existing non-BLSR 1-way cross-connection with rate vc4 the omode will be set to AIS via:

```
ED-CRS-VC4:UNITE-NE:1-1-#-#-10-1-4,1-1-#-#-20-1-7:123456:::omode=AIS;

   UNITE-NE 00-11-14 12:00:00
```

```
M  123456 COMPLD
;
```

Error responses

Validation rule: Entities (tributaries) must exist

Cross-connection command processing verifies that the logical tributaries specified in the command do exist.

Error code:

`IENE – Input Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: Entity (cross-connection) must exist

Cross-connection command processing verifies that the specified cross-connection exists.

Error code:

`IENE – Input Entity Not Exists, Specified cross-connection does not exist`

Validation rule: Specified rate consistent with the cross-connecton rate

Cross-connection command processing verifies that the specified rate (*modifier* parameter) is compliant with the rate of the existing cross-connection.

Error code:

`IPNC – Input Parameter Not Consistent, Rate inconsistent with cross-connection rate`

Validation rule: Only those parameter present which are needed

command processing shall verify according to the given context only those parameter are present which are needed for that context.

This means that e.g.

- for editing a non-BLSR or BLSR-ADD cross-connection the *loca* parameter must not be present
- for editing a non-BLSR or BLSR-DROP cross-connection the *locz* parameter must not be present
- for editing a non-BLSR and unprotected cross-connection the *loca* and *locz* parameter must not be present

Error code:

`IPNC – Input Parameter Not Consistent, Rate inconsistent with cross-connection rate`

Validation rule: TID validation

Cross-connection command processing verifies that the new TID(s) (*loca* and/or *locz*) are compliant with the actual cross-connection configuration according to the following rules:

- *loca* is a non-empty string in case the *in_aid* is involved in a BLSR protection roup and the automatic squelch map calculation is disabled
- *locz* is a non-empty string in case the *out_aid* is involved in a BLSR protection group and the automatic squelch map calculation is disabled

Error code:

`IPNC – Input Parameter Not Consistent, TID not compliant with cross-connection configuration`

Validation rule: Presence of spec_block parameter

Cross-connection command processing shall verify that at least one spec_block parameter is submitted with the command.

Error code: `IDNV – Input, Data Not Valid`

Validation rule: Cross-connection must not be of *xconcls* NN

Cross-connection command processing shall verify, that the cross-connection is not of *xconcls* NN if other parameters than *loca* and *locz* are changed..

Error code:

`SNVS – Status, Not in Valid State, Cross-connection must not be of xconcls NN`

Validation rule: loca/locz information only retrievable for EXTRA TRAFFIC

Cross-connection command processing shall deny commands, if affected tributaries belong to EXTRA TRAFFIC and loca/locz information is specified in the command. The loca/locz information is automatically created for EXTRA TRAFFIC by the NE.

Error code:

`IDNC – Input, Data Not Consistent, It is not allowed to specify loca/locz for EXTRA TRAFFIC`

Output format

Syntax: **ED-CRS**-*modifier*:*in_aid*,*out_aid*:[*in_aid2*]:*spec-block*;

Output parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection on which the **ED-CRS** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command.
   Type: Alphanumeric value set.
   Range:
   - LOVC12
   - LOVC3
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - LOVT1
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - AU3TU3
   - TU3AU3

   No **all** value is supported.
2. **in_aid** – Input Access Identifier
   This parameter specifies the source of the cross-connection.
   For a detailed description please refer to the in_aid input parameter in "RTRV-CRS: Retrieve cross-connection" (p. 3-2306).
   Type: GenTribAID or GenLOTribAID.
   Range: n.a. No use of the **all** or **usall** or **vall** values within the in_aid is allowed.

3. **out_aid** – Output Access Identifier
   This parameter specifies the tributary which is the sink of the cross-connection.
   Type: GenTribAID or GenLOTribAID. STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs, VCGNumAID are used for high-order tributaries on e.g. GE***n***, OPT2G5 packs, GenLOTribAID are used for low-order tributaries on I/O packs e.g. OP***n***, EP155.
   Range: n.a. (**all** or **usall** or **vall** values shall never occur as part of an output parameter).
4. **in_aid2** – Input Access Identifier 2
   This parameter is applicable to and is present for path-protected cross-connections only and specifies either the source of the protection leg or the source of the working leg.
   This depends on the value of the *repleg* parameter:
   - E.g. for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSW the worker leg is given by IN1 -> OUT and the protection leg is given by IN2 -> OUT;
   - for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSP the worker leg is given by IN2 -> OUT and the protection leg is given by IN1 -> OUT.

   Thus *in_aid* and *out_aid* specify one leg of the legpair of a path-protected cross-connection, while *in_aid2* and *out_aid* specify the second leg.
   Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID.
   STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs; TMuxAPTNumAID are used for asynchronous high-order tributaries on TransMUX packs, GenLOTribAID are used for low-order tributaries on e.g. OP***n***, EP155.
   Note: Using VCGNumAID (when using e.g. GE***n*** packs) is NOT applicable as those packs can not be the input to a path-protected cross-connection. Therefore specific AID types are mentioned instead of GenTribAID.
   Range: n.a. (**all** values shall never occur as part of an output parameter).

Spec block parameters

1. **loca** – Location-a
   This parameter *loca* (location-a) specifies the TID of the node at which service is added to the BLSR. T
   his parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections. The *loca* parameter value is an empty string for ADD and non-BLSR connections.
   A 2way cross-connection is considered to be a DROP if the out_aid is a non BLSR tributary. The figure “2-way scenario” (p. 3-2322)in section RTRV-CRS (the 3 NEs should be seen as part of an BLSR) depicts the 2way scenario.
   Inter ring cross-connections with collapsed node: Note that beside the above described THROUGH case there can be also another situation where both *loca* and *locz* are different from the empty string: If two rings are interconnected in a collapsed node then *loca* refers to the (add-node of the) ring where the signal is dropped from, and *locz* refers to the (drop-node of the) ring where the signal is

added to. In such cases the cross-connection cannot be provisioned as bidirectional, thus the information is still unambiguous.

A note to the loca2 parameter: Although *loca2* (Location-a-2) is a parameter which is used in the **ENT-CRS** command, *loca2* is not retrieved explicitly. This is due to the fact that for path-protected cross-connections – and only for those this *loca2* is applicable – the retrieval will be on a leg-basis and not on a leg-pair basis. In other words: If a path-protected cross-connection is retrieved two entries will be sent, one for the working leg (incl. the *loca* and *locz* parameter) and one for the protection leg (incl. the *loca* parameter and the same *locz* parameter, and in this case the *loca* returned is the *loca2* as entered when establishing the path-protected cross-connection).

The parameter *loca* is also required for EXTRA TRAFFIC connections. In contrast to incoming references from other commands to this whole chapter it is exclusively applicable for the command **RTRV-CRS**.

For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of loca refer to the parameter *sqfa*.

For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides. If there is no such function in an upstream ring node then loca is the TID of the node where the related HO circuit is first added to the ring.

The picture “Lower-order cross-connections” (p. 3-2322)in section RTRV-CRS shows an example of a LO path through a part of a ring. The LO path is added to/dropped from the ring in NE-1 and NE-2. 2-way cross-connections are considered to be either an Add or a Drop connection depending whether the input or the output tributary is at the ring port.

In NE-3 there is a HO through connection, which contains the LO path. In NE-3 there is no HO path termination. In NE-4 there is a LO through connection. Consequently, there are HO path terminations in NE-4.

The fact that loca refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same loca value.
- Any LO through-connection will be treated as add/drop. loca will identify the node of the through connection, and not the node where the LO service is added to the ring.

At the lower-order side of a conversion cross-connection, the same rules for *loca* is applicable as for lower-order cross-connections.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: *""*

2. **locz** – Location-z
This parameter *locz* (Location-z) specifies the TID of the node at which service is dropped from the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and ADD connections. The *locz* parameter value is an empty string for DROP and non-BLSR connections. A
2way cross-connection is considered to be a ADD if the in_aid is a non BLSR tributary.
Refer to figure “2-way scenario” (p. 3-2322) in thr RTRV-CRS section for further explanation.
locz is also required for EXTRA TRAFFIC connections.
For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of *locz* refer to the parameter *sqfz*.
For lower-order cross-connections the parameter *locz* is the TID of that ring node in the direction towards the specified output tributary (downstream), where the HO path termination sink function resides. If there is no such function in a downstream ring node then *locz* is the TID of the node, where the related HO circuit is last dropped from the ring. Refer to figure “Lower-order cross-connections” (p. 3-2322) in the RTRV-CRS section for further explanation.

The fact that *loca* refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same loca value.
- Any LO through-connection will be treated as add/drop. loca will identify the node of the through connection, and not the node where the LO service is added to the ring.

At the lower-order side of a conversion cross-connection, the same rules for *locz* is applicable as for lower-order cross-connections.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: "" Note: In output direction the empty string appears as \"\".

3. **omode** – Output Mode

   The parameter *omode* specifies the output mode of the crossconnection:

   - for a 1way cross-connection the output is clearly defined by the destination (*out_aid*)
   - for a 2way cross-connection the output is defined as the source-to-destination direction (*in_aid* to *out_aid*)

   NORM: this is the normal output i.e. the signal from the *in_aid* is passed through to the *out_aid*.
   IDLE/UNEQ: this mode outputs an unequipped signal.
   AIS: this mode outputs an AIS signal
   omode and adaptive-mode:
   In case a SONET-port is provisioned to adaptive-mode setting the *omode* to IDLE/UNEQ or AIS will be lead to transmitting the corresponding signal (UNEQ or AIS) on STS1 base for all the STS1 tributary comprising the STS-N signal. Thus for an output of an STS3 cross-connection, if either AIS or IDLE/UNEQ is selected each of the 3 STS1 will output the AIS or IDLE/UNEQ signal. When switching the *omode* back to NORM the original STS3 cross-connection-signal will re-appear again.
   omode in case of pathprotected cross-connection:
   In case of a pathprotected cross-connection the *omode* affects the output of the pathselector and is thus not setable on a per leg base. In other words the *omode* insertion is done after (downstream direction) the selector function.
   Type: Alphanumeric value set.

   Range:

   - NORM
   - IDLE/UNEQ
   - AIS

   Default: NORM

4. **`onnsConnControl`** – ONNS Connection Control
   This parameter indicates for cross-connections of *xconcls* NN, whether the ONNS connection a cross-connection is assigned to is controlled by ONNS directly or by an external control (setup via UNI or eNNI or as SPC connection).
   For cross-connections of *xconcls* TRADITIONAL the value UNKNOWN is reported for this parameter.
   The value UNKNOWN shall also be reported for cross-connections of *xconcls* NN, the onnsConnControl of which cannot be determined.
   Type: Alphanumeric value set.
   Range:
   - UNKNOWN
   - ONNS
   - EXT
5. **`onnsPathID`** – ONNS Path Identity
   This parameter indicates for cross-connections of *xconcls* NN the path ID of the ONNS path a cross-connection is assigned to.
   For cross-connections of *xconcls* TRADITIONAL an empty string is reported for this parameter.
   Type: Character string of length up to 20 or empty string
   Range:
   nodeID-Index
   - nodeID: four dot separated numeric strings: each string 0..255
   - Index: Numeric string 0-65535

   Example: 29.13.196.203-65111
   Default: empty string
6. **`repleg`** – Reported Leg Pair
   This parameter provides compact information about the leg(s) of cross-connections and is derived, as shown in the table below, from a combination of the following elementary parameter:
   - atomic cross-connection topology
   - leg status
   - path-protected group working leg (if applicable i.e. being part of a protection group).

Atomic cross-connection Topology	Path Protection Leg Role	Leg Status	Reported Legpair (*repleg*)
point-to-point	n.a.	1-way	1WAY
point-to-point	n.a.	2-way	2WAY
path-protected	W	1-way	1WAYPSW
path-protected	P	1-way	1WAYPSP

Atomic cross-connection topology:

Two atomic cross-connection topologies are supported:

- Point to point: The point to point cross-connection consists of one leg only, which is defined by its source-trib (*in_aid*) and its destination-trib (*out_aid*) and its particular transmission rate.
- path-protected: The path-protected cross-connection consists of a path protection group with two legs, a working leg and a protection leg – the declaration of working respectively protection is made when establishing the cross-connection (ENT-CRS command).

  The two legs are defined by two input tributaries and one output tributary – thus one input tributary and the output tributary form the working leg while the other input tributary and the output tributary form the protection leg.

  Note that:

  both input tributaries must belong to ports with the same interface standard (either SONET or SDH), due to different switch criteria;

  both legs must be at the same cross-connection rate.

Leg status:

The leg status indicates whether a leg is monitored and reported as a 1-way cross-connection or a leg pair i.e. a 2-way cross-connection.

1-way: The leg status for a path-protected cross-connection is always defined as 1-way.

2-way: The leg status for a (non path-protected) cross-connection is set to 2-way if all the following conditions are fulfilled: there are 2 cross-connections in opposite direction between the same tributaries; both of these cross-connections have the same rate (independent if the SONET or SDH rate was used when establishing i.e. VC3 is equivalent to STS1, VC4 is equivalent to STS3 etc); the source and destination TIDs do match i.e. the source TID of one leg is the destination TID of the other leg and vice versa (this condition of course holds only in case of BLSR cross-connections).

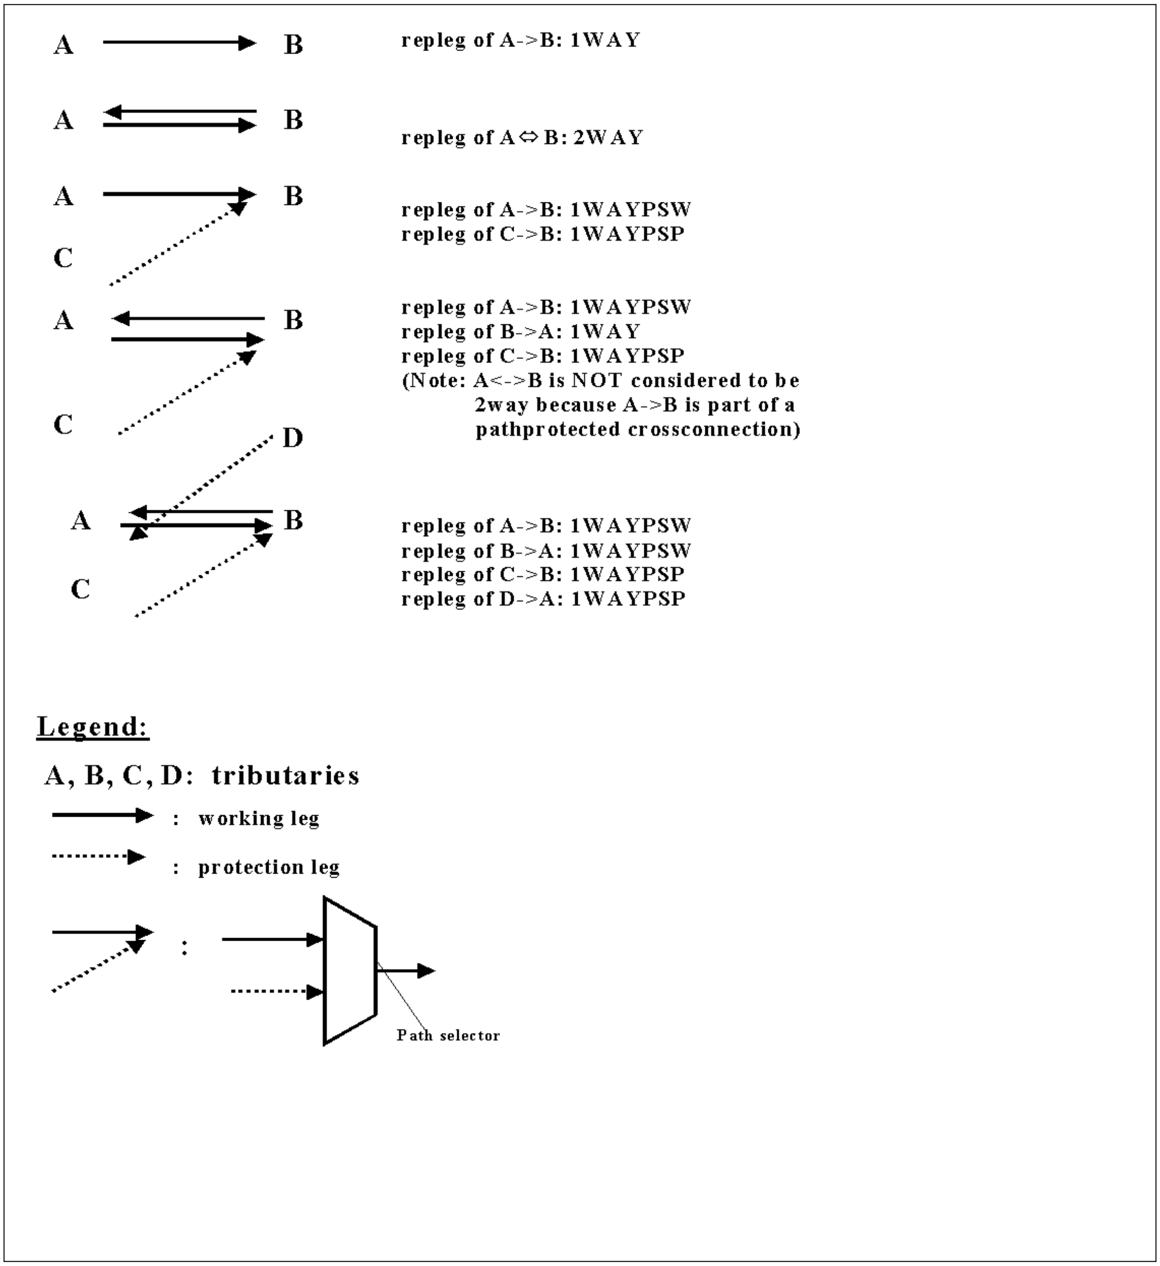
Note that the criteria for a 2-way leg-pair do not depend on whether the two legs were set up at the same time, nor on whether either leg was set up as part of a 2-way cross-connection topology

Path Protection leg role:

This indicates if the leg of a path protection group is defined as the working (W) leg or the protection (P) leg.

1WAYPSW and 1WAYPSP stands for 1-way path switched working and 1-way path switched protection respectively.

The following figure shows examples for the *repleg* parameter for several cross-connection configurations including compound cross-connection.



Range:

- 1WAY
- 2WAY
- 1WAYPSW
- 1WAYPSP.

The values 1WAYPAP and 1WAYPAW are not supported in the initial release.

7. **`rtntaccstat`** – Return Test Access Status
   This parameter indicates whether the input tributary of the return direction (destination-to-source) of a 2-way cross-connection is cross-connected or bridged to a test access tributary of a test session. In the case of a 1-way cross-connection the parameter is omitted.
   Type: Alphanumeric value set.
   Range: YES, NO (default).
8. **`taccstat`** – Test Access Status
   This parameter indicates whether the input tributary of a 1-way cross-connection or the input tributary of the source-to-destination direction of a 2-way cross-connection is cross-connected or bridged to a test access tributary of a test session.
   Type: Alphanumeric value set.
   Range: YES, NO (default).
9. **`xcappl`** – cross-connection application
   This parameter is a numeric value which indicates the application for which the cross-connection is used in the context of compound cross-connection topologies. The parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection.

   As a possible assignment proposal the following may serve:

   - 0) Unknown
   - 1) 1-Way Point-to-Point
   - 2) 1-Way Path-Protected
   - 3) 1-Way Adjunct Path-Protected
   - 4) 1-Way Conversion Cross-Connection
   - 10) 2-Way Point-to-Point
   - 11) 2-Way Conversion Cross-Connection
   - 20) UPSR (or SNCP Ring) Add, Drop
   - 21) UPSR (or SNCP) Ring-to-Ring, Single Node Interconnection, Same NE
   - 22) UPSR (or SNCP) Drop, 1-Way Broadcast
   - 23) UPSR (or SNCP Ring) Add, Drop connection (Broadcast)
   - 30) Logical Ring (or SNCP) Add, Drop
   - 40) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Node
   - 41) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Nodes in same NE
   - 42) Ring Interworking, Dual Transmit, BLSR (or MS-SPRing) Terminating Node
   - 50) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring)

- 51) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring) Nodes in same NE
- 60) 1-Way Broadcast -- note: this is with N greater than or equal to 2.

Type: numerical value set.
Range: {0, 1, 2,..., 255}.
Default: The default value is 0.

10. **`xcnum`** – cross-connection Number
Note: *rtnxcappl*, *rtnxcnum* and *rtnomode* are not listed because these parameters are always in the scope of one leg. Note that in contrast to CG the ED-CRS notification is used to notify *repleg* changes – CG therefore did use the ENT-CRS notification which is not logical.
The parameter *xcnum* (cross-connection number) is a multiple digit number, identifiying each leg in a specific compound cross-connection. (Compound cross-connection are a composition of several atomic cross-connection in order to form complex scenarios like e.g. decribed in ″Example input/output″ section of the **`RTRV-CRS`** command like UPSR, DRI etc.).
Like the xcappl parameter the xcnum parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection. It may be used by a manager to characterize and group cross-connections belonging to complex cross-connection topology (e.g. compound cross-connections as used in Ring Interworking scenarios).
The following format for the 12 digits is recommended:
   - two digits for the bay
   - one digit for the shelf
   - two digits for the slot
   - two digit for the port
   - three digits for the high-order tributary and
   - two digits for the low-order tributary.

   If a high-order tributary is addressed then the last two digits are set to 00. The digits values pertain to the out_aid.
Type: numeric value set (12 digit)
Range: 000000000000 .. 999999999999
Default: The default value is 000000000000.

11. **`xconcls`** – cross-connection class
Note: Modification can only be done by a privileged user via ED-NNCRS.
This parameter identifies, whether the cross-connection has been setup in the TRADITIONAL way by an operator via the **`ENT-CRS`** command or via the NN application as part of an ENT-PATH command. This parameter therefore also indicates who is the owner of the cross-connection and can modify or delete it.
Note: Refer to the NN TL1 catalogue for the **`ENT-PATH`** command.
Type: Alphanumeric value set.
Range: TRADITIONAL, NN.

Example output

Refer to the ″Detailed behavior description″ of "ED-CRS: Edit cross-connection" (p. 3-292).

ED-DAT: Edit date and time

The **ED-DAT** command can be initiated by a user to change the date and time information in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: no

Input format

Command syntax: **ED-DAT**:*tid*::*ctag*::*[date][,time]*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **date** – Date
   The *date* specifies the current date as YY-MM-DD. If the parameter *time* is not specified, the current value is not changed, but then *date* must be specified for the **ED-DAT** command to complete successfully.
   Type: value set.
   Range: YY-MM-DD, with YY between 00 and 99, MM between 01 and 12, DD between 01 and 31.
   Default: 00-01-01 after start-up with default DB, current NE value, if not supplied in the command.
4. **time** – Time
   The *time* specifies the current time of day as HH-MM-SS. If the parameter *date* is not specified, the current value is not changed, but then *time* must be specified for the **ED-DAT** command to complete successfully.
   Type: value set.
   Range: HH-MM-SS, with HH between 00 and 23, MM between 00 and 59, SS between 00 and 59.
   Default: 00-00-00 after start-up with default DB current NE value, if not supplied in the command.

Output format

If the ED-DAT request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The following attributes of the system entity is updated due to that command

1. *date* as specified in the command input
2. *time* as specified in the command input.

If either *date* or *time* is not supplied in the command parameter, this value is left unchanged.

The update is reported by means of an ED-DAT notification for the system.

Update affected entities

If ED-DAT is changed so that a performance monitoring period is crossed, than one history bin will be lost. In every case the *validity* parameter is modified accordingly (see “RTRV-PM: Retrieve performance monitoring” (p. 3-2731)).

Example input/output

```
ED-DAT:LT-UNITE:789::123456::01-12-31,11-50-30;

   LT-UNITE:789 01-12-31 11:51:41
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ED-DAT`** command.

Validation rule: Incorrect date/time format

If the NE receives an ED-DAT command with an incorrectly formatted date and/or time, the following error response is returned. This check includes checks for invalid days within a month (e.g. no 30th February).

Error code: `IDNV – Input, Data Not Valid, incorrect date/time format`

GR-199-CORE

ED-DAT notification

Output format

Syntax: **ED-DAT**:::[*date*][,*time*]

Output parameters

Command parameters

1. **date** – Date
   The *date* specifies the current date as YY-MM-DD. If the parameter *time* is not specified, the current value is not changed, but then *date* must be specified for the **ED-DAT** command to complete successfully.
   Type: value set.
   Range: YY-MM-DD, with YY between 00 and 99, MM between 01 and 12, DD between 01 and 31.
   Default: 00-01-01 after start-up with default DB, current NE value, if not supplied in the command.
2. **time** – Time
   The *time* specifies the current time of day as HH-MM-SS. If the parameter *date* is not specified, the current value is not changed, but then *time* must be specified for the **ED-DAT** command to complete successfully.
   Type: value set.
   Range: HH-MM-SS, with HH between 00 and 23, MM between 00 and 59, SS between 00 and 59.
   Default: 00-00-00 after start-up with default DB, current NE value, if not supplied in the command.

Detailed behavior description

Date and time in the ED-DAT notification

The *date* and *time* parameters in the header of the **REPT DBCHG** notification as well as the **REPT DBCHG** output parameters *chgdat* and *chgtm* indicate the NE date and time when the **ED-DAT** command has been invoked, that means the date and time before the change.

The **ED-DAT** spec block parameters *date* and *time* contained in the **REPT DBCHG** command show the new NE date and time after the change.

Example output

Example of an **ED-DAT** command invoked on November 14 2007 at 17:50:10:

```
ED-DAT:UNITE-NE:789::123456::07-11-16,12-20-00;

   UNITE-NE:789 07-11-14 17:50:10

A  078  REPT  DBCHG
   ”Time=17-50-10,DATE=07-11-14:ED-DAT:::date=07-11-16,time=12-20-00”
;
```

ED-EC1: Edit EC1 port

The command **ED-EC1** is used to retrieve all parameters related to the electrical EC1 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax:

ED-EC1:*tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   Access Identifier of a EC1 port.
   Type: AID
   Range: SPortAID of EC1 port. The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **eif** – Electrical Interface Type
   This parameter specifies the type of input to which the port is provisioned.
   Type: Alphanumeric value set.
   Range: DS3, EC1 (default)
   The default vlaue EC1 leaves the interface type unchanged, if the parameter is omitted.
2. **felpm** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section/line.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default)
3. **lbo** – Line Build Out
   This parameter defines the cable length applicable for the EC1 port.
   Type: Alphanumeric value set.

Range:

- SHORT (default): 0 … 68.5 m (0 … 225 ft)
- LONG: 68.5 … 137 m (225 … 450 ft).

4. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message “do not use” will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range: ENABLE: set a forced DUS/DNU; DISABLE (default): clear a forced DUS/DNU
5. **`nelpm`** – Near-End Line PM Enable
   Enable or disable near-end multiplex section (near-end line) performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
6. **`pmmsfeses`** – Performance Monitoring Line Far-End SES Threshold
   This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
   Type: numeric value set.
   Range: 1 – 6400.
   Default: 51
7. **`pmmsneses`** – Performance Monitoring Line Near-End SES Threshold
   This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
   Type: numeric value set
   Range: 1 – 6400.
   Default: 51
8. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.
9. **`pmrsneses`** – Performance Monitoring Section Near-End SES Threshold
   This parameter describes the Section Near-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
   Type: numeric value set.
   Range: 1 … 64000
   Default: 52

10. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when sdsfmode=POISSON.
    Type: numeric value set.
    Range: (as exponents of 10): -5 -6 (default), -7, -8, -9
11. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
12. **`sfthr`** – Signal Failure Threshold
    Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when sdsfmode=POISSON
    Type: numeric value set
    Range: (as exponents of 10): -3 (default), -4, -5
13. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
14. **`sonet`** – SONET ASAP
    SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports of corresponding line rate (see RTRV-STM4, output parameter sdhpn) to be compatible with current generation applications.
    Type: Alphanumeric string
    Range: String with a maximum of 24 characters. A hyphen (“-”) is allowed in the name additionally.
    Default: DEFAULT.
15. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
16. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted.
    Type: Hexadecimal digits
    Range: 1 byte string, One byte is expressed as two hexadecimal digits (example value: 6D).
    Default: 01Hex

Output format

If the ED-EC1 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the **RTRV-HDR** command.

Detailed behavior description

The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed port entity according to the parameters given with this command. The modification is reported by means of an ED-EC1 notification for port (except for parameter eif; see below).

Switching of interface type - Ignore other parameters

If additional parameters beside eif are specified with the ED-EC1 command they will be ignored by the NE.

Switching of interface type - Impact on port and Tributary Entities

Setting *eif* to T3 shall

- delete the STS-1 path termination entity related to the EC1 port,
- delete the EC1 port entity,
- create one T3 port entity with the defined default values for the port parameters,
- create one STS-1 path termination with the default values for the PTF parameters.

The deletion and creation of ports and tributaries are notified via the appropriate DLT and ENT notifications.

Switching of interface type - Impact on Fault Management

Setting *eif* to T3 shall

- clear all active alarms for the EC1 port and the related tributary
- re-evaluate the alarm status after the creation of the T3 port and the path termination
- raise all active alarms for the T3 port and the tributary.

The clearing and raising of alarms are notified with the appropriate notifications.

Switching of interface type - Impact on Performance Monitoring

Setting *eif* to T3 shall

- disable all active PM monitoring points for the EC1 port and the related tributary
- clear all current and history bins for the EC1 port and the related tributary.

Example input/output

```
ED-EC1:UNITE-NE:1-1-#-#-1-36:123456:::FELPM=ENABLE,NELPM=ENABLE;

   UNITE-NE 04-12-23 08:00:00
M  123456 COMPLD
;

   UNITE-NE 04-12-23 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=04-12-23:ED-EC1:1-1-#-#-1-1::felpm=enable,nelpm=enable:"
;
```

Error responses

See definition in "RTRV-HDR: Retrieve header" (p. 3-2417) command error responses section for general validation rules. The error responses listed there also apply to the ED-EC1 command.

Validation rule: Check CCB against *ptype* and *eif*

Check wether the CCB fits to *ptype* and *eif*.

Error code:`IENE – Input, Entity Not Exists`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code:`IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: no cross-connections for interface type change

Check that eif is not changed when a facility loopback is still on this port.

Error code:
`SNVS – Status, Not in Valid State, cross-connections still exist`

Validation rule: no conversion cross-connections for interface type change

Check that *eif* is not changed when conversion cross-connections are still on this port.

Error code:
`SNVS – Status, Not in Valid State, conversion cross-connections are still existing`

Validation rule: no XC loopbacks for interface type change

Check that *eif* is not changed when cross-connections loopback is still on this port.

Error code:

`SNVS – Status, Not in Valid State, a cross-connect loopback exists`

Validation rule: No facility loopbacks for interface type change

Check that *eif* is not changed when a facility loopback is still on this port.

Error code:

`SNVS – Status, Not in Valid State, facility loopbacks still exist`

Validation rule: no test access session for interface type change

Check that *eif* is not changed when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Check whether system is in maintenance condition

Check that *eif* is not changed when the system in is maintenance condition.

Error code:

`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loobackp is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (strcout) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data Not Consistent, strcout length must match the given outgoing J0 trace mode`

ED-EC1 autonomous notifications

LOS for transmission port EC1 clears

If LOS is cleared and current port mode is AUTO, then portmode is updated (new value: MON). This update is reported via ED-EC1 notification with parameter pmode.

ED-EC1 notification

Output format

Command syntax:

ED-EC1:*tid:aid:ctag:::spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID
   Range: EC1 port AID

Spec block parameters

1. **felpm** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section/line.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default)
2. **frcdus** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message “do not use” will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range: ENABLE: set a forced DUS/DNU; DISABLE (default): clear a forced DUS/DNU
3. **fsflpbkstat** – Far Side Facility Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output aid. A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback exististing for the aid.
   Note: not both loopbacks (lpbk and fsflpbkstat) can be set to YES at the same time.
   Type: Alphanumeric value set.
   Range: YES, NO (default).
4. **lbo** – Line Build Out
   This parameter defines the cable length applicable for the EC1 port.
   Type: Alphanumeric value set.
   Range:
   - SHORT (default): 0 … 68.5 m (0 … 225 ft)
   - LONG: 68.5 … 137 m (225 … 450 ft).

5. **`lpbk`** – Loopback
   This parameter specifies the current near-side loopback status of the considered output aid. A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback exististing for the port.
   Type: Alphanumeric value set.
   Range: YES, NO (default)
6. **`nelpm`** – Near-End Line PM Enable
   Enable or disable near-end multiplex section (near-end line) performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default)
7. **`pmmsfeses`** – Performance Monitoring Line Far-End SES Threshold
   This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
   Type: numeric value set.
   Range: 1 – 6400.
   Default: 51
8. **`pmmsneses`** – Performance Monitoring Line Near-End SES Threshold
   This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
   Type: numeric value set
   Range: 1 – 6400.
   Default: 51
9. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.

   Range:

   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.
10. **`pmrsneses`** – Performance Monitoring Section Near-End SES Threshold
    This parameter describes the Section Near-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
    Type: numeric value set.
    Range: 1 … 64000
    Default: 52

11. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when sdsfmode=POISSON.
    Type: numeric value set.
    Range: (as exponents of 10): -5 -6 (default), -7, -8, -9
12. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
13. **`sfthr`** – Signal Failure Threshold
    Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when sdsfmode=POISSON
    Type: numeric value set
    Range: (as exponents of 10): -3 (default), -4, -5
14. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
15. **`sonet`** – SONET ASAP
    SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports of corresponding line rate (see RTRV-STM4, output parameter sdhpn) to be compatible with current generation applications.
    Type: Alphanumeric string
    Range: String with a maximum of 24 characters. A hyphen (“-”) is allowed in the name additionally.
    Default: DEFAULT.
16. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
17. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted.
    Type: Hexadecimal digits
    Range: 1 byte string, One byte is expressed as two hexadecimal digits (example value: 6D).
    Default: 01Hex

Example Output

ED-EPORT: Edit Ethernet port

The **ED-EPORT** command modifies the properties of an Ethernet port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No

Input format

Command syntax: **ED-EPORT**:*modifier*:*tid*:*aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **modifier**
   This modifier specifies the type of the Ethernet port at the LAN side.
   Type: Alphanumeric value set.
   Range: 1GE representing a 1 GE port on a GE1 pack , 1GEPL representing a 1 GE port on a GE10PL1 pack, 10GEPL representing a 10 GE port on a GE10PL1 pack.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **aid** – Access Identifier
   This parameter specifies the Ethernet port to be operated on.
   Type: AID
   Range: EPortAID as defined in AID structure. The usage of the following values are excluded:
   - *all* in the BayAID definition
   - *all* in the Simple_ShelfAID definition
   - *usall* in the Simple_UnivSlotAID definition
   - *all* in the Simple_UnivSlotAID definition
   - *all* in the Simple_EPortAID definition.
4. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameter

1. **`autoneg`** – Auto Negotiation Mode
   This parameter controls auto-negotiation process to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE or 10GEPL. If the parameter *autoneg* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: ENABLE (default); DISABLE.
2. **`cnprole`** – Customer/Network Port Role
   This parameter specifies whether the addressed port is used as a customer LAN port or a network LAN port.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: CUSTOMER (default), for a customer LAN port; NETWORK, for a network LAN port.
3. **`dftpri`** – Default User Priority
   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - HIGH
   - LOW (default).
4. **`dftvlan`** – Default VLAN Identifier
   This parameter specifies the value of the VLAN identifier which is applied to frames (tagging) at LAN ingress (i.e. from LAN into the Ethernet-port). This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - 1, 2, 3, … 4092, 4093
   - UNAVAILABLE (default).

   To express the state UNAVAILABLE system internally the invalid VLAN ID 4094 is used.

5. **`droppause`** – Drop Incoming Pause Frames
   This parameter controls whether incoming pause frames are dropped (value = ENABLE) or not (value = DISABLE). This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter droppause is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE
   Default: DEFAULT.
6. **`enetpn`** – Ethernet Alarm Severity Assignment Profile
   This parameter points to an ASAP profile name of type ENET for the designated AID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
7. **`enettca`** – Ethernet TCA Profile
   This parameter specifies the name of the threshold crossing alert (TCA) profile used for Ethernet ports.
   Type: Alphanumeric string.
   Range: 1 … 24 characters length.
   Default: DEFAULT0.
8. **`epmode`** – Ethernet Port Monitoring Mode
   This parameter specifies the monitoring mode of the Ethernet port. Alarms for this port will be reported if in state MON otherwise not. The configuration of epmode will change from AUTO to MON if a valid signal is applied to that port.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default), for automatic
   - MON, for monitored
   - NMON, for not monitored.
9. **`eppm`** – Ethernet Port Performance Monitoring
   This parameter specifies whether the performance monitoring is enabled or disabled for this port.
   Type: Alphanumeric value set.
   Range:
   - DISABLE (default)
   - ENABLE
10. **`fcmd`** – Flow Control Mode
    This parameter specifies the configuration for the pause operation of this port. If the input parameter modifier = 1GE, then the parameter fcmd is supported only in case that the bridge operates in backward-compatible mode (vlantagmd = BCMD).
    Type: Alphanumeric value set.

Range:

- AUTO, for auto-negotiate
- DISABLE, for pause mode bidirectionally disabled
- ASYMTOPARTNER, for pause mode having receive disabled, transmit enabled
- ASYMTOLOCAL, for pause mode having transmit disabled, receive enabled
- SYM, for pause mode bidirectionally enabled.

Restrictions: If the parameter *fcmd* is not supported, then the parameter is omitted.
The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GE.
The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = ENABLE. The value AUTO is notsupported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = DISABLE.
The value AUTO is not supported, if the input parameter *modifier* = 10GEPL.
Possible combinations of the parameters *modifier*, *autoneg*, *vlantagmd* (parameter of the referring circuit pack entity, see "RTRV-EQPT (CP): Retrieve equipment (circuit pack)" (p. 3-2375) for definition) and *fcmd* are as follows:

Input parameter *modifier*	**In-/output parameter *autoneg***	**In-/output parameter *vlantagmd***	**In-/output parameter *fcmd***
1GE	not supported	BCMD	AUTO, DISABLE
		other than BCMD	not supported
1GEPL	ENABLE	not supported	AUTO, DISABLE
	DISABLE		DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM
10GEPL	not supported	not supported	DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM

Default:

- AUTO (for *modifier* 1GE or 1GEPL)
- SYM (for *modifier* 10GEPL).

11. **`rcf_htmr`** – Remote Client Fail Hold Off Timer
The parameter specifies the hold-off time for applying the LPT consequent action to disable the laser at the LAN port. The hold-off timer is only applicable if there is a strict one-to-one relationship between the LAN port in question and its related WAN port.
This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_htmr* is not supported, then the parameter is omitted.
Type: numeric string [ms].
Range: 0 … 2000 ms in 100 ms steps
Default: 0.

12. **`rcf_linkdown`** – Link Pass Through Mode
    This parameter controls the consequent action (to switch-off the laser upon receipt of a client signal fail [CSF] indication) to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_linkdown* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE.
    Default: ENABLE.
13. **`rptmode`** – Repeater Mode
    This parameter sets the bridge device for this LAN port into the repeater mode (promiscuous mode), valid for a point to point connection between one LAN and one WAN port. Operating in repeater mode imposes some restrictions. See detailed behavior section.
    If the input parameter *modifier* = 1GE, then the parameter rptmode is meaningful only if in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
14. **`servcond`** – Service Condition
    This parameter specifies the service condition for this port. Some configuration possibilities like loopbacks may be dependent on the state of *servcond*.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default)
    - OUTOFSERVICE.
15. **`stdis`** – Spanning Tree Protocol Disable
    This parameter allows to enable or disable the Spanning Tree Protocol for the given port. If the input parameter modifier = 1GE, then this parameter is meaningful only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter stdis is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.

Range:

- DISABLE, STP is disabled, i.e. the port is not used in the spanning tree protocol
- ENABLE (default), STP is enabled, i.e. the port is used in the spanning tree protocol.

16. **`stpcost`** – Spanning Tree Path Cost
The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.
If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.
If the parameter *stpcost* is not supported, then the parameter is omitted.
Type: Integer.
Range: 1 to 200000000.
Default: 20000.
The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.

17. **`stpp`** – Spanning Tree Port Priority
This parameter specifies the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.
Type: Integer.
Range: 0 to 255.
The stepping as recommended by the standard (steps of 16 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction ″0 to 240″ is not done by the NE.
Default: 128.

18. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding. Two thresholding methods are applicable: TR-only. (also known as the implicit reset method), TR-RTR. (also known as the explicit reset method).
Type: Alphanumeric value set.
Range: TR, TRRTR (default).

19. **vvidls** – Valid VLAN Identifier List (static)
    This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&). The list is packed by the NE and the management systems as good as possible by using '&' and '&&' . The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (cnprole = NETWORK).
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.
    Type: Alphanumeric string and the character '&'.
    Range:
    - Value of each single member (valid VLAN identifier) in the list 1, 2, ..., 4092, 4093
    - In case the list has no members (empty list) -1.

    The length of the list is limited only by the usual system limitations like e.g. TL1 line length. The number of entries in this list is limited to 64 by some NE-internal restrictions. Ranging and grouping by using the operators '&' and '&&' has no impact on the number of entries, it only reduces the length of the list being transported to/from CIT/EMS.
    Default: -1.
    Example 1:
    vvidls=-1. The list has no members (empty list).
    Example 2:
    vvidls=3&5&40&&45. This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.
    Example 3:
    vvidls=1&&4093 This list has the members 1,2, 3, ..., 4092, 4093.

Output format

If the NE fully complies with the ED-EPORT request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The ED-EPORT generates a REPT DBCHG message.

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command. In case of defined options for a specific parameter, the related parameter can only be modified if all conditions to support this parameter are given.

The modification is reported by means of an ED-EPORT notification.

Update affected entities due to a change of the repeater mode

A change of the value of the parameter *rptmode* shall have the following side effects: Any change of the value from DISABLE to ENABLE or vice versa shall reset the parameter dftvlan and vvidls for this port to their default values.

During repeater mode operation no VLAN ingress filtering for tagged frames or classification for untagged frames is done. It is not intended to keep the VLAN settings being active before a switch to the repeater mode for later restoration. This requirement is only applicable if the input parameter *modifier* = 1GE.

Relation of repeater mode - *rptmode* and VLAN tagging mode - *vlantagmd* of related slot

When *vlantagmd* is set to BCMD (backward compatible mode) the value of *rptmode* is relevant. When *vlantagmd* has a value different from BCMD the value of *rptmode* is irrelevant and changes of *rptmode* is not allowed. When switching *vlantagmd* back to BCMD the value of *rptmode* from the database becomes relevant again. This requirement is only applicable if the input parameter *modifier* = 1GE.

Reset to default values when switching from VLAN-aware p2p mode to repeater mode

When vlantagmd is set to BCMD and rptmode is changed from DISABLE to ENABLE the following parameters of the related EPORTs are set to their default values:

- *dftpri*, *dftvlan*, *vvidls*.
  This requirement is only applicable if the input parameter *modifier* = 1GE.

Implicit changes of *fcmd* while configuring *autoneg*

If the parameter *autoneg* is changed from the value DISABLE to ENABLE without modifying the parameter fcmd within the same command then the parameter fcmd will change implicitly to the value AUTO unless it had the value DISABLE previously.

If the parameter *autoneg* is changed from the value ENABLE to DISABLE without modifying the parameter fcmd within the same command then the parameter fcmd will change implicitly to the value DISABLE provided it had a different value previously.

Any implicit change have to be reported within the same ED-EPORT notification. This requirement is only applicable if the input parameter *modifier* = 1GEPL or if the input parameter *modifier* = 10GEPL.

Implicit changes of anegst while configuring autoneg

If the parameter *autoneg* is changed from the value DISABLE to ENABLE then the parameter anegst will change implicitly to a different value than DISABLE.

If the parameter *autoneg* is changed from the value ENABLE to DISABLE then the parameter anegst will change implicitly to the value DISABLE provided the value has not yet been previously indicated.

Any implicit change will not be reported but will be visible within the response to a subsequent RTRV-EPORT command being issued for the related port. This requirement is only applicable if the input parameter *modifier* = 1GEPL or if the input parameter *modifier* = 10GEPL.

Although usually no requirements are given for a parameter which changes during the modification of another parameter and which is not subsequently notified, here is an exception to indicate that the indicated value range of the parameter (*anegst*) will change depending on the configuration value of the other parameter (*autoneg*).

Implicit enabling/disabling of GVRP when enabling/disabling STP for a port

When enabling/disabling STP for a network port via parameter *stdis* GVRP is implicitly enabled/disabled for this port (if enabled via parameter *gvrpmode* of the virtual switch).

This requirement is only applicable if the input parameter *modifier* = 1GE.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. Stop PM counting
2. All current bins related to the PM monitor is deleted
3. All history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of ’pm enable attributes’. PM monitors can be disabled explicitly by means of the ’pm enable’ attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Example input/output

```
ED-EPORT-1GE:LT-UNITE:1-1-#-#-1-1:123457:::epmode=NMON;

   LT-UNITE 00-11-11 11:11:00
M  123457 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ED-EPORT** command.

Validation rule: *modifier* consistent with given port-rate

The system shall verify that the modifier parameter is consistent with the rate of the port (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-EPORT** command for applicable combinations.

Error code:

`IDNC – Input, Data Not Consistent, modifier is inconsistent with existing port rate`

Validation rule: *modifier* consistent with the related circuit pack type

The system shall verify that the modifier parameter is consistent with the related pack type (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-EPORT** command for applicable combinations.

Error code:

`IDNC – Input, Data Not Consistent, modifier is inconsistent with the related circuit pack type`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: servcond must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **`ED`** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **`ED`** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Validation rule: No Modification of fcmd if *vlantagmd* = 802.1TAG

No modification of the flow control mode fcmd is allowed if the VLAN tagging mode vlantagmd of the pack, to which the specified EPORT belongs to, is set to 802.1TAG.

Error code:

`SNVS – Status, Not in Valid State, Modification of flow control mode not allowed`

Validation rule: Default VLAN ID not allowed in repeater mode

No VLAN ingress classification with dftvlan is possible during repeater mode operation. The default VLAN ID has to be the value ″unavailable″ during this state.

Error code:

`SNVS – Status, Not in Valid State, Active Repeater Mode for this Port does not allow dftvlan to be modified`

Validation rule: VLAN filtering database not allowed in repeater mode

No VLAN filtering database, extracted from the vvidls, is used during repeater mode operation. The valid VLAN list has to be an empty list during this state.

Error code:

`SNVS – Status, Not in Valid State, Active Repeater Mode for this Port does not allow vvidls to be modified`

Validation rule: Parameter modification not allowed in backward compatible mode

No modification of the following parameters is allowed if the VLAN tagging mode *vlantagmd* of the pack, to which the specified EPORT belongs to, is set to backward compatible mode (BCMD): *cnprole*, *stdis*, *stpp*, *stpcost*, *rstpmd*.

Error code:

`SNVS – Status, Not in Valid State, Modification not allowed in Backward Compatible Mode`

Validation rule: No modification of *rptmode* if *vlantagmd* = 802.1TAG

No modification of the repeater mode *rptmode* is allowed if the VLAN tagging mode *vlantagmd* of the pack, to which the specified EPORT belongs to, is set to 802.1TAG.

Error code: `SNVS – Status, Not in Valid State, Modification not allowed`

The rationale for this restriction is to avoid side-effects when changing *rptmode*.

Validation rule: Parameters not supported on GE1 pack

The command is denied for ports on the GE1 pack, if one of the parameters *rcf_htmr* or *rcf_linkdown* is specified in the command.

Error code:

`IDNV – Input, Data Not Valid, Parameter(s) present which are not allowed`

Validation rule: Default VLAN ID is already assigned for this system

The default VLAN ID of a LAN port cannot have the same value as the default VLAN Id of another LAN port in the system or any other instantiated VLAN in the system, except for the value 4094.

Error code:

`IDNC-Input, Data, Not Consistent, Default VLAN ID is already assigned for this System`

System is here to be seen with the granularity of a GE1 circuit pack.

Validation rule: BCMD mode - Default VLAN ID is no allowed member of valid VLAN list for this System

If the system is running in backward-compatible mode (*vlantagmd* = BCMD), the default VLAN ID of a LAN port cannot be included into the valid VLAN list of any LAN port within the system.

Error code:

`IDNC-Input, Data Not Consistent, Default VLAN ID is not an allowed member of valid VLAN list`

System is here to be seen with the granularity of a GE1 circuit pack.

Validation rule: Maximum number of entries in valid VLAN ID list exceeded

If the number of VLAN IDs specified with parameter *vvidls* is greater than 247 the following error code is returned. For calculating the number of VLAN IDs being specified the grouping and ranging operators ’&’ and ’&&’ have to be resolved first.

Error code:

`SSRE – Status, System Resources Exceeded, limit of VLAN Identifiers exceeded`

Validation rule: GE10PL1 Pack specific validation rule: No fix flow control settings if autonegotiation enabled

The system shall reject an attempt to modify the parameter fcmd to the values ASYMTOPARTNER, ASYMTOLOCAL and SYM if the parameter *autoneg* is not modified to the value DISABLE within the same command and the current setting of the parameter *autoneg* = ENABLE.

Error code:

`IDNC – Input, Data Not Consistent, Flow Control settings do not match to existing autonegotiation mode`

Validation rule: GE10PL1 Pack specific validation rule: No auto flow control settings if autonegotiation disabled

The system shall reject an attempt to modify the parameter fcmd to the value AUTO if the parameter *autoneg* is not modified to the value ENABLE within the same command and the current setting of the parameter *autoneg* = DISABLE.

Error code:

`IDNC – Input, Data Not Consistent, Flow Control settings do not match to existing autonegotiation mode`

- “RTRV-EPORT: Retrieve Ethernet port” (p. 3-2358).

ED-EPORT notification

Output format

The **ED-EPORT** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

The **ED-EPORT** notification has the following specific syntax:

ED-EPORT-*modifier:aid::spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the Ethernet port to be operated on.
   Type: AID
   Range: EPortAID as defined in AID structure. The usage of the following values are excluded:
   - *all* in the BayAID definition
   - *all* in the Simple_ShelfAID definition
   - *usall* in the Simple_UnivSlotAID definition
   - # in the Simple_UnivSlotAID definition
   - all in the Simple_EPortAID definition.
2. **modifier**
   This modifier specifies the type of the Ethernet port at the LAN side.
   Type: Alphanumeric value set.
   Range: 1GE representing a 1 GE port on a GE1 pack , 1GEPL representing a 1 GE port on a GE10PL1 pack, 10GEPL representing a 10 GE port on a GE10PL1 pack.

Spec block parameters

1. **autoneg** – Auto Negotiation Mode
   This parameter controls auto-negotiation process to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE or 10GEPL. If the parameter *autoneg* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: ENABLE (default); DISABLE.
2. **cnprole** – Customer/Network Port Role
   This parameter specifies whether the addressed port is used as a customer LAN port or a network LAN port.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *cnprole* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.

Range:

- USTOMER for a customer LAN port
- NETWORK for a network LAN port

Default: CUSTOMER

3. **`dftpri`** – Default User Priority
   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *cnprole* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: HIGH, LOW (default).
4. **`dftvlan`** – Default VLAN Identifier
   This parameter specifies the value of the VLAN identifier which is applied to ingressing frames (tagging) . This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *cnprole* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: 1, 2, 3, … 4092, 4093; UNAVAILABLE (default)
5. **`droppause`** – Drop Incoming Pause Frames
   This parameter controls whether incoming pause frames are dropped (value = ENABLE) or not (value = DISABLE). This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter droppause is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE
   Default: DEFAULT.
6. **`enetpn`** – Ethernet Alarm Severity Assignment Profile Name
   This parameter points to an ASAP profile name of type ENET for the designated AID.
   Type: Alphanumeric string A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length
   Default: DEFAULT
7. **`enettca`** – Ethernet TCA Profile Name
   This parameter specifies the name of the threshold crossing alert (TCA) profile used for Ethernet ports.
   Type: Alphanumeric string
   Range: 1 … 24 characters length
   Default: DEFAULT0

8. **`epmode`** – Ethernet Port Monitoring Mode
   This parameter specifies the monitoring mode of the Ethernet port.
   Type alphanumeric value set
   Range:
   - AUTO for automatic (default)
   - MON for monitored
   - NMON for not monitored.
9. **`eppm`** – Ethernet Port Performance Monitoring
   This parameter specifies whether the performance monitoring is enabled or disabled for this port.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE
10. **`fcmd`** – Flow Control Mode
    This parameter specifies the configuration for the pause operation of this port. If the input parameter modifier = 1GE, then the parameter fcmd is supported only in case that the bridge operates in backward-compatible mode (vlantagmd = BCMD).
    Type: Alphanumeric value set.
    Range:
    - AUTO, for auto-negotiate
    - DISABLE, for pause mode bidirectionally disabled
    - ASYMTOPARTNER, for pause mode having receive disabled, transmit enabled
    - ASYMTOLOCAL, for pause mode having transmit disabled, receive enabled
    - SYM, for pause mode bidirectionally enabled.

    Restrictions: If the parameter *fcmd* is not supported, then the parameter is omitted.
    The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GE.
    The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = ENABLE. The value AUTO is notsupported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = DISABLE.
    The value AUTO is not supported, if the input parameter *modifier* = 10GEPL.

    Possible combinations of the parameters modifier, autoneg, vlantagmd (parameter of the referring circuit pack entity, see RTRV-EQPT for definition) and fcmd are as follows:
    - Input parameter *modifier*=1GE, In-/Output parameter *autoneg* = not supported, In-/Output parameter *vlantagmd* = other than BCMD, In-/Output parameter *fcmd* = AUTO, DISABLE
    - Input parameter *modifier*=1GE, In-/Output parameter *autoneg* = not supported, In-/Output parameter *vlantagmd* = BCMD, In-/Output parameter *fcmd* = not supported

- Input parameter *modifier*=1GEPL, In-/Output parameter *autoneg* = ENABLE, In-/Output parameter *vlantagmd* = not supported, In-/Output parameter *fcmd* = AUTO, DISABLE
- Input parameter *modifier*=1GEPL, In-/Output parameter *autoneg* = DISABLE, In-/Output parameter *fcmd* = DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM

Default:

- AUTO (for *modifier* 1GE or 1GEPL)
- SYM (for *modifier* 10GEPL).

11. **`fsflpbkstat`** – Far Side Facility Loopback Status
This parameter reports the configuration of the far-side facility loopback of this port. A far-side loopback means that the signal on the outgoing port is looped to the incoming port (Tx -> Rx). For GE1 there is only this type of facility loopback. For changing the loopback operation refer to OPR-LPBK of section Transmission and Cross-Connection Handling, Port
Type: Alphanumeric value set.
Range:
    - YES, for enabled loopback
    - NO (default), for disabled loopback.
12. **`rcf_htmr`** – Remote Client Fail Hold Off Timer
The parameter specifies the hold-off time for applying the LPT consequent action to disable the laser at the LAN port. The hold-off timer is only applicable if there is a strict one-to-one relationship between the LAN port in question and its related WAN port.
This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_htmr* is not supported, then the parameter is omitted.
Type: numeric string [ms].
Range: 0 … 2000 ms in 100 ms steps
Default: 0.
13. **`rcf_linkdown`** – Link Pass Through Mode
This parameter controls the consequent action (to switch-off the laser upon receipt of a client signal fail [CSF] indication) to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_linkdown* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: ENABLE.
14. **`rptmode`** – Repeater Mode
This parameter sets the bridge device for this LAN port into the repeater mode (promiscuous mode), valid for a point to point connection between one LAN and one WAN port. Operating in repeater mode imposes some restrictions. See detailed behavior section.
If the input parameter *modifier* = 1GE, then the parameter rptmode is meaningful

only if in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

15. **`servcond`** – Service Condition
This parameter specifies the service condition for this port.
Type alphanumeric value set
Range: INSERVICE (default), OUTOFSERVICE

16. **`stdis`** – Spanning Tree Protocol Disable
This parameter allows to enable or disable the Spanning Tree Protocol for the given port. If the input parameter modifier = 1GE, then this parameter is meaningful only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter stdis is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

    Range:

    - DISABLE, STP is disabled, i.e. the port is not used in the spanning tree protocol
    - ENABLE (default), STP is enabled, i.e. the port is used in the spanning tree protocol.

17. **`stpcost`** – Spanning Tree Path Cost
The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.
If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.
If the parameter *stpcost* is not supported, then the parameter is omitted.
Type: Integer.

Range: 1 to 200000000.
Default: 20000.
The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.

18. **stpp** – Spanning Tree Port Priority
This parameter specifies the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.
Type: Integer.
Range: 0 to 255.
The stepping as recommended by the standard (steps of 16 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction ″0 to 240″ is not done by the NE.
Default: 128.

19. **tcamd** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
   - TR-only. (also known as the implicit reset method)
   - TR-RTR. (also known as the explicit reset method)

   Type: Alphanumeric value set.
Range: TR, TRRTR (default)

20. **vvidls** – Valid VLAN Identifier List
This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&) acc. GR-833-CORE Input Commands and Responses.
The list is packed by the NE and the management systems as good as possible by using ’&’ and ’&&’ .
The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list vvidlsd. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (cnprole = NETWORK).
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *vvidls* is not supported, then the parameter is omitted.
Type: Alphanumeric string and the character ’&’.

Range: Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093. In case the list has no members (empty list) -1 (default).
The length of the list is limited by the usual system limitations like e.g. TL1 line length and some NE internal restrictions as described below. The number of entries in this list is limited to 247 by some NE-internal restrictions. Ranging and grouping by using the operators '&' and '&&' has no impact on the number of entries, it only reduces the length of the list being transported to/from CIT/EMS.
Example 1: *vvidls=-1*. The list has no members (empty list).
Example 2: v*vidls=3&5&40&&45*. This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.
Example 3: *vvidls=1&&4093*. This list has the members 1,2, 3, …, 4092, 4093.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ED-EPORT-1GE:1-1-#-#-1-1::fcmd=DISABLE″
;
```

ED-EQPT (CP): Edit equipment (circuit pack)

The **ED-EQPT** command modifies the provisioning values associated with equipment. Circuit packs must first be provisioned with the **ENT-EQPT** command or via auto provisioning before they can be modified.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-EQPT***:tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of an equipment.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for for circuit pack in any slot
   - LoxcAID ::= UnivSlotAID-loxc for LOXCpack in universal slots.

   The keyword **usall** is not allowed for Simple_UnivSlotAID.
   The keyword **xcall** is not allowed for Simple_XCSlotAID.
   The keyword **ctlall** is not allowed for Simple_CTLSlotAID.
   The keyword **all** is not allowed for Simple_SlotAID.
   PowerAID for power interface: The keyword **piall** is not allowed for PowerAID.
   EciAID for ECI interface The keyword **eciall** is not allowed for EciAID.
   TimingInterfaceAID for TI Interface board The keyword ″tiall″ is not allowed for TimingInterfaceAID.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`dcn_ipad`** – DCN IP address for CLI/SNMP
   DCN IP address for CLI/SNMP management of the card.
   This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255.
   The values 0.0.0.0, 1.1.1.1, 127.0.0.1, and 224.0.0.0 to 255.255.255.255 are excluded.
   Default: Empty string.
2. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-UNPROT of the circuit pack. This parameter is reported for a CpAID , PowerAID, EciAID, TimingInterfaceAID and LoxcAID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.
3. **`eqptprotpn`** – Protected Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT for the equipment.
   Option: This parameter is only reported for a CpAID, LoxcAID or PowerAID.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (“-”) is allowed in the name additionally.
   Default: DEFAULT
4. **`es64ucap`** – ES64U capacity
   Switch capacity of the ES64U pack.
   This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.
   Type: Value set.
   Range:
   - 0 – ES64U in suspended state, initial value after ES64U CP creation.
   - 20 – ES64U active or member of equipment protection group, capacity 20 Gbit/s.

   Default: 0.
5. **`vlantagmd`** – VLAN Tagging Mode
   VLAN tagging mode of the circuit pack. This parameter is relevant only for circuit packs of type GE1 (that means, *nvmname* = GE1).
   Type: value set.
   Range:
   - BCMD (default), for the backward compatible mode
   - 802.1tag, for the VLAN tag based mode according to IEEE802.1Q.

   Default: BCMD

6. **`loswcap`** – LOXC switch capacity
   Switch capacity of the LOXC pack. This parameter is relevant only for circuit packs of type LOXC, thus the parameter shall be omitted for other packs.
   Type: Value set.
   Range:
   If *nvmname*==LOXC:
   - 0 (default): LOXC in suspended state, initial value after LOXC CP creation
   - 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s

   If *nvmname* = LOXC40G2S or LOXC40G3S:
   - 0: LOXC in suspended state, initial value after LOXC CP creation
   - 5: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s
   - 40: LOXC active or member of equipment protection group, switch capacity 40 Gbit/s
7. **`tmuxcap`** – TransMUX capacity
   Switch capacity of the TransMUX pack.
   This parameter is relevant only for circuit packs of type TransMUX (that means, *nvmname* = TransMUX), thus the parameter shall be omitted for other packs.
   Type: Value set.
   Range:
   - 0: TransMUX in suspended state, initial value after TransMUX CP creation.
   - 2G5: TransMUX active or member of equipment protection group, capacity 2.5 Gbit/s

   Default: 0
8. **`istd`** – Interface Standard of the Circuit Pack
   Interface standard supported by the circuit pack. This parameter is supported on GE10PL1 and ES64U circuit packs. On the circuit packs, the parameter *istd* defines the interface standard of the virtual concatenation groups.
   Option: If the parameter *istd* is not supported, then the parameter is omitted.
   Type: Value set.
   Range:
   - for GE10PL1: SDH or SONET
   - for ES64U: SONET or UNDEFINED (ES64U not used, *es64ucap* = 0)

   Default:
   - for GE10PL1: The default is derived from the system parameter *istddflt*.
   - for ES64U: UNDEFINED.

Output format

If the **ED-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command modifies the value of *eqptpn*, *eqptprotpn* for a circuit pack entity as indicated by the *spec_block* parameter.

The update is reported by means of an **ED-EQPT** notification for circuit pack.

Change of VLAN tagging mode: changing *vlantagmd* to 802.1TAG - update affected entities

If *nvmname* is GE1 a change of parameter vlantagmd from BCMD to 802.1TAG has the following side effects:

- The command shall create one instance of entity virtual switch. This are notified by a ENT-VRTSW notification
- The attribute *fcmd* of all related EPORTs are set to DISABLED.
- The attribute *rptmode* of all related EPORTs are set to DISABLED.
- All other attributes of related EPORTs and VCGs shall remain unchanged.

Change of VLAN tagging mode: changing vlantagmd to BCMD - update affected entities

If *nvmname* is GE1 a change of parameter vlantagmd from 802.1TAG to BCMD has the following side effects: The command shall delete the instance of entity virtual switch. This are notified by a DLT-VRTSW notification.

The following attributes of the related EPORTs are set to their default values:

- *fcmd*, *stdis*, *stpp*, *stpcost*.

The following attributes of the related VCGs are set to their default values:

- *cnprole*, *stdis*, *stpp*, *stpcost*.

All other attributes of related EPORTs and VCGs shall remain unchanged.

Change of LOXC switch capacity: changing of *loswcap*

The paramter *loswcap* can be set with the ED-EQPT(cp) command. Changing this parameter to a different value than 0 is only allowed if there is no active LOXC pack in the system.

The term active LOXC pack refers to:

- either an unprotected pack with loswcap unequal to 0,
- or an active pack in an LOXC equipment protection group.

Standby LOXC packs are not considered as active LOXC pack.

Change of LOXC switch capacity: update of LO tributary Standard

If the parameter *loswcap* is set to a different value than 0, then the parameter *lostd* is set to the current value of the parameter *istddflt*. If the parameter *loswcap* is set to 0, then the parameter *lostd* is set to UNDEFINED.

Change of Interface Standard - behavior due to interface standard change on GE10PL1 pack

A change of *istd* is not dependent from pending alarms or active performance monitoring for the individual tributaries. A change of *istd* changes the interface standard of all existing VCG ports on the pack.

VCG ports are set to default values:

- *enettca*, *htmr*, *inputsig*, *lcasmd*, *plcrthr, plctthr, tcamd*, *unequiposig*, *vcat*, *vmode*, *vpm*, *wtr*.

Moreover the parameter *istd* of all existing VCG ports are set to the value being provided in the ED-EQPT(cp) command.

The parameter value changes at the VCG ports are notified via ED-VCG notifications.

Change of Interface Standard - Interface standard change on GE10PL1 pack, update affected entities

A change of istd shall set the following parameters of all VCG tributaries on the pack to their default values:

- *brstintvl*, *brstthr*, *degthr*, *dexcthr*, *hptimais*, *hptimmoninmbs*, *outmbs*, *pmhpfeses*, *pmhpneses*, *ptca*, *ptrcrfmt*, *ptrcwfmt*, *tmonmd*, *trc*, *sdsfmode*, *tcamd*.

The parameter value changes at the VCG tributaries are notified via ED-VCGTRIB notifications, using the modifier for the new interface standard.

Change of TransMUX capacity

Update affected entities – TransMUX capacity unequal 0

The parameter *tmuxcap* can be set with the ED-EQPT(cp) command. Changing this parameter to a different value than 0 shall create following entities:

1. 8 instances of port TMAT3 is created. This are reported by means of ENT-TMAT3 notification for port.
2. 48 instances of port TMST3 is created. This are reported by means of ENT-TMST3 notification for port.
3. 1 STS1 path termination is created for each of the previously created TMST3 ports. This are reported by means of ENT-PTF-TMSSTS1 notifications.

4. 1 STS1 path termination is created for each of the previously created TMAT3 ports. This are reported by means of ENT-PTF-TMASTS1 notifications.
5. 28 DS1 NIMs are created for each of the previously created TMAT3 ports. This are reported by means of ENT-LONIM-DS1 notifications.
6. 28 VT1.5 PTFs are created for each of the previously created TMST3 ports. This are reported by means of ENT-LOPTF-TMSVT notifications.

Update affected entities – TransMUX capacity equal 0

The parameter *tmuxcap* can be set with the **`ED-EQPT(cp)`** command. Changing this parameter to 0 shall delete following entities:

1. 28 VT1.5 PTFs are deleted for each of the existing TMST3 ports. This are reported by means of **`DLT-LOPTF`** notifications.
2. 28 DS1 NIMs are deleted for each of the existing TMAT3 ports. This are reported by means of **`DLT-LONIM`** notifications.
3. 1 STS1 path termination is deleted for each of the existing TMAT3 ports. This are reported by means of **`DLT-PTF`** notifications.
4. 1 STS1 path termination is deleted for each of the existing TMST3 ports. This are reported by means of **`DLT-PTF`** notifications.
5. 48 instances of port TMAT3 is deleted This are reported by means of **`DLT-TMAT3`** notification for port.
6. 48 instances of port TMST3 is deleted This are reported by means of **`DLT-TMST3`** notification for port.

Group Notification for VT1.5 PTFs and DS1 NIMs

For efficiency reasons the notifications for VT1.5 PTFs and DS1 NIMs are sent out as a single notification (so-called group notification) using a range over the aid.

That means:

- the Simple_TMuxSLONumAID field in the TMuxSLONumAID is set to: 1&&-28
- the Simple_DS1NumAID field in the DS1NumAID is set to: 1&&-28

Example:

The AID field in a group notification for a tributaries related to synchronous and asynchronous adjunct ports of a TransMUX card in slot 1 looks like:

- DS1 NIM: 1-1-#-#-1-tma1-1-1&&-28
- VT1.5 PTF: 1-1-#-#-1-tms1-1-1&&-28

Implicit disabling of PM Monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. Stop PM counting
2. All current bins related to the PM monitor is deleted
3. All history bins related to the PM monitor is deleted

The term PM monitor has the same semantics as the term PM package. The number of PM monitors is determined by means of the number of ’pm enable attributes’.

PM monitors can be disabled explicitly by means of the ’pm enable’ attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts the disabling of a PM monitor shall have the following impacts:

- The system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Change of ES64U capacity

Update affected entities - ES64U capacity.

No transmission entities shall be created or deleted by changing the ES64U capacity.

Example input/output

```
ED-EQPT:UNITE-NE:1-1-#-#-1-cp:123456:::eqptpn=NOALARM;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ED-EQPT`** command.

Validation rule: Validate ASAP profile

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: Check whether VLAN lists are empty

If *nvmname* is GE1 and the parameter *vlantagmd* is set to BCMD it is checked whether for the specified slot:

- the static VLAN lists (vvidls) of all EPORT entities are empty
- the static VLAN lists (vvidls) of all VCG entities are empty

- the default VLAN Id (dftvlan) of all EPORT entities is set to unavailable
- the default VLAN Id (dftvlan) of all VCG entities is set to unavailable.

Error code:

`SNVS – Status, Not in Valid State, static VLAN configuration not cleared`

Validation rule: Check whether LOXC circuit pack is member of an equipment protection group

If an attempt is made to change *loswcap* to 0, the circuit pack must not be member of an equipment protection group.

Error code:

`SNVS – Status, Not in Valid State, circuit pack is member of an equipment protection group`

Validation rule: Check whether LOXC circuit pack is in use

If an attempt is made to change *loswcap* to 0 while LO cross-connections or conversion cross-connections or LO substructure exist at one or more HO tributaries in the system, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Check number of active LOXC packs

Not more than 1 (2 in case of equipment protection groups) LOXC packs with *loswcap* = 15 may exist in the system.

Error code:

`SSRE – Status, System Resources Exceeded, allowed number of active LOXC packs exceeded`

Validation rule: LO switch capacity setting only for LOXC in worker slots

If an attempt is made, to change *loswcap* for an LOXC pack which is not in a dedicated equipment protection worker slot, then the command is denied.

Error code:

`IDNV – Input, Data Not Valid, invalid LO switch capacity for LOXC in this slot`

For the LOXC equipment protection dedicated pairs of worker and protection slots are defined. Only for the worker slots *loswcap* can be set away from 0. During creation of the protection group, *loswcap* of the protection LOXC is set autonomously.

Validation rule: LO switch capacity allowed for LOXC type

If an attempt is made to change *loswcap* to a value which is not supported by the LOXC type, then the command is denied.

Error code:

`IDNV – Input, Data Not Valid, invalid LO switch capacity for the LOXC type`

Validation rule: LO switch capacity allowed for both LOXC in an equipment protection group

If an attempt is made to change *loswcap* to a value which is not supported by both LOXC in the LOXC equipment protection group, then the command is denied.

Error code:

`IDNV – Input, Data Not Valid, invalid LO switch capacity for the LOXC type`

Validation rule: Only decreasing of LO switch capacity to 0 G allowed

If an attempt is made to decrease *loswcap* to another value than 0, then the command is denied.

Error code:

`IDNV – Input, Data Not Valid, invalid change of LO switch capacity`

Validation rule: No LO switch capacity setting without XC

If an attempt is made to change *loswcap* away from 0 for a LOXC pack and no XC is provisioned, then the command is denied.

Error code:

`SROF – Status, Requested Operation Failed,, invalid LOXC switch capacity without XC`

Validation rule: Check number of active TransMUX packs

Not more than 6 worker TransMUX packs with *tmuxcap* > 0 may exist in the system.

Error code:

`SSRE – Status, System Resources Exceeded, allowed number of active TransMUX packs exceeded`

Validation rule: Check whether TransMUX circuit pack is member of an equipment protection group

If an attempt is made to change *tmuxcap* to 0, the circuit pack must not be member of an equipment protection group.

Error code:

`SNVS – Status, Not in Valid State, circuit pack is member of an equipment protection group`

Validation rule: Check whether TransMUX circuit pack is in use

If an attempt is made to change *tmuxcap* to 0 while HO or LO cross connections exist at the TransMUX, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, HO or LO cross-connections still exist`

Validation rule: TransMUX capacity setting not for TransMUX in protection functionality

If an attempt is made, to change *tmuxcap* for a TransMUX pack which is the protecting pack in a equipment protection, then the command is denied.

The slots, where the change of *tmuxcap* is allowed, are defined in SRD_Configuration.

Error code:

`IDNV – Input, Data Not Valid, invalid TransMUX switch capacity for TransMUX in this slot`

Validation rule: No TransMUX capacity setting without XC

If an attempt is made, to change *tmuxcap* away from 0 for a TransMUX pack and no XC is provisioned, then the command is denied.

Error code:

`SROF – Status, Requested Operation Failed,, invalid TransMUX switch capacity without XC`

Validation rule: No ES64U capacity setting without XC

If an attempt is made, to change *es64ucap* away from 0 for a ES64U pack and no XC is provisioned, then the command shall be denied.

Error code:

`SROF – Status, Requested Operation Failed, invalid ES64U switch capacity without XC`

Validation rule: Check number of active ES64U packs

Not more than one ES64U packs with *es64ucap* > 0 may exist in the system.

Error code:

`SSRE – Status, System Resources Exceeded, allowed number of active ES64U packs exceeded`

Validation rule: Check whether ES64U circuit pack is member of an equipment protection group

If an attempt is made to change *es64ucap* to 0, the circuit pack must not be member of an equipment protection group.

Error code:

`SNVS – Status, Not in Valid State, circuit pack is member of an equipment protection group`

Validation rule: Check whether ES64U circuit pack is in use

If an attempt is made to change *es64ucap* to 0 while HO cross connections, test access sessions or loopbacks exist at the ES64U , then the command shall be denied.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check whether DCC Channel available for ES64U circuit pack

If an attempt is made to change *es64ucap* to 20 while no more DDC-M channel is available in the NE , then the command shall be denied.

Error code:

`SSRE – Status, System Resources Exceeded,  no free DDC-M channel available for ES64U`

Validation rule: ES64U capacity setting not for ES64U in protection functionality

If an attempt is made, to change *es64ucap* away from 20 for a ES64U pack which is the protecting pack in a equipment protection, then the command shall be denied.

Error code:

`IDNV – Input, Data Not Valid, invalid ES64U switch capacity for ES64U in this slot`

Validation rule: Auto-encapsulation must be enabled

If an attempt is made to change *es64ucap* to 20 while the auto-encapsulation functionality *autoencap* is not enabled, then the command shall be denied.

Error code:

`SNVS – Status, Not in Valid State,  Auto-Encapsulation must be switched on`

Validation rule: dcn_ipad must be configured

If an attempt is made to change *es64ucap* to 20 while the configured *dcn_ipad* address is not configured, then the command shall be denied.

Error code:

`SNVS – Status, Not in Valid State,  DCN IP Address is not configured`

Validation rule: dcn_ipad must be unique in the system

If an attempt is made to change *es64ucap* to 20 while the configured *dcn_ipad* address is already used in the system, then the command shall be denied.

Error code: `IDNV – Input, Data Not Valid, IP Address already used`

Validation rule: ESdcn_ipad setting not for card in protection functionality

If an attempt is made, to change *dcn_ipad* for a pack which is the protecting pack in a equipment protection, then the command shall be denied.

Error code: `SNVS – Status, Not in Valid State, Pack is protecting pack`

Validation rule: No interface standard change on GE10PL1 pack with existing cross-connection

Check that the interface standard is not changed on a GE10PL1 pack if there is a cross-connection existing at a VCG tributary of any VCG port on the pack.

Error code: `IDNV – Input, Data Not Valid, Cross-connections still existing`

Validation rule: No interface standard change on GE10PL1 pack with existing loopbacks

Check that the interface standard is not changed on a GE10PL1 pack if there is a cross-connection loopback existing at a VCG tributary of any VCG port on the pack.

Error code: `IDNV – Input, Data Not Valid, a loopback is existing`

Validation rule: No ONNS for interface standard change on GE10PL1 pack

Check that the interface standard is not changed on a GE10PL1 pack if ONNS functionality is available.

This means for any VCG on the pack that:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: No interface standard change on GE10PL1 pack with existing test access session

Check that the interface standard is not changed on a GE10PL1 pack if there is a test access session existing at a VCG tributary of any VCG port on the pack.

Error code:
`SNVS – Status, Not in Valid State, a test access session exists`

ED-EQPT (CP) notification

Output format

Syntax: **`ED-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The AID of an equipment.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for circuit pack in any slot
   - LoxcAID::=UnivSlotAID-loxc for LOXC pack in universal slots

   The keyword **`usall`** is not allowed for Simple_UnivSlotAID.
   The keyword **`xcall`** is not allowed for Simple_XCSlotAID.
   The keyword **`ctlall`** is not allowed for Simple_CTLSlotAID.
   The keyword **`all`** is not allowed for Simple_SlotAID.
   PowerAID for power interface: The keyword **`piall`** is not allowed for PowerAID.
   EciAID for ECI interface The keyword **`eciall`** is not allowed for EciAID.
   TimingInterfaceAID for TI Interface board The keyword ″tiall″ is not allowed for TimingInterfaceAID.

Spec block parameters

1. **`dcn_ipad`** – DCN IP address for CLI/SNMP
   DCN IP address for CLI/SNMP management of the card.
   This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255.
   The values 0.0.0.0, 1.1.1.1, 127.0.0.1, and 224.0.0.0 to 255.255.255.255 are excluded.
   Default: Empty string.
2. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-UNPROT of the circuit pack. This parameter is reported for a CpAID, PowerAID, EciAID, TimingInterfaceAID and LoxcAID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.

3. **`eqptprotpn`** – Protected Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT for the equipment.
   Option: This parameter is only reported for a CpAID, LoxcAID or PowerAID.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen ("-") is allowed in the name additionally.
   Default: DEFAULT
4. **`es64ucap`** – ES64U capacity
   Switch capacity of the ES64U pack.
   This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.
   Type: Value set.
   Range:
   - 0 – ES64U in suspended state, initial value after ES64U CP creation.
   - 20 – ES64U active or member of equipment protection group, capacity 20 Gbit/s.

   Default: 0.
5. **`vlantagmd`** – VLAN Tagging Mode
   VLAN tagging mode of the circuit pack. This parameter is relevant only for circuit packs of type GE1 (i.e. nvmname = GE1).
   Type: value set.
   Range:
   - BCMD (default), for the backward compatible mode
   - 802.1tag, for the VLAN tag based mode according to IEEE802.1Q.
6. **`loswcap`** – LOXC switch capacity
   Switch capacity of the LOXC pack. This parameter is relevant only for circuit packs of type LOXC, thus the parameter shall be omitted for other packs.
   Type: value set.
   Range, if *nvmname* = LOXC
   - 0: LOXC in suspended state, initial value after LOXC CP creation
   - 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s.

   Range, if *nvmname* = LOXC40G2S or LOXC40G3S:
   - 0: LOXC in suspended state, initial value after LOXC CP creation
   - 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s
   - 40: LOXC active or member of equipment protection group, switch capacity 40 Gbit/s

   Default: 0.

7. **`lostd`** – LO tributary standard
   LO tributary standard supported by the LOXC pack. This parameter is relevant only for circuit packs of type LOXC (i.e. *nvmname* = LOXC).
   Type: value set.
   Range:
   - SDH: LOXC supports SDH LO tributaries (VC3, VC12)
   - SONET: LOXC supports SONET LO tributaries (VT1.5)
   - UNDEFINED (default): no LO tributaries (loswcap = 0).

   LO VC3 tributaries provided with lostd=SDH support LO cross-connections and AU3/AU4 conversion cross-connections.
8. **`tmuxcap`** – TransMUX capacity
   Switch capacity of the TransMUX pack.
   This parameter is relevant only for circuit packs of type TransMUX (that means, *nvmname* = TransMUX), thus the parameter shall be omitted for other packs.
   Type: Value set.
   Range:
   - 0: TransMUX in suspended state, initial value after TransMUX CP creation.
   - 2G5: TransMUX active or member of equipment protection group, capacity 2.5 Gbit/s

   Default: 0
9. **`istd`** – Interface Standard of the Circuit Pack
   Interface standard supported by the circuit pack. This parameter is supported on GE10PL1 and ES64U circuit packs. On the circuit packs, the parameter *istd* defines the interface standard of the virtual concatenation groups.
   Option: If the parameter *istd* is not supported, then the parameter is omitted.
   Type: Value set.
   Range:
   - for GE10PL1: SDH or SONET
   - for ES64U: SONET or UNDEFINED (ES64U not used, *es64ucap* = 0)

   Default:
   - for GE10PL1: The default is derived from the system parameter *istddflt*.
   - for ES64U: UNDEFINED.

Example output

```
ED-EQPT:UNITE-NE:1-1-#-#-1-cp:123456:::eqptpn=NOALARM;

   UNITE-NE 00-11-14 08:00:00

;
```

ED-EQPT (shelf): Edit equipment (shelf)

The **ED-EQPT** command modifies the provisioning values associated with the shelf.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no.

Input format

Command syntax: **ED-EQPT**:*tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of the shelf/subrack.
   Type: AID
   Range: ShelfAID. The keyword **all** is allowed on bay AID and shelf AID level.
   Default: 1-1.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **eqptpn** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-UNPROT of the shelf level.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
2. **eqptprotpn** – Protected Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT of the shelf level.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
3. **ssoride** – SS Bits Overrides
   This parameter determines the value to be inserted into the SS bits of the pointer of every AU-N or STS-N signal in the output direction of every SDH or SONET port in the shelf.

The terms *override*, *enable* and *disable* are used since:

- the default value of the SS bits in 00
- the parameter allows you to diverge from that default.

Type: Alphanumeric value set.
Range: ENABLE insert value 00 into SS bits, DISABLE insert value 10 into SS bits.
Default: DISABLE.

Output format

If the **ED-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The following attribute of the shelf entity is updated due to the command **ED-EQPT**:

- *eqptpn* as specified in the command input
- *eqptprotpn* as specified in the command input.

The modification is reported by means of an **ED-EQPT** notification for the shelf.

Example input/output

```
ED-EQPT:UNITE-NE:1-1:123456:::eqptpn=Nuernberg-1;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to RTRV-EQPT (shelf) command.

Validation rule: Check for ASAP profile existence

When no ASAP profile with the name specified by *eqptpn* or *eqptprotpn* does exist the following error message is returned.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

ED-EQPT (slot): Edit equipment (slot)

The **`ED-EQPT`** command modifies the provisioning values associated with slot.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax: **`ED-EQPT`***:tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **`aid`** – Access Identifier
   The AID of a slot.
   Type: AID
   Range:
   - SlotAID
   - UnivSlotAID
   - XCSlotAID
   - CTLSlotAID.

   The keyword **`usall`** is allowed for Simple_UnivSlotAID.
   The keyword **`xcall`** is allowed for Simple_XCSlotAID.
   The keyword **`ctlall`** is allowed for Simple_CTLSlotAID.
   The keyword **`all`** is allowed for Simple_SlotAID.
   The keyword **`all`** is not allowed on bay/shelf level.
3. **`ctag`** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT on slot level
   Type: Alphanumeric string
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
   Note: *eqptpn* is used on system, shelf and circuit pack level for a profile of type EQUIP-UNPROT.
2. **`nvmname`** – Circuit Pack Name
   This parameter specifies the name of the provisioned circuit pack of the slot. If no circuit pack is provisioned the default value is reported.
   Type: value set.
   Range: 12 character.
   Default: UNDEFINED.
3. **`nvmqual`** – Circuit Pack Qualifier
   This parameter specifies the qualifier of the provisioned circuit pack of the slot. If no circuit pack is provisioned the value UNDEF is reported.
   Type: value set.
   Range: 7 characters.
   The allowed values are:
   - UNDEF (default)
   - EXTD
   - all values as defined in SRD_ConfigurationManagement

   Note: The TL1-representation of the functional qualifier follows the following rules:
   - alphanumeric characters or the special character '-' only
   - special characters like '/' and '.' to be omitted.

Output format

If the **`ED-EQPT`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Generic behavior

The command modifies the provisioned circuit pack for a specified slot. The spec block parameters of the slot entity as specified in the command input is updated due to that operation.

The modification is reported by means of ED-EQPT notification for the slot.

OP10D reprovisioning

Impact on sockets when changing OP10D/PAR2 to an OP10D/PAR2XFP

If the command is used to change the provisioned circuit pack in the slot from an OP10D/PAR2 to an OP10D/PAR2XFP, then the optical module type for provisioned sockets on the pack is set to OMX10/10KM1. Unprovisioned sockets shall remain unprovisioned For each socket on the pack, an ED-EQPT notification without spec block parameters is sent.

Impact on sockets when changing OP10D/PAR2XFP to an OP10D/PAR2

If the command is used to change the provisioned circuit pack in the slot from an OP10D/PAR2XFP to an OP10D/PAR2, then the optical module type for provisioned sockets on the pack is set to OM10/1.5IR1. Unprovisioned sockets shall remain unprovisioned.

For each socket on the pack an ED-EQPT notification without spec block parameters is sent. The setting of the provisioned optical module type to a default module avoids the situation that an optical module is provisioned, which is not allowed for the new circuit pack type. This may lead to a module mismatch, which has to be corrected manually. The empty ED-EQPT notification for the sockets indicates the change of the socket type. With the change of the socket type all previous inventory parameter values for the sockets become invalid.

Example input/output

```
ED-EQPT:UNITE-NE:1-1-#-#-1:123456:::nvmname=OP10,nvmqual=1.5LR1;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ED-EQPT** command.

Validation rule: Check whether CP is acceptable

Check of the circuit pack type which is allowed for the slot.

Consistency is checked at two levels:

- between *actlname*/*actlqual* with *nvmname*/*nvmqual* at system level
- between *actlname* with *nvmname* at slot level.

Error code:

`ENRE – Equipage, Not Recognized Equipage, unrecognized CP for this slot`

Validation rule: Check whether system is maintenance condition

Preprovisioning is not allowed, when the system in maintenance condition (see “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400)).

Error code:

`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: Check for ASAP profile existence

When no ASAP profile with the name specified by *eqptpn* exists the following error is returned.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: Check exchangeability rules for optical packs

When the currently provisioned circuit pack is replaced by a new one by specifying the parameters *nvmname* and *nvmqual* the following exchangeability rules are checked whether all are fulfilled:

- the currently provisioned CP as well as the new one is an optical pack
- the holder state of the addressed slot is empty OR a pack with the specified *nvmname* and *nvmqual* is already plugged in
- the number of ports of both CPs is identical
- the transmission capacity of both CPs is identical.
- the current port configuration concerning forward error correction is supported by the new CP.

Error code:

`ENRE – Equipage, Not Recognized Equipage, unrecognized CP for this slot`

Validation rule: Check exchangeability rules for electrical packs

When the currently provisioned circuit pack is replaced by a new one by specifying the parameters nvmname and nvmqual the following exchangeability rules are checked whether all are fulfilled:

- the currently provisioned CP as well as the new one is an electrical pack
- the holder state of the addressed slot is empty OR a pack with the specified nvmname and nvmqual is already plugged in.
- the number of ports of both CPs is identical
- the transmission capacity of both CPs is identical.

Error code:

`ENRE – Equipage, Not Recognized Equipage, unrecognized CP for this slot`

Validation rule: Check exchangeability rules for XC packs

When the currently provisioned circuit pack is replaced by a new one by specifying the parameters nvmname and nvmqual the following exchangeability rules are checked whether all are fulfilled:

- the currently provisioned CP as well as the new one is a cross-connect pack AND
- the holder state of the addressed slot is empty OR a pack with the specified *nvmname* and *nvmqual* is already plugged in.

Error code:

`ENRE – Equipage, Not Recognized Equipage, unrecognized CP for this slot`

Validation rule: Check exchangeability rules for LOXC packs

When the currently provisioned circuit pack is replaced by a new one by specifying the parameters nvmname and nvmqual the following exchangeability rules are checked whether all are fulfilled:

- the currently provisioned CP as well as the new one is an LOXC pack AND
- the holder state of the addressed slot is empty OR a pack with the specified *nvmname* and *nvmqual* is already plugged in.

Error code:

`ENRE – Equipage, Not Recognized Equipage, unrecognized CP for this slot`

ED-EQPT (slot) notification

Output format

Syntax: **`ED-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Description: The AID of a slot.
   Type: AID
   Range: SlotAID
   The keyword **`usall`** is not allowed for Simple_UnivSlotAID.
   The keyword **`xcall`** is not allowed for Simple_XCSlotAID.
   The keyword **`ctlall`** is not allowed for Simple_CTLSlotAID.
   The keyword **`all`** is not allowed for Simple_SlotAID, Simple_UnivSlotAID, Simple_XCSlotAID, Simple_CTLSlotAID.
   The keyword **`all`** is not allowed on bay/shelf level.

Spec block parameters

1. **`actlname`** – Acceptable Circuit Pack Name
   This parameter is reported by itself The line is repeated for all groups of acceptable circuit packs in the slot. This list specifies the groups of circuit packs which can be provisioned for that slot. The detailed information about the groups can be requested via RTRV-ACTLCP.
   Type: value set.
   Range: 12 character.
2. **`nvmname`** – Circuit Pack Name
   This parameter specifies the name of the provisioned circuit pack of the slot. If no circuit pack is provisioned the default value is reported.
   Type: value set.
   Range: 12 character.
   Default: UNDEFINED.
3. **`nvmqual`** – Circuit Pack Qualifier
   This parameter specifies the qualifier of the provisioned circuit pack of the slot. If no circuit pack is provisioned the value UNDEF is reported.
   Type: value set.
   Range: 7 characters.

   The allowed values are:

   - UNDEF (default)
   - EXTD
   - all values as defined in SRD_ConfigurationManagement

Note: The TL1-representation of the functional qualifier follows the following rules:

- alphanumeric characters or the special character ’-’ only
- special characters like ’/’ and ’.’ to be omitted.

4. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT on slot level
   Type: Alphanumeric string
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
   Note: *eqptpn* is used on system, shelf and circuit pack level for a profile of type EQUIP-UNPROT.
5. **`name`** – Circuit Pack Name
   Circuit Pack Name as stored in the EEPROM of the replaceable unit.
   Type: value set.
   Range: up to 12 characters.
   Default: empty string ″″
   The default is reported on CP plug-out or when the EEPROM is not readable.
   Note: In TL1 output direction the quotes have to escaped \″\″.
6. **`qual`** – Circuit Pack Qualifier
   Circuit Pack Qualifier as stored in the EEPROM of the replaceable unit.
   Type: value set.
   Range: up to 7 characters.
   Default: empty string ″″
   The default is reported on CP plug-out or when the EEPROM is not readable.
   Note: In TL1 output direction the quotes have to escaped \″\″.
7. **`app`** – Apparatus Code
   Apparatus Code as stored in the EEPROM of the replaceable unit.
   Type: Alphanumeric string.
   Range: up to 9 characters.
   Default: empty string ″″
   The default is reported on CP plug-out or when the EEPROM is not readable.
   Note: In TL1 output direction the quotes have to escaped \″\″.
8. **`ssn`** – Series Number
   Series Number as stored in the EEPROM of the replaceable unit.
   Type: value set.
   Range: up to 6 characters.
   Default: empty string ″″
   The default is reported on CP plug-out or when the EEPROM is not readable.
   Note: In TL1 output direction the quotes have to escaped \″\″.
   Note: A dash (-) is used instead of a colon (:) for the series number in TL1.

9. **`clei`** – Common Language Equipment
   Common Language Equipment as stored in the EEPROM of the replaceable unit.
   Type: value set.
   Range: 10 characters.
   Default: empty string ″″
   The default is reported on CP plug-out or when the EEPROM is not readable.
   Note: In TL1 output direction the quotes have to escaped \″\″.
10. **`eci`** – Equipment Catalog Item
    Equipment Catalog Item as stored in the EEPROM of the replaceable unit.
    Type: value set.
    Range: 6 digits.
    Default: empty string ″″
    The default is reported on CP plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \″\″.
11. **`sln`** – Serial Number
    Serial number as stored in the EEPROM on the circuit pack to identify the replaceable unit and indicate the date and place of manufacture.
    Type: Alphanumeric string.
    Range: 12 characters.
    Default: empty string ″″
    The default is reported on CP plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \″\″.

Example output

The following examples shows the case after pre-provisioning of slot 1 for an OP2G5/13SR4 pack:

```
ED-EQPT:UNITE-NE:1-1-#-#-1:123456:::nvmname=OP2G5,nvmqual=13SR4;

   UNITE-NE 00-11-14 08:00:00

   ″TIME=08-00-12,DATE=00-11-14:ED-EQPT:1-1-#-#-
      1::name=OP2G5,qual=13SR4,app=KFA12,ssn=1-
      1,clei=WMTBJDGAAA,eci=276912,sln=123456789012″
;
```

The following examples shows a case after plug-out of the OP2G5/13SR4 pack from slot 1:

```
   UNITE-NE 00-11-14 08:00:31
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-14:ED-EQPT:1-1-#-#-
      1::name=\″\″,qual=\″\″,app=\″\″,ssn=\″\″,clei=\″\″,eci=\″\″,sln=\″\″″
;
```

The following examples shows the case after auto-provisioning of an OP40 into slot 4 and the effect on slot 1:

```
   UNITE-NE 00-11-14 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-14:ED-EQPT:1-1-#-#-1::nvmname=OP40,nvmqual=EXTD″
   ″TIME=08-00-12,DATE=00-11-14:ED-EQPT:1-1-#-#-1::actlname=\″\″″
;
```

ED-EQPT (socket): Edit equipment

The **ED-EQPT** command shall modify the provisioning values associated with socket.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no.

Input format

Command syntax: **ED-EQPT***:tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keyword *usall* or *all* is allowed for Simple_UnivSlotAID. The keyword *scall* is allowed for Simple_SocketAID. The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **eqptpn** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT on socket level.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen ("-") is allowed in the name additionally.
   Default: DEFAULT.
2. **nvmname** – Provisioned Module Name
   This parameter specifies the name of the provisioned module of the socket. If no module is provisioned the default value is reported.
   Type: value set.
   Range: 12 character.
   Default: UNDEFINED.

3. **nvmqual** – Provisioned Module Qualifier
This parameter specifies the qualifier of the provisioned module of the slot. If no module is provisioned the default value is reported..
Type: value set.
Range: 7 characters.
Default: UNDEF.
Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:
- alphanumeric characters or the special character '-' only
- special characters like '/' and '.' to be omitted.

Output format

If the **ED-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the provisioned module for a specified socket. The spec block operation. The modification is reported by means of ED-EQPT notification for the slot.

Example input/output

This example shows an ED-EQPT command which reprovisions the socket and assigns a new ASAP:

```
ED-EQPT:UNITE-NE:1-1-#-#-5-sc2:123456:::nvmname=OM2G5,nvmqual=15LR1,eqptpn=PROFILE1;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ED-EQPT** command.

Validation rule: Check whether system is in maintenance condition

Preprovisioning is not allowed, when the systemis in maintenance condition. (See "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).)

Error code:
`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: Check for ASAP profile existence

When no ASAP profile with the name specified by *eqptpn* exists the following error is returned.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: Socket must already be provisioned

If the *nvmname* of the pack the socket belongs to is **not equal to** GE10PL1 the following rule is applicable:

When re-provisioning a module, i.e. changing *nvmname*/*nvmqual*, it is checked whether the socket is already provisioned (i.e. *nvmname*/*nvmqual* is different from UNDEFINED/UNDEF).

Error code: `SNVS – Status, Not in Valid State, socket is not provisioned`

Validation rule: Exchangeability I: Equipage status and inventory data of module must be accessible

If the socket is already provisioned (i.e. *nvmname*/*nvmqual* is different from UNDEFINED/UNDEF) but the equipage status or inventory data of the module is not accessible (e.g. due to the parent pack being in recovery) re-provisioning of the socket is not allowed.

Error code: `SNVS – Status, Not in Valid State, unknown module equipage`

Validation rule: Exchangeability II: Invalid module plugged in

If

- the socket is already provisioned (i.e. *nvmname*/*nvmqual* is different from UNDEFINED/UNDEF)
- the socket is neither empty nor equipped with the new type of module being specified by *nvmname*/*nvmqual*

then re-provisioning of the socket is not allowed.

Error code:
`SNVS – Status, Not in Valid State, the module is not plugged out`

Validation rule: Exchangeability III: Invalid module plugged in

If

- the socket is already provisioned (i.e. *nvmname*/*nvmqual* is different from UNDEFINED/UNDEF),
- the socket is not empty
- the socket is equipped with the new type of module being specified by *nvmname*/*nvmqual*
- the new type of module being specified by *nvmname*/*nvmqual* is not in the list of acceptable modules (given by parameters *actlname*, *actlqual* of RTRV-EQPT(socket))

then re-provisioning of the socket is not allowed.

Error code:

`ENRE – Equipage, Not Recognized Equipage, unrecognized module for this socket`

GR-199-CORE

ED-EQPT (socket) notification

Output format

Syntax: **`ED-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keyword *usall* or *all* is allowed for Simple_UnivSlotAID. The keyword *scall* is allowed for Simple_SocketAID. The keyword **`all`** is not allowed on bay/shelf level.

Spec block parameters

1. **`actlname`** – Acceptable Module Name
   This parameter is reported by itself together with actlmodqual. The line is repeated for all acceptable modules in the socket. This list specifies the modules which can be provisioned for that socket.
   Type: value set.
   Range: 12 characters.
2. **`actlqual`** – Acceptable Module Qualifier
   This parameter is reported by itself together with actlmodname. The line is repeated for all acceptable modules in the socket. This list specifies the modules which can be provisioned for that socket.
   Type: value set.
   Range: 7 characters.

   Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

   - alphanumeric characters or the special character ’-’ only
   - special characters like ’/’ and ’.’ to be omitted
3. **`app`** – Apparatus Code
   This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED. The 9 character *app* string is represented left aligned and padded on the right with ASCII spaces (20HEX) to a 12 character alphanumeric string.
   Type: Alphanumeric string
   Range: 12 characters alphanumeric string or empty string.
   Default: empty string ″″. The default is reported on module plug-out when the EEPROM is not readable or when the Apparatus Code value cannot be derived from the EEPROM content.. Note: In TL1 output direction the quotes have to escaped \″\″.

4. **`ccode`** – Commercial Code
   Commercial code + suffix as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
   Type: Alphanumeric string
   Range: up to 12 digits
   Default: empty string "". The default is reported on module plug-out or when the EEPROM is not readable. Note: In TL1 output direction the quotes have to escaped \"\".
5. **`clei`** – Common Language Equipment
   Common Language Equipment as stored in the EEPROM of the module.
   Type: value set.
   Range: 10 characters.
   Default: empty string "".
   The default is reported on module plug-out or when the EEPROM is not readable.
   Note: In TL1 output direction the quotes have to escaped \"\".
6. **`compatibilitybyte`** – Compatibility Byte
   This parameter indicates the compatibility of the module with the system. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.
   Type: Numeric string or text string
   Range: 0 … 255.
   Default: empty string "".
   The default is reported on module plug-out or when the EEPROM is not readable.
   Note: In TL1 output direction the quotes have to escaped \"\".
7. **`connectortype`** – Connector Type
   This parameter indicates the type of connector at the module plugged into the socket. (E.g. 07 for LC). This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.
   Type: Hexadecimal number or text string
   Range: 1 byte which is represented as 2 hexadecimal digits.
   Default: empty string "".
   The default is reported on module plug-out or when the EEPROM is not readable.
   Note: In TL1 output direction the quotes have to escaped \"\".
8. **`datecde`** – Date Code
   Vendor Date Code as stored in the EEPROM on the module. This parameter is kept for compatibility reasons only and is reported with the fixed value empty string "" for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

Type: Text string.
Range: empty string ″″.
Default: empty string ″″.
The default is reported on module plug-out or when the EEPROM is not readable.
Note: In TL1 output direction the quotes have to escaped \″\″.

9. **eci** – Equipment Catalog Item
Equipment Catalog Item as stored in the EEPROM of the module. This parameter is reported for a SocketAID, if the data in the EEPROM is stored according to the Small EEPROM Format.
Type: Value set.
Range: 6 digits.
Default: empty string ″″.
The default is reported on module plug-out or when the EEPROM is not readable.
Note: In TL1 output direction the quotes have to escaped \″\″.

10. **eqptpn** – Equipment ASAP Profile Name
The name of the current ASAP profile of type EQUIP-PROT on socket level.
Type: Alphanumeric string.
Range: up to 24 characters. A hyphen (“-”) is allowed in the name additionally.
Default: DEFAULT.

11. **interchangemarker** – Interchangeability Marker
This parameter is derived from the EEPROM content on the module and reported for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string
Range: 6 characters.
Default: ″S1-1″.
The default is reported on module plug-out, when the EEPROM is not readable or when the Interchangeability Marker value is not available in the EEPROM.
Note: A dash (-) is used instead of a colon (:) for the interchangeability marker in TL1.

12. **name** – Module Name
Module Name as stored in the EEPROM of the module.
Type: value set.
Range: up to 12 characters.
Default: empty string ″″.
The default is reported on module plug-out or when the EEPROM is not readable.
Note: In TL1 output direction the quotes have to escaped \″\″.

13. **nvmname** – Provisioned Module Name
This parameter specifies the name of the provisioned module of the socket. If no module is provisioned the default value is reported.
Type: value set.
Range: 12 character.
Default: UNDEFINED.

14. **`nvmqual`** – Provisioned Module Qualifier
    This parameter specifies the qualifier of the provisioned module of the slot. If no module is provisioned the default value is reported..
    Type: value set.
    Range: 7 characters.
    Default: UNDEF.

    Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

    - alphanumeric characters or the special character '-' only
    - special characters like '/' and '.' to be omitted.

15. **`physicalidentifier`** – Physical Identifier
    The Physical Identifier indicates the type of module plugged into the socket. (E.g. 03 for SFP). This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.
    Type: Hexadecimal number or text string.
    Range: 1 byte which is represented as 2 hexadecimal digits.
    Default: empty string "".
    The default is reported on module plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \"\".

16. **`prodid`** – Product Line Id
    Binary Compatibility + UNITE Serial Number Identifier as stored in the EEPROM on the module. This parameter is kept for compatibility reasons only and is reported with the fixed value empty string "", if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
    Type: Text string
    Range: empty string ""
    Default: empty string "".
    The default is reported on module plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \"\".

17. **`qual`** – Module Qualifier
    Module Qualifier as stored in the EEPROM of the module.
    Type: value set.
    Range: up to 7 characters.
    Default: empty string "".
    The default is reported on module plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \"\".

18. **sln** – Serial Number
    Serial number as stored in the EEPROM on the module to identify the module and indicate the date and place of manufacture.
    Type: Alphanumeric string.
    Range: 12 characters.
    Default: empty string ″″.
    The default is reported on module plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \″\″.
19. **ssn** – Series Number
    Series Number as stored in the EEPROM of the module.
    Type: value set.
    Range: up to 6 characters.
    Default: empty string ″″.
    The default is reported on modlue plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \″\″.
    Note: A dash (-) is used instead of a colon (:) for the series number in TL1.
20. **transceivercode** – Transceiver Code
    This parameter indicates the type of transceiver at the module plugged into the socket. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.
    Type: Hexadecimal number or text string
    Range: 8 bytes where each byte is represented as 2 hexadecimal digits.
    Default: empty string ″″
    The default is reported on module plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \″\″.
21. **uniquenumber** – Lucent Unique Number
    Lucent Unique Number as stored in the EEPROM. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED. The Lucent Unique Number is represented right aligned and padded on the left with ASCII spaces (20HEX) to a 12 character numeric string.
    Type: Numeric String or text string
    Range: 12 characters alphanumeric string or empty string.
    Default: empty string ″″
    The default is reported on module plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \″\″.
22. **vendorname** – Vendor Name
    This parameter is kept for compatibility reasons only and is reported with the fixed value empty string ″″ for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

Type: Text string
Range: 16 characters
Default: empty string ″″
The default is reported on module plug-out or when the EEPROM is not readable.
Note: In TL1 output direction the quotes have to escaped \″\″.

23. **`vendoroui`** – Vendor Company Identifier
This parameter is kept for compatibility reasons only and is reported with the fixed value empty string ″″ for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Hexadecimal number or text string
Range: 3 bytes where each byte is represented as 2 hexadecimal digits.
Default: empty string ″″
The default is reported on module plug-out or when the EEPROM is not readable.
Note: In TL1 output direction the quotes have to escaped \″\″.

24. **`vendorpartno`** – Vendor Part Number
This parameter is kept for compatibility reasons only and is reported with the fixed value empty string ″″ for a the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string
Range: 16 characters
Default: empty string ″″
The default is reported on module plug-out or when the EEPROM is not readable.
Note: In TL1 output direction the quotes have to escaped \″\″.

25. **`vendorrevlvl`** – Vendor Revision Level
Vendor Revision Level as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string
Range: 4 characters
Default: empty string ″″
The default is reported on module plug-out or when the EEPROM is not readable.
Note: In TL1 output direction the quotes have to escaped \″\″.

26. **`vendorsln`** – Vendor Serial Number
Vendor Serial Number + WES Vendor Identifier as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string
Range: 20 characters
Default: empty string ″″
The default is reported on module plug-out or when the EEPROM is not readable.
Note: In TL1 output direction the quotes have to escaped \″\″.

27. **`wesserialno`** – WES Serial Number
    This parameter is read from the EEPROM on the module and reported for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
    Type: Text string
    Range: 18 characters
    Default: empty string ″″
    The default is reported on module plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \″\″.
28. **`wesvendorid`** – WES Vendor ID
    WES Vendor Identifier as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
    Type: Text string
    Range: 4 characters
    Default: empty string ″″
    The default is reported on module plug-out or when the EEPROM is not readable.
    Note: In TL1 output direction the quotes have to escaped \″\″.

Example output

This example shows the ED-EQPT notification after reprovisioning of a socket:

```
   UNITE-NE 00-11-14 08:00:30
A 001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-14:ED-EQPT:1-1-#-#-5-
      sc2::nvmname=OM2G5,nvmqual=15LR1,eqptpn=PROFILE1″
;
```

This example shows the ED-EQPT notification reporting the inventory data after plugging in a module with data stored in Small EEPROM forma:

```
   UNITE-NE 00-11-14 08:00:30
A 001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-14:ED-EQPT:1-1-#-#-5-sc2::name=OM2G5,qual=15LR1,
ccode=109192278000,clei=WM3ILPEDAA,eci=255694,sln=00NB01002333,ssn=1-1″
;
```

This example shows the ED-EQPT notification reporting the inventory data after plugging in a modul with data stored in SFP EEPROM format:

```
   UNITE-NE 06-06-30 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=06-06-30:ED-EQPT:1-1-#-#-5-
      sc2::name=OM2G5,qual=CL61L1,app=\″\″,ccode=109496869,clei=WM1T37KBAA,compatibilitybyte=
;
```

This example shows the ED-EQPT notification reporting the not readable inventory data after plug out of a module with data stored in Small EEPROM format:

```
   UNITE-NE 00-11-14 08:00:30
A 001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-14:ED-EQPT:1-1-#-#-5-sc2::name=\″\″,qual=\″\″,
comcde=\″\″,clei=\″\″,eci=\″\″,sln=\″\″,ssn=\″\″″
;
```

ED-EQPT (system): Edit equipment (system)

The **ED-EQPT** command modifies the provisioning values associated with system (NE) level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-EQPT***:tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
The aid of the system itself.
Type: AID
Range: system. The usage of the keyword **all** on system level is not allowed.
Default: system
3. **ctag** – Correlation Tag
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **eqptpn** – Equipment ASAP Profile Name
The name of the current ASAP profile on the system level
Type: Alphanumeric string
Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
Default: DEFAULT
2. **istddflt** – Interface Standard Default
Defining the predominantly used interface standard for a port.
Type: Alphanumeric value set.
Range:
   - SONET
   - SDH

   Default: SDH

3. **`mondelay`** – Port Auto to Mon Delay
   The switch of the port mode from the value AUTO to the value MON is delayed by this timer. It requires that a valid signal is present for the set timer period prior to the port transitioning to monitored. If during the timer period the signal is interrupted, the time should reset and begin another period when a valid signal is once again presented.
   Type: Numeric string.
   Range:
   - 0 = no timer will be started
   - 1…480 = in steps of 1 representing a switch delay of the port mode in minutes.

   Default: 0
4. **`portclassdflt`** – Port Class Default
   Defines the default port class, which is used when a new port is created and xcsetup=SWISS. When xcsetup=TRADITIONAL this parameter is not evaluated.
   Type: Alphanumeric value set.
   Range:
   - TRADITIONAL
   - EDGE

   Default: TRADITIONAL.
5. **`synccrtc`** – System Synchronization Characteristic
   This parameter specifies whether the NE uses the SDH or SONET timing function for synchronization.
   Type: Alphanumeric value set.
   Range:
   - SONET
   - SDH.

   Default: SDH.
6. **`trbmddflt`** – Tributary Mode Default
   Defining the predominantly used tributary mode for a port.
   Type: Alphanumeric value set.
   Range:
   - FIXED
   - ADAPTIVE

   Default: FIXED.
7. **`swmaxcap`** – Maximum Switch Capacity
   This parameter indicates the maximum switch capacity of the system that the user intends to use.
   Type: value set.
   Range:
   - LXC160 (default), 160 GBit/s switch capacity
   - LXC320, 320 GBit/s switch capacity.

8. **`upsrportalarming`** – Enh. SA/NSA Detection for UPSR and SNCP
   The parameter specifies whether the Enhanced SA/NSA Detection for UPSR Rings and SNCP is switched on or off.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
9. **`xcsetup`** – Cross Connect Setup
   This parameter indicates whether the system supports the set-up of cross-connections via the ONNS application.
   Type: value set.
   Range: SWISS ONNS application is enabled; TRADITIONAL ONNS application is disabled.
   Default: TRADITIONAL.

Output format

If the **`ED-EQPT`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the current values for the system. The values of the attributes as listed above in section spec block parameters are updated as specified in the command input.

Change of the parameters *istddflt, trbmddflt* has no effect on the corresponding parameters for existing entities on port and tributary level, but only on entities which are created afterwards.

The modification is reported by means of an **`ED-EQPT`** notification for the system.

Dependencies *istddflt* and *trbmddflt*

If *istddflt* is changed to SDH the *trbmddflt* parameter is set to FIXED by the system.

Updated affected entities

See discussion in Chapter 10, "TL1 messages - synchronization" after change of *synccrtc* and leave of MCOND.

Behavior when setting of *xcsetup* from TRADITIONAL to SWISS or vice versa

The system must assure that the validation rules as listed in the Error responses section are met.

To set the system back from *xcsetup* = SWISS to *xcsetup* = TRADITIONAL it has to be ensured that no resources are in use by SWISS (ONNS).

The following steps are recommended to achieve this:

- identify all SDH/SONET ports with *portClass* = INNI or *portClass* = EDGE, then set *portControl* = LOCKOUT
- identify all GbE ports with *eportClass* = INNI or *eportClass* = EDGE, then set *eportControl* = LOCKOUT
- ensure that all NN paths which start, end, or traverse this NE are deleted or re-routed by the SWISS application via NN TL1 ENT/ED/DLT-PATH
- In exceptional cases, when the previous step is not possible: Identify all remaining cross-connections with *xconcls* = NN, then use ED-NNCRS to set *xconcls* = TRADITIONAL
- identify all SDH/SONET ports with *portClass* = INNI or *portClass* = EDGE, then set *portClass* = TRADITIONAL
- identify all GbE ports with *eportClass* = INNI or *eportClass* = EDGE, then set *eportClass* = TRADITIONAL
- identify all DCC channels with *scn_dccstat* = ENABLE, then set *scn_dccstat* = DISABLE
- identify all LANs with *osinode* = scnnode, then either set osinode to osinode{1..8} or DISABLE lanstat, ip_lanstat.

Dependency between setting of *xcsetup* and acceptable CP type list

By changing the value of *xcsetup* also the acceptable circuit pack type list changes.

Dependency between *xcsetup* and ONNS TL1 commands

While *xcsetup* = TRADITIONAL any ONNS TL1 command is rejected.

Update affected entities when changing *swmaxcap* from LXC160 to LXC320

When changing *swmaxcap* from LXC160 to LXC320 the acceptable circuit pack name list *actlname*:

- of all universal slots in the lower row shall change from an empty list to a non-empty list.
- of the XC slots 9 and 10 is modified such that it does not contain XC160 anymore.

The modification is reported by means of ED-EQPT notifications for the affected slot entities.

Update affected entities when changing *swmaxcap* from LXC320 to LXC640

When changing *swmaxcap* from LXC320 to LXC640 the acceptable circuit pack name list *actlname*:

- of universal slot n-1 shall change from an emtpy list to a non-empty list if currently a double density circuit pack is provisioned in slot n.
- of the XC slots 9 and 10 is modified such that it does not contain XC320 anymore.

The modification is reported by means of ED-EQPT notifications for the affected slot entities.

Update affected entities when changing *swmaxcap* from LXC160 to LXC640

When changing *swmaxcap* from LXC160 to LXC640 the acceptable circuit pack name list *actlname*:

- of all universal slots in the lower row shall change from an emtpy list to a non-empty list.
- of universal slot n-1 shall change from an emtpy list to a non-empty list if currently a double density circuit pack is provisioned in slot n
- of the XC slots 9 and 10 is modified such that it does not contain XC160 and XC320 anymore.

The modification is reported by means of ED-EQPT notifications for the affected slot entities.

Dependency *portclassdflt* with *xcsetup*

Change of the parameter *portclassdflt* shall not have effects on existing ports. The parameter *portclassdflt* shall automatically be set to TRADITIONAL, when *xcsetup* is set to TRADITIONAL.

Example input/output

```
ED-EQPT:UNITE-NE:system:123456:::istddflt=SONET;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
;

ED-EQPT:UNITE-NE:system:123456:::portclassdflt=EDGE,xcsetup=SWISS;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-EQPT** command.

Validation rule: check for ASAP profile existence

When no ASAP profile with the name specified by *eqptpn* does not exist the following error is returned.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: check of the maintenance condition

System must be in MCOND for change of *synccrtc*.

Error code:
`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: compatibility *istddflt* and *trbmddflt*

Change of *trbmddflt* to ADAPTIVE while *istddflt*= SDH is not allowed.

Error code:
`SNVS – Status, Not in Valid State, incompatibility istddflt and trbmddflt`

Validation rule: Compatibility *xcsetup* and HW configuration

The system shall verify that ONNS capable HW is (pre-) provisioned during an attempt to set *xcsetup* = SWISS. Otherwise the following error is reported:

Error code: `SNVS – Status, Not in Valid State, no SwiSS capable HW`

Validation rule: Compatibility *xcsetup* and NVM size

The system shall verify that the installed NVM has a capacity > 256 Mbytes during an attempt to set *xcsetup* = SWISS. Otherwise the following error is reported:

Error code: `SNVS – Status, Not in Valid State, NVM size not sufficient`

Validation rule: Compatibility *xcsetup* and IP configuration for SCN

The system shall verify that the mandatory ASTN IP address is provisioned during an attempt to set *xcsetup* = SWISS. Otherwise the following error is reported:

Error code: `SNVS – Status, Not in Valid State, incomplete IP configuration`

See corresponding validation rules in “ENT-ULS: Enter upper layer stack” (p. 3-1944) for details.

Validation rule: Compatibility *xcsetup* and software state

The system verifies that the software is not in trial phase during an attempt to set xcsetup=SWISS. Otherwise the following error is reported:

Error code:
`SNVS – Status, Not in Valid State, SW generic is in trial phase`

Validation rule: Setting *xcsetup* back to TRADITIONAL

On an attempt to set *xcsetup* to TRADITIONAL it has to be ensured that all of the following rules are fulfilled:

- for all (pre-)provisoned SDH/SONET ports (i.e. ports which are identified via SPortAID) in the system holds *portClass* = TRADITIONAL, see RTRV/ED-rr (port)
- for all (pre-)provisoned GbE ports (i.e. ports which are identified via EPortAID) in the system holds *eportClass* = TRADITIONAL, see RTRV/ED-EPORT
- for all cross-connections in the system holds *xconcls* = TRADITIONAL, see RTRV/ED-CRS, ED-NNCRS
- no DCC channel shall have *scn_dccstat* = ENABLED, see RTRV/ENT-FECOM
- no LAN is assigned to the SCN with *osinode* = scnnode, see RTRV/ENT-FECOM-LAN.

Otherwise the following error is reported:

Error code: `SNVS – Status, Not in Valid State, resources in use by SwiSS`.

Validation rule: Do not accept ONNS TL1 commands when *xcsetup* = TRADITIONAL

The system shall DENY ONNS TL1 commands when *xcsetup* = TRADITIONAL.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: Do not accept setting *portclassdflt* to EDGE when *xcsetup* = TRADITIONAL

The system shall DENY setting the parameter *portclassdflt* to the value EDGE when xcsetup=TRADITIONAL.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: Maximum switch capacity according XC CP

If the *swmaxcap* parameter is set it is ensured that the provided switch capacity is not higher than the switch capacity of the provisioned XC circuit pack with the smallest switch capacity in the system.

Error code:

`SNVS – Status, Not in Valid State, switch capacity below provisioned XC CP switch capacity`

Validation rule: No decrease of maximum switch capacity

If the *swmaxcap* parameter is set it is ensured that the *swmaxcap* value in the **`ED-EQPT`** command is not lower than the actual provisioned swmaxcap value in the system.

Error code:

`IDNV – Input, Data Not Valid, switch capacity cannot be decreased`

ED-EQPT (system) notification

Output format

Syntax: **`ED-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system. The usage of the keyword **`all`** on system level is not allowed.
   Default: system

Spec block parameters

1. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile on the system level
   Type: Alphanumeric string
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT
2. **`istddflt`** – Interface Standard Default
   Defining the predominantly used interface standard for a port.
   Type: Alphanumeric value set.
   Range:
   - SONET
   - SDH
   Default: SDH
3. **`mondelay`** – Port Auto to Mon Delay
   The switch of the port mode from the value AUTO to the value MON is delayed by this timer. It requires that a valid signal is present for the set timer period prior to the port transitioning to monitored. If during the timer period the signal is interrupted, the time should reset and begin another period when a valid signal is once again presented.
   Type: Numeric string.
   Range:
   - 0 = no timer will be started
   - 1…480 = in steps of 1 representing a switch delay of the port mode in minutes.
   Default: 0
4. **`portclassdflt`** – Port Class Default
   Defines the default port class, which is used when a new port is created and xcsetup=SWISS. When xcsetup=TRADITIONAL this parameter is not evaluated.
   Type: Alphanumeric value set.

Range:

- TRADITIONAL
- EDGE

Default: TRADITIONAL.

5. **synccrtc** – System Synchronization Characteristic
This parameter specifies whether the NE uses the SDH or SONET timing function for synchronization.
Type: Alphanumeric value set.
Range:
    - SONET
    - SDH.

    Default: SDH.
6. **trbmddflt** – Tributary Mode Default
Defining the predominantly used tributary mode for a port.
Type: Alphanumeric value set.
Range:
    - FIXED
    - ADAPTIVE

    Default: FIXED
7. **swmaxcap** – Maximum Switch Capacity
This parameter indicates the maximum switch capacity of the system that the user intends to use.
Type: Value set.
Range:
    - LXC160 160 GBit/s switch capacity
    - LXC320 320 GBit/s switch capacity
    - LXC640 640 GBit/s switch capacity

    Default: LXC160.
8. **upsrportalarming** – Enh. SA/NSA Detection for UPSR and SNCP
The parameter specifies whether the Enhanced SA/NSA Detection for UPSR Rings and SNCP is switched on or off.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
9. **xcsetup** – Cross Connect Setup
This parameter indicates whether the system supports the set-up of cross-connections via the ONNS application.
Type: value set.
Range: SWISS ONNS application is enabled; TRADITIONAL ONNS application is disabled.
Default: TRADITIONAL.

Example output

```
ED-EQPT:UNITE-NE:system:123456:::istddflt=SONET;

   UNITE-NE 00-11-14 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-14 08:00:50
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-14:ED-EQPT:system::istddflt=SONET”
;
```

ED-FECOM notification

Output format

The **ED-FECOM** notification has the following specific syntax:

ED-FECOM::*port*,*dcctype*:*spec_block*

Output parameters

Command parameters

1. **port**
   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel.
   Type: AID.
   Range: SPortAID; the keyword **all** is not allowed.
2. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS DCC of the *port* is affected by the command.
   Type: Alphanumeric value set.
   Range:
   - LINE
   - SECTION.

   Default:
   - SECTION if dccstat is set to ENABLE
   - no default (i.e. parameter is mandatory) if *scn_dccstat* or uni_dccstat is ENABLE.

Spec block parameters

1. **dccprottp**
   This parameter reports the protection type of the DCC channel. 0X1 means the port is not involved in a protection group or DCC protection switching is disabled. 1+1 means DCC protection switching is enabled: In these case only the active worker line is shown.
   Type: Alphanumeric value set.
   Range: 0X1 (default), 1+1.
2. **dccstat**
   Note: The default value of DISABLED is used when a DCC channel is created, this will be reported via the ENT-FECOM notification, or when a Transparent DCC Cross Connection is deleted, this will be reported via the ED-FECOM notification. The value TRANSPARENT is reported when a Transparent DCC Cross Connection is created. In this case all other spec_block parameters does not have any effect on operation of the system if reported. The other spec_block parameters does have only operational effect if the value is ENABLED.

This parameter indicates whether MCN communication over the DCC channel is enabled or if it is used in a Transparent DCC Cross Connection.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE (default), TRANSPARENT.
Note: Output responses with *dccstat* = DISABLE will only sent when either *scn_dccstat* = ENABLE or *uni_dccstat* = ENABLE or *enni_dccstat* = ENABLE, see also Detailed behavior description below.

3. **`lapdmode`**
This parameter indicates the type of LAPD service. Modes are AITS and UITS. Starting with R2.0 this parameter is also used to determine the service for the LinkID protocol.
If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.
Type: Alphanumeric value set..
Range:
   - UITS (default)
   - AITS.
4. **`lapdrl`**
This parameter indicates the LAPD role. This parameter is also used to determine the service for the LinkID protocol.
If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.
Type: Alphanumeric value set.
Range:
   - USER-SIDE (default)
   - NETWORK-SIDE.
5. **`osinode`**
Assignment of a DCC channel to an MCN node in the NE. The parameter is omitted when *dccstat* = ENABLE.
An NE can have up to 8 instances of the OSI stack. Node-1 is default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00). Nodes 2-8 can be created and configured, see command **`ENT-ULSDCC-L3`**.
Type: AID.
Range: osinode{1-8}

6. **`scn_dccstat`**
   This parameter indicates whether the DCC channel is used for communication over the SCN or is involved in a transparent DCC cross-connection.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE, TRANSPARENT.
   Note: Output responses with *scn_dccstat* = DISABLE will only sent when either *dccstat* = ENABLE or *uni_dccstat* = ENABLE or *enni_dccstat* = ENABLE, see also Detailed Behavior Description below.
7. **`uni_dccstat`**
   This parameter indicates whether the DCC channel is used for UNI communication.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE, TRANSPARENT.
   Note: Output responses with *uni_dccstat* = DISABLE will only sent when either *dccstat* = ENABLE or *scn_dccstat* = ENABLE or *enni_dccstat* = ENABLE, see also Detailed Behavior Description below.
8. **`enni_dccstat`**
   This parameter indicates whether the DCC channel is used for E-NNI communication.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE, TRANSPARENT.
   Note: Output responses with *enni_dccstat* = DISABLE will only be sent when either *dccstat* = ENABLE or *scn_dccstat* = ENABLE or *uni_dccstat* = ENABLE, see also Detailed Behavior Description below.

Example output

```
   NE-UNITE 00-11-03 01:00:00
A  000 REPT DBCHG
   ”TIME=01-00-00,DATE=00-12-13:ED-FECOM::1-1-#-#-5-3,line:dccprottp=0X1”
;
```

ED-FETID: Edit far end target identifier

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No

Input format

Command syntax: **`ED-FETID`**:*tid*:[*aid*]:*ctag*::[*rid*],*spec_block;*

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **`ctag`** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.

Spec block parameters

1. **oldtid** – Old Target Identifier
   This parameter is the previous TID of a remote node on the ring which may be associated with one or more local cross-connections.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: 1 to 20 characters.
2. **newtid** – New Target Identifier
   The newtid parameter is the previous TID of a remote node on the ring which may be associated with one or more local cross-connections.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: 1 to 20 characters.

Output parameters

1. **sid** – Source Identifier
   This is the currently active name of the network element to which the command is addressed. The tid is a case insensitive character string.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: 1 to 20 characters.
2. **date** – Date
   Date when output message is generated. This has the format YY-MM-DD (year-month-day)
   Type: value set.
   Range: for YY 00 to 99, for MM 01 to 12, for DD 01 to 31
   TL1 messages use YY-MM-DD for the format of a date, meaning that the year only has two digits. This is consistent with Telcordia requirements. Internally, however, the system does use a 4-digit year. When the year appears in a response, the internal 4-digit year is truncated to two digits. When the year appears as an input parameter, for example in the **ED-DAT** command, years in the range 90-99 will represent 1990-1999, and years in the range 00-37 will represent 2000-2037.
   Default:00-01-01
3. **time** – Time
   Time when output message is generated. This has the format HH:MM:SS (hours:minutes:seconds).
   Type: Value set.
   Range: for HH 00 to 23, for MM 00 to 59, for SS 00 to 59.
   Default: 00:00:00
4. **M** – Message
   M indicates that the output message is generated in response to a manual command.
   Type: Value set.
   Range: M

5. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: Non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.
6. **`IP`** – In Progress
   IP is sent in response to all commands with the exception of commands that result in error code output.
   Type: Value set.
   Range: IP
7. **`RL`** – Repeat Later
   The requested command cannot be executed due to unavailable system resources. The command may be entered again later.
   Type: Value set.
   Range: RL
8. **`COMPLD`** – Completion Code
   It indicates that the command has been completed.
   COMPLD for successful command execution: For a command that is decomposed into a set of atomic commands a COMPLD completion code means that the command was successful for all atomic commands (e.g. AID ranges, group alias).
   COMPLD for no changes: If a parameter has a current value, and a provisioning command attempts to reprovision the parameter with a value that is the same as its current value, the command will return a COMPLD completion code.
   Type: Value set.
   Range: COMPLD.

Output parameters

See definition in output parameters section in “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **`ED-FETID`** command is used to update the TID of a remote node on the ring which may be associated with one or more local cross-connections. The command can only be applied when automatic ring discovery is disabled. The network provider would then have to issue this command to every node on the ring. The **`ED-FETID`** command generates a REPT-DBCHG message.

Example input/output

The following is an example of the **`ED-FETID`** command:

```
ED-FETID:NENAME-1::123456::RingID:oldtid=NENAME-2,newtid=NENAME-3;
```

```
   NENAME-1 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Automatic ring discovery to be disabled

If the automatic ring discovery is enabled, the following error response is returned:

Error code: `SNVS – Status, Not Valid State`

Validation rule: consistent aid and rid

If both an aid and an rid are specified as input parameters and they are inconsistent, then the following error response is returned.

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

Validation rule: Old TID not in ring map

If the specified Old Target Identifier value is not contained in the list of Ring Node Target Identifiers, the command is denied.

Error code:
`IDNV – Input, Data Not Valid, old TID not in in the list of ring node TIDs`

Validation rule: Local node TID not allowed

If the specified Old Target Identifier is the TID of the local node, the command is denied.

Error code: `IDNV – Input, Data Not Valid, TID of local node not allowed`

Validation rule: No duplicate ring node TIDs

If the specified New Target Identifier is already contained in the list of ring node TIDs and is different from the Old Target Identifier, the command is denied.

Error code: `IDNV – Input, Data Not Valid, duplicate ring node TID`

ED-FETID notification

Output format

Command syntax: **`ED-FETID`**:*aid*:[*rid*]*:spec_block;*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
2. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
   Option: The *rid* is only included in the ED-FETID notification if the *rid* has been specified in the **`ED-FETID`** command.

Spec block parameters

1. **`oldtid`** – Old Target Identifier
   This parameter is the previous TID of a remote node on the ring which may be associated with one or more local cross-connections.
   Type: identifier, in addition the special character underscore “_” and the password characters are allowed.
   Range: 1 to 20 characters.
2. **`newtid`** – New Target Identifier
   The newtid parameter is the previous TID of a remote node on the ring which may be associated with one or more local cross-connections.
   Type: identifier, in addition the special character underscore “_” and the password characters are allowed.
   Range: 1 to 20 characters.

Example input/output

The following example reports the change of a TID in an NE’s ring map for a 4 fibre MS-SPRing/BLSR protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ED-FETID:1-1-t001:RingID:oldtid=NE_1,newtid=NE_2″
;
```

ED-LONIM: Edit lower-order non-intrusive monitor

The *ED-LONIM* command modifies the properties of a lower-order tributary (LONIM).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax:

`ED-LONIM`-*modifier*:*tid*:*aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **`modifier`**
   The modifier specifies the type of the low-order tributary. The purpose is to distinguish between SDH and SONET tributaries.
   Type: Alphanumeric value set.
   Range:
   - LOVC
   - LOVT
   - DS1
2. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`aid`** – Access Identifier
   The access identifier specifies a low-order tributary to be operated on.
   Type: AID
   Range: GenLOTribAID, DS1NumAID.
   The following values are not used:
   - *all*, *usall* in Simple_UnivSlotAID,
   - *all* in Simple_SPortAID, Simple_TMuxAPortAID, Simple_TMuxSPortAID
   - *all* in Simple_PTNumAID, Simple_TMuxAPTNumAID, Simple_TMuxSPTNumAID
   - *all* in Simple_LONumAID, Simple_DS1NumAID, Simple_TMuxSLONumAID
   Default: None.
4. **`ctag`** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec Block Parameters

1. **`degthr`** – Signal Degrade Threshold

   This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **`RTRV-VCGTRIB`**, **`RTRV-VC3`**, **`RTRV-STS1`**).

   The parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range: –5, –6, –7, –8, –9; that means, the range is 10^{-9} to 10_{-5}.
   Default: –6.

2. **`dexcthr`** – Excessive Degrade Threshold

   This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **`RTRV-VCGTRIB`**, **`RTRV-VC3`**, **`RTRV-STS1`**).

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range (as exponents of 10): –3; –4; –5, that means, the range is 10^{-5} to 10^{-3}.
   Default: –3.

3. **`explptrc`** – Expected LO Path Trace Identifier

   This parameter is only significant if *ptrcrfmt* is set to 16. However, setting this parameter while the format is different will not be rejected but stored in the NE and needs not be set again if the format is set later to the 16 byte mode.
   This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Hexadecimal number without a preceding “H”.
   Range: length: 32 hexadecimal; digits: value specific string acc. ITU/ETSI mode 1
   Default: 89000000000000000000000000000000

4. **`feppm`** – Far End Path PM Enable

   This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set
Range: DISABLE, ENABLE.
Default: DISABLE.

5. **`fmt`** – Digital Signal Format for DS1
This parameter is used to specify the digital signal format expected to be received from the DS1 at the specified port(s). The TransMUX circuit pack supports DS1 path PM; it does not support DS1 line PM.
The parameter is only supported for modifier:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range:
   - SF: Super Frame, supports near-end DS1 path and line PM only.
   - ESF: Extended Super Frame, supports near-end and far-end DS1 path and line PM.

   Default: ESF.
6. **`lonimpn`** – LO NIM ASAP Profile Name
This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
The ASAP type depends on the *modifier*:
   - for LOVC/LOVT modifier, an ASAP of type PATH is required
   - for DS1 modifier, an ASAP of type DS1 is required

   Type: Alphanumeric string. A hyphen (" – -") is allowed in the name additionally.
Range: 1 to 24 characters
Default: DEFAULT.
7. **`lptimmon`** – LO Path Trace Identifier Mismatch Monitor
This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format ptrcrfmt is set to 16 (16-byte specific-string mode).
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE.
Default: DISABLE.
8. **`neppm`** – Near End Path PM Enable
This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE.
Default: DISABLE.

9. **`outpm`** – Outgoing Near End Path PM Enable
The parameter *outpm* specifies whether the performance monitoring for the near end in outgoing direction is enabled or disabled for this tributary.

The parameter is only supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE
Default: DISABLE.

10. **`pmlpfeses`** – PM LO Path Far End SES Threshold
This parameter specifies the Low Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end.
The behavior depends on *modifier* and the transmission rate of this low-order tributary. For modifiers which include more than one transmission rate, the transmission rate can be derived from the parameter *inputsig* of the related PTF entity.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range:

The range depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF:

- 1, 2, 3, ..., 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
- 1, 2, 3, ..., 1998, 1999, 2000 (if the entity represents a VC12 tributary)
- 1, 2, 3, ..., 3998, 3999, 4000 (if the entity represents a VT1.5 tributary)

Default: The default value depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary).

11. **`ptca`** – Path TCA Profile Pointer
The parameter *ptca* specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

The TCA Profile type depends on the modifier.

- for LOVC *modifier*, a TCA Profile of type LOVC is required
- for LOVT *modifier*, a TCA Profile of type LOPATH is required
- for DS1 *modifier*, a TCA Profile of type DS1 is required

Type: Alphanumeric string.
Range: 1 … 24 characters.
Default: DEFAULT0.

12. **`pmlpneses`** – PM LO Path Near End SES Threshold
This parameter specifies the Low Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by istd for the related port owning this tributary and the transmission rate of this low-order tributary. For definition of istd refer to RTRV-rr Output Parameters. The transmission rate can only be derived from the parameter inputsig of the related PTF entity.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range:

The range depends on the tributary type in input direction, which can be derived from inputsig of the related PTF:

- 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
- 1, 2, 3, …, 1998, 1999, 2000 (if the entity represents a VC12 tributary)
- 1, 2, 3, …, 3998, 3999, 4000 (if the entity represents a VT1.5 tributary).
- 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a DS1 tributary)

Default: The default value depends on the tributary type in input direction, which can be derived from inputsig of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary); 1544 (if the entity represents a DS1 tributary).

13. **`ptrcrfmt`** – Path Trace Read Format
This parameter specifies the format of the path trace (J1 or J2 byte) to be received (sink).

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Numeric string.

Range:

- 2 (default), for non-specific repeating byte
- 16, for 16-byte specific string
- 64, for 64-byte string (only applicable if the entity represents a LO-VC3 tributary).

To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.

14. **`tcamd`** – TCA mode

    This parameter is only available for SDH mode and will therefore only be reported if the output parameter *aidtype* is LOVC. The parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable for SDH:

    - TR-only. (also known as the implicit reset method)
    - TR-RTR. (also known as the explicit reset method).

    For SONET the parameter *tcamd* is not supported. SONET ports only support “TR-only” mode. Thus the mode must be internally set to ″“TR-only”.

    The parameter is not supported for the following modifiers:

    - DS1
    - LOVT

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: TR, TRRTR

    Default:

    - SDH mode: TRRTR
    - SONET mode: TR (internal).

    For SONET the parameter *tcamd* is not supported. SONET ports only support “TR-only” mode. Thus the mode must be internally set to ″“TR-only”.

15. **`tmonmd`** – Tributary Monitoring Mode

    This parameter specifies the monitoring mode for the tributary.
    Type: Alphanumeric value set.
    Range: MON, NMON.
    Default: NMON.

Output format

If the network element fully complies with the *ED-LONIM* request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The *ED-LONIM* shall generate a *REPT DBCHG* message. The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed acgLOTrib entity according to the parameters given with this command. The modification is reported by means of an ED-LONIM notification.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts, the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of *tcamd* from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Example input/output

```
ED-LONIM-LOVC:LT-UNITE:1-1-#-#-39-16-1-43:123456:::tmonmd=NMON;

   LT-UNITE 00-11-11 11:11:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the *ED-LONIM* command.

Validation rule: Check *aid* against PTF substructure

If the command is applied with an aid which does not exist according to the input signal substructure of the owning PTF entity then the command is denied.

Error code: `IENE – Input, Entity Not Exists, aid not part of substructure`

Example:

Given the parameter of HPT[1-1-#-#-39-16-1]:inputsig is 23-2112, the following aid will be rejected: 1-1-#-#-39-16-1-43.

Note that the status of the parameter HPT:unequiposig is irrelevant.

The validation rule is not relevant for SONET entities, because SONET PTFs support only one input signal structure, 28 VT1.5/DS1 (2811). SONET PTFs, which do not have an *inputsig* parameter shall implicitly use the signal structure 2811.

Validation rule: Check if parameters are supported for the *modifier*

If the command is applied with spec block parameters which are not supported for the *modifier*, then the command is denied.

Error code: `INUP – Input, Non-null Unimplemented Parameter`

Validation rule: Check *modifier* and *ptrcrfmt* consistency

If the command is applied with the parameter ptrcrfmt which is going to be set to 64 and the addressed entity does not represent a LO VC3 tributary then the command is denied.

Error code:
`IPNC – Input, Parameter Not Consistent, 64 byte path trace not allowed`

64 byte path trace format only allowed for LO-VC3 tributaries. The tributary type the addressed entity represents can only be derived from the parameter inputsig of the related PTF entity.

Validation rule: Check *modifier* and *pmlpneses*/*pmlpnefeses* consistency

If the command is applied for:

- an entity representing a LO-VC3 tributary and one of the parameters *pmlpneses* or *pmlpfeses* is not in the range from 1 to 8000,
- an entity representing a VC12 tributary and one of the parameters *pmlpneses* or *pmlpfeses* is not in the range from 1 to 2000,

- an entity representing a VT1.5 tributary and one of the parameters *pmlpneses* or *pmlpfeses* is not in the range from 1 to 4000,
- an entity representing a DS1 tributary and one of the parameters *pmlpneses* is not in the range from 1 to 8000,

then the command is denied.

Error code:
`IPNC – Input, Parameter Not Consistent, SES threshold out of range for this modifier`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: No LO tributary at HO side of conversion cross-connection

If the LO tributary specified in the command is related to a HO tributary, which is used as HO side of a conversion cross-connection, then the command is rejected.

Error code:
`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

ED-LONIM notification

Output format

Command syntax:

`ED-LONIM`-*modifier*:*aid*:*ctag*::*spec_block*;

Output parameters

Command parameters

1. **`modifier`**
   The modifier specifies the type of the low-order tributary. The purpose is to distinguish between: – SDH/SONET tributaries.
   Type: Alphanumeric value set.

   Range:

   - LOVC
   - LOVT
2. **`aid`** – Access Identifier
   The access identifier specifies a low-order tributary to be operated on.
   Type: AID
   Range: GenLOTribAID, DS1NumAID.

   The following values are not used:

   - *all*, *usall* in Simple_UnivSlotAID,
   - *all* in Simple_SPortAID, Simple_TMuxAPortAID, Simple_TMuxSPortAID
   - *all* in Simple_PTNumAID, Simple_TMuxAPTNumAID, Simple_TMuxSPTNumAID
   - *all* in Simple_LONumAID, Simple_DS1NumAID, Simple_TMuxSLONumAID

   Default: None.

Spec Block Parameters

1. **`crslpbkstat`** – Cross-connect Loopback Status
   This parameter shall report the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035).

   The parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.

Range:

- YES: for enabled loopback
- NO: for disabled loopback.

2. **`degthr`** – Signal Degrade Threshold
This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **`RTRV-VCGTRIB`**, **`RTRV-VC3`**, **`RTRV-STS1`**).
The parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range: –5, –6, –7, –8, –9; that means, the range is 10^{-9} to 10_{-5}.
   Default: –6.

3. **`dexcthr`** – Excessive Degrade Threshold
This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **`RTRV-VCGTRIB`**, **`RTRV-VC3`**, **`RTRV-STS1`**).
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range (as exponents of 10): –3; –4; –5, that means, the range is 10^{-5} to 10^{-3}.
   Default: –3.

4. **`explptrc`** – Expected LO Path Trace Identifier
This parameter is only significant if *ptrcrfmt* is set to 16. However, setting this parameter while the format is different will not be rejected but stored in the NE and needs not be set again if the format is set later to the 16 byte mode.
This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Hexadecimal number without a preceding “H”.
   Range: length: 32 hexadecimal; digits: value specific string acc. ITU/ETSI mode 1
   Default: 89000000000000000000000000000000

5. **`feppm`** – Far End Path PM Enable
This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set
Range: DISABLE, ENABLE.
Default: DISABLE.

6. **`fmt`** – Digital Signal Format for DS1
This parameter is used to specify the digital signal format expected to be received from the DS1 at the specified port(s). The TransMUX circuit pack supports DS1 path PM; it does not support DS1 line PM.
The parameter is only supported for modifier:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range:
   - SF: Super Frame, supports near-end DS1 path and line PM only.
   - ESF: Extended Super Frame, supports near-end and far-end DS1 path and line PM.

   Default: ESF.
7. **`lonimpn`** – LO NIM ASAP Profile Name
This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
The ASAP type depends on the *modifier*:
   - for LOVC/LOVT modifier, an ASAP of type PATH is required
   - for DS1 modifier, an ASAP of type DS1 is required

   Type: Alphanumeric string. A hyphen (" – -") is allowed in the name additionally.
Range: 1 to 24 characters
Default: DEFAULT.
8. **`lptimmon`** – LO Path Trace Identifier Mismatch Monitor
This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format ptrcrfmt is set to 16 (16-byte specific-string mode).
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE.
Default: DISABLE.
9. **`neppm`** – Near End Path PM Enable
This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE.
Default: DISABLE.

10. **`outpm`** – Outgoing Near End Path PM Enable
The parameter *outpm* specifies whether the performance monitoring for the near end in outgoing direction is enabled or disabled for this tributary.
The parameter is only supported for modifier:
    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE
Default: DISABLE.

11. **`pmlpfeses`** – PM LO Path Far End SES Threshold
This parameter specifies the Low Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end.
The behavior depends on *modifier* and the transmission rate of this low-order tributary. For modifiers which include more than one transmission rate, the transmission rate can be derived from the parameter *inputsig* of the related PTF entity.
The parameter is not supported for modifier:
    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range:
The range depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF:
    - 1, 2, 3, ..., 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
    - 1, 2, 3, ..., 1998, 1999, 2000 (if the entity represents a VC12 tributary)
    - 1, 2, 3, ..., 3998, 3999, 4000 (if the entity represents a VT1.5 tributary)

    Default: The default value depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary).

12. **`pmlpneses`** – PM LO Path Near End SES Threshold
    This parameter specifies the Low Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by istd for the related port owning this tributary and the transmission rate of this low-order tributary. For definition of istd refer to RTRV-rr Output Parameters. The transmission rate can only be derived from the parameter inputsig of the related PTF entity.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Integer.
    Range:

    The range depends on the tributary type in input direction, which can be derived from inputsig of the related PTF:

    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
    - 1, 2, 3, …, 1998, 1999, 2000 (if the entity represents a VC12 tributary)
    - 1, 2, 3, …, 3998, 3999, 4000 (if the entity represents a VT1.5 tributary).
    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a DS1 tributary)

    Default: The default value depends on the tributary type in input direction, which can be derived from inputsig of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary); 1544 (if the entity represents a DS1 tributary).
13. **`ptca`** – Path TCA Profile Pointer
    The parameter *ptca* specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    The TCA Profile type depends on the modifier.

    - for LOVC *modifier*, a TCA Profile of type LOVC is required
    - for LOVT *modifier*, a TCA Profile of type LOPATH is required
    - for DS1 *modifier*, a TCA Profile of type DS1 is required

    Type: Alphanumeric string.
    Range: 1 … 24 characters.
    Default: DEFAULT0.
14. **`ptrcrfmt`** – Path Trace Read Format
    This parameter specifies the format of the path trace (J1 or J2 byte) to be received (sink).

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Numeric string.

Range:

- 2 (default), for non-specific repeating byte
- 16, for 16-byte specific string
- 64, for 64-byte string (only applicable if the entity represents a LO-VC3 tributary).

To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.

15. **`tcamd`** – TCA mode

This parameter is only available for SDH mode and will therefore only be reported if the output parameter *aidtype* is LOVC. The parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable for SDH:

- TR-only. (also known as the implicit reset method)
- TR-RTR. (also known as the explicit reset method).

For SONET the parameter *tcamd* is not supported. SONET ports only support “TR-only” mode. Thus the mode must be internally set to ″“TR-only”.

The parameter is not supported for the following modifiers:

- DS1
- LOVT

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: TR, TRRTR

Default:

- SDH mode: TRRTR
- SONET mode: TR (internal).

For SONET the parameter *tcamd* is not supported. SONET ports only support “TR-only” mode. Thus the mode must be internally set to ″“TR-only”.

16. **`tmonmd`** – Tributary Monitoring Mode

This parameter specifies the monitoring mode for the tributary.
Type: Alphanumeric value set.
Range: MON, NMON.
Default: NMON.

Example output

Example of **`ED-LONIM`** notification representing a LO-VC3 tributary:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ED-LONIM-LOVC:1-1-#-#-39-16-1-43::\
    crslbkstat=NO,degthr=-6,dexcthr=-3,\
    explptrc=89000000000000000000000000000000,feppm=DISABLE,\
    lptimmon=DISABLE,lonimpn=DEFAULT,neppm=DISABLE,pmlpfeses=2400,\
    pmlpneses=2400,ptca=DEFAULT0,ptrcrfmt=1,tcamd=TRRTR,tmonmd=NMON″
```

```
;
```

Example of **ED-LONIM** notification representing a VC12 tributary:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ED-LONIM-LOVC:1-1-#-#-39-16-1-63::\
    crslbkstat=NO,degthr=-6,dexcthr=-3,\
    explptrc=89000000000000000000000000000000,feppm=DISABLE,\
    lptimmon=DISABLE,lonimpn=DEFAULT,neppm=DISABLE,pmlpfeses=600,\
    pmlpneses=600,ptca=DEFAULT0,ptrcrfmt=1,tcamd=TRRTR,tmonmd=NMON″
;
```

Example of **ED-LONIM** notification representing a VT1.5 tributary:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG

;
```

ED-LOPTF: Edit lower-order path termination function

The **ED-LOPTF** command modifies the properties of a lower-order path termination tributary (LOPTF).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-LOPTF**-*modifier*:*tid*:*aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the low-order tributary.
   Type: Alphanumeric value set.
   Range: TMSVT.
   Default: None.
2. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **aid** – Access Identifier
   The access identifier specifies the low-order tributary whose attributes are reported.
   Type: AID
   Range: TMuxSLONumAID.
   The following values are not used:
   - **all**, **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID
   - **all** for Simple_TMuxSPTNumAID
   - **all** for Simple_TMuxSLONumAID

   No wildcards are allowed.
   Default: None.
4. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **degthr** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).
   This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range (as exponents of 10): –5; –6; –7; –8; –9, that means, the range is 10^{-9} to 10^{-5}.
   Default: –6.
2. **dexcthr** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).
   This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range (as exponents of 10): –3; –4; –5, that means, the range is 10^{-5} to 10^{-3}.
   Default: –3.
3. **explptrc** – Expected LO Path Trace Identifier
   This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
   This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Hexadecimal number without a preceding “H”.
   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.
   Default: 89000000000000000000000000000000
4. **lopn** – LO ASA Profile Name
   This parameter points to a tributary ASAP profile name *pfname* for the designated AID. For *modifier* = TMSVT, an ASAP profile of type *PATHTERM* is required.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 to 24 characters.
   Default: DEFAULT.

5. **`lptimais`** – LO Trace Identifier Mismatch AIS Insertion
   This parameter specifies whether a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).
   Type: Alphanumeric value set.
   Range:
   - DISABLE
   - ENABLE

   Default: The default value depends on interface standard:
   - SONET: DISABLE.
6. **`lptimmon`** – LO Path Trace Identifier Mismatch Monitor
   This parameter specifies the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).
   This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - DISABLE
   - ENABLE

   Default: DISABLE
7. **`ptrcrfmt`** – Path Trace Read Format
   The parameter *ptrcrfmt* specifies the format of the path trace (J1 or J2 byte) to be received (sink).
   The parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Numeric string.
   Range:
   - 2: for non-specific repeating byte
   - 16: for 16-byte specific string
   - 64: for 64-byte string.

   To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.
   Default: 2.
8. **`ptrcwfmt`** – Path Trace Write Format
   This parameter specifies the format of the path trace (J2 byte) to be sent (source).
   Type: Numeric string.

Range:

- 2: for non-specific repeating byte
- 16: for 16-byte specific string

Default: 2.

9. **`tmonmd`** – Tributary Monitoring Mode
   This parameter specifies the monitoring mode for the tributary.
   Type: Alphanumeric value set.
   Range:
   - MON
   - NMON

   Default: NMON.
10. **`trc`** – Outgoing Path Trace
    This parameter specifies the path trace (J2) to be sent (source). For the 16-byte path trace format, the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
    Type: Hexadecimal number without a preceding "H".
    Range: The range depends on the parameter *ptrcwfmt* specified in **`RTRV-PTF`** output parameters
    - length: 32 hexadecimal digits.
    - value: specific string acc. ITU/ETSI mode 1.

    Default: 00.

Output format

If the **`ED-LOPTF`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **`ED-LOPTF`** shall generate a **`REPT DBCHG`** message. The command shall modify the attributes (listed in the spec_block parameters part of this command) of the addressed LO Path Termination entitity according to the parameters given with this command. The modification is reported by means of an **`ED-LOPTF`** notification.

Example input/output

```
ED-LOPTF-TMSVT:LT-UNITE:1-1-#-#-39-tms16-1-28:123456:::tmonmd=NMON;

   LT-UNITE 00-11-11 11:11:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ED-LOPTF** command.

Validation rule: Check *modifier* and *ptrcrfmt* consistency

If the command is applied with the parameter *ptrcrfmt* which is going to be set to 64, then the command is denied.

Error code:

`IPNC – Input, Parameter Not Consistent, 64 byte path trace not allowed`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Related TL1 messages

ED-LOPTF notification

Output format

Command syntax: **ED-LOPTF**-*modifier*:*aid*::*spec_block*;

Output parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the low-order tributary.
   Type: Alphanumeric value set.
   Range: TMSVT.
   Default: None.
2. **aid** – Access Identifier
   The access identifier specifies the low-order tributary whose attributes are reported.
   Type: AID
   Range: TMuxSLONumAID.
   The following values are not used:
   - **all**, **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID
   - **all** for Simple_TMuxSPTNumAID
   - **all** for Simple_TMuxSLONumAID

   No wildcards are allowed.
   Default: None.

Spec block parameters

1. **degthr** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).
   This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range (as exponents of 10): –5; –6; –7; –8; –9, that means, the range is 10^{-9} to 10^{-5}.
   Default: –6.
2. **dexcthr** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range (as exponents of 10): –3; –4; –5, that means, the range is 10^{-5} to 10^{-3}.
Default: –3.

3. **`explptrc`** – Expected LO Path Trace Identifier
   This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Hexadecimal number without a preceding "H".
   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.
   Default: 89000000000000000000000000000000
4. **`lopn`** – LO ASA Profile Name
   This parameter points to a tributary ASAP profile name *pfname* for the designated AID. For *modifier* = TMSVT, an ASAP profile of type *PATHTERM* is required.
   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
   Range: 1 to 24 characters.
   Default: DEFAULT.
5. **`lptimais`** – LO Trace Identifier Mismatch AIS Insertion
   This parameter specifies whether a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).
   Type: Alphanumeric value set.

   Range:

   - DISABLE
   - ENABLE

   Default: The default value depends on interface standard:

   - SONET: DISABLE.
6. **`lptimmon`** – LO Path Trace Identifier Mismatch Monitor
   This parameter specifies the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.

Range:

- DISABLE
- ENABLE

Default: DISABLE

7. **`ptrcrfmt`** – Path Trace Read Format
The parameter *ptrcrfmt* specifies the format of the path trace (J1 or J2 byte) to be received (sink).
The parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Numeric string.
Range:
   - 2: for non-specific repeating byte
   - 16: for 16-byte specific string
   - 64: for 64-byte string.

   To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.
Default: 2.
8. **`ptrcwfmt`** – Path Trace Write Format
This parameter specifies the format of the path trace (J2 byte) to be sent (source).
Type: Numeric string.
Range:
   - 2: for non-specific repeating byte
   - 16: for 16-byte specific string

   Default: 2.
9. **`tmonmd`** – Tributary Monitoring Mode
This parameter specifies the monitoring mode for the tributary.
Type: Alphanumeric value set.
Range:
   - MON
   - NMON

   Default: NMON.
10. **`trc`** – Outgoing Path Trace
This parameter specifies the path trace (J2) to be sent (source). For the 16-byte path trace format, the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
Type: Hexadecimal number without a preceding “H”.

Range: The range depends on the parameter *ptrcwfmt* specified in **RTRV-PTF** output parameters

- length: 32 hexadecimal digits.
- value: specific string acc. ITU/ETSI mode 1.

Default: 00.

Example input/output

Example of ED-LOPTF notification representing a VT1.5 tributary:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ED-LOPTF-TMSVT:1-1-#-#-39-tms16-1-28::\
    explptrc=89000000000000000000000000000000,\
    lptimmon=DISABLE,lopn=DEFAULT,\
    ptrcrfmt=1,tmonmd=NMON″
;
```

ED-MAP-RING: Edit map ring

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

Input format

Command syntax: **`ED-MAP-RING`**:*tid*:[*aid*]:*ctag*::[*rid*],*spec_block;*

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **`ctag`** – Correlation Tag
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
4. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
   Option: If *aid* is specified, then *rid* can be omitted. If *rid* is omitted, the *aid* parameter is used to select a ring. The values of *aid* and *rid* must not both be omitted.

Spec block parameters

1. **`localnid`** – Local Node ID
   This parameter specifies the local node ID of the NE receiving the retrieve request (i.e. the node which has been addressed within RTRV-MAP-Ring command) as used by the MS-SPRing/BLSR APS protocol.
   Type: Numeric string.
   Range: 0 .. 15
   Option: The operator is responsible of the uniqueness of the value in the ring.
2. **`ringdir`** – Ring Direction
   This parameter indicates whether the local node's east or west provisioned or hardwired direction port is connected to the next node in the ring map.
   Type: Alphanumeric string.
   Range: E.
3. **`rnids`** – Ring Node Identifiers
   This is an ampersand-separated list with a maximum of 16 entries, where each entry is an integer between 0 and 15. The first entry is the lowest numbered node ID on the ring. Each subsequent value is the node IF of the next node on the ring. Each permitted value may only be used once in the list. The number of values defines the number of nodes on the ring. If the number of nodes specified is smaller than previously specified, those unspecified entries in the ring map are set to the default value.
   Type: string.
   Range: All permutations of a subset of {0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15} separated by a '&'.
4. **`rtids`** – Ring Node Target Identifiers
   This is an ampersand-separated list with a maximum of 16 entries, where each entry is a valid TID. Each entry in the list is the TID corresponding to the entry in that position of the *rnids* list. Similarly, if the size of the ring map decreases from the previous ED-MAP-RING command, those unspecified TID entries in the ring map are set to the default value. The number of values for *rnids* and *rtids* must be equal.
   Option: If *aid* is specified, then *rid* can be omitted.
   Type: string.
   Range: 16 ampersand-separated TIDs.
   Default: None (empty).

Note:

When different numbers of ring node identifiers (*rnids*) and ring node target identifiers (*rtids*) are entered, the command is denied. However, the related error message is not precise enough, but it simply states: `/* Input, Data Not Valid */`. The correct error message should be:

```
/* Input, Data Not Valid, different number of values in rnids and rtids
*/
```

Output format

After receiving the **`ED-MAP-RING`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

1. **`sid`** – Source Identifier
   This is the currently active name of the network element to which the command is addressed. The tid is a case insensitive character string.
   Type: identifier, in addition the special character underscore “_” and the password characters are allowed.
   Range: 1 to 20 characters.
2. **`date`** – Date
   Date when output message is generated. This has the format YY-MM-DD (year-month-day)
   Type: value set.
   Range: for YY 00 to 99, for MM 01 to 12, for DD 01 to 31
   TL1 messages use YY-MM-DD for the format of a date, meaning that the year only has two digits. This is consistent with Telcordia requirements. Internally, however, the system does use a 4-digit year. When the year appears in a response, the internal 4-digit year is truncated to two digits. When the year appears as an input parameter, for example in the **`ED-DAT`** command, years in the range 90-99 will represent 1990-1999, and years in the range 00-37 will represent 2000-2037.
   Default:00-01-01
3. **`time`** – Time
   Time when output message is generated. This has the format HH:MM:SS (hours:minutes:seconds).
   Type: Value set.
   Range: for HH 00 to 23, for MM 00 to 59, for SS 00 to 59.
   Default: 00:00:00
4. **`M`** – Message
   M indicates that the output message is generated in response to a manual command.
   Type: Value set.
   Range: M

5. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: Non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.
6. **IP** – In Progress
   IP is sent in response to all commands with the exception of commands that result in error code output.
   Type: Value set.
   Range: IP
7. **RL** – Repeat Later
   The requested command cannot be executed due to unavailable system resources. The command may be entered again later.
   Type: Value set.
   Range: RL
8. **COMPLD** – Completion Code
   It indicates that the command has been completed.
   COMPLD for successful command execution: For a command that is decomposed into a set of atomic commands a COMPLD completion code means that the command was successful for all atomic commands (e.g. AID ranges, group alias).
   COMPLD for no changes: If a parameter has a current value, and a provisioning command attempts to reprovision the parameter with a value that is the same as its current value, the command will return a COMPLD completion code.
   Type: Value set.
   Range: COMPLD.

Detailed behavior description

For open rings, the output shall start at the end with the lower nid value and shall continue to the other end. For closed rings, the output shall start at the node with the lowest *nid* value and shall continue in the direction of the first node’s east neighbor. The **ED-MAP-RING** command is also denied if the list does not contain the local node , if the list does not contain at least 2 nodes, or if duplicate nid values appear in the list.

Example input/output

The following is an example of the **ED-MAP-RING** command. Manually, node numbers 3 for NENAME-1, 14 fr NENAME-2 and 8 for NENAME-3 are assigned:

```
ED-MAP-RING:NENAME-1::123456::RingID:rnids=3&14&8,rtids=NENAME-1&NENAME-2&NENAME-3;
   NENAME-1 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: consistent aid and rid

If both an *aid* and an *rid* are specified as input parameters and they are inconsistent, then the following error response is returned.

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

Validation rule: No duplicate Ring Node Identifiers

If the list of ring node identifiers specified in the parameter rnids contains duplicate values, the command is denied.

Error code: `IDNV – Input, Data Not Valid, duplicate ring node identifiers`

Validation rule: No duplicate Ring Node Target Identifiers

If the list of ring node target identifiers specified in the parameter rtids contains duplicate values, the command is denied.

Error code:
`IDNV – Input, Data Not Valid, duplicate ring node target identifiers`

Validation rule: Consistent *rnids* and *rtids* lists

The lists of ring node identifiers and ring node target identifiers specified in the parameters *rnids* and *rtids* shall contain the same number of values, otherwise the command is denied.

Error code:
`IDNV – Input, Data Not Valid, different number of values in rnids and rtids`

Validation rule: Illegal local node ID

If the local node identifier specified with the parmater localnid is not contained in the list of ring node identifers, or if the local node identifier has not been specified, the command is denied.

Error code:
`SNVS – Status, Not in Valid State, illegal local node identifier`

Validation rule: Less than 2 nodes specified

If the list of ring node identifiers contains less than 2 values, the command is denied.

Error code: `INUP – Input, Non-null Unimplemented Parameter`

ED-NE: Edit NE

The **ED-NE** command is used to activate or de-activate DCN functions associated with the NE at the system level, e.g. the IP tunneling function or the TL1 Translation Device (T-TD) function.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-NE**:*tid*::*ctag*:::*spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
Description: Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
Description: Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
Type: CTAG.

Spec block parameters

1. **ftamftpgw** – File Transfer Translation Device (FT-TD) function
This parameter is used to enable or disable the File Transfer Translation Device (FT-TD) function.
Type: Value set.
Range: ENABLE, DISABLE (default).
2. **tl1tcpipgw** – TL1 Translation Device (T-TD) function
This parameter is used to enable or disable the TL1 Translation Device (T-TD) function.
Type: Value set.
Range: ENABLE, DISABLE (default).

3. **dcnpn** – DCN ASAP Profile Name
   This parameter specifies the name of the current ASAP profile used for DCN alarms.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.
4. **scnpn** – SCN ASAP Profile Name
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.

Output format

If the **ED-NE** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command activates or de-activate the DCN function associated with the parameters specified in the *spec_block* section.

Disabling *ftamftpgw*

When the parameter ftamftpgw is set to DISABLE existing file transfers via FT-TD shall complete normally, but no new file transfer via FT-TD is allowed.

Example input/output

The following example shows the result of an ED-NE command, where IP tunneling is enabled:

```
ED-NE:LT-UNITE::123456:::scnpn=PROFILE2;

   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the *RTRV-NE* command.

Validation rule: Check for correct IP configuration

The request to ENABLE *ftamftpgw*, *tl1tcpipgw* or *tunstat* is only allowed if there is already a valid IP configuration (IP address of LAN1, subnet mask of LAN1, default router) provisioned for the system.

Error code: `SNVS – Status, Not in Valid State, incomplete IP configuration`

For the specific checks refer to

- ENT-FECOM-LAN, parameter ip_lanstat
- ENT-FECOM-LAN, parameter ip_snm
- ENT-ULS, parameter ip_drad.

Validation rule: Check for correct TARP configuration

The request to ENABLE *tl1tcpipgw* is only allowed if TARP originator, propagator and responder roles are enabled for node 1.

Error code: `SNVS – Status, Not in Valid State, TARP not enabled`

Validation rule: Modification of SCN related parameters only while ONNS is enabled

The system shall not allow to modify the SCN related parameters *lsprepholdoff* and *scnpn* while ONNS is disabled (system parameter xcsetup=TRADITIONAL).

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Related TL1 messages

- “RTRV-NE: Retrieve NE” (p. 3-2549)
- “RTRV-FECOM-LAN: Retrieve LAN channel related parameters” (p. 3-2413)
- “ENT-FECOM-LAN: Enter LAN related parameters” (p. 3-1581)

ED-NE notification

Output format

The **ED-NE** notification has the following specific syntax:

ED-NE:::*spec_block*

The output parameters *sid*, *date*, *time*, and *atag* are described in the **REPT DBCHG** notification.

Output parameters

1. **ftamftpgw** – File Transfer Translation Device (FT-TD) function
   This parameter is used to enable or disable the File Transfer Translation Device (FT-TD) function.
   Type: Value set.
   Range: ENABLE, DISABLE (default).
2. **tl1tcpipgw** – TL1 Translation Device (T-TD) function
   This parameter is used to enable or disable the TL1 Translation Device (T-TD) function.
   Type: Value set.
   Range: ENABLE, DISABLE (default).
3. **dcnpn** – DCN ASAP Profile Name
   This parameter specifies the name of the current ASAP profile used for DCN alarms.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.
4. **scnpn** – SCN ASAP Profile Name
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.

Example output

The following is an example ED-NE notification in case the *tunstat* function has been enabled:

```
   LT-UNITE 06-06-30 08:00:00
A  000 REPT DBCHG
   ″TIME=08-00-00,DATE=06-06-30:ED-NE:::scnpn=PROFILE2″

;
```

ED-NE-SECU: Edit NE security

The **ED-NE-SECU** command can be initiated by a user to modify global security parameters in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: No

Input format

Command syntax: **ED-NE-SECU**:*tid*::*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Spec block parameters

1. **age** – Lockout Aging Period
   The time interval during which the number of invalid login attempts are counted. When *age* expires after the last invalid login attempt, the counter of invalid login attempts by that *uid* is reset to zero.
   Type: Numeric string.
   Range: 1 – 999 [minute]
   Default: 60
2. **intrvl** – Lockout Period
   The time during which login attempts using that *uid* will not be allowed. This occurs when the number of consecutive invalid login attempts by a *uid* reaches *thrshld*. When *intrvl* expires, login attempts will again be allowed from that *uid*. If this parameter is set to 0 (zero), the lockout feature is disabled.
   Type: Numeric string.
   Range: 0 – 99 [minute]
   Default: 10

3. **`thrshld`** – Lockout Threshold
   The maximum number of consecutive invalid login attempts that are allowed by a *uid*. If the count of invalid login attempts is equal to the threshold, the *uid* is locked out for *intrvl* period of time. If a login attempt is successful, the count of *invalid* login attempts by that *uid* is reset to zero.
   Type: Numeric string.
   Range: 2 – 99
   Default: 5
4. **`usrage`** – User ID Aging Period
   If a *uid* has never been used to perform a successful login during a specified time interval it is disabled. A value of 0 disables user ID aging.
   The *usrage* does not apply to the super-users. Super-users will be never disabled.
   Type: Numeric string.
   Range: 0 – 999 [days]
   Default: 10

Output format

After receiving the **`ED-NE-SECU`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The NE returns the successful completion response even if none of the parameter values are modified using the **`ED-NE-SECU`** command.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the **`RTRV-HDR`** command.

Detailed behavior description

This command updates the NE security administration values of *thrshld* (Lockout Threshold), *intrvl* (Lockout Period), *age* (Lockout Aging Period), *usrage* (User ID Aging Period) according the values in the parameters .

This update is reported via the corresponding ED-NE-SECU notification – see "ED-NE-SECU notification" (p. 3-449).

Example input/output

The following example shows the successful completion of the **`ED-NE-SECU`** command by the NE:

`ED-NE-SECU:LT-UNITE-123::123456:::thrshld=5,intrvl=2,age=50,usrage=200;`

```
   LT-WBM-789 00-01-01 08:00:00
M  123456 COMPLD
```

;

Error responses

The general error responses defined in “RTRV-HDR: Retrieve header” (p. 3-2417) are also valid for this command.

Related TL1 messages

- “ACT-USER: Activate user” (p. 3-24)
- “RTRV-NE-SECU: Retrieve NE security” (p. 3-2552)

ED-NE-SECU notification

Output format

The **ED-NE-SECU** notification has the following specific syntax:

ED-NE-SECU:::*spec_block*

Output parameters

Spec block parameters

1. **age** – Lockout Aging Period
   The time interval during which the number of invalid login attempts are counted. When age expires after the last invalid login attempt, the counter of invalid login attempts by that uid is reset to zero.
   Type: Numeric string.
   Range: 1 – 999 [minute]
   Default: 60
2. **intrvl** – Lockout Period
   The time during which login attempts using that uid will not be allowed. This occurs when the number of consecutive invalid login attempts by a uid reaches thrshld. When intrvl expires, login attempts will again be allowed from that uid. If this parameter is set to 0 (zero), the lockout feature is disabled.
   Type: Numeric string.
   Range: 0 – 99 [minute]
   Default: 10
3. **thrshld** – Lockout Threshold
   The maximum number of consecutive invalid login attempts that are allowed by a uid. If the count of invalid login attempts is equal to the threshold, the uid is locked out for intrvl period of time. If a login attempt is successful, the count of invalid login attempts by that uid is reset to zero.
   Type: Numeric string.
   Range: 2 – 99
   Default: 5
4. **usrage** – User ID Aging Period
   Type: Numeric string.
   Range: 0 – 999 [days], default: 10

Example output

The example shows a normal notification after an ED-NE-SECU command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:ED-NE-SECU:::thrshld=5,intrvl=2,age=50,usrage=200″
;
```

ED-NNCNFG: Modify ONNS system configuration

Overview

The **ED-NNCNFG** command is used to modify ONNS system level parameters.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P4

Abortable: No

Input format

Command syntax: **ED-NNCNFG:***srcTid:srcAid:ctag::specBlock;*

Input parameters

Command parameters

1. **srcTid** – Source Target Identifier
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set.
2. **srcAid**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **ctag** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

Spec block parameters

1. **`AdminCostEscalation`**
   Determines whether a cost escalation algorithm is applied or not. This algorithm raises the cost of a link bundle to reduce the attractiveness when the link bundle fills up.
   Type: Alphanumeric value set.
   Range: DISABLE, ENABLE (default).
2. **`DefaultRstrPriority`** – Default Restoration Priority
   This parameter determines the connection restoration priority default to be used if a value is not specified in the **`ENT-PATH`** command. Lower values denote higher priority.
   Note: Though the parameter *DefaultRstrPriority* can be set via ED-NNCNFG, it is for future use only, i.e. an actual value different from 0 will not be considered on connection setup. If no restoration priority is given via the **`ENT-PATH`** command, the priorty of the corresponding connection is always 0, no matter of the actual value of *DefaultRstrPriority*.
   Type: Integer.
   Range: 0 – 7).
   Default: 0.
3. **`NNFunctionUpgradeState`**
   After a software upgrade, new ONNS functionality must be explicitly enabled. This parameter indicates whether this has been done or not.
   Type: Alphanumeric value set.
   Range:
   - ENABLE: New ONNS functionality already enabled.

   Default: ENABLE.
4. **`TCAThresholdHigh`**
   Upper threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status HIGH for this link bundle
   Type: Integer
   Range: 10 – 100 %
   Default: 70 %

5. **`TCAThresholdLow`**
   Lower threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status LOW or HIGH for this link bundle.
   Type: Integer
   Range: 10 – 100%
   Default: 40%
6. **`WaitToRevertTimer`**
   Determines how long an original path must be steadily OK before it is made active again through tear-down of the restoration path. Applies only to auto-reroute revertive connections. This parameter shall apply to M:N protected connections as well.
   Type: Integer
   Range: 60 – 1800 seconds
   Default: 300 seconds.

Note: When parameters *WaitToRevertTimer* or *DefaultRstrPriority* have been changed via the **`ED-NNCNFG`** command, such changes will not be confirmed by the system with a REPT-NNCHG notification. Execute RTRV-NNCHG to get confirmation about changed values from the system.

Output format

If the **`ED-NNCNFG`** request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   ″specBlock″
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) command.

Spec block parameters

This block contains the descriptions and allowed values for the reported output parameters.

1. **`AdminCostEscalation`**
   Determines whether a cost escalation algorithm is applied or not. This algorithm raises the cost of a link bundle to reduce the attractiveness when the link bundle fills up.
   Type: Alphanumeric value set.
   Range: DISABLE, ENABLE (default).
2. **`DefaultRstrPriority`** – Default Restoration Priority
   Determines the connection restoration priority default to be used if a value is not specified in the **`ENT-PATH`** command. Lower values denote higher priority.
   Note: Though the parameter *DefaultRstrPriority* can be set via ED-NNCNFG, it is for future use only, i.e. an actual value different from 0 will not be considered on connection setup. If no restoration priority is given via the **`ENT-PATH`** command, the priorty of the corresponding connection is always 0, no matter of the actual value of *DefaultRstrPriority*.
   Type: Integer
   Range: 0 – 7 (default = 0, highest priority).
3. **`NNFunctionUpgradeState`**
   After a software upgrade, new ONNS functionality must be explicitly enabled. This parameter indicates whether this has been done or not.
   Type: Alphanumeric value set.

   Range:

   - ENABLE: New ONNS functionality already enabled.

   Default: ENABLE.
4. **`TCAThresholdHigh`**
   Upper threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status HIGH for this link bundle
   Type: Integer
   Range: 10 – 100 %
   Default: 70 %

5. **`TCAThresholdLow`**
   Lower threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status LOW or HIGH for this link bundle.
   Type: Integer
   Range: 10 – 100 %
   Default: 40 %

6. **`WaitToRevertTimer`**
   Determines how long an original path must be steadily OK before it is made active again through tear-down of the restoration path. Applies to auto-reroute revertive connections. This parameter shall apply to M:N protected connections as well.
   Type: Integer
   Range: 60 – 1800 seconds
   Default: 300 seconds

Example input/output

The following example demonstrates the usage of the **`ED-NNCNFG`** command for provisioning the system configuration of the wait to revert timer to 60 seconds:

```
ED-NNCNFG:LT-ONNS-A::123456::waitToRevertTimer=60;

   LT-ONNS-A 2002-08-01 08:00:24
M  123456 COMPLD
   ”WaitToRevertTimer=60”
;
```

The following example demonstrates the usage of the **`ED-NNCNFG`** command for provisioning the system configuration of the default connection restoration priority to 5:

```
ED-NNCNFG:LT-ONNS-A::123456::defaultRstrPriority=5;

   LT-ONNS-A 2002-08-01 08:00:24
M  123456 COMPLD
   ”DefaultRstrPriority=5”
;
```

The following example demonstrates the usage of the **`ED-NNCNFG`** command for provisioning the system configuration of the lower TCA threshold to 42%:

```
ED-NNCNFG:LT-ONNS-A::123456::TCAThresholdLow=42;

   LT-ONNS-A 2002-08-01 08:00:24
M  123456 COMPLD
   ”TCAThresholdLow=42”
;
```

The following example demonstrates the usage of the **ED-NNCNFG** command for provisioning the system configuration of the upper TCA threshold to 69%:

```
ED-NNCNFG:LT-ONNS-A::123456::TCAThresholdHigh=69;

   LT-ONNS-A 2002-08-01 08:00:24
M  123456 COMPLD
   ”TCAThresholdHigh=69”
;
```

The following example demonstrates the usage of the **ED-NNCNFG** command for disabling the cost escalation algorithm:

```
ED-NNCNFG:LT-ONNS-A::123456::AdminCostEscalation=DISABLE;

   LT-ONNS-A 2003-08-01 09:00:35
M  123456 COMPLD
   ”AdminCostEscalation=DISABLE”
;
```

The following example demonstrates the usage of the **ED-NNCNFG** command for the provisioning of multiple ONNS system configuration parameters:

```
ED-NNCNFG:LT-ONNS-A::123456::waitToRevertTimer=120,defaultRstrPriority=4;

   LT-ONNS-A 2002-08-01 08:00:24
M  123456 COMPLD
   ”WaitToRevertTimer=120,
   DefaultRstrPriority=4”
;
```

The following example demonstrates the usage of the **ED-NNCNFG** command to enable new ONNS functionality after a SW upgrade:

```
ED-NNCNFG:LT-ONNS-A::123456::NNFunctionUpgradeState=ENABLE;

   LT-ONNS-A 2002-08-01 08:00:24
M  123456 COMPLD
   ”NNFunctionUpgradeState=ENABLE”
;
```

Error responses

Command with an invalid Spec bloc parameter

If the NE receives an ED-NNCNFG command with an invalid specific block input named parameter, then one of the following error responses is returned:

Error code:

`E030 – Syntax, Parameter Data Invalid, invalid_parameter=fieldName`

Error code:

`E246 – Syntax, Parameter Name Invalid, invalid_parameter=fieldName`

TCA related error messages

If the NE receives an ED-NNCNFG command with a *TCAThresholdHigh* value which is out of range, then the following error response is returned:

Error code:

`E420 – Input, Parameter out of Range,invalid_parameter=TCAThresholdHigh`

If the NE receives an ED-NNCNFG command with a *TCAThresholdLow* or *TCAThresholdHigh* which does not fulfill the condition *TCAThresholdLow* <= *TCAThresholdHigh*, the following error response is returned:

Error code: `E422 – Input, TCAThresholdLow Greater than TCAThresholdHigh`

If both parameters are changed with the same command, the validation will be done among these two parameters, otherwise the new value will be compared against the value of the existing second TCA threshold value.

ED-NNCRS: Edit NN cross-connection

The **ED-NNCRS**-modifier command can be initiated by a user to set the cross-connection class parameter (*xconcls*) to TRADITIONAL. The command is available for privileged users as a precondition to delete a cross-connection with *xconcls* = NN via DLT-CRS.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P5

Priority: 1

Abortable: No

Input format

Command syntax: **ED-NNCRS**-*modifier*:*tid*:*in_aid*,*out_aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection on which the **ED-NNCRS** command acts on.
   For detailed description please refer to the **RTRV-CRS** command.
   Type: Alphanumeric value set.
   Range: VC3, VC4, VC44C, VC416C, VC464C, STS1, STS3, STS12, STS48, STS192.
   No **all** value is supported.
2. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and the description of this parameter.
3. **in_aid** – Input Access Identifier
   This parameter specifies the source of the cross-connection. For a detailed description refer to the *in_aid* output parameter in “RTRV-CRS: Retrieve cross-connection” (p. 3-2306).
   Type: GenTribAID.
   The GenTribAID includes the TMuxAPTNumAID, which identifies the HO path terminations of asynchronous TransMUX ports. Because the **ED-NNCRS** command can only be used for cross-connections with class NN, and TransMUX ports cannot be used for ONNS, the TMuxAPTNumAID will never be applicable for this command.
   Range: No use of the **all** or **usall** or **vall** values within the *in_aid* is allowed.

4. **`out_aid`** – Output Access Identifier
   This parameter specifies the sink of the cross-connection. For a detailed description refer to the *out_aid* output parameter in "RTRV-CRS: Retrieve cross-connection" (p. 3-2306).
   Type: GenTribAID.
   The GenTribAID includes the TMuxAPTNumAID, which identifies the HO path terminations of asynchronous TransMUX ports. Because the **`ED-NNCRS`** command can only be used for cross-connections with class NN, and TransMUX ports cannot be used for ONNS, the TMuxAPTNumAID will never be applicable for this command.
   Range: No use of the **`all`** or **`usall`** or **`vall`** values within the *in_aid* is allowed..
5. **`ctag`** – Correlation Tag
   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **`xconcls`** – cross-connection class
   This parameter identifies, whether the cross-connection has been switched explicitly on the traditional way via an ENT-CRS command or implicitly via setting up an ONNS path. It can be set to TRADITIONAL via this command.
   Type: Alphanumeric value set.
   Range: TRADITIONAL

Output format

If the **`ED-NNCRS`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of the "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The *xconcls* parameter of a cross-connection is set to TRADITIONAL via the **`ED-NNCRS`** command.

The change is reported via an ED-CRS (not ED-NNCRS!) notification.

Path-protected cross-connections

If the **`ED-NNCRS`** command is applied on one leg of a path-protected cross-connection, then the cross-connection class of both legs of the path-protected cross-connection is changed.

2-way cross-connections

If the **`ED-NNCRS`** command is applied on one direction of a 2-way cross-connection, then only the cross-connection class of the specified direction is changed. The class of the other direction shall remain unchanged.

Example input/output

```
ED-NNCRS-VC4:UNITE-NE:1-1-#-#-10-1-4,1-1-#-#-20-1-7:123456:::xconcls=TRADITIONAL;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Entities (tributaries) must exist

Cross-connection command processing verifies that the logical tributaries specified in the command do exist.

Error code:

`IENE – Input Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: Entity (cross-connection) must exist

Cross-connection command processing verifies that the specified cross-connection exists.

Error code:

`IENE – Input Entity Not Exists, Specified crossconnection does not exist`

Validation rule: Specified rate consistent with the cross-connecton rate

Cross-connection command processing verifies that the specified rate (*modifier* parameter) is compliant with the rate of the existing cross-connection.

Error code:

`IPNC – Input Parameter Not Consistent, Rate inconsistent with cross-connection rate`

Validation rule: Cross-connection must have *xconcls* = NN

Cross- connection command processing shall verify that the specified cross-connection has set *xconcls* = NN.

Error code:

`SNVS – Status, Not in Valid State, Cross-connection not of class NN`

Validation rule: Cross-connection not involved in Test Access Session

Cross-connection command processing shall verify that the specified cross- connection is not involved in a Test Access Session.

Error code:

`SNVS – Status, Not in Valid State, Cross-connection involved in Test Access Session`

ED-OC3: Edit OC3 port

The **ED-OC3** command is used to provision all parameters related to optical OC3 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-OC3**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC3 port.
   Type: AID.
   Range: OC3 port AID
   For changing the *portControl* parameter the ALL qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.

3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.

4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

6. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
7. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU
8. **`inputsig`** – Tributary Input Signal Rate List
   This parameter is a list of STSn rates across the port's bandwidth.
   If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is setable and retrievable as in fixed mode but does not influence the port behavior.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.
   Default: 31.
   Example: An O-3 signal might be represented by 31 which implies 3 STS1's or 13 which implies 1 STS3C.
9. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
   Type: Alphanumeric value set.
   Range: SONET, SDH.
   Default: As specified via *istddflton* system level, see definition in RTRV-EQPT (system).
10. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

11. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
12. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
13. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 or STS3 (default)

14. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default) or STS3.
15. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
16. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborASTNNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.
17. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If

ndetmd = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

18. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

19. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

20. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

21. **`nelpm`** – Near-End Line PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).

22. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: Alphanumeric value set.
    Range:
    - IPV4 (default)
    - IPV6
    - NSAP

23. **`networkTNAAddress`** – Network TNA Address
    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

24. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-1/OC-3: 1 – 192000.

Default: The default values differ for SDH and SONET:

- STM1: 28800
- OC3: 154.

25. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM1: 28800
    - OC3: 154.
26. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.
27. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000.
Default: The default values differ for SDH and SONET and the different rates:
    - STM1: 2400
    - OC3: 155.
28. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

29. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT

30. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …255. The unit of this value is ″milliseconds″.

31. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

32. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295

33. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
34. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: *""*
35. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.
36. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

37. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST
    - POISSON (default).
38. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
    Default: –6.
39. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
40. **`sfthr`** – Signal Failure Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –3; –4; –5.
    Default: –3.
41. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
42. **`sonet`** – SONET ASAP
    SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see "RTRV-STM4: Retrieve STM4 port" (p. 3-2881), output parameter *sdhpn*) to be compatible with current generation applications.
    Type: Alphanumeric string.
    Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.
    Default: DEFAULT.

43. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
44. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.
45. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
46. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

47. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
48. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in “RTRV-STM16: Retrieve STM16 port” (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
    - ADAPTIVE
    - FIXED.

    Default: FIXED. The initial value is defined as the *trbmddflt* parameter on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400) command.
49. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port’s bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.
Default: 3 1 = all STS1.

50. **`z0outmode`** – Mode of outgoing Z0 byte insertion
    The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
    Type: Alphanumeric value set.
    Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Output format

If the ED-OC3 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-OC3 notification for port (except for parameter *istd;* see below).

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SONET to SDH has the following impact related to Fault Management:

- all SONET alarms related to that port are cleared
- the corresponding SDH alarms are raised.

Switching of tributary mode

When changing the parameter *trbmd* – tributary mode from FIXED to ADAPTIVE the parameter *crstat* may change its value, too, depending on the current input signal structure. This change is notified using the related ED-OC3 notification.

When changing the parameter *trbmd* – tributary mode from ADAPTIVE to FIXED the parameter *crstat* may change its value, too, depending on the current setting of parameter *inputsig*. This change is notified using the related ED-OC3 notification.

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value, the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Impact on port parameters

The switching of *istd* should not result in an deletion and recreation of the port. NE internally there are no differences between SDH and SONET.

Switching of interface standard I:

In detail the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *brstintvl* is set to the default value
- *brstthr* is set to the default value
- *crstat* may change according to its semantics (see description of *crstat*)
- *degthr* is set to the default value for an SDH port
- *dexcthr* is set to the default value for an SDH port
- *felpm* is mapped to *femspm* (no changes)
- *inputsig* is set to the default value

- *istd* is set to SDH
- *nelpm* is mapped to *nemspm* (no changes)
- *rstimca* is set to the default value for a SDH port
- *rstimmon* is set to the default value for a SDH port
- *sdsfmode* is set to the default value for an SDH port
- *spm* is mapped to *rspm* (no changes)
- *sonet* is mapped to *sdhpn* (no changes)
- *trbmd* is set to the default value for an SDH port
- *unequiposig* is set to its default value.

All other port parameters remain unchanged.

Switching of interface standard II:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *rsmstca* is set to the default value for an SDH port
- *tcamd* is set to the default value for a SDH port.

Switching of interface standard III:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *pmmsfeses* is set to the default value for a SDH port
- *pmmsneses* is set to the default value for a SDH port
- *pmrsneses* is set to the default value for a SDH port.

Switching of interface standard IV:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- **`minNNXCRate`** is set to the default value for a SDH port
- **`maxNNXCRate`** is set to the default value for a SDH port

Switching of interface standard – Side effects on tributaries

The switching of *istd* should not result in an deletion and recreation of the tributaries of a port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *brstintvl* is set to the default value for a SDH tributary
- *brstthr* is set to the default value for a SDH tributary
- *pse* (PDI-P parameter) is set to the default value for a SDH tributary
- *sdsfmode* is set to the default value for a SDH tributary.

Switching of interface standard – Side effects on tributaries II

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *degthr* is set to the default value for an SDH tributary
- *dexcthr* is set to the default value for an SDH tributary
- *ptca* is set to the default value for a SDH tributary
- *tcamd* is set to the default value for a SDH tributary.

Switching of interface standard – Side effects on tributaries III

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *pmhpneses* is set to the default value for an SDH tributary
- *pmhpfeses* is set to the default value for an SDH tributary.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-OCn command all resulting parameter changes are reported by ED-STMn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – notification behavior for tributary attributes

When changing the interface standard *istd* using the ED-OCn command all resulting tributary parameter changes are reported by ED-VC3 notifications.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while *portClass* is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual ***portClass***

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when portClass is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when ***portClass*** is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when ***portClass*** is set to INNI and ***ndetmd*** is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when ***portClass*** is set to INNI and ***ndetmd*** is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

ONNS ENNI PORT related behavior - Impact on *ndetmd* when *portClass* is set to ENNI

When *portClass* is set to ENNI, the parameter *ndetmd* is set to MAN.

ONNS ENNI PORT related behavior - Impact on remaining ENNI related port parameter settings, when *portClass* is set to ENNI

When the *portClass* is changed to ENNI, the following parameters of the ENNI parameter set shall keep their actual values, unless specified differently in the command setting the *portClass* to ENNI:

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *remTID*

For remaining ENNI parameters, values different to their default values are mandatory. This is covered by a corresponding validation rule.

ONNS ENNI PORT related behavior - Impact on ENNI related port parameter settings, if *portClass* is changed away from ENNI

When *portClass* is changed away from ENNI, the following parameters are set to their default values:

- *remAdvNodeID*
- *localLinkID*

- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Example input/output

;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the ED-OC3 command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections for fixed tributary mode

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross connections-connections if the port operates in the fixed tributary mode.

Error code:

`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: *unequiposig* consistent with existing cross-connections for fixed tributary mode

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross connections-connections if the port operates in the fixed tributary mode.

Error code:

`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: no cross-connections for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when cross-connections are still on this port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure are still on this port. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: no loopbacks for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no test access session for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: no protection for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when this port is in an protection group.

Error code:

`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: no path protection for *trbmd* change to ADAPTIVE

Check that *trbmd* is not changed to ADAPTIVE when tributaries of this port are used as input tributaries in a path protection group.

Error code:

`SNVS – Status, Not in Valid State, a path protection group is existing`

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:

`SNVS – Status, Not in Valid State, Timing reference is assigned to this port`

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

`SNVS – Status, Not in Valid State, DCC channels are active for this port`

Validation rule: *servcond* must be enabled for protection ports

Check that the *servcond* is not OUTOFSERVICE if the port is used as protection port.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for protection ports`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode.`

Validation rule: ’ALL’ qualifier used for wrong parameters

The ’ALL’ qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:
`IDNC – Input, Data Not Consistent, 'ALL' qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to ptype and SDH standard.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=OC3 is made on a EP155 port which is provisioned as ptype=STM1E.

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:

`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI PORT related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

```
SNVS – Status, Not in Valid State, LO cross-connections, substructure
or conversion cross-connections still exist
```

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

`SNVS – Status, Not in Valid State, Port must not be member of a protection group`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:

`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:

`SNVS – Status, Not in Valid State, port mode change not allowed for INNI ports`

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

Error code:

`SNVS – Status, Not in Valid State, J0 parameters can not be set for INNI ports`

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

```
SNVS – Status, Not in Valid State, only allowed for INNI port in
lockout state
```

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

```
SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI
parameters
```

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State, ndetmd must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

```
IDNV – Input, Data Not Valid, zero values can only be set for all
neighbor information consistently
```

ONNS EDGE PORT related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 4f-BLSR group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 4f-BLSR protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following preconditions must be fulfilled:

- No cross-connections of *xconcls* = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: No modification of *trbmd* to ADAPTIVE at ports of *portClass* EDGE with existing ONNS cross-connections

The system shall not allow to set the tributary mode (parameter *trbmd*) from FIXED to ADAPTIVE for ports with *portClass* EDGE, while NN cross-connections exist at the port.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* to FIXED at ports of *portClass* EDGE with existing ONNS cross-connections

The system shall not allow to set the tributary mode (parameter *trbmd*) from ADAPTIVE to FIXED for ports with *portClass* EDGE, while NN cross-connections or traditional cross-connections exist at the port.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* at ports of *portClass* EDGEwhile *portControl* is not LOCKOUT

It is possible to modify the *trbmd* for an EDGE port only

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to EDGE

Error code:
```
SNVS – Status, Not in Valid State, only allowed for EDGE port in
lockout sate
```

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters if there still any cross-connections for the EDGE port exist which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist

Check if lower-order cross-connections, substructure, or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure, or conversion cross-connections exist, the following error message is returned:

Error code:

```
SNVS – Status, Not in Valid State, LO cross-connections, substructure
or conversion cross-connections still exist
```

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the **protection port** of a 1+1 MSP/APS group.

Error code:

```
SNVS – Status, Not in Valid State, Port must not be a 1+1 protection
port
```

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI if the port is the **protection port** of a 1:1 MSP/APS group.

Error code:

```
SNVS – Status, Not in Valid State, Port must not be a 1:1 protection
port
```

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if UNI-N node is not enabled for the NE.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameters

It is not possible to change the *portClass* to UNI unless valid values for the following UNI parameters are given:

- *clientNodeID*
- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:
`IDNV – Input, Data Not Valid, Valid values for UNI parameters required`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:
`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if the target of *portClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:
`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Check of parameters for UNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for UNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameters not settable for ports of *portClass* = UNI

The following parameter is not changeable to value FIXED for ports with *portClass* = UNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It shall not be possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

ONNS ENNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to ENNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist

Check if lower-order cross-connections, substructure, or conversion cross-connections exist which involve the port to be changed. If lower-order cross-connections, substructure, or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI if the port is the **protection port** of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI if the port is **any member** of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a member of a 1:1 protection group`

Validation rule: Check of ENNI parameters

It is not possible to change the *portClass* to ENNI unless valid values for the following ENNI parameters are given:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, Valid values for ENNI parameters required`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the ENNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to ENNINode`

Validation rule: Check of parameters for ENNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for ENNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: No modification of *trbmd* at ports of *portClass* ENNI with existing cross-connections

The tributary mode (parameter *trbmd*) is not changeable for ports with *portClass* ENNI while cross-connections exist at that port.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* at ports of *portClass* ENNI while *portControl* is not LOCKOUT

The tributary mode (parameter *trbmd*) is not changeable for ports with *portClass* ENNI while cross-connections exist at that port.

It is possible to modify the *trbmd* for an ENNI port only

- if the *portControl* state is LOCKOUT or
- during the transition of the *portClass* to ENNI

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Some parameter values not settable for ports of portClass ENNI

The following parameter is not changeable to value AUTO for ports with *portClass* ENNI:

- *ndetmd*

Error code: `SNVS – Status, Not in Valid State, portClass must not be ENNI`

Validation rule: Modify of ENNI parameters

It is possible to modify the ENNI related parameters only:

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to ENNI.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*
- *remTID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Modify of ENNI parameters

It is not possible to modify any of the ENNI related parameters, if there still exist any cross-connection for the ENNI port.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Unique setting of *localLinkID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value if this value is unique within the system.

Error code:

`IDNV – Input, Data Not Valid, local Link ID value must be unique`

Validation rule: Unique setting of *localLinkID* wrt. *localLPID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value if this value is not already assigned to parameter *localLPID* of any port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of ENNI parameters

It is not possible to set the following ENNI parameters to their default values if *portClass* is equal to ENNI or during the setting of *portClass* to ENNI:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, ENNI Port Parameters must be different to their DEFAULT values`

"RTRV-OC3: Retrieve OC3 port" (p. 3-2602)

References

GR-199-CORE (ED-*rr*)

ED-OC3 autonomous notifications

LOS for transmission port OC3 clears

If LOS is cleared and current port mode is AUTO, then portmode is updated (new value: MON). This update is reported via ED-OC3 notification with parameter *pmode*.

Change of the constituent rates status list

If *trbmd* = ADAPTIVE a change of the attribute *crstat* is notified by the related ED-OC3 notification.

Change of neighbor node and neighbor port information

If *ndetmd* = AUTO a change of the attributes *neighborNodeID*, *neighborPortID* or *neighborASTNNodeID* is notified by the related ED-OC3 notification.

ED-OC3 notification

Output format

Syntax: **`ED-OC3`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of an OC3 port.
   Type: AID.
   Range: SPortAID of OC3 port.
   The keyword **`all`** is allowed up to shelf level.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Description Bursty Interval. Measurement period for determining bursty errors. This parameter applies when sdsfmode=BURST.
   Type: numeric value set
   Range: 2 to 10
   Default: 7
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when sdsfmode=BURST.
   Type: numeric value set (as percentage) 5, 10, … 50
   Default: 30
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future. This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.

6. **`exprstrc`** – Value of Expected J0
Expected regenerator section trace identifier. The parameter expstrc specifying the expected path trace is only relevant for the section trace supervision when the related trace read format strcfmt is set to 16 (16-byte-specific-string mode).
Type: Hexadecimal digits
Range: 16 byte string Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

7. **`felpm`** – Far-end Line PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default)

8. **`frcdus`** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message “do not use” will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range: ENABLE: set a forced DUS/DNU, DISABLE (default): clear a forced DUS/DNU

9. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of STSn rates across the port's bandwidth. If trbmd is FIXED, then inputsig constrains the cross-connection rates that can be entered for the port. If trbmd is ADAPTIVE, then inputsig is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set
    Range: NX-NX-NX-. N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C
    Default: 31
    Example: An OC3 signal might be represented by 31 which implies 3 STS1's or 13 which implies 1 STS3C

11. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range: SONE, SDH
    Default: As specified via istddflton system level, see definition in RTRV-EQPT (system)

12. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

13. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
15. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 or STS3 (default)
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default) or STS3.
18. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`neighborSigPCID` –** Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

25. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

26. **`networkTNAAddress`** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET:

    - STM1: 28800
    - OC3: 154.

28. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 28800
    - OC3: 154.

29. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

30. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000.
Default: The default values differ for SDH and SONET and the different rates:
    - STM1: 2400
    - OC3: 155.
31. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
32. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
33. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.
34. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

35. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

36. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

37. **`remTID`** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: *""*

38. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.

Range:

- ENABLE: enable consequent action for TIM
- DISABLE (default): disable consequent action for TIM.

39. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
40. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST
    - POISSON (default).
41. **`sdthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
42. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
43. **`sfthr`** – Signal Failure Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –3; –4; –5.
Default: –3.
44. **`sltca`** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

45. **`sonet`** – SONET ASAP
SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see "RTRV-STM4: Retrieve STM4 port" (p. 3-2881), output parameter *sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string.
Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.
Default: DEFAULT.

46. **`spm`** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

47. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

48. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc).
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

49. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string dependent on the strcwfmt parameter.

    Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex
50. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout).
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
51. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
    - ADAPTIVE
    - FIXED.

    Default: FIXED. The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
52. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does

not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.
Default: 3 1 = all STS1.

53. **`z0outmode`** – Mode of outgoing Z0 byte insertion
The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
Type: Alphanumeric value set.
Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Example output

```
ED-OC3:UNITE-NE:1-1-#-#-u1-1:123456:::INPUTSIG=31,UNEQUIPOSIG=31;

   UNITE-NE 00-11-28 08:00:00

ED-OC12: Edit OC12 port

The command **ED-OC12** is used to provision all parameters related to optical OC12 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-OC12**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC12 port.
   Type: AID.
   Range: OC12 port AID
   For changing the *portControl* parameter the ALL qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.

3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.

4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

6. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
7. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU
8. **`inputsig`** – Tributary Input Signal Rate List
   This parameter is a list of STSn rates across the port's bandwidth.
   If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is setable and retrievable as in fixed mode but does not influence the port behavior.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C, STS12C.
   Default: 121.
   Example: An OC12 signal might be represented by 31-33 which implies 3 STS1's, 3 STS3C's.
9. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
   Type: Alphanumeric value set.
   Range: SONET, SDH.
   Default: As specified via istddflton system level, see definition in RTRV-EQPT (system).
10. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

11. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
12. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
13. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3 or STS12 (default)

14. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3 or STS12.

15. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN

16. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborASTNNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

17. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If

ndetmd = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

18. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

19. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

20. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

21. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

22. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

23. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

24. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET:

    - STM4: 115200
    - OC12: 615.

25. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 115200
    - OC3: 615.

26. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

27. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of allowed ranges for SDH and SONET):1 – 64000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 2400
    - OC12: 616.

28. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

29. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT

30. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …255. The unit of this value is ″milliseconds″.

31. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

32. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295

33. **remRAID** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

34. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: *""*

35. **rstimca** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
- ENABLE: enable consequent action for TIM
- DISABLE (default): disable consequent action for TIM.

36. **rstimmon** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

37. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.

Range:

- BURST
- POISSON (default).

38. **sdthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

39. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

40. **sfthr** – Signal Failure Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –3; –4; –5.
Default: –3.

41. **sltca** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

42. **sonet** – SONET ASAP
SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see “RTRV-STM4: Retrieve STM4 port” (p. 3-2881), output parameter *sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string.
Range: String with a maximum of 24 characters. A hyphen (“-”) is allowed in the name additionally.
Default: DEFAULT.

43. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
44. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.
45. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
46. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

47. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
48. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
    - ADAPTIVE
    - FIXED.

    Default: FIXED. The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
49. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.
Default: 121 = all STS1 (fixed).

50. **`z0outmode`** – Mode of outgoing Z0 byte insertion
    The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
    Type: Alphanumeric value set.
    Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Output format

If the ED-OC12 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-OC12 notification for port (except for parameter *istd;* see below).

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SONET to SDH has the following impact related to Fault Management:

- all SONET alarms related to that port are cleared
- the corresponding SDH alarms are raised.

Switching of tributary mode

When changing the parameter *trbmd* – tributary mode from FIXED to ADAPTIVE the parameter *crstat* may change its value, too, depending on the current input signal structure. This change is notified using the related ED-OC12 notification.

When changing the parameter *trbmd* – tributary mode from ADAPTIVE to FIXED the parameter *crstat* may change its value, too, depending on the current setting of parameter *inputsig*. This change is notified using the related ED-OC12 notification.

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value, the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Impact on port parameters

The switching of *istd* should not result in an deletion and recreation of the port. NE internally there are no differences between SDH and SONET.

Switching of interface standard I:

In detail the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *brstintvl* is set to the default value
- *brstthr* is set to the default value
- *crstat* may change according to its semantics (see description of *crstat*)
- *degthr* is set to the default value for an SDH port
- *dexcthr* is set to the default value for an SDH port
- *felpm* is mapped to *femspm* (no changes)
- *inputsig* is set to the default value

- *istd* is set to SDH
- *nelpm* is mapped to *nemspm* (no changes)
- *rstimca* is set to the default value for a SDH port
- *rstimmon* is set to the default value for a SDH port
- *sdsfmode* is set to the default value for an SDH port
- *spm* is mapped to *rspm* (no changes)
- *sonet* is mapped to *sdhpn* (no changes)
- *trbmd* is set to the default value for an SDH port
- *unequiposig* is set to its default value.

All other port parameters remain unchanged.

Switching of interface standard II:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *rsmstca* is set to the default value for an SDH port
- *tcamd* is set to the default value for a SDH port.

Switching of interface standard III:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *pmmsfeses* is set to the default value for a SDH port
- *pmmsneses* is set to the default value for a SDH port
- *pmrsneses* is set to the default value for a SDH port.

Switching of interface standard IV:

In addition to the list of attributes above the following attributes are influenced by switching of the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- **`minNNXCRate`** is set to the default value for a SDH port
- **`maxNNXCRate`** is set to the default value for a SDH port

Switching of interface standard – Side effects on tributaries

The switching of *istd* should not result in an deletion and recreation of the tributaries of a port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *brstintvl* is set to the default value for a SDH tributary
- *brstthr* is set to the default value for a SDH tributary
- *pse* (PDI-P parameter) is set to the default value for a SDH tributary
- *sdsfmode* is set to the default value for a SDH tributary.

All other tributary parameters remain unchanged.

Switching of interface standard – Side effects on tributaries II

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *degthr* is set to the default value for an SDH tributary
- *dexcthr* is set to the default value for an SDH tributary
- *ptca* is set to the default value for a SDH tributary
- *tcamd* is set to the default value for a SDH tributary.

Switching of interface standard – Side effects on tributaries III

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *pmhpneses* is set to the default value for an SDH tributary
- *pmhpfeses* is set to the default value for an SDH tributary.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-OCn command all resulting parameter changes are reported by ED-STMn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – notification behavior for tributary attributes

When changing the interface standard *istd* using the ED-OCn command all resulting tributary parameter changes are reported by ED-VC3 notifications.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while *portClass* is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual ***portClass***

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when portClass is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when ***portClass*** is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when ***portClass*** is set to INNI and ***ndetmd*** is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when ***portClass*** is set to INNI and ***ndetmd*** is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

ONNS ENNI PORT related behavior - Impact on *ndetmd* when *portClass* is set to ENNI

When *portClass* is set to ENNI, the parameter *ndetmd* is set to MAN.

ONNS ENNI PORT related behavior - Impact on remaining ENNI related port parameter settings, when *portClass* is set to ENNI

When the *portClass* is changed to ENNI, the following parameters of the ENNI parameter set shall keep their actual values, unless specified differently in the command setting the *portClass* to ENNI:

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *remTID*

For remaining ENNI parameters values different to their default values are mandatory. This is covered by a corresponding validation rule.

ONNS ENNI PORT related behavior - Impact on ENNI related port parameter settings, if *portClass* is changed away from ENNI

When *portClass* is changed away from ENNI, the following parameters are set to their default values:

- *remAdvNodeID*
- *localLinkID*

- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Example input/output

```

```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **`ED-OC12`** command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections for fixed tributary mode

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross connections-connections if the port operates in the fixed tributary mode.

Error code:

`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: *unequiposig* consistent with existing cross-connections for fixed tributary mode

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross connections-connections if the port operates in the fixed tributary mode.

Error code:

`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: no cross-connections for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when cross-connections are still on this port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure are still on this port. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: no loopbacks for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no test access session for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: no protection for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when this port is in an protection group.

Error code:

`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: no path protection for *trbmd* change to ADAPTIVE

Check that *trbmd* is not changed to ADAPTIVE when tributaries of this port are used as input tributaries in a path protection group.

Error code:

`SNVS – Status, Not in Valid State, a path protection group is existing`

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:

`SNVS – Status, Not in Valid State, Timing reference is assigned to this port`

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

`SNVS – Status, Not in Valid State, DCC channels are active for this port`

Validation rule: *servcond* must be enabled for protection ports

Check that the *servcond* is not OUTOFSERVICE if the port is used as protection port.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for protection ports`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode.`

Validation rule: ’ALL’ qualifier used for wrong parameters

The ’ALL’ qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:
`IDNC – Input, Data Not Consistent, ’ALL’ qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to *ptype* and SDH standard.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

Example: DENY, if a command with rr = OC3 is made on a EP155 port which is provisioned as *ptype* = STM1E.

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:

`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI PORT related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

```
SNVS – Status, Not in Valid State, LO cross-connections, substructure
or conversion cross-connections still exist
```

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

`SNVS – Status, Not in Valid State, Port must not be member of a protection group`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:

`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:

`SNVS – Status, Not in Valid State, port mode change not allowed for INNI ports`

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

Error code:

`SNVS – Status, Not in Valid State, J0 parameters can not be set for INNI ports`

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

```
SNVS – Status, Not in Valid State, only allowed for INNI port in
lockout state
```

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

```
SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI
parameters
```

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State,` *`ndetmd`* `must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

`IDNV – Input, Data Not Valid, zero values can only be set for all neighbor information consistently`

ONNS EDGE PORT related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 4f-BLSR group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 4f-BLSR protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following preconditions must be fulfilled:

- No cross-connections of *xconcls* = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: No modification of *trbmd* to ADAPTIVE at ports of *portClass* EDGE with existing ONNS cross-connections

The system shall not allow to set the tributary mode (parameter *trbmd*) from FIXED to ADAPTIVE for ports with *portClass* EDGE, while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* to FIXED at ports of *portClass* EDGE with existing ONNS cross-connections

The system shall not allow to set the tributary mode (parameter *trbmd*) from ADAPTIVE to FIXED for ports with *portClass* EDGE, while NN cross-connections or traditional cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* at ports of *portClass* EDGEwhile *portControl* is not LOCKOUT

It is possible to modify the *trbmd* for an EDGE port only

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to EDGE

Error code:

```
SNVS – Status, Not in Valid State, only allowed for EDGE port in
lockout sate
```

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters if there still any cross-connections for the EDGE port exist which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist

Check if lower-order cross-connections, substructure, or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure, or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the **protection port** of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI if the port is the **protection port** of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if UNI-N node is not enabled for the NE.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameters

It is not possible to change the *portClass* to UNI unless valid values for the following UNI parameters are given:

- *clientNodeID*
- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:
`IDNV – Input, Data Not Valid, Valid values for UNI parameters required`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:
`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if the target of *portClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:
`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Check of parameters for UNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for UNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameters not settable for ports of *portClass* = UNI

The following parameter is not changeable to value FIXED for ports with *portClass* = UNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It shall not be possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

ONNS ENNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to ENNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist

Check if lower-order cross-connections, substructure, or conversion cross-connections exist which involve the port to be changed. If lower-order cross-connections, substructure, or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI if the port is the **protection port** of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI if the port is **any member** of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a member of a 1:1 protection group`

Validation rule: Check of ENNI parameters

It is not possible to change the *portClass* to ENNI unless valid values for the following ENNI parameters are given:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, Valid values for ENNI parameters required`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the ENNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to ENNINode`

Validation rule: Check of parameters for ENNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for ENNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: No modification of *trbmd* at ports of *portClass* ENNI with existing cross-connections

The tributary mode (parameter *trbmd*) is not changeable for ports with *portClass* ENNI while cross-connections exist at that port.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* at ports of *portClass* ENNI while *portControl* is not LOCKOUT

The tributary mode (parameter *trbmd*) is not changeable for ports with *portClass* ENNI while cross-connections exist at that port.

It is possible to modify the *trbmd* for an ENNI port only

- if the *portControl* state is LOCKOUT or
- during the transition of the *portClass* to ENNI

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Some parameter values not settable for ports of portClass ENNI

The following parameter is not changeable to value AUTO for ports with *portClass* ENNI:

- *ndetmd*

Error code: `SNVS – Status, Not in Valid State, portClass must not be ENNI`

Validation rule: Modify of ENNI parameters

It is possible to modify the ENNI related parameters only:

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to ENNI.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*
- *remTID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Modify of ENNI parameters

It is not possible to modify any of the ENNI related parameters, if there still exist any cross-connection for the ENNI port.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Unique setting of *localLinkID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value if this value is unique within the system.

Error code:
`IDNV – Input, Data Not Valid, local Link ID value must be unique`

Validation rule: Unique setting of *localLinkID* wrt. *localLPID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value if this value is not already assigned to parameter *localLPID* of any port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of ENNI parameters

It is not possible to set the following ENNI parameters to their default values if *portClass* is equal to ENNI or during the setting of *portClass* to ENNI:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

```
IDNV – Input, Data Not Valid, ENNI Port Parameters must be different to
their DEFAULT values
```

“RTRV-OC12: Retrieve OC12 port” (p. 3-2620)

References

GR-199-CORE (ED-*rr*)

ED-OC12 autonomous notifications

LOS for transmission port OC12 clears

If LOS is cleared and current port mode is AUTO, then portmode is updated (new value: MON). This update is reported via ED-OC12 notification with parameter pmode.

Change of the constituent rates status list

If *trbmd* = ADAPTIVE a change of the attribute *crstat* is notified by the related ED-OC12 notification.

Change of neighbor node and neighbor port information

If *ndetmd* = AUTO a change of the attributes *neighborNodeID*, *neighborPortID* or *neighborASTNNodeID* is notified by the related ED-OC12 notification.

ED-OC12 notification

Output format

The ED-OC12 notification uses the general format of a **`REPT DBCHG`** (Report Database Change) notification.

Syntax: **`ED-OC12`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of an OC12 port.
   Type: AID.
   Range: SPortAID of OC12 port.
   The keyword **`all`** is allowed up to shelf level.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.

4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute "uniClientNodeID", as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
6. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
7. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU
8. **`inputsig`** – Tributary Input Signal Rate List
   This parameter is a list of STSn rates across the port's bandwidth.
   If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is setable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C, STS12C.
Default: 121.
Example: An OC12 signal might be represented by 31-33 which implies 3 STS1's, 3 STS3C's.

9. **`istd`** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
Type: Alphanumeric value set.
Range: SONET, SDH.
Default: As specified via istddflton system level, see definition in RTRV-EQPT (system).

10. **`linkResCls`** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

11. **`localLinkID`** – Local Link IDentity
The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

12. **`localLPID`** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is

not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

13. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).

14. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: STS1, STS3 or STS12 (default)

15. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: STS1 (default), STS3 or STS12.

16. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
17. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborASTNNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.
18. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0
    If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

19. **`neighborPortID`** – Neighbor Port Id
    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is used by the ONNS application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.
20. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
21. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: IPv4 format: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
22. **`nelpm`** – Near-End Line PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

23. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

24. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type:
    - networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
    - networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
    - networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  0000000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

25. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold
    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET:
    - STM4: 115200
    - OC12: 615.
26. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold
    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET and the different rates:

- STM4: 115200
- OC3: 615.

27. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

28. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000.
Default: The default values differ for SDH and SONET and the different rates:
    - STM4: 2400
    - OC12: 616.

29. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

30. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

31. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …255. The unit of this value is ″milliseconds″.

32. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

33. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295

34. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

35. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: ″″
36. **rstimca** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
   - ENABLE: enable consequent action for TIM
   - DISABLE (default): disable consequent action for TIM.
37. **rstimmon** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
   - ENABLE: enable TIM Monitor
   - DISABLE (default): disable TIM Monitor
38. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
   - BURST
   - POISSON (default).
39. **sdthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

40. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.
41. **sfthr** – Signal Failure Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –3; –4; –5.
Default: –3.
42. **sltca** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
43. **sonet** – SONET ASAP
SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see "RTRV-STM4: Retrieve STM4 port" (p. 3-2881), output parameter *sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string.
Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.
Default: DEFAULT.
44. **spm** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).
45. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the

same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

46. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc).
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
47. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string dependent on the *strcwfmt* parameter.

    Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex
48. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout).
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

49. **trbmd** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
   - ADAPTIVE
   - FIXED.

   Default: FIXED. The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
50. **unequiposig** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.
Default: 121 = all STS1 (fixed).
51. **z0outmode** – Mode of outgoing Z0 byte insertion
The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
Type: Alphanumeric value set.
Range:
   - FIXEDCC (default): for inserting the fixed value CChex
   - STSID: for inserting the STS-Id of the current frame.

Example output

```
ED-OC12:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=31-33,UNEQUIPOSIG=31-33;

   UNITE-NE 00-11-28 08:00:00

```

ED-OC48: Edit OC48 port

The command **ED-OC48** is used to provision all parameters related to optical OC48 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-OC48**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC-48 port.
   Type: AID.
   Range: OC-48 port AID
   For changing the *portControl* parameter the AL’ qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

6. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
7. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU
8. **`inputsig`** – Tributary Input Signal Rate List
   This parameter is a list of STSn rates across the port's bandwidth.
   If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.
   Default: 481.
   Example: An OC-48 signal might be represented by 91-13-112-241 which implies 9 STS1's, 1 STS3C, 1 STS12C, 24 STS1's.
9. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
   Type: Alphanumeric value set.
   Range: SDH.
   Default: SDH
10. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

11. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
12. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
13. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3, STS12 or STS48 (default)

14. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3, STS12 or STS48.
15. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
16. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborASTNNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.
17. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If

ndetmd = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

18. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

19. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

20. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

21. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

22. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

23. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

24. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800

- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

25. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

26. **pmode** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

27. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

28. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

29. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

30. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.

31. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

32. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
33. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
34. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
    Default: empty string: *""*
35. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.

36. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
37. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST
    - POISSON (default).
38. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
    Default: –6.
39. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
40. **`sfthr`** – Signal Failure Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –3; –4; –5.
    Default: –3.
41. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.

42. **sonet** – SONET ASAP
This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see "RTRV-STM16: Retrieve STM16 port" (p. 3-2899), output parameter *sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

43. **spm** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

44. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

45. **strcfmt** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)

- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

46. **strcout** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
47. **strcwfmt** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
48. **trbmd** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in “RTRV-STM16: Retrieve STM16 port” (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
    - ADAPTIVE
    - FIXED.

    Default: FIXED. The initial value is defined as the *trbmddflt* parameter on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400) command.

49. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.
Default: 481 = all STS1 (fixed).
50. **`z0outmode`** – Mode of outgoing Z0 byte insertion
The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
Type: Alphanumeric value set.
Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Output format

If the ED-OC48 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-OC48 notification for port (except for parameter *istd;* see below).

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SONET to SDH has the following impact related to Fault Management:

- all SONET alarms related to that port are cleared
- the corresponding SDH alarms are raised.

Switching of tributary mode

When changing the parameter *trbmd* – tributary mode from FIXED to ADAPTIVE the parameter *crstat* may change its value, too, depending on the current input signal structure. This change is notified using the related ED-OC48 notification.

When changing the parameter *trbmd* – tributary mode from ADAPTIVE to FIXED the parameter *crstat* may change its value, too, depending on the current setting of parameter *inputsig*. This change is notified using the related ED-OC48 notification.

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value, the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Impact on port parameters

The switching of *istd* should not result in an deletion and recreation of the port. NE internally there are no differences between SDH and SONET.

Switching of interface standard I:

In detail the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *brstintvl* is set to the default value
- *brstthr* is set to the default value
- *crstat* may change according to its semantics (see description of *crstat*)
- *degthr* is set to the default value for an SDH port
- *dexcthr* is set to the default value for an SDH port
- *felpm* is mapped to *femspm* (no changes)
- *inputsig* is set to the default value
- *istd* is set to SDH
- *nelpm* is mapped to *nemspm* (no changes)
- *rstimca* is set to the default value for a SDH port
- *rstimmon* is set to the default value for a SDH port
- *sdsfmode* is set to the default value for an SDH port
- *spm* is mapped to *rspm* (no changes)
- *sonet* is mapped to *sdhpn* (no changes)
- *trbmd* is set to the default value for an SDH port
- *unequiposig* is set to its default value.

All other port parameters remain unchanged.

Switching of interface standard II:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *rsmstca* is set to the default value for an SDH port
- *tcamd* is set to the default value for a SDH port.

Switching of interface standard III:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *pmmsfeses* is set to the default value for a SDH port
- *pmmsneses* is set to the default value for a SDH port
- *pmrsneses* is set to the default value for a SDH port.

Switching of interface standard IV:

In addition to the list of attributes above the following attributes are influenced by switching of the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- **`minNNXCRate`** is set to the default value for a SDH port
- **`maxNNXCRate`** is set to the default value for a SDH port

Switching of interface standard – Side effects on tributaries

The switching of *istd* should not result in an deletion and recreation of the tributaries of a port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *brstintvl* is set to the default value for a SDH tributary
- *brstthr* is set to the default value for a SDH tributary
- *pse* (PDI-P parameter) is set to the default value for a SDH tributary
- *sdsfmode* is set to the default value for a SDH tributary.

All other tributary parameters remain unchanged.

Switching of interface standard – Side effects on tributaries II

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *degthr* is set to the default value for an SDH tributary
- *dexcthr* is set to the default value for an SDH tributary
- *ptca* is set to the default value for a SDH tributary
- *tcamd* is set to the default value for a SDH tributary.

Switching of interface standard – Side effects on tributaries III

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *pmhpneses* is set to the default value for an SDH tributary
- *pmhpfeses* is set to the default value for an SDH tributary.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-OCn command all resulting parameter changes are reported by ED-STMn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – notification behavior for tributary attributes

When changing the interface standard *istd* using the ED-OCn command all resulting tributary parameter changes are reported by ED-VC3 notifications.

For efficiency reasons the ED-VC3 notifications is sent out as a single notification using a range over the aid which depends on the port rate of the associated port, i. e. the Simple_STS1NumAID field in the STS1NumAID is set to

- 1 – 3 in case of an STS1/OC3 port
- 1 – 12 in case of an STS4/OC12 port
- 1 – 48 in case of an STS16/OC48 port
- 1 – 192 in case of an STS64/OC192 port
- 1 – 768 in case of an STS256/OC768 port.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while *portClass* is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual *portClass*

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when portClass is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when *portClass* is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

ONNS ENNI PORT related behavior - Impact on *ndetmd* when *portClass* is set to ENNI

When *portClass* is set to ENNI, the parameter *ndetmd* is set to MAN.

ONNS ENNI PORT related behavior - Impact on remaining ENNI related port parameter settings, when *portClass* is set to ENNI

When the *portClass* is changed to ENNI, the following parameters of the ENNI parameter set shall keep their actual values, unless specified differently in the command setting the *portClass* to ENNI:

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *remTID*

For remaining ENNI parameters values different to their default values are mandatory. This is covered by a corresponding validation rule.

ONNS ENNI PORT related behavior - Impact on ENNI related port parameter settings, if *portClass* is changed away from ENNI

When *portClass* is changed away from ENNI, the following parameters are set to their default values:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Example input/output

```

;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the ED-OC48 command.

Validation rule: Enough bandwidth reserved for 2F protection group

Check of the tributary rate (*inputsig*, *unequiposig*) if the port is member of a 2f protection group. Then the assigned bandwith is max. half of the port's bandwith.

Error code:

`IDNV – Input, Data Not Valid, Assigned bandwidth exceeds half port's bandwith`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections for fixed tributary mode

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross connections-connections if the port operates in the fixed tributary mode.

Error code:

`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: *unequiposig* consistent with existing cross-connections for fixed tributary mode

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross connections-connections if the port operates in the fixed tributary mode.

Error code:

`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: no cross-connections for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when cross-connections are still on this port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure are still on this port. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, the following error message is returned:

Error code:
`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: no loopbacks for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no test access session for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:
`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: no protection for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when this port is in an protection group.

Error code:
`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: no path protection for *trbmd* change to ADAPTIVE

Check that *trbmd* is not changed to ADAPTIVE when tributaries of this port are used as input tributaries in a path protection group.

Error code:
`SNVS – Status, Not in Valid State, a path protection group is existing`

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:
`SNVS – Status, Not in Valid State, Timing reference is assigned to this port`

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

`SNVS – Status, Not in Valid State, DCC channels are active for this port`

Validation rule: *servcond* must be enabled for protection ports

Check that the *servcond* is not OUTOFSERVICE if the port is used as protection port.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for protection ports`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **`ED`** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **`ED`** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode.`

Validation rule: 'ALL' qualifier used for wrong parameters

The 'ALL' qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:
`IDNC – Input, Data Not Consistent, 'ALL' qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to ptype and SDH standard.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=OC3 is made on a EP155 port which is provisioned as ptype=STM1E.

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:

`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI PORT related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

`SNVS – Status, Not in Valid State, Port must not be member of a protection group`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:
`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:
`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:
`SNVS – Status, Not in Valid State, port mode change not allowed for INNI ports`

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*

- *strcout*
- *strcwfmt*

Error code:

`SNVS – Status, Not in Valid State, J0 parameters can not be set for INNI ports`

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

`SNVS – Status, Not in Valid State, only allowed for INNI port in lockout state`

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI parameters`

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State, ndetmd must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

```
IDNV – Input, Data Not Valid, zero values can only be set for all
neighbor information consistently
```

ONNS EDGE PORT related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 4f-BLSR group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 4f-BLSR protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following preconditions must be fulfilled:

- No cross-connections of *xconcls* = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: No modification of *trbmd* to ADAPTIVE at ports of *portClass* EDGE with existing ONNS cross-connections

The system shall not allow to set the tributary mode (parameter *trbmd*) from FIXED to ADAPTIVE for ports with *portClass* EDGE, while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* to FIXED at ports of *portClass* EDGE with existing ONNS cross-connections

The system shall not allow to set the tributary mode (parameter *trbmd*) from ADAPTIVE to FIXED for ports with *portClass* EDGE, while NN cross-connections or traditional cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* at ports of *portClass* EDGEwhile *portControl* is not LOCKOUT

It is possible to modify the *trbmd* for an EDGE port only

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to EDGE

Error code:

```
SNVS – Status, Not in Valid State, only allowed for EDGE port in
lockout sate
```

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters if there still any cross-connections for the EDGE port exist which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist

Check if lower-order cross-connections, substructure, or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure, or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the **protection port** of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI if the port is the **protection port** of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if UNI-N node is not enabled for the NE.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameters

It is not possible to change the *portClass* to UNI unless valid values for the following UNI parameters are given:

- *clientNodeID*
- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Valid values for UNI parameters required`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Check of parameters for UNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for UNI ports.

Error code:

`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameters not settable for ports of *portClass* = UNI

The following parameter is not changeable to value FIXED for ports with *portClass* = UNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It shall not be possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

ONNS ENNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to ENNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist

Check if lower-order cross-connections, substructure, or conversion cross-connections exist which involve the port to be changed. If lower-order cross-connections, substructure, or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI if the port is the **protection port** of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI if the port is **any member** of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a member of a 1:1 protection group`

Validation rule: Check of ENNI parameters

It is not possible to change the *portClass* to ENNI unless valid values for the following ENNI parameters are given:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, Valid values for ENNI parameters required`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the ENNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to ENNINode`

Validation rule: Check of parameters for ENNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for ENNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: No modification of *trbmd* at ports of *portClass* ENNI with existing cross-connections

The tributary mode (parameter *trbmd*) is not changeable for ports with *portClass* ENNI while cross-connections exist at that port.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* at ports of *portClass* ENNI while *portControl* is not LOCKOUT

The tributary mode (parameter *trbmd*) is not changeable for ports with *portClass* ENNI while cross-connections exist at that port.

It is possible to modify the *trbmd* for an ENNI port only

- if the *portControl* state is LOCKOUT or
- during the transition of the *portClass* to ENNI

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Some parameter values not settable for ports of portClass ENNI

The following parameter is not changeable to value AUTO for ports with *portClass* ENNI:

- *ndetmd*

Error code: `SNVS – Status, Not in Valid State, portClass must not be ENNI`

Validation rule: Modify of ENNI parameters

It is possible to modify the ENNI related parameters only:

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to ENNI.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*
- *remTID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Modify of ENNI parameters

It is not possible to modify any of the ENNI related parameters, if there still exist any cross-connection for the ENNI port.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Unique setting of *localLinkID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value if this value is unique within the system.

Error code:
`IDNV – Input, Data Not Valid, local Link ID value must be unique`

Validation rule: Unique setting of *localLinkID* wrt. *localLPID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value if this value is not already assigned to parameter *localLPID* of any port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of ENNI parameters

It is not possible to set the following ENNI parameters to their default values if *portClass* is equal to ENNI or during the setting of *portClass* to ENNI:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

```
IDNV – Input, Data Not Valid, ENNI Port Parameters must be different to
their DEFAULT values
```

“RTRV-OC48: Retrieve OC48 port” (p. 3-2638)

References

GR-199-CORE (ED-*rr*)

ED-OC48 autonomous notifications

LOS for transmission port OC48 clears

If LOS is cleared and current port mode is AUTO, then portmode is updated (new value: MON). This update is reported via ED-OC48 notification with parameter *pmode*.

Change of the constituent rates status list

If *trbmd* = ADAPTIVE a change of the attribute *crstat* is notified by the related ED-OC48 notification.

Change of neighbor node and neighbor port information

If *ndetmd* = AUTO a change of the attributes *neighborNodeID*, *neighborPortID* or *neighborASTNNodeID* is notified by the related ED-OC48 notification.

ED-OC48 notification

Output format

Syntax: **`ED-OC48`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: OC-48 port AID.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Bursty Interval. Measurement period for determining bursty errors. This parameter applies when sdsfmode=BURST.
   Type: numeric value set
   Range: 2 to 10.
   Default: 7
3. **`brstthr`** – Bursty Error Threshold
   Description Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set (as percentage) 5, 10, … 50
   Default: 30
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future. This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
   When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
   For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3, 12, 48 representing STS1, STS3C, STS12C, STS48C.
6. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier. The parameter expstrc specifying the expected path trace is only relevant for the section trace supervision when the related trace read format strcfmt is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
7. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default)
8. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message “do not use” will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range: ENABLE: set a forced DUS/DNU, DISABLE (default): clear a forced DUS/DNU.

9. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of STSn rates across the port's bandwidth. If *trbmd* is FIXED, then inputsig constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then inputsig is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set
    Range: NX-NX-NX-… N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.
    Default: 481
    Example: An OC-48 signal might be represented by 91-13-112-241 which implies 9 STS1's, 1 STS3C, 1 STS12C, 24 STS1's.

11. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range: SONET, SDH
    Default: As specified via istddflton system level, see definition in RTRV-EQPT (system)

12. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

13. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
15. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3, STS12 or STS48 (default)
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3, STS12 or STS48.
18. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0
    If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is used by the ONNS application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

25. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

26. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type:
- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:
- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:
- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:
- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340

28. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

29. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Typ:e alphanumeric value set
    Range:
    - AUTO: indicates that, when a signal is detected at the port, then alarm monitoring will start (default).
    - MON: indicates that alarm monitoring is taking place on the port.
    - NMON: means that alarm monitoring is not occurring on the port.
30. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
    Type: numeric value set (superset of allowed ranges for SDH and SONET): 1 – 64000
    Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8854
    - SONET OC768:22776
31. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
32. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT

33. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.

34. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

35. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

36. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

37. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

38. **rstimca** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0). This parameter is relevant only if the related trace read format strcfmt is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: ENABLE: enable consequent action for TIM, DISABLE (default): disable consequent action for TIM

39. **rstimmon** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0). This parameter is relevant only if the related trace read format strcfmt is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: ENABLE: enable TIM Monitor, DISABLE (default): disable TIM Monitor.

40. **sdsfmode** – Signal Degrade/Signal Fail Mode
he degraded state is detected in Burst or Poisson mode.
Type alphanumeric value set
Range: BURST, POISSON (default)

41. **sdthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when sdsfmode=POISSON.
Type: numeric value set (as exponents of 10): -5, -6 (default), -7, -8, -9

42. **servcond** – Service Condition
This parameter shall indicate its status concerning service involvement.
Type alphanumeric value set
Range: INSERVICE (default): Provisioning values for service is accepted, OUTOFSERVICE: Provisioning values for service is not accepted.

43. **sfthr** – Signal Failure Threshold
Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when sdsfmode=POISSON
Type: numeric value set (as exponent of 10): -3 (default), -4, -5

44. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string
    Range: String with maximum of 24 characters
    Default: DEFAULT0

45. **`sonet`** – SONET ASAP
    SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see RTRV-STM16, output parameter sdhpn) to be compatible with current generation applications.
    Type: Alphanumeric string A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT

46. **`spm`** – Section PM Enable
    Description Enable or disable regenerator section (section) performance monitoring.
    Type; alphanumeric value set
    Range: ENABLE, DISABLE (default)

47. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.

48. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming regenerator section/section trace (strc) and the expected regenerator section/section trace (*exprstrc*). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.

Range:

- 1 for specific repeating byte (SONET)
- 2 (default) for non-specific repeating byte (ITU/ETSI mode 2)
- 16 for 16 byte specific string (ITU/ETSI mode 1)
- 64 for 64 byte string (SONET).

Default: 2

49. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter. If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits
Range: 1 byte string; 16 bytes string; 64 bytes string dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

50. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing regenerator section/section trace (*strcout*). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1 for specific repeating byte (SONET)
    - 2 (default) for non-specific repeating byte (ITU/ETSI mode 2)
    - 16 for 16 byte specific string (ITU/ETSI mode 1)
    - 64 for 64 byte string (SONET).

51. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
Type: Alphanumeric value set.
Range: ADAPTIVE, FIXED
Default: The initial value is defined as the trbmddflt parameter on system level, see definition in RTRV-EQPT (system) command.

52. **`unequiposig`** – Unequipped Output Signal List
Tributary Unequipped Output Signal Rate List. This parameter is a list of STSn rates across the port’s bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. unequiposig and inputsig do not need to have the identical setting. Mixed rates for tx and rx side of

the port is allowed. If trbmd is ADAPTIVE, then unequiposig is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set. NX-NX-NX-… N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.
Default: 481 = all STS1 (fixed).

53. **`z0outmode`** – Mode of outgoing Z0 byte insertion
The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3,12,48).
Type: Alphanumeric value set.
Range: FIXEDCC (default). for inserting the fixed value CChex, STSID: for inserting the STS-Id of the current frame Default FIXEDCC

ED-OC48T: Edit OC48 transparent port

The command **ED-OC48T** is used to provision all parameters related to optical OC48 transport port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-OC48T**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Type: AID.
   Range: OC-48T port AID.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **exprstrc** – Value of Expected J0
   For ED-OC48T this parameter refers to the incoming (ingress) direction.
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

2. **`exprstrcout`** – Value of Expected J0 in outgoing direction
   Expected regenerator section trace identifier in outgoing (egress) direction.
   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
3. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET.
   Type: Alphanumeric value set.
   Range: SONET.
4. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.

   Range:

   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.
5. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
   For ED-OC48T this parameter refers to the incoming (ingress) direction.
   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set.
   Range (superset of allowed ranges for SDH and SONET):1 – 64000

   Default: The default values differ for SDH and SONET and the different rates:

   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.

6. **`pmrsnesesout`** – Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction
   This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set
   Range (superset of allowed ranges for SDH and SONET): 1 – 64000
   Default:

   The default values differ for SDH and SONET and the different rates:

   - SDH (all rates): 2400
   - SONET OC48: 2392
7. **`rstimmon`** – RS TIM Monitor Enable
   For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
   Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
   This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
   Type: Alphanumeric value set.

   Range:

   - ENABLE: enable TIM Monitor
   - DISABLE (default): disable TIM Monitor
8. **`rstimmonout`** – RS TIM Monitor Enable in Outgoing direction
   Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor
9. **`servcond`** – Service Condition
   This parameter indicates its status concerning service involvement.
   Type: Alphanumeric value set.

   Range:

   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.

10. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
11. **`sonet`** – SONET ASAP
    This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see "RTRV-STM16: Retrieve STM16 port" (p. 3-2899), output parameter *sdhpn*) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
12. **`spm`** – Section PM Enable
    For ED-OC48T this parameter refers to the incoming (ingress) direction.
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
13. **`spmout`** – Section PM Enable in Outgoing Direction
    Enable or disable regenerator section (section) performance monitoring for the outgoing (egress) direction.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
14. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

    For ED-OC48T this parameter refers to the incoming (ingress) direction.

15. **`strcfmtout`** – Format of outgoing J0
    The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).
    Type: Numeric string.
    Range:
    - 1, for specific repeating byte (SONET)
    - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
    - 16, for 16 byte specific string (ITU/ETSI mode 1)
    - 64, for 64 byte string (SONET).

Output format

If the ED-OC48T command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-OC48T notification for port (except for parameter *istd;* see below).

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt/strcfmtout) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc/expstrcout) and the currently received J0 (strc/strcout).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SONET to SDH has the following impact related to Fault Management:

- all SONET alarms related to that port are cleared
- the corresponding SDH alarms are raised.

Switching of interface standard – Impact on port parameters

The switching of *istd* should not result in an deletion and recreation of the port. NE internally there are no differences between SDH and SONET.

Switching of interface standard :

In detail the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *istd* is set to SDH
- *rstimmon* is set to the default value for a SDH port
- *rstimmonout* is set to the default value for a SDH port
- *spm* is mapped to *rspm* (no changes)
- *spmout* is mapped to rspmout (no changes)
- *sonet* is mapped to *sdhpn* (no changes)
- *rsmstca* is set to the default value for an SDH port
- *tcamd* is set to the default value for a SDH port
- *pmrsneses* is set to the default value for a SDH port
- *pmrsnesesout* is set to the default value for a SDH port.

All other port parameters remain unchanged.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-OCn command all resulting parameter changes are reported by ED-STMn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged

3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the impacts listed above, the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Example input/output

```
ED-OC48T:UNITE-NE:1-1-#-#-1-1:123456:::SPM=ENABLE,SPMOUT=ENABLE;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-28:ED-OC48T:1-1-#-#-1-1::spm=ENABLE,spmout=ENABLE:”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ED-OC48T** command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:
`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:
`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **ED** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **ED** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Check CCB against *ptype* and *istd*

Check wether the CCB fits to ptype and istd.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

LOS for OC48 Transparent transmission port clears

If LOS is cleared and current port mode is AUTO, then *portmode* is updated (new value: MON). This update is reported via ED-OC48T notification with parameter *pmode*.

ED-OC48T notification

Output format

Syntax

`ED-OC48T`*:aid::spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: OC-48 port AID.

Spec block parameters

1. **`exprstrc`** – Value of Expected J0
   For ED-OC48T Notification this parameter refers to the incoming (ingress) direction.
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
2. **`exprstrcout`** – Value of Expected J0 in outgoing direction
   Expected regenerator section trace identifier in outgoing (egress) direction.
   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

3. **`fsflpbkstat`** – Far Side Facility Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).
4. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET.
   Type: Alphanumeric value set.
   Range: SONET.
   Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
5. **`lpbk`** – Loopback
   This parameter specifies the current near-side loopback status of the considered output *aid*.
   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).
6. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

7. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
   For ED-OC48T Notification this parameter refers to the incoming (ingress) direction.
   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set.
   Range (superset of allowed ranges for SDH and SONET):1 – 64000
   Default: The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.
8. **`pmrsnesesout`** – Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction
   This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set
   Range (superset of allowed ranges for SDH and SONET): 1 – 64000
   Default:
   The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
9. **`rstimmon`** – RS TIM Monitor Enable
   For ENT-OC48T Notification this parameter refers to the incoming (ingress) direction.
   Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
   This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
   Type: Alphanumeric value set.
   Range:
   - ENABLE: enable TIM Monitor
   - DISABLE (default): disable TIM Monitor

10. **`rstimmonout`** – RS TIM Monitor Enable in Outgoing direction
Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor
11. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
12. **`sltca`** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
13. **`sonet`** – SONET ASAP
This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see "RTRV-STM16: Retrieve STM16 port" (p. 3-2899), output parameter *sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
14. **`spm`** – Section PM Enable
For ED-OC48T this parameter refers to the incoming (ingress) direction.
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
15. **`spmout`** – Section PM Enable in Outgoing Direction
Enable or disable regenerator section (section) performance monitoring for the outgoing (egress) direction.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).

16. **`strcfmt`** – Format of incoming J0
    For ED-OC48T this parameter refers to the incoming (ingress) direction.
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
17. **`strcfmtout`** – Format of outgoing J0
    The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).
    Type: Numeric string.
    Range:
    - 1, for specific repeating byte (SONET)
    - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
    - 16, for 16 byte specific string (ITU/ETSI mode 1)
    - 64, for 64 byte string (SONET).

Example input/output

```

ED-OC192: Edit OC192 port

The command **ED-OC192** is used to provision all parameters related to an optical OC192 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-OC192**:*tid*:*aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC192 port.
   Type: AID.
   Range: SPortAID of OC192 port.
   The keyword **all** is allowed up to shelf level.
   For changing the *portControl* parameter the ALL qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.

3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.

4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

6. **`fec`** – FEC Enable
   Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
   Type: Alphanumeric value set.
   Range:
   DISABLE (only) for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics
   - OC192 / STM64 client ports (related to OTN ports)
   - OC768/STM256 basis low cost intra office 1310 nm optics.

   ENABLE / DISABLE for:
   - OC192 / STM64 OLS800G compatible 80 colour optics
   - OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
   - OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
   - OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

   Default:
   DISABLE for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics
   - OC192 / STM64 client ports (related to OTN ports)
   - OC768/STM256 basis low cost intra office 1310 nm optics

   ENABLE for:
   - OC192 / STM64 OLS800G compatible 80 colour optics
   - OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
   - OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
   - OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)
7. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

8. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.

   Range:

   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **`inputsig`** – Tributary Input Signal Rate List
   This parameter is a list of STSn rates across the port's bandwidth.
   If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C or STS192C.
   Default: 1921.

10. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: SDH

11. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

12. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass*

values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

13. **`localLPID`** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

14. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: STS1, STS3, STS12, STS48 or STS192 (default)

15. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: STS1 (default), STS3, STS12, STS48 or STS192.

16. **`msrei`** – MS-REI mode
Definition: An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.
Type: Alphanumeric value set.
Range:
    - SINGLE
    - EXTENDED (default).
17. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN
18. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

19. **neighborNodeID** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0
    If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

20. **neighborPortID** – Neighbor Port Id
    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is used by the ONNS application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

21. **neighborSigPCID** – Neighbor Signaling PC IDentity
    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

22. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).

24. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
   - IPV4 (default)
   - IPV6
   - NSAP

25. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

26. **och** – optical channel enable
Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don’t have any impact on transmission.
Type: Alphanumeric value set.

Range:

- for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel

- for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
- for client ports on packs which support OTN: DISABLE; disable, optical channel not applicable.

Default:

- for OP10 and Op40 packs, which cannot support OCH: DISABLE
- for OP10 packs, which cannot support OCH: ENABLE
- for OP10 and OP40 packs, which only support OCH: ENABLE
- for client ports on packs which support OTN: DISABLE.

27. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

28. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

29. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

    Default:
    - AUTO for optical SDH/SONET ports
    - NMON for client ports.
30. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

31. **`polynomial`** – Optical Channel Scrambling Polynomial
    This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (och = ENABLE).
    Type: numeric value set.
    Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.
    Default: 2.
32. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
33. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
34. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …255. The unit of this value is ″milliseconds″.
35. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

36. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295
37. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0
38. **`remTID`** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: *""*
39. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.

40. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
41. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST
    - POISSON (default).
42. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
    Default: –6.
43. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
44. **`sfthr`** – Signal Failure Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –3; –4; –5.
    Default: –3.
45. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.

46. **`sonet`** – SONET ASAP
    This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see “RTRV-STM64: Retrieve STM64 port” (p. 3-2926), output parameter *sdhpn*) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
47. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
48. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.
49. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)

- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

50. **strcout** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
51. **strcwfmt** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
52. **trbmd** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.

Range:

- ADAPTIVE
- FIXED.

Default: FIXED. The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.

53. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12, 48 or 192 representing STS1, STS3C, STS12C, STS48C or STS192C.
Default: 1921 = all STS1 (fixed).

Output format

If the ED-OC192 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-OC192 notification for port (except for parameter *istd;* see below).

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SONET to SDH has the following impact related to Fault Management:

- all SONET alarms related to that port are cleared
- the corresponding SDH alarms are raised.

Switching of tributary mode

When changing the parameter *trbmd* – tributary mode from FIXED to ADAPTIVE the parameter *crstat* may change its value, too, depending on the current input signal structure. This change is notified using the related ED-OC192 notification.

When changing the parameter *trbmd* – tributary mode from ADAPTIVE to FIXED the parameter *crstat* may change its value, too, depending on the current setting of parameter *inputsig*. This change is notified using the related ED-OC192 notification.

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value, the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Impact on port parameters

The switching of *istd* should not result in an deletion and recreation of the port. NE internally there are no differences between SDH and SONET.

Switching of interface standard I:

In detail the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *brstintvl* is set to the default value
- *brstthr* is set to the default value
- *crstat* may change according to its semantics (see description of *crstat*)
- *degthr* is set to the default value for an SDH port
- *dexcthr* is set to the default value for an SDH port
- *felpm* is mapped to *femspm* (no changes)
- *inputsig* is set to the default value
- *istd* is set to SDH
- *nelpm* is mapped to *nemspm* (no changes)
- *rstimca* is set to the default value for a SDH port
- *rstimmon* is set to the default value for a SDH port
- *sdsfmode* is set to the default value for an SDH port
- *spm* is mapped to *rspm* (no changes)
- *sonet* is mapped to *sdhpn* (no changes)
- *trbmd* is set to the default value for an SDH port
- *unequiposig* is set to its default value.

All other port parameters remain unchanged.

Switching of interface standard II:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *rsmstca* is set to the default value for an SDH port
- *tcamd* is set to the default value for a SDH port.

Switching of interface standard III:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *pmmsfeses* is set to the default value for a SDH port
- *pmmsneses* is set to the default value for a SDH port
- *pmrsneses* is set to the default value for a SDH port.

Switching of interface standard IV:

In addition to the list of attributes above the following attributes are influenced by switching of the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- **`minNNXCRate`** is set to the default value for a SDH port
- **`maxNNXCRate`** is set to the default value for a SDH port

Switching of interface standard – Side effects on tributaries

The switching of *istd* should not result in an deletion and recreation of the tributaries of a port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SONET to SDH (see also the related RTRV-STM*n* command for SDH parameter description):

- *brstintvl* is set to the default value for a SDH tributary
- *brstthr* is set to the default value for a SDH tributary
- *pse* (PDI-P parameter) is set to the default value for a SDH tributary
- *sdsfmode* is set to the default value for a SDH tributary.

Switching of interface standard – Side effects on tributaries II

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *degthr* is set to the default value for an SDH tributary
- *dexcthr* is set to the default value for an SDH tributary
- *ptca* is set to the default value for a SDH tributary
- *tcamd* is set to the default value for a SDH tributary.

Switching of interface standard – Side effects on tributaries III

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH (see also the related RTRV-STMn command for SDH parameter description):

- *pmhpneses* is set to the default value for an SDH tributary
- *pmhpfeses* is set to the default value for an SDH tributary.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-OCn command all resulting parameter changes are reported by ED-STMn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – notification behavior for tributary attributes

When changing the interface standard *istd* using the ED-OCn command all resulting tributary parameter changes are reported by ED-VC3 notifications.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while ***portClass*** is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual ***portClass***

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when portClass is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when ***portClass*** is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

ONNS ENNI PORT related behavior - Impact on *ndetmd* when *portClass* is set to ENNI

When *portClass* is set to ENNI, the parameter *ndetmd* is set to MAN.

ONNS ENNI PORT related behavior - Impact on remaining ENNI related port parameter settings, when *portClass* is set to ENNI

When the *portClass* is changed to ENNI, the following parameters of the ENNI parameter set shall keep their actual values, unless specified differently in the command setting the *portClass* to ENNI:

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *remTID*

For remaining ENNI parameters values different to their default values are mandatory. This is covered by a corresponding validation rule.

ONNS ENNI PORT related behavior - Impact on ENNI related port parameter settings, if *portClass* is changed away from ENNI

When *portClass* is changed away from ENNI, the following parameters are set to their default values:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Example input/output

```
ED-OC192:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=74-33-84,UNEQUIPOSIG=74-33-84;

;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the ED-OC192 command.

Validation rule: Enough bandwidth reserved for 2F protection group

Check of the tributary rate (*inputsig*, *unequiposig*) if the port is member of a 2f protection group. Then the assigned bandwith is max. half of the port’s bandwith.

Error code:
`IDNV – Input, Data Not Valid, Assigned bandwidth exceeds half port’s bandwith`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections for fixed tributary mode

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross connections-connections if the port operates in the fixed tributary mode.

Error code:

`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: *unequiposig* consistent with existing cross-connections for fixed tributary mode

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross connections-connections if the port operates in the fixed tributary mode.

Error code:

`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: no cross-connections for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when cross-connections are still on this port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure are still on this port. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: no loopbacks for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no test access session for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: no protection for *istd*, *trbmd* change

Check that *istd* or *trbmd* is not set to FIXED when this port is in an protection group.

Error code:

`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: no path protection for *trbmd* change to ADAPTIVE

Check that *trbmd* is not changed to ADAPTIVE when tributaries of this port are used as input tributaries in a path protection group.

Error code:

`SNVS – Status, Not in Valid State, a path protection group is existing`

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:

`SNVS – Status, Not in Valid State, Timing reference is assigned to this port`

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

`SNVS – Status, Not in Valid State, DCC channels are active for this port`

Validation rule: *servcond* must be enabled for protection ports

Check that the *servcond* is not OUTOFSERVICE if the port is used as protection port.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for protection ports`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **`ED`** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **`ED`** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode`.

Validation rule: Change of FEC parameters only if supported by the current circuit pack

When changing one of the FEC-related parameters *fec*, *feccor* and *fectype*, it is checked whether the currently provisioned circuit pack supports this. If it is not supported the following error code is used:

Error code: `IDNV – Input, Data Not Valid, Parameter not supported`.

Validation rule: Enabling of Optical Channel only if supported by the current circuit pack

When enabling the optical channel via parameter *och*, it is checked whether the currently provisioned circuit pack supports this. If it is not supported the following error code is used:

Error code: `IDNV – Input, Data Not Valid, Parameter not supported`.

Validation rule: IDNV - Input, Data Not Valid, Parameter not supported

The command is denied if FEC is enabled (*fec* = ENABLE) while the optical channel is disabled or if the optical channel is disabled (*och* = DISABLE) while FEC is enabled.

It is allowed to enable or disable FEC and the optical channel together in one command.

Error code:

`SNVS – Status, Not in Valid State, Optical Channel must be enabled.`

Validation rule: 'ALL' qualifier used for wrong parameters

The 'ALL' qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:

`IDNC – Input, Data Not Consistent, 'ALL' qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to ptype and SDH standard.

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with *rr* = OC3 is made on a EP155 port which is provisioned as *ptype* = STM1E.

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:

`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI PORT related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

```
SNVS – Status, Not in Valid State, LO cross-connections, substructure
or conversion cross-connections still exist
```

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

`SNVS – Status, Not in Valid State, Port must not be member of a protection group`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:
`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:
`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:
`SNVS – Status, Not in Valid State, port mode change not allowed for INNI ports`

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*

- *strcout*
- *strcwfmt*

Error code:

`SNVS – Status, Not in Valid State, J0 parameters can not be set for INNI ports`

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

`SNVS – Status, Not in Valid State, only allowed for INNI port in lockout state`

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI parameters`

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State, *ndetmd* must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

```
IDNV – Input, Data Not Valid, zero values can only be set for all
neighbor information consistently
```

ONNS EDGE PORT related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 4f-BLSR group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 4f-BLSR protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following preconditions must be fulfilled:

- No cross-connections of *xconcls* = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: No modification of *trbmd* to ADAPTIVE at ports of *portClass* EDGE with existing ONNS cross-connections

The system shall not allow to set the tributary mode (parameter *trbmd*) from FIXED to ADAPTIVE for ports with *portClass* EDGE, while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* to FIXED at ports of *portClass* EDGE with existing ONNS cross-connections

The system shall not allow to set the tributary mode (parameter *trbmd*) from ADAPTIVE to FIXED for ports with *portClass* EDGE, while NN cross-connections or traditional cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* at ports of *portClass* EDGEwhile *portControl* is not LOCKOUT

It is possible to modify the *trbmd* for an EDGE port only

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to EDGE

Error code:

```
SNVS – Status, Not in Valid State, only allowed for EDGE port in
lockout sate
```

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters if there still any cross-connections for the EDGE port exist which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist

Check if lower-order cross-connections, substructure, or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure, or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the **protection port** of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI if the port is the **protection port** of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI if UNI-N node is not enabled for the NE.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameters

It is not possible to change the *portClass* to UNI unless valid values for the following UNI parameters are given:

- *clientNodeID*
- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Valid values for UNI parameters required`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Check of parameters for UNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for UNI ports.

Error code:

`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameters not settable for ports of *portClass* = UNI

The following parameter is not changeable to value FIXED for ports with *portClass* = UNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It shall not be possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

ONNS ENNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to ENNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist

Check if lower-order cross-connections, substructure, or conversion cross-connections exist which involve the port to be changed. If lower-order cross-connections, substructure, or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI if the port is the **protection port** of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI if the port is **any member** of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a member of a 1:1 protection group`

Validation rule: Check of ENNI parameters

It is not possible to change the *portClass* to ENNI unless valid values for the following ENNI parameters are given:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, Valid values for ENNI parameters required`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the ENNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to ENNINode`

Validation rule: Check of parameters for ENNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for ENNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: No modification of *trbmd* at ports of *portClass* ENNI with existing cross-connections

The tributary mode (parameter *trbmd*) is not changeable for ports with *portClass* ENNI while cross-connections exist at that port.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No modification of *trbmd* at ports of *portClass* ENNI while *portControl* is not LOCKOUT

The tributary mode (parameter *trbmd*) is not changeable for ports with *portClass* ENNI while cross-connections exist at that port.

It is possible to modify the *trbmd* for an ENNI port only

- if the *portControl* state is LOCKOUT or
- during the transition of the *portClass* to ENNI

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Some parameter values not settable for ports of portClass ENNI

The following parameter is not changeable to value AUTO for ports with *portClass* ENNI:

- *ndetmd*

Error code: `SNVS – Status, Not in Valid State, portClass must not be ENNI`

Validation rule: Modify of ENNI parameters

It is possible to modify the ENNI related parameters only:

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to ENNI.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*
- *remTID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Modify of ENNI parameters

It is not possible to modify any of the ENNI related parameters, if there still exist any cross-connection for the ENNI port.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Unique setting of *localLinkID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value if this value is unique within the system.

Error code:
`IDNV – Input, Data Not Valid, local Link ID value must be unique`

Validation rule: Unique setting of *localLinkID* wrt. *localLPID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value if this value is not already assigned to parameter *localLPID* of any port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of ENNI parameters

It is not possible to set the following ENNI parameters to their default values if *portClass* is equal to ENNI or during the setting of *portClass* to ENNI:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, ENNI Port Parameters must be different to their DEFAULT values`

"RTRV-OC192: Retrieve OC192 port" (p. 3-2664)

References

GR-199-CORE (ED-*rr*)

ED-OC192 autonomous notifications

LOS for transmission port OC192 clears

If LOS is cleared and current port mode is AUTO, then portmode is updated (new value: MON). This update is reported via ED-OC192 notification with parameter *pmode*.

Change of the constituent rates status list

If *trbmd* = ADAPTIVE a change of the attribute *crstat* is notified by the related ED-OC192 notification.

Change of neighbor node and neighbor port information

If *ndetmd* = AUTO a change of the attributes *neighborNodeID*, *neighborPortID* or *neighborASTNNodeID* is notified by the related ED-OC192 notification.

ED-OC192 notification

Output format

Syntax: **`ED-OC192`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of an OC192 port.
   Type: AID.
   Range: SPortAID of OC192 port.
   The keyword **`all`** is allowed up to shelf level.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Bursty Interval. Measurement period for determining bursty errors. This parameter applies when sdsfmode=BURST.
   Type: numeric value set
   Range: 2 to 10
   Default: 7
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when sdsfmode=BURST.
   Type: numeric value set (as percentage) 5, 10, … 50
   Default: 30
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
   When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
   For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the tributary input rate signal list.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C, STS192C.
6. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier. The parameter expstrc specifying the expected path trace is only relevant for the section trace supervision when the related trace read format strcfmt is set to 16 (16-byte-specific-string mode).
   Type Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
7. **`fec`** – FEC Enable
   Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
   Type: Alphanumeric value set.
   Range:
   DISABLE (only) for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310nm optics
   - OC192 / STM64 client ports (related to OTN ports)
   - OC768/STM256 basis low cost intra office 1310nm optics.

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

Default:

DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768/STM256 basis low cost intra office 1310 nm optics

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

8. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default)

9. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message “do not use” will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range: ENABLE (default): set a forced DUS/DNU), DISABLE: clear a forced DUS/DNU.

10. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.

Range:

- YES
- NO (default).

11. **`inputsig`** – Tributary Input Signal Rate List
This parameter is a list of STSn rates across the port's bandwidth. If *trbmd* is FIXED, then inputsig constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then inputsig is settable and retrievable as in fixed mode but does not influence the port behavior.
Type numeric value set
Range: NX-NX-NX-… N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C,STS48C or STS192C
Default: 1921

12. **`istd`** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET.
Type: Alphanumeric value set.
Range: SONET, SDH
Default: As specified via istddflton system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400)

13. **`linkResCls`** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

14. **`localLinkID`** – Local Link IDentity
The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

15. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
16. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).
17. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3, STS12, STS48 or STS192 (default)

18. **minNNXCRate** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: STS1 (default), STS3, STS12, STS48 or STS192.

19. **msrei** – MS-REI mode
Definition: An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.
Type: Alphanumeric value set.
Range:
    - SINGLE
    - EXTENDED (default).

20. **ndetmd** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **neighborASTNNodeID** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID` –** Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

27. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

28. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type:
- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:
- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:
- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:
- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`och`** – Optical Channel enable
Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don’t have any impact on transmission.
Type: Alphanumeric value set.

Range:

- for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE disable optical channel
- for ports on OP10 and OP40 packs, which only support OCH: ENABLE enable optical channel
- for client ports on packs which support OTN: DISABLE: disable, optical channel not applicable.

Default:

- for OP10 and OP40 packs, which cannot support OCH: DISABLE
- for OP10 packs, which can support OCH: ENABLE
- for OP10 and OP40 packs, which only support OCH: ENABLE
- for client ports on packs which support OTN: DISABLE.

30. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

31. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

32. **pmode** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

Default:

- AUTO for optical SDH/SONET ports
- NMON for client ports.

33. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
Type: numeric value set (superset of allowed ranges for SDH and SONET): 1 – 64000 ·
Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8854
- SONET OC768:22776

34. **`polynomial`** – Optical Channel Scrambling Polynomial
The polynomial used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (och = ENABLE)
Type: numeric value set
Range: 1x7 + x + 1, 2x16 + x12 + x3 + x + 1
Default: 2

35. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

36. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

37. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.

38. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

39. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
40. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
41. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: *""*
42. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0). This parameter is relevant only if the related trace read format strcfmt is set to 16 (16-byte-specific-string mode).
    Type alphanumeric value set
    Range: ENABLE: enable consequent action for TIM, DISABLE (default): disable consequent action for TIM.

43. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
44. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST
    - POISSON (default).
45. **`sdthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
46. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
47. **`sfthr`** – Signal Failure Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –3; –4; –5.
Default: –3.
48. **`sltca`** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

49. **`sonet`** – SONET ASAP
    This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see "RTRV-STM64: Retrieve STM64 port" (p. 3-2926), output parameter *sdhpn*) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
50. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
51. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.
52. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc).
    Type: Numeric string.
    Default: 2
53. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string dependent on the strcwfmt parameter..

Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

54. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Default: 2

55. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
   - ADAPTIVE
   - FIXED.

   Default: FIXED. The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.

56. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12, 48 or 192 representing STS1, STS3C, STS12C, STS48C or STS192C.
Default: 1921 = all STS1 (fixed)

Example output

```
ED-OC192:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=74-33-84,UNEQUIPOSIG=74-33-84;

ED-OTU2: Edit OTU2 port

The command **ED-OTU2** is used to edit parameters related to the OTU2 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: Yes

Input format

Command syntax: **ED-OTU2**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   Access Identifier of an OTU2 port.
   Type: AID
   Range: OTNPortAID of OTU2 port.
   The keyword ″otall″ is not allowed.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string.
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831

Spec block parameters

1. **expotutti** – Expected OTU TTI
   Expected OTU trail trace identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the expected OTU TTI.
   Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
   Range: 15 byte hexadecimal string
   Default: 15 bytes each with value 00.
2. **fectype** – FEC Type
   Forward error correction type.
   Type: Alphanumeric value set.
   Range: RS_FEC, V_FEC (default).

3. **`ochpm`** – OCH PM Enable
   Enable or disable optical channel performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
4. **`opwl`** – Optical Wavelength
   Optical Wavelength in nanometers.
   Type: numeric value set
   Range:
   - 35 wavelengths in C-Band (1554.537 … 1568.362), i.e:
     1554.537, 1554.940, 1555.343, 1555.747, 1556.151, 1556.555, 1556.959, 1557.363, 1557.768, 1558.173, 1558.578, 1558.983, 1559.389, 1559.794, 1560.200, 1560.606, 1561.013, 1561.419, 1561.828, 1562.233, 1562.640, 1563.047, 1563.455, 1563.863, 1564.271, 1564.679, 1565.087, 1565.496, 1565.905, 1566.314, 1566.723, 1567.133, 1567.542, 1567.952, 1568.362
   - 93 wavelengths in L-Band (1568.773 … 1607.466), i.e:
     1568.773, 1569.183, 1569.594, 1570.005, 1570.416, 1570.828, 1571.239, 1571.651, 1572.063, 1572.476, 1572.888, 1573.301, 1573.714, 1574.127, 1574.540, 1574.954, 1575.368, 1575.782, 1576.196, 1576.610, 1577.025, 1577.440, 1577.855, 1578.270, 1578.686, 1579.102, 1579.518, 1579.934, 1580.350, 1580.767, 1581.184, 1581.601, 1582.018, 1582.436, 1582.854, 1583.271, 1583.690, 1584.108, 1584.527, 1584.946, 1585.365, 1585.784, 1586.203, 1586.623, 1587.043, 1587.463, 1587.884, 1588.304, 1588.725, 1589.146, 1589.568, 1589.989, 1590.411, 1590.833, 1591.255, 1591.678, 1592.100, 1592.523, 1592.946, 1593.369, 1593.793, 1594.217, 1594.641, 1595.065, 1595.489, 1595.914, 1596.339, 1596.764, 1597.189, 1597.615, 1598.041, 1598.467, 1598.893, 1599.320, 1599.746, 1600.173, 1600.600, 1601.028, 1601.455, 1601.883, 1602.311, 1602.740, 1603.168, 1603.597, 1604.026, 1604.455, 1604.885, 1605.314, 1605.744, 1606.174, 1606.605, 1607.035, 1607.466
5. **`otutimca`** – OTU TIM Consequent Action Enable
   OTU Trail Trace Identifier Mismatch consequent action enable. The parameter *otutimca* shall enable or disable the TIM consequent action. In addition, to the TIM consequent action also the TIM detection is enabled or disabled.
   Type: Alphanumeric value set.
   Range: ENABLE: enable consequent action for TIM (default), DISABLE: disable consequent action for TIM.
6. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default):

indicates that, when a signal is detected at the port, then alarm monitoring will start.

- MON:
  indicates that alarm monitoring is taking place on the port.
- NMON:
  means that alarm monitoring is not occurring on the port.

7. **`txenable`** – Optical Output Enable
   Optical output enabling.
   Type: Alphanumeric value set.
   Range:
   - DISABLE (default): optical output disabled
   - ENABLE: optical output enabled.
8. **`votutti`** – Value of outgoing OTU TTI
   Value of the transmitted OTU Trail Trace Identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the transmitted OTU TTI.
   Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
   Range: 15 byte SAPI (Source Access Point Identifier).
   Default: 15 bytes each with value 00.

Output format

If the ED-OTU2 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-OTU2 notification for port.

Disabling of PM Monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. Stop PM counting
2. All current bins related to the PM monitor is deleted
3. All history bins related to the PM monitor is deleted

PM monitors can be disabled explicitly by means of the 'pm enable' attribute or are implicitly disabled as part of a port/tributary deletion.

Example input/output

```
ED-OTU2:UNITE-NE:1-1-#-#-1-1:123456:::FECTYPE=RS_FEC;

   UNITE-NE 06-06-30 08:00:00
M  123456 COMPLD
;

   UNITE-NE 06-06-30 08:00:01
A  001 REPT DBCHG
   "TIME=08-00-00,DATE=06-06-30:ED-STM16:1-1-#-#-1-1::fectype=RS_FEC:"
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the ED-OTU2 command.

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Validation rule: Output can only be enabled when wavelength is provisioned

Check that the optical wavelength is provisioned, i.e. *opwl* is set away from 0, when the optical output is enabled (*txenable* = ENABLE).

Error code:

`SNVS – Status, Not in Valid State, optical wavelength is not provisioned`

Validation rule: Optical wavlength must be in the optical window

Check that the optical wavelength (opwl) specified in the command is in the optical window (opwind) supported by the pack.

Error code:

`IDNV – Input, Data Not Valid, optical wavelength not in optical window`

Related TL1 messages

- "RTRV-OTU2: Retrieve OTU2 port" (p. 3-2685)

ED-OTU2 autonomous notification

LOS for transmission port OTU2 clears

If LOS is cleared and current port mode is AUTO, then *pmode* is updated (new value: MON). This update is reported via ED-OTU2 notification with parameter pmode.

ED-OTU2 notification

Output format

Command syntax: **ED-OTU2**:*aid*::*spec_block*;

Output parameters

Command parameters

1. **aid** – Access Identifier
   Access Identifier of an OTU2 port.
   Type: AID
   Range: OTNPortAID of OTU2 port.
   The keyword ″otall″ is not allowed.

Spec block parameters

1. **expotutti** – Expected OTU TTI
   Expected OTU trail trace identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the expected OTU TTI.
   Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
   Range: 15 byte hexadecimal string
   Default: 15 bytes each with value 00.
2. **fectype** – FEC Type
   Forward error correction type.
   Type: Alphanumeric value set.
   Range: RS_FEC, V_FEC (default).
3. **ochpm** – OCH PM Enable
   Enable or disable optical channel performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
4. **opwl** – Optical Wavelength
   Optical Wavelength in nanometers.
   Type: numeric value set
   Range:
   - 35 wavelengths in C-Band (1554.537 … 1568.362), i.e:
     1554.537, 1554.940, 1555.343, 1555.747, 1556.151, 1556.555, 1556.959, 1557.363, 1557.768, 1558.173, 1558.578, 1558.983, 1559.389, 1559.794, 1560.200, 1560.606, 1561.013, 1561.419, 1561.828, 1562.233, 1562.640, 1563.047, 1563.455, 1563.863, 1564.271, 1564.679, 1565.087, 1565.496, 1565.905, 1566.314, 1566.723, 1567.133, 1567.542, 1567.952, 1568.362
   - 93 wavelengths in L-Band (1568.773 … 1607.466), i.e:

1568.773, 1569.183, 1569.594, 1570.005, 1570.416, 1570.828, 1571.239, 1571.651, 1572.063, 1572.476, 1572.888, 1573.301, 1573.714, 1574.127, 1574.540, 1574.954, 1575.368, 1575.782, 1576.196, 1576.610, 1577.025, 1577.440, 1577.855, 1578.270, 1578.686, 1579.102, 1579.518, 1579.934, 1580.350, 1580.767, 1581.184, 1581.601, 1582.018, 1582.436, 1582.854, 1583.271, 1583.690, 1584.108, 1584.527, 1584.946, 1585.365, 1585.784, 1586.203, 1586.623, 1587.043, 1587.463, 1587.884, 1588.304, 1588.725, 1589.146, 1589.568, 1589.989, 1590.411, 1590.833, 1591.255, 1591.678, 1592.100, 1592.523, 1592.946, 1593.369, 1593.793, 1594.217, 1594.641, 1595.065, 1595.489, 1595.914, 1596.339, 1596.764, 1597.189, 1597.615, 1598.041, 1598.467, 1598.893, 1599.320, 1599.746, 1600.173, 1600.600, 1601.028, 1601.455, 1601.883, 1602.311, 1602.740, 1603.168, 1603.597, 1604.026, 1604.455, 1604.885, 1605.314, 1605.744, 1606.174, 1606.605, 1607.035, 1607.466

5. **`otutimca`** – OTU TIM Consequent Action Enable
   OTU Trail Trace Identifier Mismatch consequent action enable. The parameter *otutimca* shall enable or disable the TIM consequent action. In addition, to the TIM consequent action also the TIM detection is enabled or disabled.
   Type: Alphanumeric value set.
   Range: ENABLE: enable consequent action for TIM (default), DISABLE: disable consequent action for TIM.
6. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default):
     indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON:
     indicates that alarm monitoring is taking place on the port.
   - NMON:
     means that alarm monitoring is not occurring on the port.
7. **`txenable`** – Optical Output Enable
   Optical output enabling.
   Type: Alphanumeric value set.

Range:

- DISABLE (default): optical output disabled
- ENABLE: optical output enabled.

8. **`votutti`** – Value of outgoing OTU TTI
   Value of the transmitted OTU Trail Trace Identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the transmitted OTU TTI.
   Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
   Range: 15 byte SAPI (Source Access Point Identifier).
   Default: 15 bytes each with value 00.

Example input/output

```
ED-OTU2:UNITE-NE:1-1-#-#-1-1:123456:::FECTYPE=RS_FEC;

   UNITE-NE 06-06-30 08:00:00
M  123456 COMPLD
;

   UNITE-NE 06-06-30 08:00:01
A  001 REPT DBCHG
   "TIME=08-00-00,DATE=06-06-30:ED-STM16:1-1-#-#-1-1::fectype=RS_FEC:"
;
```

ED-PATH: Add or modify alias of ONNS connection

Overview

The **ED-PATH** command is used to modify the user defined alias of an ONNS connection or to add a new alias to an ONNS connection.

ED-PATH can be used to edit or replace the user defined connection alias itself. In this case the spec parameter *connAlias* identifies the old string and the spec parameter *newconnAlias* specifies the new string.

connID	*connAlias*	*newConnAlias*	meaning
present	present	present	*connAlias* replaced by *newConnAlias*, *connID* used for identification
present	not present	present	*connAlias* set to *newConnAlias*, *connID* used for identification
not present	present	present	*connAlias* replaced by *newConnAlias*, *connAlias* used for identification
not present	not present	present	DENY, inconsistent input
(not) present	(not) present	not present	DENY, inconsistent input

The **ED-PATH** command is applicable for connections with *connControl* = ONNS (e.g. ONNS connections initiated by Management System) and for connections with *connControl* = EXT (e.g. ONNS connections initiated by UNI).

Original routing constraints of ONNS connection get lost in case of manual reroute with explicit node constraint

In case an ONNS connection, that originally has been setup with routing constraints like “exclude SRLG” or “max delay”, is manually rerouted with routing constraint “explicit node”, the original routing constraints will get lost.

This will be the case even if the rerouted connection still fulfills the original constraints.

Customer workaround: After manual reroute with constraints being lost, another manual reroute can be applied specifying the original constraints again, if these are still known.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Abortable: No

Input format

Command syntax:
ED-PATH:*srcTid:[srcAid]:ctag::[srvID]:[connID]:[ConnAlias=connAlias,]NewConnAlias=newConnAlias;*

Input parameters

Command parameters

1. **srcTid**
Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique Tid used by Host NE. See also the definition of tid in "RTRV-HDR: Retrieve header" (p. 3-2417).
Type: identifier, in addition the special character underscore "_" and the password characters are allowed
Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**
Source node ONNS application access identifier *srcAid* of the ONNS controller OS command interface port.
Type: AID
Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn

3. **ctag**
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages. See also the definition of ctag in "RTRV-HDR: Retrieve header" (p. 3-2417).
Type alphanumeric string
Range: The ctag parameter is a character strings of up to 6 ASCII characters.The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″). It should be a unique value for each new command.

4. **`srvID`**
   The service identifier (srvID) is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
   Type Integer
   Range: 1.. 20,000,000
   Only one *srvID* accepted. The value ALL is not supported.
5. **`connID`** – Connection ID for an existing ONNS optical path connection service
   This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and Ingress Tributary# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.
   Type: Character string of length up to 39.
   Range: *ALL* – special value to retrieve all connection records

   Range: *nodeID&Tributary AID&Index* - to retrieve a specific entry, with

   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

     Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
   - Index: Numeric string 0-4294967295

   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x. Example: 29.13.196.203&1-1-13-15-1&271584

   Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with

   - nodeID: four dot separated numeric strings: each string 0..255;
   - Tributary AID: five dash separated numeric strings representing:

     Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 9), Tributary # ALL – special value to retrieve all connection records associated with the port ID.

   As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

   Range: *nodeID&defaultTributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with

   - nodeID: four dot separated numeric strings: each string 0..255
   - default Tributary AID: five dash separated numeric strings with:

     Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##.
   - Index: Numeric string 0-4294967295

   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Range: *nodeID&groupIndex* - to retrieve all connections belonging to an M:N protected connection group, with

- nodeID: four dot separated numeric strings: each string 0..255
- groupIndex: integer value specifying a connection group within nodeID 0-65535.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Spec block parameters

1. **`connAlias`** – connection alias
   connAlias specifies a user defined string as an alternate name for the connection instead of *connID*.
   Type: Character string up to length 83.
   Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.
2. **`newConnAlias`** – New connection alias
   This parameter is the replacement of the existing *connAlias* or the new *connAlias* (in case no one was defined so far). There is no possibility to remove the connAlias via this command.
   Type: Character string up to length 83
   Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes.

Output format

If the **`ED-PATH`** request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   ”ConnID=connID,ConnStatus=connStatus,pdir,,bandwidth,
   ConnAlias=newConnAlias,
   ,SrvID=srvID,,,,,specBlock,,
   SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID[,
   brDestNID=brdestNID,brdestPortID]:
   PathID=pathID1,State=pst1&sst1&tst1,
   NodeList=pNodeList1[:
   PathID=pathID2,State=pst2&sst2&tst2,
   NodeList=pNodeList2]”
;
```

The returned value for *connAlias* is the replaced string.

Output parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`date`**
   This parameter is set to the date when the output message is generated:
   YY-MM-DD where YY=00-99, MM=01-12, DD=01-31.
3. **`time`**
   This parameter is set to the time when the output message is generated:
   HH:MM:SS where HH=00-23,MM=00-59, SS=00-59.
4. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages. The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
5. **`completionCode`**
   Standard TL1 completion code result.
   Type: Value set.

   Range:

   - COMPLD: for success (default)
   - PRTL: for partial success / failure, see section ERROR RESPONSES for details
   - DENY: in case of errors, see section ERROR RESPONSES for details
6. **`connID`** – Connection ID
   This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and IngressPort# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.
   Type: Character string of length up to 39.
   Range: *ALL* – special value to retrieve all connection records

   Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:

   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing with:

Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 .. 192).

- Index: Numeric string 0-4294967295

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x. Example: 29.13.196.203&1-1-13-15-1&271584.

Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 9), Tributary # ALL – special value to retrieve all connection records associated with the port ID.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG.
The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203&1-5-13-7-ALL.
The port AID 1-5-13-7 must denote a VCG.

Range: *nodeID&defaultTributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- defaultTributary AID: five dash separated numeric strings with Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#)
- Index: Numeric string 0-4294967295.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Range: *nodeID&groupIndex* - to retrieve all connections belonging to an M:N protected connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- groupIndex: integer value specifying a connection group within nodeID 0-65535

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

7. **`connStatus`** – Connection Status
   ConnStatus = pst&sst(&tst) Connection status is the overall status of the connection connID which may be different than the status of an individual *pathID* in that connection.

connStatus is composed out of

- pst (PrimaryState)
- sst (SecondaryState)
- tst (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter. The two values must be separated by an ampersand (“&”). Individual status values are 7 characters or less.

Type: up to three &-separated value sets.

Range *pst* values:

- CON: Connected
- DLT: Deleted
- NOCON: Not Connected
- MAINT: Maintenence Mode
- UNKNOWN: Conn state unknown.

Range *sst* & *tst* values:

- OK: Conn good
- FAILED: Conn failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- PREMPT: Path pre-empted
- SETUPFL: Connection SetUp Failed
- FL-NVM: Not saved in NVM
- WTORV: Waiting to revert path
- EPRTFL: EDGE Port Failed
- BAD-IN Conn failed, Bad signal in
- BRDGD Path bridged

Note: Some states listed in this list will only occur within a DLT-PATH command response or within a REPT PTHCHG or REPT PTHEVT notification message.

Range *sst* values:

- STBY: Standby (for protecting connections within an M:N protection group, when connection is not protecting a working connection)
- USED: Used (for protecting connections within an M:N protection group, when connection is currently protecting a working connection)

Range *tst* values:

- DEGRADED: Non-revertive restoration was not possible if the worker or protection path of a permanent 1+1 protected connection fails.

8. **`pdir`** – Path Direction Topology
   Uni-direction A-Z (1WAY) or Bi-direction – (2WAY).
   For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
   Type: Value set.
   Range: 1WAY (default), 2WAY
9. **`bandwidth`** – Requested bandwidth/signalRate
   Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.
   Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.
10. **`connAlias`** – connection Alias
    This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
    Type: Character string up to length 83.
    Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes.
    This are an optional output parameter in the **`ED-PATH`** command reply.
11. **`srvID`** – Service Identifier
    This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
    The *srvID* parameter is an integer value range = 1 – 20,000,000. Only one *srvID* is accepted. ALL is not supported.
12. **`srcNID`** – Source nodeID
    ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
    Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
13. **`srcPortID`** – Source PortID
    ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.
    Value: dash-separated list of 5 numeric strings

Example: 1-1-3-1-4
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#). This range is valid for protecting connections in M:N connection groups

14. **`destNID`** – Destination nodeID
ONNS destination nodeID. Together with the following *destPortID* field defines the associated Engress *connPoint* that connects the destination node to the edge/gateway switch or client router.
Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

15. **`destPortID`** – Destination PortID
ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the destNID egress *connPoint*.
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#). This range is valid for protecting connections in M:N connection groups

16. **`brDestNID`** – Bridged Destination NodeID
brDestNID is an optional output parameter in the **`ED-PATH`** command reply. It is used for the second path of a YCONN connection.
ONNS bridged destination nodeID. Together with the following brDestPortID field defines the second associated Egress connPoint that connects the destination node to the edge/gateway switch or client router in case of protectionClass YCONN.
Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

17. **`brDestPortID`** – Bridged Destination PortID
ONNS bridged destination node egress *portID* in case *protectionClass* = YCONN. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the brDestNID egress connPoint. 4.1; 5; 6
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
brDestPortID is an optional output parameter in the **`ED-PATH`** command reply. It is sed for the second path of a YCONN connection.

18. **`pathID1`** – Path ID 1
The PathID of the 1st path that was created.
Type: character string of length up to 20.
Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255) (Index: Numeric string).
The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111

19. **`pathState1`** – Path State 1
Path State1 = *pst*& *sst*[*&tst*]. pathState1 represents the status of the first path of the connection which may be different than the status of the overall connection in *connStatus*.
PathState1 is composed out of *pst* (PrimaryState), *sst* (SecondaryState) and *tst* (TertiaryState, optional) Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.
Type: up to three &-separated value sets.
Range *pst* values:
    - CON: Connected
    - NOCON: Not Connected
    - DLT: Deleted
    - MAINT: Maintenance mode.

    Range *sst* & *tst* values
    - OK: Conn good
    - FAILED-PATH: failed
    - SETUP: Conn SetUp occurring
    - TRDOWN: Conn teardown occurring
    - NO-IN: Conn failed, signal in bad
    - RSTOR: path restore occurring
    - RSTRD: Conn restored
    - RSTRFL: Conn restore failed
    - DLT-FL: Delete operation Failed
    - UNKNOWN: Conn state unknown
    - WTORSTR: Waiting to restore path
    - SETUPFL: Connection SetUp Failed
    - RVRTFL: Conn revert failed
    - PREMPTD: Preempted
    - WTORV: Waiting to revert path
    - BRDGD: Path bridged
    - EPRTFL: EDGE Port Failed
    - BAD-IN: path failed, Bad signal in
    - FLT: Fault.

    Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

Range *pst* values:

- RSVD: Reserved, for paths associated to protecting connections within an M:N protection group, while not protecting a working traffic.

20. **`pNodeList1`** – Path Node List 1
The path node list contains the list of nodes that the 1st path (*pathID1*) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
This is an optional output parameter in the **`ED-PATH`** command reply.

21. **`pathID2`** – Path ID 2
The PathID of the 2nd path (if existing) that was created.
Type: character string of length up to 20.
Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255), (Index: Numeric string 0-65535).
The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111
pathID2 is an optional output parameter in the **`ED-PATH`** command reply. It is used for the second path of a N1PLUS1 connection.

22. **`pathState2`** – Path State 2
pathState2 = pst&sst[&tst]. *pathState2* represents the status of the second path (if existing) of the connection which may be different than the status of the overall connection in *connStatus*.

PathState2 is composed out of

- pst (PrimaryState)
- sst (SecondaryState)
- tst (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.
Type: up to three &-separated value sets

Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values

- OK: Conn good
- FAILED-PATH: failed
- SETUP: Conn SetUp occurring

- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.
This is an optional output parameter in the **`ED-PATH`** command reply.

23. **`pNodeList2`** – Path Node List 2
The path node list contains the list of nodes that the 2nd path (pathID1, if existing) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
This are an optional output parameter in the **`ED-PATH`** command reply.

Spec block parameter

1. **`connMode`** – Connection Mode
   This parameter specifies whether revertive or non-revertive mode is used as operation mode of the auto-reroute or 1+1 protected connection.
   This parameter can be used with the **`ENT-PATH-AUTO`** and **`ENT-PATH-N1PLUS1`** command. This parameter can be used with the **`ENT-PATH-P1PLUS1NR`** command to specify, whether revertive or non-revertive mode is used as operation mode of the 1+1 protection of the permanent 1+1 protected connection.
   Type: Alphanumeric value set.
   Range: NONREVERTIVE (default), REVERTIVE
2. **`disjointness`**
   The actual level of disjointness of the calculated and established connection. The parameter is not filled when *protectionClass* is UNPROT.
   Type: Alphanumeric value set.
   Range:
   - COMPLETE: fully node and SRLG disjoint path
   - FULLYSRLG: maximal node and fully SRLG disjoint path
   - MAXIMAL: maximal node disjoint path.
3. **`rstrPriority`** – Restoration Priority
   This parameter describes the restoration priority of the connection.
   Type: Integer
   Range: 0 … 7 (lower values represent higher priority).
   Default: 0.

Example input/output

The following example shows the successful execution of the command with old and new *conn Alias*:

```
ED-PATH:DENVER:snn:1044::::ConnAlias=AE-CHG-NY,NewConnAlias=AE-BOS-NY;

   DENVER 2003-03-03 10:36:44
M  1044 COMPLD
   ″ConnID=29.13.85.0&1-1-4-1-4&159,ConnStatus=CON&OK,2WAY,,STS3,
   ConnAlias=AE-BOS-NY,
   ,SrvID=2,,,,,ConnMode=NONREVERTIVE&RstrPriority=0&Disjointness=COMPLETE,,
   SrcNID=29.13.85.0,1-1-4-1-4,DestNID=29.13.85.32,1-1-21-2-1:
   PathID=29.13.85.0-346,State=CON&OK,
   NodeList=29.13.85.0&29.13.83.176&29.13.83.192&29.13.85.32″
;
```

Error responses

ED-PATH Request Denied - Parameter InValid

The following list identifies conditions that will cause similar error responses:

Error code: `E035 – ICAE – Input, ConnAlias Already Exists`

Error code: `E037 – INCS – Input, Neither ConnID nor ConnAlias Specified`

The following error response will be raised in case old connection alias and connection ID specified in the command do not match:

Error code: `E038 – IICS – Input, Inconsistent connAlias Specified`

ConnectionID does not exist

If the Source Node ONNS receives a ED-PATH command when the specified connection path does not exist, then the following error response is returned:

Error code: `E220 – ICNE Error – Input, ConnectionID Non-Existent`

ED-PATH-PROT: Modify ONNS connection parameters or protection type

Overview

The **ED-PATH-PROT** command is used to modify connection parameters or change the protection type, e.g. from unprotected to auto-reroute or from non-revertive auto-reroute to revertive auto-reroute.

ED-PATH-PROT is used to modify an existing connection

The **ED-PATH-PROT** command modifies the existing connection service based on its *connID* by changing an existing connection (or path) configuration or the connection constraints. The *reqType* parameter specifies what type of path operation(s) occurs on the connection.

The **ED-PATH-PROT** command is not applicable to ONNS connections of protectionClass MBYNWRK or MBYNPRT.

User Defined Connection Alias used as an Alternate Key

Instead of the *connID*, the user may optionally use the *connAlias* as an alternate key. The **ED-PATH-PROT** command could have either or both specified. If both are specified by the user, then *ConnID* id used as the key.

Either the *connID* or the *connAlias* must be present in a command. The *connAlias* is returned as an output parameter. If it is not defined, a NULL is returned.

ED-PATH-PROT to change a connection parameter (reqType=setParam)

The **ED-PATH-PROT** command is used to change a parameter of an ONNS connection.

With *reqType* = setParam the command can be used to change the *rstrPriority* of the connection identified by the *connID* field. The new *rstrPriority* is specified as a specBlock parameter. Changing the *rstrPriority* is allowed for connections of type *connControl* = ONNS and EXT.

With *reqTyp*e=setParam the command can be used to change the *wtr* (wait to restore timer) of the connection identified by the *connID* field. The new *wtr* is specified as a specBlock parameter for a 1+1 connection. Changing the *wtr* is allowed for connections of type *connControl* = ONNS only. Parameter applies to 1+1 protected and permanent 1+1 protected connections.

With *reqType* = setParam the command can be used to change the *htmr* (hold off timer) of the connection identified by the *connID* field. The new *htmr* is specified as a spec block parameter for a 1+1 connection. Changing the *htmr* is allowed for connections of type *connControl* = ONNS only. Parameter applies to 1+1 protected and permanent 1+1 protected connections.

ED-PATH-PROT to modify the protectionClass (reqType=setProt)

The **ED-PATH-PROT** command is modify the *protectionClass* of an ONNS connection.

With *reqType* = setProt the command is applicable for connections with *connControl* = ONNS (e.g. ONNS connections initiated by Management Systems).

With *reqType* = setProt the command is not applicable for connections with *connControl* = EXT (e.g. ONNS connections initiated by UNI).

With *reqType* = setProt the command can be used to change the *protectionClass* of the connection identified in the *connID* field. The new *protectionClass* is specified as the specBlock parameter *connMode*. A new *rstrPriority* can be specified at the same time.

With *reqType* = setProt the command can be used to change the reversion mode of the connection identified in the *connID* field to a 1+1 connection. The new reversion mode is specified as the specBlock parameter *connMode*. A new *wtr, htmr* can be specified at the same time.

When the *reqType* = setProt is used with the **ED-PATH-PROT** command, only explicit node list constraint for a second new path is allowed, for the exclude lists ONNS shall use the existing constraints.

The *reqType* = *setProt* function allows the user to change the conn mode from

- UNPROT to auto reroute NONREVERTIVE
- UNPROT to auto reroute REVERTIVE
- UNPROT to N1PLUS1NR
- UNPROT to N1PLUS1RV
- auto reroute NONREVERTIVE to UNPROT
- auto reroute NONREVERTIVE to auto reroute REVERTIVE
- auto reroute REVERTIVE to UNPROT
- auto reroute REVERTIVE to auto reroute NONREVERTIVE
- N1PLUS1NR to UNPROT
- N1PLUS1NR to N1PLUS1NR
- N1PLUS1NR to N1PLUS1RV
- N1PLUS1RV to UNPROT
- N1PLUS1RV to N1PLUS1NR
- N1PLUS1RV to N1PLUS1RV

ONNS chooses the active path and deletes the failed or inactive path in all cases where the new protection type is UNPROT.

The modification of the conn mode from N1PLUS1NR to N1PLUS1NR and N1PLUS1RV to N1PLUS1RV is allowed because ONNS has no knowledge about the used reversion mode of the according path protection group.

The modification of the conn mode from UNPROT to auto reroute REVERTIVE shall support the simultaneous setting of switchBack to AUTO or MAN for the resulting AUTORV connection. If no value of switchBack is specified, AUTO shall be configured.

The modification of the conn mode from auto reroute NONREVERTIVE to auto reroute REVERTIVE shall support the simultaneous setting of switchBack to AUTO or MAN for the resulting AUTORV connection.

If no value of switchBack is specified, AUTO shall be configured.

The *reqType* = setProt function allows the user to change the conn mode from

- UNPROT to P1PLUS1NRNR
- UNPROT to P1PLUS1NRRV
- P1PLUS1NRNR to UNPROT
- P1PLUS1NRNR to P1PLUS1NRRV
- P1PLUS1NRNR to P1PLUS1NRNR
- P1PLUS1NRNR to N1PLUS1NR
- P1PLUS1NRNR to N1PLUS1RV
- P1PLUS1NRRV to UNPROT
- P1PLUS1NRRV to P1PLUS1NRNR
- P1PLUS1NRRV to P1PLUS1NRRV
- P1PLUS1NRRV to N1PLUS1NR
- P1PLUS1NRRV to N1PLUS1RV
- N1PLUS1NR to P1PLUS1NRNR
- N1PLUS1NR to P1PLUS1NRRV
- N1PLUS1RV to P1PLUS1NRNR
- N1PLUS1RV to P1PLUS1NRRV.

The modification of the *connMode* from P1PLUS1NRNR to P1PLUS1NRNR and P1PLUS1NRRV to P1PLUS1NRRV is allowed because ONNS has no knowledge about the used reversion mode of the according path protection group. The modification of the *connMode* from P1PLUS1NRNR or P1PLUS1NRRV to N1PLUS1NR or N1PLUS1RV is rejected if the value of the disjointness parameter is “MAXIMAL”.

Modification of the protection type

For the modification of the protection type of a connection, specific information needs to be provided.

There are four cases taken into account:

1. Conversion from Unprotected Connections to Restoration Protected Connections
2. Conversion from Unprotected Connections to SNCP/UPSR Protected Connections
3. Conversion from Restoration Protected Connections to Unprotected Connections
4. Conversion from SNCP/UPSR Protected Connections to Unprotected Connections

For any of these modifications *reqType* = SetProt and only a subset of the input parameter apply to each case. SNCP/UPSR protected connections are 1+1 protected as also permanent 1+1 protected connections.

The following table summarizes the possible combinations for the cases 1) and 2):

Parameter Name	**Unprotected Connection**	**Unprotected Connection**
	to	**to**
	Restoration Protected Connection	**SNCP/UPSR Protected Connection**
nodeListUsage	no	yes (optional) (like nodeListUsage2 in ENT-PATH)
nodeList	no	yes (optional) (like nodeList2 in ENT-PATH)
rstrPriority (specBlock)	yes (optional)	no
connMode (specBlock)	yes (mandatory)	yes (mandatory)
disjointness (specBlock)	yes (optional)	yes (optional)
wtr (specBlock)	no	yes (optional)
htmr (specBlock)	no	yes (optional)
switchBack (specBlock)	yes (optional)	no

The following table summarizes the possible combinations for the cases 3) and 4):

Parameter Name	**Restoration Protected Connection**	**SNCP/UPSR Protected Connection**
	to	**to**
	Unprotected Connection	**Unprotected Connection**
nodeListUsage	no	no
nodeList	no	no

Parameter Name	Restoration Protected Connection	SNCP/UPSR Protected Connection
	to	to
	Unprotected Connection	Unprotected Connection
rstrPriority (specBlock)	no	no
connMode (specBlock)	yes (mandatory)	yes (mandatory)
disjointness (specBlock)	no	no
wtr (specBlock)	no	no
htmr (specBlock)	no	no
switchBack (specBlock)	no	no

Legend to the tables:

no	parameter not applicable for this modification
yes	parameter applicable or necessary for this modification
optional	if parameter is not specified the DEFAULT value will be taken
mandatory	parameter must be given

Modification of SNCP/UPSR Protected connections

For the modification of SNCP/UPSR Protected connections between normal SNCP/UPSR protected and permanent SNCP/UPSR protected, specific information needs to be provided.

There are two cases taken into account:

1. Conversion from normal SNCP/UPSR Protected Connections to Permanent SNCP/UPSR Protected Connections
2. Conversion from permanent SNCP/UPSR Protected Connections to Normal SNCP/UPSR Protected Connections

For any of these modifications *reqType* = SetProt and only a subset of the input parameter apply to each case.

The following table summarizes the possible combinations for the cases 1) and 2):

Parameter Name	Normal SNCP/UPSR Protected Connection to Permanent SNCP/UPSR Protected Connection	Permanent SNCP/UPSR Protected Connection to Normal SNCP/UPSR Protected Connection

Parameter Name	Normal SNCP/UPSR Protected Connection to Permanent SNCP/UPSR Protected Connection	Permanent SNCP/UPSR Protected Connection to Normal SNCP/UPSR Protected Connection
nodeListUsage	no	no
nodeList	no	no
rstrPriority (specBlock)	no	no
connMode (specBlock)	yes (mandatory)	yes (mandatory)
disjointness (specBlock)	no	no
wtr (specBlock)	yes (optional)	yes (optional)
htmr (specBlock)	yes (optional)	yes (optional)
switchBack (specBlock)	no	no

Legend to the tables:

no	parameter not applicable for this modification
yes	parameter applicable or necessary for this modification
optional	if parameter is not specified the DEFAULT value will be taken
mandatory	parameter must be given

Modification of Permanent SNCP/UPSR Protected connections

For the modification of Permanent SNCP/UPSR Protected connections to unprotected and vice versa, specific information needs to be provided.

There are two cases taken into account:

1. Conversion from unprotected Connections to permanent SNCP/UPSR protected connections
2. Conversion from permanent SNCP/UPSR protected connections to unprotected connections

For any of these modifications *reqType* = SetProt and only a subset of the input parameter apply to each case.

The following table summaries the possible combinations for the cases 1) and 2):

Parameter Name	Unprotected Connection to Permanent SNCP/UPSR Protected Connection	Permanent SNCP/UPSR Protected Connection to Unprotected Connection
nodeListUsage	yes (optional) (like nodeListUsage2 in ENT-PATH)	no
nodeList	yes (optional) (like nodeList2 in ENT-PATH)	no
rstrPriority (specBlock)	no	no
connMode (specBlock)	yes (mandatory)	yes (mandatory)
disjointness (specBlock)	no	no
wtr (specBlock)	yes (optional)	no
htmr (specBlock)	yes (optional)	no
switchBack (specBlock)	no	no

Legend to the tables:

no	parameter not applicable for this modification
yes	parameter applicable or necessary for this modification
optional	if parameter is not specified the DEFAULT value will be taken
mandatory	parameter must be given

REPT PTHCHG is generated

The **ED-PATH-PROT** command shall generate a REPT-PTHCHG message.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Abortable: No

Input format

Command syntax: **ED-PATH-PROT**:*srcTid:srcAid:ctag::[srvID]:reqType, [connID]:::[nodeListUsage1, nodeList1]:[,linkIncludeID][:specBlock];*

Input parameters

Command parameters

1. **srcTid**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique Tid used by Host NE. See also the definition of tid in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed
   Range: The srcTid parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **srcAid**
   Source node ONNS application access identifier srcAid of the ONNS controller OS command interface port.
   Type: AID
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn
3. **ctag**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages. See also the definition of ctag in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type alphanumeric string
   Range: The ctag parameter is a character strings of up to 6 ASCII characters.The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″). It should be a unique value for each new command.
4. **srvID**
   The service identifier (srvID) is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
   Type Integer
   Range: 1.. 20,000,000.
   Only one *srvID* accepted. The value ALL is not supported.
5. **reqType** – Request Type
   This parameter indicates the operation that is to be performed on the connection specified.
   Type: Alphanumeric value set.

Range:

- SETPARAM: modifies the value of *rstrPriority*, *wtr*, *htmr*, or *switchBack* of the connection to the value specified in the spec block.
- SETPROT: converts the connection specified by its *connID* to a new protection type specified by the *connMode* parameter in the spec block.

Default: None.

6. **`connID`** – Connection ID for an existing ONNS optical path connection service
This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and Ingress Tributary# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.
Type: Character string of length up to 39.
Range: *ALL* – special value to retrieve all connection records
Range: *nodeID&Tributary AID&Index* - to retrieve a specific entry, with

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:
  Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
- Index: Numeric string 0-4294967295

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203&1-1-13-15-1&271584

Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with

- nodeID: four dot separated numeric strings: each string 0..255;
- Tributary AID: five dash separated numeric strings representing:
  Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 9), Tributary # ALL – special value to retrieve all connection records associated with the port ID.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG.
The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

Range: *nodeID&defaultTributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with

- nodeID: four dot separated numeric strings: each string 0..255
- default Tributary AID: five dash separated numeric strings with:
  Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##.
- Index: Numeric string 0-4294967295

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Range: *nodeID&groupIndex* - to retrieve all connections belonging to an M:N protected connection group, with

- nodeID: four dot separated numeric strings: each string 0..255
- groupIndex: integer value specifying a connection group within nodeID 0-65535.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

7. **`nodeListUsage`** – Node List Usage
   This parameter can be used for a explicit node list (like nodeListUsage2 of ENT-PATH) for the new second path by modifying a protection type to a 1+1 connection.
   For connection setup NN used/uses the list of nodes included in the nodeList1 array block in a manner specified by the *nodeListUsage1* variable.
   Both, *nodeListUsage1* and *nodeList1*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command.
   An EXCLUDE list usage applies to all paths created (as in a N1PLUS1NR or N1PLUS1RV). A non-existent nodeID will be ignored in EXCLUDE nodeList1 during path setup. A non-existent nodeID will cause setup failure in EXPLICIT nodeList1 during path setup
   Type: Value set.
   Range: EXPLICIT: *nodeList1* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.); EXCLUDE: nodes in the *nodeList1* must all be excluded from the path created. In the case when the protectionClass is either YCONN, N1PLUS1NR or N1PLUS1RV the nodes in the nodeList1 below also apply to the second or restoration path.

8. **`nodeList`** – Node List
   This parameter can be used for a explicit node list (like nodeList2 of ENT-PATH) for the new second path by modifying a protection type to a 1+1 connection.
   When *nodeListUsage1* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([&nid2& …&nidX])-
   When nodeListUsage1=EXCLUDE: List of nodes that must all be excluded from both paths. The nodeID values are shown in the from: nid1([&nid2& …&nidX])
   If the preceding required nodeListUsage1 field is not supplied, this field must not be present. If user specifies empty EXCLUDE nodeList1, the connection should use indirect path from source node to destination node (i.e., at least one intermediate node is needed). If user specifies empty EXPLICIT nodeList1, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).

Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0..255.
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
Range nid1([&nisX])* or empty list; where X <= 25, when nodeListUsage1=EXPLICIT; where X <= 25, when nodeListUsage1=EXCLUSIVE.

9. **`linkIncludeID`** – VPN Identifier
A connection constraint link property such as linkIncludeID that must be valid to include the link in the connection path(s) to be created. linkIncludeID is a link connection property that can be used to group and classify links. VPNID is a special case of this associative property.
Type Integer
Range: 1 … 65535 0 or an empty field indicates no VPN constraint is applied.
Note: Since the corresponding value is not supported as Host port parameter any input different from 0 will lead to DENY of the command.

Spec block parameters

1. **`connAlias`** – connection alias
This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
Type: Character string up to length 83
Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.
2. **`connMode`** – Connection Mode
This parameter determines the new connection mode.
Type: Alphanumeric value set.
Range:
   - UNPROT: converts to an unprotected connection
   - N1PLUS1NR: converts to a network 1+1 protected non-revertive connection.
   - N1PLUS1RV: converts to a network 1+1 protected revertive connection.
   - NONREVERTIVE : converts to an auto-reroute non-revertive connection
   - REVERTIVE: converts to an auto-reroute revertive connection
   NOTE: The modes related to Y connections are not allowed with the **`ED-PATH-PROT`** command.
   - P1PLUS1NRNR: converts to a permanent 1+1 protected connection with non-revertive path restoration and non-revertive 1+1 protection
   - P1PLUS1NRRV: converts to a permanent 1+1 protected connection with non-revertive path restoration and revertive 1+1 protection

3. **`disjointness`**

   The parameter applies to new path only when the *reqType* requires to set up a new path such as in modifying a protection type from unprotected to a auto-reroute or Network 1+1 connection.

   The parameter does not apply to a permanent 1+1 protected connection.

   The disjointness determines the path calculation logic.

   Type: Alphanumeric value set.

   Range:

   - COMPLETE fully node and SRLG disjoint path
   - FULLYSRLG maximal node and fully SRLG disjoint path
   - MAXIMAL maximal node disjoint path.

   Maximal SRLG disjoint path calculation is not supported by the current path calculation algorithms.

   Impact on disjointness parameter values when protClass is set to N1PLUS1 or YCONN

   When *protClass* is set to N1PLUS1 or YCONN, only the *disjointness* parameter values COMPLETE and FULLYSRLG is allowed.

   Impact on disjointness parameter values when protClass is set to P1PLUS1NR

   When *protClass* is set to P1PLUS1NR, only the *disjointness* parameter values COMPLETE and FULLYSRLG is allowed.

   Default:

   - COMPLETE: for *protectionClass* N1PLUS1 and YCONN
   - MAXIMAL: for *protectionClass* AUTONR and AUTORV

     The parameter is only applicable when *protectionClass* != UNPROT.
   - COMPLETE: for *protectionClass* P1PLUS1NR

4. **`htmr`** – Hold Off Timer

   This parameter applies to 1+1 protected and permanent 1+1 protected connections.

   This parameter specifies the value of the hold-off timer for 1+1 protection switching.

   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.

   Type: numeric string [ms]

   Range:

   For high order path protection groups, the range is:

   - 0 .. 99 ms in 1 ms steps and
   - 100 .. 10000 ms in100 ms steps

For low order path protection groups, the range is:

- 0, 25, 50, 75 ms (thus in steps of 25 ms) and
- 100 .. 10000 ms in 100 ms steps.

The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block.
The path protection groups at the A and Z nodes of the connection are using the already provisioned values, if the parameter is not present in the spec_block.
Default: 0

5. **`switchBack`** – revertive restoration path switch back
   This parameter describes how a revertive restoration path is switched back to the original path.
   Type: Alphanumeric value set.
   Range:
   - AUTO: path is automatically switched back after wait to revert time.
   - MAN: path has to be manually switched back triggered by the TL1 command **`ED-PATH-ROLL`**.

   Default: AUTO.
6. **`rstrPriority`** – Restoration Priority
   Parameter applies to new path only when the *reqType* requires to set up a new path such as in modifying a protection type to a autoreroute connection.
   This parameter describes the restoration priority of the connection.
   Type: Integer
   Range: 0 (default) – 7 (lower values represent higher priority).
7. **`wtr`** – Wait to Restore Timer
   Parameter applies to a permanent 1+1 protected connection with revertive SNCP/UPSR protection.
   This parameter specifies the value of the wait-to-restore time for revertive 1+1 protection switching.
   This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.
   Type: numeric string [minute].
   Range: 0 – 60.
   The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block.
   Default: 0

Output format

If the **`ED-PATH-PROT`** request completes successfully, the following normal completion response format is returned:

```
   srcTid date time
M  ctag COMPLD
```

```
   ″ConnID=connID,ConnStatus=connStatus,pdir,,bandwidth,
   ConnAlias=connAlias,
   ,SrvID=srvID,,,,,specBlock,,
   SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID:
   PathID=pathID1,State=pathState1,
   NodeList=pNodeList1[:
   PathID=pathID2,State=pathState2,
   NodeList=pNodeList2]″
;
```

Partial system response format

The **ED-PATH-PROT** shall response with the completion code PRTL if the path protection group parameters (reversion mode, wait to restore timer or hold off timer) setup/modified with **ED-PATH-PROT** request are not successfully provisioned. The response shall contain the normal system response format to **ED-PATH-PROT** and additionally a failure information about the missing path protection group parameter provisioning:

```
   srcTid date time
M  ctag PRTL
   ″ConnID=connID,ConnStatus=connStatus,pdir,,bandwidth,
   ConnAlias=connAlias,
   ,SrvID=srvID,,,,,specBlock,,
   SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID:
   PathID=pathID1,State=pst1&sst1&tst1,
   NodeList=pNodeList1:
   PathID=pathID2,State=pst2&sst2&tst2,
   NodeList=pNodeList2″

   ″E150::\″Status, Path Protection Group parameters Not Provisioned\″,″
;
```

Output parameters

The details of the output parameters *srcTid*, *ctag*, reqType, *nodeListUsage1*, *nodeList1* and their syntax and allowed values are included in the Input parameters section of the **ED-PATH** command.

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **`date`**
   This parameter is set to the date when the output message is generate: YY-MM-DD where YY=00-99, MM=01-12, DD=01-31.

3. **`time`**
   This parameter is set to the time when the output message is generated: HH:MM:SS where HH=00-23,MM=00-59, SS=00-59.

4. **`ctag`** – Correlation Tag
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

5. **`completionCode`**
   Standard TL1 completion code result.
   Type: Value set.

   Range:

   - COMPLD: for success (default)
   - PRTL: for partial success / failure, see section ERROR RESPONSES for details
   - DENY: in case of errors, see section ERROR RESPONSES for details

6. **`connID`** – Connection ID
   This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and IngressPort# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.
   Type: Character string of length up to 39.

   Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:

   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

     Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
   - Index: Numeric string 0-4294967295.

   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203&1-1-13-15-1&1271584.

Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 9), Tributary # ALL – special value to retrieve all connection records associated with the port ID.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG.

The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

Range: *nodeID&defaultTributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- defaultTributary AID: five dash separated numeric strings with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##.
- Index: Numeric string 0-4294967295.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Range: *nodeID&groupIndex* - to retrieve all connections belonging to an M:N protected connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- groupIndex: integer value specifying a connection group within nodeID 0-65535.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

7. **`connStatus`** – Connection Status

   ConnStatus = pst&sst(&tst) Connection status is the overall status of the connection connID which may be different than the status of an individual *pathID* in that connection.

   connStatus is composed out of

   - pst (PrimaryState)
   - sst (SecondaryState)
   - tst (TertiaryState, optional).

   Type: up to three &-separated value sets.

   Range *pst* values:

   - CON: Connected
   - DLT: Deleted
   - NOCON: Not Connected

- MAINT: Maintenence Mode
- UNKNOWN: Conn state unknown.

Range *sst* & *tst* values

- OK: Conn good
- FAILED: Conn failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- PREMPT: Path pre-empted
- SETUPFL: Connection SetUp Failed
- FL-NVM: Not saved in NVM
- WTORV: Waiting to revert path
- EPRTFL: EDGE Port Failed
- BAD-IN Conn failed, Bad signal in
- BRDGD Path bridged

Note: Some states listed in this list will only occur within a DLT-PATH command response or within a REPT PTHCHG or REPT PTHEVT notification message.

Range *sst* values

- STBY: Standby (for protecting connections within an M:N protection group, when connection is not protecting a working connection)
- USED: Used (for protecting connections within an M:N protection group, when connection is currently protecting a working connection)

Range *tst* values

- DEGRADED: Non-revertive restoration was not possible if the worker or protection path of a permanent 1+1 protected connection fails

8. **`pdir`** – Path Direction Topology
   Uni-direction A-Z (1WAY) or Bi-direction – (2WAY).
   For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
   Type: Value set.
   Range: 1WAY (default), 2WAY.

9. **`bandwidth`** – Requested bandwidth/signalRate
   Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.
   Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.
10. **`connAlias`** – connection Alias
    This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
    Type: Character string up to length 83.
    Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.
11. **`srvID`** – Service Identifier
    This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
    The *srvID* parameter is an integer value range = 1 – 20,000,000. Only one *srvID* is accepted. ALL is not supported.
12. **`srcNID`** – Source nodeID
    ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
    Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
13. **`srcPortID`** – Source PortID
    ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.
    Value: dash-separated list of 5 numeric strings
    Example: 1-1-3-1-4
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#). This range is valid for protecting connections in M:N connection groups.
14. **`destNID`** – Destination nodeID
    ONNS destination nodeID. Together with the following *destPortID* field defines the associated Egress *connPoint* that connects the destination node to the edge/gateway switch or client router.
    Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

15. **`destPortID`** – Destination PortID
ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the destNID egress *connPoint*.
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#). This range is valid for protecting connections in M:N connection groups.

16. **`pathID1`** – Path ID 1
The PathID of the 1st path that was created.
Type: character string of length up to 20.
Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255) (Index: Numeric string 0-65535).
The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111

17. **`pathState1`** – Path State 1
Path State1 = *pst*& *sst*[*&tst*]. pathState1 represents the status of the first path of the connection which may be different than the status of the overall connection in *connStatus*.
PathState1 is composed out of *pst* (PrimaryState), *sst* (SecondaryState) and *tst* (TertiaryState, optional) Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.
Type: up to three &-separated value sets.
Range for *pst* values:
    - CON: Connected
    - NOCON: Not Connected
    - DLT: Deleted
    - MAINT: Maintenance mode.

    Range *sst* & *tst* values:
    - OK: Conn good
    - FAILED: PATH: failed
    - SETUP: Conn SetUp occurring
    - TRDOWN: Conn teardown occurring
    - NO-IN: Conn failed, signal in bad
    - RSTOR: path restore occurring
    - RSTRD: Conn restored
    - RSTRFL: Conn restore failed
    - DLT-FL: Delete operation Failed
    - UNKNOWN: Conn state unknown

- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.
Range for *pst* values:
RSVD – Reserved, for paths associated to protecting connections within an M:N protection group, while not protecting a working traffic.

18. **`pNodeList1`** – Path Node List 1
The path node list contains the list of nodes that the 1st path (*pathID1*) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

19. **`pathID2`** – Path ID 2
The PathID of the 2nd path (if existing) that was created.
Type: character string of length up to 20.
Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255), (Index: Numeric string 0-65535).
The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111
This are an optional output parameter in the **`ED-PATH-PROT`** command reply. Used for the second path of a N1PLUS1 and P1PLUS1NR connection.

20. **`pathState2`** – Path State 2
pathState2 = pst&sst[&tst]. *pathState2* represents the status of the second path (if existing) of the connection which may be different than the status of the overall connection in *connStatus*.

PathState2 is composed out of

- pst (PrimaryState)
- sst (SecondaryState)
- tst (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand ("&"). Individual status values are 7 characters or less.

Type: up to three &-separated value sets

Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values

- OK: Conn good
- FAILED: PATH failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed

- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.
This are an optional output parameter in the **ED-PATH-PROT** command reply. Used for the second path of a N1PLUS1 and P1PLUS1NR connection.

21. **pNodeList2** – Path Node List 2
The path node list contains the list of nodes that the 2nd path (pathID1, if existing) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
This are an optional output parameter in the **ED-PATH-PROT** command reply. Used for the second path of a N1PLUS1 and P1PLUS1NR connection.

Spec block parameters

1. **connMode** – Connection Mode
The parameter specifies whether revertive or non-revertive mode is used as operation mode of the auto-reroute or 1+1 protected connection.
This parameter can be used with the ENT-PATH-AUTO and ENT-PATH-N1PLUS1 command. This parameter can be used with the ENT-PATH-P1PLUS1NR command to specify, whether revertive or non-revertive mode is used as operation mode of the 1+1 protection of the permanent 1+1 protected connection.
Type: Alphanumeric value set.
Range: NONREVERTIVE (default), .REVERTIVE
2. **disjointness**
The actual level of disjointness of the calculated and established connection. The parameter is not filled when protectionClass is UNPROT.
Type: Alphanumeric value set.
Range:
   - COMPLETE: fully node and SRLG disjoint path
   - FULLYSRLG: maximal node and fully SRLG disjoint path
   - MAXIMAL: maximal node disjoint path.

   This are an optional output parameter in the **ED-PATH** command reply.
3. **rstrPriority** – Restoration Priority
This parameter describes the restoration priority of the connection.
Range: 0 (default) – 7. Lower values represent higher priority.

4. **`htmr`** – Hold Off Timer
   This parameter applies to 1+1 protected and permanent 1+1 protected connections.
   This parameter specifies the value of the hold-off timer for 1+1 protection switching.
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
   Type: numeric string [ms]
   Range:
   For high order path protection groups, the range is:
   - 0 .. 99 ms in 1 ms steps and
   - 100 .. 10000 ms in 100 ms steps

   For low order path protection groups, the range is:
   - 0, 25, 50, 75 ms (thus in steps of 25 ms) and
   - 100 .. 10000 ms in 100 ms steps.

   The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block.
   Default: 0
5. **`wtr`** – Wait to Restore Timer
   Parameter applies to a permanent 1+1 protected connection with revertive SNCP/UPSR protection.
   This parameter specifies the value of the wait-to-restore time for revertive 1+1 protection switching.
   This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.
   Type: numeric string [minute].
   Range: 0 – 60.
   The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block.
   Default: 0
6. **`switchBack`** – revertive restoration path switch back
   This parameter describes how a revertive restoration path is switched back to the original path.
   Type: Alphanumeric value set.
   Range:
   - AUTO: path is automatically switched back after wait to revert time.
   - MAN: path has to be manually switched back triggered by the TL1 command **`ED-PATH-ROLL`**.

   Default: AUTO.

Example input/output

Input/output example with a protectionClass change

The following shows an **ED-PATH-PROT** example with a protection class change using SETPROT:

```
ED-PATH-PROT:LT-ONNS-256:snn:123456::12354:setprot,135.13.196.23&1-5-13-4-
      1&1::::rstrPriority=5,connMode=NONREVERTIVE;

   LT-ONNS-256 2002-01-01 08:00:00
M  123456 COMPLD
   ″ConnID=135.14.196.23&1-5-13-4-1&1,ConnStatus=CON&OK,2WAY,,STS48,

Error responses

Validation rule: Insufficient network resources for alternate route

If network resources for an alternate route of a connection to be changed to a restoration protected connection are insufficient, then the following error response is returned:

Error code:
`E004 – srvID – InSufficient Network Resources for Alternate Path`

The following list identifies conditions that will cause similar error responses:

Error code: `E012 – SXCF – Status, XConn Failure caused path setup failure`

Error code:
`E013 – SSCF – Status, Signaling Communication link Failure (or abort) caused path operation failure`

Error code: `E014 – SXCT – Status, XConn Timeout`

Error code: `E016 – SHTO – Status, Host interface TimeOut`

Error code: `E017 – SSTO – Status, Signaling Timeout`

Error code:
`E022 – SPSF – Status, Path Setup Failure caused by signal transmission failure at egress node`

E016 and E022 are only sent in notifications, not in command replies

Validation rule: Maximum delay errors on calculated path

The maximum transport delay exceeded error response is shown below.

Error code: `E020 – Maximum Transport Delay Exceeded (by calculated path)`

Validation rule: ED-PATH-PROT request denied - Parameter invalid

The request parameter invalid error response is shown below:

Error code: `E030 – Syntax, Parameter Data Invalid, invalid_parameter`

The following list identifies conditions that will cause similar error responses:

Error code: `E032 – Input, Source nodeID is invalid`

Error code: `E033 – Input, Node List has Invalid / unknown ID`

Error code: `E035 -ICAE – Input, ConnAlias Already Exists`

Error code: `E037 – INCS – Input, Neither ConnID nor ConnAlias Specified`

The following error response will be raised in case connection alias and connection ID specified in the command do not match:

Error code: `E038 – IICS – Input, Inconsistent connAlias Specified`

Validation rule: ED-PATH-PROT syntax, invalid degree of disjointness value

When an invalid degree of disjointness value for protClass N1PLUS1 or YCONN is used, then the following error response is returned:

Error code:

```
E520 – IIDD – Input, Invalid Degree of Disjointness for protection type
N1PLUS1 or YCONN
```

Validation rule: ED-PATH-PROT Path Protection Group Parameter transfer failed

Error code:

```
E150 – Status, Path Protection Group parameters Not Provisioned
```

The following list identifies conditions that will cause similar error responses:

Error code: `E335 – SCOF Error – Status, Connection Operation Failed`

Error code:

```
E336 – SCTP Error – Status, Invalid command for a Connection with Two
established Paths
```

The following list identifies conditions that will cause similar error responses:

Error code:

```
E351 – SPOA – Status, Path Operation not Allowed on connection in
Restoration queue
```

Validation rule: Port related problems

If the NE receives an ED-PATH-MODIFY command where the *portID* parameter value is not valid, then one of the following error responses is returned:

Error code:

```
E082 – Status, NNI connPoint / port Unavailable ID=<ASTN node ID>
&<ConnPtID>
```

The following list identifies conditions that will cause similar error responses:

Error code:
`E083 – SCIU – Status, NNI connPoint in Use, XConn or reservation exists, ID=<ASTN node ID>&<ConnPtID>`

Error code:
`E161 – CFUT – XConn Connect Failure, Unexpected toplogy or related cross connect, ID=<ASTN node ID>&<ConnPtID>`

Error code:
`E162 – CFXE – XConn Connect Failure, Cross connect already exists, ID=<ASTN node ID>&<ConnPtID>`

Some of these errors can occur in the process of path setup and are similar to those found in ENT-PATH. The following condition will cause a similar error response:

Error code: `E279 – SNRE – Status NVM Record Exhausted`

This failure condition is only valid until a variable NVM allocation scheme is implemented, that does not have any restrictions wrt the length of connection records to be stored.

Validation rule: protectionClass is not allowed

If the NE receives an **`ED-PATH-PROT`** or **`ED-PATH-ROLL`** command or a connection of *protectionClass* MBYNWRK or MBYNPRT, then the following error response is returned:

Error code:
`SIPC – E091::Status, Invalid command for protection class MBYNWRK or MBYNPRT`

Validation rule: Protection modification for External Connections

If the network element receives an **`ED-PATH-PROT`** command for an externally controlled switched connection (*connControl* = EXT, that is, setup as part of a network connection, for example, via UNI), then the following error response is returned:

```
   srcTid date time
M  ctag DENY
   SIEC
   ″E092::\″Status, Invalid command for Externally Controlled Connections\″
;
```

The following list identifies further conditions that will cause error responses:

- Error code:
  `E360 – SPMF – Status, Path Modify Failed due to invalid protection type change`

Validation rule: Switch Back behavior modification

The following error response is returned, if a auto reroute revertive connection in a wrong state (different from CON&OK, CON&NO-IN) is modified in its switch back behavior:

Error code:

`E282 – SCSI Error – Status, Conn State Invalid for this Operation`

The following list identifies error conditions wrt. changing protection type of adaptive ONNS connections:

- Error code:
  `E170 – IIPA – Input, Invalid Protection type for Adaptive ONNS connection`

The following error response shall be raised in case the protection type of the ONNS connection cannot be changed due to a forced cross connection loopback existing on the EDGE tributary in the A or Z node:

Error code:

`E284 – SFCL – Status, Forced Cross Connection Loopback existing on EDGE tributary`

Note that this restriction only affects protection type changes requiring the setup of a path associated to the connection. Protection type changes not requiring such an action are not affected.

ED-PATH-ROLL: Modify ONNS connection route

Overview

The **ED-PATH-ROLL** command is used to modify the route of a connection between the two client ports via a bridge and roll.

ED-PATH-ROLL is used to modify a path location

The **ED-PATH-ROLL** command is used tp modify the existing connection service based on its *connID* by rolling an existing path or connection to a new path. The *reqType* parameter specifies what type of path operation(s) occurs on the connection in the context of a roll command.

With *reqType* = *rollPath* it is possible to modify a connection in a way to construct a new path bridged from the source port to the destination port that is setup using new constraints that are included in the delay, *srlgExcludeList*, *linkIncludeID*, and *nodeList* fields. If no new constraints are given, ONNS uses no user constraints and sets up the path using the least cost criteria. When the new path is stable, the old path is removed to complete the ONNS roll process. A new *rstrPriority* can be specified at the same time.

Roll of a 1+1 connection is not supported directly, the connection must be converted to an unprotected connection and then rolled. Then the connection can be modified back to a network 1+1 connection.

The **ED-PATH-ROLL** command is not applicable to NN connections of protectionClass MBYNWRK or MBYNPRT.

ED-PATH-ROLL is used to manually switch back a revertive restoration connection

The **ED-PATH-ROLL** command is used for manually switch back a revertive restoration connection based on its *connID* by switching back from the restoration path to the original path The *reqType* parameter specifies the type of path operation(s) occurs on the connection in the context of a roll command.

With *reqType* = SWBK it is possible to switch from the restoration path to the original path of a revertive restoration connection if the following criteria are fulfilled:

- the connection was setup with the switch back criteria “MAN”
- the connection is in the state CON&OK&WTORV

The **ED-PATH-ROLL** command is applicable for connections with *connControl* = ONNS (e.g. ONNS connections initiated by Management Systems).

The **ED-PATH-ROLL** command is applicable for connections with *connControl* = SC (e.g. ONNS connections initiated by UNI).

The **ED-PATH-ROLL** command is applicable for connections with *connControl* = EXT (e.g. ONNS connections initiated by UNI).

User defined connection alias used as an alternate key

Instead of the connID, the user may optionally use the connAlias as an alternate key. This applies to modifiers such as ED-PATH-PROT and ED-PATH-ROLL. The **ED-PATH** command could have either or both specified. If both are specified by the user, then *ConnID* id used as the key.

Either the *connID* or the *connAlias* must be present in a command. The *connAlias* is returned as an output parameter. If it is not defined, a NULL is returned.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Abortable: No

Input format

Command syntax: **ED-PATH-ROLL:***srcTid:[srcAid]:ctag::[srvID]:reqType, [connID]:[maxDelay]:[nodeListUsage,nodeList] [:srlgExcludeList][,linkIncludeID][:specBlock];*

Input parameters

Command parameters

1. **srcTid**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique Tid used by Host NE. See also the definition of tid in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed
   Range: The srcTid parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **srcAid**
   Source node ONNS application access identifier srcAid of the ONNS controller OS command interface port.
   Type: AID
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: *snn*
3. **ctag**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages. See also the definition of ctag in "RTRV-HDR: Retrieve header" (p. 3-2417).

Type alphanumeric string
Range: The ctag parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″). It should be a unique value for each new command.

4. **`srvID`**
   The service identifier (srvID) is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
   Type Integer
   Range: 1.. 20,000,000. Only one srvID accepted. The value ALL is not supported.
5. **`reqType`** – Request Type
   This parameter indicates the operation that is to be performed on the connection specified.
   Type: Alphanumeric value set.
   Range:
   - ROLLPATH: used to add a bridged/merge path to an existing connection and then roll to the new path.
   - SWBK: used to switch from a restoration path to the original path

   Default: n/a
6. **`connID` –** Connection ID for an existing ONNS optical path connection service
   This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and Ingress Tributary# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.
   Type: Character string of length up to 39.
   Range: *ALL* – special value to retrieve all connection records
   Range: *nodeID&Tributary AID&Index* - to retrieve a specific entry, with
   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:
     Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
   - Index: Numeric string 0-4294967295

   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203&1-1-13-15-1&271584
   Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with
   - nodeID: four dot separated numeric strings: each string 0..255;
   - Tributary AID: five dash separated numeric strings representing:

Bay/Frame #(1), Shelf #(1), Slot/Pack #(1 – 39), Port #(1 – 9), Tributary # ALL – special value to retrieve all connection records associated with the port ID.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG.

The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

Range: *nodeID&defaultTributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with

- nodeID: four dot separated numeric strings: each string 0..255
- default Tributary AID: five dash separated numeric strings with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##.
- Index: Numeric string 0-4294967295

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Range: *nodeID&groupIndex* - to retrieve all connections belonging to an M:N protected connection group, with

- nodeID: four dot separated numeric strings: each string 0..255
- groupIndex: integer value specifying a connection group within nodeID 0-65535.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

7. **`maxDelay`** – Maximum transport delay

   Parameter applies to new path only when the *reqType* requires to set up a new path such as in rolling to new path.

   Maximum transport delay through all nodes in the path. Total path delay must not exceed this value.

   Range: 0, is used to select no delay limit; 1 – 32767, maximum transport delay in milliseconds.

   Default: 0.

8. **`nodeListUsage`** – Node List Usage

   This parameter can be used for both values (exclude, explicit) to roll a path.

   Parameter applies to new path only when the *reqType* requires to set up a new path such as in rolling to new path.

   For connection setup NN used/uses the list of nodes included in the nodeList1 array block in a manner specified by the nodeListUsage1 variable.

   Both, *nodeListUsage1* and *nodeList1*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command.

   An EXCLUDE list usage applies to all paths created (as in a N1PLUS1NR or N1PLUS1RV). A non-existent nodeID will be ignored in EXCLUDE nodeList1 during path setup. A non-existent nodeID will cause setup failure in EXPLICIT nodeList1 during path setup..

   Type: Value set.

   Range: EXPLICIT: *nodeList1* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.). EXCLUDE: nodes in the *nodeList1* must all be excluded from the path created. In the case when the protectionClass is either YCONN, N1PLUS1NR or N1PLUS1RV the nodes in the nodeList1 below also apply to the second or restoration path.

9. **`nodeList`** – Node List
   This parameter can be used to roll to a new path.
   Parameter applies to new path only when the *reqType* requires to set up a new path such as in rolling to new path.
   When *nodeListUsage1* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([&nid2& …&nidX])
   When *nodeListUsage1* = EXCLUDE: List of nodes that must all be excluded from both paths. The nodeID values are shown in the from: nid1([&nid2& …&nidX])
   If the preceding required nodeListUsage1 field is not supplied, this field must not be present. If user specifies empty EXCLUDE nodeList1, the connection should use indirect path from source node to destination node (i.e., at least one intermediate node is needed). If user specifies empty EXPLICIT nodeList1, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).
   Type: &-separated list of nodeIDs A nodeID is represented as four dot separated numeric string with each numeric string between 0..255.
   Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
   Range nid1([&nisX])* or empty list; where X <= 25, when nodeListUsage1=EXPLICIT; where X <= 25, when nodeListUsage1=EXCLUSIVE.

10. **`srlgExcludeList`** – SRLG Exclude List
    Parameter applies to new path only when the reqType requires rolling to new path. List of Shared Risk Link Group identifiers that are to be used to exclude links from the connection path(s) being created. *srlgID* (or Shared_Risk_LinkGrpID) identifiers are properties of links between ONNS nodes.
    Type: &-separated list of numeric strings | empty | 0
    Example: 33&49&64
    Range: up to 25 numeric strings, each in the range 1…65535. The value 0 or an empty field indicates no constraint are applied.

11. **`linkIncludeID`** – VPN Identifier
    A connection constraint link property such as linkIncludeID that must be valid to include the link in the connection path(s) to be created. *linkIncludeID* is a link connection property that can be used to group and classify links. VPNID is a special case of this associative property.
    Type Integer
    Range: 1 … 65535. 0 or an empty field indicates no VPN constraint is applied.
    Note: Since the corresponding value is not supported as Host port parameter any input different from 0 will lead to DENY of the command.

Spec block parameters

1. **`connAlias`** – connection alias
   This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
   Type: Character string up to length 83
   Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.
2. **`rstrPriority`** – Restoration Priority
   Parameter applies to new path only when the reqType requires to set up a new path such as in rolling to new path.
   This parameter describes the restoration priority of the connection.
   Type Integer
   Range: 0 … 7 (lower values represent higher priority)

Output format

If the **`ED-PATH-ROLL`** request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   ″ConnID=connID,ConnStatus=connStatus,pdir,,bandwidth,ConnAlias=connAlias,
   ,SrvID=srvID,,,,,specBlock,
   SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID:
   PathID=pathID1,State=pst1&sst1&tst1,
   NodeList=pNodeList1:
   PathID=pathID2,State=pst2&sst2&tst2,
   NodeList=pNodeList2″
;
```

Output parameters

Command parameters

1. **srcTid**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **date**
   This parameter is set to the date when the output message is generate: YY-MM-DD where YY=00-99, MM=01-12, DD=01-31.
3. **time**
   This parameter is set to the time when the output message is generated: HH:MM:SS where HH=00-23,MM=00-59, SS=00-59.
4. **ctag** – Correlation Tag
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing "."). It should be a unique value for each new command.
5. **completionCode**
   Standard TL1 completion code result.
   Type: Value set.

   Range:

   - COMPLD: for success (default)
   - PRTL: for partial success / failure, see section ERROR RESPONSES for details
   - DENY: in case of errors, see section ERROR RESPONSES for details
6. **connID** – Connection ID
   This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and IngressPort# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.
   Type: Character string of length up to 39.

   Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:

   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).

- Index: Numeric string 0-4294967295.

The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203&1-1-13-15-1&1271584.

Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 9), Tributary # ALL – special value to retrieve all connection records associated with the port ID.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG.
The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

Range: *nodeID&defaultTributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- defaultTributary AID: five dash separated numeric strings with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##.
- Index: Numeric string 0-4294967295.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Range: *nodeID&groupIndex* - to retrieve all connections belonging to an M:N protected connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- groupIndex: integer value specifying a connection group within nodeID 0-65535.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

7. **`connStatus`** – Connection Status

   ConnStatus = pst&sst(&tst) Connection status is the overall status of the connection *connID* which may be different than the status of an individual *pathID* in that connection.

   connStatus is composed out of

   - pst (PrimaryState)
   - sst (SecondaryState)
   - tst (TertiaryState, optional).

   Type: up to three &-separated value sets.

Range *pst* values:

- CON: Connected
- DLT: Deleted
- NOCON: Not Connected
- MAINT: Maintenence Mode
- UNKNOWN: Conn state unknown.

Range *sst* & *tst* values

- OK: Conn good
- FAILED: Conn failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- PREMPT: Path pre-empted
- SETUPFL: Connection SetUp Failed
- FL-NVM: Not saved in NVM
- WTORV: Waiting to revert path
- EPRTFL: EDGE Port Failed
- BAD-IN Conn failed, Bad signal in
- BRDGD Path bridged

Note: Some states listed in this list will only occur within a DLT-PATH command response or within a REPT PTHCHG or REPT PTHEVT notification message.

Range *sst* values:

- STBY: Standby (for protecting connections within an M:N protection group, when connection is not protecting a working connection)
- USED: Used (for protecting connections within an M:N protection group, when connection is currently protecting a working connection)

Range *tst* values:

- DEGRADED: Non-revertive restoration was not possible if the worker or protection path of a permanent 1+1 protected connection fails

8. **pdir** – Path Direction Topology
   Uni-direction A-Z (1WAY) or Bi-direction – (2WAY).
   For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
   Type: Value set.
   Range: 1WAY (default), 2WAY
9. **bandwidth** – Requested bandwidth/signalRate
   Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.
   Type: Value set.
   Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.
10. **connAlias** – connection Alias
    This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
    Type: Character string up to length 83.
    Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.
11. **srvID** – Service Identifier
    This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
    The *srvID* parameter is an integer value range = 1 – 20,000,000. Only one *srvID* is accepted. ALL is not supported.
12. **srcNID** – Source nodeID
    ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
    Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
13. **srcPortID** – Source PortID
    ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.
    Value: dash-separated list of 5 numeric strings
    Example: 1-1-3-1-4
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#). This range is valid for protecting connections in M:N connection groups
14. **destNID** – Destination nodeID
    ONNS destination nodeID. Together with the following *destPortID* field defines the associated Engress *connPoint* that connects the destination node to the edge/gateway switch or client router.
    Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

15. **`destPortID`** – Destination PortID
    ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the destNID egress *connPoint*.
    Value: dash-separated list of 5 numeric strings
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#). This range is valid for protecting connections in M:N connection groups
16. **`pathID1`** – Path ID 1
    This is the *pathID* of the rerouted path.
    The PathID of the 1st path that was created.
    Type: character string of length up to 20.
    Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255); (Index: Numeric string).
    The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
    Example: 29.13.196.203-65111.
17. **`pathState1`** – Path State 1
    This is the path state of the rerouted path.
    Path State1 = *pst*& *sst*[*&tst*]. *pathState1* represents the status of the first path of the connection which may be different than the status of the overall connection in *connStatus*.
    PathState1 is composed out of *pst* (PrimaryState), *sst* (SecondaryState) and *tst* (TertiaryState, optional) Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand ("&"). Individual status values are 7 characters or less.
    Type: up to three &-separated value sets.
    Range *pst* values:
    - CON: Connected
    - NOCON: Not Connected
    - DLT: Deleted
    - MAINT: Maintenance mode.

    Range *sst* & *tst* values
    - OK: Conn good
    - FAILED: PATH failed
    - SETUP: Conn SetUp occurring
    - TRDOWN: Conn teardown occurring
    - NO-IN: Conn failed, signal in bad
    - RSTOR: path restore occurring
    - RSTRD: Conn restored
    - RSTRFL: Conn restore failed
    - DLT-FL: Delete operation Failed

- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

Range *pst* values:

- RSVD: Reserved, for paths associated to protecting connections within an M:N protection group, while not protecting a working traffic.

18. **`pNodeList1`** – Path Node List 1
This is the node list of the rerouted path.
The path node list contains the list of nodes that the 1st path (*pathID1*) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

19. **`pathID2`** – Path ID 2
The PathID of the 2nd path (if existing) that was created.
Type: character string of length up to 20.
Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255), (Index: Numeric string 0-65535).
The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111
This is the path ID of the ″old″ path.

20. **`pathState2`** – Path State 2
pathState2 = pst&sst[&tst]. *pathState2* represents the status of the second path (if existing) of the connection which may be different than the status of the overall connection in *connStatus*.

PathState2 is composed out of

- pst (PrimaryState)
- sst (SecondaryState)
- tst (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.

Type: up to three &-separated value sets

Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values

- OK: Conn good
- FAILED: PATHfailed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed

- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.
This is the path state of the ″old″ path.

21. **`pNodeList2`** – Path Node List 2
The path node list contains the list of nodes that the 2nd path (pathID1, if existing) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
This are an optional output parameter in the **`ED-PATH`** command reply.
This is the node list of the ″old″ path.

Spec block parameter

1. **`connMode`** – Connection Mode
This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the auto-reroute or 1+1 protected connection.
This parameter can be used with the ENT-PATH-AUTO and ENT-PATH-N1PLUS1 command. This parameter can be used with the ENT-PATH-P1PLUS1NR command to specify, whether revertive or non-revertive mode is used as operation mode of the 1+1 protection of the permanent 1+1 protected connection.
Type: Alphanumeric value set.
Range: NONREVERTIVE (default), REVERTIVE
2. **`disjointness`**
The actual level of disjointness of the calculated and established connection. The parameter is not filled when protectionClass is UNPROT.
Type: Alphanumeric value set.
Range:
   - COMPLETE: fully node and SRLG disjoint path
   - FULLYSRLG: maximal node and fully SRLG disjoint path
   - MAXIMAL: maximal node disjoint path.
3. **`rstrPriority`** – Restoration Priority
This parameter describes the restoration priority of the connection.
Range: 0 – 7. Lower values represent higher priority.
Default: 0.

Example input/output

The following example shows a successful execution of the **`ED-PATH-ROLL`** command to relocate a connection with new setup constraints:

```
ED-PATH-ROLL:LT-ONNS-256:snn:123459::19265478:rollPath,135.14.196.23&1-5-3-4-
      1&2:61:Exclude,135.13.42.3&135.213.242.103&135.13.198.22:65&73&83&19:RstrPriority=5;
```

```
   LT-ONNS-256 2002-09-01 08:00:00
M  123459 COMPLD
   ″ConnID=135.14.196.23&1-5-3-2-49&2,ConnStatus=CON&OK,2WAY,,STS48,
   ConnAlias=AmericanExp-NY-BOS-ckt,,
   SrvID=1351465478,,,,ConnMode=NONREVERTIVE&RstrPriority=5&Disjointness=COMPLETE,,
   SrcNID=135.14.196.23,1-5-3-2-49,DestNID=135.13.196.123,1-2-5-2-1:
   PathID=135.14.196.23-43876,State=CON&OK,
   NodeList=135.14.196.23&135.13.42.3&135.14.242.133&135.13.196.123:
   PathID=135.14.196.23-54326,State=CON&SETUP,
   NodeList=135.14.196.23&135.13.42.153&135.14.242.133&135.13.196.132″
;
```

Error responses

Validation rule: Insufficient network resources for alternate route

If network resources for an alternate route of a connection to be changed to a restoration protected connection are insufficient, then the following error response is returned:

```
   srcTid 2002-06-01 08:00:00
M  ctag DENY
   ISNR
   ″E001:srvID:\″InSufficient Network Resources for connection setup\″,″
;
```

Error code:
`E001 – srvID – InSufficient Network Resources for connection setup`

The following list identifies conditions that will cause similar error responses:

Error code: `E012 – SXCF – Status, XConn Failure caused path setup failure`

Error code:
`E013 – SSCF – Status, Signaling Communication link Failure (or abort) caused path operation failure`

Error code: `E014 – SXCT – Status, XConn Timeout`

Error code: `E016 – SHTO – Status, Host interface TimeOut`

Error code: `E017 – SSTO – Status, Signaling Timeout`

Error code:
`E022 – SPSF – Status, Path Setup Failure caused by signal transmission failure at egress node`

E016 and E022 are only sent in notifications, not in command replies

Validation rule: Maximum delay errors on calculated path

The maximum transport delay exceeded error response is shown below.

Error code: `E020 – Maximum Transport Delay Exceeded (by calculated path)`

Validation rule: ED-PATH request denied - Parameter invalid

The request parameter invalid error response is shown below:

```
   srcTid 2002-06-01 08:00:00
M  ctag DENY
   SPDI
   ″E030::\″Syntax, Parameter Data Invalid, invalid_parameter\″,″
;
```

Example: The command

```
ED-PATH-ROLL:srcTid:srcAid:ctag::srvID:rollPath,connID1::
   Explicit,BadNode5ID,Node6ID:srlgExcludeList;
```

may produce this result.

The following list identifies conditions that will cause similar error responses (including E030 shown above):

- Error code: `E030 – SPDI – Syntax, Parameter Data Invalid, invalid_parameter= fieldName`
- Error code: `E032 – ISIP – Input, Source nodeID is invalid`
- Error code: `E033 – INLI – Input, Node List has Invalid / unknown ID`
- Error code: `E037 – INCS – Input, Neither ConnID nor ConnAlias Specified`

The following error response will be raised in case connection alias and connection ID specified in the command do not match:

- Error code: `E038 – IICS – Input, Inconsistent connAlias Specified`

The following error response is raised if the connection is not a restoration revertive connection or if the switch back behavior for a revertive restoration connection is set to “AUTO”:

- Error code: `E039 – ISBF – Input, Criteria for manual Switch Back not Fulfilled`

The following error response is raised if a restoration revertive connection with switch back behavior set to “MAN” is not in state CON&OK&WTORV:

- Error code: `E282 – SCSI – Status, Conn State Invalid for this Operation`

The following error response is raised in case the ONNS connection cannot be rerouted due to a forced cross-connection loopback existing on the EDGE tributary in the A or Z node:

- Error code:
  `E284 – SFCL – Status, Forced Cross Connection Loopback existing on EDGE tributary`

ED-PID: Edit password identifier

The **ED-PID** command can be initiated by a user to change the user's own password on the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-PID**:*tid*::*ctag*::*old_pid*,*new_pid*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **old_pid** – Old Password ID
   This is the current *pid* of the user.
   This required parameter is the confidential password authenticator for the given *uid*. Password strings are transmitted in non-encrypted form in the **ACT-USER** command; are encrypted when stored in the NE; and are never transmitted from the NE.
   Type: character string (case-sensitive)
   Range: 6 to 10 legal characters. Valid passwords consist of at least two non-alphabetic characters with at least one special character. The special character can be one of the required non-alpha characters. For example, TEST1+ is a valid password. The first character of a password must be a letter.
   Default: For the two superusers the default password is: UNITE+01 for User ID LUC01 and UNITE+02 for User ID LUC02. For other users: not applicable.
4. **new_pid** – New Password ID
   This parameter specifies the new password ID. The *new_pid* value must differ from the *old_pid* value by at least one character.

Output format

After receiving the **ED-PID** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
```

```
;
```

If the password change request completes successfully during login procedure after the password expired and transitions the state of the login procedure from the "Password_Expired" state to the "Login_Active" state, the following normal completion response from the **ACT-USER** command is returned when no customer proprietary banner is provisioned:

```
   sid date time
M  ctag COMPLD
   "uid:lastdate,lasttime,attempts,systype,release,upc:spec_block"
   /* Alcatel-Lucent 1675 LambdaUnite MSS Release release
   User Privilege Code: upc
   ALCATEL-LUCENT - PROPRIETARY
   THIS SOFTWARE CONTAINS INFORMATION OF ALCATEL-LUCENT
   AND IS NOT TO BE DISCLOSED OR USED EXCEPT IN ACCORDANCE
   WITH APPLICABLE AGREEMENTS.
   NOTICE: THIS IS A PRIVATE COMPUTER SYSTEM.
   USE OF THIS SOFTWARE IS GOVERNED SOLELY AS EXPRESSLY
   AUTHORIZED IN THE RELEVANT AGREEMENT BETWEEN
   ALCATEL-LUCENT AND CUSTOMER.
   UNAUTHORIZED ACCESS OR USE MAY LEAD TO PROSECUTION.
   */

;
```

If the password change request completes successfully during login procedure after the password expired and transitions the state of the login procedure from the "Password_Expired" state to the "Login_Active" state, the following normal completion response from the **ACT-USER** command is returned when a customer proprietary banner is provisioned:

```
   sid date time
M  ctag COMPLD
   "uid:lastdate,lasttime,attempts,systype,release,upc:spec_block"
   /* Alcatel-Lucent 1675 LambdaUnite MSS Release release
   User Privilege Code: upc
   ALCATEL-LUCENT - PROPRIETARY
   THIS SOFTWARE CONTAINS INFORMATION OF ALCATEL-LUCENT
   AND IS NOT TO BE DISCLOSED OR USED EXCEPT IN ACCORDANCE
   WITH APPLICABLE AGREEMENTS.
   NOTICE: THIS IS A PRIVATE COMPUTER SYSTEM.
   USE OF THIS SOFTWARE IS GOVERNED SOLELY AS EXPRESSLY
   AUTHORIZED IN THE RELEVANT AGREEMENT BETWEEN
   ALCATEL-LUCENT AND CUSTOMER.
   UNAUTHORIZED ACCESS OR USE MAY LEAD TO PROSECUTION.
   */
   /*
   <LINE1>
```

```
   <LINE2>
    ...
    ...
    ...
   <LINE10>
   <LINE11>
   */

;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

When the NE receives an **ED-PID** command, the *pid* (password ID) associated with the user's login identifier will be changed on the NE provided that:

- the user is currently logged in on the NE
- the *old_pid* provided matches the current password for that login identifier
- the *new_pid* provided satisfies the password requirements of the NE.

It will be reported via the corresponding ED-PID notification – see "ED-PID notification" (p. 3-802) section – if a session is already established. In the password expiry scenario during a login procedure, the ED-PID notification is optional and may be omitted..

When the **ED-PID** command is successfully executed, the user session is not terminated and is unaffected. It will continue to use the previous values. The changes will take effect the next time the user logs in.

Example input/output

The following example shows a successful password change operation:

ED-PID:LT-UNITE-123::123456::soup3r+,mash%52;^

```
   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

The following example shows a successful completion response of **ED-PID** while attempting the **ACT-USER** command:

ED-PID:UNITE-123::123456::soup3r+,mash%52;

```
   UNITE-123 07-12-21 08:00:00
M  123456 COMPLD
   " nbguser1:07-12-20,09-00-00,1,WaveStar_UNITE,10.00.00,P3&M3"
   /* Alcatel-Lucent 1675 LambdaUnite MSS Release 10.00.00
```

```
   User Privilege Code: P3&M3
   ALCATEL-LUCENT - PROPRIETARY
   THIS SOFTWARE CONTAINS INFORMATION OF ALCATEL-LUCENT
   AND IS NOT TO BE DISCLOSED OR USED EXCEPT IN ACCORDANCE
   WITH APPLICABLE AGREEMENTS.
   NOTICE: THIS IS A PRIVATE COMPUTER SYSTEM.
   USE OF THIS SOFTWARE IS GOVERNED SOLELY AS EXPRESSLY
   AUTHORIZED IN THE RELEVANT AGREEMENT BETWEEN
   ALCATEL-LUCENT AND CUSTOMER.
   UNAUTHORIZED ACCESS OR USE MAY LEAD TO PROSECUTION.
   */
;
```

Error responses

Validation rule: Invalid *old_pid*

If the NE receives an ED-PID command with an *old_pid* value that does not match with the password ID of the associated user login ID.

Error code: `IDNV – Input, Data Not Valid, wrong old_pid`

Validation rule: Missing or invalid or syntactically incorrect *new_pid*

If the NE receives an ED-PID command with a missing *new_pid* or the *new_pid* is same as the *old_pid* or the *new_pid* is syntactically incorrect.

Error code: `IDNV – Input, Data Not Valid, incorrect new_pid`

References

TR-NWT-000835, OTGR Section 12.5: Operations Applications Messages – NE and Network System Security Administration Messages.

ED-PID notification

Output format

See definition of "REPT DBCHG: Report data base change" (p. 3-2118).

The ED-PID notification has the following specific syntax:

ED-PID:*uid*

Output parameters

Command parameters

1. **uid** – User ID
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of *uid* values for the **ACT-USER** command are not allowed. Valid *uid* values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
   Type: Alphanumeric string (case-sensitive)
   Range: 1 – 10 characters
   The *uid* ALL is not allowed in any combination of upper or lower cases.

Example output

The example shows a normal notification after an ED-PID command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:ED-PID:nbguser1″
;
```

ED-PROTN-GRP: Edit protection group

The **ED-PROTN-GRP** command allows one to modify parameter/attributes related to an already existing protection group instance of any protection group type.

Note: Manual protection switching is done by means of commands **OPR-PROTNSW**, **RLS-PROTNSW**.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 1

Abortable: No

Input format

Multiplex section/line protection group

Command syntax: **ED-PROTN-GRP**:*tid*:*aid*:*ctag*::*protype*:*spec_block;*

2-/4-fibre MS-SPRing/BLSR protection group

Command syntax: **ED-PROTN-GRP**:*tid*:*[aid]*:*ctag*::*protype,[rid]*:*spec_block*;

Path protection group

Command syntax: **ED-PROTN-GRP**:*tid*:*[aid]*:*ctag*::*protype, ,[ppgname][,aid1]*:*spec_block*;

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

Input parameters

Command parameters (multiplex section/line protection group)

1. **tid** – Target Identifier
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the aid of a 1+1 multiplex section/line protection group or the aid of a 1:1 multiplex section/line protection group (only R3.0 and later) or an port aid being a member of the group.
   Type: AID
   Range: OnePlusOne_ProtGrpAID (not ranged) or NByOne_ProtGrpAID (not ranged) or SPortAID (not ranged).

3. **ctag** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **protype** – Protection Type
   The command parameter *protype* is used for additional identification beside the *aid*, it is not usable to change the value of protype.
   This parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1xNOPT (only R3.0 and later)
   Type: Value set.
   Range: 1+1 or 1xNOPT

Command parameters (2-/4-fibre MS-SPRing/BLSR protection group)

1. **tid** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged).
3. **ctag** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **protype** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: 2F or 4F
5. **rid** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.

Command parameters (path protection group)

1. **tid** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies a path protection group aid or an input tributary aid being a member of the group in combination with *ppgname*.
   This parameter specifies an input tributary *aid* when used in combination with parameter *aid1*.
   Option: If *ppgname* is specified, then *aid* can be omitted or used as an input tributary aid.
   For low order path protections, the *aid* cannot be omitted as the *ppgname* is not supported for those protection groups. For such protection groups always a path protection group AID has to be specified.
   The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
   Option: If parameters aid specifies a HO tributary on a port of port class EDGE and this tributary is combined with another HO tributary within an OUC, then ED-PROTN-GRP shall operate on all protection groups of type PATHDRI identified by these two HO tributaries, if existing. If aid specifies a HO tributary on a port of port class INNI, the command is rejected.
   Option: When parameter *aid* is used in combination with parameter *aid1*, then ED-PROTN-GRP shall operate on all protection groups of type PATHDRI having the AIDs given in parameters *aid* and *aid1* as input tributaries. If *aid* or *aid1* specifies a tributaries on a port of port class INNI, the command is rejected.
   Type: AID.
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.
   The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **all** or **vall** or **usall** in various positions) are allowed.
3. **ctag** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **protype** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: PATHDRI
5. **ppgname** – Path protection group Name
   In particular follow the reference to check options and mandatory omissions associated with this parameter.
   The parameter specifies the path protection group name. Storage and retrieval of the ppgname is case sensitive, but actual use of the ppgname to determine the

corresponding protection group is case insensitive.
Option for high order path protection groups: For high order path protections, if *aid* is specified, then *ppgname* can be omitted. For low order path protections, the *ppgname* is omitted as not being supported at all. If an input value is specified for *ppgname* and none is specified for *aid*, then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified path protection group name.
If input values are specified for *aid* and *ppgname* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified *aid*, *ppgname* pair. The command will complete successfully if there is no protection group described by *aid*, *ppgname*, but no data will be returned.
The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
Type: text string
Range: 1 to 24 characters

6. **`aid1`** – Access identifier 1
   Together with parameter *aid* this parameter specifies a pair of input tributaries in order to access emulated selector bridges in one command.
   If input values are specified for *aid* and *aid1* then ED-PROTN-GRP operates on all protection groups of type PATHDRI that have these specified tributaries as inputs.If input values are specified for *aid* and *aid1*and additionally a value is specified for *ppgname*, ED-PROTN-GRP operates only on those protection groups that additionally match the ppgname valu.. If *aid1* specifies a HO tributary in a port of port class INNI, the command is rejected.
   Type: AID
   Range: STS1NumAID
   The use of wildcards is not allowed.

Spec block parameters (multiplex section/line protection group)

1. **`apspn`** – MSP-APS ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MSP-APS (Multiplex Section Protection – Automatic protection switching).
   Type: Alphanumeric string
   Range: 1-24 characters including the character "-".
   Default: DEFAULT
2. **`dcclmsprotmd`** – DCC Line/MS Protection Mode
   The parameter specifies, whether the line/MS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.
   Type: Alphanumeric value set 3;
   Range: ENABLE, DISABLE
   Default: DISABLE

3. **dccsrsprotmd** – DCC Sect/RS Protection Mode
   The parameter specifies, whether the section/RS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.
   Type: Alphanumeric value set
   Range: ENABLE, DISABLE
   Default: DISABLE
4. **wtr** – Wait To Restore Time
   The parameter specifies the "wait to restore" time used by the protection state machine operating in revertive mode. In case of MSP 1+1 optimized, the same parameter is used for the "wait to rename" time.
   Type: numeric string [minute]
   Range: 0 – 60
   Default: 5.

Spec block parameters (2-fibre MS-SPRing/BLSR protection group)

1. **ard** – Automatic Ring Discovery
   If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value manually with ED-MAP-RING and supply the ring map information to each node on the ring for the BLSR protocol to operate. It is necessary to activate this user-provisioned information with SET-MAP-RING. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
   Type: Alphanumeric string.
   Range: ENABLE, DISABLE.
   Default: ENABLE.
2. **asmc** – Automatic Squelch Map Calculation
   If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
   Type: alhpanumeric string
   Range: ENABLE, DISABLE (default)
3. **blsrpn** – MS-SPRing-BLSR ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
   Type: Alphanumeric string
   Range: 1-24 characters including the character "-".
   Default: DEFAULT

4. **`newrid`** – New Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
5. **`rcamode`** – Ring Circuit Alarm Mode
   This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If rcamode is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE
6. **`wtr`** – Wait To Restore Time
   This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
   Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.
   Type: numeric string [minute].
   Range: 0 – 12 in 1 minute increments and 99.
   Default: 5.

Spec block parameters (4-fibre MS-SPRing/BLSR protection group)

1. **`ard`** – Automatic Ring Discovery
   If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value and supply the ring map information to each node on the ring for the BLSR protocol to operate. Until all

nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
Type: Alphanumeric string.
Range: ENABLE, DISABLE.
Default: ENABLE.

2. **`asmc`** – Automatic Squelch Map Calculation
If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
Type: alhpanumeric string
Range: ENABLE, DISABLE (default)
3. **`blsrpn`** – MS-SPRing-BLSR ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
Type: Alphanumeric string.
Range: 1-24 characters including the character "-".
Default: DEFAULT.
4. **`eastwkg`** – East Worker Port
This parameter specifies the port being a member in the role of the east worker port for a 4-fibre MS-SPRing/BLSR protection group.
Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID.
Range: In case of an asymmetric ring: NOTUSED. In all other cases: SPortAID.
5. **`newrid`** – New Ring Identification
This parameter specifies the new ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE
6. **`protnmode`** – Protection Switch Mode
The parameter specifies the protection switch mode. The value LOOPBACK is used for the classical ring application. The value SHORTENED is used for transmission delay sensitive applications. The value TOPEX (only R3.0 - R3.2 and later) is used for the so called transoceanic application, which allows extra traffic, improves restorability and improves delay as well as in SHORTENED mode.
In case of a ring switch … LOOPBACK performs the bridge and switch function in that nodes which are most close to the failed span. SHORTENED performs the bridge function at the add node repectively the switch function at the drop node of each ring circuit. It is an application only similar to the transoceanic protocol. TOPEX allows, compared to SHORTENED mode, additionally the traffic restoration of not affected spans. It is the transoceanic protocol application.
Consistent Protection Switch Mode Setting: The Protection Switch Mode must be set consistently on all nodes in the ring. E.g. for all UNITE NEs in a TOP+EX ring

the parameter protnmode must be set to TOPEX. In a ring with inconsistent Protection Switch Mode, there will be no protection switching. The UNITE NEs will raise an Inconsistent Ring Protection Mode alarm.
Type: Alphanumeric value set.
Range: LOOPBACK, SHORTENED, TOPEX.
Default: LOOPBACK.

7. **rcamode** – Ring Circuit Alarm Mode
This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If rcamode is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
Type: Alphanumeric value set.
Range: ENABLE (default), DISABLE

8. **swtr** – Span Wait To Restore Time
The parameter specifies the wait to restore time for span switches used by the protection state machine operating in revertive mode. The protection shall operate in revertive mode if the wait-to-restore time is in the range 0-12. The protection shall operate in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.
Type: numeric string [minute].
Range: 0 – 12 in 1 minute increments and 99.
Default: 5.

9. **westwkg** – West Worker Port
This parameter specifies the port being a member in the role of the west worker port for a 4-fibre MS-SPRing/BLSR protection group
Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID
Range: In case of an asymmetric ring: NOTUSED; in all other cases: SPortAID.

10. **wtr** – Wait To Restore Time
This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
Note: If wtr time is set to infinite, the switch request state is WTR until a higher request occurs.
Type: numeric string [minute].
Range: 0 – 12 in 1 minute increments and 99.
Default: 5.

Spec block parameters (path protection group)

1. **`dripathpn`** – SNCP-UPSR ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type SNCP-UPSR.
   Type: Alphanumeric string.
   Range: 1-24 characters including the character "-".
   Default: DEFAULT.
2. **`htmr`** – Hold-Off Time
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
   Type: numeric string [ms].

   Range for high order path protection groups, the range is:

   - 0 .. 99 ms in 1 ms steps and
   - 00 .. 10000 ms in100 ms steps

   Range for low order path protection groups, the range is:

   - 0, 25, 50, 75 ms (thus in steps of 25 ms) and
   - 100 .. 10000 ms in 100 ms steps.
3. **`newppgname`** **–** New Path protection group Name
   This parameter specifies the path protection group name. Storage and retrieval of the *ppgname* is case sensitive, but actual use of the *ppgname* to determine the corresponding protection group is case insensitive.
   Type: text string.
   Range: 0 to 24 characters.
   Default: empty string
4. **`rme`** – Protection Reversion
   This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group.
   The value ENABLE is used if the protection operates in revertive mode.
   The value DISABLE is used if the protection operates in non-revertive mode.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
5. **`snctype`** **–** SNC Protection Type
   This parameter specifies the type of the path protection w.r.t. switch criteria used by the protection state machine.
   The value SNCI (Inherent) is used if server signal fail is used as switch criteria.
   The value SNCN (Non-Instrusive) is used if server signal fail and defects

supervised by a non-intrusive path monitor are used as switch criteria
The value NA is used if one of the tributary inputs is related to a port operating in SONET mode.
Type: Alphanumeric value set.
Range: SNCI, SNCN, NA.

6. **`wtr`** – Wait To Restore Time
   This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.
   Type: numeric string [minute].
   Range: 0 – 60.

Note:

If a value beyond the allowed range is entered for the hold-off time (*htmr*) or for the wait-to restore time (*wtr*) the returned error code is incorrect: Instead of `/* Input, Data Not Valid */` the following error code is returned: `/*Input, Non-null Unimplemented Parameter*/`

Output format

After receiving the **`ED-PROTN-GRP`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

Refer to the "Output parameters" section of the "RTRV-HDR: Retrieve header" (p. 3-2417) command for a normal completion response.

Detailed behavior description

The command modifies attributes for the existing protection group instances identified by *aid, rid, ppgname* of type as specified by means of parameter *protype*. The corresponding attribute of the protection group instance is updated with the value as specified in command block.

The command parameter *newrid* causes an update of the attribute *rid*. The command parameter *newppgname* causes an update of the attribute *ppgname*.

The update of the attributes is reported by means of an ED-PROTN-GRP notification.

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* to identify path protection groups is not recommended.

DCC protection as part of 1+1 multiplex section/line protection

If DCC protection is enabled for section/rs dcc channels (value of dccsrsprotmd equals ENABLE), then following updates for DCC channels are done.

1. The protection mode (attribute dccprottp) of the dcc channel of type 'SECTION' associated with the worker port is set to '1+1' protected. This update is reported by means of a ED-FECOM notification for the changed attribute.

If DCC protection is disabled for section/rs dcc channels (value of dccsrsprotmd equals DISABLE), then following updates for DCC channels are done.

1. The protection mode (attribute dccprottp) of the dcc channel of type 'SECTION' associated with the worker port is set to '0X1' unprotected. This update is reported by means of a ED-FECOM notification for the changed attribute.

If DCC protection is enabled for line/ms dcc channels (value of dcclmsprotmd equals ENABLE), then following updates for DCC channels are done.

1. The protection mode (attribute dccprottp) of the dcc channel of type 'LINE' associated with the worker port is set to '1+1' protected. This update is reported by means of a ED-FECOM notification for the changed attribute.

If DCC protection is disabled for line/ms dcc channels (value of dcclmsprotmd equals DISABLE), then following update for DCC channels are done.

1. The protection mode (attribute dccprottp) of the dcc channel of type 'LINE' associated with the worker port is set to '0X1' unprotected. This update is reported by means of a ED-FECOM notification for the changed attribute.

Path protection group

Identification of VCG tributaries: The system shall allow to edit path protection groups at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading ″v″.

Example input/output

Multiplex section/line protection group 1+1

The following example assigns a wait-to-restore time of 8 minutes to the protection group named 1-1-o011 which is of type 1+1:

```
ED-PROTN-GRP:LT-UNITE:1-1-o011:123456::1+1:wtr=8;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

2 fibre MS-SPRing/BLSR protection group

The following example assigns a wait-to-restore time of 10 minutes to the two fiber protection group that is identified by ring id *denver21*. It also renames the ring id to *dallas3*:

```
ED-PROTN-GRP:LT-UNITE::123456::2F,”denver21”:newrid=”dallas3”,wtr=10;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

4 fibre MS-SPRing/BLSR protection group

The following example assigns a wait-to-restore time of 10 minutes to the four fiber protection group that is identified by ring id *denver2*1. It also renames the ring id to *dallas3*:

```
ED-PROTN-GRP:LT-UNITE::123456::4F,”denver21”:newrid=”dallas3”,wtr=10;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Path protection group

The following example assigns a holdoff time of 100 mesc to the path protection group that is identified by path protection group name *denver21*. It also renames the path protection group name to *dallas3*:

```
ED-PROTN-GRP:LT-UNITE::123456::PATHDRI,, ”denver21”:newppgname=”dallas3”,htmr=10;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

The following example assigns a holdoff time of 100 mesc to both path protection groups forming an emulated selector bridge on input tributaries 1-1-#-#-8-1-25 and 1-1-#-#-6-1-25. It also renames the path protection group name to dallas3:

```
ED-PROTN-GRP:LT-UNITE:1-1-#-#-8-1-25:123456::PATHDRI,,,
1-1-#-#-6-1-25:newppgname=”dallas3”,htmr=10;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses (Multiplex section/Line protection group)

Validation rule: dcc protection side is enabled

The dcc channel (section/line) of the protection side is disabled if corresponding dcc protection is enabled (section/line).

Error code:

```
SNVS – Status, Not in Valid State, protection dcc channel is enabled
```

Validation rule: dcc protection: working side is disabled

The dcc channel (section/line) of the working side is enabled if corresponding dcc protection is enabled (section/line).

Error code:

`SNVS – Status, Not in Valid State, working dcc channel is disabled`

Validation rule: dcc protection: protection side is active

The system shall reject the disabling of the dcc protection, if the protection side of dcc protection is the active one.

Error code:

`SNVS – Status, Not in Valid State, dcc protection side carries traffic`

Validation rule: Transparent DCC for DCC Line/MS protection mode

The LINE DCC channel of protecting port is not used in a transparent DCC cross-connection if DCC Line/MS Protection Mode – *dcclmsprotmd* – will be set to ENABLED.

Error code:

`SNVS – Status, Not in Valid State, DCC channel used in transparent DCC cross-connection`

Validation rule: Transparent DCC for DCC Sect/RS protection mode

The SECTION DCC channel of protecting port is not used in a ransparent DCC cross-connection if DCC Sect/RS Protection Mode – dcslrsprotmd – will be set to ENABLED.

Error code:

`SNVS – Status, Not in Valid State, DCC channel used in transparent DCC cross-connection`

Error responses (2-fibre MS-SPRing/BLSR protection group)

Validation rule: unique rid

The specified *newrid* is not already used by an already existing protection group of type 2F, 4F.

Error code:

`IDNV – Input, Data Not Valid, rid is already used by another protection group`

Validation rule: consistent aid and rid

If both an *aid* and an *rid* are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

Validation rule: Automatic squelch map calculation only with automatic ring discovery

The system shall not allow to set *ard* to DISABLE while the Automatic Squelch Map Calculation (asmc) is enabled or to set *asmc* to ENABLE while the Automatic Ring Discovery (ard) is disabled.

Error code:

`IDNV – Input, Data Not Valid, Automatic Squelch Map Calculation only allowed with Automatic Ring Discovery`

Error responses (4-fibre MS-SPRing/BLSR protection group)

Validation rule: unique *rid*

The specified *newrid* is not already used by an already existing protection group of type 2F, 4F.

Error code:

`IDNV – Input, Data Not Valid, rid is already used by another protection group`

The check of *rid* uniqueness is case insensitive.

Validation rule: port on same pack

Each port being added as member for the protection group is located on different circuit packs.

Error code:

`SNVS – Status, Not in Valid State, ports must be on different circuit packs`

Validation rule: common interface standard

Each port being added as member for the protection group shall have the same interface standard as already included ports.

Error code:

`SNVS – Status, Not in Valid State, ports have different interface types`

Validation rule: port in one group

Each port being added as member for the protection group is not be a member of an already provisioned protection group.

Error code:

`SNVS – Status, Not in Valid State, port is already used in another protection group`

Validation rule: common port rate

Each port being added as member for the protection group shall have the same port rate as the other ports.

Error code:

`SNVS – Status, Not in Valid State, ports have different port rates`

Validation rule: no XC loopback on tribs

There shall exist no cross-connection loopbacks on tributaries related to the specified ports being added/removed as member for the protection group.

Error code:

`SNVS – Status, Not in Valid State, Tributary is used in cross-connection`

Validation rule: No HO/LO cross-connection or LO substructure at tributaries

There shall exist no HO or LO cross-connection or LO substructure on tributaries related to the specified ports being added/removed as member for the protection group.

Error code:

`SNVS – Status, Not in Valid State, cross-connections or substructure still exist`

Validation rule: no test access session active

Tributaries related to the specified ports being added/removed as member for the protection group must not be used in a test access session either as tributaries under test or as test access tributaries.

Error code:

`SNVS – Status, Not in Valid State, Tributary used in test access session`

Validation rule: dcc enabled on worker port

If automatic ring discovery (parameter ard) is ENABLED, then for each working port being added as member for the protection group at least one dcc channel (section/dcc-r or line/dcc-m) with mode UITS is enabled.

Error code:

`SNVS – Status, Not in Valid State, no dcc channel with mode UITS enabled`

Validation rule: dcc enabled on protection port

If the worker port is removed from one side of a protection group while the parameter ard (automatic ring discovery) is ENABLED, then at least one dcc channel (section/dcc-r or line/dcc-m) for the protection port at the same side is enabled.

Error code: `SNVS – Status, Not in Valid State, no dcc channel enabled`

Validation rule: Automatic squelch map calculation only with automatic ring discovery

The system shall not allow to set *ard* to DISABLE while the Automatic Squelch Map Calculation (asmc) is enabled or to set *asmc* to ENABLE while the Automatic Ring Discovery (ard) is disabled.

Error code:

`IDNV – Input, Data Not Valid, Automatic Squelch Map Calculation only allowed with Automatic Ring Discovery`

Validation rule: Working port to be added is assigned as timing reference

If a port that is already assigned as timing reference is added to a protection group as working port, then no port of the circuit pack that holds the protection port is assigned as timing reference.

Error code:

`SNVS – Status, Not in Valid State, one port of protection unit is assigned as timing reference`

Validation rule: Timing Reference Assigned on Protection Unit

If a port which is not assigned as timing reference is added to a protection group as working port, then the protection port is not assigned as timing reference.

Error code:

`SNVS – Status, Not in Valid State, protection port is assigned as timing reference`

Validation rule: consistent *aid* and *rid*

If both an aid and an rid are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

Validation rule: no multiple added XCs for TOP

If *protnmode* is changed to SHORTENED or TOPEX and there exists a path protection group having one trib of worker port as output (so-called multiple added XC) then the following error response is returned.

Error code:

`SNVS – Status, Not in Valid State, multiple added XCs for MS-SPRing TOP`

Validation rule: SDH ports for TOP

If *protnmode* is changed to SHORTENED or TOPEX then all member ports shall have the interface standard SDH.

Error code:

`SNVS – Status, Not in Valid State, SONET port not allowed for TOP`

Validation rule: No cross-connections allowed when leaving TOPEX

The system shall reject all ED-PROTN-GRP commands for changing the parameter protnmode to any value beside TOPEX if the current value of the protection group is TOPEX and the protection ports of the protection group are involved in any cross-connection.

Error code:
`SNVS – Status, Not in Valid State, extra traffic cross-connections are still existing`

Validation rule: Idle ring node for protocol conversion

If protnmode is changed then ringndst is ’IDLE’ or ’SUSPENDED-IDLE’.

Error code: `SNVS – Status, Not in Valid State, node not in idle state`

Validation rule: supported *portClass* for TOP

If *protnmode* equals SHORTENED or TOPEX (both are TOP), then none of the specified member ports shall have the *portClass* EDGE.

Error code:
`SNVS – Status, Not in Valid State, portClass must not be EDGE for TOP`

Validation rule: portClass not INNI

Ports must not be of portClass INNI.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Unallowed modification of worker ports

The system shall only allow to change the parameters eastwkg and westwkg from a port AID to NOTUSED or from NOTUSED to a port AID (i.e. asymmetric ring conversion). All other modification attempts, i.e. change from one port AID to another port AID is denied.

Error code:
`IDNV – Input, Data Not Valid, change of worker port not allowed`

Error responses (path protection group)

Validation rule: Protection Group must exist

If the parameter *aid*, or the combination of the parameters *aid* and *ppgname* does not specify a path protection group, then the following error response is returned:

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Protection Group must exist

If the combination of the parameters *aid* and *aid1* does not specify a path protection group, then the following error response is returned:

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Maximum number of ppgnames exceeded

The new *ppgname* shall not exceed the maximum number of 768 ppgnames (i.e. is already in use for 768 other path protection groups).

Error code:

`SSRE – Status, System Resources Exceeded, limit of ppgnames exceeded`

Validation rule: *ppgname* and low order path protections

If a *ppgname* is given as input parameter while the *aid* references a low order tributary, then the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, ppgname not supported for this transmission rate`

Validation rule: SNC Type change on higher order path protection groups sharing input tributaries

The system shall allow to change the SNC type of a higher order path protection group only if one of the following conditions is fulfilled:

- None of the two input tributaries of the path protection group is used as input tributary of another path protection group.
- Both input tributaries of the path protection group are used as input tributaries of the same colocated path protection group.

Error code:

`SNVS – Status, Not in Valid State, Input tributary shared with other path protection group`

Validation rule: Access via tributary on INNI port

If in input parameter *aid* or *aid1* for access via input or output a tributary is given located on a port of port class INNI, then the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, No Access via AID located on INNI port`

ED-PROTN-GRP notification

Output format

The following syntax is used for 1+1 multiplex section/line, 2-/4-fibre MS-SPRing/BLSR, path protection group.

General Syntax: **`ED-PROTN-GRP`**:*aid*:*protype:spec_block*;

Path Protection Group Syntax: **`ED-PROTN-GRP`**:*aid:protype:spec_block {outtribaid, CML: cml_block}+* ;

Output parameters

Command parameters (multiplex section/line protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the aid of a 1+1 multiplex section/line protection group or the aid of a 1:1 multiplex section/line protection group (only R3.0 and later) or an port aid being a member of the group.
   Type: AID
   Range: *bay-shelf*-oall (ranged over OnePlusOne_ProtGrpAID) or OnePlusOne_ProtGrpAID (not ranged) or NByOne_ProtGrpAID (not ranged) or SPortAID (not ranged)
2. **`protype`** – Protection Type
   The parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1x***N***OPT (only R3.0 and later).
   In mind the ***N*** in “1x***N***OPT” is considered to be always equal “1”.
   Type: Alphanumeric value set.
   Range: 1+1 (default) or 1xNOPT.
   Default: 1+1

Command parameters (2-fibre MS-SPRing/BLSR protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID
   Range: *bay-shelf*-tall (ranged over TwoFibre_ProtGrpAID) or bay-shelf-fall (ranged over FourFibre_ProtGrpAID) or TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged).
2. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: 2F or 4F

Command parameters (4-fibre MS-SPRing/BLSR protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID
   Range: *bay-shelf*-tall (ranged over TwoFibre_ProtGrpAID) or bay-shelf-fall (ranged over FourFibre_ProtGrpAID) or TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged).
2. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: 2F or 4F

Command parameters (path protection group)

1. **`aid`** – Access Identifier
   The parameter specifies the AID of the path protection group.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.
2. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: PATHDRI
3. **`outtribaid`** – Output Tributary Access Identifier
   This parameter specifies the output tributary AID for a constituent signal within the protection group. One value is returned for each constituent signal together with the corresponding CML (Constituent Member List) block.
   Type:AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.

Spec block parameters (multiplex section/line protection group)

1. **apspn** – MSP-APS ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MSP-APS (Multiplex Section Protection – Automatic protection switching).
   Type: Alphanumeric string
   Range: 1-24 characters including the character "-".
   Default: DEFAULT
2. **dcclmsprotmd** – DCC Line/MS Protection Mode
   The parameter specifies, whether the line/MS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.
   Type: Alphanumeric value set 3;
   Range: ENABLE, DISABLE
   Default: DISABLE
3. **dccsrsprotmd** – DCC Sect/RS Protection Mode
   The parameter specifies, whether the section/RS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.
   Type: Alphanumeric value set
   Range: ENABLE, DISABLE
   Default: DISABLE
4. **wtr** – Wait To Restore Time / Wait to Rename Time
   The parameter specifies the "wait to restore" time used by the protection state machine operating in revertive mode. In case of MSP 1+1 optimized, the same parameter is used for the "wait to rename" time.
   Type: numeric string [minute]
   Range: 0 – 60
   Default: 5.

Spec block parameters (2-fibre MS-SPRing/BLSR protection group)

1. **ard** – Automatic Ring Discovery
   If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value manually with ED-MAP-RING and supply the ring map information to each node on the ring for the BLSR protocol to operate. It is necessary to activate this user-provisioned information with

SET-MAP-RING. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
Type: Alphanumeric string.
Range: ENABLE, DISABLE.
Default: ENABLE.

2. **`asmc`** – Automatic Squelch Map Calculation
If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
Type: Alphanumeric string
Range: ENABLE, DISABLE (default)
3. **`blsrpn`** – MS-SPRing-BLSR ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
Type: Alphanumeric string
Range: 1-24 characters including the character "-".
Default: DEFAULT
4. **`newrid`** – New Ring Identification
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE.
5. **`rcamode`** – Ring Circuit Alarm Mode
This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. I f *rcamode* is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
Type: Alphanumeric value set.
Range: ENABLE (default), DISABLE
6. **`wtr`** – Wait To Restore Time
This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.

Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.
Type: numeric string [minute].
Range: 0 – 12 in 1 minute increments and 99.
Default: 5.

Spec block parameters (4-fibre MS-SPRing/BLSR protection group)

1. **`ard`** – Automatic Ring Discovery
If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value and supply the ring map information to each node on the ring for the BLSR protocol to operate. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
Type: Alphanumeric string.
Range: ENABLE, DISABLE.
Default: ENABLE.
2. **`asmc`** – Automatic Squelch Map Calculation
If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
Type: Alphanumeric string
Range: ENABLE, DISABLE (default)
3. **`blsrpn`** – MS-SPRing-BLSR ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
Type: Alphanumeric string.
Range: 1-24 characters including the character “-”.
Default: DEFAULT.
4. **`newrid`** – New Ring Identification
This parameter specifies the new ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE
5. **`protnmode`** – Protection Switch Mode
The parameter specifies the protection switch mode. The value LOOPBACK is used for the classical ring application. The value SHORTENED is used for transmission delay sensitive applications. The value TOPEX (only R3.0 - R3.2 and later) is used for the so called transoceanic application, which allows extra traffic, improves restorability and improves delay as well as in SHORTENED mode.
In case of a ring switch … LOOPBACK performs the bridge and switch function in

that nodes which are most close to the failed span. SHORTENED performs the bridge function at the add node repectively the switch function at the drop node of each ring circuit. It is an application only similar to the transoceanic protocol. TOPEX allows, compared to SHORTENED mode, additionally the traffic restoration of not affected spans. It is the transoceanic protocol application. Consistent Protection Switch Mode Setting: The Protection Switch Mode must be set consistently on all nodes in the ring. E.g. for all UNITE NEs in a TOP+EX ring the parameter protnmode must be set to TOPEX. In a ring with inconsistent Protection Switch Mode, there will be no protection switching. The UNITE NEs will raise an Inconsistent Ring Protection Mode alarm.
Type: Alphanumeric value set.
Range: LOOPBACK, SHORTENED, TOPEX.
Default: LOOPBACK.

6. **`rcamode`** – Ring Circuit Alarm Mode
   This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If rcamode is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE
7. **`swtr`** – Span Wait To Restore Time
   The parameter specifies the wait to restore time for span switches used by the protection state machine operating in revertive mode. The protection shall operate in revertive mode if the wait-to-restore time is in the range 0-12. The protection shall operate in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
   Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.
   Type: numeric string [minute].
   Range: 0 – 12 in 1 minute increments and 99.
   Default: 5.
8. **`wtr`** – Wait To Restore Time
   This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
   Note: If wtr time is set to infinite, the switch request state is WTR until a higher request occurs.
   Type: numeric string [minute].
   Range: 0 – 12 in 1 minute increments and 99.
   Default: 5.

Spec block parameters (Path protection group)

1. **dripathpn** – SNCP-UPSR ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type SNCP-UPSR
   Type: Alphanumeric string
   Range: 1-24 characters including the character "-".
   Default: DEFAULT
2. **htmr** – Hold-Off Time
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
   Type: numeric string [ms].
   Range: 0 .. 99 ms in 1 ms steps and 100 .. 10000 ms in 100 ms steps.
3. **newppgname** – New Path protection group Name
   This parameter specifies the path protection group name. Storage and retrieval of the *ppgname* is case sensitive, but actual use of the *ppgname* to determine the corresponding protection group is case insensitive.
   Type: text string.
   Range: 0 to 24 characters.
   Default: empty string
4. **protn** – Protection Tributary
   This parameter specifies the protection input tributary AID being a member of the path protection group.
   Type: AID.
   Range: STS1NumAID, VCGNumAID, GenLOTribAID, GenLOTribAID, TMuxAPTNumAID.
   Default: None.
5. **rme** – Protection Reversion
   This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group.
   The value ENABLE is used if the protection operates in revertive mode.
   The value DISABLE is used if the protection operates in non-revertive mode.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
6. **snctype** – SNC Protection Type
   This parameter specifies the type of the path protection w.r.t. switch criteria used by the protection state machine.
   The value SNCI (Inherent) is used if server signal fail is used as switch criteria.
   The value SNCN (Non-Instrusive) is used if server signal fail and defects supervised by a non-intrusive path monitor are used as switch criteria
   The value NA is used if one of the tributary inputs is related to a port operating in SONET mode.
   Type: Alphanumeric value set.
   Range: SNCI, SNCN, NA.

7. **`wkg`** – Worker Tributary
   This parameter specifies the worker input tributary AID being a member of the path protection group.
   Type: AID.
   Range: STS1NumAID, VCGNumAID, GenLOTribAID, GenLOTribAID, TMuxAPTNumAID.
   Default: None.
8. **`wtr`** – Wait To Restore Time
   This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.
   Type: numeric string [minute].
   Range: 0 – 60.

CML block parameters (Path protection group)

1. **`cst`** – Constituent Signal Type
   The parameter specifies the rate of the constituent signal within the path protection group.
   Type: Alphanumeric string
   Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C
   Default: The default value is derived from the tributary input signal rate list in case of fixed mode.

Example output

Multiplex section/line protection group (1+1)

The following example reports the modification of wait-to restore timer for an 1+1 multiplex section/line protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ”TIME=15-00-00,DATE=00-11-03:ED-PROTN-GRP:1-1-o001:1+1:wtr=8”
;
```

2 fibre MS-SPRing/BLSR protection group

The following example reports the modification of wait-to-restore time and ring id for a two fiber protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ”TIME=15-00-00,DATE=00-11-03:ED-PROTN-GRP:1-1-t001:2F:newrid=\”dallas3\”,wtr=10”
;
```

4 fibre MS-SPRing/BLSR protection group

The following example reports the modification of wait-to-restore time and ring id for a four fiber protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ED-PROTN-GRP:1-1-f001:4F:newrid=\″dallas3\″,wtr=10″
;
```

Path protection group

The following example reports the modification of hold off time and path protection group name for a path protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ED-PROTN-GRP:1-1-#-#-10-1-
      25:PATHDRI:newppgname=\″dallas3\″,htmr=10″
;
```

ED-PTF: Edit tributary with Path Termination Function (PTF)

The **ED-PTF** command modifies the properties of a tributary with path termination function.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-PTF**-*modifier:tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range:
   - STS for DS3 card
   - HOSTS1 for LOXC card
   - HOVC4 for LOXC card
   - TMASTS1 for TransMUX asynchronous port
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **aid** – Access Identifier
   The access identifier specifies the PTF tributary whose attributes are reported.
   Type: AID
   Range:
   - PTNumAID for modifier: STS, HOSTS1, HOVC4 as defined in AID structure. That means the value **all** is allowed for Simple_PTNumAID.
   - TMuxAPTNumAID for modifier: TMASTS1

   For Simple_UnivSlotAID there is no **usall** value. For Simple_TMuxAPortAID there is no **all** value.
4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   The parameter *brstintvl* specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST, then *brstintvl* has no affect to NE behavior.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter *brstintvl* is not supported for the following modifiers:

   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

   Option: If the parameter *brstintvl* is not supported, then the parameter is omitted.
   Type: Integer.
   Range: 2, 3, … 10 [seconds]
   Default: 7 [seconds].

2. **`brstthr`** – Bursty Error Threshold
   The parameter *brstthr* specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter *brstthr* is not supported for the following modifiers:

   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

   Option: If the parameter *brstthr* is not supported, then the parameter is omitted.
   Type: Integer.
   Range: 5, 10, 15, … 50 [%].
   Default: 30.

3. **`degthr`** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to

RTRV-PTF Output parameters.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter *degthr* is not supported for the following modifiers:

- TMSSTS1

Type: Integer.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

4. **`dexcthr`** – Excessive Degrade Threshold
This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of sdsfmode refer to RTRV-PTF Output parameters.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter *dexcthr* is not supported for the following modifiers:

- TMSSTS1

Type: Integer.
Range (as exponents of 10): –3; –4; –5.
Default: –3.

5. **`exphptrc`** – Expected HP trace identifier
This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if ptrcrfmt is set to 16.

Limitation: The parameter is not supported for modifiers:

- TMSSTS1

Type: Hexadecimal number without a preceding “H”.
Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.
Default: 89000000000000000000000000000000

6. **`feppm`** – Far End Path PM Enable
The parameter *feppm* specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the parameters for far-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1

Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

7. **`hptimais`** – HP Trace Identifier Mismatch AIS Insertion

   The parameter *hptimais* shall specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   The parameter is not supported for the following modifiers:

   - TMSSTS1

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE.

   Default: The default value depends on interface standard specified by *ptfstd* for the PTF tributary. DISABLE, if *ptfstd* = SONET

8. **`hptimmon`** – HP Trace Identifier Mismatch Monitor

   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   The parameter is not supported for the following modifiers:

   - TMSSTS1

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

9. **`inputsig`** – Tributary Input Signal Rate List

   This parameter specifies the input LO signal structure.

   The parameter *inputsig* is only supported for the following modifiers:

   - HOVC4
   - HOSTS1
   - TMSSTS1

   Option: If the parameter *inputsig* is not supported, then the parameter is omitted.
   Type: numeric value set
   Range: NX-NX-… (N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).
   The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33

The possible values (SONET) are: 2811
Restricted Range with AU3/AU4 Conversion cross-connections:
If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *inputsig* is restricted to: 33.
Restricted Range with TransMUX:
If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.

Default:

- 6312 for SDH
- 2811 for SONET

10. **neppm** – Near End Path PM Enable
This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the possibility to enable near-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1

Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE.

Default: DISABLE.

11. **pmhpfeses** – PM HP Far End SES Threshold
This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *ptfstd* for the PTF tributary. If *ptfstd* is not set to SDH then *pmhpfeses* has no affect to NE behavior.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the possibility to enable far-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1

Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.
Default: 2400

12. **`pmhpneses`** – PM HP Near End SES Threshold
    This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by *ptfstd* for the tributary. If *ptfstd* is not set to SDH then *pmhpneses* has no affect to NE behavior.
    This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
    Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1

    Type: Integer.
    Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.
    Default: 2400

13. **`ptca`** – Path TCA Profile Pointer
    This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    TCA profile: The TCA profile type depends on the type and standard of the PTF, which is specified with the parameter *modifier* or *aidtype*:

    - PATH if *modifier* = TMASTS1

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1
    - HOVC4

    Type: Alphanumeric value set.
    Range: 1 … 24 characters.
    Default: DEFAULT0

14. **`ptfstd`** – Path Termination Standard
    Standard of the tributary with Path Termination Function.
    This is currently a read-only parameter.
    Type: Alphanumeric value set.

    Range:

    - SDH (only if *modifier* = HOVC4)
    - SONET (only if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1)

    Default:

    - SDH (if if *modifier* = HOVC4)
    - SONET (if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1).

15. **`ptpn`** – Path Terminating ASA Profile Name
    This parameter points to a tributary ASAP profile name *pfname* for the designated AID.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Type: Alphanumeric value set. A hyphen (“-”) is allowed in the name additionally.
    Range: 1 … 24 characters
    Default: DEFAULT

16. **`ptrcrfmt`** – Path Trace Read Format
    The parameter *ptrcrfmt* specifies the format of the path trace (J1 byte) to be received (sink).

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Type: Numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.

17. **`ptrcwfmt`** – Path Trace Write Format
    The parameter *ptrcwfmt* specifies the format of the path trace (J1 byte) to be sent (source).

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Type: Numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.

    Default: 2.

18. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    This parameter specifies the determination mode of degraded defect for transmission.
    Limitation for PTF related to modifiers: Near-end performance monitoring is not available for modifier STS. The parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1

- HOVC4
- HOSTS1

Option: If the parameter *sdsfmode* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: BURST, POISSON
Default: The default value depends on interface standard specified by *ptfstd* for the tributary. POISSON, if *ptfstd* = SONET.

19. **`tmonmd`** – Tributary Monitoring Mode
    This parameter specifies the monitoring mode for the tributary.
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Type: Alphanumeric value set.
    Range: MON, NMON.
    Default: NMON.
20. **`trc`** – Outgoing Path Trace
    This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Type: Hexadecimal number without a preceding “H”.
    Range: the range depends on the parameter ptrcwfmt specified in RTRV-PTF Output parameters
    - length: 32 hexadecimal digits, if *ptrcwfmt*=16; 128 hexadecimal digits, if *ptrcwfmt* = 64
    - value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt*=16; 64 byte string if *ptrcwfmt* = 64

    Default: 00. This implies also that *ptrcwfmt* is set to 2.
21. **`tslmmon`** – Trail Signal Label Mismatch Monitor
    The parameter *tslmmon* specifies the mode of the TSL mismatch detection.
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Type: Alphanumeric value set.
    Range: DISABLE, ENABLE.
    Default: ENABLE.
22. **`unequiposig`** – Unequipped Output Signal List
    The parameter *unequiposig* specifies the output LO signal structure, independent whether the signal is connected or not. The parameter *unequiposig* is only supported for modifiers HOVC4. HOSTS1. and TMSSTS1.
    Option: If the parameter *unequiposig* is not supported, then the parameter is

omitted.
Type: numeric value set
Range: NX-NX-…(N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).
The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33
The possible values (SONET) are: 2811
Restricted Range with AU3/AU4 Conversion cross-connections:
If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *unequiposig* is restricted to: 33.
Restricted Range with TransMUX:
If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.
Default:

- 6312 for SDH
- 2811 for SONET

Output format

If the network element fully complies with the **ED-PTF** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The ED-PTF shall generate a REPT DBCHG message. The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed entity according to the parameters given with this command. The parameters *brstintvl*, *brstthr*, *degthr* and *dexcthr* is modifiable also if they are not meaningful at the moment. The modification is reported by means of an ED-PTF notification.

Dependencies

- *brstintvl* and *brstthr* are only meaningful if *sdsfmode* is set to BURST.
- *degthr* and *dexcthr* are only meaningful if *sdsfmode* is set to POISSON.

Supply outgoing J1 trace value and format together

When changing the format of the outgoing J1 trace *ptrcwfmt*, the parameter *trc* specifying the outgoing J1 trace shall always be supplied within the same TL1-command to always have a consistent set of trace format and value. When the format of the outgoing J1 trace *ptrcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J1 trace (mandatory parameter trc) specified in the command is ignored.

Supply outgoing J1 trace value according to format of outgoing J1

When changing the outgoing J1 trace value, the format must be according to the format parameter ptrcwfmt for the outgoing J1 trace.

Change of J1 expected format - FM impact

When the expected J1 format (ptrcrfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J1 (exphptrc) and the currently received J1 (ptrc).

When the expected J1 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of tributary standard - Notification behavior

A change of the interface standard ptfstd is not allowed unless this parameter is set to the same value. For convenience reasons, the parameter ptfstd is not dropped from the message definition as other products managed by the same EMS may support this common parameter.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Changing LO substructure (SDH only)

The system shall update the parameters *inputsig* and *unequiposig*. Changes of the inputsig and unequiposig values are notified via ED-PTF notifications. If one or both of the parameters *inputsig* and *unequiposig* are not specified in the command or are set to the same value as already provisioned, then the system shall not change the parameter value(s).

Update affected entities

- If one third of the substructured VC4 tributary is changed from 21 LO VC12 to 1 LO VC3 then the parameters of the first LONIM entity of that third is set to default values according to the newly represented transmission rate. The parameters neppm, feppm, tcamd and ptca of the first LONIM entity of that third is not changed.. The parameters of the other 20 LO tributaries shall remain unchanged.
- If one third of the substructured VC4 tributary is changed from 1 LO VC3 to 21 LO VC12 then the parameters of all 21 LONIM entities of that third is set to default values according to the newly represented transmission rate. The parameters neppm, feppm, tcamd and ptca of the 21 LONIM entities of that third shall remain unchanged.

Changes of LO tributary parameter values are notified via ED-LONIM Notifications. Group notifications are used if a contiguous range of LO tributaries is affected in the same way (i.e. AID ranging is applicable).

Example input/output

```
ED-PTF-STS:LT-UNITE:1-1-#-#-21-1-1:123456:::tmonmd=NMON;

   LT-UNITE 00-11-11 11:11:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ED-PTF`** command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: supply of transmitted path trace

Check that a transmit path trace (trc) is supplied, too, if the path trace mode (ptrcwfmt) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trc must also be supplied for a path trace mode change`

Validation rule: transmitted path trace length

Check that a length of the transmit path trace (trc) fits to the length given by path trace mode, i.e. write format (ptrcwfmt).

Error code:

`IDNC – Input, Data Not Consistent, trc length must match the given path trace mode`

Validation rule: Substructure change not allowed while conversion cross-connections exist

The command processing shall not allow to modify the substructure (parameters *inputsig* and *unequiposig*) when AU3/AU4 conversion cross-connections exist at LO tributaries related to the PTF.

Error code:

`SNVS – Status, Not in Valid State, conversion cross-connections are still existing`

Validation rule: Substructure change not allowed with LO cross-connections at input tributaries

If inpusig is set to a new value, while LO cross-connections exist at input tributaries of the affected third of the substructure, then the command is denied

Error code:

`SNVS – Status, Not in Valid State, lower order cross-connections are still existing`

Validation rule: Substructure change not allowed with LO cross-connections at output tributaries

If *unequiposig* is set to a new value, while LO cross-connections exist at output tributaries of the affected third of the substructure, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, lower order cross-connections are still existing`

Validation rule: Maximum number of enabled PM monitors

For PTF entities with the modifier STS, check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **`ED`** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **`ED`** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

This validation rule is not applicable for entities related to lower order tributaries (PTF and LONIM) as all possible monitors on these entities are allowed to be activated in parallel.

This validation rule is not applicable for entities related to TransMUX tributaries (PTF) as all possible monitors on these entities are allowed to be activated in parallel.

Validation rule: Check CCB against *ptfstd* of related tributary

Check wether the CCB fits to *ptfstd* of the tributary.

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

Example: DENY, if a command with modifier = VC is made on a port which is provisioned as *ptfstd* = SONET.

ED-PTF notification

Output format

Syntax

ED-PTF:*aid,aidtype::spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   The access identifier specifies the PTF tributary whose attributes are reported.
   Type: AID
   Range:
   - PTNum for modifier: STS, HOSTS1, HOVC4, ALL
   - TMuxAPTNumAID for modifier: TMASTS1, ALL
   - TMuxSPTNumAID for modifier: TMSSTS1, ALL

   as defined in AID structure with exception of value *all*.
2. **aidtype** – Access Identifier Type
   The *aidtype* specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range:
   - STS
   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

   Default: None.

Spec block parameters

1. **brstintvl**– Bursty Interval
   The parameter *brstintvl* specifies the measurement period for degraded defect if *sdsfmode* is set to BURST.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.
   The parameter *brstintvl* is not supported for the following modifiers:
   - HOSTS1
   - HOVC4

- TMASTS1
- TMSSTS1

Option: If the parameter *brstintvl* is not supported, then the parameter is omitted.
Type: Integer.
Range: 2, 3, … 10 [seconds]
Default: 7 [seconds].

2. **`brstthr`** – Bursty Error Threshold
   The parameter *brstthr* specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter *brstthr* is not supported for the following modifiers:

   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

   Option: If the parameter *brstthr* is not supported, then the parameter is omitted.
   Type: Integer.
   Range: 5, 10, 15, … 50 [%].
   Default: 30.

3. **`crslpbkstat`** – Cross-connect Loopback Status
   The parameter *crslpbkstat* reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035).

   The parameter *crslpbkstat* is not supported for the following modifiers:

   - HOSTS1
   - HOVC4
   - TMSSTS1

   Option: If the parameter *crslpbkstat* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: YES, for enabled loopback; NO, for disabled loopback

4. **`degthr`** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to RTRV-PTF Output parameters.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter *degthr* is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Integer.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

5. **`dexcthr`** – Excessive Degrade Threshold
This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of sdsfmode refer to RTRV-PTF Output parameters.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.
The parameter *dexcthr* is not supported for the following modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
Type: Integer.
Range (as exponents of 10): –3; –4; –5.
Default: –3.

6. **`exphptrc` –** Expected HP trace identifier
This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
Limitation: The parameter is not supported for modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
Type: Hexadecimal number without a preceding “H”.
Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.
Default: 89000000000000000000000000000000

7. **`feppm` –** Far End Path PM Enable
The parameter *feppm* specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the parameters for far-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

8. **`hptimais`** – HP Trace Identifier Mismatch AIS Insertion
The parameter *hptimais* shall specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE.

Default: The default value depends on interface standard specified by *ptfstd* for the PTF tributary. DISABLE, if *ptfstd* = SONET

9. **`hptimmon`** – HP Trace Identifier Mismatch Monitor
This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. **`inputsig`** – Tributary Input Signal Rate List
This parameter specifies the input LO signal structure.

The parameter *inputsig* is only supported for the following modifiers:

- HOVC4
- HOSTS1
- TMSSTS1

Option: If the parameter *inputsig* is not supported, then the parameter is omitted.
Type: numeric value set
Range: NX-NX-… (N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).
The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33
The possible values (SONET) are: 2811
Restricted Range with AU3/AU4 Conversion cross-connections:
If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *inputsig* is restricted to: 33.
Restricted Range with TransMUX:
If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.

Default:

- 6312 for SDH
- 2811 for SONET

11. **neppm** – Near End Path PM Enable
This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the possibility to enable near-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE.

Default: DISABLE.

12. **pmhpfeses** – PM HP Far End SES Threshold
This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *ptfstd* for the PTF tributary. If *ptfstd* is not set to SDH then *pmhpfeses* has no affect to NE behavior.

This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the possibility to enable far-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.
Default: 2400

13. **`pmhpneses`** – PM HP Near End SES Threshold
    This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by *ptfstd* for the tributary. If *ptfstd* is not set to SDH then *pmhpneses* has no affect to NE behavior.
    This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
    Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Integer.
    Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.
    Default: 2400

14. **`ptca`** – Path TCA Profile Pointer
    This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    TCA profile: The TCA profile type depends on the type and standard of the PTF, which is specified with the parameter *modifier* or *aidtype*:

    - PATH if *modifier* = TMASTS1

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1
- HOVC4

Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set.
Range: 1 … 24 characters.
Default: DEFAULT0

15. **`ptfstd`** – Path Termination Standard
Standard of the tributary with Path Termination Function.
This is currently a read-only parameter.
Type: Alphanumeric value set.
Range:
    - SDH (only if *modifier* = HOVC4)
    - SONET (only if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1)

    Default:
    - SDH (if if *modifier* = HOVC4)
    - SONET (if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1).
16. **`ptpn`** – Path Terminating ASA Profile Name
This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set. A hyphen (“-”) is allowed in the name additionally.
Range: 1 … 24 characters
Default: DEFAULT
17. **`ptrcrfmt`** – Path Trace Read Format
The parameter *ptrcrfmt* specifies the format of the path trace (J1 byte) to be received (sink).
The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
Type: Numeric string.
Range:
    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.

18. **`ptrcwfmt`** – Path Trace Write Format
The parameter *ptrcwfmt* specifies the format of the path trace (J1 byte) to be sent (source).

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Numeric string.

Range:

- 2: for non-specific repeating byte
- 16: for 16 byte specific string
- 64: for 64 byte string.

Default: 2.

19. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
This parameter specifies the determination mode of degraded defect for transmission.
Limitation for PTF related to modifiers: Near-end performance monitoring is not available for modifier STS. The parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1
- HOVC4
- HOSTS1

Option: If the parameter *sdsfmode* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: BURST, POISSON
Default: The default value depends on interface standard specified by *ptfstd* for the tributary. POISSON, if *ptfstd* = SONET.

20. **`substr`** – Substructured
The parameter *substr* indicates if the PTF is substructured.

Additional description for LOXC

This parameter indicates if the PTF is configured for AU3/AU4 conversion cross-connections.
The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created. A PTF, which is configured for AU3/AU4 conversion cannot be used to set up HO cross-connections.
The parameter *substr* is only supported, if *modifier* = STS.
If the parameter *substr* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- CNV: In use for HO side of a conversion cross-connection
- NO: Not used for conversion cross-connections

Default: NO.

21. **`tmonmd`** – Tributary Monitoring Mode
This parameter specifies the monitoring mode for the tributary.
The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Alphanumeric value set.
    Range: MON, NMON.
    Default: NMON.

22. **`trc`** – Outgoing Path Trace
This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Hexadecimal number without a preceding "H".
    Range: the range depends on the parameter *ptrcwfmt* specified in RTRV-PTF Output parameters
    - length: 32 hexadecimal digits, if *ptrcwfmt* = 16; 128 hexadecimal digits, if *ptrcwfmt* = 64
    - value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt*=16; 64 byte string if *ptrcwfmt* = 64

    Default: 00. This implies also that *ptrcwfmt* is set to 2.

23. **`tslmmon`** – Trail Signal Label Mismatch Monitor
The parameter *tslmmon* specifies the mode of the TSL mismatch detection.
The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Alphanumeric value set.
    Range: DISABLE, ENABLE.
    Default: ENABLE.

24. **`unequiposig`** – Unequipped Output Signal List
The parameter *unequiposig* specifies the output LO signal structure, independent whether the signal is connected or not. The parameter *unequiposig* is only supported for modifiers HOVC4. HOSTS1. and TMSSTS1.
Option: If the parameter *unequiposig* is not supported, then the parameter is

omitted.
Type: numeric value set
Range: NX-NX-…(N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).
The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33
The possible values (SONET) are: 2811
Restricted Range with AU3/AU4 Conversion cross-connections:
If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *unequiposig* is restricted to: 33.
Restricted Range with TransMUX:
If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.
Default:

- 6312 for SDH
- 2811 for SONET

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ED-PTF:1-1-#-#-21-1-1,STS::tmonmd=MON″
;
```

ED-RC-GENERAL: Edit general routing controller settings

The **RTRV-RC-GENERAL** command is used to edit the general settings of the network element routing controller.

> **Important!** This functionality requires the software version R10.5.1. With older software versions it is not possible to configure parameters “Hello Interval” and “Dead Interval” to values different from their default values of 10 s (for “Hello Interval”) and 30 s (for “Dead Interval”).
>
> As corresponding parameters must be set to equal values for all RCs in the network, the whole network must be run with the default values. In case of a multi-vendor network, set the corresponding parameters of the non-1675 LambdaUnite MSS products to the default values of 1675 LambdaUnite MSS.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-RC-GENERAL**:*tid*::*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*.

Spec block parameters

1. **`hellointerval`** – Hello Interval
   This parameter is used to indicate the time (in seconds) between two succeeding "Hello" messages to be sent to a neighbor RC.
   Type: Numerical.
   Range: 1 … 65535.
   Default: 10.
2. **`deadintv`** – Dead Interval
   This parameter is used to indicate the time (in seconds) that the system waits for the reception of "Hello" PDU from a neighbor RC before the neighbor RC is considered to be dead.
   Type: Numerical.
   Range: 1 … 65535.
   Default: 30.

Output format

If the **`ED-RC-GENERAL`** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **`ED-RC-GENERAL`** specifies the hello interval and the router dead interval. The hello interval is the time between two "Hello" PDU messages that are sent to an RC neighbor. The dead interval is the amount of time which must be passed without receiving a "Hello" PDU from an RC neighbor, before this RC neighbor is declared dead.

Example input/output

The following example shows the result of **`ED-RC-GENERAL`**:

```
ED-RC-GENERAL:NE-UNITE::123456:::hellointv=20, deadintv=60;
   LT-UNITE 00-12-24 12:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`RTRV-RC-GENERAL`** command.

Validation rule: RC must be created

If the RC is not created (through **`ACT-L1ROUTING`**), then the command is denied.

Error code: `IDNV – Input, Data Not Valid, RC not created`

ED-RC-GENERAL notification

Syntax

ED-RC-GENERAL:::*spec_block*

Output parameters

Spec block parameters

1. **hellointerval** – Hello Interval
   This parameter is used to indicate the time (in seconds) between two succeeding "Hello" messages to be sent to a neighbor RC.
   Type: Numerical.
   Range: 1 … 65535.
   Default: 10.
2. **deadintv** – Dead Interval
   This parameter is used to indicate the time (in seconds) that the system waits for the reception of "Hello" PDU from a neighbor RC before the neighbor RC is considered to be dead.
   Type: Numerical.
   Range: 1 … 65535.
   Default: 30.

Output format

If the **ED-RC-GENERAL** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Example input/output

```
   NE-UNITE 06-10-09 08:59:00
A  000 REPT DBCHG
   "TIME=08-59-00,DATE=06-10-09:ED-RC-GENERAL::: hellointv=20, deadintv=60";
```

ED-RSVP: Modify RSVP parameters

The **ED-RSVP** command modifies RSVP related parameters applicable for UNI or ENNI signaling on system level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-RSVP**-*modifier*:*tid*::*ctag*:::*spec_block;*

Input parameters

Command parameters

1. **modifier**
   The parameter modifier indicates the communication function entity for which the RSVP parameters apply.
   Type: Alphanumeric value set.
   Range: UNI or ENNI.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*.

Spec block parameters

1. **hellointerval** – Hello Interval
   This parameter is used to indicate the time between two succeeding HELLO messages to be sent to any neighbor in hello interworkings.
   Type: Numeric string.
   Range: 1 … 60, indicating the Hello Interval in seconds
2. **maxhelloretransmit** – Maximum Hello Retransmissions
   This parameter is used to indicate the number of Hello Intervals without any HELLO_REQUEST or HELLO_ACK object received from a neighbor after which communication to this neighbor is considered as lost.
   Type: Numeric string.
   Range: 1 to 10.
   Default: 3
3. **srefreshtimer** – Srefresh Timer
   This parameter is used to indicate the maximum time between two consecutive SREFRESH requests for a UNI or network connection towards affected neighbors in srefresh interworkings.
   Type: Numeric string.
   Range: 10 … 180 indicating the Srefresh time in seconds.
   Default: 15.

Output format

If the **RTRV-RSVP** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command shall update the RSVP parameters for the node specified by the command modifier.

Example input/output

The following example shows the result of an **ED-RSVP** command:

```
ED-RSVP-UNI:LT-UNITE::123456:::maxhelloretransmit=8;

   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
```

```
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`RTRV-NE`** command.

Validation rule: Check of the maintenance condition

The system must be in maintenance condition (MCOND = YES). Otherwise the command is rejected.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: UNI node IP Address must be provisioned

If the command is executed with *modifier* = UNI while no valid UNI Node IP Address (uni_ip_ad) is provisioned, then the command is denied.

Error code:
`SNVS – Status, Not in Valid State, UNI Node IP address not provisioned`

Validation rule: ENNI node must be created

If the command is executed with *modifier* = ENNI while the ENNI Node is not created (by provisioning of the *sigPCIP_Address* in ENT-ULS), then the command is denied.

Error code: `SNVS – Status, Not in Valid State, ENNI Node not created`

Related TL1 messages

- “RTRV-RSVP: Retrieve RSVP parameters” (p. 3-2823)

ED-RSVP notification

Output format

Command syntax: **ED-RSVP**-*modifier*:::*spec_block;*

The output parameters *sid*, *date*, *time*, and atag are described in the REPT DBCHG Report Database Change notification.

Output parameters

Command parameters

1. **modifier**
   The parameter modifier indicates the communication function entity for which the RSVP parameters apply.
   Type: Alphanumeric value set.
   Range: UNI or ENNI.

Spec block parameters

1. **hellointerval** – Hello Interval
   This parameter is used to indicate the time between two succeeding HELLO messages to be sent to any neighbor in hello interworkings.
   Type: Numeric string.
   Range: 1 … 60, indicating the Hello Interval in seconds
2. **maxhelloretransmit** – Maximum Hello Retransmissions
   This parameter is used to indicate the number of Hello Intervals without any HELLO_REQUEST or HELLO_ACK object received from a neighbor after which communication to this neighbor is considered as lost.
   Type: Numeric string.
   Range: 1 to 10.
   Default: 3
3. **srefreshtimer** – Srefresh Timer
   This parameter is used to indicate the maximum time between two consecutive SREFRESH requests for a UNI or network connection towards affected neighbors in srefresh interworkings.
   Type: Numeric string.
   Range: 10 … 180 indicating the Srefresh time in seconds.
   Default: 15.

Example output

The following is an example **ED-RSVP-UNI** notification in case the *maxhelloretransmit* parameter has been changed:

```
   LT-UNITE 06-06-30 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=06-06-30:ED-RSVP-UNI:::maxhelloretransmit=8″
```

```
;
```

ED-STATE-EQPT (CP) notification

Output format

Syntax: **`ED-STATE-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The AID of a circuit pack.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for any circuit pack
   - LoxcAID::=UnivSlotAID-loxc for LOXC pack in universal slots.

   The keyword **`usall`** is allowed for Simple_UnivSlotAID
   The keyword **`xcall`** is allowed for Simple_XCSlotAID
   The keyword **`ctlall`** is allowed for Simple_CTLSlotAID
   The keyword **`all`** is allowed for Simple_SlotAID
2. **`opstate`** – Operational State
   Each circuit pack has a retrievable attribute indicating whether circuit pack is operational for the system internal communication.
   Type: Alphanumeric value set.
   Range:
   - OS_ENABLED
   - OS_DISABLED (default)
   - OS_SYNCHING.

Example output

```
   UNITE-NE 00-11-14 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-14:ED-STATE-EQPT:1-1-#-#-1-cp:::opstate=OS_ENABLE”;
```

ED-STATE-EQPT (slot) notification

Output format

Syntax: **`ED-STATE-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The AID of a slot.
   Type: AID
   Range:
   - SlotAID

   The keyword **`usall`** is allowed for Simple_UnivSlotAID.
   The keyword **`xcall`** is allowed for Simple_XCSlotAID.
   The keyword **`ctlall`** is allowed for Simple_CTLSlotAID.
   The keyword **`all`** is allowed for Simple_SlotAID, Simple_UnivSlotAID, Simple_XCSlotAID, Simple_CTLSlotAID.
   The keyword **`all`** is not allowed on bay/shelf level.

Spec block parameters

1. **`holdst`** – Holder Status
   Each provisionable slot has an attribute indicating its equipage state.
   Type: Alphanumeric value set.
   Range:
   - EMPTY. The system uses the value ″EMPTY″ if no circuit pack is equipped in that slot.
   - VALID. The system shall use the value ″Valid″ if a circuit pack is equipped in that slot as provisioned.
   - UNEXPECTED. The system shall use the value ″Unexpected″ if a different circuit pack is equipped in that slot as provisioned or if the circuit pack is not acceptable for this slot.
   - UNKNOWN. The system shall use the value ″Unknown″ if a circuit pack is equipped in that slot with non-readable functional type or illegal values for the functional type.

   Default: EMPTY.

Example output

```
    UNITE-NE 00-11-14 08:00:30
A   001 REPT DBCHG
    ″TIME=08-00-12,DATE=00-11-14:ED-STATE-EQPT:1-1-#-#-1::holdst=VALID″
```

```
;
```

ED-STATE-EQPT (socket) notification

Output format

Syntax: **`ED-STATE-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keyword *usall* or *all* is allowed for Simple_UnivSlotAID. The keyword *scall* is allowed for Simple_SocketAID. The keyword **`all`** is not allowed on bay/shelf level.

Spec block parameters

1. **`holdst`** – Holder Status
   Each provisionable socket shall have an attribute indicating its equipage state.
   Type: Alphanumeric value set.
   Range:
   - EMPTY, the system uses the value ″EMPTY″ if no module is equipped in that socket.
   - VALID, the system uses the value ″Valid″ if a module is equipped in that socket as provisioned.
   - UNEXPECTED, the system uses the value ″Unexpected″ if a different module is equipped in that socket as provisioned or if the module is not acceptable for this socket.
   - UNKNOWN, the system uses the value ″Unknown″ if a module is equipped in that socket with non-readable functional type or illegal values for the functional type.

   For further details w.r.t. state transitions for holder status – see SRD_Configuration-Management.
   Default: EMPTY.

Example output

This example shows an ED-STATE-EQPT notification reporting a plug out of a module from the socket:

```
UNITE-NE 00-11-14 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-14:ED-STATE-EQPT:1-1-#-#-5-sc2::holdst=EMPTY″
;
```

ED-STATE-EQPT (system): Edit equipment state

The **ED-STATE-EQPT** command modifies the state information on system (NE) level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 4

Abortable: no

Input format

Command syntax: **ED-STATE-EQPT**:*tid*:*aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system; the usage of the keyword **all** on system level is not allowed.
   Default: system
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **mcond** – Maintenance Condition
   This parameter denotes whether the system condition is in maintenance condition or not.
   Type: Alphanumeric value set.
   Range:
   - Y = maintenance mode
   - N = normal mode.

Output format

If the **ED-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
```

```
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the **RTRV-HDR** command.

Detailed behavior description

The command switches the system to the maintenance condition or back to normal condition. There is an autonomous system reset when the maintenance condition is left. The following attribute of the system entity is updated due to that operation:

mcond as specified in the command input.

The modification is reported by means of an ED-STATE-EQPT notification for the system.

Updated affected entities:

Setting *mcond* = Y causes that *opstate* = OS_DISABLED for all non-CTL circuit packs in the system. The change is reported by means of an ED-STATE-EQPT notification for the circuit pack.

Volatile maintenance condition

The maintenance condition is not stored in the configuration database. During reboot, all system states relevant for maintenance condition are re-evaluated to determine whether the system starts up in maintenance condition. As a consequence of this behavior, a maintenance condition established using ED-EQPT will be left after a reboot, if no other state causing a maintenance condition is present in the system (for example, a database serial number mismatch).

Example input/output

```
ED-STATE-EQPT:LT-UNITE:system:123456:::mcond=y;

   LT-UNITE 00-11-14 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ED-STATE-EQPT** command.

Related TL1 messages

“RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400)

ED-STATE-EQPT (system) notification

Output format

Syntax: **`ED-STATE-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system; the usage of the keyword **`all`** on system level is not allowed.
   Default: system

Spec block parameters

1. **`commitstate`** – SW Commitment Status
   The system provides an indication of the SW generic commitment status.
   Type: Alphanumeric value set.
   Range:
   - PENDING = the SW generic is in trial phase, switch back to previous generic possible
   - COMMITTED = the SW generic is comitted, no switch back possible.
2. **`dbstate`** – Data Base Change State
   The system provides an indication of the validity of the active data base.
   Type: Alphanumeric value set.
   Range:
   - EMPTY = data base state empty.
   - NEW = data base state new
   - VALID = database state valid
   - UNKNOWN = database state is not known.

   Default: UNKNOWN.
3. **`mcond`** – Maintenance Condition
   This parameter denotes whether the system condition is in maintenance condition or not.
   Type: Alphanumeric value set.
   Range:
   - Y = maintenance mode
   - N = normal mode.

Example output

```
ED-STATE-EQPT:LT-UNITE:system:123456:::mcond=n;
```

```
   LT-UNITE 00-11-14 08:00:00

```

ED-STM1E: Edit STM1E port

The **ED-STM1E** command is used to provision all parameters related to the electrical STM1E port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-STM1E**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   Access Identifier of an STM1E port.
   Type: AID.
   Range: SPortAID of STM1E port.
   For changing the *portControl* parameter the ALL qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
   The setting of this parameter is allowed when the related STM1E port is created, it is used when *sdsfmode* = BURST.
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
   The setting of this parameter is allowed when the related STM1E port is created, it is used when *sdfsmode* = POISSON.

6. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
   The setting of this parameter is allowed when the related STM1E port is created, it is used when *sdfsmode* = POISSON.
7. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
8. **`femspm`** – Far-end Multiplex Section Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU
10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port’s bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
    Default: 14.

11. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of "no localLPID provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
12. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    This identifies the maximum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    maxNNXCRate is introduced specifically for use by ONNS application.
    Type: Alphanumeric value set.
    Range: VC4 (default), VC3.
13. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    This identifies the minimum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    minNNXCRate is introduced specifically for use by ONNS application.
    Type: Alphanumeric value set.
    Range: VC3 (default), VC4.
14. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.

Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

15. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

16. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

17. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

18. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
19. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP
20. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

21. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default value for SDH: STM1: 28800.

22. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default value for SDH: STM1: 28800.

23. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

24. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
25. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
26. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255.
27. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: 1 – 64000.
Default value for SDH: STM1: 2400.
28. **`rsmstca`** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

29. **`rspm`** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
30. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
31. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
32. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC48: Retrieve OC48 port" (p. 3-2638)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
33. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.

34. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
35. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.
36. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
37. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string, dependent on the *strcwfmt* parameter.

Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

38. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
   - 1: for specific repeating byte (SONET)
   - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
   - 16: for 16 byte specific string (ITU/ETSI mode 1).
   - 64: for 64 byte string (SONET).
39. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
   - TR-only (lso known as the implicit reset method)
   - TR-RTR (lso known as the explicit reset method).

   Type: Alphanumeric value set.
Range: TR or TRRTR (default).
40. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.

Output format

If the **`ED-STM1E`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
```

;

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-STM1 notification for port (except for parameter *istd;* see below).

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value, the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc). When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term "PM monitor" has the same semantics as the term "PM package". The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while *portClass* is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual *portClass*

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when portClass is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when *portClass* is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*

- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Example input/output

```
ED-STM1E:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=14,UNEQUIPOSIG=14;

;

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the ED-STM1E command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross-connections.

Error code:

```
SNVS – Status, Not in Valid State, signal structure cannot be changed
for connected parts of a fixed port
```

Validation rule: *unequiposig* consistent with existing cross-connections

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross-connections.

Error code:

```
SNVS – Status, Not in Valid State, signal structure cannot be changed
for connected parts of a fixed port
```

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:

```
SNVS – Status, Not in Valid State, Timing reference is assigned to this
port
```

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

```
SNVS – Status, Not in Valid State, DCC channels are active for this port
```

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode.`

Validation rule: ’ALL’ qualifier used for wrong parameters

The ’ALL’ qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:

`IDNC – Input, Data Not Consistent, ’ALL’ qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to ptype and SDH standard.

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=OC3 is made on a EP155 port which is provisioned as ptype=STM1E.

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:
`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:
`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

```
SNVS – Status, Not in Valid State, LO cross-connections, substructure
or conversion cross-connections still exist
```

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

```
SNVS – Status, Not in Valid State, Port must not be member of a
protection group
```

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:

`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:

```
SNVS – Status, Not in Valid State, port mode change not allowed for
INNI ports
```

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

Error code:

```
SNVS – Status, Not in Valid State, J0 parameters can not be set for
INNI ports
```

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

`SNVS – Status, Not in Valid State, only allowed for INNI port in lockout state`

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI parameters`

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State, `*`ndetmd`*` must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

`IDNV – Input, Data Not Valid, zero values can only be set for all neighbor information consistently`

ONNS EDGE port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following must be fulfilled:

- No cross-connections of xconcls = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters, if there still exist any cross-connections for the EDGE port, which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

```
SNVS – Status, Not in Valid State, NN Cross-connections associated to
end-to-end network connections still existing
```

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* already assigned as *networkTNAAddrVCAT* to any VCG in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values, if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI port related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if UNI-N node is enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabeld`

Validation rule: Check of *UNI* parameters

It is not possible to change the *portClass* to UNI, unless valid values for the following UNI parameters are given:

clientNodeID

networkTNAType

networkTNAAddress

localLPID

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if *portcontrol* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a member of a BLSR/ MS-SPRing protection group`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if there still exist any NN cross connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Change the *portClass* away from UNI

It is not possible to modify the parameter servcond to OUTOFSERVICE for UNI ports.

Error code:

`SNVS – Status, Not in Valid State, Cannot change servcond for this port class`

Validation rule: Some Parameter Values not settable for ports of *portClass* UNI

The following parameter is not changeable to value ADAPTIVE forvalue ADAPTIVE for ports with *portClass* UNI:

trbmd

Error code:

`SNVS – Status, Not in Valid State, can not change portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters, if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values, when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It shall not be possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to any EDGE port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means, that UNI and EDGE ports are not to be mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

"RTRV-STM1E: Retrieve STM1E port" (p. 3-2849)

References

GR-199-CORE (ED-*rr*)

ED-STM1E notification

Output format

The ED-STM1E notification uses the general format of a REPT DBCHG (Report Database Change) notification.

Syntax: **`ED-STM1`**:*aid*::*spec_block*

Output parameter

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of an STM1E port.
   Type: AID.
   Range: SPortAID of STM1E port.
   The keyword **`all`** is allowed up to shelf level.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.

4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute "uniClientNodeID", as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.
6. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
8. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

9. **`femspm`** – Far-end Multiplex Section Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
10. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.
    Range:
    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU
11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).
12. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port’s bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
    Default: 14.
13. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this

attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of "no localLPID provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

14. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).

15. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
This identifies the maximum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
maxNNXCRate is introduced specifically for use by ONNS application.
Type: Alphanumeric value set.
Range: VC4 (default), VC3.

16. **`minNNXCRate`** – Minimum NN Cross Connect Rate
This identifies the minimum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
minNNXCRate is introduced specifically for use by ONNS application.
Type: Alphanumeric value set.
Range: VC4, VC3 (default).

17. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.

Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

18. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

19. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

20. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

21. **`nemspm`** – MS Near-End PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
22. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: Alphanumeric value set.
    Range:
    - IPV4 (default)
    - IPV6
    - NSAP
23. **`networkTNAAddress`** – Network TNA Address
    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

24. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default value for SDH: STM1: 28800.

25. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default value for SDH: STM1: 28800.

26. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

27. **`pmrsneses`** – Performance Monitoring RS Near-End SES Threshold
This parameter describes the RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: 1 – 64000.
Default value for SDH: STM1: 2400.
28. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
29. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
30. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255.
31. **`rsmstca`** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

32. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
33. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
34. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
35. **`sdhpn`** – SDH ASAP
    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports of corresponding line rate (see definition of output parameter sonet in "RTRV-OC12: Retrieve OC12 port" (p. 3-2620)) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
36. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON.

37. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
38. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.
39. **strcfmt** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1 for specific repeating byte (SONET)
    - 2 (default) for non-specific repeating byte (ITU/ETSI mode 2)
    - 16 for 16 byte specific string (ITU/ETSI mode 1)
    - 64 for 64 byte string (SONET).
40. **strcout** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter. If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string dependent on the *strcwfmt* parameter.

Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

41. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1 for specific repeating byte (SONET)
    - 2 (default) for non-specific repeating byte (ITU/ETSI mode 2)
    - 16 for 16 byte specific string (ITU/ETSI mode 1)
    - 64 for 64 byte string (SONET).
42. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).

43. **`trbmd`** – Tributary mode
This parameter is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
Type: Alphanumeric value set.
Range: ADAPTIVE, FIXED
Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in RTRV-EQPT (system) command.

44. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.

Example input/output

```
ED-STM1E:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=14,UNEQUIPOSIG=14;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:ED-STM1E:1-1-#-#-1-1::inputsig=14,unequiposig=14:″
;
```

ED-STM1E autonomous notifications

LOS for transmission port STM1E clears

If LOS is cleared and current port mode is AUTO, then *pmode* is updated (new value: MON). This update is reported via ED-STM1E notification with parameter *pmode*.

Change of neighbor Node and Neighbor Port Information

If *ndetmd* = AUTO a change of the attributes *neighborNodeID* or *neighborPortID* is notified by the related ED-STM1E notification.

If ndetmd=AUTO a change of the attribute *neighborASTNNodeID* is notified by the related ED-STM1E notification.

ED-STM1: Edit STM1 port

The command **ED-STM1** is used to provision all parameters related to optical STM1 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-STM1**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   Type: AID.
   Range: SPortAID of STM1 port.
   For changing the *portControl* parameter the ALL qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
   The setting of this parameter is allowed when the related STM1 port is created, it is used when *sdfsmode* = BURST.
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   The setting of this parameter is allowed when the related STM1 port is created, it is used when *sdfsmode* = BURST.
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute "uniClientNodeID", as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
   The setting of this parameter is allowed when the related STM1 port is created, it is used when *sdfsmode* = POISSON.

6. **dexcthr** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
   The setting of this parameter is allowed when the related STM1 port is created, it is used when *sdfsmode* = POISSON.
7. **exprstrc** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
8. **femspm** – Far-end Multiplex Section Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **frcdus** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU
10. **inputsig** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
    Default: 14.
11. **istd** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.

Range:

- SONET
- SDH.

Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

12. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character
13. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.

Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 or VC4 (default)

16. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default) or VC4.

17. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

18. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborASTNNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.
19. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0
    If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″
20. **`neighborPortID`** – Neighbor Port Id
    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is used by the ONNS application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

21. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
22. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: IPv4 format: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
23. **`nemspm`** – MS Near-End PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
24. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

25. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000…
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

26. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET:

    - STM1: 28800
    - OC3: 154.

27. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 28800
    - OC3: 154.

28. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

29. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

30. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT

31. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0 (default) …255. The unit of this value is ″milliseconds″.

32. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

33. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it

can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

34. **remRAID** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

35. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

36. **rspm** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

37. **rstimca** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

38. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
39. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
40. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.
41. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
42. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

43. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
44. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string dependent on the *strcwfmt* parameter.

    Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

45. **strcwfmt** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
46. **tcamd** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
Range: TR or TRRTR (default).
47. **unequiposig** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.

Output format

If the ED-STM1 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Behavior

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-STM1 notification for port (except for parameter *istd;* see below).

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SDH to SONET has the following impact related to fault management:

- all SDH alarms related to that port are cleared
- the corresponding SONET alarms are raised.

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value, the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc). When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Impact on port parameters

Switching of interface standard:

The switching of istd should not result in an deletion and recreation of the port. NE internally there are no differences between SDH and SONET.

Switching of interface standard I:

In detail the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OC*n* command for SONET parameter description):

- *brstintvl* is set to the default value
- *brstthr* is set to the default value
- *crstat* may change according to its semantics (see description of *crstat*)
- *femspm* is mapped to *felpm* (no changes)
- *inputsig* is set to the default value
- *istd* is set to SONET
- *nemspm* is mapped to *nelpm* (no changes)
- *rspm* is mapped to *spm* (no changes)
- *rstimca* is set to the default value for a SONET port
- *rstimmon* is set to the default value for a SONET port
- *sdhpn* is mapped to SONET (no changes)
- *sdsfmode* is set to the default value for a SONET port
- *sdthr* is set to the default value for a SONET port
- *sfthr* is set to the default value for a SONET port
- *trbmd* is set to the default value for a SONET port
- *unequiposig* is set to its default value
- *z0outmode* is set to its default value for a SONET port.

All other port parameters remain unchanged.

Switching of interface standard II:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *sltca* is set to the default value for a SONET port
- *tcamd* is set to the default value for a SONET port.

Switching of interface standard III:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *pmmsfeses* is set to the default value for a SONET port
- *pmmsneses* is set to the default value for a SONET port
- *pmrsneses* is set to the default value for a SONET port.

Switching of interface standard IV:

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *minNNXCrate* is set to the default value for a SONET tributary
- *maxNNXCrate* is set to the default value for a SONET tributary

Switching of interface standard – Side effects on tributaries

The switching of *istd* should not result in an deletion and recreation of the tributaries of a port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SDH to SONET (see also the related RTRV-OC*n* command for SONET parameter description):

- *brstintvl* is set to the default value for a SONET tributary
- *brstthr* is set to the default value for a SONET tributary
- *pse* (PDI-P parameter) is set to the default value for a SONET tributary
- *sdsfmode* is set to the default value for a SONET tributary.

Switching of interface standard – Side effects on tributaries II

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *degthr* is set to the default value for an SONET tributary
- *dexcthr* is set to the default value for an SONET tributary
- *ptca* is set to the default value for a SONET tributary
- *tcamd* is set to the default value for a SONET tributary.

The attribute tcamd does not exist for SONET ports. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

Switching of interface standard – Side effects on tributaries III

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *pmhpneses* is set to the default value for an SONET tributary
- *pmhpfeses* is set to the default value for an SONET tributary.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-STMn command all resulting parameter changes are reported by ED-OCn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – notification behavior for tributary attributes

When changing the interface standard *istd* using the ED-STMn command all resulting tributary parameter changes are reported by ED-STS1 notifications.

Switching of interface standard - notification behavior for active TCA events

If the changing of the interface standard *istd* to SONET includes an change of *tcamd* from TR-RTR to TR-only (SONET default value), then all active TCA events of the related entities must be cleared.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while *portClass* is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual *portClass*

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when portClass is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when *portClass* is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*

- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

ONNS ENNI PORT related behavior - Impact on *ndetmd* when *portClass* is set to ENNI

When *portClass* is set to ENNI, the parameter *ndetmd* is set to MAN.

ONNS ENNI PORT related behavior - Impact on remaining ENNI related port parameter settings, when *portClass* is set to ENNI

When the *portClass* is changed to ENNI, the following parameters of the ENNI parameter set shall keep their actual values, unless specified differently in the command setting the *portClass* to ENNI:

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *remTID*

The following parameters of the ENNI parameter set are mandatory and is set different to their default values:

- *remAdvNodeID (if a corresponding level 1routing model is defined)*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

This is covered by corresponding validation rules.

ONNS ENNI PORT related behavior - Impact on ENNI related port parameter settings, if *portClass* is changed away from ENNI

When *portClass* is changed away from ENNI, the following parameters are set to their default values:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the ED-STM1 command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross-connections.

Error code:
`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: *unequiposig* consistent with existing cross-connections

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross-connections.

Error code:
`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: no cross-connections for *istd* change

Check that the interface standard parameter (*istd*) is not changed when cross-connections are still on this port.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure for *istd* change

Check that the interface standard parameter (*istd*) is not changed when lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure are still on this port. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, the following error message is returned:

Error code:
`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: no loopbacks for *istd* change

Check that the interface standard parameter (*istd*) is not changed when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no protection for *istd* change

Check that the interface standard parameter (*istd*) is not changed when this port is in an protection group.

Error code:
`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: no test access session for *istd* change

Check that *istd* is not changed when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:

`SNVS – Status, Not in Valid State, Timing reference is assigned to this port`

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

`SNVS – Status, Not in Valid State, DCC channels are active for this port`

Validation rule: *servcond* must be enabled for protection ports

Check that the *servcond* is not OUTOFSERVICE if the port is used as protection port.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for protection ports`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode.`

Validation rule: ’ALL’ qualifier used for wrong parameters

The ’ALL’ qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:
`IDNC – Input, Data Not Consistent, ’ALL’ qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to ptype and SDH standard.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=OC3 is made on a EP155 port which is provisioned as ptype=STM1E.

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:

`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

```
SNVS – Status, Not in Valid State, LO cross-connections, substructure
or conversion cross-connections still exist
```

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

`SNVS – Status, Not in Valid State, Port must not be member of a protection group`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:

`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:

`SNVS – Status, Not in Valid State, port mode change not allowed for INNI ports`

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*

- *strcout*
- *strcwfmt*

Error code:

`SNVS – Status, Not in Valid State, J0 parameters can not be set for INNI ports`

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

`SNVS – Status, Not in Valid State, only allowed for INNI port in lockout state`

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI parameters`

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State, ndetmd must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

`IDNV – Input, Data Not Valid, zero values can only be set for all neighbor information consistently`

ONNS EDGE port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following must be fulfilled:

- No cross-connections of xconcls = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters, if there still exist any cross-connections for the EDGE port, which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means, that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* already assigned as *networkTNAAddrVCAT* to any VCG in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values, if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI port related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:
`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:
`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a cross-connect loopback exists for any tributary related to this port.

Error code:
`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the protection port of a 1+1 MSP/APS group.

Error code:
`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the protection port of a 1:1 MSP/APS group.

Error code:
`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameter

It is not possible to change the *portClass* to UNI, unless valid values for the following UNI parameters are given:

- *clientNodeI*
- *networkTNATyp*
- *networkTNAAddres*
- *localLPID*

Error code:
`IDNV - Input, Data Not Valid, UNI parameters must be different to their DEFAULT value`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:
`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the target of *portClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:
`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Check of parameters for UNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for UNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameter values not settable for ports of *portClass* UNI

The following parameter is not changeable to the value ADAPTIVE for ports with *portClass* UNI:

trbmd

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters, if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*

- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values, when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It is not possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned to any EDGE port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:
`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

ONNS ENNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if cross-connections on that port are still existing.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to ENNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:
`SNVS – SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections are still existing`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:
`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI, if cross connect loopback exists for any tributary related to this port.

Error code:
`SNVS – Status, Not in Valid State, cross connect loopback exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI, if the port is any member of a 1:1 MSP/APS group.

Error code:
`SNVS – Status, Not in Valid State, Port must not be a member of a 1:1 protection group`

Validation rule: Check of ENNI parameters

It is not possible to change the *portClass* to ENNI, unless valid values for the following ENNI parameters are given:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, Valid values for ENNI parameters required`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the ENNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to ENNINode`

Validation rule: Check of parameters for ENNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for ENNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameter values not settable for ports of portClass ENNI

The following parameter is not changeable to value AUTO for ports with *portClass* ENNI:

- *ndetmd*

Error code: `SNVS – Status, Not in Valid State, portClass must not be ENNI`

Validation rule: Modify of ENNI parameters

It is possible to modify the ENNI related parameters only:

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to ENNI.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*
- *remTID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Modify of ENNI parameters

It is not possible to modify any of the ENNI related parameters, if there still exist any cross-connection for the ENNI port.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*

- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Unique setting of *localLinkID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value, if this value is unique within the system.

Error code:

`IDNV – Input, Data Not Valid, local Link ID value must be unique`

Validation rule: Unique setting of *localLinkID* wrt. *localLPID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value, if this value is not already assigned to parameter *localLPID* of any port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of ENNI parameters

It is not possible to set the following ENNI parameters to their default values if *portClass* is equal to ENNI or during the setting of *portClass* to ENNI:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, ENNI Port Parameters must be different to their DEFAULT values`

"RTRV-STM1: Retrieve STM1 port" (p. 3-2863)

References

GR-199-CORE (ED-*rr*)

ED-STM1 autonomous notifications

LOS for transmission port STM1 clears

If LOS is cleared and current port mode is AUTO, then *pmode* is updated (new value: MON). This update is reported via ED-STM1 notification with parameter *pmode*.

Change of neighbor node and neighbor port Information

If *ndetmd* = AUTO a change of the attributes *neighborNodeID* or *neighborPortID* is notified by the related ED-STM1 notification.

If ndetmd=AUTO a change of the attribute *neighborASTNNodeID* is notified by the related ED-STM1 notification.

ED-STM1 notification

Output format

The **ED-STM1** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **ED-STM1**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID.
   Range: SPortAID of STM1 port.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **brstthr** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniClientNodeID", as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter inputsig showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-… N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

6. **`degthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

7. **`dexcthr`** – Excessive Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –3; –4; –5.
Default: –3.

8. **`exprstrc`** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

9. **`femspm`** – Far-end Multiplex Section Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. **`frcdus`** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range:
    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU
11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
12. **`inputsig`** – Tributary Input Signal Rate List
This parameter is a list of VCn rates across the port's bandwidth.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.
13. **`istd`** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET.
Type: Alphanumeric value set.
Range:
    - SONET
    - SDH.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
14. **`linkResCls`** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is

not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity
The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

16. **`localLPID`** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.

Range:

- YES
- NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 or VC4 (default)

19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default) or VC4.

20. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This

parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0.

26. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).

27. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
   - IPV4 (default)
   - IPV6
   - NSAP

28. **`networkTNAAddress`** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  0000000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET:

    - STM1: 28800
    - OC3: 154.

30. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 28800
    - OC3: 154.

31. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

32. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000.
Default: The default values differ for SDH and SONET and the different rates:
    - STM1: 2400
    - OC3: 155.
33. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
34. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
35. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.
36. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0
If *portClass* has a value supporting this parameter, this default value shall have the meaning of “no ID provisioned”.

37. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

38. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

39. **`remTID`** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: ″″

40. **`rsmstca`** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

41. **`rspm`** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

42. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

43. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

44. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

45. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
- BURST (default)
- POISSON.

46. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

47. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

48. **strcfmt** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
- 1 for specific repeating byte (SONET)
- 2 (default)for non-specific repeating byte (ITU/ETSI mode 2)

- 16 for 16 byte specific string (ITU/ETSI mode 1). 64 for 64 byte string (SONET)
- 16 for 16 byte specific string (ITU/ETSI mode 1). 64 for 64 byte string (SONET)

49. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter. If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string dependent on the strcwfmt parameter.

    Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

50. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1 for specific repeating byte (SONET)
    - 2 (default)for non-specific repeating byte (ITU/ETSI mode 2)
    - 16 for 16 byte specific string (ITU/ETSI mode 1). 64 for 64 byte string (SONET)
    - 16 for 16 byte specific string (ITU/ETSI mode 1). 64 for 64 byte string (SONET)

51. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
Range: TR or TRRTR (default).

52. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
    Type: Alphanumeric value set.
    Range: ADAPTIVE, FIXED
    Default: The initial value is defined as the trbmddflt parameter on system level, see definition in RTRV-EQPT (system) command.
53. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
    Default: 14.

Example output

```
ED-STM1:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=14,UNEQUIPOSIG=14;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ED-STM1:1-1-#-#-1-1::inputsig=14,unequiposig=14:"
;
```

ED-STM4: Edit STM4 port

The command **ED-STM4** is used to provision all parameters related to optical STM4 ports.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-STM4**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Type: AID.
   Range: SPortAID of STM4 port.
   For changing the portControl parameter the ALL qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
   The setting of this parameter is allowed when the related STM4 port is created, it is used when *sdfsmode* = BURST.
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   The setting of this parameter is allowed when the related STM4 port is created, it is used when *sdfsmode* = BURST.
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
   The setting of this parameter is allowed when the related STM4 port is created, it is used when *sdfsmode* = POISSON.

6. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
   The setting of this parameter is allowed when the related STM4 port is created, it is used when *sdfsmode* = POISSON.
7. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
8. **`femspm`** – Far-end Multiplex Section Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU
10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4 or 4C representing VC3, VC4 or VC4-4C.
    Default: 44.
11. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.

Range:

- SONET
- SDH.

Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

12. **linkResCls** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character
13. **localLinkID** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **localLPID** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.

Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4 or VC44C (default)

16. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4 or VC44C.

17. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

18. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborASTNNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.
19. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0
    If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″
20. **`neighborPortID`** – Neighbor Port Id
    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is used by the ONNS application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

21. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
22. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: IPv4 format: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
23. **`nemspm`** – MS Near-End PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
24. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

25. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000…
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

26. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET:

    - STM4: 115200
    - OC12: 615.

27. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 115200
    - OC3: 615.

28. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

29. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000.
Default: The default values differ for SDH and SONET and the different rates:
   - STM4: 2400
   - OC12: 616.
30. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
31. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
32. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0 (default) …255. The unit of this value is ″milliseconds″.
33. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

34. **remLinkID** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

35. **remRAID** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

36. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: *""*

37. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
38. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
39. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
40. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
41. **`sdhpn`** – SDH ASAP
    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.

42. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON.
43. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
44. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.
45. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

46. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string dependent on the strcwfmt parameter.

    Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex
47. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
48. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
Range: TR or TRRTR (default).
49. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port’s bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4 or 4c representing VC3, VC4 or VC4-4C.
Default: 44.

Output format

If the ED-STM4 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Behavior

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-STM16 notification for port (except for parameter *istd;* see below).

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SDH to SONET has the following impact related to fault management:

- all SDH alarms related to that port are cleared
- the corresponding SONET alarms are raised.

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value, the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Impact on port parameters

Switching of interface standard.

The switching of istd should not result in an deletion and recreation of the port. NE internally there are no differences between SDH and SONET.

Switching of interface standard I:

In detail the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OC*n* command for SONET parameter description):

- *brstintvl* is set to the default value
- *brstthr* is set to the default value
- *crstat* may change according to its semantics (see description of *crstat*)
- *femspm* is mapped to *felpm* (no changes)
- *inputsig* is set to the default value
- *istd* is set to SONET
- *nemspm* is mapped to *nelpm* (no changes)
- *rspm* is mapped to *spm* (no changes)
- *rstimca* is set to the default value for a SONET port
- *rstimmon* is set to the default value for a SONET port
- *sdhpn* is mapped to SONET (no changes)
- *sdsfmode* is set to the default value for a SONET port
- *sdthr* is set to the default value for a SONET port
- *sfthr* is set to the default value for a SONET port
- *trbmd* is set to the default value for a SONET port
- *unequiposig* is set to its default value
- *z0outmode* is set to its default value for a SONET port.

All other port parameters remain unchanged.

Switching of interface standard II:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *sltca* is set to the default value for a SONET port
- *tcamd* is set to the default value for a SONET port.

Switching of interface standard III:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *pmmsfeses* is set to the default value for a SONET port
- *pmmsneses* is set to the default value for a SONET port
- *pmrsneses* is set to the default value for a SONET port.

Switching of interface standard IV:

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *minNNXCrate* is set to the default value for a SONET tributary
- *maxNNXCrate* is set to the default value for a SONET tributary

Switching of interface standard – Side effects on tributaries

The switching of *istd* should not result in an deletion and recreation of the tributaries of a port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SDH to SONET (see also the related RTRV-OC*n* command for SONET parameter description):

- *brstintvl* is set to the default value for a SONET tributary
- *brstthr* is set to the default value for a SONET tributary
- *pse* (PDI-P parameter) is set to the default value for a SONET tributary
- *sdsfmode* is set to the default value for a SONET tributary.

Switching of interface standard – Side effects on tributaries II

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *degthr* is set to the default value for an SONET tributary
- *dexcthr* is set to the default value for an SONET tributary
- *ptca* is set to the default value for a SONET tributary
- *tcamd* is set to the default value for a SONET tributary.

Switching of interface standard – Side effects on tributaries III

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *pmhpneses* is set to the default value for an SONET tributary
- *pmhpfeses* is set to the default value for an SONET tributary.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-STMn command all resulting parameter changes are reported by ED-OCn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – notification behavior for tributary attributes

When changing the interface standard *istd* using the ED-STMn command all resulting tributary parameter changes are reported by ED-STS1 notifications.

Switching of interface standard - notification behavior for active TCA events

If the changing of the interface standard *istd* to SONET includes an change of *tcamd* from TR-RTR to TR-only (SONET default value), then all active TCA events of the related entities must be cleared.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while *portClass* is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual *portClass*

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when *portClass* is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when *portClass* is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*

- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

ONNS ENNI PORT related behavior - Impact on *ndetmd* when *portClass* is set to ENNI

When *portClass* is set to ENNI, the parameter *ndetmd* is set to MAN.

ONNS ENNI PORT related behavior - Impact on remaining ENNI related port parameter settings, when *portClass* is set to ENNI

When the *portClass* is changed to ENNI, the following parameters of the ENNI parameter set shall keep their actual values, unless specified differently in the command setting the *portClass* to ENNI:

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *remTID*

For remaining ENNI parameters values different to their default values are mandatory.

This is covered by a corresponding validation rule.

ONNS ENNI PORT related behavior - Impact on ENNI related port parameter settings, if *portClass* is changed away from ENNI

When *portClass* is changed away from ENNI, the following parameters are set to their default values:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Example input/output

```
ED-STM4:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=14-33-24,UNEQUIPOSIG=14-33-24;

;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the ED-STM4 command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross-connections.

Error code:
`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: *unequiposig* consistent with existing cross-connections

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross-connections.

Error code:
`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: no cross-connections for *istd* change

Check that the interface standard parameter (*istd*) is not changed when cross-connections are still on this port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure for *istd* change

Check that the interface standard parameter (*istd*) is not changed when lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure are still on this port. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: no loopbacks for *istd* change

Check that the interface standard parameter (*istd*) is not changed when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no protection for *istd* change

Check that the interface standard parameter (*istd*) is not changed when this port is in an protection group.

Error code:

`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: no test access session for *istd* change

Check that *istd* is not changed when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:

`SNVS – Status, Not in Valid State, Timing reference is assigned to this port`

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

`SNVS – Status, Not in Valid State, DCC channels are active for this port`

Validation rule: *servcond* must be enabled for protection ports

Check that the *servcond* is not OUTOFSERVICE if the port is used as protection port.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for protection ports`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode.`

Validation rule: ’ALL’ qualifier used for wrong parameters

The ’ALL’ qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:

`IDNC – Input, Data Not Consistent, ’ALL’ qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to ptype and SDH standard.

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=OC3 is made on a EP155 port which is provisioned as ptype=STM1E.

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:

`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

`SNVS – Status, Not in Valid State, Port must not be member of a protection group`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:

`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:
`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:
`SNVS – Status, Not in Valid State, port mode change not allowed for INNI ports`

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

Error code:
`SNVS – Status, Not in Valid State, J0 parameters can not be set for INNI ports`

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

`SNVS – Status, Not in Valid State, only allowed for INNI port in lockout state`

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI parameters`

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*

- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State,` *`ndetmd`* `must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

```
IDNV – Input, Data Not Valid, zero values can only be set for all
neighbor information consistently
```

ONNS EDGE port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following must be fulfilled:

- No cross-connections of xconcls = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters, if there still exist any cross-connections for the EDGE port, which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means, that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* already assigned as *networkTNAAddrVCAT* to any VCG in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values, if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI port related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the protection port of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the protection port of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameter

It is not possible to change the *portClass* to UNI, unless valid values for the following UNI parameters are given:

- *clientNodeI*
- *networkTNATyp*
- *networkTNAAddres*
- *localLPID*

Error code:

`IDNV - Input, Data Not Valid, UNI parameters must be different to their DEFAULT value`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Check of parameters for UNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for UNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameter values not settable for ports of *portClass* UNI

The following parameter is not changeable to the value ADAPTIVE for ports with *portClass* UNI:

trbmd

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters, if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values, when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It is not possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned to any EDGE port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

ONNS ENNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to ENNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections are still existing`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI, if cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, cross connect loopback exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI, if the port is any member of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a member of a 1:1 protection group`

Validation rule: Check of ENNI parameters

It is not possible to change the *portClass* to ENNI, unless valid values for the following ENNI parameters are given:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*

- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, Valid values for ENNI parameters required`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the ENNINode.

Error code:

`SNVS – Status, Not in Valid State, DCC must not be assigned to ENNINode`

Validation rule: Check of parameters for ENNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for ENNI ports.

Error code:

```
SNVS – Status, Not in Valid State, can not change servcond for this
port class
```

Validation rule: Some parameter values not settable for ports of portClass ENNI

The following parameter is not changeable to value AUTO for ports with *portClass* ENNI:

- *ndetmd*

Error code: `SNVS – Status, Not in Valid State, portClass must not be ENNI`

Validation rule: Modify of ENNI parameters

It is possible to modify the ENNI related parameters only:

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to ENNI.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*
- *remTID*

Error code:

```
SNVS – Status, Not in Valid State, only allowed for ENNI port in
lockout state
```

Validation rule: Modify of ENNI parameters

It is not possible to modify any of the ENNI related parameters, if there still exist any cross-connection for the ENNI port.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

```
SNVS – Status, Not in Valid State, Cross-connections still existing
```

Validation rule: Unique setting of *localLinkID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value, if this value is unique within the system.

Error code:
`IDNV – Input, Data Not Valid, local Link ID value must be unique`

Validation rule: Unique setting of *localLinkID* wrt. *localLPID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value, if this value is not already assigned to parameter *localLPID* of any port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of ENNI parameters

It is not possible to set the following ENNI parameters to their default values if *portClass* is equal to ENNI or during the setting of *portClass* to ENNI:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:
`IDNV – Input, Data Not Valid, ENNI Port Parameters must be different to their DEFAULT values`

"RTRV-STM4: Retrieve STM4 port" (p. 3-2881)

References

GR-199-CORE (ED-*rr*)

ED-STM4 autonomous notifications

LOS for transmission port STM4 clears

If LOS is cleared and current port mode is AUTO, then *pmode* is updated (new value: MON). This update is reported via ED-STM4 notification with parameter *pmode*.

Change of neighbor node and neighbor port Information

If *ndetmd* = AUTO a change of the attributes *neighborNodeID*, *neighborPortID* or *neighborASTNNodeID* is notified by the related ED-STM4 notification.

ED-STM4 notification

Output format

The ED-STM4 notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **ED-STM4**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
Type: AID.
Range: SPortAID of STM4 port.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. **brstthr** – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
Type: numeric value set.
Range (as percentage): 5, 10, … 50.
Default: 30.
4. **clientNodeID** – Client Node IDentifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.

6. **`degthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

7. **`dexcthr`** – Excessive Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –3; –4; –5.
Default: –3.

8. **`exprstrc`** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

9. **`femspm`** – Far-end Multiplex Section Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).

10. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.
    Range:
    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU
11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).
12. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4 or 4C representing VC3, VC4 or VC4-4C.
    Default: 44.
13. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range:
    - SONET
    - SDH.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
14. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute

represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295

16. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.

Range:

- YES
- NO (default).

18. **maxNNXCRate** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4 or VC44C (default)

19. **minNNXCRate** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4 or VC44C.

20. **ndetmd** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **neighborASTNNodeID** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This

parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **neighborNodeID** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **neighborPortID** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **neighborSigPCID** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

27. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

28. **`networkTNAAddress`** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET:

    - STM4: 115200
    - OC12: 615.

30. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 115200
    - OC3: 615.

31. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

32. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of allowed ranges for SDH and SONET):1 – 64000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 2400
    - OC12: 616.

33. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

34. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT

35. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …255. The unit of this value is ″milliseconds″.

36. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

37. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

38. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

39. **`remTID`** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: *""*

40. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
41. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
42. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
43. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
44. **`sdhpn`** – SDH ASAP
    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
45. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.

Range:

- BURST (default)
- POISSON.

46. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

47. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

48. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1 for specific repeating byte (SONET)
    - 2 (default) for non-specific repeating byte (ITU/ETSI mode 2)
    - 16 for 16 byte specific string (ITU/ETSI mode 1)
    - 64 for 64 byte string (SONET).

49. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter. f ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string dependent on the strcwfmt parameter.

    Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
50. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1 for specific repeating byte (SONET)
    - 2 (default) for non-specific repeating byte (ITU/ETSI mode 2)
    - 16 for 16 byte specific string (ITU/ETSI mode 1)
    - 64 for 64 byte string (SONET).
51. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).

52. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
Type: Alphanumeric value set.
Range: ADAPTIVE, FIXED
Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in RTRV-EQPT (system) command.

53. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4 or 4c representing VC3, VC4 or VC4-4C.
Default: 44.

Example output

```
ED-STM4:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=14-33-24,UNEQUIPOSIG=14-33-24;

A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ED-STM4:1-1-#-#-1-1::inputsig=14-33-
      24,unequiposig=14-33-24:"
;
```

ED-STM16: Edit STM16 port

The command **ED-STM16** is used to provision all parameters related to optical STM16 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-STM16**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Description: Access Identifier of an STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **all** is allowed up to shelf level.
   For changing the *portControl* parameter the ALL qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
The setting of this parameter is allowed when the related STM16 port is created, it is used when *sdfsmode* = BURST.
Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.

3. **`brstthr`** – Bursty Error Threshold
The setting of this parameter is allowed when the related STM16 port is created, it is used when *sdfsmode* = BURST.
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
Type: numeric value set.
Range (as percentage): 5, 10, … 50.
Default: 30.

4. **`clientNodeID`** – Client Node IDentifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`degthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
The setting of this parameter is allowed when the related STM16 port is created, it is used when *sdfsmode* = POISSON.

6. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
   The setting of this parameter is allowed when the related STM16 port is created, it is used when *sdfsmode* = POISSON.
7. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
8. **`femspm`** – Far-end Multiplex Section Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU
10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port’s bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.

Default: The initial value of X is 4.
Example:
An STM-16 signal might be represented by 93-14-14C-243 which implies 9 VC3s, 1 VC4, 1 VC4-4C, 24 VC3s. The representation is not unique, for example it could also be 33-63-14-14C-243. Worst case of string length for STM16: 47 characters.

11. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range:
    - SONET
    - SDH.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
12. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character
13. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is

not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4, VC44C or VC416C (default)

16. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4, VC44C or VC416C.

17. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.

Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

18. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

19. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

20. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

21. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

22. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

24. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this

attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

25. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000…
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

26. `pmmsfeses` – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
   - STM-16/OC-48: 1 – 3072000
   - STM-64/OC-192: 1 – 12288000
   - STM-256/OC-768: 1 – 49152000.

   Default: The default values differ for SDH and SONET and the different rates:
   - STM16: 460800
   - STM64: 1843200
   - STM256: 7372800
   - SONET OC48: 2459
   - SONET OC192: 9835
   - SONET OC768: 39340.
27. `pmmsneses` – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
   - STM-16/OC-48: 1 – 3072000
   - STM-64/OC-192: 1 – 12288000
   - STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

28. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.
29. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.
30. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

31. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
32. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …255. The unit of this value is ″milliseconds″.
33. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
34. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295

35. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

36. **`remTID`** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

37. **`rsmstca`** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

38. **`rspm`** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

39. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

40. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
41. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC48: Retrieve OC48 port" (p. 3-2638)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
42. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.
43. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
44. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

45. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
46. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex

47. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
48. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
Range: TR or TRRTR (default).
49. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* shall not need the identical setting. Mixed rates for tx and rx side of the port is allowed.
Type: numeric value set
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
Default: 164 = all VC4.

Output format

If the ED-STM16 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Behavior

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-STM16 notification for port (except for parameter *istd;* see below).

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SDH to SONET has the following impact related to fault management:

- all SDH alarms related to that port are cleared
- the corresponding SONET alarms are raised.

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value, the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Impact on port parameters

Switching of interface standard I:

In detail the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OC*n* command for SONET parameter description):

- *brstintvl* is set to the default value
- *brstthr* is set to the default value
- *crstat* may change according to its semantics (see description of *crstat*)
- *femspm* is mapped to *felpm* (no changes)
- *inputsig* is set to the default value
- *istd* is set to SONET
- *nemspm* is mapped to *nelpm* (no changes)
- *rspm* is mapped to *spm* (no changes)
- *rstimca* is set to the default value for a SONET port
- *rstimmon* is set to the default value for a SONET port
- *sdhpn* is mapped to SONET (no changes)
- *sdsfmode* is set to the default value for a SONET port
- *sdthr* is set to the default value for a SONET port
- *sfthr* is set to the default value for a SONET port
- *trbmd* is set to the default value for a SONET port
- *unequiposig* is set to its default value
- *z0outmode* is set to its default value for a SONET port.

All other port parameters remain unchanged.

Switching of interface standard II:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *sltca* is set to the default value for a SONET port
- *tcamd* is set to the default value for a SONET port.

The attribute *tcamd* does not exist for SONET ports. SONET ports only support TR-only mode. Thus the mode must be internally set to TR-only.

Switching of interface standard III:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *pmmsfeses* is set to the default value for a SONET port
- *pmmsneses* is set to the default value for a SONET port
- *pmrsneses* is set to the default value for a SONET port.

Switching of interface standard IV:

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *minNNXCrate* is set to the default value for a SONET tributary
- *maxNNXCrate* is set to the default value for a SONET tributary

Switching of interface standard – Side effects on tributaries

The switching of *istd* should not result in an deletion and recreation of the tributaries of a port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SDH to SONET (see also the related RTRV-OC*n* command for SONET parameter description):

- *brstintvl* is set to the default value for a SONET tributary
- *brstthr* is set to the default value for a SONET tributary
- *pse* (PDI-P parameter) is set to the default value for a SONET tributary
- *sdsfmode* is set to the default value for a SONET tributary.

Switching of interface standard – Side effects on tributaries II

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *degthr* is set to the default value for an SONET tributary
- *dexcthr* is set to the default value for an SONET tributary
- *ptca* is set to the default value for a SONET tributary
- *tcamd* is set to the default value for a SONET tributary.

The attribute tcamd does not exist for SONET ports. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

Switching of interface standard – Side effects on tributaries III

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *pmhpneses* is set to the default value for an SONET tributary
- *pmhpfeses* is set to the default value for an SONET tributary.

The attribute tcamd does not exist for SONET ports. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-STMn command all resulting parameter changes are reported by ED-OCn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – notification behavior for tributary attributes

When changing the interface standard *istd* using the ED-STMn command all resulting tributary parameter changes are reported by ED-STS1 notifications.

For efficiency reasons the ED-STS1 notifications are sent out as a single notification using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to

- 1 – 3, in case of an STM1/OC3 port
- 1 – 12, in case of an STM4/OC12 port
- 1 – 48, in case of an STM16/OC48 port
- 1 – 192, in case of an STM64/OC192 port
- 1 – 768, in case of an STM256/OC768 port.

Switching of interface standard - notification behavior for active TCA events

If the changing of the interface standard *istd* to SONET includes an change of *tcamd* from TR-RTR to TR-only (SONET default value), then all active TCA events of the related entities must be cleared.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while *portClass* is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual *portClass*

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when portClass is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when *portClass* is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*

- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

ONNS ENNI PORT related behavior - Impact on *ndetmd* when *portClass* is set to ENNI

When *portClass* is set to ENNI, the parameter *ndetmd* is set to MAN.

ONNS ENNI PORT related behavior - Impact on remaining ENNI related port parameter settings, when *portClass* is set to ENNI

When the *portClass* is changed to ENNI, the following parameters of the ENNI parameter set shall keep their actual values, unless specified differently in the command setting the *portClass* to ENNI:

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *remTID*

For remaining ENNI parameters, values different to their default values are mandatory. This is covered by a corresponding validation rule.

ONNS ENNI PORT related behavior - Impact on ENNI related port parameter settings, if *portClass* is changed away from ENNI

When *portClass* is changed away from ENNI, the following parameters are set to their default values:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Example input/output

```
ED-STM16:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=74-33-84,UNEQUIPOSIG=74-33-84;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ED-STM16:1-1-#-#-1-1::inputsig=74-33-
      84,unequiposig=74-33-84:"
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the ED-STM16 command.

Validation rule: Enough bandwidth reserved for 2F protection group

Check of the tributary rate (inputsig/unequiposig) if the port is member of a 2f protection group. Then the assigned bandwith is max. half of the port’s bandwith.

Error code:
`IDNV – Input, Data Not Valid, Assigned bandwidth exceeds half port’s bandwith`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross-connections.

Error code:
`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: *unequiposig* consistent with existing cross-connections

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross-connections.

Error code:
`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: no cross-connections for *istd* change

Check that the interface standard parameter (*istd*) is not changed when cross-connections are still on this port.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure for *istd* change

Check that the interface standard parameter (*istd*) is not changed when lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure are still on this port. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: no loopbacks for *istd* change

Check that the interface standard parameter (*istd*) is not changed when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no protection for *istd* change

Check that the interface standard parameter (*istd*) is not changed when this port is in an protection group.

Error code:

`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: no test access session for *istd* change

Check that *istd* is not changed when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:

`SNVS – Status, Not in Valid State, Timing reference is assigned to this port`

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

`SNVS – Status, Not in Valid State, DCC channels are active for this port`

Validation rule: *servcond* must be enabled for protection ports

Check that the *servcond* is not OUTOFSERVICE if the port is used as protection port.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for protection ports`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **ED** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **ED** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:
`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode.`

Validation rule: ’ALL’ qualifier used for wrong parameters

The ’ALL’ qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:
`IDNC – Input, Data Not Consistent, ’ALL’ qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to ptype and SDH standard.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=OC3 is made on a EP155 port which is provisioned as ptype=STM1E.

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:

`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

`SNVS – Status, Not in Valid State, Port must not be member of a protection group`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:

`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:

```
SNVS – Status, Not in Valid State, port mode change not allowed for
INNI ports
```

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

Error code:

```
SNVS – Status, Not in Valid State, J0 parameters can not be set for
INNI ports
```

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

```
SNVS – Status, Not in Valid State, only allowed for INNI port in
lockout state
```

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI parameters`

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State, ndetmd must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

`IDNV – Input, Data Not Valid, zero values can only be set for all neighbor information consistently`

ONNS EDGE port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following must be fulfilled:

- No cross-connections of xconcls = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters, if there still exist any cross-connections for the EDGE port, which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means, that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* already assigned as *networkTNAAddrVCAT* to any VCG in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values, if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI port related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the protection port of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the protection port of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameter

It is not possible to change the *portClass* to UNI, unless valid values for the following UNI parameters are given:

- *clientNodeI*
- *networkTNATyp*
- *networkTNAAddres*
- *localLPID*

Error code:

`IDNV - Input, Data Not Valid, UNI parameters must be different to their DEFAULT value`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:
`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the target of *portClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:
`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Check of parameters for UNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for UNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameter values not settable for ports of *portClass* UNI

The following parameter is not changeable to the value ADAPTIVE for ports with *portClass* UNI:

trbmd

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters, if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values, when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It is not possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned to any EDGE port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

ONNS ENNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to ENNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections are still existing`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI, if cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, cross connect loopback exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI, if the port is any member of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a member of a 1:1 protection group`

Validation rule: Check of ENNI parameters

It is not possible to change the *portClass* to ENNI, unless valid values for the following ENNI parameters are given:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, Valid values for ENNI parameters required`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if the target of *portClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the ENNINode.

Error code:
`SNVS – Status, Not in Valid State, DCC must not be assigned to ENNINode`

Validation rule: Check of parameters for ENNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for ENNI ports.

Error code:
```
SNVS – Status, Not in Valid State, can not change servcond for this
port class
```

Validation rule: Some parameter values not settable for ports of portClass ENNI

The following parameter is not changeable to value AUTO for ports with *portClass* ENNI:

- *ndetmd*

Error code: `SNVS – Status, Not in Valid State, portClass must not be ENNI`

Validation rule: Modify of ENNI parameters

It is possible to modify the ENNI related parameters only:

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to ENNI.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*

- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*
- *remTID*

Error code:
`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Modify of ENNI parameters

It is not possible to modify any of the ENNI related parameters, if there still exist any cross-connection for the ENNI port.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Unique setting of *localLinkID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value, if this value is unique within the system.

Error code:
`IDNV – Input, Data Not Valid, local Link ID value must be unique`

Validation rule: Unique setting of *localLinkID* wrt. *localLPID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value, if this value is not already assigned to parameter *localLPID* of any port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of ENNI parameters

It is not possible to set the following ENNI parameters to their default values if *portClass* is equal to ENNI or during the setting of *portClass* to ENNI:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

```
IDNV – Input, Data Not Valid, ENNI Port Parameters must be different to
their DEFAULT values
```

"RTRV-STM16: Retrieve STM16 port" (p. 3-2899)

References

GR-199-CORE (ED-*rr*)

ED-STM16 autonomous notifications

LOS for transmission port STM16 clears

If LOS is cleared and current port mode is AUTO, then *pmode* is updated (new value: MON). This update is reported via ED-STM16 notification with parameter *pmode*.

Change of neighbor node and neighbor port Information

If ndetmd=AUTO a change of the attributes *neighborNodeID*, *neighborPortID* or *neighborASTNNodeID* is notified by the related ED-STM16 notification.

ED-STM16 notification

Output format

The **ED-STM16** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **ED-STM16**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Description: Access Identifier of an STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **brstthr** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is

not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (trbmd = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List .
   Type: numeric value set
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
6. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
8. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
9. **`femspm`** – Far-end Multiplex Section Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. **frcdus** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.

    Range:

    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU

11. **fsflpbkstat** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **inputsig** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
    Default: The initial value of X is 4.
    Example:
    An STM-16 signal might be represented by 93-14-14C-243 which implies 9 VC3s, 1 VC4, 1 VC4-4C, 24 VC3s. The representation is not unique, for example it could also be 33-63-14-14C-243. Worst case of string length for STM16: 47 characters.

13. **istd** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.

    Range:

    - SONET
    - SDH.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

14. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character
15. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
16. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: VC3, VC4, VC44C or VC416C (default)

19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: VC3 (default), VC4, VC44C or VC416C.

20. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.

Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **neighborASTNNodeID** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **neighborNodeID** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **neighborPortID** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

27. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this

attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

28. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000…
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

30. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

31. **pmode** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

32. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

33. **portClass** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

34. **`portControl`** – Port Control (PortAdministrative Mode)
 The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
 Type: Alphanumeric value set.
 Range: NORMAL (default), LOCKOUT

35. **`propagationDelay`** – Propagation Delay
 This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
 propagationDelay is used by the ONNS application.
 Type: Numeric string.
 Range: 0(default) …255. The unit of this value is ″milliseconds″.

36. **`remAdvNodeID`** – Remote Advertised Node IDentity
 The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
 For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
 This parameter is supported by ports of *portClass* ENNI.
 Type: Four dot separated numeric string
 Range: Each numeric string: 0…255
 Default: 0.0.0.0

37. **`remLinkID`** – Remote Link IDentity
 The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
 This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
 This parameter is supported by ports of *portClass* ENNI.
 Type: numeric value set
 Range: 0 (default) to 4294967295

38. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
39. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: ""
40. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
41. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
42. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

43. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
   - ENABLE: enable TIM Monitor
   - DISABLE (default): disable TIM Monitor
44. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC48: Retrieve OC48 port" (p. 3-2638)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
45. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
   - BURST (default)
   - POISSON.
46. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.
47. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

48. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc).
Type: Numeric string.
Default: 2

49. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
Type: Hexadecimal digits.
Range:
   - 1 byte string
   - 16 bytes string
   - 64 bytes string dependent on the strcwfmt parameter.

   Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

50. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout).
Type: Numeric string.
Default: 2

51. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
   - TR-only (lso known as the implicit reset method)
   - TR-RTR (lso known as the explicit reset method).

   Type: Alphanumeric value set.
Range: TR or TRRTR (default).

52. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
Type: Alphanumeric value set.
Range: ADAPTIVE, FIXED
Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in RTRV-EQPT (system) command.

53. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* shall not need the identical setting. Mixed rates for tx and rx side of the port is allowed.
Type: numeric value set
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
Default: 164 = all VC4.

Example output

```
ED-STM16:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=74-33-84,UNEQUIPOSIG=74-33-84;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:ED-STM16:1-1-#-#-1-1::inputsig=74-33-
      84,unequiposig=74-33-84:″
;
```

ED-STM16T: Edit STM16T port

The command **ED-STM16T** is used to provision all parameters related to optical STM16T port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-STM16T**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
aid – Access Identifier
Access Identifier of STM16T port.
Type: AID.
Range: SPortAID of STM16T port.
The keyword **all** is not allowed.
3. **ctag** – Correlation Tag
Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **exprstrc** – Value of Expected J0
For ED-STM16T this parametr refers to the incoming (inress) direction.
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

2. **`exprstrcout`** – Value of Expected J0 in outgoing direction
   Expected regenerator section trace identifier in outgoing (egress) direction.
   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
3. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
   Type: Alphanumeric value set.
   Range: SDH.
   Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
4. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.
5. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set.
   Range (superset of allowed ranges for SDH and SONET):1 – 64000
   Default: The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392

- SONET OC192: 8554
- SONET OC768: 22776.

6. **`pmrsnesesout`** – Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction
   This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set
   Range (superset of allowed ranges for SDH and SONET): 1 – 64000
   Default:
   The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
7. **`rsmstca`** – RS/MS TCA Profile Pointer
   Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
   Type: Alphanumeric string.
   Range: String with maximum of 24 characters.
   Default: DEFAULT0.
8. **`rspm`** – RS PM Enable
   For ED-STM16T this parameter refers to the incoming (ingress) direction.
   Enable or disable regenerator section (section) performance monitoring.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`rspmout`** – RS PM Enable in Outgoing Direction
   Enable or disable regenerator section (section) performance monitoring for the outgoing (egress) direction.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
10. **`rstimmon`** – RS TIM Monitor Enable
    For ED-STM16T this parameter refers to the incoming (Ingress) direction.
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

11. **rstimmon**out – RS TIM Monitor Enable in Outgoing direction
Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor
12. **sdhpn** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC48: Retrieve OC48 port" (p. 3-2638)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
13. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
14. **strcfmt** – Format of incoming J0
For ED-STM16T this parameter refers to the incoming (Ingress) direction.
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
15. **strcfmt**out – Format of outgoing J0
The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).
Type: Numeric string.

Range:

- 1, for specific repeating byte (SONET)
- 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
- 16, for 16 byte specific string (ITU/ETSI mode 1)
- 64, for 64 byte string (SONET).

16. **`tcamd`** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR or TRRTR (default).

Output format

If the ED-STM16T command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Behavior

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-STM16T notification for port (except for parameter *istd;* see below).

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt/strcfmtout) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc/expstrcout) and the currently received J0 (strc/strcout).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-STM16T* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SDH to SONET has the following impact related to fault management:

- all SDH alarms related to that port are cleared
- the corresponding SONET alarms are raised.

Switching of interface standard – Impact on port parameters

Switching of interface standard:

The switching of *istd* should not result in a deletion and recreation of the port. NE internally there are no differences between SDH and SONET. In detail the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OC48T command for SONET parameter description):

- *istd* is set to SONET
- *rspm* is mapped to *spm* (no changes)
- *rspmout* is mapped to spmout (no changes)
- *pmrsneses* is set to the default value for a SONET port
- *pmrsnesesout* is set to the default value for a SONET port
- *rstimmon* is set to the default value for a SONET port
- *rstimmonout* is set to the default value for a SONET port
- *sdhpn* is mapped to SONET (no changes)
- *sltca* is set to the default value for a SONET port
- *tcamd* is set to the default value for a SONET port.

All other port parameters remain unchanged.

The attribute tcamd does not exist for SONET ports. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-STM16T command all resulting parameter changes are reported by ED-OC48T notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard - notification behavior for active TCA events

If the changing of the interface standard *istd* to SONET includes an change of *tcamd* from TR-RTR to TR-only (SONET default value), then all active TCA events of the related entities must be cleared.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Example input/output

```
ED-STM16T:UNITE-NE:1-1-#-#-1-1:123456:::RSPM=ENABLE,RSPMOUT=ENABLE;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ED-STM16T:1-1-#-#-1-1::rspm=ENABLE,rspmout=ENABLE:"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ED-STM16T** command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:
`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:
`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **ED** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **ED** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Check CCB against *ptype* and *istd*

Check wether the CCB fits to *ptype* and *istd*.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

ED-STM16T notification

Output format

The **ED-STM16T** notification uses the general format of a REPT DBCHG notification.

Syntax

ED-STM16T*:aid::spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Access Identifier of STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **all** is not allowed.

Spec block parameters

1. **exprstrc** – Value of Expected J0
   For ED-STM16T Notification this parameter refers to the incoming (inress) direction
   Expected regenerator section trace identifier. TThe parameter expstrc specifying the expected path trace is only relevant for the section trace supervision when the related trace read format strcfmt is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
2. **exprstrcout** – Value of Expected J0 in outgoing direction
   Expected regenerator section trace identifier in outgoing (egress) direction. The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.

3. **`fsflpbkstat`** – Far Side Facility Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

4. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.
   Type: Alphanumeric value set.
   Range: SDH
   Default: As specified via istddflt on system level, see definition in RTRV-EQPT (system).

5. **`lpbk`** – Loopback
   This parameter specifies the current near-side loopback status of the considered output *aid*.
   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

6. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.

   Range:

   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

7. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set.
   Range (superset of allowed ranges for SDH and SONET):1 – 64000
   Default: The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.
8. **`pmrsneses`**out – Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction
   This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set
   Range (superset of allowed ranges for SDH and SONET): 1 – 64000
   Default:
   The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
9. **`rsmstca`** – RS/MS TCA Profile Pointer
   Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
   Type: Alphanumeric string.
   Range: String with maximum of 24 characters.
   Default: DEFAULT0.
10. **`rspm`** – RS PM Enable
   For ED-STM16T this parameter refers to the incoming (ingress) direction.
   Enable or disable regenerator section (section) performance monitoring.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).

11. **`rspmout`** – RS PM Enable in Outgoing Direction
Enable or disable regenerator section (section) performance monitoring for the outgoing (egress) direction.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).

12. **`rstimmon`** – RS TIM Monitor Enable
For ED-STM16T Notification this parameter refers to the incoming (Ingress) direction.
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
   - ENABLE: enable TIM Monitor
   - DISABLE (default): disable TIM Monitor

13. **`rstimmonout`** – RS TIM Monitor Enable in Outgoing direction
Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor

14. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in “RTRV-OC48: Retrieve OC48 port” (p. 3-2638)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

15. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.

16. **`strcfmt`** – Format of incoming J0
    For ED-STM16T this parameter refers to the incoming (Ingress) direction.
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
17. **`strcfmt`**out – Format of outgoing J0
    The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).
    Type: Numeric string.

    Range:

    - 1, for specific repeating byte (SONET)
    - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
    - 16, for 16 byte specific string (ITU/ETSI mode 1)
    - 64, for 64 byte string (SONET).
18. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).

Example output

```
ED-STM16T:UNITE-NE:1-1-#-#-1-1:123456:::RSPM=ENABLE,RSPMOUT=ENABLE;

ED-STM64: Edit STM64 port

The command **ED-STM64** is used to provision all parameters related to optical STM64 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-STM64**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM64 port.
   Type: AID.
   Range: STM-64 port AID
   For changing the *portControl* parameter the ALL qualifier for the port aid is allowed.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535

2. **`brstintvl`**– Bursty Interval
   The setting of this parameter is allowed when the related STM64 port is created, it is used when *sdfsmode* = BURST.
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   The setting of this parameter is allowed when the related STM64 port is created, it is used when *sdfsmode* = BURST.
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter is allowed when the related STM64 port is created, it is used when *sdfsmode* = POISSON.
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.

6. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter is allowed when the related STM64 port is created, it is used when *sdfsmode* = POISSON.
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
7. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
8. **`fec`** – FEC Enable
   Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
   Type: Alphanumeric value set.
   Range:
   DISABLE (only) for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics
   - OC192 / STM64 client ports (related to OTN ports)
   - OC768 / STM256 basis low cost intra office 1310 nm optics.

   ENABLE / DISABLE for:
   - OC192 / STM64 OLS800G compatible 80 colour optics
   - OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
   - OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

   ENABLE (only) for:
   - OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G.

   Default:

DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768 / STM256 basis low cost intra office 1310 nm optics.

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

9. **`femspm`** – Far-end Multiplex Section Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).
10. **`frcdus`** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range:
    - ENABLE: (set a forced DUS/DNU)
    - DISABLE (default): (clear a forced DUS/DNU).
11. **`inputsig`** – Tributary Input Signal Rate List
This parameter is a list of VCn rates across the port's bandwidth.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.
Default: 644.
12. **`istd`** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET.
Type: Alphanumeric value set.

Range:

- SONET
- SDH.

Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

13. **linkResCls** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

14. **localLinkID** – Local Link IDentity
The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

15. **localLPID** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4, VC44C, VC416C or VC464C (default)

17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4, VC44C, VC416C or VC464C.

18. **`msrei`** – MS-REI mode
Definition: An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.
Type: Alphanumeric value set.
Range:
    - SINGLE
    - EXTENDED (default).

19. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.

Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

20. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

21. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

22. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

23. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

26. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this

attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

27. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000…
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

28. **och** – optical channel enable
Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don’t have any impact on transmission.
Type: Alphanumeric value set.
Range:
    - for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
    - or ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
    - or ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
    - for client ports on packs which support OTN: DISABLE: disable, optical channel not applicable

    Default:
    - for OP10 and OP40 packs, which cannot support OCH: DISABLE
    - for OP10 packs, which cannot support OCH: ENABLE
    - for OP10 and OP40 packs, which only support OCH: ENABLE
    - for client ports on packs which support OTN: DISABLE.
29. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200

- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

30. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

31. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

    Default:
    - AUTO: for optical SDH/SONET ports
    - NMON for client ports.

32. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.
33. **`polynomial`** – Optical Channel Scrambling Polynomial
This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (och = ENABLE).
Type: numeric value set.
Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.
Default: 2.
34. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
35. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
36. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.

37. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

38. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

39. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

40. **`remTID`** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

41. **`rsmstca`** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

42. **`rspm`** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

43. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

44. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

45. **sdhpn** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC192: Retrieve OC192 port" (p. 3-2664)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

46. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
   - BURST (default)
   - POISSON.

47. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.

48. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

49. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc).
If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
50. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string dependent on the strcwfmt parameter.

    Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
51. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout).
If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
52. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (lso known as the implicit reset method)
- TR-RTR (lso known as the explicit reset method).

Type: Alphanumeric value set.
Range: TR or TRRTR (default).

53. **unequiposig** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.
Default: 644 = all VC4.

Output format

If the ED-STM64 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Behavior

The command modifies the attributes (listed in the *spec_block* parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an ED-STM64 notification for port (except for parameter *istd*; see below).

Switching of interface standard – Ignore other parameters

If additional parameters beside *istd* are specified with the *ED-rr* command they will be ignored by the NE.

This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard – FM impact

The change of the interface standard of a port from SDH to SONET has the following impact related to fault management:

- all SDH alarms related to that port are cleared
- the corresponding SONET alarms are raised.

Supply outgoing J0 trace value and format together

When changing the format of the outgoing J0 trace *strcwfmt*, the parameter *strcout* specifying the outgoing J0 trace is always supplied within the same TL1-command to always have a consistent set of trace format and value.

When the format of the outgoing J0 trace *strcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J0 trace (mandatory parameter strcout) specified in the command is ignored.

Supply outgoing J0 trace value according to format of outgoing J0

When changing the outgoing J0 trace value , the format must be according to the format parameter *strcwfmt* for the outgoing J0 trace.

Change of J0 expected format - FM impact

When the expected J0 format (strcfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J0 (expstrc) and the currently received J0 (strc).

When the expected J0 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Switching of interface standard – Impact on port parameters

Switching of interface standard:

The switching of istd should not result in an deletion and recreation of the port. NE internally there are no differences between SDH and SONET.

Switching of interface standard I:

In detail the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OC*n* command for SONET parameter description):

- *brstintvl* is set to the default value
- *brstthr* is set to the default value
- *crstat* may change according to its semantics (see description of *crstat*)
- *femspm* is mapped to *felpm* (no changes)
- *inputsig* is set to the default value
- *istd* is set to SONET
- *nemspm* is mapped to *nelpm* (no changes)

- *rspm* is mapped to *spm* (no changes)
- *rstimca* is set to the default value for a SONET port
- *rstimmon* is set to the default value for a SONET port
- *sdhpn* is mapped to SONET (no changes)
- *sdsfmode* is set to the default value for a SONET port
- *sdthr* is set to the default value for a SONET port
- *sfthr* is set to the default value for a SONET port
- *trbmd* is set to the default value for a SONET port
- *unequiposig* is set to its default value
- *z0outmode* is set to its default value for a SONET port.

All other port parameters remain unchanged.

Switching of interface standard II:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *sltca* is set to the default value for a SONET port
- *tcamd* is set to the default value for a SONET port.

The attribute *tcamd* does not exist for SONET ports. SONET ports only support TR-only mode. Thus the mode must be internally set to TR-only.

Switching of interface standard III:

In addition to the list of attributes above the following attributes are influenced by switching of the *istd* from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *pmmsfeses* is set to the default value for a SONET port
- *pmmsneses* is set to the default value for a SONET port
- *pmrsneses* is set to the default value for a SONET port.

Switching of interface standard IV:

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *minNNXCrate* is set to the default value for a SONET tributary
- *maxNNXCrate* is set to the default value for a SONET tributary

Switching of interface standard – Side effects on tributaries

The switching of *istd* should not result in an deletion and recreation of the tributaries of a port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SDH to SONET (see also the related RTRV-OC*n* command for SONET parameter description):

- *brstintvl* is set to the default value for a SONET tributary
- *brstthr* is set to the default value for a SONET tributary
- *pse* (PDI-P parameter) is set to the default value for a SONET tributary
- *sdsfmode* is set to the default value for a SONET tributary.

Switching of interface standard – Side effects on tributaries II

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *degthr* is set to the default value for an SONET tributary
- *dexcthr* is set to the default value for an SONET tributary
- *ptca* is set to the default value for a SONET tributary
- *tcamd* is set to the default value for a SONET tributary.

The attribute tcamd does not exist for SONET ports. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

Switching of interface standard – Side effects on tributaries III

In addition to the list of attributes above the following side-effects apply to the related tributary attributes when switching the istd from SDH to SONET (see also the related RTRV-OCn command for SONET parameter description):

- *pmhpneses* is set to the default value for an SONET tributary
- *pmhpfeses* is set to the default value for an SONET tributary.

The attribute tcamd does not exist for SONET ports. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

Switching of interface standard – notification behavior for port attributes

When changing the interface standard *istd* using the ED-STMn command all resulting parameter changes are reported by ED-OCn notifications of the related port rate. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard – notification behavior for tributary attributes

When changing the interface standard *istd* using the ED-STMn command all resulting tributary parameter changes are reported by ED-STS1 notifications.

For efficiency reasons the ED-STS1 notifications are sent out as a single notification using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to

- 1 – 3, in case of an STM1/OC3 port
- 1 – 12, in case of an STM4/OC12 port
- 1 – 48, in case of an STM16/OC48 port
- 1 – 192, in case of an STM64/OC192 port
- 1 – 768, in case of an STM256/OC768 port.

Switching of interface standard - notification behavior for active TCA events

If the changing of the interface standard *istd* to SONET includes an change of *tcamd* from TR-RTR to TR-only (SONET default value), then all active TCA events of the related entities must be cleared.

Switching of interface standard – PM impact

The change of interface standard has the following impacts w.r.t. existing PM registers:

1. all current bins related to the port will be reset
2. all history bins related to the port remain unchanged
3. all current bins related to tributaries being a member of the port will be reset
4. all history bins related to tributaries being a member of the port remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Generic ONNS specific behavior - Impact on *portControl* when changing *portClass*

When *portClass* is changed to TRADITIONAL, *portControl* is set to NORMAL, if not set differently within the same command.

Such a change is reported by an ED-OC48 notification for the parameter *portControl*.

Generic ONNS specific behavior - Impact on port parameter settings while *portClass* is TRADITIONAL

When *portClass* has the value TRADITIONAL for a port, setting of the following parameters are accepted, but shall have no impact until *portClass* is changed away from TRADITIONAL: *portControl*.

At the moment the *portClass* is changed away from TRADITIONAL the current values of these parameters are considered as valid.

portControl change with wildcard AID on port level

If the parameter *portControl* is changed and the value all is specified in the AID at port level, then the system shall change the parameter value for all ports that match the rate specified in the command *modifier*.

A mismatch of the port rate with the command *modifier* value shall not lead to error responses.

The system shall send DBCHG notifications for all ports, where the parameter *portControl* has been changed.

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual *portClass*

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *portClass* is changed to a value where this parameter is supported.

At the moment the *portClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

ONNS INNI Port related behavior - Impact on tributary mode setting when portClass is set to INNI

When *portClass* is set to INNI for a port, the parameter *trbmd* is set to “ADAPTIVE”. This are reported by an ED-OC48 notification for the parameter *trbmd*.

ONNS INNI Port related behavior - Impact on tributary parameter settings when *portClass* is set to INNI

When *portClass* is set to INNI, the parameter *hptimmon* is set to DISABLE for all tributaries located on this port. This are reported by ED-STS1 notifications for the parameter *hptimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to AUTO

When *portClass* is set to INNI and *ndetmd* is set to AUTO for a port, the parameter *pmode* is set to MONITORING. This are reported by an ED-OC48 notification for the parameter *pmode*.

ONNS INNI Port related behavior - Impact on port parameter settings when *portClass* is set to INNI and *ndetmd* is set to MAN

When *portClass* is set to INNI and *ndetmd* is set to MAN for a port, the parameters *rstimca* and *rstimmon* is set to DISABLE. This are reported by an ED-OC48 notification for the parameters *rstimca* and *rstimmon*.

ONNS INNI Port related behavior - Impact on port parameter settings while *portClass* is INNI

When *portClass* has the value INNI for a port, setting of the following parameters are inhibited:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

At the moment *portClass* is changed away from INNI the parameters are set back to their default values. This are reported by means of an ED-OC48 notification.

ONNS INNI Port related behavior - Impact on Neighbor related parameters when *portClass* is set to INNI

When *portClass* is set to INNI, each of the following parameters shall take its default value, unless a value is specified together with the transition of *portClass* to INNI:

- *ndetmd*
- *neighborASTNNodeID*

- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on neighbor related parameters if *portClass* is changed away from INNI

When *portClass* is changed away from INNI, the following parameters are set to their default values:

- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*

ONNS INNI Port related behavior - Impact on port parameter settings when *ndetmd* is set to AUTO

When *ndetmd* is set to AUTO for a port, the parameters *neighborNodeID* and *neighborPortID* shall keep their current values until automatic neighbor detection delivers new valid values.

When *ndetmd* is set to AUTO for a port, the parameter *neighborASTNNodeID* shall keep its current value until automatic neighbor detection delivers a new valid value.

ONNS EDGE Port related behavior - Impact on *loca*, *locz* when setting *portClass* from EDGE to TRADITIONAL when port is involved in a 2F or 4F BLSR/MS-SPRing protection group

For all tributaries of that port the *loca*, *locz* parameters are reset to their default values (empty string). This is reported by an ED-STS1 (*istd* = SONET for the port) or ED-VC3 (*istd* = SDH for the port) notification using a range over the port.

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, when *portClass* is set to EDGE

When the *portClass* is changed to EDGE, the following parameters of the EDGE parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to EDGE:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS EDGE Port related behavior - Impact on EDGE related port parameter settings, if *portClass* is changed away from EDGE

When *portClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

ONNS UNI PORT related behavior - Impact on tributary mode (*trbmd*) setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *trbmd* is set to FIXED. This are reported by an ED-rr notification for the parameter *trbmd*.

ONNS UNI PORT related behavior - Impact on *portControl* setting, when *portClass* is set to UNI

When *portClass* is set to UNI for a port, the parameter *portControl* is set to NORMAL. This are reported by an ED-rr notification for the parameter *portControl*.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, when *portClass* is set to UNI

When the *portClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *portClass* to UNI:

- *networkTNAType*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddress*
- *clientNodeID*
- *localLPID*

This is covered by corresponding validation rules.

ONNS UNI PORT related behavior - Impact on UNI related port parameter settings, if *portClass* is changed away from UNI

When *portClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

ONNS ENNI PORT related behavior - Impact on *ndetmd* when *portClass* is set to ENNI

When *portClass* is set to ENNI, the parameter *ndetmd* is set to MAN.

ONNS ENNI PORT related behavior - Impact on remaining ENNI related port parameter settings, when *portClass* is set to ENNI

When the *portClass* is changed to ENNI, the following parameters of the ENNI parameter set shall keep their actual values, unless specified differently in the command setting the *portClass* to ENNI:

- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *remTID*

For remaining ENNI parameters, values different to their default values are mandatory. This is covered by a corresponding validation rule.

ONNS ENNI PORT related behavior - Impact on ENNI related port parameter settings, if *portClass* is changed away from ENNI

When *portClass* is changed away from ENNI, the following parameters are set to their default values:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Example input/output

```
ED-STM64:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=644,UNEQUIPOSIG=644;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-28:ED-STM16:1-1-#-#-1-1::inputsig=644,unequiposig=644:”
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the ED-STM64 command.

Validation rule: Enough bandwidth reserved for 2F protection group

Check of the tributary rate (inputsig/unequiposig) if the port is member of a 2f protection group. Then the assigned bandwith is max. half of the port's bandwith.

Error code:
`IDNV – Input, Data Not Valid, Assigned bandwidth exceeds half port's bandwith`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *inputsig* consistent with existing cross-connections

Check of the consistency of the structure of the input signal (*inputsig*) with existing cross-connections.

Error code:
`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: *unequiposig* consistent with existing cross-connections

Check of the consistency of the structure of the output signal (*unequiposig*) with existing cross-connections.

Error code:
`SNVS – Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port`

Validation rule: no cross-connections for *istd* change

Check that the interface standard parameter (*istd*) is not changed when cross-connections are still on this port.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: No lower order cross-connections, conversion cross-connections, loopbacks or substructure for *istd* change

Check that the interface standard parameter (*istd*) is not changed when lower order cross-connections, conversion cross-connections, lower order loopbacks or lower order substructure are still on this port. If lower order cross-connections, conversion cross-connections, loopbacks or substructure exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: no loopbacks for *istd* change

Check that the interface standard parameter (*istd*) is not changed when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no protection for *istd* change

Check that the interface standard parameter (*istd*) is not changed when this port is in an protection group.

Error code:

`SNVS – Status, Not in Valid State, a protection group is existing`

Validation rule: no test access session for *istd* change

Check that *istd* is not changed when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: *servcond* must be enabled when timing source

Check that the *servcond* is not disabled when the port is used as a timing source.

Error code:

`SNVS – Status, Not in Valid State, Timing reference is assigned to this port`

Validation rule: *servcond* must be enabled when DCC enabled

Check that the *servcond* is not disabled when DCC channels are still existing for this port.

Error code:

`SNVS – Status, Not in Valid State, DCC channels are active for this port`

Validation rule: *servcond* must be enabled for protection ports

Check that the *servcond* is not OUTOFSERVICE if the port is used as protection port.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for protection ports`

Validation rule: *servcond* must be disabled for facility loopback

Check that the *servcond* is not enabled when a facility loopback is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **`ED`** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **`ED`** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Validation rule: Supply of outgoing J0 trace

Check that an outgoing J0 trace value (*strcout*) is supplied, too, if the format of the outgoing J0 trace (*strcwfmt*) is changed.

Error code:

`IDNC – Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`

Validation rule: transmitted path trace length

Check that the length of the outgoing J0 trace value (*strcout*) fits to the length given by outgoing J0 trace mode, i.e. write format (*strcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode.`

Validation rule: Change of FEC parameters only if supported by the current circuit pack

When changing one of the FEC-related parameters *fec*, *feccor*, and *fectype*, it is checked, whether the currently provisioned circuit pack supports this. If it is not supported the following error code is used:

Error code: `IDNV – Input, Data Not Valid, Parameter not supported`.

Validation rule: Enabling of Optical Channel only if supported by the current circuit pack

When enabling the optical channel via parameter *och* it is checked, whether the currently provisioned circuit pack supports this. If it is not supported the following error code is used:

Error code: `IDNV – Input, Data Not Valid, Parameter not supported`.

Validation rule: Enabling of FEC only while Optical Channel is enabled

The command is denied if FEC is enabled (*fec* = ENABLE) while the optical channel is disabled or if the optical channel is disabled (*och* = DISABLE) while FEC is enabled.

It is allowed to enable or disable FEC and the optical channel together in one command.

Error code:
`SNVS – Status, Not in Valid State, Optical Channel must be enabled`.

Validation rule: ’ALL’ qualifier used for wrong parameters

The ’ALL’ qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:
`IDNC – Input, Data Not Consistent, ’ALL’ qualifier for port aid not allowed`

Validation rule: Check CCB against ptype and istd

Check wether the CCB fits to ptype and SDH standard.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=OC3 is made on a EP155 port which is provisioned as ptype=STM1E.

ONNS specific error codes (validation rules)

Validation rule: *portClass* only settable when *xcsetup* = SWISS

Modification of the *portClass* parameter is only allowed when xcsetup=SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule: No ONNS for interface standard change

Check that the interface standard parameter (*istd*) is not changed if ONNS functionality is available. This means:

- *portClass* must be TRADITIONAL or
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: *localLPID* already assigned to VCG port at VCAT layer

It is only allowed to set the parameter *localLPID* to a value different from its default value, if this value is not already assigned to the parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:
`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule: No setting of *minNNXCRate* to values larger than value of *maxNNXCRate* and vice versa

It is not allowed to configure parameters *maxNNXCRate* and *minNNXCRate* in a way, that the value of *minNNXCRate* is larger than the value of *maxNNXCRate*.

Error code:
`IDNV – Input, Data Not Valid, Min. and max. NN XC rates incompatible`

ONNS INNI port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI only possible, if service condition not OUTOFSERVICE

It is not allowed to change *portClass* to INNI, if servcond=OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Setting of *portClass* to INNI only possible, if no cross-connection existing

It is not allowed to change *portClass* to INNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Setting of *portClass* to INNI only possible, if no test access session active

It is not allowed to change portClass of a port to INNI when a tributary related to :this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to INNI

It is not possible to change *portClass* to INNI, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Setting of *portClass* to INNI not possible for ports in Protection Groups

It is not allowed to change portClass of a port to INNI, if this port is member of a Line/MS protection scheme.

Error code:

`SNVS – Status, Not in Valid State, Port must not be member of a protection group`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the portClass away from INNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from INNI

It is not possible to change the *portClass* away from INNI, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled:

- No cross-connection may exist on any tributary of the port
- *portControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Setting of *portClass* away from INNI only possible, if the port is not in use by M:N reservation

For setting *portClass* from INNI to TRADITIONAL or EDGE, the following must be fulfilled: No reservation related to a protecting NN connection within an M:N protected connection group may exist on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Changing of *portClass* from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port

For changing the value of the parameter *portClass*, no DCC of the port must be enabled for the SCN.

Error code:

`SNVS – Status, Not in Valid State, DCC on SCN may not be enabled`

Validation rule: *servcond* must be enabled when portClass = INNI

Check that the servcond is not OUTOFSERVICE when *portClass* = INNI.

Error code:

`SNVS – Status, Not in Valid State, can not disable servcond for INNI ports`

Validation rule: Some parameters not settable for ports of *portClass* = INNI

The following parameter is not changeable to value FIXED for ports with *portClass* = INNI:

- *trbmd*.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: Port Mode not settable for ports of *portClass* = INNI

The system shall not allow to change the parameter *pmode* if *portClass* has been set to INNI prior to this command or if *portClass* is set to INNI with this command. The parameter *pmode* shall either be omitted or specified with the only allowed value MON.

Error code:

`SNVS – Status, Not in Valid State, port mode change not allowed for INNI ports`

Validation rule: Some Parameters not settable for ports of *portClass* = INNI

The following parameters is not changeable for ports with *portClass* = INNI:

- *exprstrc*
- *rstimca*
- *rstimmon*
- *strcfmt*
- *strcout*
- *strcwfmt*

Error code:
