This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
Type: Alphanumeric value set.
Range: 1 – 64000; default = 51
12. **`pmmsneses`** – Performance Monitoring Line Near-End SES Threshold
This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
Type: numeric value set
Range: 1 – 64000; default = 51
13. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the *pmode* state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range: AUTO (default): indicates that, when a signal is detected at the port, then alarm monitoring will start. MON: indicates that alarm monitoring is taking place on the port. NMON: means that alarm monitoring is not occurring on the port.

14. **`pmrsneses`** – Performance Monitoring Section Near-End SES Threshold
    This parameter describes the Section Near-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
    Type: numeric value set.
    Range: 1 … 64000
    Default: 52
15. **`portClass`** – Port Class
    This identifies the port class of the AID.
    Type: Alphanumeric value set.
    Range: TRADITIONAL
16. **`portControl`** – Port Control
    This identifies the administrative mode of the EC1 port. This parameter is not relevant for EC1 ports, because the portClass is always TRADITIONAL. The parameter can only be retrieved but not changed.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
17. **`ptype`** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: EC1
18. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when sdsfmode=POISSON.
    Type: numeric value set.
    Range: (as exponents of 10): -5 -6 (default), -7, -8, -9
19. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
20. **`sfthr`** – Signal Failure Threshold
    Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when sdsfmode=POISSON
    Type: numeric value set
    Range: (as exponents of 10): -3 efault), -4, -5
21. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string
    Range: String with maximum of 24 characters
    Default: DEFAULT0

22. **`sonet`** – SONET ASAP
    SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports of corresponding line rate (see RTRV-STM4, output parameter sdhpn) to be compatible with current generation applications.
    Type: Alphanumeric string
    Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.
    Default: DEFAULT
23. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    RANGE: ENABLE, DISABLE (default)
24. **`strc`** – Value of incoming J0
    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If strcst indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D)
    Range: 1 byte string
25. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc).
    Type: Numeric string.
    Range: 1 (default) for specific repeating byte (SONET)
26. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted.
    Type: Hexadecimal digits
    Range: 1 byte string. One byte is expressed as two hexadecimal digits (example value: 6D).
    Default: 01Hex
27. **`strcst`** – Status of incoming J0
    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
    Type: Alphanumeric value set.

    Range:

    - NORMAL: strc contains a valid value
    - UNAVAILABLE: no value for strc could be obtained by the system
    - AIS: no value for strc due to an SF condition.

28. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout).
    Type: Numeric string.
    Range: 1 (default) for specific repeating byte (SONET)
29. **`trbmd`** – Tributary mode
    The parameter trbmd indicates the tributary mode of the port. In the case of EC1 port, the only possible value is FIXED.
    Type: Alphanumeric value set.
    Range: FIXED
30. **`unequiposig`** – Unequipped Output Signal List
    Tributary Unequipped Output Signal Rate List. This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection.
    Type: numeric value set
    Range: 11 (default), 1 xSTS1)

Detailed behavior description

The command shall retrieve the parameters as described above. The command **`RTRV-EC1`** do not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-EC1 command. Not all output parameters are listed (missing ones indicated by …).

```
RTRV-EC1:LT-UNITE:1-1-#-#-1-36:123456;

   LT-UNITE 04-12-23 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-36:eif=EC1,ptype=EC1,sfthr=-3,sdthr=-6, pmode=MON,.....
      pmmsneses=51,pmrsneses=52"
;
```

Error responses

See definition in "RTRV-HDR: Retrieve header" (p. 3-2417) command error responses section for general validation rules. The error responses listed there also apply to the RTRV-EC1 command.

Validation rule: Check CCB against *ptype* and *eif*

Check wether the CCB fits to *ptype* and *eif*.

Error code: `IENE – Input, Entity Not Exists`

RTRV-ELDR: Retrieve ONNS external link data repository

The **RTRV-ELDR** command requests information of the ONNS ELDR data repository, which contains ONNS information about external links to associated neighbor domains.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No.

Input format

The **RTRV-ELDR** command has an input parameter *dataType* that defines what type of information is expected in the *componentID* field that determines what portion of the data repository records is retrieved.

Command syntax: **RTRV-ELDR**:*srcTid:srcAid:ctag::dataType[,componentID];*

Description

The **RTRV-ELDR** command retrieves information stored in the external link data repository that is in RAM Memory. The **RTRV-ELDR** command operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local external link data repository. Data from other ONNS nodes is acquired by the flooding and exchange of LSAs.

Retrieving ALL external link data repository records

When the *dataType* = ALL, Network Navigator shall respond to a request to retrieve its external link data repository by sending a complete report of the contents of the data repository specified. The request shall cause the ONNS node to send all information in the specified data repository. When the external link data repository is retrieved, each TL1 response message contains a record with all of the data relevant to an external link or LSA.

Retrieving external link data repository records for any ASTN node ID

The command **RTRV-ELDR** with *dataType* = LSAID and *componentID* = ASTNNodeID shall retrieve the ELDR LSA records that relate to all of the external links from the specified node with the ASTNNodeID to adjacent domains. This ASTNNodeID can be the address of any node in the ONNS domain.

REPT PTHCHG or REPT NNCHG is not generated

The **RTRV-ELDR** command shall not generate a REPT PTHCHG or REPT NNCHG notification.

Input parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.
   See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Type: AID
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn (default).
3. **`ctag`**
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″).
   It should be a unique value for each new command.
4. **`dataType`**
   This parameter specifies, which part of the ELDR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.
   Range:
   - *ALL*: retrieves the entire external link data repository in RAM
   - *LSAID*: retrieves the LSA in ELDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
5. **`componentID`**
   componentID depends on the previous *dataType* parameter and is one of:
   - not represented when *datatype* = ALL
   - *nodeID*: when *datatype* = LSAID
     Description: Identifier of an ASTN node
     Type: Four dot separated numeric string

Range: 0 … 255, for each numeric string

Output format

The external link data repository record structure

The complete ELDR of one node consists of LSARecords for all nodes with external links (including the reporting node itself) within the same ONNS domain. Within a LSARecord all external links to neighbor domains are kept in LinkRecords (one record for each neighbor domain relation).

External link data repository (ELDR) without data

An addressed node without data in the ELDR shall response only the HeaderRecord with *NumberOfLSAs* = 0. The external link data repository record is composed of an *ELDR_HeaderRecord* and multiple *LSARecords* which are described below:

ELDR_Record ::=

<ELDR_HeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

ELDR_HeaderRecord ::=

eldrID,*dataType[=componentID]*,*srcNodeASTNNodeID*,*NumberOfLSAs= LSA_Count*

LSARecord ::=

<LSAHeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

LSAHeaderRecord ::=

LSAAdvertisedRouter=*origNodeASTNNodeID*,LinkCount=*linkCount*

LinkRecord ::=

LocalNodeID=*localAdvNodeID*,RemoteNodeID=*remoteAdvNodeID*,LocalLinkID=

localLinkID,RemoteLinkID=*remoteLinkID*,*remoteTID*,RemoteRAID=*remoteRAID*,

SRLG=*srlgList*,LinkMetric=*adminCost*,LinkResourceClass=*linkResCls*,

LinkProtType=*protType*,Bandwidth=*bandwidthList*

Output format with normal data retrieve completion report for dataType=ALL

If the **RTRV-ELDR** request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   ″eldrID,ALL,srcNodeASTNNodeID,NumberOfLSAs=LSA_Count″
   ″LSAHeaderRecord_1:
    LinkRecord_1_1″
   ...
   ″LSAHeaderRecord_n:
    LinkRecord_n_1,
    LinkRecord_n_2″
>
   srcTid date time
M  ctag COMPLD
   ″LSAHeaderRecord_n+1:
    LinkRecord_n+1_1″
   ...
   ″LSAHeaderRecord_m:
     LinkRecord_m_1,
   ...
    LinkRecord_m_n″
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the **RTRV-PATH** command.

ELDR_HeaderRecord

1. **eldrID**
   ONNS Data Repository dataID to be returned
   Type: Alphanumeric value set.
   Range: ELDRexternal link data repository in RAM
   Default: ELDR
2. **dataType**
   This parameter specifies, which part of the ELDR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.
   Range: ALL retrieves the entire external link data repository in RAM. LSAID retrieves the LSA in ELDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*.
3. **componentID**

componentID depends on the previous *dataType* parameter and is one of:

- not represented when *datatype* = ALL
- *nodeID*: when *datatype* = LSAID
  Description: Identifier of an ASTN node.
  Type: Four dot separated numeric string
  Range: 0 … 255, for each numeric string
  Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **`srcNodeASTNNodeID`** – Reporting Node ID
   ASTN node ID of the ONNS node replying to this command.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 … 255
5. **`LSACount`**
   This parameter indicates the number of LSA records in the report. Also equals number of NE nodes in the network for *dataType* = ALL.
   Type: Integer
   Range:
   - >0: number of LSAs with external link records
   - 0: no ENNI port(s) are defined at this node or within the network

LSARecord

For each reported node of the topology one LSARecord is reported.

1. **`LSAHeaderRecord`**
   All parameters in the LSAHeaderRecord describe properties of the *origNodeASTNNodeID*.
   origNodeASTNNodeID
   Description: The ASTN node ID of the advertiser of the LSA with the external link data following the LSAHeaderRecord
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   linkCount
   Description: Number of reported links of *origNodeASTNNodeID* towards other nodes in the network.
   Type: Integer
   Range: >0
2. **`LinkRecord`**
   For each external domain neighborship of the *origNodeASTNNodeID* one LinkRecord is reported.
   localAdvNodeID
   Node ID of own domain for level 1 Routing
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   remoteAdvNodeID
   Corresponding Node ID of neighbor domain for level 1 Routing.

Type: four dot separated numeric string
Range: 0 … 255, for each numeric string

localLinkID

Link ID from own domain for level 1 Routing.
Type: Numeric string.
Range: 0..42946967295

remoteLinkID

Corresponding Link ID from neighbor domain for level 1 Routing.
Type: Numeric string.
Range: 0..42946967295

remoteTID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty string (default).
Range: Please refer to the TID definition in the RTRV-HDR description.

remRAID

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: four dot separated numeric string
Range: 0 … 255, for each numeric string
Default: 0.0.0.0

srlgList

Shared Risk Link Group Identifier list.
See also parameter *srlgList* in RTRV-rr.
The max. number of identities that can be provisioned per port may be release dependent.
Type: Up to ten &-separated Integers
Examples:
198&233&0&0&0&0&0&0&0&0
10&20&30&40&0&0&0&=&0&0
89&1000&4&10&20&31&111&231&300&777
Range: 0 … 65535
Default. 0 (means no SRLG provisioned)
SRLG list is not applicable for EDGE and UNI ports and is set to the default value.

adminCost – Administrative Cost
Provisioned administrative cost of the port connection when used in a connection path. See also parameter *adminCost* in RTRV-rr.
Type: Integer
Range: 1 (default) … 65535
Administrative cost parameter is not applicable for EDGE and UNI ports and is set to the default value.

linkResCls
The *linkResCls* globally classifies routing purposes the link of the corresponding port is assigned to.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

linkProtType
The *linkProtType* globally classifies routing purposes the link of the corresponding port is assigned to.
Type: Alphanumeric value set.
Range:

- 0x1 (unprotected)
- 1+1-W (1+1 MSP)

bandwidthList
The *bandwidthList* indicates the available bandwidth per signal rate.
Type: Character string.
Range:
Bandwidth List: five dash separated numeric strings representing STS1 #, STS3c #, STS12c #, STS48c #, STS192c # with:

- STS1 #0..4097
- STS3c #0..1023
- STS12c #0..255
- STS48c #0..63
- STS192c #0..15

Example for an available bandwidth of 2 STS48c and a defined minimal XC STS3c: 0-32-8-2-0.

Example input/output

The **RTRV-ELDR** command with *dataType* = ALL produces this example output result:

```
RTRV-ELDR:LT-ONNS-61::123456::ALL;

RTRV-ENNIMANROUTE: Retrieve all manual routes of the E-NNI node

The **RTRV-ENNIMANROUTE** command is used to retrieve all manual route entries known by the E-NNI node.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-ENNIMANROUTE**:*modifier*:*tid*::*ctag*;

Input parameters

Command parameters

1. **modifier**
   The parameter modifier indicates whether the manual route is used to reach a signaling controller (SC) or a routing controller (RC) subnet.
   Type: Alphanumeric value set.
   Range: SC or RC
2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Output format

If the RTRV-ENNIMANROUT is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "spec_block"
       ...
   "spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Output parameters

Spec block parameters

1. **`neighborSIGPCIPAddress`** – Neighbor Signaling Controller IP Address
   This parameter is used to indicate the IP address of a neighboring signaling controller that is connected via a LAN interface.
   The term "neighbor" refers to logical neighborship. The neighboring SC is not necessarily a physical neighbor.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.
2. **`neighborSIGPCID`** – Neighbor Signaling Controller Identifier
   This parameter is used to indicate the identifier of a neighboring signaling controller that is connected via a LAN interface.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.
3. **`neighborRCIPAddress`** – Neighbor Route Controller IP Address
   This parameter is used to indicate the IP address of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.

4. **`neighborRCIPSubnetMask`** – Neighbor Route Controller IP Subnet Mask
   This parameter is used to indicate the subnet mask of the IP subnet of a neighboring route controller.
   The IP subnet that can be reached via the manual route is described by the tuple neighborRCIPAddress + neighborRCIPSubnetMask.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
5. **`lan_nh_ifipad`** – Next Hop Interface IP Address for LAN Interfaces
   This parameter is used to indicate the interface IP address of the next hop of a manual route using a LAN. This parameter is insignificant for point-to-point interfaces.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the interface *if_type* is a LAN. It must not be present, if the interface *if_type* is a point-to-point interface.
6. **`if_id`** – interface id
   This parameter is used to indicate the interface associated with the manual route.
   Type: AID
   Range: SPortAID or LanPort AID (the keyword “all” is not used)
7. **`dcctype`** – DCC type
   This parameter is used to further specify the DCC type, in case the *if_id* refers to a DCC channel.
   Type: Alphanumeric value set.
   Range: LINE or SECTION
   Optional parameter: This parameter must be present if the interface *if_id* is a DCC. It must not be present, if the interface *if_id* is no DCC.
8. **`if_type`** – interface type
   This parameter is used to indicate whether the interface with the interface id if_id is a point-to-point interface (e.g. a DCC) or a point to multi-point interface, i.e. a LAN.
   Type: Alphanumeric value set.
   Range: P2P or LAN

Detailed behavior description

The **`RTRV-ENNIMANROUTE`** command shall retrieve manual routes of the E-NNI node. The SC list of routes also includes the manual routes that are implicitely created when setting the neighbor SC on a point-to-point interface (via the edit port commands).

Example input/output

The following example shows the result of RTRV-ENNIMANROUTE-SC:

```
ENT-MANROUTE-LAN:LT-UNITE:1-1-lan2:123456:::ip_ad=135.168.90.4,ip_ad_
      uni=135.168.90.4,ip_snm=255.255.0.0,osinode=uninode;

   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
;
```

The following example shows the result of RTRV-ENNIMANROUTE-RC:

```
ENT-MANROUTE-LAN:LT-UNITE:1-1-lan2:123456:::ip_ad=135.168.90.4,ip_ad_
      uni=135.168.90.4,ip_snm=255.255.0.0,osinode=uninode;

   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ENNIMANROUTE** command.

Validation rule: E-NNI Node must be created

If the E-NNI node is not created (by provisioning of the *sigPCIP_Address* in **ENT-ULS**), then the command is denied.

Error code: `SNVS – Status, Not in Valid State, E-NNI Node not created`

Related TL1 messages

- “ENT-ENNIMANROUTE: Enter manual route to the E-NNI node” (p. 3-1520)
- “DLT-ENNIMANROUTE: Delete manual route from the E-NNI node” (p. 3-164)

RTRV-EPM: Ethernet performance monitoring

The **RTRV-EPM** command is initiated by a user to request the NE to send the current and/or historical Performance Monitoring (PM) data associated with one or more Ethernet ports. For each value in the *emontype* parameter of the **RTRV-EPM** input Parameters section, PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-EPM-*modifier*:*tid*:*aid*:*ctag*::[*emontype*], [*monlev*],*tmper*, [*mondat*], [*montm*];

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the Ethernet port on which the **RTRV-EPM** command is to act on.
   Type: Alphanumeric value set.
   Range: ENET, 1GEPL, 10GEPL.
2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **aid** – Access Identifier
   Type: AID.
   Range: EPortAID, VCGAID.
   Range is supported up to shelf level or system level; i.e.
   ALL-ALL-#-#-ALL-ALL (range over EPortAID)
   ALL-ALL-#-#-ALL-vALL (range over VCGAID).
4. **ctag** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417) in the input parameters section.

5. **`emontype`** – Monitored parameter type
   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.
   Type: value set.
   Range for modifier ENET: CBR, CBS, PDE.
   Range for modifiers 1GEPL and 10GEPL: EINB, EONB, EINF, EONF, EDFE, EDFC
   The following value is for input monitored type only: ALL.
   Default: ALL.
6. **`monlev`** – Monitored Level
   This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.
   Type: value set.

   Range:

   - 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
   - 0-UP: Means the NE will report zero and all positive data.

   Default: 1-UP.
7. **`tmper`** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.

   Range:

   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.
8. **`mondat`** – Monitored Date
   This requests the beginning date of the interval for which the PM data is to be reported. For both values of tmper parameter, the maximum allowable range of valid dates includes the current and previous one day.
   Type: value set.

   Range:

   - MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
   - ALL: Current and previous day.

   Default: Current date
9. **`montm`** – Monitored Time

This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:

a. A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).

b. A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).

c. All applicable beginning times for the given *mondat* value (i.e., all).

Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondat* value provided is ALL.
Type: Character string.

Range:

- HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
- THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of $$-$$indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##-##indicates the previous 15-min interval.
- ALL: All applicable beginning times for the given *mondat* value.

If the *tmper* value is 1-DAY, the *montm* parameter will not be used.
Default:
If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.
If HOD-MOH is omitted, the PM period for the current time will be reported.

Output format

Normal completion message

If the NE fully complies with the RTRV-PM request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″aid,aidtype:emontype,monval,[validity],[tca],tmper,[mondat],[montm]″
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Normal completion message – empty reply

If there is no PM data stored within the NE, then the following response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

1. **`aid`** – Access Identifier
   Description: Access identifier.
   Type: AID.
   Range: EPortAID, VCGAID.
2. **`aid`**type – Aid type
   Type: value set.
   Range: ENET
3. **`emontype`** – Monitored parameter type
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417) in the input parameters section.
4. **`monval`** – Monitored Value
   This parameter contains the measured value of the parameter specified in *montype*.
   Type: Integer.
   Range: 0-108000000000000
   The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.
   W.r.t. value range for the specific PM parameters see
   - TCA profile section (if thresholding is applicable for that parameter)
   - PM parameter introduction section (if thresholding is not applicable for that parameter).
5. **`validity`** – validity indicator
   This parameter indicates the validity of the PM data.
   Type: Integer.
   Range: 1: valid; (omitted): non-valid.
6. **`tca`** – Threshold Crossing Alert
   Type: value set.

Range for the current interval:

- in TCA mode TR, that the current value exceeds the provisioned threshold
- in TCA mode TR-RTR, that a *tca* occurred since the beginning of this; interval or that the tca reset condition was not fulfilled in any previous; interval since the last tca occurred

f the value is omitted, it indicates

- in TCA mode TR, that the current value is below the provisioned threshold
- in TCA mode TR-RTR, that no tca occurred since the beginning of this; interval and that the tca reset condition was fulfilled at least in one previous , interval

For previous intervals, the tca parameter indicates the state at the end of the interval.

7. **`tmper`** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.
   Range:
   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.
8. **`mondat`** – Monitored Date
   This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.
   Type: value set.
   Range: MM-DD: Month-Day
   Default: Current date
9. **`montm`** – Monitored Time
   This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).
   Type: Character string.
   Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

Example input/output

The following example shows the successful completion of a **`RTRV-EPM`** command by the NE:

```
RTRV-EPM-ENET:UNITE-NE:1-1-#-#-01-1:123456::PDE,,15-MIN,01-01,08-00;
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   ”1-1-#-#-01-1,ENET:PDE,2,,,15-MIN,01-01,08-00”
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-EPM** command.

GR-833-CORE

RTRV-EPORT: Retrieve Ethernet port

The **RTRV-EPORT** command retrieves the attributes of one or more Ethernet ports.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-EPORT**-*modifier*:*tid*:*aid*:*ctag[:::spec_block]*;

Input parameters

Command parameters

1. **modifier**
   This parameter specifies the type of the Ethernet port at the LAN side of the unit.
   Type: Alphanumeric value set.
   Range:
   - 1GE representing a 1 GE port on a GE1 pack
   - 1GEPL representing a 1 GE port on a GE10PL1 pack
   - 10GEPL representing a 10 GE port on a GE10PL1 pack.
2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **aid** – Access Identifier
   This parameter specifies the Ethernet port to be operated on.
   Type: AID
   Range: EPortAID as defined in AID structure. The values
   - vall for Simple_EPortAID
   - usall for Simple_UnivSlotAID
   - all for Simple_UnivSlotAID

- all for Simple_ShelfAID and
- all for BayAID

are accepted.

4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Spec block parameter

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values *all* or *usall* at the appropriate positions of the input AID. For input AIDs not using *all* or *usall* this parameter is not allowed. This implies that with such input AIDs the dynamic parameters are always returned.

   The following output parameters of an Ethernet port are affected:

   - anegst
   - fcmdo
   - macaddr
   - rfltst
   - stmd
   - stpop
   - stpid
   - stprole
   - vss
   - vvidlsd.

   Note that not only those parameters have to be returned which are supported by the related Ethernet pack. Not all Ethernet packs support all listed parameters. For details refer to the detailed specification of those output parameters.
   Type: Alphanumeric value set.
   Range: YES: Report dynamic parameters in the reply as well; NO (default): Do not report dynamic parameters in the reply.

Output format

After receiving the **RTRV-EPORT** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ”aid,modifier::spec_block”
```

```
       ...
       ...
   "aid,modifier::spec_block"
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the Ethernet port to be operated on.
   Type: AID.
   Range: EPortAID as defined in AID structure. The usage of the following values are excluded:
   - all in the BayAID definition
   - all in the Simple_ShelfAID definition
   - usall in the Simple_UnivSlotAID definition
   - all in the Simple_UnivSlotAID definition
   - all in the Simple_EPortAID definition.
2. **modifier**
   This parameter specifies the type of the Ethernet port at the LAN side of the unit.
   Type: Alphanumeric value set.
   Range: 1GE representing a 1 GE port on a GE1 pack, 1GEPL representing a 1 GE port on a GE10PL1 pack, 10GEPL representing a 10 GE ports on a GE10PL1 pack.

Spec block parameters

1. **anegst** – Auto Negotiation Status
   This parameter reports the result of the autonegotiation process (e.g. flow control) of this port with its link partner.
   This parameter is not supported if the input parameter *modifier* = 10GEPL. If the parameter *anegst* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - ANER, for auto negotiation error
   - CFG, for configuring
   - CPL, for complete

- UNAVAILABLE, for not available/unavailable
- DISABLE, for being disabled.

Restrictions: The value DISABLE is not returned if the input parameter *modifier* = 1GE. The values ANER, CFG, CPL and UNAVAILABLE is not returned if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = DISABLE.

2. **`autoneg`** – Auto Negotiation Mode
   This parameter controls auto-negotiation process to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE or 10GEPL. If the parameter *autoneg* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: ENABLE (default); DISABLE.
3. **`cnprole`** – Customer/Network Port Role
   This parameter specifies whether the addressed port is used as a customer LAN port or a network LAN port.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter *cnprole* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: CUSTOMER (default), for a customer LAN port; NETWORK, for a network LAN port.
4. **`dftpri`** – Default User Priority
   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter *dftpri* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - HIGH
   - LOW (default).
5. **`dftvlan`** – Default VLAN Identifier
   This parameter specifies the value of the VLAN identifier which is applied to frames (tagging) at LAN ingress (i.e. from LAN into the Ethernet-port). This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter *dftvlan* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.

Range:

- 1, 2, 3, … 4092, 4093
- UNAVAILABLE (default).

To express the state UNAVAILABLE system internally the invalid VLAN ID 4094 is used.

6. **droppause** – Drop Incoming Pause Frames
This parameter controls whether incoming pause frames are dropped (value = ENABLE) or not (value = DISABLE). This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter droppause is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: ENABLE (default), DISABLE
Default: DEFAULT.
7. **enetpn** – Ethernet Alarm Severity Assignment Profile Name
This parameter points to an ASAP profile name of type ENET for the designated AID.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: 1 … 24 characters length.
Default: DEFAULT.
8. **enettca** – Ethernet TCA Profile Name
This parameter specifies the name of the threshold crossing alert (TCA) profile used for Ethernet ports.
Type: Alphanumeric string.
Range: 1 … 24 characters length.
Default: DEFAULT0.
9. **epmode** – Ethernet Port Monitoring Mode
This parameter specifies the monitoring mode of the Ethernet port. Alarms for this port will be reported if in state MON otherwise not. The configuration of epmode will change from AUTO to MON if a valid signal is applied to that port.
Type: Alphanumeric value set.
Range:
   - AUTO (default), for automatic
   - MON, for monitored
   - NMON, for not monitored.
10. **eppm** – Ethernet Port Performance Monitoring
This parameter specifies whether the performance monitoring is enabled or disabled for this port.
Type: Alphanumeric value set.
Range:
    - DISABLE (default)
    - ENABLE

11. **fcmd** – Flow Control Mode
This parameter specifies the configuration for the pause operation of this port. If the input parameter *modifier* = 1GE, then the parameter *fcmd* is supported only in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).
Type: Alphanumeric value set.
Range:
   - AUTO, for auto-negotiate
   - DISABLE, for pause mode bidirectionally disabled
   - ASYMTOPARTNER, for pause mode having receive disabled, transmit enabled
   - ASYMTOLOCAL, for pause mode having transmit disabled, receive enabled
   - SYM, for pause mode bidirectionally enabled.

   Restrictions: If the parameter *fcmd* is not supported, then the parameter is omitted. The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GE.
   The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = ENABLE. The value AUTO is notsupported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = DISABLE.
   The value AUTO is not supported, if the input parameter *modifier* = 10GEPL.
   Possible combinations of the parameters *modifier*, *autoneg*, *vlantagmd* (parameter of the referring circuit pack entity, see "RTRV-EQPT (CP): Retrieve equipment (circuit pack)" (p. 3-2375) for definition) and *fcmd* are as follows:

Input parameter *modifier*	**In-/output parameter *autoneg***	**In-/output parameter *vlantagmd***	**In-/output parameter *fcmd***
1GE	not supported	BCMD	AUTO, DISABLE
		other than BCMD	not supported
1GEPL	ENABLE	not supported	AUTO, DISABLE
	DISABLE		DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM
10GEPL	not supported	not supported	DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM

   Default:
   - AUTO (for *modifier* 1GE or 1GEPL)
   - SYM (for *modifier* 10GEPL).

12. **fcmdo** – Flow Control Mode Operation
This parameter reports the status of the pause operation at this port. If the input parameter modifier = 1GE, then the parameter fcmdo is meaningful only in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).
Type: Alphanumeric value set.

Range:

- DISABLE, for Transmit and Receive Disabled
- ENABLE, for Transmit and Receive Enabled
- ENXDISR, for Transmit Enabled, Receive Disabled
- DISXENR, for Transmit Disabled, Receive Enabled
- UNAVAILABLE, for anegst equal ANER or CFG or if the value can not be retrieved.

13. **`fsflpbkstat`** – Far Side Facility Loopback Status
This parameter reports the configuration of the far-side facility loopback of this port. A far-side loopback means that the signal on the outgoing port is looped to the incoming port (Tx -> Rx). For GE1 there is only this type of facility loopback.
Type: Alphanumeric value set.
Range:
    - YES, for enabled loopback
    - NO (default), for disabled loopback.
14. **`macaddr`** – Port MAC Address
This parameter specifies the MAC address of the port.
Type: Alphanumeric value set.
Range: 000000000000 to FFFFFFFFFFFF or UNAVAILABLE if the value cannot be retrieved.
15. **`rcf_htmr`** – Remote Client Fail Hold Off Timer
The parameter specifies the hold-off time for applying the LPT consequent action to disable the laser at the LAN port. The hold-off timer is only applicable if there is a strict one-to-one relationship between the LAN port in question and its related WAN port.
This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_htmr* is not supported, then the parameter is omitted.
Type: numeric string [ms].
Range: 0 … 2000 ms in 100 ms steps
Default: 0.
16. **`rcf_linkdown`** – Link Pass Through Mode
This parameter controls the consequent action (to switch off the laser upon receipt of a client signal fail [CSF] indication) to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_linkdown* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: ENABLE.
17. **`rfltst`** – Remote Fault Status
This parameter reports the fault status of the remote link partner.
Type: Alphanumeric value set.

Range for modifiers 1GE and 1GEPL:

- ANER, for auto negotiation error
- LNKFL, for link failure
- UNAVAILABLE, for not available/unavailable
- NOER, for no error
- OFFL, for offline.

Range for modifier 10GEPL:

- REMOTEFLT, for remote fault
- UNAVAILABLE, for not available/unavailable
- NOER, for no error
- LOCALFLT, for local fault.

18. **`rptmode`** – Repeater Mode
    This parameter sets the bridge device for this LAN port into the repeater mode (promiscuous mode), valid for a point to point connection between one LAN and one WAN port. Operating in repeater mode imposes some restrictions. See detailed behavior section.
    If the input parameter *modifier* = 1GE, then the parameter *rptmode* is meaningful only if in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter rptmode is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
19. **`servcond`** – Service Condition
    This parameter specifies the service condition for this port. Some configuration possibilities like loopbacks may be dependent on the state of *servcond*.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default)
    - OUTOFSERVICE.
20. **`stdis`** – Spanning Tree Protocol Disable
    This parameter allows to enable or disable the Spanning Tree Protocol for the given port. If the input parameter modifier = 1GE, then this parameter is meaningful only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the

database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter stdis is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- DISABLE, STP is disabled, i.e. the port is not used in the spanning tree protocol
- ENABLE (default), STP is enabled, i.e. the port is used in the spanning tree protocol.

21. **`stmd`** – Spanning Tree Protocol Mode
This parameter returns whether the normal STP according to IEEE802.1D or the rapid spanning tree protocol rSTP according to IEEE802.1w is used on the given port. If the input parameter modifier = 1GE, then this parameter is meaningful only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stmd is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- 802.1D, for the normal ST
- 802.1W, for rSTP
- UNAVAILABLE if the value can not be retrieved.

Default: There is no default value.

22. **`stpcost`** – Spanning Tree Path Cost
The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.
If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.
If the parameter *stpcost* is not supported, then the parameter is omitted.
Type: Integer.
Range: 1 to 200000000.
Default: 20000.
The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.

23. **`stpid`** – Spanning Tree Port Identifier
    The port identifier is a 16 bit parameter consisting of the port priority (high-order bits) and the port number (low-order bits). The port number is assigned by the system to a port and is not provisionable. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK).. For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: 0 to 65535 and UNAVAILABLE if the value can not be retrieved.
24. **`stpop`** – Spanning Tree Protocol Operational
    This parameter indicates whether the Spanning Tree Protocol is operational or not. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK).. For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: YES, operational; NO, not operational, UNAVAILABLE if the value can not be retrieved.
25. **`stpp`** – Spanning Tree Port Priority
    This parameter specifies the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 0 to 255.
    The stepping as recommended by the standard (steps of 16 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction ″0 to 240″ is not done by the NE.
    Default: 128.
26. **`stprole`** – Spanning Tree Protocol Role
    This parameter reports the role of the given port in rSTP. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK) and operates in rSTP mode (stmd = 802.1W). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However,

changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- ROOT, root
- DESG, designated
- ALT, alternative
- BACKUP, backup
- UNAVAILABLE if the value can not be retrieved.

27. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding. Two thresholding methods are applicable: TR-only. (also known as the implicit reset method), TR-RTR. (also known as the explicit reset method).
Type: Alphanumeric value set.
Range: TR, TRRTR (default).

28. **`vrtswid`** – Virtual Switch Identifier

This parameter is not supported if the input parameter

- *modifier* = 1GEPL, or *modifier* = 10GEPL.

This parameter identifiers the instance of the virtual switch.

- A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
- There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

Type: Integer.
Range: 1 **–** Currently this is the only allowed value.
Default: 1.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL.
Option: If the parameter vrtswid is not supported, then the parameter is omitted. If not generally omitted, then this parameter is reported only if the virtual switch entity exists (i.e. the VLAN tagging mode *vlantagmd* of the circuit pack the addressed EPort belongs to is set to 802.1TAG).

29. **`vss`** – Spanning Tree Status
This parameter returns the status of the spanning tree protocol for the given port. If the input parameter modifier = 1GE, then this parameter is applicable only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.
The name of this parameter originally stands for VCG STP status which is somewhat misleading for an EPORT but is kept for consistency reasons with other products. (When using an EPORT as a network port it participates in STP and therefore also has status information.) If the parameter vss is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- FWG, Forwarding
- LRG, Learning
- LIS, Listening (IEEE8102.D/STP only)
- BLK, Blocking (IEEE8102.D/STP only)
- DISF, Disabled due to a failure (IEEE8102.D/STP only)
- DISA, Disabled via provisioning
- BRK, Broken (IEEE8102.w/rSTP only)
- DCD, Discarding (IEEE8102.w/rSTP only)
- UNAVAILABLE if the value can not be retrieved.

30. **vvidls** – Valid VLAN Identifier List (static)
This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&). The list is packed by the NE and the management systems as good as possible by using ’&’ and ’&&’ . The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (cnprole = NETWORK).
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter vvidls is not supported, then the parameter is omitted.
Type: Alphanumeric string and the character ’&’.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, ..., 4092, 4093
- In case the list has no members (empty list) -1.

The length of the list is limited by the usual system limitations like e.g. TL1 line length and some NE internal restrictions as described below. The number of entries in this list is limited to 64 by some NE-internal restrictions. Ranging and grouping by using the operators ’&’ and ’&&’ has no impact on the number of entries, it only reduces the length of the list being transported to/from CIT/EMS.
Default: -1.

Example 1:
vvidls=-1. The list has no members (empty list).
Example 2:
vvidls=3&5&40&&45. This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.
Example 3:
vvidls=1&&4093 This list has the members 1,2, 3, …, 4092, 4093.

31. **vvidlsd** – Valid VLAN Identifier List (dynamic)
This parameter gives the list of all dynamic VLAN identifiers allowed for this port as gathered autonomously via GVRP. The list is ampersand grouped (& and &&). The vlan identifier of an incoming frame must be a member of this dynamic VLAN Id list or the static VLAN Id list vvidls. Frames tagged by a vlan identifier not member of these lists will be discarded. This parameter is also used in transparent tagging mode to report the list of valid customer tags (CIDs) for network ports (cnprole = NETWORK) collected by GVRP.
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter vvidlsd is generally not supported, then the parameter is always omitted.
Otherwise, this parameter is reported only if

- the virtual switch entity exists (i.e. the VLAN tagging mode vlantagmd of the slot the addressed EPort belongs to is set to 802.1TAG) AND
- GVRP is enabled on the virtual switch (*gvrpmode* = ENABLED)
- the port is a NETWORK port (*cnprole* = NETWORK).

Type: Alphanumeric string and the character ’&’.
Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
- In case the list has no members (empty list) -1.

The length of the list is limited by the usual system limitations like e.g. TL1 line length and some NE internal restrictions as described below. The number of entries in this list is limited to 247 by some NE-internal restrictions. Ranging and grouping by using the operators ’&’ and ’&&’ has no impact on the number of entries, it only reduces the length of the list being transported to/from CIT/EMS.
Default: There is no default value.-1
Example 1:
vvidlsd=-1 The list has no members (empty list).
Example 2:
vvidlsd=3&5&40&&45 This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.

Detailed behavior description

The values of the following parameters are directly requested form the hardware:

- anegst
- fcmdo

- macaddr
- rfltst
- stmd
- stpop
- stpid
- stprole
- vss
- vvidlsd.

Thus the value ″UNAVAILABLE″ is reported, if the CP HW is not available in the system.

Note that not only those parameters have to be returned which are supported by the related Ethernet pack. Not all Ethernet packs support all listed parameters. For details refer to the detailed specification of those output parameters.

Example input/output

Example for a 10GE port of a GE10PL1 pack:

```
RTRV-EPORT-10GEPL:LT-UNITE:1-1-#-#-1-9:123456;
   LT-UNITE 02-05-21 11:11:00
M  123456 COMPLD
   ″1-1-#-#-1-9,10GEPL::droppause=ENABLE,\
    enetpn=DEFAULT,enettca=DEFAULT,epmode=AUTO,eppm=DISABLE,fcmd=SYM,\
    fcmdo=UNAVAILABLE,fsflpbkstat=NO, \
    rcf_htmr=2000,rcf_linkdown=DISABLE, \
    macaddr=112233445566,rfltst=UNAVAILABLE, \
    servcond=INSERVICE,tcamd=TR″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-EPORT** command.

Validation rule: *modifier* consistent with given port-rate

The system shall verify that the modifier parameter is consistent with the rate of the port (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-EPORT** command for applicable combinations.

Error code:

`IDNC – Input, Data Not Consistent, modifier is inconsistent with existing port rate`

Validation rule: *modifier* consistent with the related circuit pack type

The system shall verify that the modifier parameter is consistent with the related pack type (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-EPORT** command for applicable combinations.

Error code:

`IDNC – Input, Data Not Consistent, modifier is inconsistent with the related circuit pack type`

RTRV-EQPT (bay): Retrieve equipment (bay)

The **RTRV-EQPT** command retrieves information associated with the bay level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-EQPT**:*tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Description: The AID of the bay/rack.
   Type: AID.
   Range: **all**
   Default: none.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

aid – Access Identifier

Description: The AID of the bay/rack.

Type: AID

Range: BayAID. The keyword **all** is not allowed as output parameter.

Default: 1

Detailed behavior description

The system supplies a normal completion response with the AID of the bay/subrack.

Example input/output

```
RTRV-EQPT:UNITE-NE:all:123456;

   UNITE-NE 07-12-23 08:00:00
M  123456 COMPLD
   "1"
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to RTRV-EQPT (bay) command.

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a circuit pack, the backplane or another replaceable unit (e.g. user panel or fan unit).
   Type: AID
   Range:
   - CpAID ::= UnivSlotAID-cp for universal circuit packs
   - CpAID ::= XCSlotAID-cp for cross-connect circuit packs
   - CpAID ::= CTLSlotAID-cp for controller circuit packs
   - CpAID ::= SlotAID-cp for any circuit pack
   - LoxcAID::=UnivSlotAID-loxc for LOXC packs in universal slots
   - CpAllAID::= UnivSlotAID-cpall for any circuit pack in universal slots
   - CpAllAID::=SlotAID-cpall for any circuit pack in any slot
     The keyword **xcall** is allowed for Simple_XCSlotAID.
     The keyword **ctlall** is allowed for Simple_CTLSlotAID.
     The keyword **all** is allowed for Simple_SlotAID
   - BackplaneAID for backplane. The keyword **all** is not allowed for the backplane AID.
   - UserPanelAID for user panel. The keyword **all** is not allowed for the user panel AID.
   - FanAID for fan. The keyword **fanall** is not allowed for FanAID.

- TimingInterfaceAID for TI Interface board. The keyword **tiall** is allowed for TimingInterfaceAID.
- CiCtlAID for CI-CTL Interface board. The keyword **all** is not allowed for the CiCtl AID
- PowerAID for power interface The keyword **piall** is allowed for PowerAID.
- EciAID for Electrical Connector interface The keyword **eciall** is allowed for EciAID.

The keyword **all** is not allowed on bay/shelf level.

3. **ctag** – Correlation Tag
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

1. **aid** – Access Identifier
The AID of a circuit pack, the backplane or another replaceable unit (e.g. user panel or fan unit).
Type: AID
Range:
   - CpAID ::= SlotAID-cp for any slot
   - LoxcAID ::= UnivSlotAID loxc for LOXC pack in universal slots
     The keyword **usall** is allowed for Simple_UnivSlotAID.
     The keyword **xcall** is allowed for Simple_XCSlotAID.
     The keyword **ctlall** is allowed for Simple_CTLSlotAID.
     The keyword **all** is allowed for Simple_SlotAID
   - BackplaneAID for backplane. The keyword **all** is not allowed for the backplane AID.
   - UserPanelAID for user panel. The keyword **all** is not allowed for the user panel AID.

- FanAID for fan. The keyword **`fanall`** is not allowed for FanAID.
- TimingInterfaceAID for TI Interface board. The keyword **`tiall`** is allowed for TimingInterfaceAID.
- CiCtlAID for CI-CTL Interface board. The keyword **`all`** is not allowed for the CiCtl AID
- PowerAID for power interface The keyword **`piall`** is allowed for PowerAID.
- EciAID for Electrical Connector interface The keyword **`eciall`** is allowed for EciAID.

Refer to the AID syntax description.

Spec block parameters

1. **`name`** – Circuit Pack Name
   Circuit Pack Name as stored in the EEPROM of the replaceable unit.
   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.
   This parameter is not reported for a CpAID. The *name* parameter is not reported for an LOXCAID.
   Type: value set.
   Range: up to 12 characters.
2. **`qual`** – Circuit Pack Qualifier
   Circuit Pack Qualifier as stored in the EEPROM of the replaceable unit.
   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, if equipped and supported.
   This parameter is not reported for a CpAID. The *qual* parameter is not reported for an LOXCAID.
   Type: value set.
   Range: up to 7 characters.

   Note: The TL1-representation of the functional qualifier follows the rules as defined in SRD_ConfigurationManagement:

   - alphanumeric characters or the special character ’-’ only
   - special characters like ’/’ and ’.’ to be omitted.
3. **`app`** – Apparatus Code
   Apparatus code as stored in the EEPROM of the replaceable unit.
   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.
   This parameter is not reported for a CpAID. The *app* parameter is not reported for an LOXCAID.
   Type: Alphanumeric string.
   Range: up to 9 characters.

4. **ssn** – Series Number
   Series number as stored in the EEPROM of the replaceable unit.
   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.
   This parameter is not reported for a CpAID. The *ssn* parameter is not reported for an LOXCAID.
   Type: value set.
   Range: up to 6 characters.
   Note: A dash (-) is used instead of a colon (:) for the series number in TL1.
5. **clei** – Common Language Equipment
   Common Language Equipment as stored in the EEPROM of the replaceable unit.
   This parameter should be reported for the AID for the backplane, AID for the user-panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.
   This parameter is not reported for a CpAID. The *clei* parameter is not reported for an LOXCAID.
   Type: value set.
   Range: 10 characters.
6. **eci** – Equipment Catalog Item
   Equipment Catalog Item as stored in the EEPROM of the replaceable unit.
   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.
   This parameter is not reported for a CpAID. The *eci* parameter is not reported for an LOXCAID.
   Type: value set.
   Range: 6 digits.
7. **sln** – Serial Number
   Serial number as stored in the EEPROM on the circuit pack to identify the replaceable unit and indicate the date and place of manufacture.
   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.
   This parameter is not reported for a CpAID. The *sln* parameter is not reported for an LOXCAID.
   Type: Alphanumeric string.
   Range: 12 characters.

8. **`dcn_ipad`** – DCN IP address for CLI/SNMP
   DCN IP address for CLI/SNMP management of the card.
   This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255.
   The values 0.0.0.0, 1.1.1.1, 127.0.0.1, and 224.0.0.0 to 255.255.255.255 are excluded.
   Default: Empty string.
9. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-UNPROT of the circuit pack. This parameter is reported for a CpAID , PowerAID, EciAID, imingInterfaceAID and LoxcAID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.
10. **`eqptprotpn`** – Protected Equipment ASAP Profile Name
    The name of the current ASAP profile of type EQUIP-PROT for the equipment.
    Option: This parameter is only reported for a CpAID, LoxcAID or PowerAID.
    Type: Alphanumeric string.
    Range: up to 24 characters. A hyphen (“-”) is allowed in the name additionally.
    Default: DEFAULT.
11. **`es64ucap`** – ES64U capacity
    Switch capacity of the ES64U pack.
    This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.
    Type: Value set.

    Range:

    - 0 – ES64U in suspended state, initial value after ES64U CP creation.
    - 20 – ES64U active or member of equipment protection group, capacity 20 Gbit/s.

    Default: 0.
12. **`vlantgmd`** – VLAN Tagging Mode
    VLAN tagging mode of the circuit pack. This parameter is relevant only for circuit packs of type GE1 (i.e. nvmname = GE1).
    Type: Value set.

    Range:

    - BCMD (default), for the backward compatible mode
    - 802.1tag, for the VLAN tag based mode according to IEEE802.1Q.
13. **`loswcap`** – LOXC switch capacity
    Switch capacity of the LOXC pack. This parameter is relevant only for circuit packs of type LOXC, thus the parameter shall be omitted for other packs.
    Type: value set.

Range, if *nvmname* = LOXC

- 0: LOXC in suspended state, initial value after LOXC CP creation
- 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s.

Range, if *nvmname* = LOXC40G2S or LOXC40G3S:

- 0: LOXC in suspended state, initial value after LOXC CP creation
- 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s
- 40: LOXC active or member of equipment protection group, switch capacity 40 Gbit/s

Default: 0.

14. **`lostd`** – LO tributary standard
LO tributary standard supported by the LOXC pack. This parameter is relevant only for circuit packs of type LOXC (i.e. *nvmname* = LOXC).
Type: value set.
Range:
    - SDH: LOXC supports SDH LO tributaries (VC3, VC12)
    - SONET: LOXC supports SONET LO tributaries (VT1.5)
    - UNDEFINED (default): no LO tributaries (loswcap = 0).

    LO VC3 tributaries provided with *lostd* = SDH support LO cross-connections and AU3/AU4 conversion cross-connections.
15. **`tmuxcap`** – TransMUX capacity
Switch capacity of the TransMUX pack.
This parameter is relevant only for circuit packs of type TransMUX (that means, *nvmname* = TransMUX), thus the parameter shall be omitted for other packs.
Type: Value set.
Range:
    - 0: TransMUX in suspended state, initial value after TransMUX CP creation.
    - 2G5: TransMUX active or member of equipment protection group, capacity 2.5 Gbit/s

    Default: 0
16. **`istd`** – Interface Standard of the Circuit Pack
Interface standard supported by the circuit pack. This parameter is supported on GE10PL1 and ES64U circuit packs. On the circuit packs, the parameter *istd* defines the interface standard of the virtual concatenation groups.
Option: If the parameter *istd* is not supported, then the parameter is omitted.
Type: Value set.
Range:
    - for GE10PL1: SDH or SONET
    - for ES64U: SONET or UNDEFINED (ES64U not used, *es64ucap* = 0)

Default:

- for GE10PL1: The default is derived from the system parameter *istddflt*.
- for ES64U: UNDEFINED.

Detailed behavior description

Omit Inventory Data parameters if not accessible

If the system cannot access inventory data of a circuit pack, e.g. due to a missing or defect pack or a system-internal communication outage, the following parameters are omitted from the command response:

- **app**
- **clei**
- **eci**
- **name**
- **qual**
- **sln**
- **ssn**.

Example input/output

The following shows the successful execution of the command for a replaceable unit (non CpAID):

```
RTRV-EQPT:UNITE-NE:1-1-usrpnl:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ″1-1-usrpnl:name=UPL,qual=-″

```

The following shows the successful execution of the command for a circuit pack (CpAID):

```
RTRV-EQPT:UNITE-NE:1-1-#-#-5-cp:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ″1-1-#-#-5-cp:eqptpn=DEFAULT,eqptprotpn=DEFAULT″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-EQPT** command.

RTRV-EQPT (shelf): Retrieve equipment (shelf)

The **RTRV-EQPT** command retrieves the provisioning information associated with the shelf level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-EQPT***:tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of the shelf/subrack.
   Type: AID
   Range: ShelfAID. The keyword **all** is allowed on bay AID and shelf AID level.
   Default: 1-1.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "1-1[:spec_block]"
        ...
        ...
   "1-1[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

1. **`aid`** – Access Identifier
   The AID of the shelf/subrack.
   Type: AID
   Range: ShelfAID. The keyword **`all`** is not allowed on bay AID and shelf AID level.
   Default: 1-1.

Spec block parameters

1. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-UNPROT of the shelf level.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
2. **`eqptprotpn`** – Protected Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT of the shelf level.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
3. **`shlftp`** – Shelf Type
   The shelf type of the addressed NE is provided.
   Type: Alphanumeric value set.
   Range: LXC40.
   Default: none.
4. **`ssoride`** – SS Bits Overrides
   This parameter determines the value to be inserted into the SS bits of the pointer of every AU-N or STS-N signal in the output direction of every SDH or SONET port in the shelf.

   The terms *override*, *enable* and *disable* are used since:

   - the default value of the SS bits in 00
   - the parameter allows you to diverge from that default.

   Type: Alphanumeric value set.
   Range: ENABLE insert value 00 into SS bits, DISABLE insert value 10 into SS bits.
   Default: DISABLE.

Detailed behavior description

The system retrieves the output parameters as described above.

The shelf type is derived from the inventory data of the subrack.

Example input/output

```
RTRV-EQPT:UNITE-NE:1-1:123456;
```

```
   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ”1-1:eqptpn=DEFAULT,eqptprotpn=DEFAULT,shlftp=LXC40”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to RTRV-EQPT (shelf) command.

RTRV-EQPT (slot): Retrieve equipment (slot)

The **RTRV-EQPT** command retrieves the provisioning information associated with slot.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-EQPT***:tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a slot.
   Type: AID
   Range:
   - SlotAID
   - UnivSlotAID
   - XCSlotAID
   - CTLSlotAID.

   The keyword **usall** is allowed for Simple_UnivSlotAID.
   The keyword **xcall** is allowed for Simple_XCSlotAID.
   The keyword **ctlall** is allowed for Simple_CTLSlotAID.
   The keyword **all** is allowed for Simple_SlotAID.
   The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
```

```
      ...
   ″aid[:spec_block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

The output actlname is an attribute list per slot and nvmname/nvmqual is an optional pair of attributes per slot.

1. **aid** – Access Identifier
   Description: The AID of a slot.
   Type: AID
   Range: SlotAID
   The keyword **usall** is not allowed for Simple_UnivSlotAID.
   The keyword **xcall** is not allowed for Simple_XCSlotAID.
   The keyword **ctlall** is not allowed for Simple_CTLSlotAID.
   The keyword **all** is not allowed for Simple_SlotAID, Simple_UnivSlotAID, Simple_XCSlotAID, Simple_CTLSlotAID.
   The keyword **all** is not allowed on bay/shelf level.

Spec block parameters

1. **actlname** – Acceptable Circuit Pack Name
   This parameter is reported by itself The line is repeated for all groups of acceptable circuit packs in the slot. This list specifies the groups of circuit packs which can be provisioned for that slot. The detailed information about the groups can be requested via RTRV-ACTLCP.
   Type: value set.
   Range: 12 character.
2. **app** – Apparatus Code
   Apparatus Code as stored in the EEPROM on the circuit pack.
   This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
   Type: Alphanumeric string.
   Range: up to 9 characters.
3. **clei** – Common Language Equipment
   Common Language Equipment as stored in the EEPROM on the circuit pack.
   This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
   Type: Value set.
   Range: 10 characters

4. **`eci`** – Equipment Catalog Item
   Equipment Catalog Item as stored in the EEPROM on the circuit pack.
   This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
   Type: value set.
   Range: 6 digits.
   Default: none.
5. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT on slot level
   Type: Alphanumeric string
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
   Note: *eqptpn* is used on system, shelf and circuit pack level for a profile of type EQUIP-UNPROT.
6. **`name`** – Circuit Pack Name
   Circuit Pack Name as stored in the EEPROM on the circuit pack.
   This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
   Type: value set.
   Range: up to 12 characters.
7. **`nvmname`** – Circuit Pack Name
   This parameter specifies the name of the provisioned circuit pack of the slot. If no circuit pack is provisioned the default value is reported.
   Type: value set.
   Range: 12 character.
   Default: UNDEFINED.
8. **`nvmqual`** – Circuit Pack Qualifier
   This parameter specifies the qualifier of the provisioned circuit pack of the slot. If no circuit pack is provisioned the value UNDEF is reported.
   Type: value set.
   Range: 7 characters.

   The allowed values are:

   - UNDEF (default)
   - EXTD
   - all values as defined in SRD_ConfigurationManagement

   Note: The TL1-representation of the functional qualifier follows the following rules:

   - alphanumeric characters or the special character ’-’ only
   - special characters like ’/’ and ’.’ to be omitted.

9. **`nvmsize`** – NVM Size
   This parameter indicates the size of the NVM installed on the CTL pack. The parameter is reported only for a CTLSlotAID.
   Type: Alphanumeric value set.
   Range:
   - 256MB
   - 512MB
   - 1GB
   - 2GB
   - 4GB
   - UNKNOWN

   The value UNKNOWN is returned, if the NVM size cannot be determined.
10. **`qual`** – Circuit Pack Qualifier
    Circuit Pack Qualifier as stored in the EEPROM on the circuit pack.
    This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
    Type: value set.
    Range: up to 7 characters.
    Note: The TL1-representation of the functional qualifier follows the following rules:
    - alphanumeric characters or the special character '-' only
    - special characters like '/' and '.' to be omitted.
11. **`sln`** – Serial Number
    Serial number as stored in the EEPROM on the circuit pack to identify each circuit pack and indicate the date and place of manufacture.
    This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
    Type: Alphanumeric string.
    Range: 12 characters.
12. **`ssn`** – Series Number
    Series Number as stored in the EEPROM on the circuit pack.
    This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
    Type: value set.
    Range: up to 6 characters.
    Note: A dash (-) is used instead of a colon (:) for the series number in TL1.

Example input/output

```
RTRV-EQPT:UNITE-NE:1-1-#-#-5:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
```

```
   ”1-1-#-#-5:actlname=OP2G5”
   ”1-1-#-#-5:actlname=OP10”
    ...
   ”1-1-#-#-5:nvmname=OP2G5,nvmqual=13SR4,eqptpn=DEFAULT”
   ”1-1-#-#-5:name=OP2G5,qual=13SR4,app=KFA12”
   ”1-1-#-#-5:clei=SN49CRTBAB,eci=255694”
   ”1-1-#-#-5:sln=00NB01002333,ssn=1-1”
;
```

The following example shows the case when it is not possible to provision slot 5, because *actlname* is empty:

```
RTRV-EQPT:UNITE-NE:1-1-#-#-5:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ”1-1-#-#-5:actlname=\”\””
    ...
   ”1-1-#-#-5:nvmname=OP40,nvmqual=EXTD,eqptpn=DEFAULT”
   ”1-1-#-#-5:name=\”\”,qual=\”\”,app=\”\””
   ”1-1-#-#-5:clei=\”\”,eci=\”\””
   ”1-1-#-#-5:sln=\”\”,ssn=\”\””
;
```

Error responses

Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command in the Error responses section. The error responses listed there also pertain to the **RTRV-EQPT** command.

RTRV-EQPT (socket): Retrieve equipment (socket)

The **RTRV-EQPT** command shall retrieve the provisioning information associated with socket.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-EQPT**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keyword *usall* or *all* is allowed for Simple_UnivSlotAID. The keyword *scall* is allowed for Simple_SocketAID. The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   ″aid[:spec_ block]″
   ... ...
   ″aid[:spec_ block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

The output *actlname*/*actlqual* is a list of attribute pairs per socket and *nvmname*/*nvmqual* is an optional pair of attributes per socket.

1. **`aid`** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keywords *all* / *usall* / *scall* shall are not allowed on any level.

Spec block parameters

1. **`actlname`** – Acceptable Module Name
   This parameter is reported by itself together with actlmodqual. The line is repeated for all acceptable modules in the socket. This list specifies the modules which can be provisioned for that socket.
   Type: value set.
   Range: 12 characters.
2. **`actlqual`** – Acceptable Module Qualifier
   This parameter is reported by itself together with actlmodname. The line is repeated for all acceptable modules in the socket. This list specifies the modules which can be provisioned for that socket.
   Type: value set.
   Range: 7 characters.

   Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

   - alphanumeric characters or the special character '-' only
   - special characters like '/' and '.' to be omitted
3. **`app`** – Apparatus Code
   Apparatus Code as stored in the EEPROM. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED. The 9 character Apparatus Code string is represented left aligned and padded on the right with ASCII spaces (20HEX) to a 12 character alphanumeric string.
   Type: Alphanumeric string.
   Range: 12 characters alphanumeric string or empty string (default).
   The default is reported when the Apparatus Code value cannot be derived from the EEPROM content. Note: In TL1 output direction the quotes have to escaped \"\".
4. **`ccode`** – Commercial Code
   Commercial code + suffix as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFPEEPROM Format.
   Type: numeric string.
   Range: up to 12 digits.

5. **`compatibilitybyte`** – Compatibility Byte
   The Compatibility Byte indicates the compatibility of the module with the system. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.
   Type: numeric string.
   Range: 0…255.
6. **`clei`** – Common Language Equipment
   Common Language Equipment as stored in the EEPROM on the module.
   This parameter should be reported for a SocketAID, if the value of *holdst* is VALID or UNEXPECTED.
   Type: value set.
   Range: 10 characters.
7. **`connectortype`** – Connector Type
   This parameter indicates the type of connector at the module plugged into the socket. (E.g. 07 for LC) This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.
   Type: Hexadecimal number
   Range: 1 byte which is represented as 2 hexadecimal digits.
8. **`datecde`** – Date Code
   Vendor Date Code. This parameter is kept for compatibility reasons only and is reported with the fixed value empty string ″″ for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
   Type: Text string.
   Range: empty string.
9. **`eci`** – Equipment Catalog Item
   Equipment Catalog Item as stored in the EEPROM on the module.
   This parameter should be reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED.
   Type: value set.
   Range: 6 digits.
10. **`eqptpn`** – Equipment ASAP Profile Name
    The name of the current ASAP profile of type EQUIP-PROT on socket level.
    Type: Alphanumeric string.
    Range: up to 24 characters. A hyphen (“-”) is allowed in the name additionally.
    Default: DEFAULT.
11. **`interchangemarker`** – Interchangeability Marker
    This parameter is derived from the EEPROM content on the module and reported for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
    Type: Test string.
    Range: 6 characters

Default: ″S1-1″
The default is reported when the Interchangeability Marker value is not available in the EEPROM.
Note: A dash (-) is used instead of a colon (:) for the interchangeability marker in TL1.

12. **`name`** – Module Name
Circuit Pack Name as stored in the EEPROM on the module.
This parameter should be reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED.
Type: value set.
Range: up to 12 characters.
13. **`nvmname`** – Provisioned Module Name
This parameter specifies the name of the provisioned module of the socket. If no module is provisioned the default value is reported.
Type: value set.
Range: 12 character.
Default: UNDEFINED.
14. **`nvmqual`** – Provisioned Module Qualifier
This parameter specifies the qualifier of the provisioned module of the slot. If no module is provisioned the default value is reported.
Type: value set.
Range: 7 characters.
Default: UNDEF.
Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:
    - alphanumeric characters or the special character ’-’ only
    - special characters like ’/’ and ’.’ to be omitted.
15. **`physicalidentifier`** – Physical Identifier
This parameter indicates the type of module plugged into the socket. (e.g. 03 for SFP). This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.
Type: Hexadecimal number.
Range: 1 byte which is represented as 2 hexadecimal digits.
16. **`prodid`** – Product Line Id
Binary Compatibility + Alcatel-Lucent Unique Number as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string.
Range: empty string ″″ Note: In TL1 output direction the quotes have to escaped \″\″.

17. **`qual`** – Module Qualifier
    Circuit Pack Qualifier as stored in the EEPROM on the module.
    This parameter should be reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED.
    Type: value set.
    Range: up to 7 characters.

    Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

    - Alphanumeric characters or the special character '-' only
    - Special characters like '/' and '.' to be omitted.
18. **`sln`** – Serial Number
    Serial number as stored in the EEPROM on the module to identify each module and indicate the date and place of manufacture.
    This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the Small EEPROM Format.
    Type: Alphanumeric string
    Range: 12 characters.
19. **`ssn`** – Series Number
    Series Number as stored in the EEPROM on the module.
    This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the Small EEPROM Format.
    Type: value set.
    Range: up to 6 characters.
    Note: A dash (-) is used instead of a colon (:) for the series number in TL1.
20. **`transceivercode`** – Transceiver Code
    This parameter indicates indicates the type of transceiver at the module plugged into the socket. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.
    Type: Hexadecimal number or text string
    Range: 8 bytes where each byte is represented as 2 hexadecimal digits.
21. **`uniquenumber`** – Lucent Unique Number
    Alcatel-Lucent Unique Number as stored in the EEPROM. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED. The Alcatel-Lucent Unique Number is represented right aligned and padded on the left with ASCII spaces (20HEX) to a 12 character numeric string.
    Type: Numeric string.
    Range: 12 characters alphanumeric string or empty string.

22. **`vendorname`** – Vendor Name
This parameter is kept for compatibility reasons only and is reported with the fixed value empty string ″″ for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string
Range: empty string ″″
23. **`vendoroui`** – Vendor Company Identifier
This parameter is kept for compatibility reasons only and is reported with the fixed value empty string ″″ for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string
Range: empty string ″″
24. **`vendorpartno`** – Vendor Part Number
This parameter is kept for compatibility reasons only and is reported with the fixed value empty string ″″ for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string
Range: empty string ″″
25. **`vendorrevlvl`** – Vendor Revision Level
Vendor Revision Level as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string.
Range: 4 characters.
26. **`vendorsln`** – Vendor Serial Number
Vendor Serial Number + WES Vendor Identifier as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
Type: Text string.
Range: 20 characters.

27. **`wesserialno`** – WES Serial Number
    This parameter is read from the EEPROM on the module and reported for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
    Type: Text string.
    Range: 18 characters.
    Default: empty string "". The default is reported when the WES Serial Number value is not available in the EEPROM.
28. **`wesvendorid`** – WES Vendor ID
    WES Vendor Identifier as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.
    Type: Text string.
    Range: 4 characters.

Detailed behavior description

Omit inventory data parameters if not accessible.

If the system cannot access inventory data related to the addressed socket, e.g. due to a missing or defect pack or a system-internal communication outage, the following parameters are omitted from the command response:

- *app*
- *ccode*
- *clei*
- *compatibilitybyte*
- *connectortype*
- *datecde*
- *eci*
- *interchangemarker*
- *name*
- *physicalid*
- *prodid*
- *qual*
- *sln*
- *ssn*
- *transceivercode*
- *uniquenumber*
- *vendorname*
- *vendoroui*
- *vendorpartno*

- *vendorrevlvl*
- *vendorsln*
- *wesserialno*
- *wesvendorid*.

Reporting of inventory data for different module types

Different module types will support a different set of inventory data.

Modules with a Alcatel-Lucent specific specification will support following parameters:

- *clei*
- *eci*
- *name*
- *qual*
- *sln*
- *ssn*.

For SFP and XFP modules the following parameters will be supported:

- *ccode*
- *clei*
- *compatibilitybyte*
- *connectortype*
- *datecde*
- *interchangemarker*
- *name*
- *physicalid*
- *prodid*
- *qual*
- *transceivercode*
- *uniquenumber*
- *vendorname*
- *vendoroui*
- *vendorpartno*
- *vendorrevlvl*
- *vendorsln*
- *wesserialno*
- *wesvendorid*.

Reporting of inventory data based on defined format of EEPROM content

As long as the Inventory Data on the Optical Modules is accessible and readable, the parameters are reported as they are extracted from the EEPROM according to the format definitions. If the data in the EEPROM is not according to the defined format, then for each parameter the defined number of bytes is taken from the defined location in the EEPROM without any check of the extracted data.

Example input/output

The following exampleb shows a normal response for RTRV-EQPT for one socket when a module is plugged in with data stored in Small EEPROM format:

```
RTRV-EQPT:UNITE-NE:1-1-#-#-5-sc2:123456;

   UNITE- NE 00-11-03 08:00:00
M  123456 COMPLD
   ”1- 1-#-#-5-sc2:actlname=OM2G5,actlqual=13LR1”
   ”1- 1-#-#-5-sc2:actlname=OM2G5,actlqual=15LR1”
   ”1- 1-#-#-5-sc2:nvmname=OM2G5,nvmqual=13SR4,eqptpn=DEFAULT”
   ”1- 1-#-#-5:name=OM2G5,qual=15LR1,comcde=109192278000,clei=WM3ILPEDAA,eci=255694,
sln=00NB01002333,ssn=1-1”
;
```

The following example shows a response if a module is not plugged into a socket:

```
RTRV -EQPT:UNITE-NE:1-1-#-#-5-sc2:123456;

   UNITE- NE 00-11-03 08:00:00
M  123456 COMPLD
   ”1- 1-#-#-5-sc2:actlname=OM2G5,actlqual=13LR1”
   ”1- 1-#-#-5-sc2:actlname=OM2G5,actlqual=15LR1”
   ”1- 1-#-#-5-sc2:nvmname=OP2G5,nvmqual=13SR4,eqptpn=DEFAULT”
   ”1- 1-#-#-
      5:name=OM2G5,qual=CL61L1,app=\”\”,ccode=109496869,clei=WM1T37KBAA,compatibilitybyte=128
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-EQPT** command.

RTRV-EQPT (system): Retrieve Equipment (system)

The **RTRV-EQPT** command retrieves the provisioning information on system (NE) level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-EQPT**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system. The usage of the keyword **all** on system level is not allowed.
   Default: system
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "system:spec_block"
       ...
       ...
   "system:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

1. **`aid`** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system. The usage of the keyword **`all`** on system level is not allowed.
   Default: system

Spec block parameters

1. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile on the system level
   Type: Alphanumeric string
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT
2. **`istddflt`** – Interface Standard Default
   Defining the predominantly used interface standard for a port.
   Type: Alphanumeric value set.
   Range:
   - SONET
   - SDH

   Default: SDH
3. **`mondelay`** – Port Auto to Mon Delay
   The switch of the port mode from the value AUTO to the value MON is delayed by this timer. It requires that a valid signal is present for the set timer period prior to the port transitioning to monitored. If during the timer period the signal is interrupted, the time should reset and begin another period when a valid signal is once again presented.
   Type: Numeric string.
   Range:
   - 0 = no timer will be started
   - 1…480 = in steps of 1 representing a switch delay of the port mode in minutes.

   Default: 0
4. **`portclassdflt`** – Port Class Default
   Defines the default port class, which is used when a new port is created and xcsetup=SWISS. When xcsetup=TRADITIONAL this parameter is not evaluated.
   Type: Alphanumeric value set.
   Range:
   - TRADITIONAL
   - EDGE

   Default: TRADITIONAL.
5. **`trbmddflt`** – Tributary Mode Default
   Defining the predominantly used tributary mode for a port.
   Type: Alphanumeric value set.

Range:

- FIXED
- ADAPTIVE

Default: FIXED.

6. **`swmaxcap`** – Maximum Switch Capacity
   This parameter indicates the maximum switch capacity of the system that the user intends to use.
   Type: value set.
   Range:
   - LXC160 (default), 160 GBit/s switch capacity
   - LXC320, 320 GBit/s switch capacity
   - LXC640, 640 GBit/s switch capacity.
7. **`synccrtc`** – System Synchronization Characteristic
   This parameter specifies whether the NE uses the SDH or SONET timing function for synchronization.
   Type: Alphanumeric value set.
   Range:
   - SONET
   - SDH.

   Default: SDH.
8. **`systype`** – System Type
   This parameter specifies the type of NE.
   Type: Alphanumeric value set.
   Range: WaveStar_UNITE.
   Default: WaveStar_UNITE
9. **`upsrportalarming`** – Enh. SA/NSA Detection for UPSR and SNCP
   The parameter specifies whether the Enhanced SA/NSA Detection for UPSR Rings The parameter specifies whether the Enhanced SA/NSA Detection for UPSR Rings is switched on or off.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).

10. **xcsetup** – Cross Connect Setup
    This parameter indicates whether the system supports the set-up of cross-connections via the ONNS application.
    Type: value set.
    Range: SWISS ONNS application is enabled; TRADITIONAL ONNS application is disabled.
    Default: TRADITIONAL.
11. **ASTNNodeID** – ASTN node ID
    This parameter shows the unique identification of the NE as used by the ONNS application. The value will be read from backplane, if DB is empty.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.

Detailed behavior description

The command retrieves the parameters as indicated in the output parameter section from the system.

Example input/output

```
RTRV-EQPT:UNITE-NE:system:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ″system:systype=WaveStar_UNITE″
   ″system:istddflt=SDH″
   ″system:trbmddflt=FIXED″
   ″system:synccrtc=SDH″
   ″system:eqptpn=DEFAULT″
;
```

Error responses

Refer to “RTRV-HDR: Retrieve header” (p. 3-2417) command Error Response section. The generic error responses listed there also apply to the **RTRV-EQPT** command.

RTRV-EXT-CONT: Retrieve external control

The **RTRV-EXT-CONT** command instructs an NE to send the control state of MDO ports (external controls). The command can be used to audit the result of an **OPR-EXT-CONT** or an **RLS-EXT-CONT** command.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-EXT-CONT**:*tid*:[*aid*]:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   This is the address of the MDO port entities on which the command operates. If misc_outall is specified the configuration of all MDO’s will be retrieved.
   Type: AID
   Range: Miscellaneous_out_discreteAID
   Default: misc_outall (if the *aid* is omitted).
3. **ctag** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

The following example shows the successful completion of the **RTRV-EXT-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
   ″aid:,dur,contstate″
   ...
   ″aid:,dur,contstate″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This is the address of the MDO port entity for which the configuration is retrieved or on which an operation is performed.
   Type: AID.
   Range: Miscellaneous_out_discreteAID. misc_outall must not be reported or used.
2. **`dur`** – Duration
   This parameter defines in which mode the device connected to the MDO is expected to be operated. It is a fixed value because this feature will be not supported by the system. This parameter is in for compatibility reason. The system operates only continuous that means if the MDO is operated it is switched on and it is released it is switched off.
   Type: Alphanumeric value set.
   Range: CONTS, continuous duration.
3. **`contstate`** – Control State
   This is the state of the MDO (external control)
   Type: Alphanumeric value set.
   Range:
   - OPER – Operated, that means the MDO is switched on
   - RLS – Released (default), that means the MDO is switched off.

Detailed behavior description

The **`RTRV-EXT-CONT`** command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful completion of the **`RTRV-EXT-CONT`** command by the NE:

```
RTRV-EXT-CONT:LT-UNITE-123:MISC_OUT3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″MISC_OUT3:,CONTS,RLS″
;
```

The following example shows the successful completion of the **`RTRV-EXT-CONT`** command by the NE if the aid is omitted:

```
RTRV-EXT-CONT:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″MISC_OUT1:,CONTS,RLS″
   ″MISC_OUT2:,CONTS,OPER″
```

```
   ”MISC_OUT3:,CONTS,OPER”
   ”MISC_OUT4:,CONTS,RLS”
   ”MISC_OUT5:,CONTS,RLS”
   ”MISC_OUT6:,CONTS,OPER”
   ”MISC_OUT7:,CONTS,RLS”
   ”MISC_OUT8:,CONTS,RLS”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-EXT-CONT** command.

Related TL1 messages

- “OPR-EXT-CONT: Operate external control” (p. 3-2032)
- “RLS-EXT-CONT: Release external control” (p. 3-2190).

RTRV-FECOM: Retrieve DCC related parameters

The **RTRV-FECOM** command can be initiated by a user to retrieve parameters of Data Communication Channels (DCC) and its attachment to specific OSI nodes.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-FECOM***:tid::ctag::[port],[dcctype],[networktype];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **port** – DCC port
   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel.
   Type: AID.
   Range: SPortAID.
   Default: If this field is omitted, the report will include the DCC parameters of all transmission ports belonging to the NE.

4. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS DCC parameters of the *port* is reported by the command.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.
   Default: If this parameter is omitted, LINE and SECTION DCC parameters will be considered for the output.
5. **networktype** – Network Type
   This parameter specifies whether the MCN or SCN related DCC parameters of the port is reported by the command.
   Type: Alphanumeric value set.
   Range: MCN, SCN.
   Default: If this parameter is omitted, MCN and SCN related parameters will be considered for the output.

Output format

If the RTRV-FECOM is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″port,dcctype:spec_block″
        ...
        ...
        ...
   ″port,dcctype:spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`port`** – DCC port
   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel.
   Type: AID.
   Range: SPortAID.
   Default: If this field is omitted, the report will include the DCC parameters of all transmission ports belonging to the NE.
2. **`dcctype`**
   This parameter specifies whether the LINE/MS or SECTION/RS DCC parameters of the *port* is reported by the command.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.
   Default: If this parameter is omitted, LINE and SECTION DCC parameters will be considered for the output.

Spec block parameters

1. **`dccprottp`**
   This parameter reports the protection type of the DCC channel. 0X1 means the port is not involved in a protection group or DCC protection switching is disabled. 1+1 means DCC protection switching is enabled: In these case only the active worker line is shown.
   Type: Alphanumeric value set.
   Range: 0X1 (default), 1+1.
2. **`dccstat`**
   This parameter indicates whether MCN communication over the DCC channel is enabled or if it is used in a Transparent DCC Cross Connection.
   Type: Alphanumeric value set.
   Range: DISABLE, ENABLE (default), TRANSPARENT.
   Note: Output responses with dccstat=DISABLE will only sent when either *scn_dccstat* = ENABLE or *uni_dccstat* = ENABLE or *enni_dccstat* = ENABLE, see also Detailed behavior description below.
3. **`lapdmode`**
   This parameter indicates the type of LAPD service. Modes are AITS and UITS. Starting with R2.0 this parameter is also used to determine the service for the LinkID protocol.
   If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* is set to ENABLE, or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.
   Type: Alphanumeric value set..
   Range:
   - UITS (default)
   - AITS.

4. **lapdrl**
   This parameter indicates the LAPD role. This parameter is also used to determine the service for the LinkID protocol.
   If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* is set to ENABLE or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.
   Type: Alphanumeric value set.
   Range:
   - USER-SIDE (default)
   - NETWORK-SIDE.
5. **osinode**
   Assignment of a DCC channel to an MCN node in the NE. The parameter is omitted when *dccstat* = ENABLE.
   An NE can have up to 8 instances of the OSI stack. Node-1 is default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00). Nodes 2-8 can be created and configured, see command **ENT-ULSDCC-L3**.
   Type: AID.
   Range: osinode{1-8}
6. **scn_dccstat**
   This parameter indicates whether the DCC channel is used for communication over the SCN or is involved in a transparent DCC cross-connection.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE, TRANSPARENT.
   Note: Output responses with *scn_dccstat* = DISABLE will only sent when either *dccstat* = ENABLE or *uni_dccstat* = ENABLE, or *enni_dccstat* = ENABLE, see also Detailed behavior description below.
7. **uni_dccstat**
   This parameter indicates whether the DCC channel is used for UNI communication.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE, TRANSPARENT
   Note: Output responses with *uni_dccstat* = DISABLE will only sent when either *dccstat* = ENABLE or *scn_dccstat* = ENABLE, or *enni_dccstat* = ENABLE, see also Detailed behavior description below.
8. **enni_dccstat**
   This parameter indicates whether the DCC channel is used for E-NNI communication.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE, TRANSPARENT
   Note: Output responses with *enni_dccstat* = DISABLE will only be sent when either *dccstat* = ENABLE or *scn_dccstat* = ENABLE or *uni_dccstat* = ENABLE, see also Detailed Behavior Description below.

Detailed behavior description

The command retrieves the system parameter as described in the Output Parameter Section.

Output responses will only be delivered for DCC channels with

- *dccstat!* = DISABLE or

- *scn_dccstat!* = DISABLE or

– *uni_dccstat*!=DISABLE or

– *enni_dccstat*!=DISABLE.

The command shall return an empty response, if there is no data matching the criteria given by the input parameters of the command.

The command processing uses the input parameters as filter criteria to search for data to be retrieved. If no data is found, an empty response is returned. Error messages are only returned for general syntax and range errors.

The command is not able to retrieve DCC characteristics parameters from the protecting port of a 1+1 MSP group, if DCC protection switching is enabled.

Example input/output

The following example shows the result of RTRV-FECOM:

```
RTRV-FECOM:NE-UNITE::123456::1-1-#-#-5-all,line;
   NE-UNITE 00-12-24 11:00:00
M  123456 COMPLD
   ″1-1-#-#-5-1,LINE:dccstat=ENABLE,lapdmode=UITS,osinode=osinode1,
dccprottp=0X1,″
;
```

The following example shows the result of RTRV-FECOM for a port which is used by the SCN:

```
RTRV-FECOM:NE-UNITE::123456::1-1-#-#-5-all,line;
   NE-UNITE 00-12-24 11:00:00
M  123456 COMPLD
   ″1-1-#-#-5-1,LINE:dccstat=DISABLE,dccprottp=0X1,scn_dccstat=ENABLE, uni_
      dccstat=DISABLE, enni_dccstate=DISABLE″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-FECOM** command.

Related TL1 messages

- "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
"RTRV-CRS-FECOM: Retrieve transparent DCC cross-connection" (p. 3-2329)

RTRV-FECOM-LAN: Retrieve LAN channel related parameters

The **RTRV-FECOM-LAN** command can be initiated by users to retrieve the provisioned state of the LAN ports (LAN1, LAN2, and LAN3).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-FECOM-LAN**:*tid:[aid]:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   Default: If this field is omitted, the report will display the status of all lan ports belonging to the *tid*.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.

Output format

If the **RTRV-FECOM-LAN** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
        ...
   "aid:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Output parameters

Command parameters

1. **aid** – Target Identifier
   This parameter indicates the LAN port AID. The value *lanall* is not allowed.
   Type: AID.
   Range: LanPort AID.

Spec block parameters

1. **ip_ad** – IP Address
   This parameter indicates the assigned IP address for the LAN interface. The IP-address includes both, a router address and a HOST address. The HOST address that will be used for FTP depends on the LAN interface where the related TCP connection request originates.
   The CIT is expected to use the HOST address of LAN1. The *Navis*® Optical EMS is expected to use the HOST address of LAN2 (or LAN3 in later releases).
   Type: 32-bit IPv4 address: Four dot separated numeric strings OR empty string The empty string value is used as indication for an invalid/undefined IP address.
   Range: For first numeric string: 0 .. 223; for second to fourth numeric string: 0 .. 255.
   The values 0.0.0.0 and 1.1.1.1 are excluded.
   Default: For LAN1, LAN2 and LAN3: empty string.
2. **ip_lanstat** – IP-LAN Status
   This parameter indicates whether IP communication over the external LAN channel is enabled or disabled. Note: Enabling has no effect if *lanstat* is disabled for that interface.
   Type: Alphanumeric value set.
   Range: ENABLE or DISABLE for LAN1, LAN2, LAN3
   Default: DISABLE for LAN1, LAN2, LAN3.
3. **ip_snm** – IP Subnet Mask
   This parameter indicates the assigned IP subnet mask (32-bit IPv4) for the LAN interface. The full IP-address is needed as host-address. Each LAN needs its own IP-address and IP-mask, indicating that all IP-addresses that match the prefix (Unmasked part) are grouped as the subnet-ID for this LAN-subnet.
   If the LAN interface is used for UNI, then the parameter ip_snm is used to define a subnet for multiple UNI-Cs which belong to the same customer.
   Type: 32-bit IPv4 address: Four dot separated numeric strings or empty string. The empty string value is used as indication for an invalid/undefined IP subnet mask.
   Range: For each numeric string: 0 .. 255.
   Default: For LAN1, LAN2, and LAN3: empty string.

4. **`isis_stat`** – (I) IS-IS Status
   This parameter indicates whether (integrated) IS-IS is enabled or disabled on the LAN port specified by the input *aid*.
   Note: Enabling has no effect if *lanstat* is disabled for that interface.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE.
5. **`lanrpri`** – LAN Designated Router Priority
   This parameter sets the relative priority for the node in the election for designed router on this LAN. There is a separate election for each separate LAN to which the node is connected. A higher value indicates a higher probability to be selected as designated router. A designated router is selected per area (between the nodes on that LAN with the same area address) and for the Level-2 nodes on the LAN.
   Note: When *osinode* = scnnode modification of this parameter has no effect.
   Note: When *osinode* = uninode this parameter has no effect.
   Note: When *osinode* = enninode this parameter has no effect.
   Type: numeric string.
   Range: 1 – 127.
   Default: 64.
6. **`lanstat`** – LAN Status
   This parameter indicates whether physical communication over the external channel is enabled or disabled.
   Note: Disabling of an interface also affects usage of protocols over this interface, see *lan_stat* and *osi_stat*.
   Type: Alphanumeric value set.
   Range: ENABLE for lan1; ENABLE, DISABLE for lan2, lan3:
   Default: ENABLE for lan1 and lan2; DISABLE for lan3.
7. **`lantlss`** – LAN TARP Storm Suppression
   This parameter indicates the enhanced TARP propagation rules that suppress TARP LAN storms.
   Note: When *osinode* = uninode this parameter has no effect.
   Note: When *osinode* = enninode this parameter has no effect.
   Type: Alphanumeric value set.
   Range:
   - ENABLE (default)
   - DISABLE.
8. **`osinode`**
   Assignment of LAN port to an OSI-node, the SCN node, the UNI node, or the E-NNI node in the NE. A UNITE NE can have up to 8 instances of the OSI stack, has one SCN node, one UNI node, and one E-NNI node.
   Node-1 is the default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00).
   Node 1 is always present. The SCN node is created when the ASTN IP address is configured, the UNI node is created when the UNI IP address is configured, the SC node (ENNI node) is created when the SC IP address and the SC ID is configured.

Node 2-8 can be created and configured, see command **ENT-ULSDCC-L3**.
Type: AID.
Range:
For LAN1: osinode1 (fixed value).
For LAN2 and LAN3: osinode{1-8} | scnnode | uninode | enninode.
Note: If this parameter is set to scnnode or uninode or enninode, then *lanstat* and *ip_lanstat* must be ENABLED.
Default: osinode1.

9. **osi_lanstat** – OSI LAN Status
This parameter indicates whether OSI communication over the external channel is enabled or disabled.
Type: Alphanumeric value set.
Range: ENABLE for LAN1, LAN2, LAN3

Detailed behavior description

The command retrieves system parameter as described in the Output parameter section.

Example input/output

The following example shows the result of RTRV-FECOM-LAN:

```
RTRV-FECOM-LAN:NE-UNITE:1-1-lan1:123456;
   NE-UNITE 00-12-24 11:01:00
M  123456 COMPLD
   ″1-1-lan1:ip_lanstat=ENABLE,ip_ad=135.248.206.72,ip_snm=255.255.0.0,
lanstat=ENABLE,lanrpri=64,lantlss=ENABLE,osinode=osinode1,osi_lanstat=ENABLE″
;
```

The following example shows the result of RTRV-FECOM-LAN:

```
RTRV-FECOM-LAN:NE-UNITE:1-1-lan1:123456;
   NE-UNITE 00-12-24 11:01:00
M  123456 COMPLD
   ″1-1-lan2:ip_lanstat=ENABLE,ip_ad=135.248.206.72,ip_snm=255.255.0.0,
lanstat=ENABLE,lanrpri=64,lantlss=ENABLE,osinode=enninode,osi_lanstat=ENABLE″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-FECOM-LAN** command.

Related TL1 messages

- “ENT-FECOM-LAN: Enter LAN related parameters” (p. 3-1581)

RTRV-HDR: Retrieve header

Description

The **RTRV-HDR** command can be initiated by a user to request that the NE returns a normal completion response.

Parameters

In TL1 terminology, a parameter block always follows a colon ’:’. Any trailing colons at the end of a command line may be omitted if they do not contain any parameters. A parameter block can be either a block of position-defined parameters or it can be a spec_block (a block of name-defined parameters). In a block of position-defined parameters, the parameter values are supplied at predefined positions within the parameter block. Two parameter values are separated by a comma. If the default value for a parameter is to be used, a null value is placed in the command line and the position of the parameter is maintained by keeping the comma. When default values are used for parameters at the end of the parameter block, it is not necessary to include all the trailing commas. In all the TL1 command pages, for position-defined parameter blocks, simplified notation such as: [d],[e],[f],[g] is used to represent the following format: [d][,[e][,[f][,g]]]. The following notation is also equivalent: [d],[e],[f][,g]. In a specification block (spec_block), every parameter name is followed by an equal sign and the parameter value. The command line does not have to use all of the spec_block parameters. Also, spec_block parameters can appear in any order.

NULL parameter value

The word NULL is used for some of the parameter values in TL1 messages. For both input and output parameters, NULL means that the parameter is omitted.

Quoted text strings

Some string-valued parameters, like NENAME, allow any printable character within the double-quoted string (″″). On output (RTRV and **REPT DBCHG**), the string is surrounded by escaped quotes \″\″. Those parameters can contain any printable characters, including the TL1 parse characters (; : , ″). Spaces and upper/lowercase are also preserved. Using two double-quotes ″″ will set the parameter to an empty string. But according to GR-831, within a quoted string, a double-quote character is escaped as \″ and the backslash is escaped as \\\. Within a backslash-quoted string (\″\″), the double-quote character is escaped as ″″ and the backslash is escaped as \\\. Another caveat is that while that parameter can contain any printable character, in networks using a Telcordia OS, the TL1 parse characters (; : , ″) should not be used. Particularly, the semicolon (;), less-than (<), and greater-than (>) characters must not be used in the string.

Other notational conventions

The following conventions are used in the description of RTRV-HDR itself to visualize non-printable characters (in all other commands those characters are indicated by a blank).

<cr>

A carriage return in ASCII

<lf>

A line feed in ASCII

<>

The brackets are used to enclose one or more information items, e.g., <date>, <time>, <source identifier>, etc. The brackets are not transmitted.

^

The character ^ indicates a blank that must appear in the message.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): Any

Priority: 1

Abortable: Yes

Input format

Syntax: `RTRV-HDR`*:tid::ctag*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   This is the currently active name of the NE to which the command is addressed. The *tid* is a case insensitive character string.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed
   Range: 1 to 20 characters
   Default: UNITE-NE
2. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string.
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows '0' as valid *ctag*, which is an extension to GR-831.

Output format

Normal system response

After receiving the **RTRV-HDR** command, the following normal completion response is returned:

```
IP^ctag<cr><lf>
<cr><lf><lf><lf>
^^^sid^date^time<cr><lf>
M^^ctag^COMPLD<cr><lf>
;
```

The format definition shows only the minimum of <CR> characters needed for the response. The response may contain additional <CR> characters at the beginning or end of lines. These <CR> characters have no effect on the visible formatting of the response message.

RL Acknowledgment

If a command cannot be executed at the present time, the following RL (Repeat Later) Acknowledgment is returned:

```
RL^ctag<cr><lf>
<cr><lf><lf>
```

Continuation responses and IP acknowledgments

For commands that generate output, if the output response is less than or equal to 4096 bytes, the response will be terminated by the semicolon (;) character. If the output response is greater than 4096 bytes, the response lines will be partitioned into multiple responses. The continuation response will have another set of header lines with the same ctag, along with additional output response lines. Each response will be terminated with the greater than (>) character, except the last one which will be terminated by the semicolon (;) character.

Output parameters

1. **sid** – Source Identifier
   This is the currently active name of the NE to which responses to the command. See definition of *tid* input parameter in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **date** – Date
   Date when output message is generated. This has the format YY-MM-DD (year-month-day).
   Type: value set.

Range:

- for YY: 00 to 99
- for MM: 01 to 12
- for DD: 01 to 31

2-digit years
TL1 messages use YY-MM-DD for the format of a date, meaning that the year only has two digits. This is consistent with Telcordia requirements. Internally, however, the system does use a 4-digit year. When the year appears in a response, the internal 4-digit year is truncated to two digits. When the year appears as an input parameter, for example in the **ED-DAT** command, years in the range 90-99 will represent 1990-1999, and years in the range 00-37 will represent 2000-2037.
Default: 00-01-01

3. **time** – Time
   Time when output message is generated. This has the format HH:MM:SS (hours:minutes:seconds).
   Type: Value set.
   Range:
   - for HH: 00 to 23
   - for MM: 00 to 59
   - for SS: 00 to 59

   Default: 00:00:00
4. **M** – Message
   This parameter indicates that the output message is generated in response to a manual command.
   Type: Value set.
   Range: M
5. **ctag** – Correlation Tag
   See definition of *ctag* input parameter in "RTRV-HDR: Retrieve header" (p. 3-2417).
6. **IP** – In Progress
   IP is sent in response to all commands with the exception of commands that result in error code output.
   Type: value set.
   Range: IP

7. **RL** – Repeat Later
   The requested command cannot be executed due to unavailable system resources. The command may be entered again later.
   Type: value set.
   Range: RL.
8. **COMPLD** – Completion Code
   This parameter indicates that the command has been completed.
   COMPLD for successful command execution For a command that is decomposed into a set of atomic commands a COMPLD completion code means that the command was successful for all atomic commands (e.g. AID ranges, group alias).
   COMPLD for no changes If a parameter has a current value, and a provisioning command attempts to reprovision the parameter with a value that is the same as its current value, the command will return a COMPLD completion code.
   Type: value set.
   Range: COMPLD.

Detailed behavior description

The **RTRV-HDR** command returns a normal completion response with *sid*, *date* and *time* output parameter as described above.

Example input/output

```
RTRV-HDR:LT-UNITE::123456;
IP 123456
<
   LT-UNITE 00-11-03 08:00:00
M  123456 COMPLD
;
```

Error responses

The following error conditions are not unique to the **RTRV-HDR** command but may apply to any TL1 command. Other commands will use the defined command specific error codes with additional error texts.

If there is a specific error behavior defined for another command, e.g. other error code or the suppression of error responses in some cases, then the specific error behavior, which is defined together with the command, shall overrule the generic behavior defined in this chapter.

There is no implied priority order of error checking suggested by this list of error responses.

In general the *sid* value in the error responses is that of the addressed NE. This is true even if a TL1-GNE sends an error message on behalf of an RNE. Some exceptions are noted for some error codes below (e.g. IITA). If the TL1-GNE forwards a command to a remote NE and a communication failure occurs before the remote NE is able to respond, it is understood that no response may be returned.

When an error response is returned, there may not be an in-progress (IP) acknowledgment in the response.

Note, that validation rules for the generic error conditions described below are not repeated for each specific command in the Error response section.

General format

The general output format is shown below, where <error code> is a 4-character code and <error text> is a text string.

```
<cr><lf><lf>
   sid date time<cr><lf>
M  ctag^DENY<cr><lf>
   <error code><cr><lf>
   /*<error text[, additional command specific error text]>*/<cr><lf>
;
```

Validation rule: Input failure (ICNV)

If there was an input failure because the command cannot be processed, the following error response is returned:

Error code: `ICNV – Input, Command Not Valid`

```
   sid date time
M  ctag DENY
   ICNV
   /* Input, Command Not Valid */
;
```

Validation rule: Input failure for omitted TID

If a *tid* value is required but no *tid* value is included, the following error response is returned, using the *sid* of the system that detected the error:

Error code: `ICNV – Input, Command Not Valid, missing TID`

```
   sid date time<cr><lf>
M  ctag DENY
   ICNV
   /*Input, Command Not Valid, missing TID*/
;
```

Validation rule: Command not recognized (SCNF)

If the command is not recognized or command parameters are not valid, the following error response is returned:

Error code:
`SCNF – Status, Command Not Found, command not recognized or command parameters not valid`

```
   sid date time
M  ctag DENY
   SCNF
   /* Status, Command Not Found, command not recognized
or command parameters not valid */
;
```

Validation rule: Syntax or Punctuation Error (IISP)

If the command cannot be parsed due to a syntax or punctuation error, the following error response is returned. If the command cannot be parsed for at least 3 colons, and no more than the maximum number of colons allowed before the TL1 end-of-message semicolon, the following error response is returned:

Error code: `IISP – Input, Invalid Syntax or Punctuation`

```
   sid date time
M  ctag DENY
   IISP
   /* Input, Invalid Syntax or Punctuation */
;
```

Validation rule: Command too long

If the command is longer than 4096 characters, the following error response is returned:

Error code: `IISP – Input, Invalid Syntax or Punctuation, command too long`

Validation rule: Parameter Input Failure (INUP)

If there is an input failure due to the parameter types, the following error response is returned:

Error code: `INUP – Input, Non-null Unimplemented Parameter`

```
   sid date time<cr><lf>
M  ctag DENY
   INUP
   /* Input, Non-null Unimplemented Parameter */
;
```

Validation rule: Parameter Missing (IPMS)

If an input parameter value is missing, the following error response is returned.

Error code: `IPMS – Input, Parameter MiSsing,<parameter_name> is missing`

```
   sid date time
M  ctag DENY
   IPMS
   /* Input, Parameter MiSsing */
;
```

Validation rule: Any Input Parameter not valid (IDNV)

If any one or more of the input parameter values are not valid, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid`

```
   sid date time
M  ctag DENY
   IDNV
   /* Input, Data Not Valid */
;
```

Validation rule: Input Parameter not valid (IDNV)

If an input parameter value is not valid, the following error response is returned. This is the preferred error response.

Error code: `IDNV – Input, Data Not Valid, invalid <parameter_name>`

```
   sid date time<cr><lf>
M  ctag DENY
   IDNV
   /* Input, Data Not Valid, invalid <parameter name> */
;
```

Validation rule: Invalid Entity (IENE)

If there is an input failure due to an invalid entity, the following error response is returned:

Error code: `IENE – Input, Entity Not Exists`

```
   sid date time
M  ctag DENY
   IENE
   /* Input, Entity Not Exists  */
;
```

Validation rule: Invalid Command Qualifier (IPNC)

If there is an input failure due to an invalid command qualifier, the following error response is returned:

Error code. `IPNC – Input, Parameter Not Consistent`

```
   sid date time
M  ctag DENY
   IPNC
   /* Input, Parameter Not Consistent */
;
```

Validation rule: Invalid Instance (SDNC)

If there is an input failure due to an invalid instance of an entity, the following error response is returned:

Error code: `SDNC – Status, Data Not Consistent, invalid instance of entity`

```
   sid date time
M  ctag DENY
   SDNC
   /* Status, Data Not Consistent,invalid instance of entity */
;
```

Validation rule: Incorrect TID (IITA)

If the command has a syntactically incorrect *tid*, the following error response is returned, using the *sid* of the system that detected the error:

Error code: `IITA – Input, Invalid TArget identifier, incorrect syntax`

```
   sid date time
M  ctag DENY
   IITA
   /* Input, Invalid TArget identifier,incorrect syntax */
;
```

Validation rule: Unknown TID (IITA)

If a command contains an unknown tid value (a *tid* value that does not exist in the network), the following error response is returned, using the *sid* of the system that detected the error:

Error code: `IITA – Input, Invalid TID, Unknown TID`

```
   sid date time
M  ctag DENY
   IITA
   /* Input, Invalid TID, Unknown TID */
;
```

Validation rule: Not reachable TID (IITA)

If a command has a valid *tid* value but the addressed remote NE is temporarily unable to communicate with the TL1-GNE, the following error response is returned, using the *sid* of the addressed system:

Error code: `IITA – Input, Invalid TID, Communications Failure`

```
   sid date time
M  ctag DENY
   IITA
   /* Input, Invalid TID,Communications Failure */
;
```

Validation rule: Too much AID parameters (ICNV)

If the command line has more aid parameters in the *aid* block than are allowed for that command, the following error response is returned:

Error code: `ICNV – Input, Command Not Valid, extra AID`

```
   sid date time
M  ctag DENY
   ICNV
   /* Input, Command Not Valid, extra AID */
;
```

Validation rule: Missing AID (ICNV)

If the command line has fewer aid parameters in the *aid* block than are required for the command, the following error response is returned:

Error code: `ICNV – Input, Command Not Valid, required AID missing`

```
   sid date time
M  ctag DENY
   ICNV
   /* Input, Command Not Valid, required AID missing */
;
```

Validation rule: Incorrect AID Syntax (IIAC)

For commands that have aid input parameters in the *aid* block, if the aid is syntactically incorrect, the following error response is returned:

Error code: `IIAC – Input, Invalid ACcess identifier, incorrect syntax`

```
   sid date time
M  ctag DENY
   IIAC
   /* Input, Invalid ACcess identifier, incorrect syntax */
;
```

Validation rule: Unknown AID (IIAC)

For commands that have aid input parameters in the *aid* block, if the aid is valid syntactically but has an unknown value, the following error response is returned:

Error code: `IIAC – Input, Invalid ACcess identifier, unknown AID`

```
   sid date time
M  ctag DENY
   IIAC
   /* Input, Invalid ACcess identifier, unknown AID */
;
```

Validation rule: Missing CTAG (ICNV)

If the *ctag* value is missing, the following error response is returned. Note that the *ctag* value is 0 in the error response:

Error code: `ICNV – Input, Command Not Valid,missing CTAG`

```
   sid date time
M  0 DENY
   ICNV
   /* Input, Command Not Valid,missing CTAG */
;
```

Validation rule: Invalid CTAG (IICT)

If the *ctag* value is non-NULL but invalid, the following error response is returned. Note that the same invalid *ctag* value is used for the *ctag* field in the error response:

Error code: `IICT – Input, Invalid Correlation Tag (CTAG), incorrect syntax`

```
   sid date time
M  ctag DENY
   IICT
   /* Input, Invalid Correlation Tag (CTAG), incorrect syntax */
;
```

Validation rule: Input Parameter Range Incorrect (IDRG)

If an input parameter accepts a range but the given range is incorrect, the following error response is returned:

Error code: `IDRG – Input, Data Range Error`

```
   sid date time
M  ctag DENY
   IDRG
   /* Input, Data, Range Error */
;
```

Validation rule: Invalid File or Directory Name (SDNC)

If the command failed due to an invalid file or directory name, the following error response is returned:

Error code: `SDNC – Status, Data Not Consistent, invalid file or directory`

```
   sid date time
M  ctag DENY
   SDNC
   /* Status, Data Not Consistent, invalid file or directory */
;
```

Validation rule: Invalid Input Parameter Value Combination (IDNC)

If a command has more than one input parameter, but the combination of values is not valid, the following error response is returned:

Error code `IDNC – Input, Data Not Consistent`

```
   sid date time
M  ctag DENY
   IDNC
   /* Input, Data Not Consistent */
;
```

Validation rule: Missing Equipage (ENEQ)

If the command failed due to equipage that is missing, the following error response is returned:

Error code: `ENEQ – Equipage, Not EQuipped`

```
   sid date time
M  ctag DENY
   ENEQ
   /* Equipage, Not EQuipped */
;
```

Validation rule: Insufficient File Space (ENEQ)

If the command failed due to insufficient file space, the following error response is returned:

Error code: `ENEQ – Equipage, Not EQuipped, insufficient file space`

```
   sid date time
M  ctag DENY
   ENEQ
   /* Equipage, Not EQuipped, insufficient file space */
;
```

Validation rule: Incorrect Equipage (EATN)

If the command failed due to incorrect equipage, the following error response is returned:

Error code: `EATN – Equipage, not valid for Access Type, incorrect equipage`

```
   sid date time
M  ctag DENY
   EATN
   /* Equipage, not valid for Access Type, incorrect equipage */
;
```

Validation rule: TID Mismatch in retrieved File (EATN)

If the command failed due to a TID mismatch in a retrieved file, the following error response is returned:

Error code:

`EATN – Equipage, Not Valid for Access Type, retrieved file TID mismatch`

```
   sid date time
M  ctag DENY
   EATN
   /* Equipage, Not Valid for Access Type, retrieved file TID mismatch    */
;
```

Validation rule: Product Mismatch (SRAC)

If the command failed due to a product mismatch in the retrieved file, the following error response is returned:

Error code:

`SRAC – Status, Requested Access Configuration is invalid, retrieved file NE mismatch`

```
   sid date time
M  ctag DENY
   SRAC
   /* Status, Requested Access Configuration is invalid, retrieved    file NE
      mismatch */
;
```

Validation rule: Failed Target Hardware (SSTP)

If the command failed due to failed target hardware, the following error response is returned:

Error code: `SSTP – Status, Stopped, failed target hardware`

```
   sid date time
M  ctag DENY
   SSTP
   /* Status, Stopped, failed target hardware */
```

```
;
```

Validation rule: Command denied based on Mode, State or Status (SNVS)

If the command is denied based on mode, state, or status, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State`

```
   sid date time
M  ctag DENY
   SNVS
   /* Status, Not in Valid State */
;
```

Validation rule: Command denied based on Maintenance Condition (SNVS)

If the command is denied based on the maintenance condition, the following error response is returned:

Error code:

`SNVS – Status, Not in Valid State, not in Maintenance Condition`

```
   sid date time
M  ctag DENY
   SNVS
   /* Status, Not in Valid State, not in Maintenance Condition */
;
```

Validation rule: Entity already exists (IEAE)

If an entity already exists, the following error response is returned:

Error code: `IEAE – Input, Entity Already Exists`

```
   sid date time
M  ctag DENY
   IEAE
   /* Input, Entity Already Exists */
;
```

Validation rule: Session is not initiated (PLNA)

If a user issues a command before a session is initiated with ACT-USER, the following error response is returned:

Error code: `PLNA – Privilege, Login Not Active`

```
   sid date time
M  ctag DENY
   PLNA
   /* Privilege, Login Not Active */
;
```

Validation rule: Command requires higher privilege (PICC)

If a command requires a privilege higher than that of the user issuing the command, or for any other security-related problems, the following error response is returned:

Error code: `PICC – Privilege, Illegal Command Code`

```
   sid date time
M  ctag DENY
   PICC
   /* Privilege, Illegal Command Code */
;
```

Validation rule: System Initializing not completed (SNVS)

If a command is not allowed because the system has not completed initializing, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State, system initializing`

```
   sid date time
M  ctag DENY
   SNVS
   /* Status, Not in Valid State, system initializing */
;
```

Validation rule: System Limit exceeded (SARB)

If the system is experiencing temporary exhaustion of allocated resources, the following error response is returned:

Error code: `SARB – Status, All Resources Busy, system limit exceeded`

```
   sid date time
M  ctag DENY
   SARB
   /* Status, All Resources Busy, system limit exceeded */
;
```

Validation rule: System Busy with SW Generic Installation (SARB)

If the command cannot be executed because the system is prepared for a SW Generic installation with fall-back option, the following error response is returned:

Error code: `SARB – Status, All Resources Busy`

```
   sid date time
M  ctag DENY
   SARB
   /* Status, All Resources Busy */
;
```

Validation rule: Internal Limit exceeded (SSRE)

If a command attempts to exceed an internal limit, the following error response is returned:

Error code:

`SSRE – Status, System Resources Exceeded, allowed limit exceeded`

```
   sid date time
M  ctag DENY
   SSRE
   /* Status, System Resources Exceeded, allowed limit exceeded */
;
```

Validation rule: Operation Failed (SROF)

If the command cannot be completed due to system difficulties other than hardware or equipment, the following error response is returned:

Error code: `SROF – Status, Requested Operation Failed`

```
   sid date time
M  ctag DENY
   SROF
   /* Status, Requested Operation Failed */
;
```

Validation rule: Processing Failed (SROF)

If the command cannot be completed due to internal system processing problems, the following error response is returned:

Error code: `SROF – Status, Requested Operation Failed, processing failure`

```
   sid date time
M  ctag DENY
   SROF
   /* Status, Requested Operation Failed, processing failure */
;
```

Validation rule: Hardware Failed (SWFA)

If the command failed because the control hardware is failed, missing, or initializing, the following error response is returned:

Error code:

`SWFA – Status, Working unit Failed, control hardware failed, missing or initializing`

```
   sid date time
M  ctag DENY
   SWFA
   /* Status, Working unit Failed, control hardware failed, missing or
   initializing */
```

```
;
```

Validation rule: Communication Failure (SROF)

If the command failed due to an external communications failure, the following error response is returned:

Error code:
`SROF – Status, Requested Operation Failed, external communications failure`

```
   sid date time
M  ctag DENY
   SROF
   /* Status, Requested Operation Failed, external communications
   failure */
;
```

Validation rule: Generic not available (ENSG)

If the command failed because the generic is not available, the following error response is returned:

Error code: `ENSG – Equipage, Not Software Generic, generic not available`

```
   sid date time
M  ctag DENY
   ENSG
   /* Equipage, Not Software Generic, generic not available */
;
```

Validation rule: Command Aborted (SABT)

If a user or outside agent has aborted the command, the following error response is returned:

Error code: `SABT – Status, Aborted`

```
   sid date time
M  ctag DENY
   SABT
   /* Status, Aborted */
;
```

Partial successful completion of a set of atomic commands

For provisioning commands (non-RTRV commands) that operate on a range of entities (e.g. AID range, or via an group alias) range as input, if the command succeeded on only a non-empty subset of the AIDs or another set of atomic commands, the following error response is returned for the AIDs or atomic commands that were not completed successfully. Note that the completion code is PRTL, not DENY.

```
   sid date time
```

```
M  ctag PRTL
   ″aid″
   <error code>
   /* <error text> */
   ″aid″
   <error code>
   /* <error text> */
   ...
   ″aid″
   <error code>
   /* <error text> */
;
```

The error codes and error text fields are as defined in the other error responses above. If the command failed on all the AIDs, the completion code will be DENY, and there will only be a single error code and error text in the response.

Partial completion on RTRV commands

For RTRV commands that take an AID range as input, if the command fails on a non-empty subset of the AIDs, and the failure is not related to filtering, the entire command will fail and one error response is returned. If the error is related to filtering, the command completes successfully but only the data that matches is returned.

If there is no data matching the filter criteria, the NE just responds with an empty reply.

For example, RTRV-OC48 with an **`all`** AID range for all the ports on a shelf will return the data for the existing OP2G5 circuit packs. RTRV-OC48 with a single AID of a non-OC48 port will fail.

If during the processing of a RTRV command which reports output responses for a number of AIDs an internal error occurs while the system has already started to send response data, the system does not terminate the output response with the ″;″ character.

This behavior will lead to a time-out of the manager and cause him to abort the command.

Related TL1 messages

All other TL1 commands refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for common requirements.

Additional notes

Compliance of output parameter blocks with GR-833

For commands that have output parameter blocks, like the following one. The block may have optional trailing commas on a line.

```
sid date time
```

```
M  ctag COMPLD
   ″aid:<parameter block>″
   ...
;
```

AID grouping of output lines

For commands where the output has the AID prepended to each line, like this:

```
   sid date time
M  ctag COMPLD
   ″aid:block″
   ...
;
```

If the parameters for the same AID value are on separate lines, those lines are grouped together.

spec_blocks continued on another line

For commands that have spec_blocks in the output, like this:

```
   sid date time
M  ctag COMPLD
   ″aid:spec_block″
   ...
;
```

If the output line becomes too long, the keywords may be continued on another line, but the AID is repeated on the continuation line. In addition, the output lines are not limited to 80 characters, and there are no requirements as to how many parameters appear on a line.

Refer to the following example

```
RTRV-EQPT:UNITE-NE:system:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ″system:systype=LXC40″
   ″system:istddflt=SDH″
   ″system:trbmddflt=FIXED″
   ″system:synccrtc=SDH″
;
```

RTRV-IP-MAP: Retrieve TCP/IP map

The **RTRV-IP-MAP** command retrieves the entries from the IP map.

The *tl1tcpipgw* parameter in the **RTRV-NE** command indicates whether or not the mapping feature is enabled.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-IP-MAP**:tid*::ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.

Output format

If the RTRV-IP-MAP request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "system::spec_block"
   ...
   "system::spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Output parameters

1. **`system`** – system AID
   This parameter shall denote the system AID of the NE.
   Type: AID
   Range: system (default).
2. **`ip`** – IP Address
   This parameter is used to set or retrieve the IP address(es) of the manager(s) of the NE.
   Type: IPv4 address: four dot separated numeric strings.
   Values: IPv4 address: Each numeric string: 0 .. 255. Number of entries: Mmaximum of 20 entries allowed.
   Default: null.
3. **`acid`** – Application Context ID
   This parameter is used to set or retrieve the application context ID to be assigned to a particular manager IP address.
   Type: Alphanumeric string of length 0 .. 23.
   Range: TL1MAINTENANCE, TL1MEMORYADMINISTRATION, TL1TEST, TL1OTHER1, TL1PEERCOMM.
   Default: TL1PEERCOMM.
   Although acid is a mandatory parameter it will not be evaluated in the NE. The parameter is present for backward compatibility.

Detailed behavior description

The command shall retrieve the spec_block parameters as described in the Output parameter section.

Sorting: If several managers are entered, the system shall respond with one line per *ip* parameter and sort the output according the *ip* parameter.

Example input/output

The following example shows the result of a RTRV-IP-MAP command with one manager entered:

```
RTRV-IP-MAP:LT-UNITE::123456;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
      ″system::ip=198.78.46.8,acid=TL1MAINTENANCE″
      ″system::ip=198.78.46.13,acid=TL1TEST″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`RTRV-NE-IP-MAP`** command.

RTRV-L1ADR: Retrieve level 1 Address Data Repository

The command **RTRV-L1ADR** requests information of the level 1 topology data repository, which contains information about available TNAs of a connected multi-domain network. The level 1 topology data repository is only available on ONNS nodes defined as level 1 routing controllers.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No.

Input format

Command syntax: **RTRV-L1ADR**:*srcTid:srcAid:ctag::dataType[,componentID];*

Description

The command **RTRV-L1ADR** retrieves information stored in the ONNS data repository of level 1 routing controllers that is in RAM Memory. The command **RTRV-L1ADR** operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local data repository. Data from other level 1 routing controllers is acquired by the flooding and exchange of LSAs.

Retrieving ALL level 1 address data repository records

When the *dataType* = ALL, Network Navigator shall respond to a request to retrieve its level 1 address data repository by sending a complete report of the contents of the data repository specified. The request shall cause the ONNS node with level 1 routing controller functionality to send all information in the specified data repository.

Retrieving level 1 address data repository records for any routing controller ID

The command **RTRV-L1ADR** with *dataType* = LSAID and *componentID* = L1RCID shall retrieve the L1ADR LSA records of the adjacent routing controllers of neighbor domains related to the specified routing controller with the L1RCID. This L1RCID can be the address of any domain of the connected multi-domain network.

Notification is not generated

The command **RTRV-L1ADR** shall not generate any kind of notification.

Input parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.
   See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Type: AID
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn (default).
3. **`ctag`**
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″).
   It should be a unique value for each new command.
4. **`dataType`**
   This parameter specifies, which part of the data repository is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.
   Range:
   - *ALL*: retrieves the entire (L1TDR) level 1 Topology data repository in RAM
   - *LSAID*: retrieves the LSA in level 1 topology data repository related to the routing controller ID, *componentID* must be a L1RCID
5. **`componentID`**
   componentID depends on the previous *dataType* parameter and is one of:
   - not represented when *datatype* = ALL
   - *L1RCID*: when *datatype* = LSAID
     Description: *routeControlID* defines the identity of the level 1 routing controller
     Type: Four dot separated numeric string

Range: 0 … 255, for each numeric string

Output format

The level 1 Topology data repository (L1ADR) record structure

The complete L1ADR of one routing controller consists of LSARecords for all known routing controllers (including the reporting routing controller itself) in the multi-domain topology. Within a LSARecord all (direct) neighbor domain releationships are kept in TNARecords (one record for each neighbor domain relation).

Level 1 address data repository (L1ADR) without data

An addressed node without data in the L1ADR shall response only the HeaderRecord with *NumberOfLSAs* = 0. The level 1 address data repository record is composed of an *L1ADRHeaderRecord* and multiple *LSARecords* which are described below:

L1ADRRecord ::=

<L1ADRHeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

L1ADRHeaderRecord ::=

″*l1tdrID*,*dataType[=componentID]*,*srcNodeASTNNodeID*, NumberOfLSAs=*LSA_Count*″

LSARecord ::=

<LSAHeaderRecord>

<TNARecord_1>

…

<TNARecord_n>

LSAHeaderRecord ::=

″LSAAdvertisedRouter=*L1RcID*,TNACount=*TNAcount*″

TNARecord ::=

LocAdvNodeID=*locAdvNodeID*,NumberTNAs=*numberTNAs*″

″*TNAtype_1=TNAaddress_1[,TNAtype_2=TNAaddress_2]*″

″*TNAtype_3=TNAaddress_3[,TNAtype_3=TNAaddress_3]*″

…

″*TNAtype_n-1=TNAaddress_n-1[,TNAtype_n=TNAaddress_n]*″

Output format with normal data retrieve completion report for dataType=ALL

If the RTRV-L1ADR request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   ″L1ADR_HeaderRecord″
   ″LSAHeaderRecord_1″
     ″TNARecord_1_1″
   ...
   ″LSAHeaderRecord_n″
     ″TNARecord_n_1″
     ″TNARecord_n_2″
>
   srcTid date time
M  ctag COMPLD
   ″LSAHeaderRecord_n+1″
     ″TNARecord_n+1_1″
   ...
   ″LSAAddr_HeaderRecord_m″
     ″TNARecord_m_1″
     ″TNARecord_m_2″
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the **RTRV-PATH** command.

L1ADRHeader_Record

1. **l1adrID**
   NN Data Repository dataID to be returned
   Type: Alphanumeric value set.
   Range: L1ADRLevel 1 Address Data Repository in RAM
   Default: L1ADR
2. **dataType**
   This parameter specifies, which part of the data repository is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.
   Range: ALL retrieves the entire (L1ADR) level 1 Topology data repository in RAM. LSAID retrieves the LSA in level 1 topology data repository related to the routing controller ID, *componentID* must be a L1RCID.
3. **componentID**
   componentID depends on the previous *dataType* parameter and is one of:
   - not represented when *datatype* = ALL
   - *L1RCID*: when *datatype* = LSAID

Description: *routeControlID* defines the identity of the level 1 routing controller
Type: Four dot separated numeric string
Range: 0 … 255, for each numeric string
Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **`srcNodeASTNNodeID`** – Reporting Node ID
   ASTN node ID of the ONNS node replying to this command.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 … 255

LSARecord

For each reported primary routing controller of the level 1 topology one LSARecord is reported.

1. **`LSAHeaderRecord`**
   All parameters in the LSAHeaderRecord describe properties of the *LSAAdvertisedRouter*.
   L1RcID – ID of Advertising Routing Controller
   Description: *routeControlID* defines the identity of the level 1 routing controller
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
2. **`TNARecord`**
   localAdvNodeID – Local Advertised Node ID
   The *localAdvNodeID* of the advertiser of the LSA with the address data following in this TNARecord.
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   numberTNAs
   Number of reported TNAs known in the advertising level 1 node.
   Type: Integer
   Range: ≥0
   TNAType
   TNAType specifies the address type of the TNA address.
   Type: Alphanumeric value set.
   Range:
   - IPV4TNAADDR (default): TNA address is a IPv4 address
   - IPV6TNAADDR: TNA address is a IPv6 address
   - NSAPTNAADDR: TNA address is a NSAP address

TNAAddress depends on the previous *TNAtype* parameter and is one of:

- IPv4TNAAddress (when TNAtype=IPV4TNAADDR)
- IPv6TNAAddress (when TNAtype=IPV6TNAADDR)
- NSAPTNAAddress (when TNAtype=NSAPTNAADDR)

IPv4TNAAddress
Identifier of a TNA address in IPv4 format.
Type: four dot separated numeric string
Range: 0 … 255, for each numeric string

IPv6TNAAddress
Identifier of a TNA address in IPv6 format.
Type: Eight hyphen separated hexadecimal numbers
Range: for each hexadecimal number: 0..FFFF

NSAPTNAAddress
Identifier of a TNA address in NSAP format.
Type: Alphanumeric value set (20 byte)
Range: up to 20 alphanumeric strings with hexadecimal values 00..FF

Example input/output

The **RTRV-L1ADR** command with *dataType* = ALL produces this example output result:

```
RTRV-L1ADR:LT-ONNS-61::123456::ALL;

LT-ONNS-61 2006-10-04 09:45:35

1ED-2FC2-3-F365-E290-119-45-A321"
;
```

Error responses

No Routing Controller available

The command is rejected when no routing controller is available on the addressed NE.

Error code: `IDNV – Input, Data Not Valid, RC node not created`

Invalid *componentID* parameter

The command is rejected when the received *componentID* is invalid.

Error code: `IRCI – Input, Invalid Routing Controller ID`

     ″LinkRecord_n+1_4″
   ...
   ″LSAAddr_HeaderRecord_m″
     ″LinkRecord_m_1″
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the **RTRV-PATH** command.

L1TDRHeader_Record

1. **l1tdrID**
   NN Data Repository dataID to be returned
   Type: Alphanumeric value set.
   Range: L1TDRLevel 1 Topology data repository in RAM
   Default: L1TDR
2. **dataType**
   This parameter specifies, which part of the data repository is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.
   Range: ALL retrieves the entire (L1TDR) level 1 Topology data repository in RAM. LSAID retrieves the LSA in level 1 topology data repository related to the routing controller ID, *componentID* must be a L1RCID.
3. **componentID**

componentID depends on the previous *dataType* parameter and is one of:

- not represented when *datatype* = ALL
- *L1RCID*: when *datatype* = LSAID
  Description: *routeControlID* defines the identity of the level 1 routing controller
  Type: Four dot separated numeric string
  Range: 0 … 255, for each numeric string
  Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **`srcNodeASTNNodeID`** – Reporting Node ID
   ASTN node ID of the ONNS node replying to this command.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 … 255

LSARecord

For each reported primary routing controller of the level 1 topology one LSARecord is reported.

1. **`LSAHeaderRecord`**
   All parameters in the LSAHeaderRecord describe properties of the *LSAAdvertisedRouter*.
   L1RcID – ID of Advertising Routing Controller
   routeControlID defines the identity of the level 1 routing controller
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string

2. **`LinkRecord`**
   locNodeID
   The *locNodeID* is the representation of a physical node of the local domain for the level 1 routing.
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   remoteNodeID
   The *remoteNodeID* is the representation of a physical node of a neighbor domain for the level 1 routing.
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   locLinkID
   The *locLinkID* specifies from the local domain's point-of-view the identification for the link the corresponding port is assigned to.
   Type: Numeric string.
   Range: 0..42946967295
   remoteLinkID
   The *remoteLinkID* specifies from the neighbor domain's point-of-view the identification for the link the corresponding port is assigned to.
   Type: Numeric string.
   Range: 0..42946967295
   linkType

The *linkType* defines the type of the link.
Type: Alphanumeric value set.
Range: PtP (point to point)

linkID

The *linkID* identifies the level 1 Routing Controller at the other end of the link.
Type: four dot separated numeric string
Range: 0 … 255, for each numeric string

adminCost – Administrative Cost

Provisioned administrative cost of the port connection when used in a connection path. See also parameter *adminCost* in RTRV-rr.
Type: Integer
Range: 1 (default) … 65535
Administrative cost parameter is not applicable for EDGE and UNI ports and is set to the default value.

srlgList

Shared Risk Link Group Identifier list.
See also parameter *srlgList* in RTRV-rr.
The max. number of identities that can be provisioned per port may be release dependent.
Type: Up to ten &-separated Integers
Examples:
198&233&0&0&0&0&0&0&0&0
10&20&30&40&0&0&0&0&=&0&0
89&1000&4&10&20&31&111&231&300&777
Range: 0 … 65535
Default. 0 (means no SRLG provisioned)
SRLG list is not applicable for EDGE and UNI ports and is set to the default value.

linkResCls

The *linkResCls* globally classifies routing purposes the link of the corresponding port is assigned to.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

linkProtType

The *linkProtType* globally classifies routing purposes the link of the corresponding port is assigned to.
Type: Set of alphanumeric values, separated by “&”.
Range for each alphanumeric value:

- NONE: value specifying that no link protection type is set
- ET: value specifying that link is for extra traffic
- 0x1: value specifying that “unprotected” link protection type is set
- 1:1-W: value specifying that “1:1” link protection type is set
- 1+1-W: value specifying that “1+1” link protection type is set
- ENH: value specifying that an enhanced protection type is set

- RESV1: reserved value for further use)
- RESV2: reserved value for further use

Examples:

- “0x1&1+1-W” will be reported if both “unprotected” and “1+1” are set.
- “NONE” will be reported only without additional values.

Note:
Multiple values or values different from “0x1” and “1+1-W” will only occur for links between domains from “foreign” vendors, as for “own” links either “0x1” or “1+1-W” will only be specified.

bandwidthList

The *bandwidthList* indicates the available bandwidth per signal rate.
Type: Character string.
Range:

Bandwidth List: five dash separated numeric strings representing STS1 #, STS3c #, STS12c #, STS48c #, STS192c # with:

- STS1 #0..4097
- STS3c #0..1023
- STS12c #0..255
- STS48c #0..63
- STS192c #0..15

Example for an available bandwidth of 2 STS48c and a defined minimal XC STS3c: 0-32-8-2-0.

Example input/output

The **RTRV-L1TDR** command with *dataType* = ALL produces this example output result:

```
RTRV-L1TDR:LT-ONNS-61::123456::ALL;

LT-ONNS-61 2006-10-04 09:45:35

Error responses

IDNV - Input, Data Not Valid, RC node not created

The command is rejected when no routing controller is available on the addressed NE.

Error code: `INRC – Input, No Routing Controller`

Invalid *componentID* parameter

The command is rejected when the received *componentID* is invalid.

Error code: `IRCI – Input, Invalid Routing Controller ID`

RTRV-LOG-ALM: Retrieve log alarm

The **RTRV-LOG-ALM** command retrieves the alarm log.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-LOG-ALM**:*tid*::*ctag*::[*startdate*],[*starttime*],[*replytype*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **startdate** – Start Date
   The date for the starting point of the report. If both startdate and starttime are omitted, the entire log is retrieved. Both startdate and starttime must be specified, or both must be omitted.
   Type: value set of the format YY-MM-DD.
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
4. **starttime** – Start Time
   The time for the starting point of the report. If both startdate and starttime are omitted, the entire log is retrieved. Both startdate and starttime must be specified, or both must be omitted.
   Type: value set of the format HH-MM-SS.
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds.
5. **replytype** – Type of Reply
   This parameter defines the kind of log retrieving.
   Type: Alphanumeric value set.

   Range:

   - BROWSE (User Browsing) – If the requested *startdate* and *starttime* is in the log, those entries and any subsequent log entries are returned. If the requested *startdate* and *starttime* is NOT in the log, the first log entry in the log with a timestamp later than the *startdate* and *starttime* plus subsequent log entries will be returned.

Important: If there are no alarm entries in the specified interval the system returns with the error code
`SNVS /* Status, Not in Valid State, no matching log entry */.`
Instead of this an empty log with a COMPLD message should be returned.

- DBSYNC – This value provides the same function as BROWSE. The value DBSYNC is allowed for compatibility reasons.

Default: BROWSE, if the parameter is omitted.

Output format

Normal completion response of successful session termination

The following example shows the successful completion of the **`RTRV-LOG-ALM`** command by the NE:

```
   sid date time
M  ctag COMPLD

      "aid,aidtype:[ntfcncde],condtype,[srveff],ocrdat,ocrtm,[condeff][:conddescr]"

        ...
   "aid,aidtype:[ntfcncde],condtype,[srveff],ocrdat,ocrtm,[condeff][:conddescr]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID.
   Range: All defined AIDs are allowed. It should be a valid AID for the specified *modifier*. Refer to the definition of AIDs.
2. **`aidtype`** – Access Identifier Type
   This parameter defines the AID type to which the alarm belongs.
   Type: Alphanumeric value set.
   Range:
   - COM: Common. An alarm/event that applies to the whole NE system; for example, a processing error.
   - EQPT: An equipment-related alarm/event.
   - SYST: An alarm/event related to system timing.
   - OUTT: An alarm/event related to output timing.

- STM1E: A facility-related alarm/event for synchronous transport mode 1 (electrical).
- STM1: A facility-related alarm/event for synchronous transport mode 1.
- STM4: A facility-related alarm/event for synchronous transport mode 4.
- STM16: A facility-related alarm/event for synchronous transport mode 16.
- STM16T: A facility-related alarm/event for fully transparent synchronous transport mode 16.
- STM64: A facility-related alarm/event for synchronous transport mode 64.
- STM256: A facility-related alarm/event for synchronous transport mode 256.
- ODU1: A facility-related alarm/event for optical data units of level 1
- OC3: A facility-related alarm/event at the optical carrier signal level 3.
- OC12: A facility-related alarm/event at the optical carrier signal level 12.
- OC48: A facility-related alarm/event at the optical carrier signal level 48.
- OC48T: A facility-related alarm/event at the fully transparent optical carrier signal level 48.
- OC192: A facility-related alarm/event at the optical carrier signal level 192
- OC768: A facility-related alarm/event at the optical carrier signal level 768
- T3: A facility-related alarm/event at the DS3 level
- TMAT3: A facility-related alarm/event at the DS3 level related to TransMUX function
- EC1: A facility-related alarm/event at the EC1 level
- 1GE: A facility-related alarm/event for 1 Gigabit Ethernet.
- 1GEPL: A facility-related alarm/event for 1 Gigabit Ethernet Private Line.
- 10GEPL: A facility-related alarm/event for 10 Gigabit Ethernet Private Line.
- VC3: A facility-related alarm/event for virtual container 3.
- VCG: A facility-related alarm/event for virtual concatenation group.
- VC4: A facility-related alarm/event for virtual container 4
- VC44C: A facility-related alarm/event for a signal concatenated at 4 times the VC4 rate.
- VC416C: A facility-related alarm/event for a signal concatenated at 16 times the VC4 rate.
- VC464C: A facility-related alarm/event for a signal concatenated at 64 times the VC4 rate.
- STS1: A facility-related alarm/event at synchronous transport signal level 1.
- TMASTS1: A facility-related alarm/event at synchronous transport signal level 1 related to TransMUX function.
- STS3C: A facility-related alarm/event at synchronous transport signal level 3.

- STS12C: A facility-related alarm/event at synchronous transport signal level 12.
- STS48C: A facility-related alarm/event at synchronous transport signal level 48.
- STS192C: A facility-related alarm/event at synchronous transport signal level 192.
- HOVC4 : A facility-related alarm/event for virtual container 4 higher-order path termination.
- HOSTS1: A facility-related alarm/event at synchronous transport signal level 1 higher-order path termination.
- LOVC3: A facility-related alarm/event for virtual container 3 (lower-order path).
- LOVC12: A facility-related alarm/event for virtual container 12
- LOVT1: A facility-related alarm/event at transport level VT1.5.
- TMSVT: A facility-related alarm/event at transport level VT1.5 related to TransMUX function.
- DS1: A facility-related alarm/event at transport level DS1.
- LINK: A signaling communication link related alarm/event for ONNS

Refer to “Alarms, events, ASAPs” (p. 6-4) for the relation of alarm / entity / *aidtype*.

3. **`ntfcncde`** – Notification Code
   This is the alarm severity (alarm level).
   Type: Alphanumeric value set.
   Range:
   - CR – Critical (ITU / Telcordia)
   - MJ – Major (ITU / Telcordia)
   - MN – Minor (ITU / Telcordia)
   - SC – Standing condition – Warning (ITU) / not alarmed (Telcordia)
   - CL – Cleared

   The abnormal condition is always a standing condition, this means it has a beginning and an end (SC and CL). The severity of a abnormal condition is not provisionable. It is always NA – warning (ITU) / not alarmed (Telcordia) which implies ABN messages are always reported via REPT EVT.
4. **`condtype`** – Condition Type
   This parameter identifies the probable cause (type of alarm indication) being reported.
   Type: Alphanumeric value set.
   Range: All defined probable causes.
   For ABN conditions see definition of *condtype* in the output parameters section of “REPT EVT: Report event” (p. 3-2121).

5. **`srveff`** – Service Effect
   This parameter identifies the service affect of alarms being reported. It presents the "best guess" from a local system point of view.
   Type: Alphanumeric value set.
   Range:
   - SA: Service-Affecting alarm condition
   - NSA: Non-Service-Affecting alarm condition.

   Abnormal condition event messages are always handled as NSA.
6. **`ocrdat`** – Occurrence Date
   This parameter indicates the raising / clearing date of the alarm.
   Type: value set of the format YY-MM-DD.
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
7. **`ocrtm`** – Occurrence Time
   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.
   Type: value set of the format HH-MM-SS.
   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.
8. **`condeff`** – Condition Effect
   This indicates the effect of the reported event on the network element. It shall be used to distinguish between persistent and transient alarms/events.
   Two state transitions can be distinguished for a persistent alarm/event:
   - raise transition: state change from not present to present
   - clear transition: state change from present to not present

   A transient alarm/event has no "presence" state; that means, just the occurrence of that event/alarm is reported.
   ABN conditions are always persistent and not transient.
   Type: Alphanumeric value set.
   Range:
   - CL: Standing condition cleared for a persistent alarm/event
   - SC: Standing condition raised for a persistent alarm/event
   - TC: Transient condition occurred for a transient alarms/events

   Default: None.
9. **`conddescr`** – Description of the Condition
   This is a textual description of the condition.
   Type: inner string of the format: "<category>, <entity>, <description>, <additional text>" or "<category>, <entity>, <description>, <additional text>-cleared" (this form is used in REPT ALM/EVT for cleared alarms).

Range: :

- category
- entity: the entity for which the alarm is reported
- description: the alarm description, the string is up to 32 characters
- additional text. If there is no additional text, then the trailing comma may be omitted.

Default: None.
Range:
Description for a protection group AID:

- Abnormal condition, forced switch active
- Abnormal condition, lockout active

Description for a timing reference AID:

- Abnormal condition, operate in hold-over
- Abnormal condition, operate in free run mode

Description for a port AID:

- Abnormal condition, facility loopback active

Description for a logical tributary AID:

- Abnormal condition, cross-connect loopback active
- Abnormal condition, test access session active

Description for a system AID:

- Abnormal condition, System operates in maintenance mode

Detailed behavior description

This log gives the user a history and time sequence of all of the most recent alarm detected by the system regarding equipment or facilities attached to the system.

TCAs are not stored within the alarm log.

Storage Order Dependency: If the storage order of entries in the alarm log is not in line with the occurrence date and time, then the command may retrieve entries which are older than the specified date and time. A storage order, which is not in line with the date and time of the entries can occur after setting the system date and time.

The **RTRV-LOG-ALM** command does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful completion of the **RTRV-LOG-ALM** command by the NE:

```
RTRV-LOG-ALM:LT-UNITE-123::123456::;

   LT-UNITE-123 00-01-01 08:00:00
```

```
M  123456 COMPLD
   ″1-1-#-#-3-1,OC48:CR,LOS,SA,01-01,07-29-13:\″Communication-Transport, OC48 port,
      LOS of Signal\″″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-LOG-ALM** command.

Related TL1 messages

- “RTRV-ALM: Retrieve alarm” (p. 3-2231)

References

GR-833-CORE, Issue 4, June 2000, OTGR Section 12.3, Network Maintenance: NE and Transport Surveillance Messages.

RTRV-LOG-NNEVT: Retrieve NN event log

The **RTRV-LOG-NNEVT** command retrieves the NN event log which is used to store the most recent NN events non volatile.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-LOG-NNEVT**:*tid::ctag::[startdate],[starttime];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
3. **startdate** – Date for the Starting point
   The format is YY-MM-DD. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set.

   Range:

   - for YY: 00 to 99
   - for MM: 01 to 12
   - for DD: 01 to 31.
4. **starttime** – Time for the Starting point
   The format is HH-MM-SS. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set.

Range:

- for HH: 00 to 23
- for MM: 00 to 59
- for SS: 00 to 59.

Output format

If the RTRV-LOG-NNEVT request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″Time=time,Date=date:nnevt″
    ...
   ″Time=time,Date=date:nnevt″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

1. **`date`** – Date
   This parameter shows the occurrence date of the NN event. .
   Type: Value set.
   Range: YY-MM-DD
2. **`time`** – Time
   This parameter shows the occurrence time of the NN event. .
   Type: value set.
   Range: HH-MM-SS.
3. **`nnevt`** – NN Event
   This parameter shall provide the details of the ONNS event. It consists of the text block without the date/time information of the ONNS event enclosed in double quotes (″).
   Note: The following ONNS event types are stored in this log:
   REPT PTHCHG
   REPT PTHEVT
   REPT NNCHG
   REPT NNEVT
   REPT CONNCHG
   The detailed TL1 specification can be found in SRD_TL1_ONNS.
   Type: inner string.
   Range: a string of arbitrary length, any character except ″ and \, upper and lower cases are considered.

Detailed behavior description

If the error log of the system does not contain any records at all or no records exist matching the specified start date and start time, an empty reply is returned. Note: The log contains the last 5000 ONNS events.

Example input/output

The following is an example of the **RTRV-LOG-NNEVT** command:

```
RTRV-LOG-NNEVT:LT-UNITE::123456::;

   LT-UNITE 02-02-05 08:00:00
M  123456 COMPLD
    ″TIME=07-59-59,DATE=02-07-01:CCB=PATH:125.114.48.12:SNN:C015:\″ Connection

   PathID=125.114.48.12-11013,State=CON &TRDOWN,
   NodeList=125.114.48.12&nodeIP4&nodeIP5&...&125.6.19.43″
   . . .
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-LOG-NNEVT** command.

RTRV-LOG-NTFCN: Retrieve notification log

The **`RTRV-LOG-NTFCN`** command retrieves the notification log, which is used to store the most recent notification reported via **`REPT DBCHG`**. This log allows the user to see the most recent activity that has caused updates to the system database. This is useful in solving database audit problems. This information can also be used to re-synchronize a management system with the NE after a communications outage between the two.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **`RTRV-LOG-NTFCN`**:*tid*::*ctag*::*[startdate]*,*[starttime]*,*[replytype]*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **`ctag`** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **`startdate`** – Date for the Starting point
   The format is YY-MM-DD. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set.
   Range:
   - for YY: 00 to 99
   - for MM: 01 to 12
   - for DD: 01 to 31.
4. **`starttime`** – Time for the Starting point
   The format is HH-MM-SS. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set.

Range:

- for HH: 00 to 23
- for MM: 00 to 59
- for SS: 00 to 59.

5. **`replytype`** – Type of Reply
BROWSE is used if user browsing is needed. If the requested *startdate* and *starttime* is in the log, those entries and any subsequent log entries are returned. If the requested *startdate* and *starttime* is NOT in the log, the first log entry in the log with a timestamp later than the *startdate* and *starttime* plus subsequent log entries will be returned. If the requested *startdate* and *starttime* is NOT in the log only a completion message is returned without further error messages.
Important: If there are no alarm entries in the specified interval the system returns with the error code
`SNVS /* Status, Not in Valid State, no matching log entry */`. Instead of this an empty log with a COMPLD message should be returned.
DBSYNC is used if the management system requires the log for database synchronization. If the requested *startdate* and *starttime* is in the log, those entries and any subsequent log entries are returned. If the requested *startdate* and *starttime* is NOT in the log, an SNVS error response is returned.
Type: Alphanumeric value set.
Range:
   - BROWSE
   - DBSYNC.

   Default: BROWSE.

Output format

If the RTRV-LOG-NTFCN request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″Time=time,Date=date:[ccb]:[aid]:[com_block]:[spec_block]″
   [″aux_block″]
   [″aux_block″]
        ...
   ″Time=time,Date=date:[ccb]:[aid]:[com_block]:[spec_block]″
   [″aux_block″]
   [″aux_block″]
        ...
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

1. **`date`** – Date
   Type: Value set.
   Range: YY-MM-DD
2. **`time`** – Time
   Type: value set.
   Range: HH-MM-SS.
3. **`ccb`** – Command Code Block
   This field will be set to the TL1 command that causes that database change. The *com_block* and *spec_block* fields will be set according to the parameters that changed.
   Type: Alphanumeric value set verb-modifier[-modifier].
4. **`aid`** – Access Identifier
   AID of the entity for which the change is reported
   Type: AID.
   Range: As defined by the *aid* input parameter of the corresponding command, defined by *ccb*.
5. **`com_block`** – Common Block
   This is a position-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter values are included in this block in the same order as the corresponding TL1 command.
   As exception to this rule are some commands in the protection fragment, where the aliases *rid* and *ppgname* are not reported in the **`REPT DBCHG`** notification.
   If the database change is the result of a TL1 command, then the parameter *ctag* from the TL1 command is not included in the *com_block*.
   Type: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
   Range: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
   Default: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
6. **`spec_block`** – Specific Block
   This is a name-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter names and values are included in this block. parameters within the specific block are positionally independent and are specified using a name-defined construct of *parameter* = value in a comma-separated list. The parameter names are the same as those for the corresponding TL1 command.
   Type: As defined in the input *spec_block* of the corresponding command, defined

by *ccb*.
Range: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.
Default: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.

7. **aux_block** – Auxiliary Block
The auxiliary block is optional. The format of the auxiliary block depends on the notification which caused the log entry.
Auxiliary block for path protection group related entries
In the case of a path protection group related notification, the auxiliary block shall have the format of the CML Block. The CML block format is defined in the output format definition of the ENT-PROTN-GRP notification and the ED-PROTN-GRP notification.

Example input/output

The following is an example of the **RTRV-LOG-NTFCN** command:

```
RTRV-LOG-NTFCN:LT-UNITE::123456::;

   LT-UNITE 00-11-15 08:00:00
M  123456 COMPLD
   "TIME=07-59-59,DATE=00-11-15:ENT-EQPT:1-1::shlftp=DUR"
   ...
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-LOG-NTFCN** command.

Validation rule: matching log entry

There is at least one matching log entry for the specified *startdate* and *starttime* if reply type equals DBSYNC.

Error code: `SNVS – Status, Not in Valid State, no matching log entry`

Related TL1 messages

“REPT DBCHG: Report data base change” (p. 3-2118)

References

GR-833

RTRV-LOG-PROTNSW: Retrieve log protection switch

The **RTRV-LOG-PROTNSW** command retrieves the protection switch log. This log gives a complete time-ordered list of switching activity which has occurred at the NE covering all different protection groups, system timing reference, station clock output timing reference and system clock.

The protection switch log is a circular buffer that should hold at least 500 entries.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-LOG-PROTNSW**:*tid*::*ctag*::[*startdate*],[*starttime*],[*replytype*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **startdate** – Start Date
   This parameter specifies a date used as filter criteria in order to determine the set of switch events being returned.
   See description of parameter *replytype* for more precise semantics definition.
   Type: value set of format YY-MM-DD
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the year, MM represents month, DD the day.

4. **`starttime`** – Start Time
   This parameter specifies a time used as filter criteria in order to determine the set of switch events being returned.
   See description of parameter *replytype* for more precise semantics definition.
   Type: value set of format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.

5. **`replytype`** – Type of Reply
   This parameter specifies, how the entries in the reply are determined. The value BROWSE is used in case of user browsing. The value DBSYNC is used in case of data synchronization with management system.
   BROWSE semantics: If the requested *startdate* and *starttime* is in the log, those entries with matching timestamp and any subsequent log entries are returned. If the requested *startdate* and *starttime* is NOT in the log, the first log entry in the log with a timestamp later than the *startdate* and *starttime* plus subsequent log entries are returned.
   Important: If there are no alarm entries in the specified interval the system returns with the error code
   `SNVS /* Status, Not in Valid State, no matching log entry */` . Instead of this an empty log with a COMPLD message should be returned.
   DBSYNC semantics: If the requested *startdate* and *starttime* is in the log (i.e. a matching timestamp was found), those entries and any subsequent log entries are returned. If the requested *startdate* and *starttime* is NOT in the log (i.e. a no matching timestamp was found), an SNVS error response is returned.
   Type: Alphanumeric value set.
   Range: BROWSE, DBSYNC.
   Default: BROWSE.

Output format

The returned log entries are ordered ascending according to their timestamp. After receiving the **`RTRV-LOG-PROTNSW`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″aid,aidtype:EVT,condtype,condeff,ocrdat,ocrtm[:\″conddescr\″]″
        <0 or more of the line above>
   ″aid:SW,,,ocrdat,ocrtm″
        <0 or more of the line above>
        <0 or more repetitions of this entire block>
;
```

The output parameters of the log entry are derived/correspond from/to the parameters in the protection switch notification. The parameter definition will reference to the corresponding parameter in the protection switch notification section. Log entry parameters are not splitted within this section w.r.t. protection type. Therefore the protection type has to be considered in order to look-up the proper definition.

Output parameters

Command parameters

1. **`aid`** – Access Identifier
2. **`aidtype`** – Access Identifier Type
3. **`condtype`** – Condition Type
4. **`condeff`** – Condition Effect
   This parameter indicates the effect of the reported event on the network element. The value TC (Transient Condition) is used for all protection switch events. Type alphanumeric value set Range TC
   Type: Alphanumeric value set.
   Range: TC
   a. ocrdat – Occurrence Date
      The parameter shall indicate the date of the switch event being reported. Type: value set of the format YY-MM-DD. Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
   b. ocrtm – Occurrence Time
      This parameter indicates the time of the switch event being reported. Type: value set of format HH-MM-SS. Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.
5. **`conddescr`** – Condition Description

Detailed behavior description

If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted. If *replytype* is specified, then *startdate* and *starttime* are present.

The log shows the same information as it could be derived from looking on the protection switches reported by means of REPT EVT and REPT SW.

Note: In case of a 1+1 equipment protection switching causing one REPT SW notification and one REPT EVT notification, then two entries are reported in the retrieve log reply.

Example input/output

1+1 Equipment protection group

The following example retrieves a manual switch to protection circuit pack for 1+1 equipment protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-xcp-cp:SW,,,01-10,08-12-00″
   ″1-1-estgrp,COM:EVT,GP,TC,01-10,08-12-00:\″Protection Switch, EQPT, Manual
      switch\″″
;
```

Multiplex section/line protection group (1+1 and 1:1)

The following example retrieves a lockout switch for a 1+1 multiplex section/line protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-10-2,OC3:EVT,WKSWBK,TC,01-10,08-12-00:\″Protection Switch, OC3 port,
      Lockout switch,, 1+1/1x1\″″
;
```

2 fibre MS-SPRing/BLSR protection group

The following example retrieves a manual ring switch of the east side for a 2F MS-SPRing/BLSR protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-10-2,OC48:EVT,WKSWPR-2,TC,01-10,08-12-00:\″Protection Switch, OC48 port,
       Manual switch, MSR, 2F\″″
;
```

4 fibre MS-SPRing/BLSR protection group

The following example retrieves a manual ring switch of the east side for a 4F MS-SPRing/BLSR protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-10-1,OC192:EVT,WKSWPR-2,TC,01-10,08-12-00:\″Protection Switch, OC192
      port, Manual switch, MSS, 4F\″″
```

```
;
```

Path protection group

The following example retrieves an autonomous switch to protection for a 1+1 path protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-10-1-25,STS1:EVT,WKSWPR-2,TC,01-10,08-12-00:\″Protection Switch, STS1
      CS, SF\″″
;
```

System clock

The following example retrieves a switch event for clock mode protection type:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″SYSTEM,SYST:EVT,HLDOVRSYNC,TC,11-09,12-00-00,,,:\″Protection switch,clock
      mode,Forced Holdover\″″
;
```

System timing reference

The following example retrieves a switch event for system timing reference protection type:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″EXTREF1,SYST:EVT,PS,TC,11-09,12-00-00,,,:\″Protection switch,sync
      reference,Manual switch\″″
;
```

Station timing reference

The following example retrieves a switch event for output timing reference protection type:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
```

```
   "LINE2,OUTT:EVT,INHSWPR,SC,11-09,12-00-00,,,:\"Protection switch,output
      reference,Lockout\""
;
```

Error responses

Validation rule: matching log entry

There is at least one matching log entry for the specified *startdate* and *starttime* if replytype equals DBSYNC.

Error code: `SNVS – Status, Not in Valid State, no matching log entry`

RTRV-LOG-SECU: Retrieve log security

The **RTRV-LOG-SECU** command can be initiated by a user to retrieve the security information log activity from the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-LOG-SECU**:*tid*::*ctag::[startdate,starttime]*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **startdate** – Start Date
   The date for the starting point of the report. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set of the format YY-MM-DD
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
4. **starttime** – Start Time
   The time for the starting point of the report. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set of the format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds.
   Default: none

Output format

After receiving the **RTRV-LOG-SECU** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "login_id:umb:action:ccb:[uid_block]:[com_block]:[spec_block]:ccde"
```

```
      ...
   ″login_id:umb:action:ccb:[uid_block]:[com_block]:[spec_block]:ccde″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **`login_id`** – Login ID
   The login identification of the user. It is the same as the user ID uid. See definition of *uid* in "ACT-USER: Activate user" (p. 3-24).
2. umb – Update Management Block
   The parameters within this block are positionally independent and are specified using a name-defined construct of parameter=value in a comma-separated list.
   - date
     The date of the user action.
     Type: value set of the format YY-MM-DD
     Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
   - time
     The time of the user action
     Type: value set of the format HH-MM-SS
     Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds.
3. **`action`** – Action
   This parameter indicates the reason for the log entry.
   Type: text string.
   Range:
   - For reasons for a logout entry following values are defined: ″inactivity timeout″ ″forced logout″ ″self logout″
     For reason for login failure following values are defined: ″expired passwd″ ″invalid uid″ ″invalid passwd″ ″locked out uid″
     For other reasons following values are defined: ″NE security variable change″
4. **`ccb`** – Command Code Block
   This parameter contains the name of the command.
   Type: Character string.
   Range: The names of the commands described in the Administration & Security except the RTRV -Commands.

5. **uid_block** – User ID Block
   This parameter contains the user ID of the user, who is affected by the logged action. If the action does not affect a specific user (e.g. modification of NE security parameters) the uid_block is empty.
   Type: Character string.
   Range: 1 – 10 character string or empty string.
6. com_block – Common Block
   It contains the common block of the command which is logged in the log. Please refer to the specifications of the commands. There exist only one exception: Passwords will be not logged.
7. spec_block – Specific Block
   It contains the specific block of the command which is logged in the log. Please refer to the specifications of the commands.
8. state_block – State Block
   It contains the state b lock of the command which is logged in the log. Please refer to the specifications of the commands.
   Note: The state block is not used in the commands to be logged. This parameter will be always empty.
9. **ccde** – Completion Code
   The completion code of the command.
   Type: Alphanumeric string
   Range: COMPLD or the 4-character error code.

Detailed behavior description

If the error log of the system does not contain any records at all or no records exist matching the specified startdate and starttime an empty reply is returned.

Example input/output

The following example shows the successful completion of **RTRV-LOG-SECU** command by the NE:

RTRV-LOG-SECU:LT-UNITE-123::123456;

```
   LT-UNITE-123 00-01-05 08:00:00
M  123456 COMPLD
   ″hugo:DATE=00-01-02,TIME=07-59-59:\″NE security variable change\″:ED-NE-
      SECU:::thrshld=30,intrvl=60,age=90:COMPLD″
   ″nbguser1:DATE=00-01-03,TIME=06-59-59:\″inactivity timeout\″:::::COMPLD″
   ″Admin1:DATE=00-01-04,TIME=09-59-59:\″invalid passwd\″:ACT-USER::::IDNV″
;
```

RTRV-LOPTF: Retrieve low-order path termination function

The **RTRV-PTF** command retrieves the attributes of a low-order path termination function (PTF) located on a TransMUX pack

VT1.5 LOPTF entities exist by changing the TransMUX capacity to 2G5. 28 LOVT instances will be created.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-LOPTF**-*modifier:tid:aid:ctag[:::spec_block];*

Input parameters

Command parameters

1. **modifier**
The modifier specifies the type of the low-order tributary.
Type: Alphanumeric value set.
Range: TMSVT.
Default: None.
2. **tid** – Target Identifier
Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **aid** – Access Identifier
The access identifier specifies a low-order tributary to be operated on.
Type: AID
Range: TMuxSLONumAID.
The following wildcard values are accepted:
   - **all**, **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID
   - **all** for Simple_TMuxSPTNumAID
   - **all** for Simple_TMuxSLONumAID

   Default: None.
4. **ctag** – Correlation Tag
Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **dyn** – Retrieve Dynamic Parameters
   his parameter controls whether dynamic data (output parameters) is reported with the command reply or not. It is only possible to retrieve those data if the aid input parameter does not address multiple entities at the same time (no wildcarding allowed). If omitted, the default value is assumed.
   The following output parameters are considered to be dynamic:
   - *ptrc*, *ptrcst*, *rsiglb*, *trailstate*

   Type: Alphanumeric value set.
   Range:
   - YES: Report dynamic parameters in the reply as well
   - NO: Do not report dynamic parameters in the reply.

Default: NO.

Output format

If the NE fully complies with the **RTRV-LOPTF** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid,aidtype[::spec_block]"
   <1 or more of the line above>
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   The access identifier specifies the low-order tributary whose attributes are reported.
   Type: AID
   Range: TMuxSLONumAID.
   The following values are not used:
   - **all**, **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID

- **`all`** for Simple_TMuxSPTNumAID
- **`all`** for Simple_TMuxSLONumAID

No wildcards are allowed.
Default: None.

2. **`aidtype`** – Access Identifier Type
The *aidtype* specifies the type of the tributary.
Type: Alphanumeric value set.
Range: TMSVT.
Default: None.

Spec block parameters

1. **`degthr`** – Signal Degrade Threshold
This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **`RTRV-VCGTRIB`**, **`RTRV-VC3`**, **`RTRV-STS1`**).
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range (as exponents of 10): –5; –6; –7; –8; –9, that means, the range is 10^{-9} to 10^{-5}.
Default: –6.

2. **`dexcthr`** – Excessive Degrade Threshold
This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **`RTRV-VCGTRIB`**, **`RTRV-VC3`**, **`RTRV-STS1`**).
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range (as exponents of 10): –3; –4; –5, that means, the range is 10^{-5} to 10^{-3}.
Default: –3.

3. **`explptrc`** – Expected LO Path Trace Identifier
This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Hexadecimal number without a preceding “H”.
Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.
Default: 89000000000000000000000000000000

4. **lopn** – LO ASA Profile Name
This parameter points to a tributary ASAP profile name *pfname* for the designated AID. For *modifier* = TMSVT, an ASAP profile of type *PATHTERM* is required.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: 1 to 24 characters.
Default: DEFAULT.

5. **lptimais** – LO Trace Identifier Mismatch AIS Insertion
This parameter specifies whether a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).
Type: Alphanumeric value set.
Range:
   - DISABLE
   - ENABLE

   Default: The default value depends on interface standard:
   - SONET: DISABLE.

6. **lptimmon** – LO Path Trace Identifier Mismatch Monitor
This parameter specifies the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range:
   - DISABLE
   - ENABLE

   Default: DISABLE

7. **ptrc** – Incoming Path Trace
This parameter reports the accepted low-order path trace identifier (J1 or J2). The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter *ptrc* is omitted from the response.

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Hexadecimal

Range: the range depends on the parameter *ptrcrfmt* specified in **`RTRV-PTF`** output parameters:

- 2: hexadecimal digits if *ptrcrfmt* = 2
- 32: hexadecimal digits if *ptrcrfmt* = 16
- 128: hexadecimal digits if *ptrcrfmt* = 64.

Default: None.

8. **`ptrcrfmt`** – Path Trace Read Format
The parameter *ptrcrfmt* specifies the format of the path trace (J1 or J2 byte) to be received (sink).
The parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Numeric string.
   Range:
   - 2: for non-specific repeating byte
   - 16: for 16-byte specific string
   - 64: for 64-byte string.

   To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.
   Default: 2.
9. **`ptrcst`** – Status of Incoming Path Trace
This parameter shows the status of the value of the incoming Path Trace Identifier (J1 or J2) which is available with parameter *ptrc*.
The parameter is not supported for modifier:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - NORMAL, *ptrc* contains a valid value
   - UNAVAILABLE, no valid value for *ptrc* could be obtained by the system
   - AIS, no valid value for *ptrc* could be obtained due to SF condition

   Default: None.
10. **`ptrcwfmt`** – Path Trace Write Format
This parameter specifies the format of the path trace (J2 byte) to be sent (source).
Type: Numeric string.

Range:

- 2: for non-specific repeating byte
- 16: for 16-byte specific string

Default: 2.

11. **`rsiglb`** – Received Signal Label
    This parameter reports the accepted trail signal label (C2 or V5). The parameter is not reported if the *trailst* parameter indicates a fail condition, that means, if it has the value AIS or UNAVAILABLE.
    The parameter is not supported for the following modifiers:
    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: 00, 01, …, FE, FF, that means two hexadecimal digits.
    Default: None.
12. **`tmonmd`** – Tributary Monitoring Mode
    This parameter specifies the monitoring mode for the tributary.
    Type: Alphanumeric value set.
    Range:
    - MON
    - NMON

    Default: NMON.
13. **`trailst`** – Trail Status
    This parameter reports the accepted trail status value.
    Type: Alphanumeric value set.
    Range:
    - AIS for Alarm Indication Signal in case of Trail Signal Fail Condition
    - UNAVAILABLE for unavailable
    - NORMAL

    Default: None.
14. **`trc`** – Outgoing Path Trace
    This parameter specifies the path trace (J2) to be sent (source). For the 16-byte path trace format, the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
    Type: Hexadecimal number without a preceding “H”.
    Range: The range depends on the parameter *ptrcwfmt* specified in **`RTRV-PTF`** output parameters
    - length: 32 hexadecimal digits.
    - value: specific string acc. ITU/ETSI mode 1.

    Default: 00.

Detailed behavior description

The **RTRV-LOPTF** does not generate a REPT DBCHG message. The command retrieves all port parameter as described in section “Output parameters”. It does not matter whether the entity is really in use or not.

Example input/output

Retrieval of all LO tributaries of a STS1 being substructured to 28 VT1.5:

```
RTRV-LOPTF-TMSVT:UNITE-NE:1-1-#-#-39-tms16-1-all:123456;

   UNITE-NE 08-03-01 11:11:00
M  123456 COMPLD
   ″1-1-#-#-39-tms16-1-1, TMSVT::\
    degthr=-6,dexcthr=-3,\
    explptrc=89000000000000000000000000000000,\
    lopn=DEFAULT,lptimais=DISABLE,lptimmon=DISABLE,\
    ptrcrfmt=2,ptrcwfmt=2,tmonmd=NMON,trc=00″
   ″1-1-#-#-39-tms16-1-2, TMSVT::\
    degthr=-6,dexcthr=-3,\
    explptrc=89000000000000000000000000000000,\
    lopn=DEFAULT,lptimais=DISABLE,lptimmon=DISABLE,\
    ptrcrfmt=2,ptrcwfmt=2,tmonmd=NMON,trc=00″

          <listing of more VT1.5 related LONIM’s of this HO Trib>
          <ending with>

   ″1-1-#-#-39-tms16-1-28, TMSVT::\
    degthr=-6,dexcthr=-3,\
    explptrc=89000000000000000000000000000000,\
    lopn=DEFAULT,lptimais=DISABLE,lptimmon=DISABLE,\
    ptrcrfmt=2,ptrcwfmt=2,tmonmd=NMON,trc=00″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-LOPTF** command, too.

Validation rule: Check *aid* and *dyn* consistency

If the command is applied with an **aid** parameter containing wildcards (**all** at any position) and the **dyn** parameter is set to YES, then the command is denied.

Error code: `IDRG – Input, Data Range Error`

Example: Given the *aid* refers to 1-1-#-#-39-tms16-1-all and the *dyn* parameter is set to YES, then the command will be rejected.

Related TL1 messages

- "DLT-LOPTF notification " (p. 3-202)

RTRV-LONIM: Low-order non-intrusive monitor

The **`RTRV-LONIM`** command retrieves the attributes of a low-order non-intrusive monitor (LONIM, for example, OP***n***, EP155, or TransMUX).

The existence of the LONIM entities depends on the functionality:

LOXC

LONIM entities exist as long as a high-order tributary has been substructured. They are represented by entities only on lowest transmission rate with the maximum number of instances. The substructure depends on the interface standard of the related high-order tributary.

As result of a substructure creation low-order instances will be created.

The LONIM entities can be:

- SDH: 63 LOVC instances,
- SONET: 28 LOVT instances.

All of those entities can be always retrieved or modified although settings will only take effect for those entities which are indicated in the actual substructure.

TransMUX

DS1 LONIM entities exist as long as the TransMUX capacity of the approriate TransMUX card (where the DS1s are located) is unequal 0.

The LONIM entities can be:

- SONET: 28 DS1 instances

Example for LOXC

Assuming a VC4 (1st VC4 of port 1 in slot 1) is substructured to 3 VC3 (inputsig=33) since three unidirectional LOVC3 cross-connections have been established with that VC3s as input each. A RTRV-LONIM command with the input aid 1-1-#-#-1-1-1-all would deliver 63 responses although only 3 of them are in use (1-1-#-#-1-1-1-1, 1-1-#-#-1-1-1-22 and 1-1-#-#-1-1-1-43). The LONIM 1-1-#-#-1-1-1-2 can be modified without having any effect.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-LONIM-*modifier*:*tid*:*aid*:*ctag*::[:::*spec_block*],

Input parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the low-order tributary. The purpose is to distinguish between: – SDH/SONET tributaries.
   Type: Alphanumeric value set.
   Range:
   - ALL
   - LOVC
   - LOVT
   - DS1

   The *modifier* value **ALL** does not include DS1 tributaries.
   The **ALL** modifier is only useful if AIDs with wildcards are used which have a bigger range than one single port or if the interface standard of the LONIM entities is unknown.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **aid** – Access Identifier
   The access identifier specifies a low-order tributary to be operated on.
   Type: AID
   Range: GenLOTribAID, DS1NumAID.
   The following wildcard values are accepted:
   - *all*, *usall* for Simple_UnivSlotAID,
   - *all* for Simple_SPortAID, Simple_TMuxAPortAID, Simple_TMuxSPortAID
   - *all* for Simple_PTNumAID, Simple_TMuxAPTNumAID, Simple_TMuxSPTNumAID
   - *all* for Simple_LONumAID, Simple_DS1NumAID, Simple_TMuxSLONumAID

   The motivation to allow a retrieval of all low-order tributaries at once (in combination with the ALL modifier) is that NE internally all slots and ports must be queried anyway to fill the response. If the retrieve command would be more restrictive then multiple commands would be necessary to retrieve all low-order tributaries which results internally to an unnecessary multiple full query.
4. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec Block Parameters

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic data (output parameters) is reported with the command reply or not. It is only possible to retrieve those data if the aid input parameter does not address multiple entities at the same time (no wildcarding allowed). If omitted the default value is assumed.
   The following output parameters are considered to be dynamic:
   - ptrc
   - ptrcst
   - rsiglb
   - trailst

   Type: Alphanumeric value set.
   Range:
   - YES: Report dynamic parameters in the reply as well
   - NO: Do not report dynamic parameters in the reply.

Output format

If the network element fully complies with the RTRV-LONIM request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid,aidtype[::spec_block]"
   <1 or more of the line above>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output Parameter section for the **RTRV-HDR** command.

Output parameters

Command Parameters

1. **aid** – Access Identifier
   The access identifier specifies the low-order tributary whose attributes are reported.
   Type: AID
   Range: GenLOTribAID, DS1NumAID.
   The following values is not used:
   - *all*, *usall* for Simple_UnivSlotAID,
   - *all* for Simple_SPortAID, Simple_TMuxAPortAID, Simple_TMuxSPortAID

- *all* for Simple_PTNumAID, Simple_TMuxAPTNumAID, Simple_TMuxSPTNumAID
- *all* for Simple_LONumAID, Simple_DS1NumAID, Simple_TMuxSLONumAID

No wildcards are allowed.

2. **`aidtype`** – Access Identifier Type
   The *aidtype* specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range: LOVC, LOVT, DS1

Spec Block Parameters

If a third of a high-order tributary has been substructured to a low-order VC-3 then only the first of the 21 referring LOVC entities will contain VC3 related contents – the other 20 entities will represent (currently unused) VC12 related contents. VC3 contents differs from VC12 contents e.g. in the range of the path trace receive format (VC3 allows 64 byte mode exclusively).

Configurations of unused entities is possible – even for performance monitoring. However, performance monitoring bins are not retrievable.

If a used entity changes its contents from VC3 to VC12 related contents or vice versa then all parameter for this entity will be set back to the referring default (note that the default values are transmission rate dependent) except for performance monitoring:

- Possibly enabled performance monitoring will not be stopped,
- SES threshold settings will be set back to default (since different)
- TCA profile assignment remains unchanged.

Other (VC12 related) entities of the same third within the referring high-order cross-connection (VC4) will not be changed at all.

1. **`crslpbkstat`** – Cross-connect Loopback Status
   This parameter shall report the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035).

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.

Range:

- YES: for enabled loopback
- NO: for disabled loopback.

Default: NO.

2. **degthr** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (i.e. in contrast to RTRV-VCGTRIB, RTRV-VC3, RTRV-STS1).
   The parameter is not supported for modifier:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range: –5, –6, –7, –8, –9; i.e. range is 10^{-9} to 10^{-5}.
   Default: –6.
3. **dexcthr** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low0order tributaries. Therefore this parameter will be always valid (i.e. in contrast to RTRV-VCGTRIB, RTRV-VC3, RTRV-STS1).
   The parameter is not supported for modifier:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range: –3, –4, –5; i.e. range is 10^{-5} to 10^{-3}.
   Default: –3.
4. **explptrc** – Expected LO Path Trace Identifier
   This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
   The parameter is not supported for modifier:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Hexadecimal number without a preceding “H”.
   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1
   Default: 89000000000000000000000000000000
5. **feppm** – Far End Path PM Enable
   This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE.
Default: DISABLE.

6. **fmt** – Digital Signal Format for DS1
This parameter is used to specify the digital signal format expected to be received from the DS1 at the specified port(s). The TransMUX circuit pack supports DS1 path PM; it does not support DS1 line PM.
The parameter is only supported for modifier:
- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range:
- SF: Super Frame, supports near-end DS1 path and line PM only.
- ESF: Extended Super Frame, supports near-end and far-end DS1 path and line PM.

Default: ESF.

7. **lonimpn** – LO NIM ASAP Profile Name
This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
The ASAP type depends on the *modifier*:
- for LOVC/LOVT modifier, an ASAP of type PATH is required
- for DS1 modifier, an ASAP of type DS1 is required

Type: Alphanumeric string. A hyphen (“ – -”) is allowed in the name additionally.
Range: 1 to 24 characters
Default: DEFAULT.

8. **lptimmon** – LO Path Trace Identifier Mismatch Monitor
This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format ptrcrfmt is set to 16 (16-byte-specific-string mode).
The parameter is not supported for modifier:
- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE.
Default: DISABLE.

9. **neppm** – Near End Path PM Enable
This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE
Default: DISABLE.

10. **`outpm`** – Outgoing Near End Path PM Enable
The parameter *outpm* specifies whether the performance monitoring for the near end in outgoing direction is enabled or disabled for this tributary.

The parameter is only supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE
Default: DISABLE.

11. **`pmlpfeses`** – PM LO Path Far End SES Threshold
This parameter specifies the Low Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end.
The behavior depends on *modifier* and the transmission rate of this low-order tributary. For modifiers which include more than one transmission rate, the transmission rate can be derived from the parameter *inputsig* of the related PTF entity.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range:

The range depends on the tributary type in input direction, which can be derived from inputsig of the related PTF:

- 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
- 1, 2, 3, …, 1998, 1999, 2000 (if the entity represents a VC12 tributary)
- 1, 2, 3, …, 3998, 3999, 4000 (if the entity represents a VT1.5 tributary)

Default: The default value depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary).

12. **pmlpneses** – PM LO Path Near End SES Threshold
    This parameter specifies the Low Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end.
    The behavior depends on *modifier* and the transmission rate of this low-order tributary. For modifiers which include more than one transmission rate, the transmission rate can be derived from the parameter *inputsig* of the related PTF entity.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Integer.
    Range:

    The range depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF:

    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
    - 1, 2, 3, …, 1998, 1999, 2000 (if the entity represents a VC12 tributary)
    - 1, 2, 3, …, 3998, 3999, 4000 (if the entity represents a VT1.5 tributary).
    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a DS1 tributary).

    Default: The default value depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary); 1544 (if the entity represents a DS1 tributary).

13. **ptca** – Path TCA Profile Pointer
    The parameter *ptca* specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    The TCA Profile type depends on the modifier.

    - for LOVC *modifier*, a TCA Profile of type LOVC is required
    - for LOVT *modifier*, a TCA Profile of type LOPATH is required
    - for DS1 *modifier*, a TCA Profile of type DS1 is required

    Type: Alphanumeric string.
    Range: 1 … 24 characters.
    Default: DEFAULT0.

14. **ptrc** – Incoming Path Trace
    The parameter ptrc shall report the accepted low order path trace identifier (J1 or J2). The length depends on the value of the parameter ptrcrfmt. The status of this value is contained in parameter ptrcst. If ptrcst indicates NORMAL, then ptrc contains a valid value. If ptrcst indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter ptrc is omitted from the response.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Hexadecimal

Range: the range depends on the parameter ptrcrfmt specified in RTRV-LONIM Output Parameters

- 2, hexadecimal digits if *ptrcrfmt* = 2
- 32, hexadecimal digits if *ptrcrfmt* = 16
- 128, hexadecimal digits if *ptrcrfmt* = 64.

15. **`ptrcrfmt`** – Path Trace Read Format
This parameter specifies the format of the path trace (J1 or J2 byte) to be received (sink).

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Numeric string.

Range:

- 2 (default), for non-specific repeating byte
- 16, for 16 byte specific string
- 64, for 64 byte string (only applicable if the entity represents a LO-VC3 tributary).

To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.

16. **`ptrcst`** – Status of Incoming Path Trace
This parameter shows the status of the value of the incoming Path Trace Identifier (J1 or J2) which is available with parameter *ptrc*.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- NORMAL, *ptrc* contains a valid value
- UNAVAILABLE, no valid value for *ptrc* could be obtained by the system
- AIS, no valid value for *ptrc* could be obtained due to SF condition

Default: None.

17. **`rsiglb`** – Received Signal Label
This parameter shall report the accepted trail signal label (C2 or V5). The parameter is not reported if the trailst parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: 00, 01, …, FE, FF, i.e. two hexadecimal digits.
Default: None.

18. **`tcamd`** – TCA mode
    This parameter is only available for SDH mode and will therefore only be reported if the output parameter *aidtype* is LOVC. The parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable for SDH:

    - TR-only. (also known as the implicit reset method)
    - TR-RTR. (also known as the explicit reset method).

    For SONET, the parameter *tcamd* is not supported. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

    The parameter is not supported for modifier:

    - DS1
    - LOVT

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: TR, TRRTR

    Default:

    - SDH mode: TRRTR
    - SONET mode: TR (internal).

    For SONET the parameter tcamd does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

19. **`tmonmd`** – Tributary Monitoring Mode
    This parameter specifies the monitoring mode for the tributary.
    Type: Alphanumeric value set.
    Range: MON, NMON.
    Default: NMON.

20. **`trailst`** – Trail Status
    This parameter shall report the accepted trail status value.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Alphanumeric string

Range:

- AIS for Alarm Indication Signal in case of Trail Signal Fail Condition
- UNAVAILABLE for unavailable
- NORMAL.

Default: None.

Detailed behavior description

The RTRV-LONIM does not generate a REPT DBCHG message. The command shall retrieve all low order tributary parameter related to specified AID as described in section Output Parameters. It does not matter whether the entity is really in use or not.

No LO NIMs exist at the HO side of a conversion cross-connection. Therefore RTRV-LONIM does not return any values related to the HO side of a conversion cross-connection.

Example input/output

Retrieval of all LO tributaries of a VC4 being substructured to 3 VC3:

```
RTRV-LONIM-LOVC:LT-UNITE:1-1-#-#-39-16-1-all:123456;

   LT-UNITE 00-11-11 11:11:00

   "1-1-#-#-15-tma1-1-d28,DS1::fmt=SF,lonimpn=DEFAULT,\
```

```
   outpm=ENABLE,pmlpneses=1544,ptca=DEFAULT0,tmonmd=NMON"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-LONIM** command, too.

Validation rule: Check LONIM::modifier against PTF::ptfstd

If the command is applied with a modifier which does not match to the interface standard parameter *ptfstd* of the owning PTF entity, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

The following combinations are allowed (*modifier istd*):

- LOVC, SDH
- LOVT, SONET
- DS1, SONET
- ALL, SDH or SONET

Validation rule: Check *aid* and *dyn* consistency

If the command is applied with an *aid* parameter containing wildcards (all at any position) and the *dyn* parameter is set to YES, then the command is denied.

Error code: `IDRG – Input, Data Range Error`

Example: Given the aid refers to 1-1-#-#-39-16-1-all and the dyn parameter is set to YES then the command will be rejected.

- "ED-LONIM: Edit lower-order non-intrusive monitor" (p. 3-411)

RTRV-LOXCPM: Retrieve performance monitoring data of LOXC pack

The **`RTRV-LOXCPM`** command is initiated by a user to request the network element to send the current and/or historical Performance Monitoring (PM) data associated with performance monitoring points located on an LOXC pack. For each value in the *montype* parameter of the **`RTRV-PM`** input Parameters section, PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

`RTRV-LOXCPM`-*modifier*:*tid*:*aid*:*ctag*::[*montype*], [*monlev*], [*locn*],,*tmper*, [*mondat*], [*montm*];

Input parameters

Command parameters

1. **`modifier`**
   This parameter defines the type of performance monitoring point.
   Type: Alphanumeric value set.
   Range: The following value is for SONET only: LOVT1.
   The following values are for SDH only: LOVC3, LOVC12.
2. **`tid`** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **`aid`** – Access Identifier
   Type: AID
   Range: GenLOTribAID
   Wildcard values in parts of both AIDs are usable as follows:
   - *all*, *usall* in Simple_UnivSlotAID,
   - *all* in Simple_SPortAID,
   - *all* in Simple_PTNumAID,
   - *all* in Simple_LONumAID.
   - *all* in Simple_TMuxSLONumAID.

   Default: None.

4. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
5. **montype** – Monitored parameter type
   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.
   Type: value set.
   Range:
   - The following values are for LOVT1 modifiers only: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE
   - The following values are for LOVC3 and LOVC12 modifiers only: VC-N-ES, VC-N-SES, VC-N-BBE, VC-N-UAS, VC-F-ES, VC-F-SES, VC-F-BBE, VC-F-UAS

   The following value is also allowed for all input modifiers: ALL.
   Default: ALL.
6. **monlev** – Monitored Level
   This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.
   Type: value set.
   Range:
   - 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
   - 0-UP: Means the NE will report zero and all positive data.

   Default: 1-UP.
7. **locn** – Location
   Location for which the PM data is monitored. The parameter value is only considered if the *montype* value is ALL; otherwise it is ignored for the calculation of the command reply (i.e has no impact on the command).
   Type: value set.
   Range:
   - NEND: Near-End PM data is requested.
   - FEND: Far-End PM data is requested.
   - ALL: All near-end and far-end data is requested. It applies only to input direction.

   Default: ALL.
8. **tmper** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.
   Range:
   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

9. **`mondat`** – Monitored Date

   This requests the beginning date of the interval for which the PM data is to be reported. For both values of tmper parameter, the maximum allowable range of valid dates includes the current and previous one day.
   Type: value set.

   Range:

   - MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
   - ALL: Current and previous day.

   Default: Current date

10. **`montm`** – Monitored Time

    This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:

    a. A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).

    b. A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).

    c. All applicable beginning times for the given *mondat* value (i.e., all).

    Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondat* value provided is ALL.
    Type: Character string.

    Range:

    - HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
    - THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of $$-$$ indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##- ## indicates the previous 15-min interval.
    - ALL: All applicable beginning times for the given *mondat* value.

    If the *tmper* value is 1-DAY, the *montm* parameter will not be used.
    Default:
    If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.
    If HOD-MOH is omitted, the PM period for the current time will be reported.

Output format

If the NE fully complies with the RTRV-LOXCPM request, the following normal completion response is returned:

```
    sid date time
M   ctag COMPLD
   "aid:montype,monval,[validity],[tca],[locn],,tmper,[mondat],[montm]"
   . . . . .
   . . . . .
   . . . . .
;
```

Note: The trailing comma has to be present even if the optional parameter is not supported for a dedicated release.

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output Parameter section for the **RTRV-HDR** command.

Normal completion message – empty reply

If there is no PM data stored within the NE, then the following response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

1. **aid** – Access Identifier
   Description: Access identifier.
   Type: AID
   Range: GenLOTribAID
   Wildcard values (e.g. *all* or *usall*) in any parts of both AIDs is not used.
2. **montype** – Monitored Parameter Type
   See montype in the input parameters section.
3. **monval** – Monitored Value
   This parameter contains the measured value of the parameter specified in montype.
   Type: Integer.
   Range: 0-4294967295
   The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.

   W.r.t. value range for the specific PM parameters see

   - "Output parameters" section in "RTRV-TCA-PROF: Retrieve TCA profile" (p. 3-2982) (if thresholding is applicable for that parameter)
   - PM parameter introduction section (if thresholding is not applicable for that parameter).

4. **`validity`** – validity indicator
   This parameter indicates the validity of the PM data.
   Type: Integer.
   Range: 1: valid; (omitted): non-valid.
   If the value is omitted, it indicates that the validity is ″non valid″.
5. **`tca`** – Threshold Crossing Alert
   Type: value set.
   Range:
   For the current interval: *tca* indicates:
   - in TCA mode TR, that the current value exceeds the provisioned threshold
   - in TCA mode TR-RTR, that a *tca* occurred since the beginning of this interval or that the *tca* reset condition was not fulfilled in any previous interval since the last tca occurred.

   If the value is omitted, it indicates
   - in TCA mode TR, that the current value is below the provisioned threshold
   - in TCA mode TR-RTR, that no tca occurred since the beginning of this interval and that the *tca* reset condition was fulfilled at least in one previous interval.

   For previous intervals, the *tca* parameter indicates the state at the end of the interval.
6. **`locn`** – Location
   Location for which the PM data is monitored.
   Type: value set.
   Range:
   - NEND: Near-End PM data is requested
   - FEND: Far-End PM data is requested.
7. **`tmper`** – Time Period
   See in the input parameters section.
8. **`mondat`** – Monitored Date
   This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.
   Type: value set.
   Range: MM-DD: Month-Day
   Default: Current date
9. **`montm`** – Monitored Time
   This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).
   Type: Character string.
   Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

Detailed behavior description

This parameter shall

- only return those parameters, which are specified by the input parameters
- omit parts of the response (maybe to return an empty response) if related performance monitoring has not been enabled (independent whether this occurs due to a specific or wildcard query)
- omit parts of the response due to a wildcard query (maybe to return an empty response) if the related entity does not exist
- omit an entity within the response if the entity is not in use for the specified transmission rate or if the entity is currently not in use at all (LOVC12 only)
- return an empty response for non-existing LONIM entities.

Examples:

If a command is executed for a specific existing LOVT1 entity to retrieve all parameters but the entity has only near-end (thus no far-end) performance monitoring enabled, then a response will be returned containing only the near-end values.

If a command is executed for all LOVC3 entities of a specific VC4 PTF but this PTF is substructured into 1 VC3 and 42 VC12 then a response will be returned containing only the parameters for the one existing VC3.

If a command is executed for a specific LOVC12 entity but the related PTF is substructure into 3 VC3 signals then an empty response will be returned.

Further examples leading to empty responses:

- A command with a specific AID containing a GenLOTribAID for a DS3 port
- A command with a specific AID and modifier LOVC3 containing a Simple_LONumAID different than 1, 22, 43
- A command with a specific AID and modifier LOVC12 containing a Simple_LONumAID equal to 1, 22 or 43 and the related third of the VC4 substructure indicates a VC3 signal rate
- A command with a specific AID and modifier LOVT1 containing a Simple_LONumAID greater than 28.

Example input/output

The following example shows the successful completion of a **RTRV-LOXCPM** command by the network element for a LOVT1:

```
RTRV-LOXCPM-LOVT1:UNITE-NE:1-1-#-#-39-16-3-28:123456::\
vc-f-es,1-up,,,15-min ,,00-00&&08-00;

   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   ”1-1-#-#-39-16-3-28:vc-f-es,17,,tca,,,15-min,,00-00”
```

```
   ″1-1-#-#-39-16-3-28:vc-f-es,10,,tca,,,15-min,,00-15″
   . . .
   ″1-1-#-#-39-16-3-28:vc-f-es,15,,tca,,,15-min,,08-00″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-LOXCPM** command. See also subsection 'Partial Completion on RTRV Commands' w.r.t. handling of internal error (for example, communication to XCn fails) for a subset of replies.

RTRV-LPBK (cross-connection): Retrieve loopback (cross-connection)

The **RTRV-LPBK**-*modifier* command can be initiated by a user to retrieve information on cross-connection loopback(s) in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-LPBK**-*modifier*:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the rate of the currently active cross-connection loopback for the specified tributary on which the **RTRV-LPBK** command acts on.
   For the adaptive rate case this means that the *modifier* does not specify the rate (constituent signal type) of the tributary, but the cross-connection loopback rate.
   Type: Alphanumeric value set.
   Range:
   - ALL
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - LOVC3

- LOVC12
- LOVT1.

2. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.
3. **`aid`** – Access Identifier
   This parameter specifies the tributary for which loopback information is requested to be retrieved.
   Type: GenTribAID or GenLOTribAID.
   Range: The **`all`**-parameter is accepted for the slot-, port-, high-order trib- and optionally for the low-order-trib-part of the AID. In addition, the value **`vall`** is accepted for the high-order trib-part and the value **`usall`** is accepted for the slot-part of the AID. If the slot-/port-/high-order trib-part is set to **`all`** or **`usall`** then all high-order loopbacks are retrieved but those referring to GE***n***, ES64U, and OPT***n***. To get those, the **`vall`** value must be used at high-order trib-part of the AID. If the low-order-trib-part is set to **`all`** then all low-order loopbacks of the system are retrieved. The value **`vall`** for the high-order trib-part of the AID is not allowed in this case.
   For example the following *aids* are valid:
   - 1-1-#-#-all-all-all specifying all HO tribs for all ports in the whole shelf
   - 1-1-#-#-2-1-all specifying all HO tribs of the first port of the pack in slot-number=02
   - 1-1-#-#-3-vall-all specifying all HO tribs of all ports of the (GE***n***, ES64U, or OPT***n***) pack in slot-number=03
   - 1-1-#-#-all-all-all-all specifying all LO tribs for all HO tribs and ports in the whole shelf

   However the following example shows an invalid aid: 1-1-#-#-all-vall-all-all there is no low order tributary on GE***n*** or OPT***n*** packs:
   1-1-#-#-all-vall-all-all: there is no lower-order tributary on GE***n***, ES64U, or OPT***n*** packs
4. **`ctag`** – Correlation Tag
   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).

Output format

Normal completion message

In response to a valid **`RTRV-LPBK-`***modifier* command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   "aid:rate:spec_block"
       ...
       ...
   "aid:rate:spec_block"
```

;

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter specifies the tributary for which loopback information is retrieved.
   Type: GenTribAID or GenLOTribAID.
   Range: No **`all`** or **`usall`** or **`vall`** value shell be possible for any part of the aid..
2. **`rate`**
   This parameter indicates the cross-connection rate. For a detailed description please refer to parameter *rate* in “RTRV-CRS: Retrieve cross-connection” (p. 3-2306).
   Type: Alphanumeric value set.
   Range:
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - LOVC3
   - LOVC12
   - LOVT1.

Spec block parameters

1. **`crslpbkstat`** – Cross-connect Loopback Status
   This parameter specifies the current cross-connection loopback status of the considered tributary *aid*.
   The value *YES* will be used in case the tributary is loop-backed.
   Note that the tributary does not need to be involved in a cross-connection – but can

be in loopback also without cross-connection.
Note that no dedicated value is specified for the case of a non loop-backed tributary since such a tributary will no be in output.
Type: Alphanumeric value set.
Range: YES.

Detailed behavior description

The **RTRV-LPBK** command allows the retrieval of loopback information for tributaries, regardless if they are involved in cross-connections or not. Tributaries which are not involved in a cross-connection loopback are not present in the reply output.

Interface Standard Independence

No command validation between port interface-standard and modifier will be performed. The output parameter *rate*, however, is filled with the rate according to the interface standard of the port.

Example Input/output

Example:

The example shows the loopback status for the 13th trib of the pack in slot 07, which has an existing loopback:

```
RTRV-LPBK-VC3:UNITE-NE:1-1-#-#-7-1-13:123456

   sid date time
M  ctag COMPLD
   "1-1-#-#-7-1-13:STS1:crslpbkstate=YES"
;
```

References

GR-199-CORE

RTRV-LPBK (facility): Retrieve loopback (facility)

The **RTRV-LPBK**-*modifier* command can be initiated by a user to retrieve information on facility loopback(s) in the NE. Facility herein is identical to port – either an optical port of an OP***n*** pack or the optical port of a GE***n*** pack – no other ports (like timing ports, UserByte ports etc) are settable to loopback.

As long as there is loopback active on a port, the *abnormal* LED lights.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-LPBK**-*modifier:tid:aid:ctag;*

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the port rate on which the **RTRV-LPBK** command acts on. (In principle this parameter is redundant, because the port-rate is implicitly given by the port-AID (*SPortAID*), but in order to align the facility loopback command with the tributary loopback command this parameter is retained.)
   Type: Alphanumeric value set.
   Range:
   - ALL
   - STM1E
   - STM1
   - STM4
   - STM16
   - STM16T
   - STM64
   - STM256
   - EC1
   - OC3
   - OC12
   - OC48
   - OC48T

- OC192
- OC768
- 1GE
- 1GEPL
- 10GEPL
- T3

2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **aid** – Access Identifier
   Access Identifier of the port for which the loopback state is returned.
   Type: AID
   Range: SPortAID (when using OP***n***, EP155, OPT***n*** packs or EC1 interfaces on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_SPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is accepted.

   APortAID (when using DS3 interfcaes on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_APortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is accepted.

   EPortAID (when using GE***n*** packs) as defined in AID structure. The values:
   - all for Simple_EPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is accepted.
4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Output format

In response to a valid RTRV-LPBK command, the following output is returned:

```
   sid date time
M ctag COMPLD
   "aid:rate:spec_block"
       ...
       ...
   "aid:rate:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   Access Identifier of the port for which the loopback state is returned.
   Type: AID
   Range: SPortAID (when using OP***n***, EP155, OPT***n*** packs or EC1 interfaces on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_SPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

   APortAID (when using DS3 interfcaes on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_APortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

   EPortAID (when using GE***n*** packs) as defined in AID structure. The values:
   - all for Simple_EPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.
2. **rate**
   This parameter indicates the port *rate*.
   Type: Alphanumeric value set.
   Range:
   - STM1E
   - STM1
   - STM4
   - STM16
   - STM16T
   - STM64
   - STM256
   - EC1
   - OC3
   - OC12
   - OC48
   - OC48T
   - OC192
   - OC768

- 1GE
- 1GEPL
- 10GEPL
- T3.

Spec block parameters

1. **lpbk** – Loopback
   This parameter specifies the current near-side loopback status of the output *aid*. A near-side loopback means that the signal on the incoming port is looped to the outgoing port.
   If *lpbk* = YES then the port is (near-side) loop-backed.
   If *lpbk* = NO then there is no (near-side) loopback existing for the port.
   Note: At most one loopback (*lpbk* or *fsflpbkstat*) can be set to YES for the same port at the same time.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).
2. **fsflpbkstat** – Far-Side-Facility-Loopback-Status
   This parameter specifies the current far-side facility loopback status of the output *aid*. A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port.
   If *fsflpbkstat* = YES then the port is (far-side) loop-backed. If *fsflpbkstat* = NO then there is no (far-side) loopback existing for the port.
   Note: At most one loopback (*lpbk* or *fsflpbkstat*) can be set to YES for the same port at the same time.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).

Detailed behavior description

The **RTRV-LPBK** command allows the retrieval of near-side and far-side loopback information for ports.

If no port exists with the specified interface standard, rate, and type (*modifier*) at the AID or in the AID range, then the command shall complete and return an empty response.

For the GE***n*** the lpbk parameter is always set to NO due to the fact that the GE (EPort) only allows the far-side loopback possibility.

Example input/output

Suppose the port 1 of the pack in slot 7 has a existing near-side loopback:

```
RTRV-LPBK-ALL:UNITE-NE:1-1-#-#-7-1:123456

   sid date time
M  ctag COMPLD
   "1-1-#-#-7-1:OC48:lpbk=YES,fsflpbkstat=NO"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-LPBK** command.

RTRV-MANROUTE-LAN: Retrieve manual route at LAN port

The **RTRV-MANROUTE-LAN** command is used to retrieve manual route entries at LAN ports, which are used as UNI control channels.

Properties

Priority: S1

Abortable: Yes

Input format

Command syntax: **RTRV-MANROUTE-LAN**:*tid:[aid]:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   Default: If this field is omitted, the report will display the manual route entries of all lan ports assigned to the UNI node.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*.

Output format

If the **RTRV-MANROUTE-LAN** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
       ...
   "aid:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Output parameters

Command parameters

1. **aid** – Target Identifier
   This parameter indicates the LAN port AID. The value *lanall* is not allowed.
   Type: AID.
   Range: LanPort AID.

Spec block parameters

1. **ip_ad** – destination IP Address
   This parameter is used o indicate the destination IP address to which a manual route is created. This is the LAN i/f address of UNI-C
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255. The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **ip_ad_uni** – Node ID of UNI-C
   This parameter is usedo indicate the router ID of the UNI-C to which a manual route is created.
   Type: Four dot separated numeric strings
   Range: Each numeric string: 0 .. 255.
3. **osinode**
   This parameter is used to indicate the OSI node assigned to the LAN port.
   Type: AID.
   Range: uninode.

Detailed behavior description

The command shall retrieve the manual route entries for LAN ports which are used for UNI control channel, i.e. are assigned to UNI node. If no manual route entries exist, the command shall return an empty list. The initial value of the manual routes it an empty list.

Example input/output

The following example shows the result of RTRV-MANROUTE-LAN:

```
RTRV-MANROUTE-LAN:NE-UNITE:1-1-lan2:123456;
   NE-UNITE 06-06-30 11:01:00
M  123456 COMPLD
   ″1-1-lan2:ip_ad=135.248.206.72,ip_ad=135.248.143.102,ip_
      snm=255.255.0.0,osinode=uninode″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **`RTRV-MANROUTE-LAN`** command.

Validation rule: Not allowed to use LAN1 for UNI

If LAN1 is specified in the AID, then the command is denied.

Error code: `IDNV – Input, Data Not Valid, LAN1 not allowed for UNI`

Validation rule: LAN port not used for UNI

If the LANport specified in the AID is not in use for UNI, i.e. is not assigned to the uninode, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, LAN port not in use for UNI`

RTRV-MANROUTE-MCN: Retrieve manual IP route for management communication

The **RTRV-MANROUTE-MCN** command is used to retrieve the provisioned manual MCN IP routes from a gateway NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-MANROUTE-MCN**:*tid:[aid]:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   The keyword "lanall" is allowed for Simple_LANPortAID.
   Default: Omitting this field has the same effect as the keyword "lanall", that means, the report will display the manual MCN route entries of all possible LAN ports assigned to the MCN.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the **RTRV-MANROUTE-MCN** request is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″aid:spec_block″
       .
       .
     <one line for each Manual MCN IP Route entry>
       .
   ″aid:spec_block″
```

```
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Target Identifier
   This parameter indicates the LAN port AID. The value *lanall* is not allowed.
   Type: AID.
   Range: LanPort AID.

Spec block parameters

1. **dest_ipad** – Destination IP Address
   The IP address of an IP node which can be reached via one of the LAN ports.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.
   Default: None.
2. **dest_ipmask** – Destination IP Subnet Mask
   The IP subnet mask of the IP node which can be reached via the LAN port.
   Type: Four dot separated numeric strings
   Range: Each numeric string: 0 … 255.
   Default: None.
3. **nexthop_ipad** – Next Hop IP Address
   The IP address of the next hop routing node via which the Destination IP Address can be reached.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The value 0.0.0.0 is used if the IP node defined by *dest_ipad* is connected to the LAN port directly. The values 1.1.1.1 and 127.0.0.1 are not allowed.
   Default: None.

Detailed behavior description

The command retrieves all provisioned manual MCN IP routes. The output of the command is not sorted.

Example input/output

The following example shows the result of **RTRV-MANROUTE-MCN**:

```
RTRV-MANROUTE-MCN:UNITE-NE::123456;
```

```
   NE-UNITE 08-06-20 11:01:00
M  123456 COMPLD
   "1-1-lan2:dest_ipad=192.168.100.72,dest_ipmask=255.255.0.0,nexthop_
      ipad=192.168.1.83"
   "1-1-lan2:dest_ipad=192.168.200.165,dest_ipmask=255.255.0.0,nexthop_
      ipad=192.168.1.83"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-MANROUTE-MCN** command.

Related TL1 messages

- "DLT-MANROUTE-MCN notification" (p. 3-209)

RTRV-MAP-NEIGHBOR: Retrieve map neighbor

The **RTRV-MAP-NEIGHBOR** command will retrieve a list of all immediate OSI neighbors to the local NE (node or NE). This can include other NEs, as well as neighbors on the LAN, such as the CIT.

A neighbor entry will not appear in the report for channels allocated to the SCN_node_AID or the UNI_node_AID or the ENNI_node_AID.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-MAP-NEIGHBOR**:*tid*::*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: TID
2. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: CTAG

Output format

If the **RTRV-MAP-NEIGHBOR** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   ″[rate]:thru[,lpaid]:spec_block″
   ...
   ″[rate]:thru[,lpaid]:spec_block″
;
```

Ordering of output lines: Output is sorted in ascending order first by *lpaid*.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **rate** – DCC Port Rate
   This parameter is only available for a DCC neighbor and provides the optical port rate as used in RTRV-*rr*.
   Type: Value set.
   Range:
   - STM1
   - STM4
   - STM16
   - STM64
   - STM256
   - OC3
   - OC12
   - OC48
   - OC192
   - OC768.

   Default: n/a – as determined by the port type.
2. **thru** – Connected Through
   This parameter specifies the type of connectivity between the NE and its neighbor.
   Type: value set.
   Range: DCC, LAN.
   Default: n/a – as determined by the type of connection.
3. **lpaid** – Local Port AID
   This parameter provides the SPortAID of the optical port in case thru=DCC or the LanPortAID in case thru=LAN.
   Type: AID.
   Range: SPortAID in case thru=DCC or LanPortAID in case thru=LAN as defined in section AID Structure.

Spec block parameters

1. **nsap** – Network Service Access Point
   This filed defines the ASAP of the neighbor.
   Type: 20 byte octet string in 40 digit hex representation.
   Range: The NSAP address/NET is composed of the following components:
   - l3idp (l3afi and l3idi)
   - l3dfi,

- l3org,
- l3res,
- l3rd,
- l3area,
- l3sys,
- l3se.l

See “RTRV-ULSDCC-L3: Retrieve layer 3 related parameters” (p. 3-3049) for details.

2. **`npaid`** – Neighbor Port AID
   This parameter is only available for DCC neighbors and provides the port AID of the optical port of the OSI neighbor. (Peer of *lpaid*)
   Since the neighbor NE might have a different AID structure it is interpreted as a string.
   Type: AID string.
   Range: up to 20 characters-
3. **`tid`** – Neighbor TID
   This parameter is only available for DCC neighbors. It provides the TID value of the neighbor NE.
   Type: TID
   Range: Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for legal values and a general description of TIDs.
4. **`dcctype`** – DCC Type
   This parameter is only available for DCC neighbors. It specifies whether the values displayed in the *spec_block* refer to the MS/LINE or RS/SECTION DCC.
   Type: value set.
   Range:
   - SECTION
   - LINE

   Default: n/a – depends on DCC channel type for which *spec_block* parameters are reported.

Detailed behavior description

The command retrieves per NE information about all neighbors which are physically connected to the local NE via DCC or LAN and about details of the connection as specified in the output command and *spec_block* parameters.

If there is a link failure between the local NE and its neighboring NE, or if the DCC is disabled, the neighbor NE entry will not appear in the report.

The command will not retrieve the neighborship between the internal osinodes of the NE. This is only relevant for the network level design and RTRV-MAP-NETWORK can be used for it.

A neighbor node entry shall not appear in the report for DCC channels allocated to the CN_node_AID or the UNI_node_AID. A neighbor node entry shall not appear in the report for LANs allocated to the SCN_node_AID or the UNI_node_AID or the ENNI_node_AID.

This command does not generate a **REPT DBCHG** notification.

Example input/output

The following example shows the result of a RTRV-MAP-NEIGHBOR command for an NE which has all DCCs (RS/MS) enabled for the port on an OP40 and the CIT LAN:

```
RTRV-MAP-NEIGHBOR:LT-UNITE::123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   ″STM256:DCC,1-1-#-#-1-1:
nsap=39840F80000000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-
      UNITE2,dcctype=SECTION″
   ″STM256:DCC,1-1-#-#-1-1:
nsap=39840F80000000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-
      UNITE2,dcctype=LINE″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-MAP-NEIGHBOR** command.

Related TL1 messages

- “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack” (p. 3-1312)
- “RTRV-ULSDCC-L3: Retrieve layer 3 related parameters” (p. 3-3049)
- “RTRV-MAP-NETWORK: Retrieve network map” (p. 3-2526)

RTRV-MAP-NETWORK: Retrieve network map

The **RTRV-MAP-NETWORK** command will retrieve a list of OSI nodes, reachable from the local NE (NE). This can include other NEs, other nodes on the local NE, as well as neighbors on the LAN, such as the CIT.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-MAP-NETWORK**:*tid*:*aid*:*ctag*[::*level2*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: TID.
2. **aid** – Access Identifier
   This parameter specifies the osinode for which the OSI nodes is retrieved. The value *osinodeall* is not allowed.
   Type: AID.
   Range: OSI_node_AID | SCN_node_AID. The value *osinodeall* is not allowed.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: CTAG.
4. **level2** – IS Routing Level
   If set to N(o), report will list only the nodes in the local level 1 area of this node.
   If set to Y(es), report will list the nodes in the level 2 sub-domain (when *aid* specifies a level 2 node).
   If set to N(o) the list will include level-1-only and level-1+2 nodes.
   Note: For nodes where level 2 routing is not supported, the output will be empty when *level2* = Y.
   Note: The previous note implies that level2 is set to N, if info for osinode=scnnode is requested.
   Type: value set.

Range:

- N (default)
- Y.

Output format

If the RTRV-MAP-NETWORK request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   ″spec_block″
   ...
   ″spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Spec block parameters

1. **`level1`** – level 1 Router
   This parameter specifies whether reachable node is level 1 router.
   Type: Value set.
   Range:
   - Y (es)
   - N (o).
2. **`level2`** – Level 2 Router
   This parameter specifies whether reachable node is level 2 router.
   Type: Value set.
   Range:
   - Y (es)
   - N (o).
3. **`ip_ad1`** – IP Address 1
   This parameter is used to retrieve the IPv4 address of a reachable SCN node or LAN interface in the network map. This output parameter is only available when input aid is of type SCN_node_AID.
   Note: The IP address can be a host address or one of up to two LAN interfaces addresses. There is no order or semantics (i.e. whether IP address belongs to SCN

node or LAN interface) specified for ip_ad1, ip_ad2, ip_ad3.
Type: Four dot separated numeric strings or empty string.
Range: Each numeric string: 0 .. 255 or empty string.
Note: The empty string is reported when the IP address can not be retrieved. In output direction it is represented as \"\".

4. **`ip_ad2`** – IP Address 2
   This parameter is used to retrieve the IPv4 address of a reachable SCN node or LAN interface in the network map. This output parameter is only available when input aid is of type SCN_node_AID.
   Note: The IP address can be a host address or one of up to two LAN interfaces addresses. There is no order or semantics (i.e. whether IP address belongs to SCN node or LAN interface) specified for ip_ad1, ip_ad2, ip_ad3.
   Type: Four dot separated numeric strings or empty string.
   Range: Each numeric string: 0 .. 255 or empty string.
   Note: The empty string is reported when the IP address can not be retrieved. In output direction it is represented as as \"\".
5. **`ip_ad3`** – IP Address 3
   This parameter is used to retrieve the IPv4 address of a reachable SCN node or LAN interface in the network map. This output parameter is only available when input aid is of type SCN_node_AID.
   Note: The IP address can be a host address or one of up to two LAN interfaces addresses. There is no order or semantics (i.e. whether IP address belongs to SCN node or LAN interface) specified for ip_ad1, ip_ad2, ip_ad3.
   Type: Four dot separated numeric strings or empty string.
   Range: Each numeric string: 0 .. 255 or empty string.
   Note: The empty string is reported when the IP address can not be retrieved. In output direction it is represented as \"\".
6. **`ip_sid`** – SID
   This parameter is used to display the SID of a reachable SCN node in the network map. This output parameter is only available when input aid is of type SCN_node_AID.
   Note: Since the SID (MAC address) is unique it might be used to detect misconfigurations of duplicate IP addresses.
   Type: Hexadecimal number.
   Range: 000000000000 – FFFFFFFFFFFF.
7. **`net`** – Network Entity Title
   This field is the Network Entity Title (NET) of one reachable OSI node. The NET is the same as the NSAP with the last byte set to 00 (hex).
   This output parameter is only available when input aid is of type OSI_node_AID.
   Type: 20 byte octet string in 40 digit hex representation.
   Range: The NET is composed of the following components:
   - l3idp (l3afi and l3idi)
   - l3dfi,

- l3org,
- l3res,
- l3rd,
- l3area,
- l3sys,
- l3sel = 00 (hex).

See “RTRV-ULSDCC-L3: Retrieve layer 3 related parameters” (p. 3-3049) for details.

8. **tid** – Target Identifier
This parameter specifies the TID of the NE. This parameter is reported for entries of the local and remote NEs if OSI node 1 is specified as AID in the command. For OSI nodes 2 – 8 and the SCN node, the parameter is only reported for entries of the local NE.
Type: TID
Range:
   - Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for legal values of TIDs
   - ″?″ when the TID cannot be determined.

Detailed behavior description

The **RTRV-MAP-NETWORK** command retrieves per node a list of OSI or SCN nodes (depending on the input aid), reachable from the local network element (NE) via the OSI or SCN stack(s). This can include other network elements, other nodes of the local NE, as well as other systems on the LAN, such as the CIT.

In contrast to RTRV-MAP-NEIGHBOR or RTRV-SCN-NEIGHBOR, which retrieve info about physical neighbors and properties of the physical connection, this command shall retrieve info with respect to (I)IS-IS routing.

If the node specified by aid is provisioned as level 2 and level2=Y, the report shall list the level 2 nodes across the level 2 subdomain and the nodes in the local level 1 area of the selected node. The output parameters level1 and level2 contain the correct level 1, 2 indication.

If level2=N, the report shall list only the nodes in the local level 1 area of the selected node (including the default level 2 node and other level 2 nodes in the local level 1 area). The output parameters level1 and level2 are meaningless.

The local OSI system is also listed in the report.

OSI node not in created state

If the specified OSI node is not in created state, then the system shall return no response.

This command does not generate a **REPT DBCHG** notification.

Example input/output

The following example shows the result of a RTRV-MAP-NETWORK command for an input aid of type OSI_node_AID:

```
RTRV-MAP-NETWORK:LT-UNITE:osinode1:123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   ″tid=LT-UNITE-A,
   net=39840F80000000000000000000000601D0d56e000,
   ip_ad1=\″\″,ip_ad2=\″\″,ip_ad3=\″\″,level1=Y,level2=N″
   ″tid=?,net=39840F80000000000000000000000108334F1E600,
   ip_ad1=\″\″,ip_ad2=\″\″,ip_ad3=\″\″,level1=Y,level2=N″
   ″tid=?,net=39840F8000000000000000000000A0D103189900,

   ip_ad1=\″\″,ip_ad2=\″\″,ip_ad3=\″\″,level1=Y,level2=N″

;
```

The following example shows the result of a RTRV-MAP-NETWORK command for an input aid of type SCN_node_AID:

```
RTRV-MAP-NETWORK:LT-UNITE:scnnode:123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   ″tid=LT-UNITE,ip_ad1=192.168.200.1,ip_sid=123456789012,level1=Y,level2=N″
   ″ip_ad1=192.168.200.8,ip_ad2=\″\″,ip_ad3=\″\″,ip_
      sid=123456789012,level1=Y,level2=N″
   ″ip_ad1=192.168.200.17,ip_ad2=\″\″,ip_ad3=\″\″,ip_
      sid=123456789123,level1=Y,level2=N″
   ″ip_ad1=192.168.200.23,ip_ad2=192.168.200.26,ip_ad3=192.168.200.29,ip_
      sid=123456789576,level1=Y,level2=N″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-MAP-NETWORK** command.

Validation rule: level2 parameter must not be present when *osinode* = scnnode

If the osinode parameter for which the network map should be retrieved is the *scnnode* the input parameter level2 is not allowed.

Error code:

`IDNC- Input, Data Not Consistent, level2 not allowed for scnnode`

RTRV-MAP-RING: Retrieve map ring

The **RTRV-MAP-RING** command retrieves the ring map for one MS-SPRing/BLSR protection group.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-MAP-RING**:*tid*:[*aid*]:*ctag*::[*rid*],*[mapsrc]*;

Important! To make sure that the complete ring map information will be given the **RTRV-RING-MAP** command should always be issued against the UNITE NE within the ring.

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **ctag** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).

4. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.

5. **`mapsrc`** – Map source
   This parameter specifies, how the ring map is derived. The value DCCEI is used if the ring map is derived via the DCF function. The value NVMRING is used if the ring map is derived from non-volatile memory as used by the MS-SPRing/BLSR protection group. The value MANUAL is used, if the ring map data which was manually populated by the user and stored in RAM is shown.
   Note: If NVMRING is specified and there is a valid and complete ringmap in NVM, it will be reported. Otherwise, nothing will be reported.
   Type: Alphanumeric value set.
   Range: DCCEI, NVMRING, MANUAL.
   Default: DCCEI.

Output format

After receiving the **`RTRV-MAP-RING`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:rid,localnid:spec_block"
    ...
    ...
   "aid:rid,localnid:spec_block"
;
```

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter specifies the aid of 2F-/4F MS-SPRing/BLSR protection.
   Type: AID
   Range: TwoFibre_ProtGrpAID or FourFibre_ProtGrpAID
2. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
3. **`localnid`** – Local Node ID
   This parameter specifies the local node ID of the NE receiving the retrieve request (i.e. the node which has been addressed within RTRV-MAP-Ring command) as used by the MS-SPRing/BLSR APS protocol.
   Type: Numeric string.
   Range: 0 .. 15

Spec block parameters

1. **`nid`** – Node ID
   This parameter specifies the node ID of the NE within the ring as used by the MS-SPRing/BLSR APS protocol. It shall correspond to the first TID in the *linkid* block.
   Type: Numeric string.
   Range: 0 .. 15
2. **`linkId`** – Link Identifier
   This parameter specifies a link connecting two NEs within the ring. It has the following format:
   linkid=\"{*nename*,[*port*],*direction*},{*nename*,[*port*],*direction*}\"
   The first value set of *nename*, *port*, *direction* corresponds to the NE as indicated by parameter *nid*.
   The second value set of *nename*, *port, direction* corresponds to the NE reachable via the link.
   The port and direction may be omitted, if the value *mapsrc* is MANUAL.
   Type: inner string
   Range: see parameter description for *nename*, *port, direction* below.
   Note: The *linkID* as used in the ring map will refer to the ports of that link which is used for the automatic detection of the ring topology (i.e. to protection ports for asymmetric spans and to worker ports for symmetric spans).

3. **`nename`** – NE Name
   See definition of parameter *tid* "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **`port`** – port AID
   This parameter specifies the port being a member within the 2-/4-fibre MS-SPRing/BLSR protection group.
   Type: AID, in case *nename* denotes the local NE; AID string, in case nename denotes another NE in the ring.
   Range: SPortAID, in case of an AID; up to 20 characters otherwise
   Option: The parameter may be omitted if unknown due to link failure.
5. **`direction`** – Direction
   This parameter specifies the side role of the corresponding port within the protection group. The value E is used for the east side. The value W is used for the west side.
   Type: Alphanumeric value set.
   Range: E, W
   Option: The parameter may be omitted if unknown due to link failure.
6. **`continuity`** – Link Continuity Status
   This parameter specifies the link continuity status of a port. The following values are supported:
   - UP – The link is working.
   - DOWN – The link has failed.
   - OPEN – The link is non-existent, as in an open ring.
   - UNKNOWN – The link ID has not been established.
   - ISOLATED – The link is in an isolated part of a segmented ring.

   Type: Alphanumeric value set.
   Range: UP, DOWN, OPEN, UNKNOWN, ISOLATED.
7. **`net`** – Network Entity Title
   This parameter specifies the NSAP (Network Service Access Point) with the last byte (SEL byte – see NSAP format) set to 00 (hex) for the node with TID as specified for the first *nename* within *linkid* list.
   Type: Hexadecimal digit string
   Range: 40 characters

Detailed behavior description

For open rings, the output starts at the end with the lower *nid* value and continuous to the other end. For closed rings, the output starts at the node with the lowest *nid* value and continues in the direction of the first node's east neighbor.

Example input/output

Ring map for an open ring – example 1

RTRV-NADR: Retrieve ONNS network (domain) address data repository

Overview

The **RTRV-NADR** command requests information of the ONNS network (domain) address data repository, which contains address information of the own domain about TNA type, TNA address, logical port IDs for UNI and EDGE ports and associated client nodes for UNI ports.

The **RTRV-NADR** command operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local data repository. Data from other ONNS nodes is acquired by the flooding and exchange of LSAs.

Retrieving ALL Network address data repository (NADR) records

When the *dataType* = ALL, Network Navigator shall respond to a request to retrieve its Network Address Data Repository (NADR) by sending a complete report of the contents of the data repository specified. The request shall cause the ONNS node to send all information in the specified data repository. When the Network address data repository is retrieved, each TL1 response message contains a record with all of the data relevant to the address information part of the LSA.

Retrieving Network address data repository (NADR) records for any ASTN node ID

The command **RTRV-NADR** with *dataType* = LSAID and *componentID* = ASTNNodeID shall retrieve the LSA address records that relates to the specified node with the ASTNNodeID. This ASTNNodeID can be the address of any node in the ONNS domain.

Retrieving Network address data repository (NADR) records for a specific port class

The command **RTRV-NADR** with *dataType* = portClass and *componentID* = UNI or EDGE shall retrieve the LSA address records that relates to the specified portClass.

REPT PTHCHG or REPT NNCHG is not generated

The **RTRV-NADR** command shall not generate a REPT PTHCHG or REPT NNCHG notification.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No

Input format

The **RTRV-NADR** command has an input parameter *dataType* that defines what type of information is expected in the *componentID* field that determines what portion of the data repository records is retrieved.

Command syntax: **RTRV-NADR**:*srcTid:srcAid:ctag::dataType[,componentID]*;

Input parameters

Command parameters

1. **srcTid**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique Tid used by Host NE. See also the definition of tid in RTRV-HDR.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The srcTid parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **srcAid**
   Source node ONNS application access identifier *srcAid* of the ONNS controller OS command interface port.
   Type: AID.
   Range: snn
   The keyword **all** is allowed up to shelf level.
3. **ctag**
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
4. **dataType**
   This parameter specifies, which part of the address information is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.
   Range: ALL – retrieves the entire (NADR) Network address data repository in RAM; LSAID – retrieves the LSA address record related to the ASTN node ID specified in the *componentID* must be an *ASTNnodeID*, PORTUSAGE – retrieves the LSA address records related to the port class specified in the *componentID* must be UNI or EDGE.
5. **componentID**
   componentID depends on the previous *dataType* parameter and is one of:
   not represented, when *datatype* = ALL
   nodeID, when *datatype* = LSAID (any ASTN node ID)
   portClass, when *datatype* = PORTUSAGE
   nodeID – Node Identifier:
   Identifier of an ASTN node.

Type: Four dot separated numeric strings.
Range: 0..255, for each numeric string.

portClass

Ports used by ONNS with additional address information.
Type: Alphanumeric value set.

Range:

- EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection
- UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection

Output format

The Network address data repository (NADR) record structure

The complete NADR of one node consists of *LSAAddrRecords* for all known nodes (including the reporting node itself) in the topology. Within a *LSAAddrRecord* all individual TNARecords with the associated logical port IDs are listed.

Network address data repository (NADR) without data

An addressed node without data in the NADR shall response only the HeaderRecord with *NumberOfLSAs* = 0. The network address data repository (NADR) Record is composed of an NADR_HeaderRecord and multiple *LSAAddrRecords* which are described below:

- **NADR_Record ::=**
  <NADR_HeaderRecord>
  <LSAAddrRecord_l>
  …
  <LSAAddrRecord_m>
- **NADR_HeaderRecord ::=**
  ″nadrID,dataType[=componentID],srcNodeASTNNodeID, NumberOfLSAs=LSA_Count″
- **LSAAddrRecord ::=**
  <LSAAddr_HeaderRecord>
  <TNARecord_1>
  <LogicalPortIDList_1>
  …
  <TNARecord_n>
  <LigicalPoerList_n>
- **LSAAddr_HeaderRecord ::=**
  ″LSAAdvertisedRouter=origNodeASTNNodeID,TNACount=TNAcount, portclass″

- **TNARecord ::=**
  ″TNAtype=TNAaddress[,ClientNodeID=nodeID]″
- **LogicalPortIDList ::=**
  ″LogicalPortIDs=lpid_1[&lpid_2&…&lpid_5]″
  [″LogicalPortIDs=lpid_6&lpid_7&…&lpid_10″]
  …
  [″LogicalPortIDs=lpid_n-4&lpid_n-3&…&lpid_n″]
  There is not more then 5 logical port IDs per line to avoid a line break.

Output format with normal data retrieve completion report for *dataType* = ALL

If the RTRV-NADR request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   ″NADR_HeaderRecord″
   ″LSAAddr_HeaderRecord1″

     ″TNARecord_5-4″
       ″LogicalPortIDList_5-4″
   ...
   ″LSAAddr_HeaderRecord9″
     ″TNARecord_9-1″
       ″LogicalPortIDList_9-1″
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) command.

NADR_HeaderRecord

1. **`nadrID`**
   Indicator for the responded data repository
   Type: Alphanumeric value set.
   Range: NADR, Network address data repository in RAM.
2. **`dataType`**
   This parameter specifies, which part of the address information is to be retrieved. Furtherore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.

   Range:

   - ALL: retrieves the entire (NADR) Network address data repository in RAM.
   - LSAID: retrieves the LSA address records related to the ASTN *nodeID* specified in the *componentID* must be an *ASTNnodeID*
   - PORTUSAGE: retrieves the LSA address records related to the port class specified in the *componentID* must be UNI or EDGE
3. **`componentID`**
   This parameter depends on the previous dataType parameter and is one of: not represented (when *datatype* = ALL), nodeID (when datatype = LSAIP (any node ID), portClass (when *datatype* = PORTUSAGE).
   `nodeID` – Node Identifier
   Identifier of an ASTN node.
   Type: Four dot separated numeric strings.
   Range: for each numeric string: 0..255
   `portClass`
   Ports used by ONNS with additional address information.
   Type: Alphanumeric value set.

   Range:

   - EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection
   - UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection

   Note: If *dataType* = ALL, *componentID* and the “=” sign are not reported.
4. **`srcNodeASTNNodeID`** – Reporting Node ID
   This parameter is the ASTN node ID of the ONNS node replying to this command.
   Values: Four dot separated numeric strings, 0 – 255 for each numeric string.

5. **`LSA_Count`**
   This parameter indicates the number of LSA address records in the report.
   Type: Integer
   Range:
   - >0: number of LSAs with address records
   - 0: no EDGE or UNI port(s) with additional address information are defined at this node or within the network

   In case of LSA_Count = 0 only the *NADR_HeaderRecord* is displayed in the output.

LSAAddrRecord

For each reported node of the topology one LSAAddrRecord per reported port class are reported.

1. LSAAddrHeaderRecord
   All parameters in the LSAAddrHeaderRecord describe properties of the *LSAAdvertisedRouter*.
   a. **`origNodeASTNNodeID`**
      The ASTN node ID of the advertiser of the LSA with the address data following the *LSAAddrHeaderRecord*.
      Type: Four dot separated numeric strings.
      Range: 0 – 255 for each numeric string.
   b. **`TNACount`**
      Number of reported TNAs of *LSAAdvertisedRouter* are provisioned on this node.
      Range: >0
   c. **`portClass`**
      Ports used by ONNS with additional address information.
      Type: Alphanumeric value set.
      Range:
      – EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection
      – UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection

TNARecord

For each TNA within the LSAAddrRecord one TNARecord is reported.

1. **`TNAType`**
   This parameter specifies the address type of the TNA address.
   Type: Alphanumeric value set.

Range:

- IPV4TNAADDR (default), TNA address is a IPv4 address
- IPV6TNAADDR, TNA address is a IPv6 address
- NSAPTNAADDR, TNA address is a NSAP address

2. **TNAAddress**
   TNAAddress depends on the previous TNAtype parameter and is one of:
   - IPv4TNAAddress, when TNAtype=IPV4TNAADDR
     Identifier of a TNA address in IPv4 format.
     Type: Four dot separated numeric strings.
     Range: 0 … 255, for each numeric string.
   - IPv6TNAAddress, when TNAtype=IPV6TNAADDR
     Identifier of a TNA address in IPv6 format.
     Type: Eight hyphen separated hexadecimal numbers.
     Range: 0 … FFFF, for each hexadecimal number.
   - NSAPTNAAddress, when TNAtype=NSAPTNAADDR
     Identifier of a TNA address in NSAP format.
     Type: Alphanumeric value set (20byte)
     Range: up to 20 alphanumeric strings with hexadecimal values 00..FF.
3. **nodeID** – Client Node ID
   IP address of the UNI client derived from the TNAAddress. This parameter is optional and only available for ports of portClass UNI.
   Type: Four dot separated numeric strings. Example: 135.13.44.61
   Range: 0 … 255, for each numeric string.
4. **LogicalPortIDList**
   The list of *LogicalPortIDs* is a list of numeric values indicating specific physical ports within a TNAaddress. The *logicalPortID* values are shown in the form: lpid1([&lpid2& …&lpidx]).
   Type: &-separated list of numeric strings.
   Range: lpid1([&lpidX])* where X <= 512 where lpidn = 0 … 42946967295. The value 512 for X results as theoretical value from the number of slots multiplied by number of possible ports per slot in 1675 LambdaUnite MSS.

Example input/output

Example NADR output for the **RTRV-NADR** command with ALL

The **RTRV-NADR** command with *dataType* = ALL produces this example output result:

RTRV-NADR:LT-ONNS-61::123456::ALL;

```
   LT-ONNS-61 2002-07-14 09:45:28

RTRV-NE: Retrieve NE

The **RTRV-NE** command retrieves DCN attributes associated with the NE at the system level but not associated with any particular facility or equipment unit.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-NE**:*tid*::*ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Description: Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Description: Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: CTAG.

Output format

If the **RTRV-NE** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   ":spec_block"
   .    .    .
   .    .    .
   .    .    .
   ":spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Spec block parameters

1. **ftamftpgw** – File Transfer Translation Device (FT-TD) function
   This parameter is used to enable or disable the File Transfer Translation Device (FT-TD) function.
   Type: Value set.
   Range: ENABLE, DISABLE (default).
2. **tl1tcpipgw** – TL1 Translation Device (T-TD) function
   This parameter is used to enable or disable the TL1 Translation Device (T-TD) function.
   Type: Value set.
   Range: ENABLE, DISABLE (default).
3. **dcnpn** – DCN ASAP Profile Name
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.
4. **scnpn** – SCN ASAP Profile Name
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.

Detailed behavior description

The command retrieves system parameters as described in the Output parameter section.

Example input/output

The following example shows the result of a **RTRV-NE** command:

```
RTRV-NE:LT-UNITE::123456;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
   ”:ftamftpgw=DISABLE”
   ”:tl1tcpipgw=DISABLE”
   ”:dcnpn=DEFAULT”
   ”:scnpn=DEFAULT”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-NE** command.

Related TL1 messages

"ED-NE: Edit NE" (p. 3-442)

RTRV-NE-SECU: Retrieve NE security

The **RTRV-NE-SECU** command can be initiated by a user to retrieve global security information in the NE. The current login sessions in the NE identified by the *uid* which established the session will also be retrieved using the **RTRV-NE-SECU** command.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: No

Input format

Command syntax: **RTRV-NE-SECU***:tid::ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

There is one output line for each session. The first line contains user information for the user and session that issued the **RTRV-NE-SECU** command.

After receiving the **RTRV-NE-SECU** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″uid::spec_block″
   ″uid″
   .
   .
   ″uid″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **uid** – User ID
   ID of the user that initiated the **RTRV-NE-SECU** command. Listed below this *uid* are *uids* of all the other sessions. If the user from which the **RTRV-NE-SECU** command was issued is logged on via other sessions, the *uid* list will contain each other instance of the *uid*, but the additional listing is just like the listing of any other user, without the additional user information.

Spec block parameters

1. **age** – Lockout Aging Period
   The time interval during which the number of invalid login attempts are counted. When *age* expires after the last invalid login attempt, the counter of invalid login attempts by that *uid* is reset to zero.
   Type: Numeric string.
   Range: 1 – 999 [minute]
   Default: 60
2. **intrvl** – Lockout Period
   The time during which login attempts using that *uid* will not be allowed. This occurs when the number of consecutive invalid login attempts by a *uid* reaches *thrshld*. When *intrvl* expires, login attempts will again be allowed from that *uid*. If this parameter is set to 0 (zero), the lockout feature is disabled.
   Type: Numeric string.
   Range: 0 – 99 [minute]
   Default: 10
3. **thrshld** – Lockout Threshold
   The maximum number of consecutive invalid login attempts that are allowed by a *uid*. If the count of invalid login attempts is equal to the threshold, the *uid* is locked out for *intrvl* period of time. If a login attempt is successful, the count of *invalid* login attempts by that *uid* is reset to zero.
   Type: Numeric string.
   Range: 2 – 99
   Default: 5
4. **usrage** – User ID Aging Period
   If a *uid* has never been used to perform a successful login during a specified time interval it is disabled. A value of 0 disables user ID aging.
   The *usrage* does not apply to the super-users. Super-users will be never disabled.
   Type: Numeric string.
   Range: 0 – 999 [days]
   Default: 10

Example input/output

The following example shows the successful completion of the **RTRV-NE-SECU** command by the NE:

```
            RTRV-NE-SECU:LT-UNITE-123::123456;
   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ”nbguser1::thrshld=3,intrvl=1,age=60,usrage=10”
   ”njsmith”
   ”hugo”
   ”airmail”
;
```

RTRV-NNCNFG: Retrieve ONNS configuration data

Overview

The **RTRV-NNCNFG** command retrieves ONNS system configuration parameters (fixed and user-provisionable). It also retrieves ONNS software version information. The data is retrieved from the ONNS system configuration data repository.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command syntax: **RTRV-NNCNFG:***srcTid:[srcAid]:ctag;*

Input parameters

Command parameters

1. **srcTid** – Source Target Identifier.
   The TID of the NE to which the command is addressed.
   See the parameter description in the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698) Input parameters section. NN uses the same *tid* used by the Host NE.
2. **srcAid**
   ONNS application access identifier: *snn*.
3. **ctag** – Correlation Tag
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
   It should be a unique value for each new command.

Output format

If the RTRV-NNCNFG request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   "specBlock"
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698) command.

Spec block parameters

This block contains the descriptions and allowed values for the reported output parameters.

1. **`AdminCostEscalation`**
   Determines whether a cost escalation algorithm is applied or not. This algorithm raises the cost of a link bundle to reduce the attractiveness when the link bundle fills up.
   Type: Alphanumeric value set.
   Range: DISABLE, ENABLE (default).
2. **`DefaultRstrPriority`**
   Determines the connection restoration priority default to be used if a value is not specified in the **`ENT-PATH`** command. Lower values denote higher priority.
   Note: Though the parameter *DefaultRstrPriority* can be set via ED-NNCNFG, it is for future use only, i.e. an actual value different from 0 will not be considered on connection setup. If no restoration priority is given via the **`ENT-PATH`** command, the priorty of the corresponding connection is always 0, no matter of the actual value of *DefaultRstrPriority*.
   Type: Integer
   Range: 0 – 7 (default = 0, highest priority).
3. **`LBA_Threshold`**
   The LinkBundle Availability threshold determines the percent change in bandwidth availability necessary to trigger an immediate LSA distribution.
   Type. Integer
   Range: 10 – 65 %
   Default: 50 %
4. **`LBA_UpdateTimer`**
   LinkBundleAvailability Update Timer determines the maximum interval for LSA distribution of bandwidth availability changes which have not exceeded threshold.
   Type. Integer
   Range: 1 – 25 minutes
   Default: 15 minutes
5. **`LB_UsageThreshold`**
   The LinkBundle usage threshold determines the percent link bundle usage that triggers cost escalation on the bundle.
   Type. Integer
   Range: 50 – 95 %
   Default: 70 %

6. **`MaxExplicitNodeList`**
   This parameter determines the maximum number of intermediate nodes that will be accepted in the ENT-PATH explicit node list.
   Type. Integer
   Range: 25 (default).
7. **`MaxExcludeNodeList`**
   Determines the maximum number of nodes that will be accepted in the ENT-PATH exclude *nodeList*.
   Type. Integer
   Range: 25 (default).
8. **`MaxSRLGList`**
   Determines the maximum number of SRLG values that will be accepted in the ENT-PATH SRLG exclude list.
   Type. Integer
   Range: 25 (default).
9. **`NN_BldInfo`**
   Version of path calculation engine. Consists of:
   - NEtype
   - NN_SWVersion
   - Operating system

   Type. alphanumeric string
   Range: *ORPx.y* for NEtype, x, y digits, *LU-NNx.y.z* for NN_SWVersion, x, y, z digits, *Chorus* for Operating System
10. **`NN_BldVersion`**
    ONNS Build version and date in format *xxx-mmddyy*, since there is no difference any longer between the ONNS and host build version, this field is set to a default value. See corresponding parameters in RTRV-PRMTR-SWTFR and ACT-USER.
    Type: two – separated numeric strings
    Range: 000-000000 (default).
11. **`NNFunctionUpgradeState`**
    After a software upgrade, new ONNS functionality must be explicitly enabled. This parameter indicates whether this has been done or not.
    Type: Alphanumeric value set.
    Range:
    - DISABLE: New ONNS functionality not yet enabled
    - ENABLE: New ONNS functionality already enabled.

    Default: ENABLE.
12. **`NN_HostName`**
    Host name of the Host NE.
    Type: Alphanumeric string
    Range: 1675 LambdaUnite MSS (default).

13. **`NN_SigIpAddress`**
    Signaling IP address of the SCN.
    Type: Four dot separated integers.
    Range: 0 – 255 for each integer.
14. **`NN_SWVersion`**
    ONNS software version number in the format *x.y.z*, where
    - *x* = release,
    - *y* = point release,
    - *z* = development integration release.

    Type: Three dot separated integers.
    Range: 0 … 99 for each integer.
15. **`NN_SystemMode`**
    NN system mode status describes the operational state of ONNS.
    Type: Alphanumeric value set
    Range:
    - INIT: Initializing
    - MAINT: in maintenance condition (MCOND)
    - RUNNING: in normal operation
16. **`NN_UiIpAddress`**
    UI IP address (currently not used).
    Type: Four dot separated integers.
    Range: 0 – 255 for each integer.
17. **`NodeID`**
    Identifier of the ASTN node to which the **`RTRV-NNDR`** command is sent.
    Type: Four dot separated numeric string
    Range: 0 – 255 for each numeric string.
18. **`PathRestoreRetryMax`**
    Determines how many retries ONNS makes during the path restoration
    Type: Integer
    Range: 0 – 5
    Default: 1
19. **`PathSetupRetryMax`** – Maximum Path Restoration Retries
    Determines how many retries ONNS makes after the initial path setup.
    Type: Integer
    Range: 0 – 5
    Default: 1

20. **`Perm1plus1HoldOffTimer`** – Permanent 1+1 Hold Off Timer
    Determines how long a worker or protection path of a permanent 1+1 connection must be steadily failed before the failed path is restored non-revertively by a new path. Applies only to a permanent 1+1 connections.
    Type: Integer
    Range: 15 – 600 seconds in 1 second steps.
    Default: 360 seconds
21. **`RestorationRetryTimer`**
    Path Restoration Queue timer, sets the time between checks to restore from the queue.
    Type: Integer
    Range: 90 – 700 seconds
    Default: 324 seconds
22. **`TCAThresholdHigh`**
    Upper threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status HIGH for this link bundle
    Type: Integer
    Range: 10 – 100 %
    Default: 70 %
23. **`TCAThresholdLow`**
    Lower threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status LOW or HIGH for this link bundle.
    Type: Integer
    Range: 10 – 100 %
    Default: 40 %
24. **`tid`** – Node Target Identifier
    Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.
    See also the definition of *tid* in RTRV-HDR.
    Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
    Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
25. **`WaitToRevertTimer`**
    Determines how long an original path must be steadily OK before it is made active again through tear-down of the restoration path. Applies to auto-reroute revertive connections. This parameter shall apply to M:N protected connections as well.
    Type: Integer
    Range: 60 – 1800 seconds
    Default: 300 seconds

Example input/output

The following is an example shows a successful execution of the **RTRV-NNCNFG** command:

```
RTRV-NNCNFG:DIETMAR:snn:C1;

   DIETMAR 2003-06-06 10:21:57
M  C1 COMPLD
   "TID = DIETMAR,
   NodeId = 29.54.174.87,
   NN_SWVersion = 2.0.0,
   NN_BldVersion = 042-032603,
   NN_BldInfo = ORP2.0, LU-NN2.0.0, Sun/Chorus,
   NN_HostName = LambdaUnite,
   NN_SystemMode = RUNNING,
   NN_SigIpAddress = 172.16.1.250,
   NN_UiIpAddress = 0.0.0.0,
   AdminCostEscalation = DISABLE,
   PathSetupRetryMax = 1,
   PathRestoreRetryMax = 1,
   DefaultRstrPriority = 0,
   RestorationRetryTimer = 324 seconds,
   Perm1plus1HoldOffTimer = 15 seconds,
   WaitToRevertTimer = 300 seconds,
   LBA_UpdateTimer = 15 minutes,
   LBA_Threshold = 50 %,
   LB_UsageThreshold = 70 %,
   TCAThresholdLow = 42 %,
   TCAThresholdHigh = 69 %,
   MaxExplicitNodeList = 8,
   MaxExcludeNodeList = 15,
   MaxSRLGList = 10,
   NNFunctionUpgradeState = ENABLE"
;
```

RTRV-NNDR: Retrieve ONNS neighbor nodal data repository

Overview

The **RTRV-NNDR** command retrieves information stored in the NNDR data repository that is in RAM memory. The **RTRV-NNDR** command operates on the current, active-memory-resident, ONNS data. ONNS writes port/connPt/pathID data to NVM shortly after each cross-connect setup of a path transaction completes. The NVM data is used in conjunction with port update messages from the NE during initialization to recover the ONNS NNDR data repository.

The NNDR record structure

The NNDR record is composed of an NNDR_HeaderRecord and multiple PortRecords which are described below, see the Output format and Output parameter sections for more detail.

Retrieving the NNDR records by ALL or by *portID*

ONNS responds to a RTRV-NNDR request to retrieve its NNDR by sending a report of the contents of the data repository. The command **RTRV-NNDR** with *dataType* = ALL shall cause the ONNS node to send all information in the NNDR data repository. When the NNDR is retrieved, each TL1 response message contains multiple PortRecords. If *dataType* = ALL, there must be no *componentID*. When *dataType* = PORT and a *componentID* = portID are specified as input parameters in RTRV-NNDR, the NNDR data repository records relating to that *portID* is returned

Retrieving the NNDR records by *neighborASTNNodeID* or *UNIclientNodeID*

When *dataType* = NBRIP and *componentID* = neighborASTNNodeID is specified, the response returns all NNDR PortRecords related to the link bundles between the reporting node and its neighbor node with the *neighborASTNNodeID*.

When *dataType* = NBRID and *componentID* = UNIClientNodeID is specified, the response returns all Neighbor Nodal data repository (NNDR) PortRecords related to the port connections between the reporting node and its neighbor node with the *UNIClientNodeID*.

The command will fail if the *neighborASTNNodeID* or the *UNIClientNodeID* is not a neighbor of the reporting node.

Retrieving the NNDR records by *PortUsage*

When *dataType* = PORTUSAGE and a *componentID* = portClass is specified, the response returns all NNDR records relating to ports with the *portClass* specified in the *componentID* field.

The **RTRV-NNDR** command sends a maximum of 4 PortRecords per block of data returned if there are no associated cross connects on the ports. PortRecords with *TribConnRecords* will be send in data blocks that are less than 4096 characters. On all messages but the last, a RTRV completion code is used and the semicolon (;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

Data blocks in PortRecords with TribConnRecords shall contain complete TribConnRecords only including leading and trailing double quotes (″).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command syntax: **`RTRV-NNDR:`***srcTid:[srcAid]:ctag::dataType[,componentID];*

Input parameters

Command parameters

1. **`srcTid`** – Target Identifier.
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **`ctag`** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
4. **`dataType`**
   This parameter specifies, which part of the NNDR is to be retrieved. Furtheron it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

Values:

- ALL: retrieves the entire NNDR in RAM.
- PORT: retrieves NNDR port data, *componentID* must be a *portID*.
- NBRID: retrieves all NNDR port data for link bundles and port connections respectively between the local and neighbor node, *componentID* must be a *neighborASTNNodeID* or a *UNIClientNodeID*.
- PORTUSAGE: retrieves all NNDR port data of ports of a specified port class, *componentID* must be a *portClass*.

5. **`ComponentID`**

   This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype* = ALL), *portID* (when *datatype* = PORT, see definition of output parameter *portID* in RTRV-PATH), *nodeID* (when *datatype* = NBRID), *portClass* (when *datatype* = PORTUSAGE).

   The detailed parameter format of the choices is described below:

   - **`portID`** – Port Identifier

     Port ID for which the NNDR data is retrieved. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.

     Type: dash-separated list of 4 numeric strings

     Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16).
   - **`nodeID`** – Neighbor Node Identifier

     This parameter identifies a neighbor ASTN node or a neighbor UNI client.

     Type: Four dot separated numeric strings (0 – 255 for each numeric string).
   - **`portClass`**

     This parameter specifies which type of port to include in the report, it determines how ONNS uses the port: EDGE (ONNS client port, where the signal enters/leaves the ONNS domain); INNI (ONNS port within the ONNS domain, topology relevant); ENNI (ONNS port, where the signal enters/leaves the ONNS domain from/to a other domain), UNI (ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client).

Output format

RTRV-NNDR output format without TribConnRecords

If the **`RTRV-NNDR`** request completes successfully, then the following normal NNDR_Report without TribConnRecords will be returned, when no tributary connections exists:

```
   srcTid date time
M  ctag RTRV
   ″NNDR_HeaderRecord″
   ″PR:PortStatusRecord_1,PortAttributeRecord_1″
   ...
   ″PR:PortStatusRecord_4,PortAttributeRecord_4″
>
```

```
   srcTid  date  time
M  ctag COMPLD
   ″PR:PortStatusRecord_5,PortAttributeRecord_5″
   ...
   ″PR:PortStatusRecord_8,PortAttributeRecord_8″
;
```

The **RTRV-NNDR** command will send a maximum of 4 port records per block. On all messages but the last, a RTRV completion code is used and the semicolon (;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

RTRV-NNDR output format with TribConnRecords

If the **RTRV-NNDR** request completes successfully, then the following normal NNDR_Report with TribConnRecords will be returned, when there are tributary connections:

```
   srcTid date time
M  ctag RTRV
   ″NNDR,ALL,srcNodeASTNNodeID,NumberOfRecords=portCount″
   ″PR:PortStatusRecord1,PortAttributeRecord1″
   [″TR:TribPathRecord_1[:TribPathRecord_1b]″]
   ...
   [″TR:TribPathRecord_n[:TribPathRecord_nb]″]
   .....
   .....
   ″PR:PortStatusRecord4,PortAttributeRecord4″
   [″TR:TribPathRecord_1[:TribPathRecord_1b]″]
   [″TR:TribPathRecord_2[:TribPathRecord_2b]″]
   [″TR:TribPathRecord_3[:TribPathRecord_3b]″]
   [″TR:TribPathRecord_4[:TribPathRecord_4b]″]
>

   srcTid  date  time
M  ctag COMPLD
   ″PR:PortStatusRecord5,PortAttributeRecord5″
   [″TR:TribPathRecord_1[:TribPathRecord_1b]″]
   ...
   [″TR:TribPathRecord_n[:TribPathRecord_nb]″]
   .....
   .....
   ″PortStatusRecord8,PortAttributeRecord8″
   [″TR:TribPathRecord_1[:TribPathRecord_1b]″]
   [″TR:TribPathRecord_2[:TribPathRecord_2b]″]
   [″TR:TribPathRecord_3[:TribPathRecord_3b]″]
   [″TR:TribPathRecord_4[:TribPathRecord_4b]″]
   [″TR:TribPathRecord_5[:TribPathRecord_5b]″]
```

```
;
```

Output syntax example with normal data retrieve report for one port with cross-connections

If the **RTRV-NNDR** request completes successfully, then the following port retrieve response is returned. The response is shown in terms of the variables that form the response record:

```
   srcTid  date  time
M  ctag COMPLD
   ″NNDR,dataType=componentID,srcNodeASTNNodeID,Number0fRecords=portCount″

      ″PR:portID,portClass,pdir,neighborNodeID&neighborPortID,lineSigStatus,portEqptStatus,pe

      portRate,monitorCap,propagationDelay,Cost=adminCost,,SRLG=srlgList,IncludeID=linkInclu
   ″TR:tribID1,pathID1,connPtA1,-X-,connPtB1,RsvStatus=rsvStatus1,XCStatus=
      xcStatus1,tribWidth1,tribSigStatus1
   :tribID1b,pathID1b,connPtA1b,-X-,connPtB1b,RsvStatus=rsvStatus1b,XCStatus=
      xcStatus1b,tribWidth1b,tribSigStatus1b″
   .........
   ″TR:tribIDn,pathIDn,xconnAn,-X-,xconnBn,RsvStatus=rsvStatusn,XCStatus=
      xcStatusn,tribWidthn,tribSigStatusn″
;
```

The *portCount* = n is shown in this example indicating that there are n tributary paths on this port.

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) command.

NNDR_HeaderRecord

1. **nndrID**
   ONNS Data Repository *dataID* to be returned: NNDR, Neighbor Nodal data repository in RAM.
2. **dataType**
   This parameter specifies, which part of the NNDR is to be retrieved. Furtheron it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Values:
   - ALL: retrieves the entire NNDR in RAM.
   - PORT: retrieves NNDR port data, *componentID* must be a *portID*.

- NBRIP: retrieves all NNDR port data for link bundles and port connections respectively between the local and neighbor node, *componentID* must be a *neighborASTNNodeID* or a *UNIClientNodeID*.
- PORTUSAGE: retrieves all NNDR port data of ports of a specified port class, *componentID* must be a *portClass*.

3. **`componentID`**
   This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype* = ALL), *portID* (when *datatype* = PORT, see definition of output parameter *portID* in RTRV-PATH), *nodeID* (when *datatype* = NBRIP), *portClass* (when *datatype* = PORTUSAGE).

   The detailed parameter format of the choices is described below:

   - **`portID`** – Port Identifier

     Port ID for which the NNDR data is retrieved. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.

     Type: dash-separated list of 4 numeric strings

     Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16).
   - **`nodeID`** – Neighbor Node Identifier

     This parameter identifies a neighbor ASTN node.

     Type: Four dot separated numeric strings (0 – 255 for each numeric string).
   - **`portClass`**

     This parameter specifies which type of port to include in the report, it determines how ONNS uses the port: EDGE (ONNS client port, where the signal enters/leaves the ONNS domain), INNI (ONNS port within the ONNS domain, topology relevant), ENNI (ONNS port, where the signal enters/leaves the ONNS domain from/to a other domain), UNI (ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client).
4. **`srcNodeASTNNodeID`** – Source Node ASTN Node ID
   Identifier of the ASTN node to which the **`RTRV-NNDR`** command is sent.
   Range:Four dot separated numeric strings, 0 – 255 for each numeric string.
5. **`NumberOfRecords`**
   This parameter indicates the number of PortRecords returned in this query.
   Values: number of NNDR records 0 – 1000.

PortRecord - PortStatusRecord

Two PortStatusRecords are present per reported port, one for each direction (see parameter pdir below).

1. **`portID`** – port identifier
   portID for which the NNDR data is retrieved. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.
   Type: dash-separated list of 4 numeric strings.
   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16).
2. **`portClass`**
   The *portClass* specifies how ONNS uses the port.

Values:

- INNI, ONNS port within the ONNS domain, topology relevant, bandwidth on this port is managed by ONNS
- EDGE, ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection.
- ENNI, ONNS port, where the signal enters/leaves the ONNS domain from/to another domain
- UNI, ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection
- NA, Traditional (non-NN) port, they are normally not included in the ONNS data repository (exception: connections with EDGE ports exist).

3. **`pdir`** – Port Direction
   This parameter specifies whether the PortRecord is for the port in receive or transmit direction.

   Values:

   - TX: PortRecord is for transmit side of port
   - RX: PortRecord is for receive side of port

4. **`neighbor`** – Neighbor Information

   The neighbor information consists of &-separated *neighborNodeID* and *neighborPortID* parameter.

   - **`neighborNodeID`**

     Identifier of the peer node (neighbor node) with respect to output parameter *portID*. This peer node can be a peer ASTN node or a peer UNI client node. The special value 0.0.0.0 indicates that the neighbor node ID is unknown. The *neighborNodeID* shall get the value “0.0.0.0” if the neighbor node is node of another domain.

     Type: Four dot separated numeric strings, (0 – 255) for each numeric string

   - **`neighborPortID`**

     PortID for which the NNDR data is retrieved. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #..

     Type: dash-separated list of 4 numeric strings.

     Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16).

     The special value 0-0-0-0 indicates that the neighbor *portID* of an ASTN node is unknown. The *neighborPortID* shall get the value “0-0-0-0” if the neighbor node is a UNI client node or a node of an other domain.

5. **`lineSigStatus`** – Port Line Signal Status
   Line Signal Status indicates the fault status of the line signal on the port as reported to ONNS from the Host..

Values:

- GOOD (ONNS assumes that the port can be used for transmission)
- BAD (ONNS assumes that the port can not be used for transmission)
- UNKNOWN (ONNS couldn’t derive status information from the Host).

6. **`portEqptState`**
This parameter indicates the fault status of the equipment associated with the port as reported to ONNS by the Host..
Values: OK (ONNS assumes that the equipment is ok and that the associated port can be used for transmission), FAILED (ONNS assumes that the equipment is failed and that the associated port can not be used for transmission), UNKNOWN (ONNS couldn’t derive status information from the Host).

7. **`portAdminMode`** – Port Control
This attribute determines the mode of operation of this port.
Values: NORMAL (Port is for unrestricted use by ONNS), LOCKOUT (ONNS is not allowed to use the port for new connections, note: ONNS might delete existing connections from that port).

PortRecord - PortAttributeRecord

Two PortAttributeRecords are present per reported port, one for each direction (see parameter *pdir* above).

1. **`portRate`**
This parameter specifies the bandwidth / port rate of the port.
Range:
   - STS3 (STM1E, STM1, OC3 port)
   - STS12 (STM4, OC12 port)
   - STS48 (STM16, OC48 port)
   - STS192 (STM64, OC192 port)
   - GE1 (GE1 port)
   - GE10 (GE10 port)
   - STS3-adaptive (STM1E, STM1, OC3 iNNI port; OC3 EDGE or eNNI port in adaptive mode)
   - STS12-adaptive (STM4, OC12 iNNI port; OC12 EDGE or eNNI port in adaptive mode)

- STS48-adaptive (STM16, OC48 iNNI port; OC48 EDGE or eNNI port in adaptive mode)
- STS192-adaptive (STM64, OC192 iNNI port; OC192 EDGE or eNNI port in adaptive mode)

2. **`propagationDelay`**
Propagation delay in milliseconds through the port connection between the pair of ports on the path. The time needed for a signal to traverse from this node to the neighbor node. A propagation delay of 1 milliseconds corresponds to about 450 km of fiber length.
Range: 0 – 255, default = 0.
Propagation delay parameter is not applicable for EDGE, ENNI and UNI ports and is set to the default value.
3. **`Cost`** – Administrative Cost
Provisioned administrative cost of the port connection when used in a connection path.
Range: 1 – 65535
Administrative cost parameter is not applicable for EDGE ports and is set to the default value. Administrative cost parameter is not applicable for UNI ports and is set to the default value.
4. **`SRLG`** – SRLG list
Shared Risk Link Group Identifier list. See also parameter srlgList in RTRV-rr. The max. number of identities that can be provisioned per port may be release dependent.
Type: Up to ten &-separated integers
Examples:
198&233&0&0&0&0&0&0&0&0
10&20&30&40&0&0&0&0&=&0&0
89&1000&4&10&20&31&111&231&300&777
Range: Each value: 0 – 65535.
Default: 0, means no SRLG provisioned.
SRLG list is not applicable for EDGE ports and is set to the default value. SRLG list is not applicable for UNI ports and is set to the default value.
5. **`IncludeID`** – VPN ID
Values: 0 – 65535. default: = 0, means *includeID* provisioned.
VPN ID is not applicable for EDGE, ENNI and UNI ports and is set to the default value.
6. **`XCRate`** (minXCrate)- Cross-connection rate
The XCRate consists of minXCrate&maxXCrate with
   - *minXCrate* denotes the smallest signal rate granularity used to provision a port into trib's,
   - *maxXCrate* denotes the largest signal rate granularity used to provision a port into trib's.

   Type: two &-separated alphanumeric value sets

Range *minXCrate*:

- STS1 (for all STM***m***, OC***n*** ports)
- STS3 (for all STM***m***, OC***n*** ports)
- STS12 (for all STM***m***, OC***n*** ports, with m = 4, 16, 64 and ***n*** = 12, 48, 192)
- STS48 (for all STM***m***, OC***n*** ports, with m = 16, 64 and ***n*** = 48, 192)
- STS192 (for all STM***m***, OC***n*** ports, with ***m*** = 64 and ***n*** = 192)
- STS1 (for 1 GbE ports in SONET mode)
- STS3 (for 1 GbE ports in SDH mode)
- STS1(for 1 GEPL ports in SONET mode)
- STS3 (for 1 GEPL ports in SDH mode)
- STS3 (for 10GEPL ports)

Range *maxXCrate*:

- STS1 (for all STM***m***, OC***n*** ports)
- STS3 (for all STM***m***, OC***n*** ports)
- STS12 (for all STM***m***, OC***n*** ports, with ***m*** = 4, 16, 64 and ***n*** = 12, 48, 192)
- STS48 (for all STM***m***, OC***n*** ports, with ***m*** = 16, 64 and ***n*** = 48, 192)
- STS192 for all STM***m***, OC***n*** ports, with ***m*** = 64 and ***n*** = 192)
- STS1 (for 1 GbE ports in SONET mode)
- STS3 (for 1 GbE ports in SDH mode)
- STS1(for 1 GEPL ports in SONET mode)
- STS3 (for 1 GEPL ports in SDH mode)
- STS3 (for 10GEPL ports)

7. **BundleID** – Link Bundle identifier

   This parameter is a unique numeric ID assigned to a link bundle or TNA address on this node.

   There are two preconditions for link bundling:

   - A number of parameters with same values, e.g. propagationDelay, provisioned on iNNI ports. See **RTRV-*rr***.
   - Same TNA address, provisioned as network TNA Address on EDGE ports or SDH/SONET UNI ports or as EPL TNA Address on GbE UNI ports. See **RTRV-*rr*** or “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078).

   Range: 1 .. 32767 (valid BundleID), 0 (for EDGE ports without network TNA address and for eNNI ports).
   Type: Integer.

TribPathRecord

For ports with *portClass* = INNI one TribPathRecord is present per cross-connection associated with the port. For ports with *portClass* = EDGE, *portClass* = UNI or *portClass* = ENNI two TribPathRecords are present per bridged cross-connection and one TribPathRecord is present per non-bridged cross-connection associated with the port.

1. **`tribID`** – Tributary Identifier
   Identifier of the tributary whose *pathID* and cross-connect information is included below. The *tribID* also denotes the timeslot of the reported cross-connection in the reported port.

   Range: 1 - n

   - with n=3 for STM1E, STM1, OC3 ports
   - with n=12 for STM4, OC12 ports
   - with n=48 for STM16, OC48 ports
   - with n=192 for STM64, OC192 ports
   - with n=21 for GE1 ports
2. **`pathID`** – Path Identifier
   The *pathID* of the associated cross-connection. The special value 0.0.0.0-0 indicates, that there is no associated pathID, i.e. the port has a non-ONNS cross-connection.
   Type: character string of length up to 20.
   Range: nodeID-Index; nodeID: four dot separated numeric strings: each string 0..255, Index: Numeric string.
   Example: 135.13.196.203-432165
3. **`connPtA`** – Connection Point A
   The *connPoint* on the reporting port of the cross-connection connPoint pair. The connPtA consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # .
   Type: dash-separated list of 5 numeric strings.
   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
   Special values for slot/pack, port, and tributary
   Slot/Pack # #
   Port # #
   Tributary # #
   Value “#” for slot/pack, port, and tributary indicates default tributary AID used for reporting the open end in not existing cross-connections in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.
   Slot/Pack # *
   Port # *
   Tributary # *
   Value “*” for slot/pack, port, and tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified

in parameter *connPtA*) is allocated by one or more LO traditional cross-connections.
Slot/Pack # @
Port # @
Tributary # @
Value “@” for slot/pack, port, and tributary indicates that the corresponding HO input and/or output tributary specified by *connPtA* is involved as EDGE-prt tributary in an OUC.
Slot/Pack # $
Port # $
Tributary # $
Value “$” for slot/pack, port, and tributary indicates a temporary reservation of an output tributary of an ENNI port needed for a network connection setup.

4. **`connInd`** – Connection Indicator
Seperator for better readability.
Range: -X- (cross-connection setup)

5. **`connPtB`**
The *connPoint* opposite to the reporting port of the cross-connection *connPoint* pair. The *connPtB* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
Type: dash-separated list of 5 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128)
Special values for slot/pack, port, and tributary
Slot/Pack # #
Port # #
Tributary # #
Value “#” for slot/pack, port, and tributary indicates default tributary AID used for reporting the open end in not existing cross-connections in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.
Slot/Pack # *
Port # *
Tributary # *
Value “*” for slot/pack, port, and tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter *connPtA*) is allocated by one or more LO traditional cross-connections.
Slot/Pack # @
Port # @
Tributary # @
Value “@” for slot/pack, port, and tributary indicates that the corresponding HO input and/or output tributary specified by *connPtA* is involved as EDGE-prt tributary in an OUC.

Slot/Pack # $
Port # $
Tributary # $
Value "$" for slot/pack, port, and tributary indicates a temporary reservation of an output tributary of an ENNI port needed for a network connection setup.

6. **`RsvStatus`** – Reservation Status
   Indicator whether the cross-connection has been allocated to a path by ONNS..
   When *RsvStatus* = 0 and *XCStatus* = 1, this is a Host NE initiated cross-connection.
   Reserved (by ONNS) = 1; Unreserved = 0; default = 1.
7. **`XCStatus`**
   Indicator whether the cross-connect operation was successful.
   When *RsvStatus* = 0 and *XCStatus* = 1, this is a Host NE initiated cross-connection.
   Range: Success = 1 (default); Failed = 0
   2 = Reserved, for cross-connections, that are not physically switched, i.e. cross-connections in A- and Z-node for protecting NN connections within M:N protected connection groups.
   3 = Reserved, for cross-connections, that are not switched on higher order, but the corresponding HO tributary is blocked by a LO cross-connection on a substructure.
   4 = Reserved, for cross-connections, that are switched to/from an EDGE tributary involved as EDGE-prt in an OUC.
8. **`tribWidth`** – Tributary Width
   The used bandwidth of the cross-connections expressed in multiples of STS1s.
   Range: STS1, STS3, STS12, STS48, STS192.
9. **`tribSigStatus`** – Tributary Signal Status
   This parameter indicates the fault status of the *connPtA* incoming signal on a path.
   Range: OK, FAILED.

Note: In the reply to the TL1 command **`RTRV-NNDR`** the parameter *tribSigStatus* is missing. This parameter is sent per tributary path record being sent for all connected tributaries of all ports reported and gives the state of the incoming signal at the corresponding tributary (value OK or FAILED). As tributary record information from RTRV-NNDR is not displayed at the GUI, this issue is only recognized when checking TL1 logfiles. Workaround: To get state information at least for paths as a whole, RTRV-PATH can be executed or the corresponding GUI screens can be used.

Example input/output

Example NNDR output for the `RTRV-NNDR` command with an INNI *portID*:

The following example shows the output of a **`RTRV-NNDR`** command for an INNI portID:

```
RTRV-NNDR:LT-ONNS-319::123456::PORT,1-1-3-4;

   LT-ONNS-319 2002-01-14 09:45:28
M  123456 COMPLD
   "NNDR,PORT=1-1-3-4,172.41.18.0,NumberOfRecords=2"
```

```
   "PR:1-1-3-4,INNI,TX,172.41.19.1&1-1-1-2,,OK,OK,,NORMAL,,

      STS48,MON,10,Cost=1,,SRLG=0&0&0&0&0&0&0&0&0&0,IncludeID=0,XCRate=STS1&STS48,BundleID=39"
   "TR:1,172.3.19.0-1011,1-1-3-4-1,-X-,1-1-2-1-1,RsvStatus=1,XCStatus=1,STS12,OK"
   "TR:13,172.3.19.0-1251,1-1-3-4-13,-X-,

Incorrect bandwidth reporting

In case a *unidirectional* Signal Degrade (SD) condition occurs on an INNI port connection within an ONNS domain, this SD condition leads to a near-end-failure condition being raised for the affected port connection by the detecting node for the corresponding direction only. This leads to the following behavior:

- For the direction opposite to the direction of the corresponding SD condition the bandwidth of the affected port connection is removed of the available bandwidth advertised for the corresponding INNI link bundle, although in this direction no failure condition at all is present.
- Asymmetric available bandwidth is reported for the affected INNI link bundle via **`RTRV-NTDR`**, but just the other way round as the actual failure condition would suggest.
- For the setup of a unidirectional ONNS path (due to connection setup or restoration) via the affected link bundle in the direction opposite to the SD condition the affected port connection will not be selected, although in this direction no failure condition exists and the setup would succeed.
- The setup of a unidirectional path in the direction of the SD condition or of a bidirectional path in any of both directions via the affected port connection would be possible and would succeed in first place, but might afterwards still fail with E022 due to the fact, that the SD condition on port connection level induced an SD condition on path level.
  This is due to the fact, that for path level an SD condition raises a failure condition that causes a path setup to fail.

Workaround

In case such asymmetric behavior occurs, INNI link bundles in the affected ONNS domain could be checked for SD conditions via **`RTRV-NTDR`**, **`RTRV-NNDR`**, and **`RTRV-rr`**. Additionally, an SD alarm should have been raised for the affected port, if not suppressed.

RTRV-NNEVT-TCA

Overview

The **RTRV-NNEVT-TCA** command retrieves the threshold control alert (TCA) status of the link bundles and operates on the current neighbor nodal data repository (NNDR) based local view on the bandwidth availability.

Retrieving all TCA status records

Network Navigator responds to a request to retrieve its TCA Status by sending a complete report of the corresponding contents of the NNDR for the local node.

The command **RTRV-NNEVT-TCA** ALL is supported, and it retrieves the entire TCA Status of the local node when the dataType field = ALL.

The **RTRV-NNEVT-TCA** command sends a maximum of 64 output lines per block. If possible, the next block shall start with the next LSA_Link_Record.

Retrieving TCA status by neighbor ASTN node ID

The command **RTRV-NNEVT-TCA** with dataType = NBRID and a neighborASTNNodeID as componentID retrieves all of the TCA status records that relate to the link between the local node and the neighbor node with that neighborASTNNodeID. The componentID is a single specific ASTN node ID of a neighbor node (ONNS adjacent node).

REPT PTHCHG or REPT NNCHG is not generated

The **RTRV-NNEVT-TCA** command do not generate a REPT PTHCHG or REPT NNCHG message.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

The **RTRV-NNEVT-TCA** command has a parameter dataType that defines what type of information is expected in the componentID field that determines what portion of the data repository records is retrieved.

Command syntax: **RTRV-NNEVT-TCA:***srcTid:[srcAid]:ctag::dataType[,componentID];*

Input parameters

Command parameters

1. **`srcTid`** – Source Target Identifier
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set.
2. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **`ctag`** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
4. **`dataType`**
   This parameter indicates the data input parameter type of the *componentID* in the next field. The input parameters in the next field may change with each *dataType* to suit the requirements of the requested *dataType*. ALL is supported in this field and requires no *componentID* in the next field.
   Type: Alphanumeric value set.
   Range:
   - *ALL*: retrieve all TCA Status information
   - *NBRID*: next field will contain a Neighbor ASTN node ID, not valid without a matching appropriate value in the *componentID* field except for dataType = ALL.
5. **`componentID`**
   This parameter allows the user to specify a portion of TCA Status information such as an ASTN node ID for a neighbor node to return the TCA Status for all bundles of a link. The TCA Status records for the specified *componentID* will be returned.
   componentID depends on the previous dataType parameter and is one of:
   - not represented when datatype=ALL, to get all TCA Status information
   - *nodeID*: when datatype=NBRID, to get the part of the TCA status of the link between that neighbor node and this node.
     Description of nodeID (Neighbor Node Identifier):

Identifier of a neighbor ASTN node or a neighbor UNI client.
Type: Four dot separated numeric strings.
Range: 0 … 255, for each numeric string.

Output format

The **RTRV-NNEVT-TCA** with *dataType* = ALL produces this example output result with the complete TCA status information of the local node:

```
RTRV-NNEVT-TCA:LT-ONN61:snn:123456::ALL;

   LT-ONN61 2002-01-14 09:45:28
M  123456 COMPLD
   ″nndrID,ALL,srcNodeASTNNodeID″
   ″LinkId=origNodeASTNNodeID&neighborASTNNodeID1″
    ″:BundleID=bundleID1,TCAStatus=TCA_Status1″
    ″:BundleID=bundleID3,TCAStatus=TCA_Status3″
   ″LinkId=origNodeASTNNodeID&neighborASTNNodeID9″
    ″:BundleID=bundleID9,TCAStatus=TCA_Status9″
   ″LinkId=origNodeASTNNodeID&neighborASTNNodeID2″
    ″:BundleID=bundleID2,TCAStatus=TCA_Status2″
    ″:BundleID=bundleID7,TCAStatus=TCA_Status7″
;
```

The **RTRV-NNEVT-TCA** command with *dataType* = NBRID produces this example output result:

```
RTRV-NNEVT-TCA:LT-ONN61:snn:123456::NBRID,neighborASTNNodeID;

   LT-ONN61 2002-01-14 09:45:28
M  123456 COMPLD
   ″nndrID,NBRID=neighborASTNNodeID,origNodeASTNNodeID″
   ″LinkId=origNodeASTNNodeID&neighborASTNNodeID″
    ″:BundleID=bundleID1,TCAStatus=TCA_Status1″
    ″:BundleID=bundleID4,TCAStatus=TCA_Status4″
    ″:BundleID=bundleID3,TCAStatus=TCA_Status3″
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) command.

Header_Record

1. **`nndrID`** – ONNS Data Repository dataID to be returned
   Type: Alphanumeric value set.
   Range: NNDR-TCA: TCA portion of Neighbour Nodal data repository.
2. **`dataType`**
   See definition of *dataType* in Input parameters section above.
3. **`componentID`**
   See definition of *componentID* in Input parameters section above.
4. **`nodeID`** - Neighbor Node Identifier
   Identifier of a neighbor ASTN node or a neighbor UNI client.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 … 255
5. **`origNodeASTNNodeID`** – ASTN node ID of the originating node.
   Type: Four dot separated numeric strings.
   Range: for each numeric string: 0..255.

Link_Header_Record

1. **`LinkID`**
   LinkID is the ASTN node ID of the originating node plus that of the neighbor node that uniquely identifies the link.
   Type: Two &-separated node IDs, each node ID consists of four dot separated numeric strings.
   Example: 135.13.44.61&135.13.3.86
   Range: for each numeric string: 0..255.

LinkBundle_Data Record

1. **`BundleID`**
   This parameter is a unique numeric ID assigned to the link bundle on this node..
   Type: Integer.
   Range: >0.
2. **`TCAStatus`** – Status of the TCA of this link bundle
   Type: Alphanumeric value set.
   Range: INACTIVE (default), LOW, HIGH

Example input/output

Output for the **`RTRV-NNEVT-TCA`** command by neighbor ASTN node ID.

The **`RTRV-NNEVT-TCA`** command with *datatype* = NBRID produces this example output result with all bundles between two neighbor nodes:

```
RTRV-NNEVT-TCA:LT-ONNS61:snn:123456::NBRID,135.13.44.86;

   LT-ONNS61 2001-01-14 09:45:28
M  123456 COMPLD
   ″NNDR-TCA,NBRID=135.13.44.86,135.13.44.61″
   ″LinkId=135.13.44.61&135.13.3.86″
```

```
    ":BundleId=1,TCAStatus=INACTIVE"
    ":BundleId=2,TCAStatus=LOW"
    ":BundleId=4,TCAStatus=HIGH"
;
```

The **RTRV-NNEVT-TCA** command with *datatype* = ALL produces this example output result:

```
RTRV-NNEVT-TCA:LT-ONNS-61:snn:123456::ALL;

   LT-ONNS-61 2002-07-14 09:45:28

    ":BundleId=7,TCAStatus=LOW"
    ":BundleId=15,TCAStatus=LOW"
    ":BundleId=8,TCAStatus=HIGH"
;
```

The **RTRV-NNEVT-TCA** command will send a maximum of 64 lines per block.

Error responses

Validation rule: Invalid *componentID* parameter

The validity of the *componentID* parameter is checked. If it is invalid an appropriate error response is returned.

The following error responses is returned for an ASTN node ID which is not that of a neighbor:

Error code: `E512 – IINI Error – Input, Invalid Neighbor node ID`

RTRV-NTDR: Retrieve ONNS network topology data repository

Overview

The **RTRV-NTDR** command retrieves information stored in the NTDR data repository that is in RAM memory. The **RTRV-NTDR** command operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local NTDR data repository. Data from other ONNS nodes is acquired by the flooding and exchange of LSAs.

Retrieving all NTDR records

When the *dataType* = ALL, Network Navigator responds to a request to retrieve its NTDR by sending a complete report of the contents of the data repository specified. The request causes the ONNS node to send all information in the specified data repository. When the NTDR is retrieved, each TL1 response message contains a record with all of the data relevant to a ONNS link group or LSA. The **RTRV-NTDR** command will send a maximum of 14 LSA linkBundle records per block.

Retrieving NTDR records for any ASTN node ID

The command **RTRV-NTDR** with *dataType* = LSAID and *componentID* = ASTNNodeID retrieves the NTDR LSA records that relate to all of the links from the specified node with the *ASTNNodeID* to adjacent nodes. This *ASTNNodeID* can be the address of any node in the ONNS domain.

Retrieving NTDR records for a neighbor ASTN node ID

The command **RTRV-NTDR** with *dataType* = NBRID and *componentID* = neighborASTNNodeID retrieves all of the NTDR LSA records that relate to the links between the current node and the neighbor node with the *neighborASTNNodeID*. The *componentID* is a single specific ASTNNodeID. The *neighborASTNNodeID* must be the ID of a neighbor node (ONNS adjacent node).

REPT PTHCHG or REPT NNCHG is not generated

The **RTRV-NTDR** command shall not generate a REPT PTHCHG or REPT NNCHG notification.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command syntax: **RTRV-NTDR**:*srcTid:srcAid:ctag::dataType[,componentID];*

Input parameters

Command parameters

1. **`srcTid`** – Source Target Identifier
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set.
2. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **`ctag`** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
4. **`dataType`**
   This parameter specifies, which part of the NNTR is to be retrieved. Furtheron it determines the expected input parameter type of the componentID input parameter. When datatype = ALL componentID must not be specified.

   Values:

   - ALL: retrieves the entire NTDR in RAM.
   - LSAID: retrieves the LSA in NTDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
   - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.
5. **`componentID`**

   This parameter depends on the previous *dataType* parameter and is one of:

   - not represented (when *datatype* = ALL)
   - *nodeID* (when *datatype* = LSAID (any node ID) or *datatype* = NBRID (neighbornode ID)

   The details for *nodeId* are described below.

nodeID – Node Identifier

- Identifier of an ASTN node.
- Type: Four dot separated numeric strings
- Range: for each numeric string: 0..255.

Note: If *dataType* = ALL, *componentID* and the = sign are not reported.

Output format

The Neighbor Topology data repository (NTDR) record structure

The complete NTDR of one node consists of LSARecords for all known nodes (including the reporting node itself) in the topology. Within a LSARecord level 1 Routing Controller information is kept in L1Routing and all (direct) neighborship relationships are kept in LinkRecords (one record for each neighbor relation). Within a LinkRecord the individual LinkBundleRecords are listed.

Neighbor Topology data repository (NTDR) without data

An addressed node without data in the NTDR shall response only the HeaderRecord with NumberOfLSAs = 0. The Neighbor Topology data repository (NTDR) Record is composed of an NTDR_HeaderRecord and multiple LSARecords which are described below:

NTDR_Record ::=

<NTDR_HeaderRecord>

<LSARecord_1>

...

<LSARecord_n>

NTDR_HeaderRecord ::=

nndrID,dataType[=componentID],srcNodeASTNNodeID,NumberOfLSAs=LSA_Count

Output format with normal data retrieve completion report for dataType=ALL

If the RTRV-NTDR request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   ″nndrID,ALL,srcNodeASTNNodeID,NumberOfLSAs=LSA_Count″
   ″LSAHeaderRecord_1::
   Link_HeaderRecord_1:
   LinkBundleRecord_1-1
   ...
   LinkBundleRecord_1-n″
   ...
   ″LSAHeaderRecord_4:L1Routing_4:
   Link_HeaderRecord_4:
   LinkBundleRecord_4-1″
>
   srcTid date time
M  ctag COMPLD
   ″LSAHeaderRecord_5::
   Link_HeaderRecord_5:
   LinkBundleRecord_5-1
   ...
   LinkBundleRecord_5-n″
```

```
   ...
   ”LSAHeaderRecord_m::
   Link_HeaderRecord_m:
   LinkBundleRecord_m-1
   ...
   LinkBundleRecord_m-n”
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) command.

NTDR_HeaderRecord

1. **nndrID**
   NN Data Repository *dataID* to be returned
   Type: Alphanumeric value set.
   Range: NTDR, Network Topology data repository in RAM

2. **dataType**
   This parameter specifies, which part of the ELDR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.

   Range:

   - ALL: retrieves the entire external link data repository in RAM
   - LSAID: retrieves the LSA in ELDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
   - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.

   This parameter specifies, which part of the NNTR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set

   Range:

   - ALL: retrieves the entire (NTDR) Neighbor Topology data repository in RAM
   - LSAID: retrieves the LSA in NTDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
   - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.

3. **componentID**

This parameter depends on the previous *dataType* parameter and is one of:

- not represented (when *datatype* = ALL)
- *nodeID* (when *datatype* = LSAID (any node ID) or *datatype* = NBRID (neighbornode ID)

The details for *nodeId* are described below.

nodeID – Node Identifier

- Identifier of an ASTN node.
- Type: Four dot separated numeric strings
- Range: for each numeric string: 0..255.

Note: If *dataType* = ALL, *componentID* and the = sign are not reported.
Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **srcNodeASTNNodeID** – Reporting Node ID
   ASTN node ID of the ONNS node replying to this command.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0..255
5. **LSA_Count**
   The parameter indicates the number of LSA records in the report. Also equals number of NE nodes in the network for *dataType* = ALL.
   Type: Integer
   Range:
   - >0: number of LSAs with topology data records
   - 0: no topology data at this node or within the network available

LSARecord

For each reported node of the topology one LSARecord is reported.

1. LSAHeaderRecord
   a. **origNodeASTNNodeASTNNodeID** – Node ID of Advertising Node
      This is the ASTN node ID of the node advertising this LSA data record.
      Type: Four dot separated numeric strings.
      Range: 0 – 255 for each numeric string.
   b. **linkCount**
      Number of reported links of *LSAAdvertisedRouter* towards other nodes in the network.
      Type: Integer
      Range: >0
   c. **nodeTid**
      Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.
      See also the definition of *tid* in RTRV-HDR.
      Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. L1Routing

   The L1Routing object is optional and only visible for the *LSAAdvertisedRouter* with the value PRIMARY for the parameter *routeFunc*.

   a. **`routeFunc`** – level 1 Routing Function

      routeFunc defines if the *LSAAdvertisedRouter* has level 1 routing controller functionality.

      Type: Alphanumeric value set.

      Range: PRIMARY (ONNS node is the primary level 1 routing controller)

   b. **`routeAreaID`** – Routing Area ID

      routeAreaID defines the identity of the routing area.

      Type: four dot separated numeric string

      Range: 0 – 255 for each numeric string.

   c. **`prouteAreaID`** – Parent Routing Area ID

      prouteAreaID defines the identity of the parent routing area.

      Type: four dot separated numeric string

      Range: 0 – 255 for each numeric string.

   d. **`routeControlID`** – level 1 Routing Controller ID

      routeControlID defines the identity of the level 1 routing controller.

      Type: four dot separated numeric string

      Range: 0 – 255 for each numeric string.

   e. **`routeControlIPAddr`** – level 1 Routing Controller IP Address

      routeControlIPAddr defines the IP address for this routing controller node as level 1 routing controller address.

      Type: four dot separated numeric string

      Range:

      For first numeric string: 0 … 223

      For second to fourth numeric string: 0 … 255

      The values 0.0.0.0 and 1.1.1.1 are excluded.

   f. **`abstractModel`** – Abstraction Model

      abstractModel defines the abstraction model used by the level 1 routing controller.

      Type: Alphanumeric value set.

      Range: ABSTRACTNODE

   g. **`abstractNodeID`**

      abstractNodeID is defined in case the *abstractModel* is ABSTRACTNODE. This parameter specifies the abstract node ID, which is advertised in the level 1 area.

      Type: four dot separated numeric string

      Range: 0 – 255 for each numeric string.

LinkRecord

For each neighborship of the *LSAAdvertisedRouter* one LinkRecord is reported.

1. Link_HeaderRecord
    a. **`LsaLinkID`**

    LsaLinkID consists of the advertising ASTN nodeID and a neighbor ASTN nodeID, which together uniquely identify a link. The two IDs are separated by a &.

    Type: Two times four dot separated numeric strings, separated by &.

    Example: 135.13.44.61&135.13.3.86

    Range: 0 – 255 for each numeric string.

    b. **`bundleCount`**

    Number of LinkBundles within the LinkRecord.

    Type: Integer

    Range: >0

2. LinkBundleRecord

    For each link bundle within the LinkRecord one LinkBundleRecord is reported.

    a. **`linkBundleID`**

    This parameter is a unique numeric ID assigned to the link bundle on this node.

    Range: 0 .. 32767

    b. **`delay`**- Propagation Delay

    Propagation delay in milliseconds through the port connection between the pair of ports on the path. The time needed for a signal to traverse from this node to the neighbor node. A propagation delay of 1 milliseconds corresponds to about 450 km of fiber length.

    Type: Integer

    Range: 0 (default) – 255

    Propagation delay parameter is not applicable for EDGE, ENNI and UNI ports and is set to the default value.

    c. **`adminCost`** – Administrative Cost

    Provisioned administrative cost of the port connection when used in a connection path.

    Type: Integer

    Range; 1 (default) – 65535

    Administrative cost parameter is not applicable for EDGE ports and is set to the default value. Administrative cost parameter is not applicable for UNI ports and is set to the default value.

    d. **`slrgList`** – Shared Risk Link Group Identifier list.

    The max. number of identities that can be provisioned per port may be release dependent.

    Type: Up to ten &-separated integers

    Examples:

    198&233&0&0&0&0&0&0&0&0

10&20&30&40&0&0&0&0&=&0&0

89&1000&4&10&20&31&111&231&300&777

Range: Each value: 0 (default) – 65535. 0 means no SRLG provisioned

SRLG list is not applicable for EDGE ports and is set to the default value. SRLG list is not applicable for UNI ports and is set to the default value.

e. **`IncludeID`** – VPN ID

   Type: Integer

   Range: 0 (default) – 65535. 0 means no includeID provisioned

   VPN ID is not applicable for EDGE, ENNI and UNI ports and is set to the default value.

f. **`minXCrate`**

   minXCrate denotes the smallest signal rate granularity used to provision a port into trib’s.

   Values: STS1 (link bundle consists of STMm, OCn ports), STS3 (link bundle consists of GE1 ports in SDH mode), STS1 (link bundle consists of GE1 ports in SONET mode).

g. **`totalBandwidth`**

   This parameter is a numeric value indicating the total bandwidth in this linkBundle as multiples of *minXCrate*.

   Type: Integer

   Range: >2

h. **`availableBandwidth`** (for *minXCrate*)

   This parameter is a numeric value indicating the available (i.e. non-used) bandwidth in this *linkBundle* as multiples of *minXCrate*.

   Type: Integer

   Range: ≥0

i. **`maxXCrate`**

   This parameter denotes the largest signal rate granularity used to provision a port into trib’s.

   Type: Alphanumeric value set.

   Range: STS1, STS3, STS12, STS48, STS192 (link bundle consists of all STMm, OCn ports), STS1 (link bundle consists of GE1 ports in SONET mode), STS3 (link bundle consists of GE1 ports in SDH mode).

j. **`availableBW_MaxXCrate`**

   This parameter is a numeric value indicating the available (i.e. non-used) bandwidth in this *linkBundle* as multiples of *maxXCrate*.

   Type: Integer

   Range: ≥0

Example input/output

Possible issues when widely using unidirectional ONNS connections

When in an ONNS network unidirectional ONNS connections are widely used, the following misbehavior may occur:

1. Local audit erroneously reports extra NN cross-connections: **AUD-LOCAL** and **RTRV-AUDLOG** may erroneously report extra NN cross-connections, if two unidirectional ONNS connections of differing bandwidth are traversing a node in opposite directions, but with connecting the same timeslots, for example, one connection from timeslot A to timeslot B and the other one from timeslot B to timeslot A.
2. Free bandwidth generally advertised on an INNI link, although no more bandwidth for bidirectional ONNS connections available: Setup of a bidirectional ONNS connection via an INNI link may fail, although for this link enough free bandwidth is generally advertised for example, via **RTRV-NTDR**. This is the case, if the corresponding link is nearly totally filled with a major part being unidirectional connections. The advertised free bandwidth may then refer to differing timeslots for both directions, thus not allowing bidirectional connections to be setup.

Incorrect bandwidth reporting

In case a *unidirectional* Signal Degrade (SD) condition occurs on an INNI port connection within an ONNS domain, this SD condition leads to a near-end-failure condition being raised for the affected port connection by the detecting node for the corresponding direction only. This leads to the following behavior:

- For the direction opposite to the direction of the corresponding SD condition the bandwidth of the affected port connection is removed of the available bandwidth advertised for the corresponding INNI link bundle, although in this direction no failure condition at all is present.
- Asymmetric available bandwidth is reported for the affected INNI link bundle via **RTRV-NTDR**, but just the other way round as the actual failure condition would suggest.
- For the setup of a unidirectional ONNS path (due to connection setup or restoration) via the affected link bundle in the direction opposite to the SD condition the affected port connection will not be selected, although in this direction no failure condition exists and the setup would succeed.
- The setup of a unidirectional path in the direction of the SD condition or of a bidirectional path in any of both directions via the affected port connection would be possible and would succeed in first place, but might afterwards still fail with E022 due to the fact, that the SD condition on port connection level induced an SD condition on path level.
  This is due to the fact, that for path level an SD condition raises a failure condition that causes a path setup to fail.

Workaround

In case such asymmetric behavior occurs, INNI link bundles in the affected ONNS domain could be checked for SD conditions via **RTRV-NTDR**, **RTRV-NNDR**, and **RTRV-rr**. Additionally, an SD alarm should have been raised for the affected port, if not suppressed.

RTRV-OC3: Retrieve OC3 port

The command **RTRV-OC3** is used to retrieve all parameters related to the optical OC3 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-OC3**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC3 port.
   Type: AID.
   Range: SPortAID of OC3 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid **RTRV-OC3** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID.
   Range: OC3 port AID.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **brstthr** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
   When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
   For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.
6. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
7. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the Far-end Line.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
8. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).
10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of STSn rates across the port's bandwidth.
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is setable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.
    Default: 31.
    Example: An O-3 signal might be represented by 31 which implies 3 STS1's or 13 which implies 1 STS3C.
11. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range: SONET.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
12. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

13. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
15. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 or STS3 (default)
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default) or STS3.
18. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).

25. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
   - IPV4 (default)
   - IPV6
   - NSAP

26. **`networkTNAAddress`** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type:

    - networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
    - networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
    - networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

    Range:

    - IPV4: Each numeric string: 0…255
    - IPV6: Each hexadecimal number: 0000…FFFF
    - NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

    Examples:

    - IPV4: 129.12.3.178
    - IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
    - NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

    Default:

    - IPV4: 0.0.0.0
    - IPV6: 0-0-0-0-0-0-0-0
    - NSAP: 0000000000000000000000000000000000000000

    The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **`opdis`** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited.

    Type: Alphanumeric value set.

Range:

- VERY-SHORT-REACH
- SHORT-REACH
- INTERMEDIATE-REACH
- LONG-REACH
- VERY-LONG-REACH
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME.
- NA.

28. **`opwl`** – Optical Wavelength
Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
Type: Alphanumeric value set.
Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).
The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

29. **`outql`** – Outgoing timing quality
This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.
Type: Alphanumeric value set.
Range:
    - PRS
    - STU
    - ST2
    - ST3
    - DUS (default).

30. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-1/OC-3: 1 – 192000.

Default: The default values differ for SDH and SONET:

- STM1: 28800
- OC3: 154.

31. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 28800
    - OC3: 154.

32. **pmode** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

33. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000

    Default: The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

34. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
35. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
36. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0 (default) …25. The unit of this value is ″milliseconds″.
37. **`ptype`** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: OC3.
38. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

39. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
40. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
41. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: ""
42. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.

43. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
44. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST
    - POISSON (default).
45. **`sdthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
46. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
47. **`sfthr`** – Signal Failure Threshold
Signal failureb threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
48. **`sltca`** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

49. **`sonet`** – SONET ASAP
SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see "RTRV-STM4: Retrieve STM4 port" (p. 3-2881), output parameter *sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string.
Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.
Default: DEFAULT.

50. **`spm`** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

51. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

52. **`strc`** – Value of incoming J0
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter

strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

55. **`strcst`** – Status of incoming J0
This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
Type: Alphanumeric value set.
Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
57. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
    Type: Alphanumeric value set.
    Range:
    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
58. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.
    Default: 3 1 = all STS1.
59. **`z0outmode`** – Mode of outgoing Z0 byte insertion
    The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
    Type: Alphanumeric value set.
    Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-OC3** does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a **RTRV-OC3** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-OC3:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1:ptype=OC3,frcdus=DISABLE,sfthr=-3,sdthr=-6, pmode=MON,.....
      pmmsneses=15,pmrsneses=30″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the RTRV-OC3 command.

Check CCB against *ptype* and *istd*

See definition of error response in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899).

References

RTRV-OC12: Retrieve OC12 port

The command **RTRV-OC12** is used to retrieve all parameters related to the optical OC12 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-OC12**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC12 port.
   Type: AID.
   Range: SPortAID of OC12 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid **RTRV-OC12** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   ”aid[:spec_block]”
       ...
       ...
   ”aid[:spec_block]”
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: OC-12 port AID.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list
   This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
   When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
   For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.
6. **exprstrc** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
7. **felpm** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the Far-end line.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
8. **frcdus** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of STSn rates across the port's bandwidth.
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.
    Default: 121.
    Example:
    An OC12 signal might be represented by 31-33 which implies 3 STS1's, 3 STS3C's.

11. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range: SONET.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

12. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

13. **`localLinkID`** – Local Link IDentity
The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

14. **`localLPID`** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3 or STS12 (default)
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3 or STS12.
18. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

25. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

26. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type:
    - networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
    - networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
    - networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

    Range:
    - IPV4: Each numeric string: 0…255
    - IPV6: Each hexadecimal number: 0000…FFFF
    - NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

    Examples:
    - IPV4: 129.12.3.178
    - IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
    - NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

    Default:
    - IPV4: 0.0.0.0
    - IPV6: 0-0-0-0-0-0-0-0
    - NSAP: 0000000000000000000000000000000000000000

    The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
27. **`opdis`** – Optical Distance
It shows the type of application for which the optical transmitter on this port is suited.
Type: Alphanumeric value set.

Range:

- VERY-SHORT-REACH
- SHORT-REACH
- INTERMEDIATE-REACH
- LONG-REACH
- VERY-LONG-REACH
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

28. **opwl** – Optical Wavelength
Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
Type: Alphanumeric value set.
Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).
The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

29. **outql** – Outgoing timing quality
This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.
Type: Alphanumeric value set.
Range:
   - PRS
   - STU
   - ST2
   - ST3
   - DUS (default).

30. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
   - STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET:

- STM4: 115200
- OC12: 615.

31. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 115200
    - OC3: 615.

32. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

33. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000

    Default: The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

34. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
35. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
36. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …25. The unit of this value is ″milliseconds″.
37. **`ptype`** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: OC12.
38. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

39. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
40. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
41. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
    Default: empty string: ""
42. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.

43. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
44. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST
    - POISSON (default).
45. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
    Default: –6.
46. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
47. **`sfthr`** – Signal Failure Threshold
    Signal failure threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
48. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.

49. **sonet** – SONET ASAP
SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see “RTRV-STM4: Retrieve STM4 port” (p. 3-2881), output parameter *sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string.
Range: String with a maximum of 24 characters. A hyphen (“-”) is allowed in the name additionally.
Default: DEFAULT.

50. **spm** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

51. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

52. **strc** – Value of incoming J0
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter

strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
54. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex
55. **`strcst`** – Status of incoming J0
This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
Type: Alphanumeric value set.
Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **strcwfmt** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
57. **trbmd** – Tributary mode
    If *trbmd* is FIXED, then inputsig constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in RTRV-STM16 for SDH equivalent.
    Type: Alphanumeric value set.
    Range:
    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400) command.
58. **unequiposig** – Unequipped Output Signal List
    This parameter is a list of STSn rates across the port’s bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.
    Default: 121 = all STS1 (fixed).
59. **z0outmode** – Mode of outgoing Z0 byte insertion
    The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
    Type: Alphanumeric value set.
    Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-OC12** does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a **RTRV-OC12** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-OC12:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1:ptype=OC12,frcdus=DISABLE,sfthr=-3,sdthr=-6, pmode=MON,.....
      pmmsneses=15,pmrsneses=30″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the RTRV-OC12 command.

Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2899).

References

GR-199-CORE (RTRV-*rr*)

RTRV-OC48: Retrieve OC48 port

The command **RTRV-OC48** is used to retrieve all parameters related to the optical OC48 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-OC48**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC-48 port.
   Type: AID.
   Range: SPortAID of OC48 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid **RTRV-OC48** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: OC-48 port AID.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
   When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
   For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3, 12, 48 representing STS1, STS3C, STS12C, STS48C.
6. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
7. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the Far-end Line.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
8. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **fsflpbkstat** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.
Range:
   - YES
   - NO (default).
10. **inputsig** – Tributary Input Signal Rate List
This parameter is a list of STSn rates across the port's bandwidth.
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.
Default: 481.
Example: An OC-48 signal might be represented by 91-13-112-241 which implies 9 STS1's, 1 STS3C, 1 STS12C, 24 STS1's.
11. **istd** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET.
Type: Alphanumeric value set.
Range: SONET.
Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
12. **linkResCls** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

13. **`localLinkID`** – Local Link IDentity
The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

14. **`localLPID`** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
   - YES
   - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3, STS12 or STS48 (default)
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3, STS12 or STS48.
18. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **nelpm** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

25. **networkTNAType** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

26. **`networkTNAAddress`** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type:

    - networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
    - networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
    - networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

    Range:

    - IPV4: Each numeric string: 0…255
    - IPV6: Each hexadecimal number: 0000…FFFF
    - NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

    Examples:

    - IPV4: 129.12.3.178
    - IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
    - NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

    Default:

    - IPV4: 0.0.0.0
    - IPV6: 0-0-0-0-0-0-0-0
    - NSAP: 0000000000000000000000000000000000000000

    The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **`opdis`** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited.

    Type: Alphanumeric value set.

Range:

- VERY-SHORT-REACH
- SHORT-REACH
- INTERMEDIATE-REACH
- LONG-REACH
- VERY-LONG-REACH
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

28. **opwl** – Optical Wavelength
Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
Type: Alphanumeric value set.
Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).
The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.
29. **outql** – Outgoing timing quality
This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.
Type: Alphanumeric value set.
Range:
    - PRS
    - STU
    - ST2
    - ST3
    - DUS (default).
30. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

31. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

32. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

33. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

34. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

35. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

36. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …25. The unit of this value is ″milliseconds″.

37. **`ptype`** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: OC48.
38. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
39. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
40. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

41. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: ""
42. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.
43. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
44. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST
    - POISSON (default).
45. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
    Default: –6.

46. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
47. **`sfthr`** – Signal Failure Threshold
    Signal failure threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
    Default: –6.
48. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
49. **`sonet`** – SONET ASAP
    This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see “RTRV-STM16: Retrieve STM16 port” (p. 3-2899), output parameter *sdhpn*) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
50. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
51. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

52. **`strc`** – Value of incoming J0
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

54. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

55. **strcst** – Status of incoming J0
This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
Type: Alphanumeric value set.
Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **strcwfmt** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

57. **trbmd** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect.
Type: Alphanumeric value set.
Range:
    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.

58. **unequiposig** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed. If *trbmd* is

ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.
Default: 481 = all STS1 (fixed).

59. z0outmode – Mode of outgoing Z0 byte insertion
The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
Type: Alphanumeric value set.
Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-OC48** does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a **RTRV-OC48** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-OC48:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ”1-1-#-#-1-1:ptype=OC48,frcdus=DISABLE,sfthr=-3,sdthr=-6, pmode=MON,.....
      pmmsneses=15,pmrsneses=30”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the RTRV-OC48 command.

Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2899).

RTRV-OC48T: Retrieve OC48T port

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **`RTRV-OC48T`**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **`aid`** – Access Identifier
   Access Identifier of an OC-48 port.
   Type: AID.
   Range: SPortAID of OC48 port.
   The keyword **`all`** is allowed up to shelf level.
3. **`ctag`** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-OC48T command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of an OC-48 port.
   Type: AID.
   Range: SPortAID of OC48 port.
   The keyword **`all`** is allowed up to shelf level.

Spec block parameters

1. **`exprstrc`** – Value of Expected J0
   For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
2. **`exprstrcout`** – Value of Expected J0 in outgoing direction
   Expected regenerator section trace identifier in outgoing (egress) direction.
   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
3. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).

4. **istd** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET.
   Type: Alphanumeric value set.
   Range: SONET.
   Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
5. **lpbk** – Loopback
   This parameter specifies the current near-side loopback status of the considered output *aid*.
   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).
6. **opdis** – Optical Distance
   It shows the type of application for which the optical transmitter on this port is suited.
   Type: Alphanumeric value set.

   Range:

   - VERY-SHORT-REACH
   - SHORT-REACH
   - INTERMEDIATE-REACH
   - LONG-REACH
   - VERY-LONG-REACH
   - OLS_PASSIVE
   - OLS_400G
   - OLS_800G
   - XTREME
   - NA.
7. **opwl** – Optical Wavelength
   Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
   Type: Alphanumeric value set.
   Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).
   The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

8. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.
9. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
   For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set.
   Range (superset of allowed ranges for SDH and SONET):1 – 64000
   Default: The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.
10. **`pmrsneses`**out – Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction
   This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set
   Range (superset of allowed ranges for SDH and SONET): 1 – 64000
   Default:
   The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
11. **`ptype`** – Port Type
   This identifies the port type of the AID.
   Type: Alphanumeric value set.
   Range: OC48T.

12. **rstimmon** – RS TIM Monitor Enable
For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
13. **rstimmonout** – RS TIM Monitor Enable in Outgoing direction
Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor
14. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
15. **sltca** – Section and Line TCA Profile Pointer
Definition of the section and line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
16. **sonet** – SONET ASAP
This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (*sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
17. **spm** – Section PM Enable
For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
Enable or disable section performance monitoring.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

18. **`spmout`** – Section PM Enable in Outgoing Direction
Enable or disable section performance monitoring for the outgoing (egress) direction.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).

19. **`strc`** – Value of incoming J0
For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

20. **`strcfmt`** – Format of incoming J0
For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
   - 1: for specific repeating byte (SONET)
   - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
   - 16: for 16 byte specific string (ITU/ETSI mode 1).
   - 64: for 64 byte string (SONET).

21. **`strcfmtout`** – Format of outgoing J0
The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).
Type: Numeric string.
Range:
   - 1, for specific repeating byte (SONET)
   - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)

- 16, for 16 byte specific string (ITU/ETSI mode 1)
- 64, for 64 byte string (SONET).

22. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.
    Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
23. **`strcst`** – Format of incoming J0
    For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
    Type: Alphanumeric value set.
    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.
24. **`strcstout`** – Status of outgoing J0
    This parameter shows the status of the value of the RS/Section Trace Identifier in outgoing (egress) direction which is available with parameter strcout.
    alphanumeric value set
    Range:
    - NORMAL, strcout contains a valid value
    - UNAVAILABLE, no value for strcout could be obtained by the system
    - AIS, no value for strcout due to an SF condition

Detailed behavior description

The command retrieves the parameters as described above.

The **`RTRV-OC48T`** command does not generate a **`REPT DBCHG`** message.

Example input/output

The following example shows the successful execution of a **RTRV-OC48T** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-OC48T:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1:ptype=OC48T,pmode=MON,..... pmrsneses=30,pmrsnesesout=30″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-OC48T** command.

Check CCB against *ptype* and *istd*

See definition of error response in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899).

GR-199-CORE (RTRV-*rr*)

RTRV-OC192: Retrieve OC192 port

The command **RTRV-OC192** is used to retrieve all parameters related to the optical OC192 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-OC192**:*tid:aid:ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC192 port.
   Type: AID.
   Range: SPortAID of OC192 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid **RTRV-OC192** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of the OC192 port.
   Type: AID.
   Range: SPortAID of OC192 port.
   The keyword **`all`** is not allowed.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
   When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
   For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the tributary input rate signal list.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C, STS192C.
6. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
7. **`fec`** – FEC Enable
   Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
   Type: Alphanumeric value set.
   Range:
   DISABLE (only) for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics
   - OC192 / STM64 client ports (related to OTN ports)
   - OC768/STM256 basis low cost intra office 1310 nm optics.

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

ENABLE (only) for:

- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G

Default:

DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768/STM256 basis low cost intra office 1310 nm optics.

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

8. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the Far-end Line.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE: (set a forced DUS/DNU)
   - DISABLE (default): (clear a forced DUS/DNU).

10. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

11. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of STSn rates across the port's bandwidth.
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C or STS192C.
    Default: 1921.

12. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range: SONET.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

13. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

14. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
15. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
16. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

17. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3, STS12, STS48 or STS192 (default)
18. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3, STS12, STS48 or STS192.
19. **`msrei`** – MS-REI mode
    An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.
    Type: Alphanumeric value set.
    Range: SINGLE or EXTENDED (default).
20. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN

21. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborASTNNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.
22. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0
    If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″
23. **`neighborPortID`** – Neighbor Port Id
    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is used by the application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: IPv4 format: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
26. **`nelpm`** – Near-End Line PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
27. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

28. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`och`** – optical channel enable
    Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don't have any impact on transmission.
    Type: Alphanumeric value set.
    Range:
    - for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
    - for client ports on packs which support OTN: DISABLE: disable, optical channel not applicable.

    Default:
    - for OP10 and OP40 packs, which cannot support OCH: DISABLE
    - for OP10 packs, which can support OCH: ENABLE
    - or OP10 and OP40 packs, which only support OCH: ENABLE
    - for client ports on packs which support OTN: DISABLE.
30. **`opdis`** – Optical Distance
    It shows the type of application for which the optical transmitter on this port is suited.
    Type: Alphanumeric value set.
    Range:
    - VERY-SHORT-REACH
    - SHORT-REACH
    - INTERMEDIATE-REACH
    - LONG-REACH
    - VERY-LONG-REACH
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G
    - XTREME
    - NA.

31. **`opwl`** – Optical Wavelength
Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
Type: Alphanumeric value set.
Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).
The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.
32. **`otnclient`** – OTN Client Port
This parameter indicates whether the port is an OTN Client Port or an optical SDH/SONET port.
Type: Alphanumeric value set.
Range: YES for OTN client port. NO for optical SDH/SONET port.
33. **`outql`** – Outgoing timing quality
This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.
Type: Alphanumeric value set.
Range:
   - PRS
   - STU
   - ST2
   - ST3
   - DUS (default).
34. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
   - STM-16/OC-48: 1 – 3072000
   - STM-64/OC-192: 1 – 12288000
   - STM-256/OC-768: 1 – 49152000.

   Default: The default values differ for SDH and SONET and the different rates:
   - STM16: 460800
   - STM64: 1843200
   - STM256: 7372800
   - SONET OC48: 2459

- SONET OC192: 9835
- SONET OC768: 39340.

35. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.
36. **pmode** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

    Default:
    - AUTO for optical SDH/SONET ports
    - NMON for client ports.

37. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.
38. **`polynomial`** – Optical Channel Scrambling Polynomial
This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (och = ENABLE).
Type: numeric value set.
Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.
Default: 2.
39. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
40. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
41. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …25. The unit of this value is ″milliseconds″.

42. **`ptype`** – Port Type
    This identifies the port type of the AID.
    It is derived from the functional name and functional qualifier of a circuit pack. If the functional qualifier indicates a pack with 10GE_WANPHY interfaces the port type has the value 10GE_WANPHY, else OC192.
    Type: Alphanumeric value set.
    Range: OC192.
43. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
44. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
45. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

46. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

47. **rstimca** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
   - ENABLE: enable consequent action for TIM
   - DISABLE (default): disable consequent action for TIM.

48. **rstimmon** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
   - ENABLE: enable TIM Monitor
   - DISABLE (default): disable TIM Monitor

49. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
   - BURST
   - POISSON (default).

50. **sdthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

51. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
52. **`sfthr`** – Signal Failure Threshold
Signal failure threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
53. **`sltca`** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
54. **`sonet`** – SONET ASAP
This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (*sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
55. **`spm`** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
56. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are

set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

57. **`strc`** – Value of incoming J0
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

58. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
   - 1: for specific repeating byte (SONET)
   - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
   - 16: for 16 byte specific string (ITU/ETSI mode 1).
   - 64: for 64 byte string (SONET).

59. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

60. **`strcst`** – Status of incoming J0
This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
Type: Alphanumeric value set.
Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

61. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

62. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in “RTRV-STM16: Retrieve STM16 port” (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.

Range:

- ADAPTIVE
- FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400) command.

63. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of STSn rates across the port’s bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port is allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1, 3, 12, 48 or 192 representing STS1, STS3C, STS12C, STS48C or STS192C.
    Default: 1921 = all STS1 (fixed).

Detailed behavior description

The command retrieves the parameters as described above.

The command **`RTRV-OC192`** does not generate a **`REPT DBCHG`** message.

Example input/output

The following example shows the successful execution of a RTRV-OC192 command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-OC192:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1:ptype=OC192,frcdus=DISABLE,sfthr=-3,sdthr=-6,emi=TRUE,
      pmode=MON,..... pmmsneses=15,pmrsneses=30″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the RTRV-OC192 command.

Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2899).

RTRV-OTU2: Retrieve OTU2 port

The command **`RTRV-OTU2`** is used to retrieve all parameters related to the OTU2 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **`RTRV-OTU2`**:*tid:aid:ctag*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`aid`** – Access Identifier
   Access Identifier of an OTU2 port.
   Type: AID
   Range: OTNPortAID of OTU2 port.
   The keyword ″otall″ is allowed at port level, **`all`** up to shelf level.
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string.
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831

Output format

In response to a valid RTRV-OTU2 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   ″aid[:spec_block]″
       ...
       ...
   ″aid[:spec_block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID.
   Range: OTNPort AID.
   The AID value ″otall″ is not allowed in the response.

Spec block parameters

1. **expotutti** – Expected OTU TTI
   Expected OTU trail trace identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the expected OTU TTI.
   Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
   Range: 15 byte hexadecimal string
   Default: 15 bytes each with value 00.
2. **fectype** – FEC Type
   Forward error correction type.
   Type: Alphanumeric value set.
   Range: RS_FEC, V_FEC (default).
3. **ochpm** – OCH PM Enable
   Enable or disable optical channel performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
4. **opwind** – Optical Window
   Optical window (L-Band, C-Band) supported by the port.
   Type: Alphanumeric value set.
   Range: BAND_L for L-Band, or BAND_C for C-Band.
5. **opwl** – Optical Wavelength
   Optical Wavelength in nanometers.
   Type: numeric value set
   Range:
   - 35 wavelengths in C-Band (1554.537 … 1568.362), i.e:
     1554.537, 1554.940, 1555.343, 1555.747, 1556.151, 1556.555, 1556.959, 1557.363, 1557.768, 1558.173, 1558.578, 1558.983, 1559.389, 1559.794, 1560.200, 1560.606, 1561.013, 1561.419, 1561.828, 1562.233, 1562.640, 1563.047, 1563.455, 1563.863, 1564.271, 1564.679, 1565.087, 1565.496, 1565.905, 1566.314, 1566.723, 1567.133, 1567.542, 1567.952, 1568.362
   - 93 wavelengths in L-Band (1568.773 … 1607.466), i.e:

1568.773, 1569.183, 1569.594, 1570.005, 1570.416, 1570.828, 1571.239, 1571.651, 1572.063, 1572.476, 1572.888, 1573.301, 1573.714, 1574.127, 1574.540, 1574.954, 1575.368, 1575.782, 1576.196, 1576.610, 1577.025, 1577.440, 1577.855, 1578.270, 1578.686, 1579.102, 1579.518, 1579.934, 1580.350, 1580.767, 1581.184, 1581.601, 1582.018, 1582.436, 1582.854, 1583.271, 1583.690, 1584.108, 1584.527, 1584.946, 1585.365, 1585.784, 1586.203, 1586.623, 1587.043, 1587.463, 1587.884, 1588.304, 1588.725, 1589.146, 1589.568, 1589.989, 1590.411, 1590.833, 1591.255, 1591.678, 1592.100, 1592.523, 1592.946, 1593.369, 1593.793, 1594.217, 1594.641, 1595.065, 1595.489, 1595.914, 1596.339, 1596.764, 1597.189, 1597.615, 1598.041, 1598.467, 1598.893, 1599.320, 1599.746, 1600.173, 1600.600, 1601.028, 1601.455, 1601.883, 1602.311, 1602.740, 1603.168, 1603.597, 1604.026, 1604.455, 1604.885, 1605.314, 1605.744, 1606.174, 1606.605, 1607.035, 1607.466

- Value 0 (default) (i.e. undefined).

6. **`otnasap`** – OTN ASAP
   OTN Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type OTN to which the designated AID points.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: DEFAULT.
7. **`otutimca`** – OTU TIM Consequent Action Enable
   OTU Trail Trace Identifier Mismatch consequent action enable. Enabling or disabling the the TIM consequent action shall also enable or disable the TIM detection.
   Type: Alphanumeric value set.
   Range: ENABLE: enable consequent action for TIM (default), DISABLE: disable consequent action for TIM.
8. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default):
     indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON:
     indicates that alarm monitoring is taking place on the port.
   - NMON:
     means that alarm monitoring is not occurring on the port.
9. **`ptype`** – Port Type
   This identifies the port type of the AID.
   Type: Alphanumeric value set.
   Range: OTU2

10. **`strecotutti`** – Status of incoming OTU TTI
    This parameter shows the status of the value of the OTU Trail Trace Identifier which is available with parameter voturectti.
    Type: Alphanumeric value set.
    Range:
    - NORMAL: voturectti contains a valid value
    - UNAVAILABLE: no value for voturectti could be obtained by the system
    - AIS: no value for voturectti due to an SF condition.
11. **`txenable`** – Optical Output Enable
    Optical output enabling.
    Type: Alphanumeric value set.
    Range:
    - DISABLE (default): optical output disabled
    - ENABLE: optical output enabled.
12. **`voturectti`** – Value of incoming OTU TTI
    Value of the received OTU Trail Trace Identifier. The status of this value is contained in parameter strecotutti. If strecotutti indicates NORMAL, then voturectti contains a valid value. If strecotutti indicates UNAVAILABLE or AIS, then no incoming OTU TTI could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter voturectti is omitted from the response. The parameter indicates the Source Point Access Identifier (SAPI) of the received OTU TTI.
    Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
    Range: 15 byte SAPI (Source Access Point Identifier).
13. **`votutti`** – Value of outgoing OTU TTI
    Value of the transmitted OTU Trail Trace Identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the transmitted OTU TTI.
    Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
    Range: 15 byte SAPI (Source Access Point Identifier).
    Default: 15 bytes each with value 00.

Detailed behavior description

The command retrieves the parameters as described above. The command **`RTRV-OTU2`** does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-OTU2 command:

```
RTRV-OTU2:LT-UNITE:1-1-#-#-1-ot1:123456;

   LT-UNITE 06-06-30 08:00:00
```

```
M  123456 COMPLD
   ″1-1-#-#-1-ot1:expotutti=4C5543454E544E45312D504F525431,fectype=V_
      FEC,ochpm=ENABLE,opwind=BAND_
      L,opwl=1569.183,otuasap=DEFAULT,otutimca=DISABLE,pmode=MON,ptype=OTU2,strecotutti=NORM
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the RTRV-OTU2 command.

Related TL1 messages

RTRV-OUC: Retrieve ONNS to UPSR/SNCP constructs

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-OUC:*tid:wrk_aid:ctag[::ouc_dir];*

Input parameters

Command parameters

1. **tid** – Target Identifier
See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **wrk_aid** – Working Tributary Access Identifier
This parameter specifies the working tributary of the OUC.
Type: STS1NumAID
Range:
   - The *1-1-#-#-all-all-all*-value is accepted in general for this parameter.
   - The *all* value is not accepted, if specified only for the slot-, port- or trib- part of this parameter.
   - The *1-1-#-#-all-all-all*-value is not accepted, if the parameter ouc_dir is present.
3. **ctag** – Correlation Tag
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Type: Alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
4. **ouc_dir** – OUC Directionality
Directionality of the OUC
Type: Alphanumeric value set.
Range:
   - BIDIR
   - UNIDIR-ADD
   - UNIDIR-DROP.

Output format

In response to a valid RTRV-OUC command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   "wrk_aid,prt_aid:ouc_dir,ouc_rate"
;
or in case of more than one OUC retrieved:

   sid date time
M  ctag COMPLD
   "wrk_aid,prt_aid:ouc_dir,ouc_rate"
       ...
       ...
   "wrk_aid,prt_aid:ouc_dir,ouc_rate"
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **`wrk_aid`** – Working Tributary Access Identifier
   This parameter specifies the working tributary of the OUC.
   Type: STS1NumAID
   Range: n.a. (*all* values shall never occur as part of an output parameter)
2. **`prt_aid`** – Protection Tributary Access Identifier
   This parameter specifies the protection tributary of the OUC.
   Type: STSNumAID
   Range: n.a. (*all* values shall never occur as part of an output parameter)
3. **`ouc_dir`** – OUC Directionality
   Directionality of the OUC
   Type: Alphanumeric value set.
   Range:
   - BIDIR (default)
   - UNIDIR-ADD
   - UNIDIR-DROP

4. **`ouc_rate`** – OUC Rate
   The parameter *ouc_rate* indicates the rate of the OUC, which is determined by the cross-connection rate of the associated cross-connections. For a detailed description please refer to parameter rate in RTRV-CRS.
   Type: Alphanumeric value set.
   Range:
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192

Example input/output

Retrieval of the single bidirectional OUC with working tributary 1-1-#-#-1-1-4:

```
RTRV-OUC:UNITE-NE:1-1-#-#-1-1-4:123456::BIDIR;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
   "1-1-#-#-1-1-4,1-1-#-#-2-2-12:BIDIR,STS1"
;
```

Retrieval of all OUCs in an NE:

```
RTRV-OUC:UNITE-NE:1-1-#-#-all-all-all:123456;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
   "1-1-#-#-1-1-4,1-1-#-#-2-2-4:BIDIR,VC4"
   "1-1-#-#-1-1-7,1-1-#-#-2-4-7:UNIDIR-DROP,VC3"
   "1-1-#-#-1-1-10,1-1-#-#-2-2-10:UNIDIR-ADD,VC4"
;
```

Error responses

Validation rule: Invalid wildcarding

OUC command processing shall verify that no wildcard is applied for *wrk_aid* on slot, port or trib level or if *ouc_dir* is present.

Error code: `IDNV – Input, Data Not Valid, Invalid Wildcarding for wrk_aid`

RTRV-OW: Retrieve orderwire and user bytes

General

The **RTRV-OW** command can be initiated by a user to retrieve the overhead access ports and any associated optical port (OP***n***) in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-OW**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   The parameter aid (Access Identifier) specifies the overhead access port.
   Type: UserBytePortAID.
   Range: As given by the *UserBytePortAID* definition, the value ″ubioall″ is supported.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Output format

In response to a valid RTRV-OW command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   ″aid:spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the overhead access port for which the following spec_block parameters are returned.
   Type: UserBytePortAID.
   Range: As given by the UserBytePortAID definition, the value ″ubioall″ is not allowed.

Spec block parameters

1. **intfctype** – Interface Type
   This parameter specifies which electrical interface standard of the overhead access port is used.

   Two different settings are possible:

   - electrical interface according to G.703
   - electrical interface according to V.11.

   Note: The overhead access ports with AIDs ubio1, .. ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.
   Type: Alphanumeric value set.
   Range: G703, V11.
   Default: G703 (for the overhead access ports given by the AIDs ubio1 .. ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 – fixed to V11).
2. **ohbyte** – Overhead-Byte
   This parameter specifies which of the overhead bytes is used.

   Three channels are possible:

   - E1 and F1 in the RSOH (section overhead)
   - E2 in the MSOH (line overhead).

   Type: Alphanumeric value set.
   Range: E1, F1, E2.
   Default: E1.
   Note: In output direction the empty string appears as \″\″.
3. **portaid**
   This parameter specifies the optical port (of an OP***n***) with which the overhead access port (given by the output parameter aid) is associated.
   The parameter value NOCONNECT is used to indicate that the port given by portaid is not associated to the overhead access port given by the parameter aid.

Type: In case an association is established: SPortAID; In case an association is no established: Alphanumeric value set (i.e. the string ″NOCONNECT″).
Range: In case an association is established: SPortAID (No **all** value is supported); in case an association is no established: NOCONNECT.
Default: NOCONNECT.

Detailed behavior description

The **RTRV-OW** command retrieves the overhead access ports and any associated optical port (OP***n***) in the NE.

Example input/output

Example 1

Suppose the UserByte port ubio6 is associated with the port-4 of an OP2G5 in slot03 (the intfctype is fixed to V11 for ubio5 and ubio6):

```
RTRV-OW:UNITE-NE:1-1-ubio6:123456

   sid date time
M  ctag COMPLD
   ″1-1-ubio6:portaid=1-1-#-#-3-4,ohbyte=E1,intfctype=V11″
;
```

Example 2

Suppose the

- UserByte port ubio1 (V11,E1) is associated with the port-4 of an OP2G5 in slot03
- UserByte port ubio3 (G703,E2) is associated with the port-1 of an OP10G in slot07
- UserByte port ubio6 (V11,F1) is associated with the port-4 of an OP10G in slot34
- The other UserByte ports (ubio2, ubio4, ob05) are not associated:

```
RTRV-OW:UNITE-NE:1-1-ubioall:123456

   sid date time
M  ctag COMPLD
   ″1-1-ubio1:portaid=1-1-#-#-3-4,ohbyte=E1,intfctype=V11″
   ″1-1-ubio2:portaid=NOCONNECT,ohbyte=E1,intfctype=G703″
   ″1-1-ubio3:portaid=1-1-#-#-7-1,ohbyte=E2,intfctype=G703″
   ″1-1-ubio4:portaid=NOCONNECT,ohbyte=E1,intfctype=G703″
   ″1-1-ubio5:portaid=NOCONNECT,ohbyte=E1,intfctype=V11″
   ″1-1-ubio6:portaid=1-1-#-#-34-4,ohbyte=F1,intfctype=V11″
;
```

RTRV-PATH: Retrieve ONNS connection data

Overview

The **RTRV-PATH** command requests information on an ONNS path which begins in the source node to which the message was addressed. The ONNS source node determines the status of the connection from the information stored in the Network Navigator databases.

The query must be directed to the source node. Querying an existing ONNS path by its *ConnectionID* or *ConnAlias* alone will return the status on all paths associated with the *ConnectionID*. The query response includes a status message like Connected and OK (CON&OK), the list of network element nodes that the path utilizes, and the list of constraint parameters for the connection.

ONNS supports querying all connections by sending RTRV-PATH with *connID* = ALL When all of the records of the connection data repository are retrieved by RTRV-PATH with *connID* = ALL, each connection record will be the same format as the RTRV-PATH ConnID response message format.

ONNS supports querying all connections of a connection group, i.e. all connections starting at VCGTRIBs of one single VCG, by sending RTRV-PATH with the ALL qualifier for the tributary number within the *connID*. When several records of the connection data repository are retrieved by RTRV-PATH with qualifier ALL for the tributary number in *connID*, each connection record will be the same format as the standard RTRV-PATH *ConnID* response message format. The *connAlias* will not be accepted as input to retrieve the connections of a group and will be ignored, if set.

ONNS supports querying all connections of an M:N protection group, i.e. working as well as protecting connections, by sending RTRV-PATH with the M:N protection group ID within the *connID*. In this case each connection record will be in the same format as the standard RTRV-PATH ConnID response message format.

The connection records will be sorted by their route membership. The connection records of each route will be headlined by a route indicator, the number of connections per route and an group asymmetry indicator.

Additionally querying of single working or protecting connections of an M:N protection group is supported by sending RTRV-PATH with the ID of the corresponding connection within the *connID*.

RTRV-PATH RetrieveDetail_Route parameters

The **RTRV-PATH** command supports the RetrieveDetail_Route function. RetrieveDetail_Route is only available when a single connection ID (connID) is requested. The RetrieveDetail_Route function retrieves data from the network.

RetrieveDetail_Route data is not be stored in the ONNS source node or any other node. RetrieveDetail_Route only operates on stable ONNS connections, with no other ONNS operations pending (including pending RetrieveDetail_Route operations).

RetrieveDetail_Route request is sent to the source node for the specific connection. The message data from individual nodes on the nodelist of the path that is traced is returned to the source node. Each node shall send the node ID, portID, and the timeslot (trib), for each connPoint involved in the path connection specified by pathID. The ability to trace the path though an intermediate node that has had its path cross-connection deleted is supported.

The message data from path nodes is collected, sort by nodeList order, organized by path, and sent as a second response block to the **`RTRV-PATH`** command. The initial RTRV-PATH response block contains the current connection data from the ONNS connection database, uses the RTRV completion code, and is terminated with a ″>″. The second RTRV-PATH response block has the same header line and is terminated with a ″;″.

The ONNS process that controls and receives the RetrieveDetail_Route signaling request responses waits for up to 15 seconds to accumulate the signaling request response messages and then send the data received via TL1 as the second and concluding response block to the **`RTRV-PATH`** command. The RetrieveDetail_Route response indicates any nodes that did not return path data by an node ID entry with no data, and indicates missing cross-connections as needed.

RTRV-PATH RetrieveDetail_State parameters

The **`RTRV-PATH`** command supports the RetrieveDetail_State function. RetrieveDetail_State is only available when a single connection ID (connID) is requested. The RetrieveDetail_State function retrieves connection data (as retrieved by RetrieveDetail_Route) and additionally connection signal states from the network. RetrieveDetail_State data and states shall not be stored in the ONNS source node or any other node. RetrieveDetail_State only operates on stable ONNS connections, with no other ONNS operations pending (including pending RetrieveDetail_Route or RetrieveDetail_State operations). The RetrieveDetail_State request is handled in the same way as the RetrieveDetail_Route request. The only difference is, that the message data from the path nodes and the output to the request contain connection signal states additionally to the connection data as retrieved via RetrieveDetail_Route request.

REPT PTHCHG is not generated

The **`RTRV-PATH`** command does not generate a **`REPT PTHCHG`** message.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No.

Input format

A user defined connection alias (an alternate name) may be optionally specified with the **RTRV-PATH** command. The alias is specified in the spec block as ConnAlias="…" (up to 83 printable ASCII characters + NULL; excluded are the following characters: colon, semicolon, double-quotes, comma). If no *connAlias* is specified, the *connID* is used as the key. If both *connAlias* and *connID* are specified then *connID* is used as the key. If neither is specified, the command is denied.

Command syntax: **RTRV-PATH**:*srcTid:[srcAid]:ctag::[servID]:[connID][:specBlock]*;

Input parameters

Command parameters

1. **srcTid**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **srcAid**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **ctag** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
4. **srvID** – Service Identifier
   This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
   Type: Integer.
   Range: 1 – 20000000
   Only one *srvID* is accepted. The value "ALL" is not supported.

5. **connID** – Connection ID for an existing ONNS optical path connection service This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and IngressPort# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.
   Type: Character string of length up to 39.
   Range: *ALL* – special value to retrieve all connection records
   Range: *nodeID&Tributary AID&Index* - to retrieve a specific entry, with
   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:
     Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
   - Index: Numeric string 0-4294967295

   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203&1-1-13-15-1&271584
   Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:
   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:
     Bay/Frame #(1), Shelf #(1), Slot/Pack #(1..39), Port #(1..9), Tributary #ALL – special value to retrieve all connection records associated with the port ID.

   As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG. The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.
   Range: *nodeID Tributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with:
   - nodeID: four dot separated numeric strings: each string 0..255
   - defaultTributary AID: five dash separated numeric strings with:
     Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#)
   - Index: Numeric string 0-4294967295
     The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

   Range: *nodeID&groupindex* -to retrieve all connections belonging to an M:N protected connection group, with:
   - nodeID: four dot separated numeric strings: each string 0..255;
   - groupIndex: integer value specifying a connection group within *nodeID* 0-65535.

   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

Spec block parameters

1. **`DetailRoute`**
   DetailRoute = ON will return the portID / trib information from all nodes in each path of the *connID* specified in the second block of the response message.
   The command is rejected if *DetailRoute* = ON and *connID* = ALL.
   The command is rejected if *DetailRoute* = ON and *connID* contains a tributary ID with qualifier ALL instead of a single tributary number.
   The command is rejected if *DetailState* = ON and *connID* specifies a connection group instead of a single connection.
   Type: Alphanumeric value set.
   Range: OFF, ON.
   Default: OFF.
2. **`DetailState`**
   DetailState = ON will return the portID / trib information including corresponding incoming signal states from all nodes in each path of the connID specified in the second block of the response message.
   The command is rejected if DetailState = ON and connID = ALL.
   The command is rejected, if DetailState = ON and connID contains a tributary ID with qualifier ALL instead of a single Tributary number.
   The command is rejected if DetailState = ON and connID specifies a connection group ID instead of a single connection.
   The command is accepted, if both DetailRoute = ON and DetailState = ON, as far as all other validations are fulfilled. In this case, the action requested by DetailState = ON shall be performed.
   Type: Alphanumeric value set.
   Range: OFF, ON.
   Default: OFF.
3. **`connAlias`** – connection alias
   This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
   Type: Character string up to length 83.
   Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.

Output format

Normal system response to RTRV-PATH for connID, output syntax

If the RTRV-PATH request completes successfully, then the following normal completion response is returned to the command.

Note: The *nodeListUsage1* = variable will be translated to either Exclude= or Explicit= , depending on which type of *nodeList* was received as input when the connection was set up.

```
   srcTid date time
```

```
M  ctag COMPLD
   ″ConnID=connID,ConnStatus=connStatus,connControl,pdir,protectionClass,
   bandwidth,[ConnAlias=connAlias],
   MaxDelay=maxDelay,[SrvID=srvID],[nodeListUsage1=nodeList1],
   [nodeListUsage2=nodeList2],[SrlgExclude=srlgExcludeList],
   [IncludeID=linkIncludeID],[specBlock],[reserved],
   SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID
   [,brDestNID=brDestNID,brDestPortID]
   [:PathID=pathID1,State=pathState1,NodeList=pNodeList1
   [:PathID=pathID2,State=pathState2,NodeList=pNodeList2]]″
;
```

NodeList1 = Node45ID & Node12ID & Node39ID & … & Node99ID to be used as set by nodeListUsage1.

pNodeList1 = srcNodeID & Node2ID & Node3ID & … & destNodeID

srlgExcludeList = SRG1 & SRG2 & SRG3 & … & SRG8

brDestNID = brDestNID, brDestPortID to be used for Y-connection.

System response to RTRV-PATH with connID = ALL for an empty connection Data Repository.

ONNS shall respond with a TL1 completion response of COMPLD and a message that the NCDR is empty when there are no connection records in the ONNS Network (Domain) Connection Data Repository (NCDR). If the **RTRV-PATH** ALL request completes successfully with an empty NCDR, then the following completion response is returned to the command.

```
   srcTid date time
M  ctag COMPLD
;
```

System response behavior to RTRV-PATH for connections within an M:N protection group

- For a working connection of an M:N protection group one single path will be associated, when this connection is currently not protected
- For a working connection of an M:N protection group two paths will be associated, when this connection is currently being protected
- For a protecting connection of an M:N protection group one single path will be associated, when this connection is currently not protecting a working connection
- For a protecting connection of an M:N protection group no path at all will be associated, when this connection is currently protecting a working connection

System response to RTRV-PATH with connID [connAlias=connAlias] and DetailRoute=ON

ONNS shall respond with a normal TL1 RTRV-PATH completion response of RTRV and an additional message block with the RetrieveDetail_Route information included. If the RTRV-PATH <connID> request completes successfully with a normal NCDR record as above, then the following completion response is returned to the command:

```
   srcTid date time
M  ctag COMPLD
   ″ConnID=connID,PathID=pathID1[,ConnAlias=connAlias]:
   nodeID1-1,connPtID1_1-1,[protConnPtId_1-1],connInd,connPtID2_1-1,,
[detailRouteStatus]:
   nodeID1-2,connPtID1_1-2,,connInd,connPtID2_1-2,,[detailRouteStatus]:
   nodeID1-3,connPtID1_1-3,,connInd,connPtID2_1-3,,[detailRouteStatus]:
   ...
   nodeID1-n,connPtID1_1-n,,connInd,connPtID2_1-n,[protConnPtID_1-n],
[detailRouteStatus]″
  [″ConnID=connID,PathID=pathID2[,ConnAlias=connAlias]:
    nodeID2-1,connPtID1_2-1,[protConnPtID_2-1],connInd,connPtID2_2-1,,
[detailRouteStatus]:
    nodeID2-2,connPtID1_2-2,,connInd,connPtID2_2-2,,[detailRouteStatus]:
    nodeID2-3,connPtID1_2-3,,connInd,connPtID2_2-3,,[detailRouteStatus]:
    ...
    nodeID2-n,connPtID1_2-n,,connInd,connPtID2_2-n,[protConnPtID_2-n],
[detailRouteStatus]″]
;
```

Note: ConnAlias is reported only for releases in which it is supported as input parameter. See above. It depends on the protectionClass and connStatus whether one or two records are reported: UNPROT connections always have one record, N1PLUS1and YCONN connections always have two records, AUTO connections may have two records (e.g. in case restoration is active for revertive mode) or one record. Protection connections of a M:N protection group which are in use for protection shall response without the RetrieveDetail_Route information.

System response to RTRV-PATH with connID [connAlias=connAlias] and DetailState=ON

ONNS shall respond with a normal TL1 **RTRV-PATH** completion response of RTRV and an additional message block with the RetrieveDetail_State information included. If the **RTRV-PATH <connID>** request completes successfully with a normal NCDR record as above, then the following completion response is returned to the command.

```
   srcTid date time
M  ctag COMPLD
   ″ConnID=connID,PathID=pathID1[,ConnAlias=connAlias]:
   nodeID1-1,connPtID1_1-1,[protConnPtId_1-1],connInd,connPtID2_1-1,,
   connPt1State_1-1,[connPt2State_1-1],[detailRouteStatus]:
```

```
   nodeID1-2,connPtID1_1-2,,connInd,connPtID2_1-2,,
   connPt1State_1-2,[connPt2State_1-2],[detailRouteStatus]:
   nodeID1-3,connPtID1_1-3,,connInd,connPtID2_1-3,,
   connPt1State_1-3,[connPt2State_1-3],[detailRouteStatus]:
   ...
   nodeID1-n,connPtID1_1-n,,connInd,connPtID2_1-n,[protConnPtID_1-n],
   connPt1State_1-n,[connPt2State_1-n],[detailRouteStatus]"
  ["ConnID=connID,PathID=pathID2[,ConnAlias=connAlias]:
   nodeID2-1,connPtID1_2-1,[protConnPtID_2-1],connInd,connPtID2_2-1,,
   connPt1State_2-1,[connPt2State_2-1],[detailRouteStatus]:
   nodeID2-2,connPtID1_2-2,,connInd,connPtID2_2-2,,
   connPt1State_2-2,[connPt2State_2-2],[detailRouteStatus]:
   nodeID2-3,connPtID1_2-3,,connInd,connPtID2_2-3,,
   connPt1State_2-3,[connPt2State_2-3],[detailRouteStatus]:
    ...
   nodeID2-m,connPtID1_2-m,,connInd,connPtID2_2-m,[protConnPtID_2-m],
   connPt1State_2-m,[connPt2State_2-m],[detailRouteStatus]"]
;
```

Normal system response to RTRV-PATH with connID = ALL or with tributary# = ALL

Connection record definition:

ConnectionIDx_dataRecord=
"<Connection_info_data>:<Path_Data_record1>[:<Path_Data_record2>]"

Connection_info_data= connID,connStatus,connControl,pdir,protectionClass,bandwidth,[connAlias],

<ConnConstraint_info>,[specBlock],{reserved},<SourceDest_info>

ConnConstraint_info= maxDelay,[srvID],[nodeListUsage1,nodeList1],[nodeListUsage2,nodeList2],[srlgExcludeList],[linkIncludeID],

SourceDest_info = srcNID,srcPortID,destNID,destPortID[,brDestNID,brDestPortID]

Path_Data_record1= pathID1,pathState1,pNodeList1:

Path_Data_record2= pathID2,pathState2,pNodeList2

If the RTRV-PATH request with connID = ALL or with tributary# = ALL completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   "ConnectionID1_dataRecord"
   ...
   "ConnectionID4_dataRecord"
>
   srcTid date time
M  ctag RTRV
```

```
   ″ConnectionID5_dataRecord″
>
   srcTid date time
M  ctag COMPLD
   ″ConnectionID6_dataRecord″
   ...
   ″ConnectionID11_dataRecord″
;
```

The RTRV-PATH <connID=ALL> command shall send a maximum of 8 connection records per block. On all large output message blocks but the last, the continuation RTRV completion code is used and the semicolon(;) is replaced with a (>) terminator. Then on the last record block, the COMPLD completion code is used with the final semicolon (;) data block terminator.

Note: This RTRV-PATH <connID=ALL> command can produce large amounts of data. This will require proper sizing of the receive buffer of the OS system. brDestNID = brDestNID,brDestPortID to be used for Y-connection.

Wrt. output format for the RTRV-PATH <tributary # = ALL> command the same requirements are valid as for the RTRV-PATH <connID=ALL> command.

Normal system response to RTRV-PATH with connID = M:N groupID

Connection record definition:

ConnectionIDx_dataRecord =
″<Connection_info_data>:<Path_Data_record1>[:<Path_Data_record2>]″

Connection_info_data = connID,connStatus,connControl,pdir,protectionClass,bandwidth, [connAlias], <ConnConstraint_info>,[specBlock],{reserved}, lt;SourceDest_info>

ConnConstraint_info = maxDelay,[srvID],[nodeListUsage1,nodeList1], [nodeListUsage2,nodeList2],[srlgExcludeList],[linkIncludeID],

SourceDest_info = srcNID,srcPortID,destNID,destPortID[,brDestNID,brDestPortID]
Path_Data_record1 = pathID1,pathState1,pNodeList1:

Path_Data_record2 = pathID2,pathState2,pNodeList2

If the RTRV-PATH request with connID = M:N groupID completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   ″Route1,NumberOfConnections,GroupAsymmetry″
   ″ConnectionID1_dataRecord″
   ...
   ″ConnectionID4_dataRecord″
>
   srcTid date time
```

```
M  ctag RTRV
   ″Route2,NumberOfConnections,GroupAsymmetry″
   ″ConnectionID5_dataRecord″
>
   srcTid date time
M  ctag COMPLD
   ″ConnectionID6_dataRecord″
   ...
   ″ConnectionID8_dataRecord″

   ″Route3,NumberOfConnections,GroupAsymmetry″
   ″ConnectionID9_dataRecord″
   ...
   ″ConnectionID12_dataRecord″
;
```

The RTRV-PATH <connID=M:N groupID> command shall send a maximum of 8 connection records per TL1 block. On all large output message blocks but the last, the continuation RTRV completion code is used and the semicolon(;) is replaced with a (>) terminator. Then on the last record block, the COMPLD completion code is used with the final semicolon (;) data block terminator.

Note: This RTRV-PATH <connID=M:N groupID> command can produce large amounts of data. This will require proper sizing of the receive buffer of the OS system.

Output parameters

Command parameters

1. **`srcTid`** – Source Node Identifier
   See definition of this parameter in Input Parameters section.
2. **`date`**
   This parameter is set to the date when the output message is generate: YY-MM-DD where YY=00-99, MM=01-12, DD=01-31.
3. **`time`**
   This parameter is set to the time when the output message is generated: HH:MM:SS where HH=00-23,MM=00-59, SS=00-59.
4. **`ctag`** – Correlation Tag
   See the parameter description in the Input parameters section above.
5. **`completionCode`**
   Standard TL1 completion code result.
   Type: Value set.
   Range: COMPLD (default) for success: RTRV for data continuation.

6. **`route`** – M:N Route
   Indicates the M:N route in front of a group of M:N protected connections with the same node list. This parameter is only used for retrival of all connections belonging to an M:N protected group.
   Type: Alphanumeric string
   Range: WorkerRoute1, WorkerRoute2, WorkerRoute3, ProtectionRoute1
7. **`numberOfConnections`** – Number of Connections per Route
   NumberOfConnections = x indicates the number of connections per route of a M:N protection group. This parameter is only used for retrival of all connections belonging to an M:N protected group.
   Type: Integer.
   Range: 1-96 (number of connections per route).
8. **`groupAsymmetry`** – M:N Group Asymmetry
   GroupAsymmetry = x indicates the connection asymmetry between the routes of a M:N protection group. This parameter is only used for retrival of all connections belonging to an M:N protected group.
   Type: Integer.
   Range: na = not applicable (value of asymmetry for the protection route); 0 – 255 indicates the difference between the number of actual worker connections within this route and the ceiling average value of worker connections per route based on the protection group.
9. **`connID`**
   See the parameter description in the Input parameters section above.
10. **`connAlias`**
    See the parameter description in the Input parameters section above.
11. **`connStatus`**
    ConnStatus = pst&sst[&tst]
    Connection status is the overall status of the connection *connID* which may be different than the status of an individual *pathID* in that connection.
    connStatus is composed out of
    - pst (PrimaryState)
    - sst (SecondaryState)
    - tst (TertiaryState, optional).

    Up to two of the allowed values are simultaneously permitted as a sst/tst parameter. The two values must be separated by an ampersand (“&”). Individual status values are 7 characters or less.
    Type: up to three &-separated value sets.
    Range *pst* values:
    - CON: Connected
    - DLT: Deleted
    - NOCON: Not Connected

- MAINT: Maintenence Mode
- UNKNOWN: Conn state unknown.

Range *sst* & *tst* values:

- OK: Conn good
- FAILED: Conn failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- PREMPT: Path pre-empted
- SETUPFL: Connection SetUp Failed
- FL-NVM: Not saved in NVM
- WTORV: Waiting to revert path
- EPRTFLEDGE: Port Failed
- BAD-IN Conn failed, Bad signal in
- BRDGD Path bridged

Note: Some states listed in this list will only occur within a DLT-PATH command response or within a REPT PTHCHG or REPT PTHEVT notification message.

Range *sst* values:

- STBY: Standby (for protecting connections within an M:N protection group, when connection is not protecting a working connection)
- USED: Used (for protecting connections within an M:N protection group, when connection is currently protecting a working connection)

Range *tst* values:

- DEGRADED: Non-revertive restoration was not possible if the worker or a permanent 1+1 protected connection fails.

12. **`connControl`** -Connection Control
    This parameter indicates whether the ONNS connection is controlled by ONNS or by external control (UNI, eNNI connections).
    Range:
    - ONNS (ONNS connections, created via ENT-PATH)
    - EXT (ONNS connections, created via ENT-CONN, UNI or eNNI)

13. **`pdir`** – Path Direction Topology
    Unidirectional A-Z (1WAY) or Bidirectional (2WAY).
    For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
    Type: Value set.
    Range: 1WAY, 2WAY
    Default: 1WAY.
14. **`protectionClass`**
    This parameter defines the type of restoration protection assigned to the path connection during path setup or after path modification.

    Range:

    - UNPROT (path from source to destination is un-protected)
    - AUTONR (path from source to destination is a non-revertive auto-reroute path connection)
    - N1PLUS1 (paths from source to destination is set up as a 1+1 protected connection)
    - AUTORV (path from source to destination is a revertive auto-reroute path connection)
    - YCONN (paths from the same source to two different destinations are set up as a bridged connection).
    - MBYNWRK (working connection in an M:N connection group)
    - MBYNPRT (protecting connection in an M:N connection group)
    - P1PLUS1NR (paths from source to destination are set up as a 1+1 protected non-revertive connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)
    - P1PLUS1NRRV (paths from source to destination are set up as a 1+1 protected revertive connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)

    Default: None.
15. **`bandwidth`** – Requested bandwidth / signalRate
    Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.
    Type: Value set.
    Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.
    Default: None.
16. **`maxDelay`** – Maximum transport delay
    Maximum transport delay through all nodes in the path. Total path delay must not exceed this value.
    Range: 0, is used to select no delay limit; 1 – 32767, maximum transport delay in milliseconds.
    Default: 0.

17. **`srvID`** – Service Identifier
    This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
    The *srvID* parameter is an integer value range = 1 – 20,000,000. Only one *srvID* is accepted. ALL is not supported.

18. **`nodeListUsage1`**
    For connection setup NN used/uses the list of nodes included in the *nodeList1* array block in a manner specified by the *nodeListUsage1* variable. Both, *nodeListUsage1* and *nodeList1*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command. An EXCLUDE list usage applies to all paths created (as in a N1PLUS1NR or N1PLUS1RV). A non-existent *nodeID* will be ignored in EXCLUDE *nodeList1* during path setup. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.
    Type: Value set.
    Range:
    - EXPLICIT, *nodeList1* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.)
    - EXCLUDE, nodes in the *nodeList1* must all be excluded from the path created. In the case when the *protectionClass* is either YCONN, N1PLUS1NR or N1PLUS1RV the nodes in the *nodeList1* below also apply to the second or restoration path.

19. **`nodeList1`**
    When *nodeListUsage1* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([&nid2& …&nidx]).
    When *nodeListUsage1* = EXCLUDE: List of nodes that must all be excluded from both paths. The *nodeID* values are shown in the from: nid1([&nid2& …&nidx]).
    If the preceding required *nodeListUsage1* field is not supplied, this field must not be present. If user specifies empty EXCLUDE *nodeList1*, the connection should use indirect path from source node to destination node (that is, at least one intermediate node is needed). If user specifies empty EXPLICIT *nodeList1*, the connection should use a direct path from source to destination node (that is, no intermediate node is allowed).
    Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
    Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
    Range: nid1([&nidx])* or empty list (where X <= 25 when *nodeListUsage1* = EXPLICIT) (where X <= 25 when *nodeListUsage1* = EXCLUSIVE)

20. **`nodeListUsage2`**
    For connection setup NN used/uses the list of nodes included in the *nodeList2* array block in a manner specified by the *nodeListUsage2* variable. Both, *nodeListUsage2* and *nodeList2*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.
    This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.
    This parameter shall also be allowed when *protectionClass* is P1PLUS1NR.
    Type: Value set.
    Range: EXPLICIT, *nodeList2* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.).
21. **`nodeList2`**
    When *nodeListUsage2* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([[&nid2& …&nidx]]).
    If the preceding required *nodeListUsage2* field is not supplied, this field must not be present. If user specifies empty EXPLICIT *nodeList2*, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).
    This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.
    This parameter shall also be allowed when *protectionClass* is P1PLUS1NR
    Type: &-separated list of *nodeIDs*. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
    Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
    Range: nid1([&nidX])* or empty list where X <= 8 when *nodeListUsage1* = EXPLICIT.
22. **`srlgExcludeList`** – SRLG Exclude List
    List of Shared Risk Link Group identifiers that are to be used to exclude links from the connection path(s) being created.
    Type: &-separated list of numeric strings | empty | 0
    Example: 33&49&64
    Range: up to 25 numeric strings, each in the range 1 – 65535. The value 0 (default) or an empty field indicates no constraint are applied.
23. **`linkIncludeID`** – VPN Identifier
    A connection constraint link property such as *linkIncludeID* that must be valid to include the link in the connection path(s) to be created. *linkIncludeID* is a link connection property that can be used to group and classify links. VPNID is a special case of this associative property.
    Type: Integer
    Range: 1 … 65535; 0 or an empty field indicates no VPN constraint is applied.
    Note: Since the corresponding value is not supported as Host port parameter any input different from 0 will lead to DENY of the command.

24. **srcNID** – Source nodeID
ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
25. **srcPortID** – Source PortID
ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.
Value: dash-separated list of 5 numeric strings
Example: 1-1-3-1-4
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port # #, Tributary ##. This range is valid for protecting connections in M:N connection groups
26. **destNID** – Destination nodeID
ONNS destination nodeID. Together with the following *destPortID* field defines the associated Engress *connPoint* that connects the destination node to the edge/gateway switch or client router.
Type: Four dot separated numeric strings. 0 – 255 for each numeric string.
27. **destPortID** – Destination PortID
ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the destNID egress *connPoint*.
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. This range is valid for protecting connections in M:N connection groups
See the parameter description in the "ENT-PATH: Create ONNS path connection" (p. 3-1701) Input parameters section.
28. **brDestNID** – Bridged Destination NodeID
ONNS bridged destination nodeID. Together with the following brDestPortID field defines the second associated Egress connPoint that connects the destination node to the edge/gateway switch or client router in case of protectionClass YCONN.
Type: Four dot separated numeric strings. 0 – 255 for each numeric string.
29. **brDestPortID** – Bridged Destination PortID
ONNS bridged destination node egress *portID* in case *protectionClass* = YCONN. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the brDestNID egress connPoint. 4.1; 5; 6
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

30. **`pathID1`** – Path ID 1
    The PathID of the 1st path that was created.
    Type: character string of length up to 20.
    Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255) (Index: Numeric string 0-65535).
    The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x
    Example: 29.13.196.203-65111
    Default: None.

31. **`pathState1`** – Path State 1
    Path State1 = *pst*& *sst*[*&tst*]. pathState1 represents the status of the first path of the connection which may be different than the status of the overall connection in *connStatus*.
    PathState1 is composed out of *pst* (PrimaryState), *sst* (SecondaryState) and *tst* (TertiaryState, optional) Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.
    Type: up to three &-separated value sets.

    Range *pst* values:

    - CON: Connected
    - NOCON: Not Connected
    - DLT: Deleted
    - MAINT: Maintenance mode.

    Range *sst* & *tst* values

    - OK: Conn good
    - FAILED-PATH: failed
    - SETUP: Conn SetUp occurring
    - TRDOWN: Conn teardown occurring
    - NO-IN: Conn failed, signal in bad
    - RSTOR: path restore occurring
    - RSTRD: Conn restored
    - RSTRFL: Conn restore failed
    - DLT-FL: Delete operation Failed
    - UNKNOWN: Conn state unknown
    - WTORSTR: Waiting to restore path
    - SETUPFL: Connection SetUp Failed
    - RVRTFL: Conn revert failed
    - PREMPTD: Preempted
    - WTORV: Waiting to revert path
    - BRDGD: Path bridged

- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

Range *pst* values:

- RSVD: Reserved, for paths associated to protecting connections within an M:N protection group, while not protecting a working traffic.

32. **`pNodeList1`** – Path Node List 1

The path node list contains the list of nodes that the 1st path (*pathID1*) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

33. **`pathID2`** – Path ID 2

The PathID of the 2nd path (if existing) that was created.
Type: character string of length up to 20.
Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255), (Index: Numeric string 0-65535).
The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111

34. **`pathState2`** – Path State 2

pathState2 = pst&sst[&tst]. *pathState2* represents the status of the second path (if existing) of the connection which may be different than the status of the overall connection in *connStatus*.

PathState2 is composed out of

- pst (PrimaryState)
- sst (SecondaryState)
- tst (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.
Type: up to three &-separated value sets

Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values

- OK: Conn good
- FAILED-PATH: failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

35. **`pNodeList2`** – Path Node List 2
The path node list contains the list of nodes that the 2nd path (pathID1, if existing) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

Spec block parameters

1. **`connMode`** – Connection Mode
The connection mode determines ONNS treatment of the failed path after an auto-reroute restoration.
Example: *connMode* = NONREVERTIVE causes path setup to be auto-reroute non-revertive.
Range:

- UNPROT: converts a auto connection to a unprotected
- N1PLUS1: Network 1+1 protected connection

- NONREVERTIVE: Auto-reroute non-revertive
- REVERTIVE: Auto-reroute revertive
- YCONN: Y-connection
- BRIDGEY: Y connection Protection
- MBYNWRK: Working connection within an M:N protection group
- MBYNPRT: Protecting connection within an M:N protection group.

2. **`rstrPriority`** – Restoration Priority
   This parameter describes the restoration priority of the connection.
   Range: 0 (default) – 7. Lower values represent higher priority.
3. **`DetailRoute`**
   DetailRoute = ON will return the portID / trib information from all nodes in each path of the *connID* specified in the second block of the response message.
   The command is rejected if *DetailRoute* = ON and *connID* = ALL.
   The command is rejected if *DetailRoute* = ON and *connID* contains a tributary ID with qualifier ALL instead of a single tributary number.
   The command is rejected if *DetailState* = ON and *connID* specifies a connection group instead of a single connection.
   Type: Alphanumeric value set.
   Range: OFF, ON.
   Default: OFF.
4. **`DetailState`**
   DetailState = ON will return the portID / trib information including corresponding incoming signal states from all nodes in each path of the connID specified in the second block of the response message.
   The command is rejected if DetailState = ON and connID = ALL.
   The command is rejected, if DetailState = ON and connID contains a tributary ID with qualifier ALL instead of a single Tributary number.
   The command is rejected if DetailState = ON and connID specifies a connection group ID instead of a single connection.
   The command is accepted, if both DetailRoute = ON and DetailState = ON, as far as all other validations are fulfilled. In this case, the action requested by DetailState = ON shall be performed.
   Type: Alphanumeric value set.
   Range: OFF, ON.
   Default: OFF.
5. **`connectionPriority`** – Connection Priority
   Connection priority allows connection setup of a higher priority connection to utilize the existing path through the network when the existing connection is pre-emptible.
   Range: 0 (default) – 7. 0 = locked, 1 – 7 = Priority, Connection may be pre-empted.

6. **`disjointness`**
   The actual level of disjointness of the calculated and established connection. The parameter is not filled when protectionClass is UNPROT.
   Type: Alphanumeric value set.
   Range:
   - COMPLETE: fully node and SRLG disjoint path
   - FULLYSRLG: maximal node and fully SRLG disjoint path
   - MAXIMAL: maximal node disjoint path.
7. **`connGrpID`**
   Connection Group ID for an existing ONNS connection to report the connection group the connection is member of or ″UNDEFINED″, if connection is not member of a group.
   For connection roups identified by A VCG EDGE port, connGrpID is formed from the *SrcNodeID* and the Ingress Port #, where 1675 LambdaUnite MSS uses bay =1= shelf.
   The connection group ID is automatically assigned to a connection, when it is setup. The connection group ID will consist of the *nodeID* and the EDGE port AID in case the EDGE port is a VCG. The connection group ID will be ″UNDEFINED″ otherwise. For M:N protected connection groups, *connGrpID* is formed from the *SrcNodeID* and a group index chosen by the source node to be unique within this node. The connection group ID is automatically assigned to a connection, when it is setup. The connection group ID will consist of the node ID and a group index in case the connection is member of an M:N connection group. The connection group ID will be ″UNDEFINED″ otherwise.
   Type: Character string of length up to 25.
   Range: UNDEFINED - special value for connections not being member of a group nodeID&Prt AID - value for connections being member of a ″GbE Connection Group″ nodeID&groupIndex - value for connections being member of a ″M:N Connection Group″
   - nodeID: four dot separated numeric strings: each string 0..255
   - Port AID: four dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port # with: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1..39), Port # (1..8).
   - groupIndex: integer value specifying an M:N connection group 0-65535.
     The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x

8. **protRatio** – Protection ratio
   For each working or protecting connection of an M:N protected connection group this parameter will report the concrete protection ratio as specified on creation of the group. For connections not being member of an M:N protected connection group, this parameter is not reported at all.
   Type: Alphanumeric value set
   Range. BY1 (ratio of 1 to 1 in number of protecting and working connections), 1BY2 (ratio of 1 to 2 in number of protecting and working connections), 1BY3 (ratio of 1 to 3 in number of protecting and working connections).
9. **assocConnID** – Associated Connection ID
   Associated Connection ID for an existing ONNS connection of an M:N connection group to report the connection ID of the associated connection within the group, when a protection switch is active, i.e. for a working connection the ID of the associated protecting connection and for a protecting connection the ID of the associated working connection is reported. The associated connection ID will be ″OPEN″ for connections of an M:N connection group not involved in a protection switch. The associated *connectionID* will not be reported for connections not being member of an M:N connection group.
   Type: Character string of length up to 39.

   Range: ALL - special value to retrieve all connection records | nodeID&Tributary AID&Index - to retrieve a specific entry, with

   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

     Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
   - Index: Numeric string 0-4294967295

   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203&1-1-13-15-1&271584

   nodeID&Tributary AID range - if port # specifies a VCG to retrieve a connection group, with:

   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

     Bay/Frame #(1), Shelf #(1), Slot/Pack #(1..39), Port #(1..9), Tributary #ALL – special value to retrieve all connection records associated with the *portID*.

   As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG. The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

nodeID Tributary AID&Index - to retrieve a protecting connection of an M:N connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- defaultTributary AID: five dash separated numeric strings with:
  Bay/Frame #(1), Shelf #(1), Slot/Pack ##, Port ##, Tributary ##
- Index: Numeric string 0-4294967295

  The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

  nodeID&groupindex -to retrieve all connections belonging to an M:N protected connection group, with:

  nodeID: four dot separated numeric strings: each string 0..255; groupIndex: integer value specifying a connection group within *nodeID* 0-65535.

  The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

10. **`htmr`** – Hold-Off Time

    This parameter specifies the value of the hold-off timer for 1+1 protection switching.
    Parameter applies to a permanent 1+1 protected connection.
    Parameter does not apply to a 1+1 protected connection.
    Parameter applies to 1+1 protected and permanent 1+1 protected connections.
    Type: numeric string [ms].
    Range for high order path protection groups: 0 .. 99 ms in 1 ms steps and 100 .. 10000 ms in 100 ms steps.
    Range for low order path protection groups: 0, 25, 50, 75 ms (in steps of 25 ms) and 100 .. 10000 ms in 100 ms steps.
    Default:
    None.
    The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block. Default Value: 0
    This parameter shall relate to the *htmr* parameter provisioned via the TL1 commands **`ENT-PATH`** or **`ED-PATH-PROT`**. Configuration of path protection group parameter via **`ED-PROTN-GRP`** is not forbidden, but should be discouraged, since this configuration is not reflected in the ONNS view. During normal operation of an ONNS connection, the **`ED-PROTN-GRP`** parameters are considered but during ONNS protection conversion, the ONNS stored path protection group parameters are considered.

11. **`wtr`** – Wait To Restore Time

    This parameter specifies the wait-to-restore time for revertive 1+1 protection switching.
    Parameter does not apply to a 1+1 protected connection revertive.
    Parameter applies to a permanent 1+1 protected connection with revertive SNCP/UPSR protection.
    Type: numeric string [minute].
    Range: 0 – 60.
    Default:
    None.

The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block. Default Value: 0 This parameter shall relate to the *wtr* parameter provisioned via the TL1 commands **ENT-PATH** or **ED-PATH-PROT**. Configuration of path protection group parameter via **ED-PROTN-GRP** is not forbidden, but should be discouraged, since this configuration is not reflected in the ONNS view. During normal operation of an ONNS connection, the **ED-PROTN-GRP** parameters are considered but during ONNS protection conversion, the ONNS stored path protection group parameters are considered.

12. **switchBack** – revertive restoration path switch back
    This parameter describes how a revertive restoration path is switched back to the original path.
    Type: Alphanumeric value set.
    Range:
    - AUTO: path is automatically switched back after wait to revert time.
    - MAN: path has to be manually switched back triggered by the TL1 command **ED-PATH-ROLL**.

    Default: AUTO.
13. **detailPath Record**
    One or two detailPath records will be reported when *detailRoute* = ON.
    a. **connID** – Connection ID
       See description in the Input parameters section below.
    b. **pathID** – Path ID
       See description in the section “Output parameters” below.
    c. **connAlias** – connection alias
       See description in the Input parameters section below.
    d. **xcon Record**
       An xcon record will be reported for each node in the path when *DetailRoute* = ON. Records are ordered in A-Z direction from the source node:
       nodeID: ID of the node which reports the xcon record. Type: Four dot separated numeric strings. Range: 0 – 255 for each numeric string.
       connPtID1 – Connection Point ID 1: ONNS connection point identifier for the ingress connection point of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
       Slot/Pack ##, Port ##, Tributary ##. Value # for Slot/Pack, Port and Tributary indicates default tributary AIDs used for reporting open ends in not existing xcons in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.
       connInd – Connection Indicator: Indicator whether cross-connection is setup. Type: Alphanumeric value set. Range: -X- (cross-connection setup).

connPtID2 – Connection Point ID 2: ONNS connection point identifier for the egress connection point of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

protConnPtID – Protection Connection Point ID: ONNS connection point identifier for the ingress or egress connection point of the protected OUC cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame #(1), Shelf #(1), Slot/Pack #(1..39), Port #(1..16), Tributary #(1..128).

detailRouteStatus – Detail Route Node/XC Status: This parameter indicates the status of a node and/or its cross-connection. Range: NO_REPLY (no reply from node) (no cross-connection found).

connPt1State – Fault State of Incoming Signal at Connection Point 1: This parameter indicates the fault state monitored for the incoming signal at the tributary identified by Connection Point ID 1.

Type:

Alphanumeric value set.

Range:

UNKNOWN (the incoming signal could not be monitored); OK (a valid incoming signal is monitored); FAILED (no valid incoming signal is monitored, but in corr. direction an incoming signal state OK is monitored at the EDGE tributary); NO-IN (no valid incoming signal is monitored and in corr. direction an incoming signal state FAILED is monitored at the EDGE tributary).

Context wrt. OUCs:

In case an OUC is configured on top of the ONNS connection in the A-node, *connPt1State* shall denote the signal state of the EDGE tributary currently selected by the corresponding path selector. That means that in case of an OUC configured on top of an ONNS connection, it is not possible to get the signal state of both involved EDGE tributaries, but the signal is monitored behind the selector, thus yielding the signal state of the tributary currently selected.

connPt2State – Fault State of Incoming Signal at Connection Point 2: This parameter indicates the fault state monitored for the incoming signal at the tributary identified by Connection Point ID 2.

Type:

Alphanumeric value set.

Range:

UNKNOWN (the incoming signal could not be monitored); OK (a valid incoming signal is monitored); FAILED (no valid incoming signal is monitored, but in corr. direction an incoming signal state OK is monitored at the EDGE tributary); NO-IN (no valid incoming signal is monitored and in corr. direction an incoming signal state FAILED is monitored at the EDGE tributary).

Context wrt. OUCs:

In case an OUC is configured on top of the ONNS connection in the A-node, *connPt2State* shall denote the signal state of the EDGE tributary currently selected by the corresponding path selector. That means that in case of an OUC configured on top of an ONNS connection, it is not possible to get the signal state of both involved EDGE tributaries, but the signal is monitored behind the selector, thus yielding the signal state of the tributary currently selected.

Example input/output

Normal system response to RTRV-PATH with connID = ALL with no NCDR records

If the **RTRV-PATH ALL** request completes successfully with an empty NCDR then the following normal completion response is returned to the command:

```
RTRV-PATH:srcTid:srcAid:ctag::srvID:ALL;.

   srcTid date time
M  ctag COMPLD
;
```

Input/Output example for a auto-reroute connection

The following example shows the successful completion of a **RTRV-PATH** command by the network element for a (non-revertive) auto-reroute connection:

```
RTRV-PATH:LT-ONNS-789:snn:193456::1351379:135.13.196.203&1-6-5-3-1&1;

   LT-ONNS-789 2001-01-01 08:00:00
M  193456 COMPLD
   ″ConnID=135.13.196.203&1-6-5-3-1&1,ConnStatus=CON&OK,ONNS,1WAY,AUTONR,STS48,

   NodeList=135.13.196.203&135.13.196.23&135.13.42.3&135.13.98.22&135.13.242.103″
;
```

Input/output example for a Network 1+1 connection

The following example shows the successful completion of a **RTRV-PATH** command by the network element for an 1+1 connection:

```
RTRV-PATH:LT-ONNS-9:snn:14345::13513794:135.13.196.203&1-6-5-3-1&1;

   LT-ONNS-9 2001-06-01 08:00:00
M  14345 COMPLD
   ″ConnID=135.13.196.203&1-6-5-3-1&1,ConnStatus=CON&OK,ONNS,2WAY,N1PLUS1,STS48,
   ConnAlias=AEXP-NY-BOS-ckt,
```

```
   MaxDelay=55,SrvID=13513794,Explicit=135.13.196.123&135.13.42.3,Explicit=
      135.13.198.23&135.13.196.3&135.13.198.213,SrlgExclude=135&1432&222,,,,
   SrcNID=135.13.196.203,1-6-5-3-1,DestNID=135.13.196.123,1-2-5-5-1&1-2-5-5-1:
   PathID=135.13.196.203-432165,State=CON&OK,
   NodeList=135.13.196.203&135.13.196.123&135.13.42.3&135.13.242.103:
   PathID=135.13.196.203-432177,State=CON&FAILED,
   NodeList=135.13.196.203&135.13.198.23&135.13.196.3&135.13.198.213&135.13.242.123"
;
```

This connection was setup using the command:

```
ENT-PATH-N1PLUS1:LT-ONNS-9:snn:99345::13513794:2WAY:sts48:55:
   135.13.196.203: 1-6-5-3-1:135.13.196.123:1-2-5-5-1:Explicit,
   135.13.196.123&135.13.42.3:Explicit,
   135.13.198.23& 135.13.196.3&
   135.13.198.213:135&1432&222,10;
```

RTRV-PATH output example for a connection with Path DetailRoute=ON

The following example shows the *detailPath* record of a **RTRV-PATH** command with the parameter *DetailRoute* = ON with an OUC existing on top of the connection in the Z-node It produces this resulting second message block that follows the normal **RTRV-PATH** response (see below for a complete example):

```
RTRV-PATH:LT-ONNS-9:onn:14345::13514794:135.14.196.203&1-6-5-3-1&1:DetailRoute=ON;

...

   LT-ONNS-9 2002-06-04 08:00:00
M  14345 COMPLD
   "ConnID=135.14.196.203&1-6-5-3-1&1,PathID=135.14.196.203-32165,:
   135.14.196.203,1-6-5-3-1,,-X-,1-2-4-3-1,,:
   135.13.196.123,1-1-5-3-1,,-X-,1-2-2-3-1,,:
   135.13.42.63,1-1-3-1-1,,-X-,1-1-4-4-1,,:
   135.13.18.23,1-1-4-4-1,,-X-,1-2-1-3-1,,:
   135.13.242.103,1-1-2-7-1,,-X-,1-2-5-1-1,3-1-2-1-1,"
;
```

RTRV-PATH output example for a connection with Path DetailState=ON

The following example shows the detailPath record of a **RTRV-PATH** command with the parameter *DetailState* = ON, it produces this resulting second message block that follows the normal **RTRV-PATH** response (see below for a complete example):

```
RTRV-PATH:LT-ONNS-9:onn:14345::13514794:135.14.196.203&1-6-5-3-1&1:DetailState=ON;
```

```
...

   LT-ONNS-9 2002-06-04 08:00:00
M  14345 COMPLD
   ″ConnID=135.14.196.203&1-6-5-3-1&1,PathID=135.14.196.203-32165,:
   135.14.196.203,1-6-5-3-1,,-X-,1-2-4-3-1,,
   GOOD,FAILED,:
   135.13.196.123,1-1-5-3-1,,-X-,1-2-2-3-1,,
   GOOD,FAILED,:
   135.13.42.63,1-1-3-1-1,,-X-,1-1-4-4-1,,
   GOOD,FAILED,:
   135.13.18.23,1-1-4-4-1,,-X-,1-2-1-3-1,,
   GOOD,GOOD,:
   135.13.242.103,1-1-2-7-1,,-X-,1-2-5-1-1,,
   GOOD,GOOD,″
;
```

This example output allows the following conclusions:

- In downstream direction, a good signal is received at the A-node EDGE tributary and stays good through the domain
- In upstream direction, a good signal is received at the Z-node EDGE tributary and stays good up to node 135.13.18.23, but is reported as FAILED by node 135.13.42.63. Thus in between these nodes a transmission failure can be assumed.

Output Example for ONNS nodes not reporting or reporting missing cross-connections

This example shows the *detailPath* record of an **RTRV-PATH** with *DetailRoute* = ON, when intermediate nodes do not respond or can not retrieve the cross connect information (see below for a complete example):

```
RTRV-PATH:LT-ONNS-9:onn:14345::13514794:135.14.196.203&1-6-5-3-1&1:DetailRoute=ON;

...

   LT-ONNS-9 2002-06-04 08:00:00
M  13456 COMPLD
   ″ConnID=135.14.196.203&1-6-5-3-1&1,PathID=135.14.196.203-32165,:
   135.14.196.203,1-6-5-3-1,-X-,1-2-4-3-1,:
   135.13.22.3, ,-X-, ,NO_REPLY:
   135.13.196.123,1-1-5-3-1,-X-,1-2-2-3-1,:
   135.13.44.93,1-2-2-2-1,-X-,1-1-4-2-1,:
   135.13.42.63,1-1-4-4-1,-X-,1-2-1-3-1,:
   135.13.242.103,1-1-2-7-1,-X-,1-2-5-1-1,″
;
```

RTRV-PATH output example for an M:N protected group of connections

The example shows a successful completion of **RTRV-PATH** command for an M:N protected group of connections within a state where a protection is currently active:

```
RTRV-PATH:LT-NN-789:snn:973456::1352463:135.13.196.203&1
;

   LT-NN-789 2002-09-18 08:00:00

```

Error responses

Validation rule: *connID* Non-Existant (ICNE)

If the source node receives a command and the specified *connID* does not exist, then the following error response is returned:

Error code: `E220 – 13513794 – Input, ConnectionID Non-Existent`

Validation rule: Invalid *srvID*

If the source node receives a command with an invalid ServiceID (srvID) parameter value, then the following error response is returned:

Error code:
`E030 – SMcon135*7.92468 – Syntax, Parameter Data Imvalid,Invalid_ parameter=SrvID`

Validation rule: Invalid command

If an unrecognized or unsupported command is received, then the following error response is returned:

Error code: `E235 – Input, Invalid CoMmand, Command not found or recognized`

Validation rule: Syntax, Invalid punctuation

If a command is received that contains incorrect punctuation, then one of the following error responses is returned:

Error code: `E240 – Syntax, InValid Punctuation`

Validation rule: Syntax invalid or unimplemented parameter

If a command is received that contains an empty field that requires a parameter, or if a parameter input has not an allowed value for the field, then the following error response is returned:

Error code: `E246 – Syntax, Parameter Not Implemented`

The following list identifies conditions that will cause similar error responses :

Error code:
`E030 – SPDI Error – Syntax, Parameter Data Invalid, invalid_parameter= fieldName`

Error code:
`E037 – INCS Error – Input, Neither ConnID nor ConnAlias Specified`

Error code: `E040 – SDNC Error – Syntax, Data Not Consistent`

Error code: `E221 – IANE Error – Input, ConnectionAlias Non-Existent`

Validation rule: Invalid target identifier

If a command is received with an invalid Target Identifier, then one of the following error responses is returned:

Error code: `E250 – Input, Invalid TArget Identifier`

Error code: `E805 – Input, Missing Target Identifier (TID)`

Validation rule: Invalid access identifier

If a command is received with an invalid access identifier, then the following error response is returned:

Error code: `E260 – Input, Invalid ACcess identifier`

Validation rule: Invalid correlation tag (CTAG) or RequestID

If a command is received with an invalid correlation tag, then one of the following error responses is returned:

Error code: `E265 – Input, Invalid Correlation Tag`

Error code: `E266 – Input, Missing Correlation Tag`

Validation rule: Status, All Resources Busy

If a command can not be completed due to insufficient processing resources or the system is in maintenance mode, then the following error response is returned:

Error code: `E280 – Status, All Resources Busy`

The following list identifies conditions that will cause similar error responses:

- Error code:
  `E281 – Status, Busy, NVM Write in Progress for same connection`
- Error code: `E282 – Status, Conn State Invalid for this Operation`

Validation rule: Requested Operation Failed (SROF)

If a command can not be completed due an internal hardware or software failure, then the following error response is returned:

Error code: `E290 – Status, Requested Operation Failed`

Example: The command
`RTRV-PATH:LT-ONNS9:snn:123456:::123.198.42.233&1-2-32-4-1;` can produce this output.

Validation rule: Error Responses Specific to RTRV-PATH

The following list identifies conditions that will cause error responses specific to **`RTRV-PATH`** commands:

Error code:
`E226 – IDNA – Input, Retrieve Detail_Route or Detail_State Not allowed for RTRV-PATH ALL`

The following list identifies conditions that will cause error responses specific to **`RTRV-PATH`** commands sent with detail_route option:

Error code:
`E227 – SRDE -Status, Retrieve Detail_Route or Detail_State Error`

Validation rule: Retrieve path with detailed route option - No path ID associated to ONNS connection

Error code: `E282 – SCSI – Status, Conn State Invalid for this Operation`

Error response E282 defined for **RTRV-PATH** applied with *RetrieveDetail_Route* option shall also be valid in case of **RTRV-PATH** applied with *RetrieveDetail_State* option.

Validation rule: Retrieve path with detailed state option - Operation Invalid for Protection Type MBYNPRT

All error responses defined for **RTRV-PATH** applied with RetrieveDetail_Route option shall also be valid in case of **RTRV-PATH** applied with RetrieveDetail_State option.

Error code:
`E283 – SOPI – Status, Operation Invalid for Protection Type MBYNPRT`

For connections of protection type MBYNPRT the retrieve detailed state option does not provide any added value for the following reasons:

- If the connection is in STBY state, both ends of its associated path are not connected in the A- and Z-node and thus only FAILED signals can be monitored for the whole path throughout the domain irr. of any failures that may exist.
- If the connection is in USED state, its associated path is allocated by an MBYNWRK connection and can be monitored there.

Validation rule: Retrieve path - Invalid connection ID for group retrieval

If the source node Network Element receives a TL1 command containing a connID with tributary# = ALL, but the corresponding port is not a VCG, then one of the following error response is returned:

```
   srcTid 2001-06-01 08:00:00
M  ctag DENY
   IICG
   ″E050:13579468:\″Input, Invalid connection ID for connection
   group/connID″
;
```

The following list identifies conditions that will cause similar error responses specific to **RTRV-PATH** commands for groups of connections (including E050 above):

- Error code:
  `E050 – IICG – Input, Invalid connection ID for connection group/conn ID`
- Error code:
  `E051 – IIDG – Input, Invalid DetailRoute or DetailState option for Group retrieve`

Example: The command

```
RTRV-PATH:LT-SNNS9:snn:123456:::123.198.42.233&1-2-32-4-ALL:detailRoute=
   ON;
```

will produce the output E051.

The following error response will be raised in case connection alias and connection ID specified in the command do not match:

Error code: `E038 – IICS – Input, Inconsistent connAlias Specified`

Possible inconsistency during soak time

If the **RTRV-PATH** request with *detailstate* = on is started while the soak timer is running, the retrieved results may be inconsistent.

After the soak timer ends, the results are correct.

RTRV-PM: Retrieve performance monitoring

The **RTRV-PM** command is initiated by a user to request the NE to send the current and/or historical Performance Monitoring (PM) data associated with one or more facilities. For each value in the *montype* parameter of the **RTRV-PM** input parameters section, PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-PM-*modifier*:*tid*:*aid*:*ctag*::[*montype*], [*monlev*], [*locn*],,*tmper*, [*mondat*], [*montm*];

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the port type or tributary on which the **RTRV-PM** command is to act on.
   Type: Alphanumeric value set.
   Range: The following values are for SONET only: STS1, STS3C, STS12C, STS48C, STS192C, OC3, OC12, OC48, OC48T, OC192, OC768, T3.
   The following values are for SDH only: VC3, VC4, VC44C, VC416C, VC464C, STM1E, STM1, STM4, STM16, STM16T, STM64, STM256, ODU1.
   The following value is for OTN only: OTU2
   Although the ODU layer is independent of SONET/SDH, the ODU1 modifier is listed here in the SDH section. This is because the ODU1 function is used for the Transparency feature, which is only supported for SDH.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **aid** – Access Identifier
   Type: AID
   Range: For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T modifiers: SPortAID.
   For T3 modifier: APortAID
   For OTU modifier: OTNPortAID
   For ODU<N> modifiers: VCGAID

For VC3, VC4, VC44C, VC416C, VC464C, STS1, STS3C, STS12C, STS48C and STS192C modifiers only: STS1NumAID.
And for modifiers VC4 and STS1: VCGNumAID.
Range is supported up to shelf level or system level; i.e.
ALL-ALL-#-#-ALL-ALL (on port level).
ALL-ALL-#-#-ALL-ALL-ALL (on tributary level).

4. **ctag** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).

5. **montype** – Monitored parameter type
   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.
   Type: Value set.
   Range: The following values are for all OC<N> and the EC1 modifiers: CVS, ESS, SESS, SEFS-S, LOSS-S, CVL, ESL, SESL, UASL, AISS-L, FC-L, CV-LFE, ES-LFE, SES-LFE, UAS-LFE, FC-LFE.
   The following values are for all OC<N>T modifiers: CVS, ESS, SESS, SEFS-S, LOSS-S.
   The following values are for all OC<N>T modifiers only: CVS-EGR, ESS-EGR, SESS-EGR, SEFS-S-EGR.
   The following values are also for OC192 and OC768 modifiers only: FECC-L.
   The following values are for STS1 (path) and are also applicable to STS3C, STS12C, STS48C and STS192C modifiers only: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE, PPJC-PGEN, NPJC-PGEN, PPJC-PDET, NPJC-PDET
   The following values are for all STM<N> modifiers: RS-N-ES, RS-N-SES, RS-N-BBE, RS-N-UAS, MS-N-ES, MS-N-SES, MS-N-BBE, MS-N-UAS, MS-F-ES, MS-F-SES, MS-F-BBE, MS-F-UAS.
   The following values are for all STM<N>T modifiers: RS-N-ES, RS-N-SES, RS-N-BBE, RS-N-UAS
   The following values are for all STM<N>T modifiers only: RS-N-ES-EGR, RS-N-SES-EGR, RS-N-BBE-EGR, RS-N-UAS-EGR
   The following values also are for STM64 and STM256 modifiers only: MS-N-FECC.
   The following values are for T3 modifier: CVL, ESL, ESA-L, ESB-L, SESL, LOSS-L, CVP, ESP, ESA-P, ESB-P, SESP, UASP, FC-P, SEFS-P, SAS-P, AISS-P, CV-PFE, ES-PFE, ESA-PFE, ESB-PFE, SES-PFE, UAS-PFE, FC-PFE, SAS-PFE, CVP-EGR, ESP-EGR, ESA-P-EGR, ESB-P-EGR, SESP-EGR, UASP-EGR, FC-P-EGR, SEFS-P-EGR, SAS-P-EGR, AISS-P-EGR, CV-PFE-EGR, ES-PFE-EGR, ESA-PFE-EGR, ESB-PFE-EGR, SES-PFE-EGR, UAS-PFE-EGR, FC-PFE-EGR, SAS-PFE-EGR
   The following values are for all ODU<N> modifiers only: ODU-N-ES, ODU-N-SES, ODU-N-BBE, ODU-N-UAS, ODU-F-ES, ODU-F-SES, ODU-F-BBE, ODU-F-UAS
   The following values are for VC3, VC4, VC44C, VC416C and VC464C modifiers

only: VC-N-ES, VC-N-SES, VC-N-BBE, VC-N-UAS, VC-F-ES, VC-F-SES, VC-F-BBE, VC-F-UAS, PJCPOS, PJCNEG
The following values are for OTU modifiers only: OTN-LOSS, OTN-FECC
The following value is also allowed for all input modifiers: ALL.
Default: ALL.

6. **`monlev`** – Monitored Level
   This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.
   Type: value set.
   Range:
   - 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
   - 0-UP: Means the NE will report zero and all positive data.

   Default: 1-UP.
7. **`locn`** – Location
   Location for which the PM data is monitored. The parameter value is only considered if the *montype* value is ALL; otherwise it is ignored for the calculation of the command reply (i.e has no impact on the command).
   Type: value set.
   Range:
   - NEND: Near-End PM data is requested.
   - FEND: Far-End PM data is requested.
   - ALL: All near-end and far-end data is requested. It applies only to input direction.

   Default: ALL.
8. **`tmper`** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.
   Range:
   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.
9. **`mondat`** – Monitored Date
   This requests the beginning date of the interval for which the PM data is to be reported. For both values of tmper parameter, the maximum allowable range of valid dates includes the current and previous one day.
   Type: value set.
   Range:
   - MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
   - ALL: Current and previous day.

   Default: Current date

10. **`montm`** – Monitored Time

    This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:

    a. A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).

    b. A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).

    c. All applicable beginning times for the given *mondat* value (i.e., all).

    Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondat* value provided is ALL.
    Type: Character string.

    Range:

    - HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
    - THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of $$-$$indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##-##indicates the previous 15-min interval.
    - ALL: All applicable beginning times for the given *mondat* value.

    If the *tmper* value is 1-DAY, the *montm* parameter will not be used.
    Default:
    If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.
    If HOD-MOH is omitted, the PM period for the current time will be reported.

Output format

If the NE fully complies with the RTRV-PM request, the following normal completion response is returned:

```
    sid date time
M  ctag COMPLD
   ″aid:montype,monval,[validity],[tca],[locn],,tmper,[mondat],[montm]″
   . . . . .
   . . . . .
   . . . . .
;
```

Note: The trailing comma has to be present even if the optional parameter is not supported for a dedicated release.

The output parameters *sid, date, time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Normal completion message – empty reply

If there is no PM data stored within the NE, then the following response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

1. **aid** – Access Identifier
   Description: Access identifier.
   Type: AID
   Range: For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T modifiers only: SPortAID.
   For T3 modifier: APortAID
   For OTU modifier: OTNPortAID
   For ODU<N> modifiers only: VCGAID
   For VC3, VC4, VC44C, VC416C, VC464C, STS1, STS3C, STS12C, STS48C and STS192C modifiers only: STS1NumAID.
   And for modifiers VC4, VC464C, STS1, STS3C and STS192C: VCGNumAID
2. **montype** – Monitored Parameter Type
   See montype in the input parameters section.
3. **monval** – Monitored Value
   This parameter specifies the measured value of the parameter specified in montype.
   Type: Integer.
   Range: 0-4294967295
   The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.

   W.r.t. value range for the specific PM parameters see

   - Section "Output parameters" in "RTRV-TCA-PROF: Retrieve TCA profile" (p. 3-2982) (if thresholding is applicable for that parameter)
   - PM parameter introduction section (if thresholding is not applicable for that parameter).

4. **`validity`** – validity indicator
   This parameter indicates the validity of the PM data.
   Type: Integer.
   Range: 1: valid; (omitted): non-valid.
5. **`tca`** – Threshold Crossing Alert
   Type: value set.
   Range for the current interval:
   - in TCA mode TR, that the current value exceeds the provisioned threshold
   - in TCA mode TR-RTR, that a *tca* occurred since the beginning of this; interval or that the tca reset condition was not fulfilled in any previous; interval since the last tca occurred

   f the value is omitted, it indicates
   - in TCA mode TR, that the current value is below the provisioned threshold
   - in TCA mode TR-RTR, that no tca occurred since the beginning of this; interval and that the tca reset condition was fulfilled at least in one previous , interval

   For previous intervals, the tca parameter indicates the state at the end of the interval.
6. **`locn`** – Location
   Location for which the PM data is monitored.
   Type: value set.
   Range:
   - NEND: Near-End PM data is requested
   - FEND: Far-End PM data is requested.
7. **`tmper`** – Time Period
   See in the input parameters section.
8. **`mondat`** – Monitored Date
   This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.
   Type: value set.
   Range: MM-DD: Month-Day
   Default: Current date
9. **`montm`** – Monitored Time
   This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).
   Type: Character string.
   Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

Example input/output

The following example shows the successful completion of a **RTRV-PM** command by the NE for a VC3:

```
RTRV-PM-vc3:UNITE-NE:1-1-#-#-5-1-27:123456::vc-f-es,1-up,,,15-min ,,
00-00&&08-00;
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   ”1-1-#-#-5-1-27:vc-f-es,17,,tca,,,15-min,,00-00”
   ”1-1-#-#-5-1-27:vc-f-es,10,,tca,,,15-min,,00-15”
   . . .
   ”1-1-#-#-5-1-27:vc-f-es,15,,tca,,,15-min,,08-00”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-PM** command. See also subsection ’Partial Completion on RTRV Commands’ w.r.t. handling of internal error (e.g. communication to XC320 fails) for a subset of replies.

RTRV-PREDEFRAG: Perform an ONNS fragmentation analysis

Overview

The **`RTRV-PREDEFRAG`** command is used to perform an analysis about the fragmentation status of a link or other entity.

This command is used by an operator in preparation for doing a defrag operation on a port or between multiple ports in a link between two nodes.

The command causes the receiving node to do an analysis of the level of fragmentation that currently exists on the specified port or link. An analysis is performed of how much usable bandwidth will be gained if defragmetation were to be done, and the time slot structure as it would be following a defragmentation operation is computed. Note that all this is done in an analysis mode. No real defragmentation is done until a subsequent “operate defrag” command is issued. The rtrv-predefrag command causes the network element to send the results of the defrag analysis in a status report back to the management system in a TL1 response.

As above stated the RTRV-PREDEFRAG is done in an analysis mode and does not guarantee the same result for Gain and *PostLDGrouping* after real defragmentation.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No.

Input format

Command syntax: **`RTRV-PREDEFRAG:`***srcTid:srcAid:ctag::scope:targetID*;

Input parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`ctag`** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
3. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
4. **`scope`**
   This parameter specifies the scope of the defrag operation: intra-port or inter-port (intra link).

   Range

   - PORT: specifies the defrag is intra-fiber operation on a specific port. In this case *targetID* specifies the local port id same as the *portAID*. The corresponding neighbor node and neighbor *portAID* can be deduced from the *targetID*.
   - LINK: specifies the link defrag is inter fiber but within a link bundle. Also, the link defrag operation is performed on all the bundles between the two neighboring nodes. TargetID specifies the neighbor nodes ASTN node ID.
5. **`targetID`**
   The specification of the *targetID* depends on the setting of the parameter scope: PORT specifies the AID of the port on the local node that is to be defragmented;LINK specifies the ASTN node ID of the neighbor node of the link that is to be defragmented.
   Type: Four dash separated numeric string for the portAID. Four dot separated numeric string for the neighbor ASTN node ID.
   Range. Each numeric string: 0…255.

Output format

If the RTRV-PREDEFRAG request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   ″PreLDGrouping=NuM&NaM&....
    PostLDGrouping=NuM&NuM&...
    Gain=NSTSn&..″
;
```

The pre and post defrag time slot structure is indicated by two strings consisting of ″&″ separated substrings. The substrings have the form NuM or NaM where N is a number indicating the number of STS1s that make up that slot and M indicates the rate (3C, 12C etc..). The letters ″u″ and ″a″ indicate whether the time slot is used or is available respectively. The value of M while specifying the number of available STS1s is always blank. Thus 2a means two STS1 slots are available.

The gain parameter indicates number of additional time slots that will become available once defrag is done.The highest rate time slots are indicated first, followed by the lower rates, with each signal rate substring being separated by an &. The fractional STS1s that form the remainder are not indicated. If there is nothing to be gained from the defrag operation, the gain parameter will say NONE.

Normal system response to RTRV-PREDEFRAG for inter-port (link) defragmentation

If the RTRV-PREDEFRAG request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   ″BundleID=bundlID_1,Gain=NSTSn&...″
   ″PortID=portID_1,
    PreLDGrouping=NuM&Na&...
    PostLDGrouping=NuM&Na&...″
   ...
   ″PortID=portID_m,
    PreLDGrouping=NuM&Na&...
    PostLDGrouping=NuM&Na&...″
   ...
   ″BundlID=bundleID_m,Gain=NSTSn&...″
   ″PortID=portID_1,
    PreLDGrouping=NuM&Na&...
    PostLDGrouping=NuM&Na&...″
   ...
   ″PortID=portID_m,
    PreLDGrouping=NuM&Na&...
```

```
    PostLDGrouping=NuM&Na&..."
;
```

The pre and post defrag time slot structure is indicated by two strings consisting of "&" separated substrings. The substrings have the form NuM or Na where N is a number indicating the number of STS1s that make up that slot and M indicates the rate (3C, 12C etc..). The letters "u" and "a" indicate whether the time slot is used or is available respectively. The available timeslots are ever shown in STS1s and no additional rate value M is needed. Thus 2a means two STS1 slots are available.

The gain parameter indicates number of additional time slots that will become available once defrag is done.The highest rate time slots are indicated first, followed by the lower rates, with each signal rate substring being separated by an &. The fractional STS1s that form the remainder are not indicated. If there is nothing to be gained from the defrag operation, the gain parameter will say NONE.

The inter-port defragmentation record will be send in data blocks that are less than 4096 characters. A data block will end with the pre and post defrag timeslot structure. On all messages but the last, a RTRV completion code is used and the semicolon (;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the section "Output parameters" of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698) command.

1. **`bundleID`**
   A unique numeric ID assigned to the link bundle on this node.
   Type: Integer
   Range: >0
2. **`portID`**
   Port ID for which the NNDR data is retrieved. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port # .
   Type: dash-separated list of 4 numeric strings
   Range: Bay/Frame #1, Shelf #1, Slot/Pack #1,..39 Port #1..16,
3. **`PreLDGrouping`**
   An ordered & separated string of numbers indicating the availability or unavailability of a group of time slots of different rates. The unit of measure is STS1. Availability is indicated by "a" and unavailability (used) by "u". Thus 1u3 indicates that one STS3c slot is used up, and 2a indicates that two STS1 slots are available. Notice that the available timeslots are always specified in terms of the number of STS1s. Hence, the "1" at the end is understood and not included to conserve space.

Type: &-separated list of numbers.
Example for an OC12 port:
PreLDGrouping=1u3&2a&1u1&1u3&1u1,2a, indicates one used STS3c, two available STS1, one used STS1, one used STS3c, 1 used STS1, two available STS1.
The size of the output string will vary depending on whether the port is OC3, OC12, OC48, OC192, OC768 and also on the distribution of the used/available time slots. For an OC192 port, the output string would indicate the STS48c, STS12c, STS3c and STS1 slots used up and the remaining unused STS1 slots.

4. **`PostLDGrouping`**
   An ordered string formatted the same way as the *PreLinkDefragGrouping* string, indicating the time slot structure once the defrag operation is completed.
   Type: &-separated list of numbers
   Example for the above case of the OC12 port, the PostLDGrouping=2u3&2u1&4a, indicating that two STS3c slots are used, two STS1 are used and four STS1 slots are available. Thus another STS3c can be accommodated.

5. **`Gain`**
   A parameter indicating whether the defrag will result in an improvement or not. ″NONE″ indicates no improvement, any other value indicates the ″delta″ improvement over the existing time slot structure. The delta is computed in terms of the additional signals that can be accommodated as a result of the defrag starting with the highest signal rate possible for that port. The improvement is represented as a string composed of one or more of the following substrings: ″STS3c″, ″STS12c″, ″STS48c″, ″STS192c″. Each substring has a numeric string preceding it indicating the number of timeslots of that type that will be available once defrag is performed. The highest signal rate is stated first, then the next highest rate and so on.
   Type: &-separated list of numbers concatenated with value set or the special value NONE.
   Range: The value is ″NONE″ if no gain. Else it indicates the additional timeslot that are now available. In the above example: Gain=1STS3C. Gain will be an & separated list if there are multiple gains. E.g: 1STS12c& 3STS3c would mean that 1 STS12c and 3 STS3c connections could be accommodated on that port once the defrag is done. Note only the additional available timeslots are included in the response.

Example input/output

Input/output examples for RTRV-PREDEFRAG intra-port defragmentation

The following example shows a successful completion of a **`RTRV-PREDEFRAG`** command:

```
RTRV-PREDEFRAG:NN001:snn:ed01::PORT,1-1-2-1;

   NN001 2002-01-12 01:03:16
M  ctag COMPLD
```

```
   ″PreLDGrouping=1u3&2a&1u1&1u3&1u1&2a
    PostLDGrouping=1u3&3a&1u3&2u1&1a
    Gain=1STS3C″
;
```

Input/output examples for RTRV-PREDEFRAG inter-port defragmentation

The following example shows a successful completion of a **RTRV-PREDEFRAG** command:

```
RTRV-PREDEFRAG:NN001:snn:ed01::Link,29.13.80.192;

   NN001 2002-01-12 01:03:16
M  ctag COMPLD
   ″BundleID=1,Gain=2STS3C″
   ″PortID=1-1-2-1
    PreLDGrouping=1u3&2a&1u1&1u3&1u1&2a
    PostLDGrouping=1u3&3a&1u3&2u1&1a″
   ″PortID=1-1-2-2
    PreLDGrouping=1u3&2a&1u1&1u3&1u1&2a
    PostLDGrouping=1u3&3a&1u3&2u1&1a″
;
```

Error responses

Invalid *PortID*

If the NE receives an RTRV-PREDEFRAG command with an *PortID* parameter value that is invalid the following error response is returned:

Error code: `E410 – Input, Invalid PortID`

Invalid *ASTNNodeID*

If the NE receives an RTRV-PREDEFRAG command with an *ASTNNodeID* parameter value that is invalid the following error response is returned.

Error code: `E512 – Input, Invalid Neighbor node ID`

RTRV-PRMTR-DATA: Retrieve parameter data

The **RTRV-PRMTR-DATA** command retrieves information about the databases being in NVM. It identifies the databases' release numbers and provides also other information such as their states.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 2

Abortable: No

Input format

Command syntax: **RTRV-PRMTR-DATA**:*tid*::*ctag*::*[amount]*;

Input parameters

Command parameters

1. **tid**- Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **amount** – Amount Of Data To Return
   This parameter specifies whether the current generic or previous generic or both is returned. If a value is omitted, then the current (active) generic is returned.
   Type: Alphanumeric value set.
   Range: CURRENT (default), PREVIOUS, ALL.
   Default: CURRENT.

Output format

The following normal completion response is returned, if the RTRV-PRMTR-DATA request completes successfully:

```
   sid date time
M  ctag COMPLD
   "nvm:spec_block"
       ...
       ...
   "nvm:spec_block"
;
```

Output parameters

Refer to the "Output parameters" section of the "RTRV-HDR: Retrieve header" (p. 3-2417) command for a normal completion response. The output parameters listed there also apply to the **RTRV-PRMTR-DATA** command. Additional parameters that specifically apply to this command are defined in the following:

1. **nvm** – Non Volatile Memory Identifier
   This parameter specifies the region of non volatile memory data (current or previous).
   Type: Value set.
   Range:
   - NVM-A: for current NVM Data
   - NVM-B: for previous NVM-Data.

   Default: Only current NVM data is reported except for *amount* having been specified to ALL.

Spec block parameters

This parameter provides information about the stored database. It contains the parameters *release, size, backuptime, restoretime, backupfile, restorefile, priorbackuptime*, *priorbackupfile*, *priorrestoretime*, *priorrestorefile*, *state*, *tid* and *serialnumber*.

When software is being downloaded to previous NVM, the database parameters for NVM-B do not need initialization because they still reflect information pertaining to the currently executing generic.

During installation, the following parameters are omitted (initialized to a blank field) for NVM-A:

backuptime, restoretime, backupfile, restorefile, priorbackuptime, prioirrestoretime, priorbackupfile, priorrestorefile.

When a backup is performed for the database in current NVM, the values of *restoretime*, *restorefile*, *priorbackuptime*, *priorbackupfile* is not modified.

1. **`release`** – Release Number
   This parameter represents the release number contained in the file. The parameter will be omitted if state is ’INITIAL’.
   Type: value set of the form x.y.z
   Range: x, y, z are integer numbers from 00 to 99 in two-digit form, that means leading zeros are not suppressed. x is not 00.
2. **`size`** – Size Of Allocated NVM
   This parameter indicates the allocated NVM size in bytes.
   It is not dynamically updated within the generic until data migration or software upgrade which may change the budget of NVM space used for database files.
   Type: Numeric string.
   Range: 0 to 99999999
   Default: In case the software generic on the NVM is empty, the value 0 is reported.
3. **`backuptime`**
   This parameter provides time and date when the last backup to a remote file store has been finished. It is omitted if the system has never been backed up.
   The NE updates *backuptime* at the OS just before file transfer starts and then update the value of current NVM’s *backuptime* when the backup finishes.
   This implies the value of *backuptime* contained in backupfile at the OS will represent a slightly earlier time than the value contained in current NVM’s database.
   backuptime is updated whether or not the file transfer was successful.
   Type: value set of the format: YY-MM-DD HH-MM-SS.
   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.
4. **`restoretime`**
   This parameter reflects the time and date when the last restore from a remote file store has been finished. It is omitted, if the system has never been restored.
   When a backup is performed for the database in current NVM, the values of *restoretime* (in current NVM, previous NVM) are not modified.
   Only database files at the current or previous NVMs shall have values for *restoretime*.
   Type: value set of the format: YY-MM-DD HH-MM-SS
   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

5. **`backupfile`**
   This parameter indicates the remote location where the last backup is stored. Omitted if never backed up.
   The NE will update *backupfile* before the file transfer starts.
   Thus, both the source (current NVM) and the destination (*Navis*® Optical EMS or CIT) will have the same value for *backupfile*.
   Type: text string.
   Range: The parameter has one of the following formats:
   - *″CIT,filename″*
   - *″EMS,filename″*
   - *″FTTD″,FTP URL″*

   The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.
   Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).
   The FTP URL must be in the format:
   ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>
   - <login>: default value: ″anonymous″
   - <password>: default for <login> ″anonymous″ is ″″ (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
   - <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
   - <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
   - <file_name>: the complete path name of the file.
6. **`restorefile`**
   This parameter reflects the remote location where the last restore came from. Omitted if never restored.
   When a backup is performed for the database in current NVM, the values of *restorefile* (in current NVM, previous NVM, the destination) will not be modified.
   restorefile is updated whether or not the file transfer was successful.
   Type: text string.

Range: *restorefile* has one of the following formats:

- *″CIT,filename″*
- *″EMS,filename″*
- *″FTTD″,FTP URL″*

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.
Because a (\) is interpreted as the escape character, it will be represented in the output as a double backslash (\\).
The FTP URL must be in the format:
ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: ″anonymous″
- <password>: default for <login> ″anonymous″ is ″″ (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

7. **`priorbackuptime`**
This parameter gives the time and date when the next-to-last backup to a remote file store finished. It is omitted, if there is no next-to-last-backup.
When a backup is performed for the database in current NVM, the values of *priorbackuptime* (in current NVM, previous NVM, the destination) will not be modified.
Type: value set of the format: YY-MM-DD HH-MM-SS
Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.
Default: n. a.

8. **`priorrestoretime`**
This parameter specifies the time and date when the next-to-last restore from a remote file store finished. It is omitted, if there is no next-to-last restore.
Type: value set of the format: YY-MM-DD HH-MM-SS.
Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

9. **`priorbackupfile`**

This parameter indicates the remote location where the next-to-last backup is stored. It is omitted, if there is no next-to-last backup.
When a backup is performed for the database in current NVM, the values of *priorbackupfile* (in current NVM, previous NVM, the destination) will not be modified.
Type: text string

Range: *priorbackupfile* has one of the following formats:

- *″CIT,filename″*
- *″EMS,filename″*
- *″FTTD″,FTP URL″*

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file system, forward slashes (/) should be used.
Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).

The FTP URL must be in the format:
ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: ″anonymous″
- <password>: default for <login> ″anonymous″ is ″″ (empty).For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

10. **`priorrestorefile`**

This parameter reflects the remote location where the next-to-last restore came from. It is omitted, if the is no next-to-last restore.
Type: text string

Range: *priorrestorefile* has one of the following formats:

- *″CIT,filename″*
- *″EMS,filename″*
- *″FTTD″,FTP URL″*

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.
Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).

The FTP URL must be in the format:
ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: ″anonymous″
- <password>: default for <login> ″anonymous″ is ″″ (empty).For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

11. **`state`** – State of the Database

This parameter describes the state of the database per NVM region:

- CORRUPT (current, previous): Unavailable for invocation or execution (e.g. corrupted check sum)
- MISMATCH (previous): Contained ES64U databases do not fit to the actual configuration
- DOWNLOADED (previous): Applies to the previous bin of database. Database has been downloaded and is ready for activation.
- INITIAL (current): Nothing in NVM.
- INITIAL (previous): Nothing in previous partition of NVM.
- INPROGRESS (current): Backup or restore in progress.
- INPROGRESS (previous): Restore is in progress.
- PREVIOUS (previous): A previously active database.
- PRESERVED (previous): Previously active database during trial state
- RUNNING (current): The currently active database.

The normal database states of current NVM are: RUNNING and INPROGRESS. Most of the time its state is equal to RUNNING, signifying that it contains a copy of the database that is currently in use. When a DB backup or a DB restore makes the NVM inaccessible, current NVM will have a database state of INPROGRESS. The normal database states of previous NVM are: PREVIOUS and INPROGRESS. Most of the time its state is equal to PREVIOUS, signifying that it contains a copy of the database that was used with the previous generic. The state PRESERVED indicates a copy of the previously active database after application of a new SW generic, while the new SW generic is in trial phase. During the trial phase a switch back to the previously installed SW generic and the previously active database is possible. When a restore makes the NVM inaccessible, previous NVM will have a database state of INPROGRESS.

The state DOWNLOADED applies to the two-step DB restoration process in which

a DB first is being downloaded and at a separate step being activated.
If an NVM has never contained a database, then the RTRV-PRMTR-DATA output for that NVM will consist of *state* INITIAL and size 0.
If an NVM is failed or missing, then RTRV-PRMTR-DATA will report only the state output variable for that NVM. *state* will have the value CORRUPT.

If an NVM contains a database generic, which contains ES64U databases and

a. the CTL does not support the ES64U feature or

b. the XC does not support the ES64U feature

then the *state* shall have the value CORRUPT
If an NVM contains a database generic, which contains ES64U databases but the contained ES64U databases do not fit to the actual ES64U configuration then the *state* shall have the value MISMATCH
Type: Alphanumeric value set.
Range: CORRUPT, MISMATCH, DOWNLOADED, INITIAL, INPROGRESS, PREVIOUS, PRESERVED, RUNNING.
Default: INITIAL

12. **`tid`** – target identifier
This parameter gives the TID that was stored in this NVM. The parameter will be omitted if state is INITIAL.
This parameter is not evaluated in the NE. *serialnumber* will be used to check whether database belongs to correct NE.
See "RTRV-HDR: Retrieve header" (p. 3-2417) for allowable tid values and details.

13. **`serialnumber`** – serial number
This parameter gives the NE serial number from the database control information showing to which NE the database belongs to. Comparing this serial number with the actual NE serial number from the backplane EEPROM may help troubleshooting when being in maintenance mode. The parameter will be omitted if state is INITIAL.
Type: Alphanumeric value set.
Range: 12 times the space character or the 12 byte serial number of electronic label.
Default: 12 times the space character.

Example input/output

In the following example for the **`RTRV-PRMTR-DATA`** command, current NVM contains a copy of the RUNNING database. The database was last backuped at 9:00 and the backup was to CIT:

```
RTRV-PRMTR-DATA:LT-UNITE::123456;
   LT-UNITE 00-11-01 09:45:28
M  123456 COMPLD
   "NVM-A:release=01.02.04,size=8234567,backuptime=00-11-01 09-00-
      00,backupfile=\"CIT,\\data\\00_11_01B\",priorbackuptime=00-11-01 08-00-
      00,priorbackupfile=\"CIT,\\data\\00_11_01A\",state=running,tid=LT-
      UNITE,serialnumber=01NB12345678"
```

;

Related TL1 messages

- "APPLY: Apply software generic or activate a downloaded database" (p. 3-35)

RTRV-PRMTR-SFTWR: Retrieve parameter software

The **RTRV-PRMTR-SFTWR** command retrieves information about the software generics being in NVM. It identifies the generics' release number and provides also other information such as its state.

RTRV-PRMTR-SFTWR can be used to determine what generic is currently executing. It can also be used to determine what generic was previously executing. If a generic was downloaded but not installed, then the output describes the downloaded generic instead of the previously executing generic.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 2

Abortable: No

Input format

Command syntax: **RTRV-PRMTR-SFTWR**:*tid*::*ctag*::*[amount]*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **amount** – Amount Of Data To Return
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the NE fully complies with the **RTRV-PRMTR-SFTWR** command and the *amount* request is specified to all, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″nvm:spec_block″
        ...
        ...
   ″nvm:spec_block″
;
```

Output parameters

Refer to the "Output parameters" section of the "RTRV-HDR: Retrieve header" (p. 3-2417) command for a normal completion response. The output parameters listed there also apply to the **RTRV-PRMTR-SFTWR** command. Additional parameters that specifically apply to this command are defined in the following:

1. **nvm** – non volatile memory identifier
   This parameter specifies the version of NVM software (current or previous).
   Type: value set.
   Range: NVM-A for Current NVM-Software, NVM-B for Previous NVM-Software.
   Default: Only current NVM software is reported except for *amount* having been specified to ALL.

Spec block parameters

This parameter provides information about the stored software. It contains the parameters *release, size, supplier, type, delivered, installed, path, state.*

1. **release** – Release Number
   Type: value set of the form x.y.z
   Range: x, y, z are integer numbers from 00 to 99 in two-digit form, that means a leading zeros are not suppressed. x is not 00.
   Default: 01.00.00.
2. **buildnmbr** – Build Number
   This parameter identifies the software load contained in the file. It is an internal representation for test purpose.
   In contrast to the *release* parameter, which is the same for all software loads of a product release, the *buildnmbr* differs for all produced software loads, for example, produced for test purposes. The build number is reported for the software load in the current NVM. For the previous NVM the default value is reported.

   The *buildnmbr* typically contains the following informations to identify the specific software load:

   - internal load number (SUSI number)
   - internal build number of the load

   Type: Text string
   Range: Up to 20 characters.
   Default: UNKNOWN.
3. **size** – Program Size
   This parameter indicates the software generic size in bytes.
   Type: numeric string.
   Range: 0 to 99999999.
   Default: In case the software generic on the NVM is empty, the value 0 is reported.

4. **`supplier`**
   This parameter provides the supplier of generic.
   Type: value set.
   Range: 0 to 128 characters
   Default: Alcatel-Lucent..
5. **`type`** – System Type
   This parameter specifies the type of system.
   Type: Value set.
   Range: WaveStar_UNITE
   Default: WaveStar_UNITE.
6. **`delivered`**
   This parameter specifies the time and date when the download finished.
   Type: value set of the format: YY-MM-DD HH-MM-SS.
   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.
   Default: 00-01-01 00-00-00.
7. **`installed`**
   This parameter specifies date and time when the installation started.
   Type: value set of the format: YY-MM-DD HH-MM-SS
   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.
   Default: 00-01-01 00-00-00.
8. **`path`**
   This parameter specifies the location in a remote file system from where the SW Generic has been downloaded. In the case of a factory installed SW generic the parameter shall have the value “PRE-LOADED”.
   Type: text string.

   Range: The path parameter has one of the following formats (see description for details):

   - ″CIT,psel,ssel,tsel,nsap,filename″
   - ″EMS,psel,ssel,tsel,nsap,filename″
   - ″FTTD,psel,ssel,tsel,nsap,FTP URL″
   - ″PRE-LOADED″

   The sizes for *psel, ssel, tsel, nsap* are as follows:

   - *psel* (path selector): 0-4 bytes (0-8 hex characters)
   - *ssel* (section selector): 0-4 bytes (0-8 hex characters)

- *tsel* (transport selector): 0-16 bytes (0-32 hex characters)
- *nsap* (network service access point): 20 bytes (40 hex characters).

There can only be an even number of hex characters since they are generated from bytes and each byte corresponds to 2 hex characters.

From MSB (Most Significant Byte) to LSB (Least Significant Byte), these bytes are (the number in parenthesis equals the number of bytes): IDP(3), DFI(1), ORG(3), RES(2), RD(2), AREA(2), SYS(6), SEL(1). The SEL field of the *nsap* is also called the NSEL.

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

Because a (\) is interpreted as the escape character, it will be represented in the RTRV-PRMTR-SFTWR output as a double backslash (\\).

When the CIT is used to enter a file name for download backup, or restore, the craft is not required to enter a double backslash; the CIT software will enter the extra backslash into the TL1 CPY-MEM command.

For FT-TD *psel*, *ssel*, *tsel* and *nsap* of the GNE is reported. The FTP URL contains the CIT or EMS and the filename.

The FTP URL must be in the format:
ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: ″anonymous″
- <password>: default for <login> ″anonymous″ is ″″ (empty).For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

9. **`state`**

This parameter describes the state of the generic per NVM region:

state (NVM):description

- CORRUPT (current, previous): Unavailable for invocation or execution.(e.g. corrupted check sum)
- DOWNLOADED (previous): Applies to the previous bin of database. Database just downloaded or ready for installation.
- INITIAL (current): Nothing in NVM.
- INITIAL (previous): Nothing in previous partition of NVM.
- INPROGRESS (current): Installation is in progress..
- INPROGRESS (previous): Previously executing generic. Available for installation

- RUNNING (current): Currently executing generic.
- PRESERVED (previous): Previously executing generic in trial phase
- PREVIOUS (previous): Previously executing generic.

The normal (as contrasted with CORRUPT) states of current NVM are: RUNNING and INPROGRESS. The state is usually equal to RUNNING, signifying that it contains a copy of the generic that is currently executing. When an installation is in progress, current NVM will have a state of INPROGRESS.

The normal states of previous NVM are: PREVIOUS, DOWNLOADED and INPROGRESS. INPROGRESS means that a download is in progress. When the download terminates successfully, the state transitions to generic is installed, the NVM pointer is adjusted, and the NVM partition then identified as previous NVM will have the state set to PREVIOUS. The state PRESERVED indicates the trial phase after application of a new SW generic. During the trial phase a switch back to the previously installed SW generic and the previously active database is possible.

If an NVM has never contained a software generic, then the RTRV-PRMTR-SFTWR output for that NVM will consist of State=INITIAL.

If an NVM is corrupt, failed or missing, the RTRV-PRMTR-SFTWR output for that NVM will consist only of a single line containing State=CORRUPT.

Type: Alphanumeric value set.

Range: CORRUPT, DOWNLOADED, INITIAL, INPROGRESS, PREVIOUS, PRESERVED, RUNNING.

Default: INITIAL.

Example input/output

In the following example for the **RTRV-PRMTR-SFTWR** command, current NVM has a copy of the executing program (normal condition), and previous NVM has a copy of the previous generic. Also, it was assumed, that the CIT is DOS based and *Navis*® Optical EMS UNIX based. This was done to illustrate the different formats for path. Notice that the current and previous NVM indicate the same number for free (and also unavailable) space since current and previous information is stored in the same physical NVM.

```
RTRV-PRMTR-SFTWR:LT-UNITE::123456::ALL;
   LT-UNITE 00-11-01 09:45:28
M  123456 COMPLD
   ″NVM-A:release=01.02.04,size=11423175,supplier=Lucent,type=Unite,delivered=00-11-
      02 08-00-10,installed=00-11-02 08-00-
      13,path=\″CIT,01,01,03,39840F8000000000000000000008006A11234500,\\unite\\generic\\1_2
   ″NVM-B:release=01.02.03,size=11343236,supplier=Lucent,type=Unite,delivered=00-11-
      01 18-30-10,installed=00-11-01 22-45-
      30,path=\″EMS,01,01,02,39840F8000000000000000000008006A11118500,/unite/generic/1_2_03
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-PRMTR-SFTWR** command.

Related TL1 messages

- "APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
- "CPY-MEM: Copy memory" (p. 3-114)
- "RTRV-PRMTR-DATA: Retrieve parameter data" (p. 3-2744)

RTRV-PROTN-GRP: Retrieve protection group

The **RTRV-PROTN-GRP** command retrieves protection group information for all existing protection group entities. The command can be used to retrieve also sets of protection groups by using ranges. The general format can be used to retrieve protection group information for different protection group types.

Input parameters for **RTRV-PROTN-GRP** identify the type of protection group that is of interest and also a specific member (or perhaps a range of members) of that protection group. If the specified member does not belong to a protection group, then the command returns COMPLD, but contains no information about the protection group. This means that the AID is unprotected.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

1+1 equipment protection group

Command syntax: **RTRV-PROTN-GRP**:*tid*:*aid*:*ctag*::*protype*;

multiplex section/line protection group

Command syntax: **RTRV-PROTN-GRP**:*tid*:*aid*:*ctag*::*protype*;

2-/4-fibre MS-SPRing/BLSR protection group

Command syntax: **RTRV-PROTN-GRP**:*tid*:*[aid]*:*ctag*::*protype,[rid]*;

Path protection group

Command syntax: **RTRV-PROTN-GRP**:*tid*:*[aid]*:*ctag*::*protype, , [ppgname][,aid1]*;

The second comma in front of *ppgname* is needed since *rid* is omitted.

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

> **Important!** The command **RTRV-PROTN-PPG** which retrieves all used path protection group names is not supported. Therefore its difficult to get an overview about all already used/defined protection group names.
>
> The operator can use the TL1 command **RTRV-PROTN-GRP** and use bay-shelf-#-#-all-all-all as value for the input parameter *aid* in order to derive all path protection groups (see *aid* – Access Identifier in "Command parameters (path protection group)" (p. 3-2762)). Then he gets the used path protection group names per protection group in the command reply.

Input parameters

Command parameters (1+1 Equipment protection group)

1. **`tid`** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`aid`** – Access Identifier
   Description: The parameter specifies the aid of 1+1 equipment protection group.
   Type: AID
   Range: 1-1-eall or SwitchAndTmgProtGrpAID or CtlProtGroupAID or EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID or TMUXProtGroupAID or ES64UProtGroupAID.

   When using aid 1-1-eall, all actual existing equipment protection groups will be returned:

   - for higher-order switch fabric and timing group (referenced by SwitchAndTmgProtGrpAID)
   - for system controller group (referenced by CtlProtGroupAID)
   - for electrical 155 MBit/s groups (referenced by EP155ProtGroupAID)
   - for electrical 51 MBit/s groups (referenced by EP51ProtGroupAID)
   - for low order switch fabric groups (referenced by LOXCProtGroupAID).
   - for TransMUX groups (referenced by TMUXProtGroupAID)
   - for ES64U groups (referenced by ES64UProtGroupAID)
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.
4. **`protype`** – Protection Type
   The parameter specifies the type of the 1+1 equipment protection group for retrieving the information. The parameter evaluation is case insensitive.
   Type: Alphanumeric value set.

   Range:

   - ALL, if *aid* is 1-1-eall;
   - EQPTSWFBR, if *aid* is SwitchAndTmgProtGrpAID;
   - EQPTCTL, if *aid* is CtlProtGroupAID;
   - EQPTEP155, if *aid* is EP155ProtGroupAID;
   - EQPTEP51, if *aid* is EP51ProtGroupAID;
   - EQPTLOXC, if *aid* is LOXCProtGroupAID.
   - EQPTTMUX, if *aid* is TMUXProtGroupAID.
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

Command parameters (multiplex section/line protection group)

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the *aid* of a 1+1 multiplex section/line protection group or the *aid* of a 1:1 multiplex section/line protection group (only R3.0 and later) or an port *aid* being a member of the group.
   Type: AID
   Range: *bay-shelf*-oall (ranged over OnePlusOne_ProtGrpAID) or OnePlusOne_ProtGrpAID (not ranged) or NByOne_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
4. **protype** – Protection Type
   This parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1xNOPT (only R3.0 and later)
   Type: Value set.
   Range: 1+1 or 1xNOPT

Command parameters (2-/4-fibre MS-SPRing/BLSR protection group)

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID
   Range: *bay-shelf*-tall (ranged over TwoFibre_ProtGrpAID) or bay-shelf-fall (ranged over FourFibre_ProtGrpAID) or TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged).
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

4. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: 2F or 4F
5. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
   Option: If *aid* is specified, then *rid* can be omitted.

Command parameters (path protection group)

1. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies a path protection group *aid* or an input tributary *aid* being a member of the group in combination with *ppgname*.
   This parameter specifies an input tributary *aid* when used in combination with parameter *aid1*.
   Option: If *ppgname* is specified, then *aid* can be omitted or used as an input tributary aid.
   As *ppgname* is not supported for low order path protections, the aid parameter must specify a path protection group AID for those protection groups.
   The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
   If the parameter *aid* specifies a HO tributary on a port of port class EDGE and this tributary is combined with another HO tributary within an OUC, then RTRV-PROTN-GRP shall operate on all protection groups of type PATHDRI identified by these two HO tributaries, if existing.
   This option is also be applied, if wild cards are used in aid. The system discards duplicate responses if several tributaries of the same OUC are within the AID range specified by the wild cards.
   When parameter *aid* is used in combination with parameter *aid1*, then RTRV-PROTN-GRP shall operate on all protection groups of type PATHDRI having the AIDs given in parameters *aid* and *aid1* as input tributaries. In this option the use of wildcards is not allowed.

Type: AID
Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.

3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

4. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: PATHDRI

5. **`ppgname`** – Path protection group Name
   The parameter specifies the path protection group name. Storage and retrieval of the ppgname is case sensitive, but actual use of the ppgname to determine the corresponding protection group is case insensitive.
   Option for high order path protection groups:
   For high order path protections, if aid is specified, then *ppgname* can be omitted.
   For low order path protections, the *ppgname* is omitted as not being supported at all.
   If an input value is specified for *ppgname* and none is specified for *aid*, then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified path protection group name.
   If input values are specified for *aid* and *ppgname* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified *aid*, *ppgname* pair.
   The command will complete successfully if there is no protection group described by *aid*, *ppgname*, but no data will be returned.
   The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
   Type: text string
   Range: 1 to 24 characters

6. **`aid1`** – Access Identifier 1
   When parameter *aid1* is applied together with parameter *aid*, these parameters specifies a pair of input tributaries for accessing emulated selector bridges in one command.
   If input values are specified for aid and *aid1* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have these specified tributaries as inputs. If an input value is specified for *aid1*, no value must be specified for

ppgname.
The command will complete successfully if there is no protection group described by aid and *aid1*, but no data will be returned. The parameter ppgname is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of ppgname is not recommended.
Type: AID
Range: STS1NumAID
The usage of wild cards is not allowed.
The *aid1* parameter is intended to be used in ONNS context. The range is restricted to the tributary types and rates supported by ONNS.

Output format

After receiving the **RTRV-PROTN-GRP** command, the following normal completion response is returned in case of protypes unequal to PATHDRI:

```
   sid date time
M  ctag COMPLD
   ″aid:[spec_block]″
       ...
       ...
   ″aid:[spec_block]″
;
```

After receiving the **RTRV-PROTN-GRP** command, the following normal completion response is returned in case of PATHDRI protection group:

```
   sid date time
M  ctag COMPLD
   ″aid:[spec_block]″
   ″outtribaid,CML:<CML block>″
       .
       .
   ″outtribaid,CML:<CML block>″
       ...
       ...
   ″aid:[spec_block]″
   ″outtribaid,CML:<CML block>″
       .
       .
   ″outtribaid,CML:<CML block>″
;
```

If no protection group entity exists matching the specified values of the input parameters *aid*, *rid* then the following response is returned:

```
   sid date time
M  ctag COMPLD
;
```

If no protection group entity exists matching the specified *ppgname* value, then no response is returned.

Output parameters

Command parameters (1+1 Equipment protection group)

1. **aid** – Access Identifier
   Description: The parameter specifies the aid of 1+1 equipment protection group.
   Type: AID
   Range: SwitchAndTmgProtGrpAID or CtlProtGroupAID or EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID or TMUXProtGroupAID or ES64UProtGroupAID.
   All actual existing equipment protection groups will be returned with a specific AID:
   - for higher-order switch fabric and timing group (referenced by SwitchAndTmgProtGrpAID)
   - for system controller group (referenced by CtlProtGroupAID)
   - for electrical 155 MBit/s groups (referenced by EP155ProtGroupAID)
   - for electrical 51 MBit/s groups (referenced by EP51ProtGroupAID)
   - for lower-order switch fabric groups (referenced by LOXCProtGroupAID).
   - for TransMUX groups (referenced by TMUXProtGroupAID)
   - for ES64U groups (referenced by ES64UProtGroupAID)

Command parameters (multiplex section/line protection group)

1. **aid** – Access Identifier
   This parameter specifies the aid of a 1+1 multiplex section/line protection group or the aid of a 1:1 multiplex section/line protection group (only R3.0 and later).
   Type: AID
   Range: OnePlusOne_ProtGrpAID or NByOne_ProtGrpAID

Command parameters (2-fibre MS-SPRing/BLSR protection group)

1. **aid** – Access Identifier
   This parameter specifies the AID of the 2 fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: TwoFibre_ProtGrpAID
   Default: No default

Command parameters (4-fibre MS-SPRing/BLSR protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the 4 fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: FourFibre_ProtGrpAID

Command parameters (Path protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the path protection group.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.
2. **`outtribaid`** – Output Tributary Access Identifier
   This parameter specifies the output tributary AID for a constituent signal within the protection group. One value is returned for each constituent signal together with the corresponding CML (Constituent Member List) block.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.

Spec block parameters (1+1 Equipment protection group)

1. **`actunit`** – Active Unit State
   This parameter specifies which unit is currently selected within the protection group as active unit.
   The value WKG specifies that the worker unit is active.
   The value PROTN specifies that the protection unit is active.
   Type: Alphanumeric value set.
   Range: WKG, PROTN
   Default: For switching protection group instance: The first provisioned/auto-created circuit pack is the default active unit. For controller protection group instance: the active controller unit at the moment of creation of the CTL protection group. For any equipment protection group instance created using the **`ENT-PROTN-GRP`** command: The worker is the default active unit.
2. **`nvmadate`** – NVM Active Date
   This parameter specifies the date of the last successful update of NVM of the current active CTL in the format YY-MM-DD.
   A value of 00-00-00 is reported in case the date information is unavailable.
   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is

omitted.
Type: Value set.
Range: YY-MM-DD with value rangesfor YY: 00 to 99for MM: 00 to 12for DD: 00 to 31
Default: None

3. **nvmatime** – NVM Active Time
   This parameter specifies the time of the last successful update of NVM of the current active CTL in the format HH-MM-SS.
   A value of 00-00-00 is reported in case the date information is unavailable.
   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.
   Type: Value set.
   Range: HH-MM-SS with value rangesfor HH: 00 to 23for MM: 00 to 59or SS: 00 to 59
   Default: None
4. **nvmsdate** – NVM Standby Date
   This parameter specifies the date of the last successful update of NVM of the current standby CTL in the format YY-MM-DD.
   A value of 00-00-00 is reported in case the date information is unavailable.
   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.
   Type: Value set.
   Range: YY-MM-DD with value rangesfor YY: 00 to 99for MM: 00 to 12for DD: 00 to 31
   Default: None
5. **nvmstime** – NVM Standby Time
   This parameter specifies the time of the last successful update of NVM of the current standby CTL in the format HH-MM-SS.
   A value of 00-00-00 is reported in case the date information is unavailable.
   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.
   Type: Value set.
   Range: HH-MM-SS with value rangesfor HH: 00 to 23for MM: 00 to 59or SS: 00 to 59
   Default: None
6. **nvmstat** – NVM Synchronization State
   This parameter specifies the current state of NVM synchronisation of the Duplex Control Protection Group.
   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.
   Type: Alphanumeric value set.

Range:

- INSYNC – if NVM of both control units are fully synchronized
- OUTOFSYNC – if either the standby control unit is not accessible or is in the process of re-synchronizing its NVM
- REPAIRING – synchronisation has been interrupted and not yet restarted

Default: None

7. **`protn`** – Protection Unit
   The parameter specifies the protection circuit pack AID being a member of the 1+1 equipment protection group.
   Type: AID
   Range: CpAID, if *protype* is not EQPTLOXC or LoxcAID, if *protype* is EQPTLOXC.
   Default:
   - 1-1-#-#-xcp-cp (if protype is EQPTSWFBR)
   - 1-1-#-#-ctlp-cp (if protype is EQPTCTL)

   For all other equipment protection groups there is no default value as the slot of the protection unit will be dynamically assigned during creation of the group. For rules applying to the selection of the slot for the protection unit refer to ENT-PROTN-GRP.
8. **`protnsiglvl`** – Protection Fault Status
   This parameter specifies the current fault status w.r.t. the protection unit as used by the protection state machine.
   The value EF (Equipment Failed) is used if an equipment defect used as switch criteria is currently present for the protection unit.
   The value NONE is used if no such defect is currently present.
   Type: Alphanumeric value set.
   Range: EF, NONE
   Default: NONE
9. **`protype`** – Protection Type
   This parameter specifies the type of the protection group.
   Type: Alphanumeric value set.
   Range:
   - EQPTSWFBR, if aid is SwitchAndTmgProtGrpAID
   - EQPTCTL, if aid is CtlProtGroupAID
   - EQPTEP155, if aid is EP155ProtGroupAID
   - EQPTEP51, if aid is EP51ProtGroupAID
   - EQPTLOXC, if aid is LOXCProtGroupAID.
   - EQPTTMUX, if aid is TMUXProtGroupAID
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

10. **swreq** – Switch Request State
This parameter specifies the current switch request state of the protection state machine.
The value EQPTFAILED (Equipment Failed) is used if an equipment failed condition is the current state.
The value FS (Forced Switch) is used if a forced switch is the current state.
The value MS (Manual Switch) is used if a manual switch is the current state.
The value NR (No Request) is used if no request is the current state.
Type: Alphanumeric value set.
Range: EQPTFAILED, FS, MS, NR for switch fabric protection and EP155 protection; EQPTFAILED, MS, NR for controller protection.
Default: NR

11. **wkg** – Worker Unit
This parameter specifies the worker circuit pack AID being a member of the 1+1 equipment protection group.
Type: AID
Range: CpAID, if *protype* is not EQPTLOXC or LoxcAID, if *protype* is EQPTLOXC.
Default:
    - 1-1-#-#-xcw-cp (if protype is EQPTSWFBR)
    - 1-1-#-#-ctlw-cp (if protype is EQPTCTL)

For all other equipment protection groups there is no default value as the slot of the worker unit will be dynamically assigned during creation of the group. For rules applying to the selection of the slot for the worker unit refer to ENT-PROTN-GRP.

12. **wkgsiglvl** – Worker Fault Status
This parameter specifies the current fault status w.r.t. worker unit as used by the protection state machine.
The value EF (Equipment Failed) is used if an equipment defect used as switch criteria is currently present for the worker unit.
The value NONE is used if no such defect is currently present.
Type: Alphanumeric value set.
Range: EF, NONE
Default: NONE; i.e. the default is the value ’NONE’

Spec block parameters (multiplex section/line protection group)

1. **`actunit`** – Active Unit State
   This parameter specifies which port is currently selected within the protection group as active port.
   The value WKG specifies that the worker port is active.
   The value PROTN specifies that the protection port is active.
   Type: Alphanumeric value set.
   Range: WKG, PROTN
   Default: WKG
2. **`actunitfe`** – Far-End Incoming Requested Selection
   This parameter is derived from the incoming K1 [5…8] overhead byte.
   The value WKG is used if accepted K byte value is equal to 0.
   The value PRTON is used if the accepted K byte value is equal to 1.
   The value UNAVAILABLE is used if an SF condition is active for the protection line.
   The value NONE is used if there is no request from the far end for 1+1 optimized (only R3.0 and later)
   The value INV (Invalid) is used in all other cases.
   Type: Alphanumeric value set.
   Range: WKG, PROTN, UNAVAILABLE, NONE, INV
   Default: WKG
3. **`actunitne`** – Near-End Outgoing Requested Selection
   This parameter is derived from the sent K1 [5…8] overhead byte.
   The value WKG is used if sent K byte value is equal to 0.
   The value PRTON is used if the sent K byte value is equal to 1.
   Type: Alphanumeric value set.
   Range: WKG, PROTN
   Default: WKG
4. **`aps`** – Far-End Incoming APS
   This parameter is derived from the incoming K1 [1…4] overhead byte.
   It indicates the type of request as follows:
   - DNR: Do Not Revert
   - EXER: Exercise
   - INV: Invalid (unused codes)
   - UNAVAILABLE: Not Available (SF condition pending for protection line)
   - FS: Forced Switch
   - LO: Lockout of Protection
   - MS: Manual Switch
   - NR: No Request
   - RR: Reverse Request
   - SF-H: Signal Fail High

- SF-L: Signal Fail Low
- SD-H: Signal Degrade High
- SD-L: Signal Degrade Low
- WTR: Wait to restore (for MSP 1+1, MSP 1:1 / only used if protection group is revertive) / Wait to rename (for MSP 1+1 Optimized).

Type: Alphanumeric value set.
Range: DNR, EXER, INV, NA, FS, LO , MS, NR, RR, SF-H, SF-L, SD-L, SD-H, WTR
Default: NR

5. **apsout** – Near-End Outgoing APS
This parameter is derived from the sent K1 [1…4] overhead byte.
It indicates the type of request as follows:
- DNR: Do Not Revert
- FS: Forced Switch
- LO: Lockout of Protection
- MS: Manual Switch
- NR: No Request
- RR: Reverse Request
- SF-H: Signal Fail High
- SF-L: Signal Fail Low
- SD-H: Signal Degrade High
- SD-L: Signal Degrade Low
- WTR: Wait to restore (for MSP 1+1, MSP 1:1 / only used if protection group is revertive). Wait to rename (for MSP 1+1 Optimized).

Type: Alphanumeric value set.
Range: DNR, FS, LO , MS, NR, RR, SF-H, SF-L, SD-H, SF-L, WTR
Default: NR

6. **apspn** – MSP-APS ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MSP-APS (Multiplex Section Protection – Automatic protection switching).
Type: Alphanumeric string
Range: 1-24 characters including the character "-".
Default: DEFAULT

7. **`dcclmsprotmd`** – DCC Line/MS Protection Mode
   The parameter specifies, whether the line/MS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.
   Type: Alphanumeric value set 3;
   Range: ENABLE, DISABLE
   Default: DISABLE
8. **`dccsrsprotmd`** – DCC Sect/RS Protection Mode
   The parameter specifies, whether the section/RS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.
   Type: Alphanumeric value set
   Range: ENABLE, DISABLE
   Default: DISABLE
9. **`pgrate`** – protection group Rate
   This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for the two ports.
   Type: Alphanumeric value set.
   Range: OC3, OC12, OC48, OC192, OC768, STM1, STM4, STM16, STM64, STM256
   Default: The default value is the interface rate of the worker port.
10. **`protn`** – Protection Unit
   This parameter specifies the protection port AID being a member of the line protection/ MS protection group.
   Type: AID
   Range: SPortAID
11. **`protnsiglvl`** – Protection Fault Status
   This parameter specifies the current fault status w.r.t. port as used by the protection state machine.
   The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the protection port.
   The value SD (Signal Degrade) is used if a defect defined as signal degraded condition is currently present for the protection port.
   The value NONE is used if no such defect is currently present.
   Type: Alphanumeric value set.
   Range: SF, SD, NONE
   Default: NONE
12. **`protocol`** – APS Protocol
   This parameter specifies the protocol used by the protection state machine.
   The value 1+1_UNI is used for 1+1 unidirectional switching.
   The value 1x***N***_BIDIR is used for 1:1 bidirectional switching (***N*** = 1) (only R3.0 and later).
   The value 1+1_OPTM is used for 1+1 optimized, bidirectional switching (only

R3.0 and later). The value 1+1_BIDIR is used for 1+1 bidirectional switching (only R4.0 and later).
The value 1+1_BIDIR is used for 1+1 bidirectional switching (only R4.0 and later).
The value 1+1_UNI shall be used for 1+1 unidirectional switching.
The value 1x***N***_BIDIR shall be used for 1:N bidirectional switching (***N*** = 1..14).
The value 1+1_OPTM shall be used for 1+1 optimized, bidirectional switching.
The value 1+1_BIDIR shall be used for 1+1 bidirectional switching.
Note that “OPTIMIZED” describes rather the protection type than a protocol. Only for compatibility reasons of TL1, the parameter *protocol* is used for its selection.
Type: Alphanumeric value set.
Range: 1+1_UNI, 1xN_BIDIR, 1+1_OPT.
In mind the ***N*** in 1x***N***_BIDIR is considered to be always equal “1”. The value 1+1_OPTM implicitly specifies bidirectional operation mode.
Default: 1+1_UNI, in case of protype = 1+1; 1xN_BIDIR, in case of protype = 1xNOPT (that means protection type 1:1).

13. **`protype`** – Protection Type
This parameter specifies the type of the protection group.
The value for the 1+1 line/MS protection group is “1+1”.
The value for the 1:1 line/MS protection group is “1x***N***OPT” (only R3.0 and later).
In mind the ***N*** in “1x***N***OPT” is considered to be always equal “1”.
Type: Value set.
Range: 1+1 or 1xNOPT.
Default: 1+1

14. **`rme`** – Protection Reversion
The parameter specifies whether revertive or non-revertive mode is used as operation mode of the protection group. The value ENABLE is used if the protection group operates in revertive mode. The value DISABLE is used if the protection group operates in non-revertive mode.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE in case of protype = 1+1; ENABLE in case of protype = 1xNOPT. ENABLE is not valid for protocol = 1+1_OPTM
Default: DISABLE, in case of protype = 1+1; ENABLE, in case of protype = 1xNOPT (i.e. protection type 1:1)

15. **`ssi`** – Secondary Section Indication
The parameter shall indicate the ’Secondary Section’ (line).
Type: AID
Range: WKG, PROTN; WKG denotes working section 1, PROTN denotes working section 2 according ITU-T G.841 Annex B.
Default: PROTN

16. **`swreq`** – Switch Request State
This parameter specifies the current switch request state of the protection state machine.

It shall have the following values:

- DNR: Do Not Revert
- FS: Forced Switch
- LO: Lockout of Protection
- MS: Manual Switch
- SF: Signal Fail
- SD: Signal Degrade
- WTR: Wait to restore (for MSP 1+1, MSP 1:1 / only used if protection group is revertive). Wait to rename (for MSP 1+1 Optimized)
- FOP: Failure Of Protocol
- NR: No Request.

Type: Alphanumeric value set.
Range: DNR, FS, LO , MS, SF, SD, WTR, FOP, NR
Default: NR

17. **`wkg`** – Worker Unit
This parameter specifies the worker port AID being a member of the 1+1 line/MS protection group.
Type: AID
Range: SPortAID

18. **`wkgsiglvl`** – Worker Fault Status
This parameter specifies the current fault status w.r.t. port as used by the protection state machine.
The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the worker port.
The value SD (Signal Degrade) is used if a defect defined as signal degraded condition is currently present for the worker port.
The value NONE issued if no such defect is currently present.
Type: Alphanumeric value set.
Range: SF, SD, NONE.
Default: NONE.

19. **`wtr`** – Wait To Restore Time / Wait to Rename Time
The parameter specifies the “wait to restore” time used by the protection state machine operating in revertive mode. In case of MSP 1+1 optimized, the same parameter is used for the “wait to rename” time.
Type: numeric string [minute]
Range: 0 – 60
Default: 5.

Spec block parameters (2-fibre MS-SPRing/BLSR protection group)

1. **`ard`** – Automatic Ring Discovery
   If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value manually with ED-MAP-RING and supply the ring map information to each node on the ring for the BLSR protocol to operate. It is necessary to activate this user-provisioned information with SET-MAP-RING. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
   Type: Alphanumeric string.
   Range: ENABLE, DISABLE.
   Default: ENABLE.
2. **`asmc`** – Automatic Squelch Map Calculation
   If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
   Type: Alphanumeric string.
   Range: ENABLE, DISABLE (default).
3. **`blsrpn`** – MS-SPRing-BLSR ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
   Type: Alphanumeric string
   Range: 1-24 characters including the character “-”.
   Default: DEFAULT
4. **`eapschst`** – Incoming East APS Channel Status
   This parameter is derived from the incoming K2 [6..8] overhead byte of the east port.

   It indicates the status as follows:

   - IDLE: Idle
   - BRIDGED: Bridged
   - BANDS: Bridged & Switched
   - XTRFC: Extra Traffic on protection channels
   - NOTUSED: Not Used – Reserved for future use
   - RDIL: RDI-L/MS-RDI (Remote Defect Indication -Line/Multiplex Section)
   - AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)

   Type: Alphanumeric value set.
   Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, RDIL, AISL
   Default: IDLE

5. **`eapsdnid`** – Incoming East APS Destination Node Id
   This parameter is derived from the incoming K1 [5..8] overhead byte of the east port. It specifies the node ID for which the K1 byte is destined.
   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric value set.
   Range: 0-15 or UNAVAILABLE
   Default: 0
6. **`eapsprotn`** – Incoming East APS Protection Path
   This parameter is derived from the incoming K2 overhead byte of the east port.
   It indicates the protection path as follows:
   - 0: short path code (S)
   - 1: long path code (L)

   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric value set.
   Range: 0, 1, UNAVAILABLE
   Default: 0
7. **`eapssnid`** – Incoming East APS Source Node Id
   This parameter is derived from the incoming K2 [1..4] overhead byte of the east port. It specifies the node ID which sourced the K1 byte.
   The value UNAVAILABLE is used in case of an pending SF condition.
   Range: 0-15 or UNAVAILABLE
   Default: 0
8. **`eapssw`** – Incoming East APS Switch Priority
   This parameter is derived from the incoming K1 [1..4] overhead byte of the east port.
   It indicates the switch priority/bridge request code as follows:
   - LPS: Lockout of Protection Span
   - FSS: Forced Switch Span (4F only)
   - FSR: Forced Switch Ring
   - SFS: Signal Fail Span (4F only)
   - SFR: Signal Fail Ring
   - SDP: Signal Degrade Protection (4F only)
   - SDS: Signal Degrade Span (4F only)
   - SDR: Signal Degrade Ring
   - MSS: Manual Switch Span (4F only)
   - MSR: Manual Switch Ring
   - WTR: Wait to Restore
   - EXERS: Exerciser Span (4F only)
   - EXERR: Exerciser Ring
   - RRS: Reverse Request Span

- RRR: Reverse Request Ring
- NR: No Request.

The value UNAVAILABLE is used in case of an pending SF condition.
Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.
Default: NR.

9. **`east`** – East Port
This parameter specifies the port being a member in the role of the east port for a 2-fibre MS-SPRing/BLSR protection group.
Type: AID
Range: SPortAID

10. **`elprotnsw`** – East Last protection switch Attempt
This parameter specifies, whether the last switch request for the east side succeeded or not.
The values have the following semantics:
    - SUCCESS: last request did succeed
    - DENY: last request was denied due a validation rule
    - FAILURE: last request could not be completed because far end node did not response with proper K-byte.

    Type: Alphanumeric value set.
Range: SUCCESS, DENY, FAILURE
Default: SUCCESS.

11. **`eswreq`** – East Switch Request State
This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value will be derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value is 'NR'.
It has the following values:
    - LPS: Lockout of Protection Span
    - FSR: Forced Switch of Service to Protection – Ring
    - SFR: Signal Fail – Ring
    - SDR: Signal Degrade – Ring
    - MSR: Manual Switch of Service to Protection – Ring
    - WTR: Wait to Restore
    - NR: No Request.

    Type: Alphanumeric value set.
Range LPS, FSR, SFR, SDR, MSR, WTR, NR.
Default: NR.

12. **`pgrate`** – protection group Rate
    This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for the two ports.
    Type: Alphanumeric value set.
    Range: OC48, OC192, OC768, STM16, STM64, STM256
    Default: The default value is the interface rate of the east port.
13. **`protype`** – Protection Type
    This parameter specifies the type of the protection group. The value for the 2-fibre MS-SPRing/BLSR protection group is 2F.
    Type: Alphanumeric value set.
    Range: 2F.
14. **`rcamode`** – Ring Circuit Alarm Mode
    This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If *rcamode* is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
    Type: Alphanumeric value set.
    Range: ENABLE (default), DISABLE
15. **`rid`** – Ring Identification
    This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
    Type: text string of chars allowed for TID strings.
    Range: 1 to 15 characters.
    Default: NONE.
16. **`ringndst`** – Ring Node APS State
    This parameter specifies the ring node APS state.
    It shall have the following values under normal conditions: IDLE, SWITCHING, PASSTHROUGH
    It shall have in addition the following values if protection state machine is suspended: SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH
    Type: Alphanumeric value set.
    Range: IDLE, SWITCHING, PASSTHROUGH, SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH.
    Default: SUSPENDED-IDLE.
17. **`wapschst`** – Incoming West APS Channel Status
    This parameter is derived from the incoming K2 [6..8] overhead byte of the west port.

It indicates the status as follows:

- IDLE: Idle BRIDGED Bridged
- BANDS: Bridged & Switched
- XTRFC: Extra Traffic on protection channels
- NOTUSED: Not Used – Reserved for future use
- RDIL: RDI-L/MS-RDI (Remote Defect Indication – Line/Multiplex Section).
- AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section).

Type: Alphanumeric value set.
Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, RDIL, AISL.
Default: IDLE.

18. **`wapsdnid`** – Incoming West APS Destination Node Id
This parameter is derived from the incoming K1 [5..8] overhead byte of the west port. It specifies the node ID for which the K1 byte is destined. The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric string.
Range: 0-15 or UNAVAILABLE.
Default: 0.

19. **`wapsprotn`** – Incoming West APS Protection Path
This parameter is derived from the incoming K2 overhead byte of the west port.
It indicates the protection path as follows:
   - 0: short path code (S)
   - 1: long path code (L)

   The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric value set.
Range: 0, 1, UNAVAILABLE.
Default: 0.

20. **`wapssnid`** – Incoming West APS Source Node Id
This parameter is derived from the incoming K2 [1..4] overhead byte of the west port. It specifies the node ID which sourced the K1 byte. The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric string.
Range: 0-15 or UNAVAILABLE.
Default: 0.

21. **`wapssw`** – Incoming West APS Switch Priority
This parameter is derived from the incoming K1 [1..4] overhead byte of the west port.
It indicates the switch priority/bridge request code as follows:
   - LPS: Lockout of Protection Span
   - FSS: Forced Switch Span (4F only)
   - FSR: Forced Switch Ring
   - SFS: Signal Fail Span (4F only)

- SFR: Signal Fail Ring
- SDP: Signal Degrade Protection (4F only)
- SDS: Signal Degrade Span (4F only)
- SDR: Signal Degrade Ring
- MSS: Manual Switch Span (4F only)
- MSR: Manual Switch Ring
- WTR: Wait to Restore
- EXERS: Exerciser Span (4F only)
- EXERR: Exerciser Ring
- RRS: Reverse Request Span
- RRR: Reverse Request Ring
- NR: No Request.

The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric value set.
Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.
Default: NR.

22. **`west`** – West Port
This parameter specifies the port being a member in the role of the west port for a 2-fibre MS-SPRing/BLSR protection group.
Type: AID.
Range: SPortAID.
Default: None.

23. **`wlprotnsw`** – West Last protection switch Attempt
This parameter specifies, whether the last switch request for the west side succeeded or not.

The values have the following semantics:

- SUCCESS: last request did succeed
- DENY: last request was denied due a validation rule
- FAILURE: last request could not be completed because far end node did not response with proper K-byte.

Type: Alphanumeric value set.
Range: SUCCESS, DENY, FAILURE
Default: SUCCESS.

24. **`wswreq`** – West Switch Request State
This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value is derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value is ’NR’.

It have the following values:

- LPS: Lockout of Protection Span
- FSR: Forced Switch of Service to Protection – Ring
- SFR: Signal Fail – Ring
- SDR: Signal Degrade – Ring
- MSR: Manual Switch of Service to Protection – Ring
- WTR: Wait to Restore
- NR: No Request.

Type: Alphanumeric value set.
Range LPS, FSR, SFR, SDR, MSR, WTR, NR.
Default: NR.

25. **`wtr`** – Wait To Restore Time
This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.
Type: numeric string [minute].
Range: 0 – 12 in 1 minute increments and 99.
Default: 5.

Spec block parameters (4-fibre MS-SPRing/BLSR protection group)

1. **`ard`** – Automatic Ring Discovery
If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value and supply the ring map information to each node on the ring for the BLSR protocol to operate. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
Type: Alphanumeric string.
Range: ENABLE, DISABLE.
Default: ENABLE.

2. **`asmc`** – Automatic Squelch Map Calculation
If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
Type: Alphanumeric string.
Range: ENABLE, DISABLE (default).

3. **blsrpn** – MS-SPRing-BLSR ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
Type: Alphanumeric string.
Range: 1-24 characters including the character “-”.
Default: DEFAULT.
4. **eactunit** – East Active Unit State
The parameter specifies whether the traffic associated with the east worker port is physically running over the east worker port (i.e. value WKG is used in that case) or over a protection port (i.e. value PROTN is used in that case). The protection port can be the east protection port in case of span switch or the west protection port in case of a loopback switch. The value of the parameter is derived from the internal handled active line state of the service port and the active line state of the protection ports. *eactunit* = WKG: active line state of east worker port is active. *eactunit* = PROTN: active line state of east worker port is standby.
Type: Alphanumeric value set.
Range: WKG, PROTN.
Default: WKG.
5. **eapschst** – Incoming East APS Channel Status
This parameter is derived from the incoming K2 [6..8] overhead byte of the east port.
It indicates the status as follows:
   - IDLE: Idle
   - BRIDGED: Bridged
   - BANDS: Bridged & Switched
   - XTRFC: Extra Traffic on protection channels
   - NOTUSED: Not Used – Reserved for future use
   - RDIL: RDI-L/MS-RDI (Remote Defect Indication -Line/MultiplexSection)
   - AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)
   - Extension for TOP-EX
     In case of *protnmode* = TOPEX the following additional value is supported: (ACT) command to ACT to complete the Switch.

   Type: Alphanumeric value set.
Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, ACT, RDIL, AISL.
Default: IDLE.
6. **eapsdnid** – Incoming East APS Destination Node Id
This parameter is derived from the incoming K1 [5..8] overhead byte of the east port. It specifies the node ID for which the K1 byte is destined.
The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric string.
Range: 0-15 or UNAVAILABLE.
Default: 0.

7. **`eapsprotn`** – Incoming East APS Protection Path
   This parameter is derived from the incoming K2 overhead byte of the east port.
   It indicates the protection path as follows:
   - 0: short path code (S)
   - 1: long path code (L)

   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric value set.
   Range: 0, 1, UNAVAILABLE.
   Default: 0.
8. **`eapssnid`** – Incoming East APS Source Node Id
   This parameter is derived from the incoming K2 [1..4] overhead byte of the east port. It specifies the node ID which sourced the K1 byte.
   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric string.
   Range: 0-15 or UNAVAILABLE.
   Default: 0.
9. **`eapssw`** – Incoming East APS Switch Priority
   This parameter is derived from the incoming K1 [1..4] overhead byte of the east port.
   It indicates the switch priority/bridge request code as follows:
   - LPS: Lockout of Protection Span
   - FSS: Forced Switch Span (4F only)
   - FSR: Forced Switch Ring
   - SFS: Signal Fail Span (4F only)
   - SFR: Signal Fail Ring
   - SDP: Signal Degrade Protection (4F only)
   - SDS: Signal Degrade Span (4F only)
   - SDR: Signal Degrade Ring
   - MSS: Manual Switch Span (4F only)
   - MSR: Manual Switch Ring
   - WTR: Wait to Restore
   - EXERS: Exerciser Span (4F only)
   - EXERR: Exerciser Ring
   - RRS: Reverse Request Span

- RRR: Reverse Request Ring
- NR: No Request.

The value UNAVAILABLE is used in case of an pending SF condition.
The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.
Type: Alphanumeric value set.
Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.
Default: NR.

10. **`eastprotn`** – East Protection Port
This parameter shall specifies the port being a member in the role of the east protection port for a 4-fibre MS-SPRing/BLSR protection group.
Type: AID
Range: SPortAID

11. **`eastwkg`** – East Worker Port
This parameter specifies the port being a member in the role of the east worker port for a 4-fibre MS-SPRing/BLSR protection group.
Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID.
Range: In case of an asymmetric ring: NOTUSED. In all other cases: SPortAID.

12. **`elprotnsw`** – East Last protection switch Attempt
This parameter specifies, whether the last switch request for the east side succeeded or not.

The values have the following semantics:

- SUCCESS: last request did succeed
- DENY: last request was denied due a validation rule
- FAILURE: last request could not be completed because far end node did not response with proper K-byte.

Type: Alphanumeric value set.
Range: SUCCESS, DENY, FAILURE.
Default: SUCCESS.

13. **`eswreq`** – East Switch Request State
This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value is derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value is 'NR'.

It has the following values:

- LPS: Lockout of Protection Span
- FSS: Forced Switch of Service to Protection – Span
- FSR: Forced Switch of Service to Protection – Ring
- SFS: Signal Fail – Span

- SFR: Signal Fail – Ring
- SDS: Signal Degrade – Span
- SDR: Signal Degrade – Ring
- SDP : Signal Degrade – Protection
- MSS: Manual Switch of Service to Protection – Span
- MSR: Manual Switch of Service to Protection – Ring
- WTR: Wait to Restore
- NR: No Request.

Type: Alphanumeric value set.
Range: LPS, FSS, FSR, SFS, SFR, SDS, SDR, SDP, MSS, MSR, WTR, NR The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.
Default: NR.

14. **`pgrate`** – protection group rate
This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for the four ports.
Type: Alphanumeric value set.
Range: OC48, OC192, STM16, STM64.
If *protnmode* = TOPEX, then the range is restricted to: STM64 only
Default: The default value is the interface rate of the east port.

15. **`protnmode`** – Protection Switch Mode
The parameter specifies the protection switch mode. The value LOOPBACK is used for the classical ring application. The value SHORTENED is used for transmission delay sensitive applications. The value TOPEX (only R3.0 – R3.2 and R8.0.1 and later) is used for the so called transoceanic application, which allows extra traffic, improves restorability and improves delay as well as in SHORTENED mode.
In case of a ring switch … LOOPBACK performs the bridge and switch function in that nodes which are most close to the failed span. SHORTENED performs the bridge function at the add node repectively the switch function at the drop node of each ring circuit. It is an application only similar to the transoceanic protocol.
TOPEX allows, compared to SHORTENED mode, additionally the traffic restoration of not affected spans. It is the transoceanic protocol application.
Consistent Protection Switch Mode Setting
The Protection Switch Mode must be set consistently on all nodes in the ring. E.g. for all UNITE NEs in a TOP+EX ring the parameter protnmode must be set to TOPEX. In a ring with inconsistent Protection Switch Mode, there will be no protection switching. The UNITE NEs will raise an Inconsistent Ring Protection Mode alarm.
Type: Alphanumeric value set.
Range: LOOPBACK, SHORTENED, TOPEX.
Default: LOOPBACK.

16. **`protype`** – Protection Type
This parameter specifies the type of the protection group. The value for the 4-fibre MS-SPRing/BLSR protection group is 4F.
Type: Alphanumeric value set.
Range: 4F.

17. **`rcamode`** – Ring Circuit Alarm Mode
This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If *rcamode* is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
Type: Alphanumeric value set.
Range: ENABLE (default), DISABLE

18. **`rid`** – Ring Identification
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE

19. **`ringndst`** – Ring Node APS State
This parameter specifies the ring node APS state.
It shall have the following values under normal conditions: IDLE, SWITCHING, PASSTHROUGH
It shall have in addition the following values if protection state machine is suspended: SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH.
Type: Alphanumeric value set.
Range: IDLE, SWITCHING, PASSTHROUGH, SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH.
Default: SUSPENDED-IDLE.

20. **`swtr`** – Span Wait To Restore Time
The parameter specifies the wait to restore time for span switches used by the protection state machine operating in revertive mode. The protection shall operate in revertive mode if the wait-to-restore time is in the range 0-12. The protection shall operate in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.

Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.
Type: numeric string [minute].
Range: 0 – 12 in 1 minute increments and 99.
Default: 5.

21. **`wactunit`** – West Active Unit State
The parameter specifies whether the traffic associated with the west worker port is physically running over the west worker port (i.e. value WKG is used in that case) or over a protection port (i.e. value PROTN is used in that case). The protection port can be the west protection port in case of span switch or the east protection port in case of a loopback switch. The value of the parameter is derived from the internal handled active line state of the service port and the active line state of the protection ports. wactunit = WKG: active line state of west worker port is active wactunit = PROTN: active line state of west worker port is standby.
Type: Alphanumeric value set.
Range: WKG, PROTN.
Default: WKG.

22. **`wapschst`** – Incoming West APS Channel Status
This parameter is derived from the incoming K2 [6..8] overhead byte of the west port.
It indicates the status as follows:
    - IDLE: Idle
    - BRIDGED: Bridged
    - BANDS: Bridged & Switched
    - XTRFC: Extra Traffic on protection channels
    - NOTUSED: Not Used – Reserved for future use
    - RDIL: RDI-L/MS-RDI (Remote Defect Indication – Line/Multiplex Section)
    - AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)
    - Extension for TOP-EX
    In case of *protnmode* = TOPEX the following additional value is supported: (ACT) command to ACT to complete the Switch.

    Type: Alphanumeric value set.
    Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, ACT, RDIL, AISL.
    Default: IDLE.

23. **`wapsdnid`** – Incoming West APS Destination Node Id
This parameter is derived from the incoming K1 [5..8] overhead byte of the west port. It specifies the node ID for which the K1 byte is destined. The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric string.
Range: 0-15 or UNAVAILABLE.
Default: 0.

24. **wapsprotn** – Incoming West APS Protection Path
This parameter is derived from the incoming K2 overhead byte of the west port.
It indicates the protection path as follows:
- 0: short path code (S)
- 1: long path code (L)

The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric value set.
Range: 0, 1, UNAVAILABLE.
Default: 0.

25. **wapssnid** – Incoming West APS Source Node Id
This parameter is derived from the incoming K2 [1..4] overhead byte of the west port. It specifies the node ID which sourced the K1 byte. The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric string.
Range: 0-15 or UNAVAILABLE.
Default: 0.

26. **wapssw** – Incoming West APS Switch Priority
This parameter is derived from the incoming K1 [1..4] overhead byte of the west port.
It indicates the switch priority/bridge request code as follows:
- LPS: Lockout of Protection Span
- FSS: Forced Switch Span
- FSR: Forced Switch Ring
- SFS: Signal Fail Span
- SFR: Signal Fail Ring
- SDP: Signal Degrade Protection
- SDS: Signal Degrade Span
- SDR: Signal Degrade Ring
- MSS: Manual Switch Span
- MSR: Manual Switch Ring
- WTR: Wait to Restore
- EXERS: Exerciser Span
- EXERR: Exerciser Ring
- RRS: Reverse Request Span

- RRR: Reverse Request Ring
- NR: No Request

The value UNAVAILABLE is used in case of an pending SF condition.
The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.
Type: Alphanumeric value set.
Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.
Default: NR.

27. **`westprotn`** – West Protection Port
This parameter specifies the port being a member in the role of the west protection port for a 4-fibre MS-SPRing/BLSR protection group.
Type: AID
Range: SPortAID

28. **`westwkg`** – West Worker Port
This parameter specifies the port being a member in the role of the west worker port for a 4-fibre MS-SPRing/BLSR protection group
Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID
Range: In case of an asymmetric ring: NOTUSED; in all other cases: SPortAID.

29. **`wlprotnsw`** – West Last protection switch Attempt
This parameter specifies, whether the last switch request for the west side succeeded or not.

The values have the following semantics:

- SUCCESS: last request did succeed
- DENY: last request was denied due a validation rule
- FAILURE: last request could not be completed because far end node did not response with proper K-byte

Type: Alphanumeric value set.
Range: SUCCESS, DENY, FAILURE.
Default: SUCCESS.

30. **`wswreq`** – West Switch Request State
This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value is derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value is 'NR'.

It have the following values:

- LPS: Lockout of Protection Span
- FSS: Forced Switch of Service to Protection – Span
- FSR: Forced Switch of Service to Protection – Ring
- SFS: Signal Fail – Span

- SFR: Signal Fail – Ring
- SDS: Signal Degrade – Span
- SDR: Signal Degrade – Ring
- SDP: Signal Degrade – Protection
- MSS: Manual Switch of Service to Protection – Span
- MSR: Manual Switch of Service to Protection – Ring
- WTR: Wait to Restore
- NR: No Request.

Type: Alphanumeric value set.
Range LPS, FSS, FSR, SFS, SFR, SDS, SDR, SDP, MSS, MSR, WTR, NR The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.
Default: NR.

31. **`wtr`** – Wait To Restore Time
This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
Note: If wtr time is set to infinite, the switch request state is WTR until a higher request occurs.
Type: numeric string [minute].
Range: 0 – 12 in 1 minute increments and 99.
Default: 5.

Spec block parameters (path protection group)

1. **`cst`** – Constituent Signal Type
This parameter specifies the rate of the path protection group.
Type: Alphanumeric value set.
Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C
2. **`dripathpn`** – SNCP-UPSR ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type SNCP-UPSR.
Type: Alphanumeric string.
Range: 1-24 characters including the character "-".
Default: DEFAULT.

3. **`htmr`** – Hold-Off Time
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
   Type: numeric string [ms].
   Range for high order path protection groups: 0 .. 99 ms in 1 ms steps and 100 .. 10000 ms in 100 ms steps.
   Range for low order path protection groups: 0, 25, 50, 75 ms (in steps of 25 ms) and 100 .. 10000 ms in 100 ms steps.
4. **`ppgname`** – Path protection group Name
   This parameter specifies the path protection group name. Storage and retrieval of the *ppgname* is case sensitive, but actual use of the *ppgname* to determine the corresponding protection group is case insensitive.
   This parameter is omitted for low order path protection groups.
   Type: text string.
   Range: 0 to 24 characters.
   Default: empty string
5. **`protn`** – Protection Tributary
   This parameter specifies the protection input tributary AID being a member of the path protection group.
   Type: AID.
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.
   The usage of wild cards is not allowed for any part of the AID.
6. **`protype`** – Protection Type
   This parameter specifies the type of the protection group. The value for the path protection group is PATHDRI.
   Type: Alphanumeric value set.
   Range: PATHDRI.
   Default: PATHDRI.
7. **`rme`** – Protection Reversion
   This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group.
   The value ENABLE is used if the protection operates in revertive mode.
   The value DISABLE is used if the protection operates in non-revertive mode.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
8. **`snctype`** – SNC Protection Type
   This parameter specifies the type of the path protection w.r.t. switch criteria used by the protection state machine.
   The value SNCI (Inherent) is used if server signal fail is used as switch criteria.
   The value SNCN (Non-Instrusive) is used if server signal fail and defects

supervised by a non-intrusive path monitor are used as switch criteria
The value NA is used if one of the tributary inputs is related to a port operating in SONET mode.
Type: Alphanumeric value set.
Range: SNCI, SNCN, NA.

9. **`wkg`** – Worker Tributary
   This parameter specifies the worker input tributary AID being a member of the path protection group.
   Type: AID.
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.
   The usage of wild cards is not allowed for any part of the AID.

10. **`wtr`** – Wait To Restore Time
    This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.
    Type: numeric string [minute].
    Range: 0 – 60.

CML Block parameters (path protection group)

The CML (Constituent Member List) block is only used in the context of the path protection group. One block will be returned for each constituent signal within the protection group.

1. **`actunit`** – Active Unit State
   This parameter specifies which input tributary is currently selected within the protection group as active input.
   The value WKG specifies that the worker tributary is active.
   The value PROTN specifies that the protection tributary is active.
   Type: Alphanumeric value set.
   Range: WKG, PROTN.
   Default: WKG.

2. **`actunitaid`** – Active Unit State AID
   This parameter specifies the input tributary AID of the constituent signal which is currently selected within the protection group as active input for the dedicated constituent tributary output (see parameter outtribaid).
   Type: AID.
   Range: STS1NumAID or VCGNumAID or GenLOTribAID.
   The usage of wild cards is not allowed for any part of the AID.
   Default: AID of the worker tributary.

3. **`cst`** – Constituent Signal Type
   This parameter specifies the rate of the constituent signal within the path protection group.
   Type: Alphanumeric value set.
   Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C.
   Default: The default value is derived from the tributary input signal rate list in case of fixed mode.
4. **`protnsiglvl`** – Protection Fault Status
   This parameter specifies the current fault status w.r.t. tributary as used by the protection state machine.
   The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the protection tributary.
   The value SD (Signal Degrade) is used if a defect defined as signal degrade condition is currently present for the protection tributary.
   The value NONE is used if no such defect is currently present.
   Type: Alphanumeric value set.
   Range: SF, SD, NONE.
   Default: NONE.
5. **`swreq`** – Switch Request State
   This parameter specifies the current switch request state of the protection state machines.

   It have the following values:

   - LO: Lockout of Protection
   - FS: Forced Switch
   - MS: Manual Switch
   - SF: Signal Fail
   - SD: Signal Degrade
   - WTR: Wait to restore (only used if protection group is revertive)
   - NR: No Request.

   Type: Alphanumeric value set.
   Range: LO ,FS, MS, SF, SD , WTR, NR.
   Default: NR.
6. **`wkgsiglvl`** – Worker Fault Status
   This parameter specifies the current fault status w.r.t. tributary as used by the protection state machine.
   The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the worker tributary.
   The value SD (Signal Degrade) is used if a defect defined as signal degrade

condition is currently present for the worker tributary.
The value NONE is used if no such defect is currently present.
Type: Alphanumeric value set.
Range: SF, SD, NONE.
Default: NONE.

Detailed behavior description

The system shall allow to retrieve path protection groups at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading ″v″.

Example input/output

1+1 Equipment Protection Group

The following example retrieves 1+1 equipment protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-estgrp:123456::EQPTSWFBR;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-estgrp:protype=EQPTSWFBR,wkg=1-1-#-#-xcw-cp,protn=1-1-#-#-xcp-cp,actunit=
WKG,protnsiglvl=NONE,wkgsiglvl=NONE,swreq=NR″
;
```

The following example retrieves 1+1 equipment protection group information for the Duplex Control Protection Group while both NVMs are fully synchronized:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-ectlgrp:123456::EQPTCTL;
   LT-UNITE 06-10-11 11:15:00
M  123456 COMPLD
   ″1-1-ectlgrp:protype=EQPTCTL,actunit=WKG,nvmadate=06-10-11,nvmatime=09-17-
      43,nvmsdate=06-10-11,nvmstime=09-17-43,nvmstat=INSYNC,protn=1-1-#-#-ctlp-
      cp,protnsiglvl=NONE,swreq=NR,wkg=1-1-#-#-ctlw-cp,wkgsiglvl=NONE″
;
```

The following example retrieves TransMUX equipment protection group information:

```
RTRV-PROTN-GRP:UNITE-NE:1-1-etmux01:123456::EQPTTMUX;
   UNITE-NE 07-12-21 09:00:00
M  123456 COMPLD
   ″1-1-etmux01:protype=EQPTTMUX,wkg=1-1-#-#-21-cp,protn=1-1-#-#-22-cp,actunit=
WKG,protnsiglvl=NONE,wkgsiglvl=NONE,swreq=NR″
;
```

Multiplex section/line protection group (1+1)

The following example retrieves 1+1 multiplex section/line protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-o001:123456::1+1;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-o01:protype=1+1,wkg=1-1-#-#-13-1,protn=1-1-#-#-14-1,wtr=5,apspn=DEFAULT,
      dcclmsprotmd=DISABLE,dccsrsprotmd=DISABLE,protocol=1+1_UNI,rme=
      DISABLE,swreq=NR,actunit=WKG,actunitfe=WKG,
      actunitne=WKG,aps=NR,apsout=NR,pgrate=OC192,wkgsiglvl=NONE,protnsiglvl=NONE″
;
```

The following example retrieves 1+1 optimized multiplex section/line protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-o001:123456::1+1;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-o001:protype=1+1,wkg=1-1-#-#-13-1,protn=1-1-#-#-14-1,wtr=5,apspn=DEFAULT,
      dcclmsprotmd=DISABLE,dccsrsprotmd=DISABLE,protocol=1+1_OPTM,rme=
      DISABLE,swreq=NR,ssi=WKG,actunit=WKG,actunitfe=NONE,
      actunitne=WKG,aps=NR,apsout=NR,pgrate=STM64,wkgsiglvl=NONE,protnsiglvl=NONE″
;
```

Multiplex Section/Line protection group (1:N)

The following example retrieves 1:N multiplex section/line protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-n001:123456::1x1;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-n001:protype=1xNOPT,wkg=1-1-#-#-13-1,protn=1-1-#-#-14-1,wtr=5,apspn=DEFAULT,
       dcclmsprotmd=DISABLE,dccsrsprotmd=DISABLE,protocol=1xN_BIDIR,rme=
      ENABLE,swreq=NR,actunit=WKG,actunitfe=WKG,
      actunitne=WKG,aps=NR,apsout=NR,pgrate=STM64,wkgsiglvl=NONE,protnsiglvl=NONE″
;
```

2 fibre MS-SPRing/BLSR protection group

The following example retrieves 2F MS-SPRing/BLSR protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-t001:123456::2F;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
```

```
   ”1-1-t001:protype=2F,east=1-1-#-#-13-1,west=1-1-#-#-14-1,rid=\”denver\”,wtr=5,
      blsrpn=DEFAULT,eswreq=NR,wswreq=NR,pgrate=OC192,eapschst=IDLE,eapsdnid=0,
      eapsprotn=0,eapssnid=0,eapssw=NR,elprotnsw=SUCCESS,ringndst=IDLE,wapschst=IDLE, wapsdnid=
;
```

4 fibre MS-SPRing/BLSR protection group

The following example retrieves 4F MS-SPRing/BLSR protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-f001:123456::4F;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ”1-1-f001:protype=4F,eastwkg=1-1-#-#-13-1,eastprotn=1-1-#-#-15-1,westwkg=1-1-#-#-
      14-1, westwkg=1-1-#-#-16-1,rid=\”denver\”,protnmode=LOOPBACK,swtr=5,wtr=5,
      blsrpn=DEFAULT,eswreq=NR,eactunit=WKG,wswreq=NR,
      wactunit=WKG,pgrate=OC192,eapschst=IDLE,eapsdnid=0,
      eapsprotn=0,eapssnid=0,eapssw=NR,elprotnsw=SUCCESS,ringndst=IDLE,wapschst=IDLE, wapsdnid=

;
```

Path protection group

Constituent Member List – Path protection group Examples: To help understand a PATHDRI examples that will be given below, it will be helpful to summarize some facts pertaining to DRIs. The first output line for a PATHDRI gives information about the DRI as a entity.

The following output line gives information about the constituent members. Even for a fixed rate path DRI, there will be two output lines. The constituent member that is described by the second line will have a rate equal to the DRIs rate.

A path DRI has two input legs, one referred to as the working leg and the other as the protection leg. It is possible for RTRV-PROTN-GRP to indicate some constituent members have been selected from the working leg while others have been selected from the protection leg. To determine whether or not all constituent members have been selected from the same leg, it is necessary to look at the *actunitaid* for each constituent member and determine if they are from the same leg.

Constituent Member List – Path protection group example for fixed mode :

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-10-1-25:123456::PATHDRI;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ”1-1-#-#-10-1-25:protype=PATHDRI,cst=STS12C,wkg=1-1-#-#-08-1-25,protn=1-1-#-#-06-
      1-1,ppgname=\”group018\”,htmr=100,wtr=5,dripathpn=path2,rme=DISABLE,snctype=NA”
   ”1-1-#-#-10-1-25,CML:cst=STS12C,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE”
;
```

Constituent Member List – Path protection group example for pipe mode: The examples shows an STS12 pipe with 10 constituent members.

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-10-1-25:123456::PATHDRI;
   LT-UNITE 05-05-31 08:00:00
M  123456 COMPLD
   ″1-1-#-#-10-1-25: protype=PATHDRI,htmr=100,rme=ENABLE,
      ppgname=\″group019\″,wtr=5,dripathpn=path2,cst=STS12C,wkg=1-1-#-#
-08-1-25,protn=1-1-#-#-06-1-1,snctype=NA″
   ″1-1-#-#-10-1-25,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE″
   ″1-1-#-#-10-1-26,CML:cst=STS1,swreq=SF,actunit=PROTN,actu
nitaid=1-1-#-#-06-1-2,wkgsiglvl=SF,protnsiglvl=NONE″
   ″1-1-#-#-10-1-27,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-27,wkgsiglvl=NONE,protnsiglvl=NONE″
   ″1-1-#-#-10-1-28,CML:cst=STS3C,swreq=SF,actunit=PROTN,actunitaid
=1-1-#-#-06-1-4,wkgsiglvl=SF,protnsiglvl=NONE″
   ″1-1-#-#-10-1-31,CML:cst=STS1,swreq=SD,actunit=PROTN,actunitaid=
1-1-#-#-06-1-7,wkgsiglvl=SD,protnsiglvl=NONE″
   ″1-1-#-#-10-1-32,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-32,wkgsiglvl=NONE,protnsiglvl=NONE″
   ″1-1-#-#-10-1-33,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-33,wkgsiglvl=NONE,protnsiglvl=NONE″
   ″1-1-#-#-10-1-34,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-34,wkgsiglvl=NONE,protnsiglvl=NONE″
   ″1-1-#-#-10-1-35,CML:cst=STS1,swreq=NR,actunit=PROTN,actu
nitaid=1-1-#-#-06-1-11,wkgsiglvl=NONE,protnsiglvl=NONE″
   ″1-1-#-#-10-1-36,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-36,wkgsiglvl=NONE,protnsiglvl=NONE″
;
```

Low Order Path Protection Group Example:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-39-16-3-28:123456::PATHDRI;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-39-16-3-28:protype=PATHDRI,cst=LOVT1,wkg=1-1-#-#-39-14-3-28,\
    protn=1-1-#-#-39-15-3-28, htmr=75,wtr=5,dripathpn=path2,\
    rme=DISABLE,snctype=NA″
   ″1-1-#-#-39-16-3-28,CML:cst=LOVT1,swreq=NR,actunit=WKG,\
    actunitaid=1-1-#-#-39-14-3-28,wkgsiglvl=NONE,protnsiglvl=NONE″
;
```

Example for Path Protection Group Retrieval using *aid* and *aid1* for addressing via input tributaries:

In this example there exist two path protection groups on the same pair of input tributaries 1-1-#-#-8-1-25 and 1-1-#-#-6-1-25 forming an emulated selector bridge. The output tributary for one of these groups is 1-1-#-#-10-1-25 and for the other one it is 1-1-#-#-4-1-25.

Both groups will be reported after this request. Note, that the parameter values for both groups are identical.

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-8-1-25:123456::
               PATHDRI,,,1-1-#-#-6-1-25;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-10-1-25:protype=PATHDRI,cst=STS12C,wkg=1-1-#-#-08-1-25,
   protn=1-1-#-#-06-1-25,ppgname=\″group018\″,htmr=100,wtr=5,
   dripathpn=path2,rme=DISABLE,snctype=NA″
   ″1-1-#-#-10-1-25,CML:cst=STS12C,swreq=NR,actunit=WKG,
   actunitaid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE″
   ″1-1-#-#-4-1-25:protype=PATHDRI,cst=STS12C,wkg=1-1-#-#-08-1-25,
   protn=1-1-#-#-06-1-25,ppgname=\″group018\″,htmr=100,wtr=5,
   dripathpn=path2,rme=DISABLE,snctype=NA″
   ″1-1-#-#-4-1-25,CML:cst=STS12C,swreq=NR,actunit=WKG,
   actunitaid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE″
;
```

Error responses (general)

Validation rule: consistent *aid* and *protype*

If a range is specified for *aid* and *protype* is not consistent with that AID (for example, an AID of 1-1-fall and a protype value of 2F), then the following error response is returned.

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and protype`

Error responses (2-/4-fibre MS-SPRing/BLSR protection group)

Validation rule: consistent *aid* and *rid*

If both an *aid* and an *rid* are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

Validation rule: *aid* range and *rid*

Validation rule: If a range is specified for *aid* and an *rid* is also specified as input parameters, then the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, no aid range in combination with rid`

Error responses (path protection group)

Validation rule: *ppgname* and low order path protections

If a *ppgname* is given as input parameter while the *aid* references a low order tributary, then the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, ppgname not supported for this transmission rate`

Validation rule: *ppgname* and *aid1*

If a *aid1* is given as input parameter and additionally a value is given for parameter *ppgname*, then the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, ppgname not allowed if aid1 is given`

Validation rule: No wildcarding on access via *aid* and *aid1*

If *aid* and *aid1* is given as input parameters for accessing via input tributaries and wildcarding is used for any of both, then the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, No wildcarding for access via input tribs`

Wrong system behavior

If 4F is used in the **RTRV-PROTN-GRP** command line although the used port AID belongs to a 2F protection group, or if 2F is used in the **RTRV-PROTN-GRP** command line although the used port AID belongs to a 4F protection group, the system shows a wrong behavior. Expected is an empty COMPLD report, however the command COMPLDs *and* the 2F/4F group is displayed.

RTRV-PTF: Retrieve tributary with path termination function

The **RTRV-PTF** command retrieves the attributes of a tributary with path termination function (PTF).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-PTF**-*modifier:tid:aid:ctag[:::spec_block];*

Input parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the tributary. The purpose is to distinguish the standard and type of the PTF.
   Type: Alphanumeric value set.
   Range:
   - ALL
   - STS for DS3 card
   - HOSTS1 for LOXC card
   - HOVC4 for LOXC card
   - TMASTS1 for TransMUX asynchronous port
   - TMSSTS1 for TransMUX synchronous port

   The value **ALL** is used to retrieve all path terminations providing lower order tributaries independent from the interface standard (for example, HOSTS1 and HOVC4).
   The following path terminations are not included:
   - path terminations related to DS3
   - path terminations related to TransMUX ports.
2. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **aid** – Access Identifier
   AID of a PTF tributary. The keyword **all** is allowed on slot, port and tributary level.

The so called ″dynamic parameters″ is not reported, if a **`all`** is used at the tributary level. The ″dynamic parameters″ are:

- *ptrc, ptrcst, rsiglb, trailstate*

Type: AID

Range:

- PTNumAID for modifier: STS, HOSTS1, HOVC4, ALL
- TMuxAPTNumAID for modifier: TMASTS1
- TMuxSPTNumAID for modifier: HOSTS1, TMSSTS1

as defined in AID structure with exception of value **`all`**.

4. **`ctag`** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`dyn`** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values all, usall or vall at the appropriate positions of the input AID. For input AIDs not using all, usall or vall this parameter is not allowed.

   The following output parameters of a PTF tributary are affected:

   - *ptrc, ptrcst, rsiglb, trailstate*

   Type: Alphanumeric value set.

   Range:

   - YES: Report dynamic parameters in the reply as well
   - NO (default): Do not report dynamic parameters in the reply.

Output format

If the NE fully complies with the **`RTRV-PTF`** request, the following normal completion response is returned:

```
sid date time
M  ctag COMPLD
   ″aid,aidtype::spec_block″
       ...
       ...
   ″aid,aidtype::spec_block″
;
```

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The access identifier specifies the PTF tributary whose attributes are reported.
   Type: AID
   Range:
   - TNumAID for modifier: STS, HOSTS1, HOVC4, ALL
   - TMuxAPTNumAID for modifier: TMASTS1
   - TMuxSPTNumAID for modifier: HOSTS1, TMSSTS1

   as defined in AID structure with exception of value **`all`**.
2. **`aidtype`** – Access Identifier Type
   The *aidtype* specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range:
   - STS
   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   The parameter *brstintvl* specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST, then *brstintvl* has no affect to NE behavior.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.
   The parameter *brstintvl* is not supported for the following modifiers:
   - HOSTS1
   - HOVC4

- TMASTS1
- TMSSTS1

Option: If the parameter *brstintvl* is not supported, then the parameter is omitted.
Type: Integer.
Range: 2, 3, … 10 [seconds]
Default: 7 [seconds].

2. **`brstthr`** – Bursty Error Threshold

   The parameter *brstthr* specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter *brstthr* is not supported for the following modifiers:

   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

   Option: If the parameter *brstthr* is not supported, then the parameter is omitted.
   Type: Integer.
   Range: 5, 10, 15, … 50 [%].
   Default: 30.

3. **`crslpbkstat`** – Cross-connect Loopback Status

   The parameter *crslpbkstat* reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035).

   The parameter *crslpbkstat* is not supported for the following modifiers:

   - HOSTS1
   - HOVC4
   - TMSSTS1

   Option: If the parameter *crslpbkstat* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: YES, for enabled loopback; NO, for disabled loopback

4. **`degthr`** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to RTRV-PTF Output parameters.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.
   The parameter *degthr* is not supported for modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
   Type: Integer.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
5. **`dexcthr`** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to RTRV-PTF Output parameters.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.
   The parameter *dexcthr* is not supported for modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
   Type: Integer.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
6. **`exphptrc`** – Expected HP trace identifier
   This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
   Limitation: The parameter is not supported for modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
   Type: Hexadecimal number without a preceding “H”.
   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.
   Default: 89000000000000000000000000000000

7. **`feppm`** – Far End Path PM Enable
   The parameter *feppm* specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.
   This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
   Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the parameters for far-end performance monitoring on T3 related path terminations are kept for compatibility reasons.
   The parameter is not supported for the following modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
8. **`hptimais`** – HP Trace Identifier Mismatch AIS Insertion
   The parameter *hptimais* shall specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   The parameter is not supported for the following modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE.

   Default: The default value depends on interface standard specified by *ptfstd* for the PTF tributary. DISABLE, if *ptfstd* = SONET
9. **`hptimmon`** – HP Trace Identifier Mismatch Monitor
   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   The parameter is not supported for the following modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE

   Default: DISABLE.

10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter specifies the input LO signal structure.
    The parameter *inputsig* is only supported for the following modifiers:
    - HOVC4
    - HOSTS1
    - TMSSTS1

    Option: If the parameter *inputsig* is not supported, then the parameter is omitted.
    Type: numeric value set
    Range: NX-NX-… (N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).
    The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33
    The possible values (SONET) are: 2811
    Restricted Range with AU3/AU4 Conversion cross-connections:
    If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *inputsig* is restricted to: 33.
    Restricted Range with TransMUX:
    If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.
    Default:
    - 6312 for SDH
    - 2811 for SONET
11. **`neppm`** – Near End Path PM Enable
    This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.
    This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
    Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the possibility to enable near-end performance monitoring on T3 related path terminations is kept for compatibility reasons.
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE.

    Default: DISABLE.
12. **`pmhpfeses`** – PM HP Far End SES Threshold
    This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *ptfstd* for the PTF tributary. If

ptfstd is not set to SDH then *pmhpfeses* has no affect to NE behavior.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the possibility to enable far-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.
Default: 2400

13. **pmhpneses** – PM HP Near End SES Threshold
This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by *ptfstd* for the tributary. If *ptfstd* is not set to SDH then *pmhpneses* has no affect to NE behavior.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1

    Option: If the parameter is not supported, then it should be omitted.
Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.
Default: 2400

14. **ptca** – Path TCA Profile Pointer
This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    TCA profile: The TCA profile type depends on the type and standard of the PTF, which is specified with the parameter *modifier* or *aidtype*:

    - PATH if *modifier* = TMASTS1

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1
- HOVC4

Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set.
Range: 1 … 24 characters.
Default: DEFAULT0

15. **`ptfstd`** – Path Termination Standard
Standard of the tributary with Path Termination Function.
This is currently a read-only parameter.
Type: Alphanumeric value set.
Range:
   - SDH (only if *modifier* = HOVC4)
   - SONET (only if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1)

   Default:
   - SDH (if if *modifier* = HOVC4)
   - SONET (if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1).
16. **`ptpn`** – Path Terminating ASA Profile Name
This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
The parameter is not supported for the following modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set. A hyphen ("-") is allowed in the name additionally.
Range: 1 … 24 characters
Default: DEFAULT
17. **`ptrc`** – Incoming Path Trace
This parameter reports the accepted higher order path trace identifier (J1). The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter ptrc is omitted from the response.
The parameter is not supported for the following modifiers:
   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.
Type: Hexadecimal

Range: the range depends on the parameter ptrcrfmt specified in RTRV-PTF Output parameters

- 2: hexadecimal digits if *ptrcrfmt*=2
- 32: hexadecimal digits if *ptrcrfmt*=16
- 128: hexadecimal digits if *ptrcrfmt*=64.

18. **`ptrcrfmt`** – Path Trace Read Format

    The parameter *ptrcrfmt* specifies the format of the path trace (J1 byte) to be received (sink).

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.

19. **`ptrcst`** – Status of Incoming Path Trace

    This parameter shows the status of the value of the incoming Path Trace Identifier (J1) which is available with parameter *ptrc*.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Alphanumeric value set.

    Range:

    - NORMAL: *ptrc* contains a valid value
    - UNAVAILABLE: no valid value for *ptrc* could be obtained by the system
    - AIS: no valid value for *ptrc* could be obtained due to SF condition.

20. **`ptrcwfmt`** – Path Trace Write Format

    The parameter *ptrcwfmt* specifies the format of the path trace (J1 byte) to be sent (source).

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.

    Default: 2.

21. **`rsiglb`** – Received Signal Label
    This parameter reports the accepted trail signal label (C2). The parameter is not reported if the *trailst* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE.
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Alphanumeric value set.
    Range: 00, 01, …, FE, FF i.e. two hexadecimal digits.
22. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    This parameter specifies the determination mode of degraded defect for transmission.
    Limitation for PTF related to modifiers: Near-end performance monitoring is not available for modifier STS. The parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.
    The parameter is not supported for the following modifiers:
    - TMSSTS1
    - TMASTS1
    - HOVC4
    - HOSTS1

    Option: If the parameter *sdsfmode* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: BURST, POISSON
    Default: The default value depends on interface standard specified by *ptfstd* for the tributary. POISSON, if *ptfstd* = SONET.
23. **`substr`** – Substructured
    The parameter *substr* indicates if the PTF is substructured.
    Additional Description for LOXC
    This parameter indicates if the PTF is configured for AU3/AU4 conversion cross-connections.
    The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created. A PTF, which is configured for AU3/AU4 conversion cannot be used to set up HO cross-connections.
    The parameter *substr* is only supported, if *modifier* = STS.
    If the parameter *substr* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - CNV: In use for HO side of a conversion cross-connection
    - NO (default): Not used for conversion cross-connections
24. **`tmonmd`** – Tributary Monitoring Mode
    This parameter specifies the monitoring mode for the tributary.

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.
Type: Alphanumeric value set.
Range: MON, NMON (default).

25. **`trailst`** – Trail Status
    This parameter reports the accepted trail status value.
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Alphanumeric value set.
    Range:
    - AIS for Alarm Indication Signal in case of Trail Signal Fail Condition
    - UNAVAILABLE for unavailable
    - NORMAL
26. **`trc`** – Outgoing Path Trace
    This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Hexadecimal number without a preceding "H".
    Range: the range depends on the parameter ptrcwfmt specified in RTRV-PTF Output parameters
    - length: 32 hexadecimal digits, if *ptrcwfmt*=16; 128 hexadecimal digits, if *ptrcwfmt* = 64
    - value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt*=16; 64 byte string if *ptrcwfmt* = 64

    Default: 00. This implies also that *ptrcwfmt* is set to 2.
27. **`tslmmon`** – Trail Signal Label Mismatch Monitor
    The parameter *tslmmon* specifies the mode of the TSL mismatch detection.
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.
    Type: Alphanumeric value set.
    Range: DISABLE, ENABLE.
    Default: ENABLE.

28. **`unequiposig`** – Unequipped Output Signal List
    The parameter *unequiposig* specifies the output LO signal structure, independent whether the signal is connected or not. The parameter *unequiposig* is only supported for modifiers HOVC4. HOSTS1. and TMSSTS1.
    Option: If the parameter *unequiposig* is not supported, then the parameter is omitted.
    Type: numeric value set
    Range: NX-NX-…(N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).
    The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33
    The possible values (SONET) are: 2811
    Restricted Range with AU3/AU4 Conversion cross-connections:
    If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *unequiposig* is restricted to: 33.
    Restricted Range with TransMUX:
    If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.
    Default:
    - 6312 for SDH
    - 2811 for SONET

Detailed behavior description

The RTRV-PTF does not generate a REPT DBCHG message. The command retrieves all port parameter as described in section Output parameters.

Dependencies

brstintvl, *brstthr* and *sdsfmode* are not supported for modifiers HOVC4, HOSTS1,TMASTS1, and TMSSTS1 and will therefore not be reported in this case.

For all other PTFs:

- *brstintvl* and *brstthr* are only meaningful if *sdsfmode* is set to BURST.
- *degthr* and *dexcthr* are only meaningful if *sdsfmode* is set to POISSON.

Parameters which are not meaningful in the current provisioning status are reported with their default values, nevertheless.

Behavior in the case of Conversion Cross-Connections

The **`RTRV-PTF`** command does not return data for the HO sides of conversion cross-connections at synchronous optical and electrical ports.

PTFs exist at the LO side of conversion cross-connections, and if the HO side is at DS3 ports, also at the HO side of conversion cross-connections.

No PTFs exist at the HO side of conversion cross-connections, when the HO side is at a synchronous optical or electrical port.

```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-PTF** command, too.

Validation rule: Check CCB against *ptfstd*

Check wether the CCB fits to ptfstd of the tributary.

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with modifier=VC is made on a port which is provisioned as ptfstd=SONET.

RTRV-RC-GENERAL: Retrieve general routing controller settings

The **RTRV-RC-GENERAL** command retrieves the general settings of the network element routing controller.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-RC-GENERAL**:*tid*::*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*.

Output format

If the **RTRV-RC-GENERAL** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "spec_block"
;
```

Output parameters

Spec block parameters

1. **hellointerval** – Hello Interval
   This parameter is used to indicate the time (in seconds) between two succeeding "Hello" messages to be sent to a neighbor RC.
   Type: Numerical.
   Range: 1 … 65535.
   Default: 10.
2. **deadintv** – Dead Interval
   This parameter is used to indicate the time (in seconds) that the system waits for the reception of "Hello" PDU from a neighbor RC before the neighbor RC is considered to be dead.
   Type: Numerical.
   Range: 1 … 65535.
   Default: 30.

Detailed behavior description

The command retrieves the routing controller general settings.

Example input/output

The following example shows the result of **RTRV-RC-GENERAL**:

```
RTRV-RC-GENERAL:NE-UNITE::123456;
   NE-UNITE 06-11-06 11:01:00
M  123456 COMPLD
   "hellointv=10, deadintv=30"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-RC-GENERAL** command.

Validation rule: RC must be created

If the RC is not created (through **ACT-L1ROUTING**), then the command is denied.

Error code: `IDNV – Input, Data Not Valid, RC not created`

Related TL1 messages

- "ED-RC-GENERAL: Edit general routing controller settings" (p. 3-853)

RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers

The **RTRV-RC-NEIGHBOR** command is used to retrieve all neighboring routing controllers that have been provisioned using the **ENT-RC-NEIGHBOR** command.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-RC-NEIGHBOR**:*tid*::*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Output format

If the **RTRV-RC-NEIGHBOR** command is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "[rate]:thru[,lpaid]:spec_block"
   ...
   "[rate]:thru[,lpaid]:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the “RTRV-HDR: Retrieve header” (p. 3-2417) command.

Output parameters

Spec block parameters

1. **`remrcid`** – Remote Routing Controller Identifier
   This parameter is used to indicate the Id of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
2. **`remrcscn`** – Remote Routing Controller IP Address
   This parameter is used to indicate the IP address of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
3. **`remrcraid`** – Remote Routing Controller Routing Aread ID
   This parameter is used to indicate the routing area ID of the level 0 area of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   0.0.0.0 is not allowed.
4. **`remrcOspfFlooding`** – Remote Routing Controller OSPF Flooding
   This parameter indicates whether OSPF flooding is enabled to the remote RC or not.
   Type: Alphanumeric value set.
   Range: DISABLE or ENABLE.

Detailed behavior description

The command shall retrieve all routing controller neighbors.

Example input/output

The following example shows the result of a **RTRV-RC-NEIGHBOR** command:

```
RTRV-RC-NEIGHBOR:NE-UNITE::123456;
   NE-UNITE 06-11-06 11:01:00
M  123456 COMPLD
   ″remrcid=1.2.3.4, remrcscn=124.24.12.56, remrcraid=1.2.3.4,
      remrcOspfFlooding=ENABLE″
   ″remrcid=5.2.3.1, remrcscn=132.12.96.2, remrcraid=17.2.5.9,
      remrcOspfFlooding=DISABLE″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-RC-NEIGHBOR** command.

Validation rule: RC must be created

If the RC is not created (via ACT-L1ROUTING), then the command is denied.

Error code: `IDNV – Input, Data Not Valid, RC not created`

Related TL1 messages

- "ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers" (p. 3-1792)
- "DLT-RC-NEIGHBOR: Delete a routing controller from the list of neighboring routing controllers" (p. 3-247)

RTRV-RESALLOC-VCG: Retrieve resource allocation virtual concatenation group

The **RTRV-RESALLOC-VCG** command retrieves the resource allocation of a ES64U in a slot. The **RTRV-RESALLOC-VCG** command is needed to provide the user an overview about the backplane fragmentation where blocking configurations are present.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-RESALLOC-VCG**:*tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   The AID of a circuit pack.
   Type: CpAID.
   The values **usall** for Simple_UnivSlotAID, **all** for Simple_UnivSlotAID, **all** for Simple_ShelfAID, and **all** for BayAID are excluded.
   Default: None.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the NE fully complies with the **RTRV-RESALLOC-VCG** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "sts1equi:resalloc"
          ...
          ...
   "sts1equi:resalloc"
     <one output line for every STS-1 equivalent, together 384 lines.>
;
```

Output parameters

Command parameters

1. **`sts1equi`** – STS-1 Equivalent
   The STS-1 equivalent describes a single backplane bandwidth element from the physical backplane structure, which is represented in STS-1 (respectively HO-VC-3) granularity.
   The STS-1 equivalent reflects that the ES64U backplane bandwidth is always split in two parts of each 192 STS-1 or VC-3.
   Type: String.
   Range: Combined string ***x***'***S***'***yyy***, where
   x = 1 | 2, for part 1 or part 2 of the backplane bandwidth segment;
   yyy = {1…192}, for the number of the STS-1 equivalents.
   "1S" or "2S" specify the first or second bandwidth segment in total circuit pack bandwidth, that means, "1S" denotes the first 192 STS-1 or VC-3 and "2S" the second 192 STS-1 or VC-3 of anES64U.
   Default: None.
2. **`resalloc`** – Resource Allocation
   The resource allocation shall list the physical backplane structure in STS-1 (respectively HO-VC-3) granularity. For each backplane bandwidth element the allocated VCGTRIB instance shall be referenced. Unused backplane bandwidth elements shall be listed as well.
   It should be noted that a contiguous concatenated VCGTRIB instance has multiple STS-1 or VC-3 bandwidth (e.g. a single STS-3c is then listed three times for this STS-1 granularity). A VC-4 is handled like a STS-3c.
   Type: String.
   Range: Combined string ***<tribaid>*** | "unused".
   Default: "unused".

Detailed behavior description

The **RTRV-RESALLOC-VCG** does not generate a **REPT DBCHG** message. The command retrieves the resource alloaction as described in section" Output parameters".

Example input/output

Example output for SONET *istd*, i.e. listing in STS-1 granularity for two 10G bandwidth segments 1S and 2S with each 192 STS-1 tributaries:

```
RTRV-RESALLOC-VCG:UNITE-NE:1-1-#-#-22-cp:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ″1S001:1-1-#-#-22-v1-1″
   ″1S002:1-1-#-#-22-v1-3″
   ″1S003:unused″
   ″1S004:unused″
   ″1S005:1-1-#-#-22-v1-2″
```

```
   "1S006:1-1-#-#-22-v8-1"
   "1S007:1-1-#-#-22-v8-3"
   "1S008:unused"
   "1S009:1-1-#-#-22-v8-2"
   "1S010:1-1-#-#-22-v4-1"
...
   "1S192:1-1-#-#-22-v1-4"
   "2S001:1-1-#-#-22-v205-8"
   "2S002:1-1-#-#-22-v205-12"
   "2S003:1-1-#-#-22-v205-6"
   "2S004:1-1-#-#-22-v205-3"
   "2S005:1-1-#-#-22-v205-2"
   "2S006:1-1-#-#-22-v205-5"
   "2S007:1-1-#-#-22-v205-11"
   "2S008:1-1-#-#-22-v205-9"
   "2S009:1-1-#-#-22-v205-7"
   "2S010:1-1-#-#-22-v205-10"
   "2S011:1-1-#-#-22-v205-4"
   "2S012:1-1-#-#-22-v205-1"
   "2S013:unused"
...
   "2S181:1-1-#-#-22-v207-7"
   "2S182:1-1-#-#-22-v207-4"
   "2S183:1-1-#-#-22-v207-2"
   "2S184:1-1-#-#-22-v207-1"
   "2S185:1-1-#-#-22-v207-9"
   "2S186:1-1-#-#-22-v207-6"
   "2S187:1-1-#-#-22-v207-5"
   "2S188:1-1-#-#-22-v207-3"
   "2S189:1-1-#-#-22-v207-8"
   "2S190:unused"
   "2S191:unused"
   "2S192:unused"
;
```

The example output above shows one time a STS-1-4v (v1), one time a STS-1-1v (v4), STS-1-12v (v205), one time a STS-1-9v (v207) and one time a STS-1-3v (v8).

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`RTRV-VCG-TRANS`** command, too.

Validation rule: Command only allowed for ES64U

If the command is not applied to a ES64U pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Command not allowed for ES64U with switch capacity 0

If the switch capacity *es64ucap* for a ES64U pack is 0, then the command is denied.

Error code:

`IENE – Input, Entity Not Exists, Command not allowed for an inactive ES64U pack`

Validation rule: Command not allowed for ES64U protecting pack

If the command is applied to an ES64U protecting pack in an equipment protection, then the command is denied.

Error code:

`IENE – Input, Entity Not Exists, Command not allowed for a protecting ES64U pack`

RTRV-RSVP: Retrieve RSVP parameters

The **RTRV-RSVP** command retrieves RSVP related parameters applicable for UNI or ENNI signaling on system level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-RSVP**-*modifier*:*tid*::*ctag*;

Input parameters

To retrieve RSVP parameters related to UNI signalling the TL1 command **RTRV-RSVP** is only valid with modifier UNI, that means, **RTRV-RSVP-UNI**.

Command parameters

1. **modifier**
   The parameter modifier indicates the communication function entity for which the RSVP parameters apply.
   Type: Alphanumeric value set.
   Range: UNI or ENNI.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*.

Output format

If the **RTRV-RSVP** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   ":spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Spec block parameters

1. **`hellointerval`** – Hello Interval
   This parameter is used to indicate the time between two succeeding HELLO messages to be sent to any neighbor in hello interworkings.
   Type: Numeric string.
   Range: 1 … 60
2. **`maxhelloretransmit`** – Maximum Hello Retransmissions
   This parameter is used to indicate the number of Hello Intervals without any HELLO_REQUEST or HELLO_ACK object received from a neighbor after which communication to this neighbor is considered as lost.
   Type: Numeric string.
   Range: 1 to 10.
   Default: 3
3. **`srefreshtimer`** – Srefresh Timer
   This parameter is used to indicate the maximum time between two consecutive SREFRESH requests for a UNI or network connection towards affected neighbors srefresh interworkings.
   Type: Numeric string.
   Range: 10 … 180 indicating the Srefresh time in seconds.
   Default: 15.

Detailed behavior description

The command shall retrieve the RSVP related parameters from the system for the node specified by the command modifier.

Example input/output

The following example shows the result of **`RTRV-RSVP`** for UNI:

```
RTRV-RSVP-UNI:NE-UNITE::123456;
   NE-UNITE 06-06-30 11:01:00
M  123456 COMPLD
   ":hellointerval=5,maxhelloretransmit=3,srefreshtimer=15"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-RSVP** command.

Validation rule: ENNI node must be created

If the command is executed with *modifier* = ENNI while the ENNI Node is not created (by provisioning of the *sigPCIP_Address* in **ENT-ULS**), then the command is denied.

Error code: `SNVS – Status, Not in Valid State, E-NNI Node not created`

Validation rule: UNI node must be created

If the command is executed with *modifier* = UNI while the UNI Node is not created, then the command is denied.

Error code:
`SNVS – Status, Not in Valid State, UNI Node IP Address not provisioned`

Related TL1 messages

- "ED-RSVP: Modify RSVP parameters" (p. 3-857)

RTRV-SCN-NEIGHBOR: Retrieve SCN neighbor

The **RTRV-SCN-NEIGHBOR** command retrieves entries from the routing table of the SCN stack.

Note that the information on neighbors given in the **RTRV-SCN-NEIGHBOR** command is related to the SCN, i.e. to the control plane of ONNS, whereas the neighbor information given in the RTRV-rr commands relates to the transmission plane of ONNS. In general the information given in RTRV-SCN-NEIGHBOR includes DCC and (ISIS) LAN neighbors which are assigned to the SCN.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-SCN-NEIGHBOR**:*tid*::*ctag*:::;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: TID.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
   Type: CTAG.

Output format

If the RTRV-SCN-NEIGHBOR request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "[rate]:thru[,lpaid]:spec_block"
   ...
   "[rate]:thru[,lpaid]:spec_block"
;
```

Output parameters

Command parameters

1. **`rate`** – DCC Port Rate
   This parameter is only available for an SCN neighbor on DCC and provides the port rate as used in RTRV-rr.
   Type: value set.
   Range:
   - STM1
   - STM1E
   - STM4
   - STM16
   - STM64
   - STM256
   - OC3
   - OC12
   - OC48
   - OC192
   - OC768

   Default: n/a – as determined by the port type.
2. **`thru`** – Connected Through
   The type of connectivity between the NE and its SCN neighbor.
   Type: Value set.
   Range: DCC, LAN.
   Default: n/a – as determined by the type of connection.
3. **`lpaid`** – Local Port AID
   This parameter provides the SPortAID of the optical port in case thru=DCC or the LanPortAID in case thru=LAN.
   Type: AID
   Range: SPortAID in case thru=DCC or LanPortAID in case thru=LAN as defined in section AID Structure.
   Note: Since LAN1 can not be assigned to the SCN it will never appear in the output.

Spec block parameters

1. **`dcctype`**
   This parameter specifies, whether MS(LINE)-DCC or RS(SECTION)-DCC is used for IP communication with the neighbor. This parameter is only available when thru=DCC.
   Type: Alphanumeric value set.
   Range: SECTION, LINE
2. **`neighbor_ip`** – Neighbor IP Address
   This parameter is used to retrieve the IPv4 address of the LAN or DCC neighbor.
   Type: Four dot separated numeric strings or empty string.
   Range: Each numeric string: 0 .. 255 or empty string.
   Note: The empty string is shown when the IP address can not be retrieved. In output direction the empty string is represented as \″\″.
3. **`neighbor_sid`** – Neighbor SID
   This parameter is used to display the SID of the neighbor.
   Note: Since the SID (MAC address) is unique it might be used to detect misconfigurations of duplicate IP addresses.
   Type: Hexadecimal number.
   Range: 000000000000 – FFFFFFFFFFFF.

Detailed behavior description

The command shall retrieve the *spec_block* parameters as described in the Output parameter section.

A neighbor entry shall not appear in the report for LANs and DCC channels allocated to an OSI_node_AID or the UNI_node_AID or the ENNI_node_AID.

Behavior if no neighbors present

An empty spec block is returned, if no neighbors are present.

Example input/output

The following example shows the result of a RTRV-SCN-NEIGHBOR command:

```
RTRV-SCN-NEIGHBOR:LT-UNITE::123456:::;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
   ″OC48:DCC,1-1-#-#-1-1:dcctype=LINE,neighbor_ip=192.168.200.1″
   ...
   ″:LAN,lan2: neighbor_ip=192.168.200.4″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-SCN-NEIGHBOR** command.

RTRV-SPANSWS: Retrieve SPAN switch state

General

The **RTRV-SPANSWS** command requests the NE to report the current switch states of an MS-SPRing TOP+EX ring protection group related to the cross-connections either being added or dropped, ingressing or egressing ectra traffic cross-connections and addressed to a specified side of the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-SPANSWS***:tid:[aid]:ctag::side,rcrole,[rid];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an service port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: FourFibre_ProtGrpAID or SPortAID.
   SPortAID identifies the protection group only, it will not be evaluated if it is located on east or west side. For this purpose specify the *side* parameter.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
4. **side** – side identifier of protection group
   This parameter specifies the ring side of the ring protection group.
   Type: Alphanumeric value set.
   Range: EAST, WEST

5. **`rcrole`** – ring cross-connection role
   This parameter specifies the cross-connection role of the ring node.
   Type: Alphanumeric value set.
   Range:
   - ADD, service cross-connections added to the ring
   - DROP, service cross-connections dropped from the ring
   - INGRESSING, ingressing extra traffic cross-connections
   - EGRESSING, egressing extra traffic cross-connections
6. **`rid`** – Ring Identification
   The parameter specifies the ring identification name. Storage and retrieval of the rid is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: Text string of chars allowed for TID strings
   Range: 1 to 15 characters
   Option: If *aid* is specified, then *rid* can be omitted.

Output format

The general format of a RTRV-SPANSWS message is as follows:

```
   tid date time
M  123456 COMPLD
   "aid:rid:side,rcrole"
   "fsts1pos:rate:protsiglvl"
   "fsts1pos:rate:protsiglvl"
       ...
       ...
   "fsts1pos:rate:protsiglvl"
;
```

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter titles the listing with the AID of the reported protection group.
   Type: AID
   Range: FourFibre_ProtGrpAID
2. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: Text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
3. **`side`** – side identifier of protection group
   This parameter titles the listing with the reported ring side of the ring protection group.
   Type: Alphanumeric value set.
   Range: EAST, WEST.
4. **`rcrole`** – ring cross-connection role
   This parameter titles the listing with the reported cross-connection role of the ring node.
   Type: Alphanumeric value set.
   Range:
   - ADD, service cross-connections added to the ring
   - DROP, service cross-connections dropped from the ring
   - INGRESSING, ingressing extra traffic cross-connections
   - EGRESSING, egressing extra traffic cross-connections
5. **`fsts1pos`** – first STS-1 tributary position
   The parameter specifies the first ’STS1NumAID’ of the listed constituent signal of the protection group, i.e. the first STS-1 position of the tributary. Each row of the list of reported constituent signals shall start with this parameter. The parameter *fsts1pos* is comparable to the parameters *in_aid* and *out_aid* of the RTRV-CRS output.
   Type: AID
   Range: STS1NumAID, the part Simple_STS1NumAID of this STS1NumAID is currently limited to 1 … 192.

6. **`rate`** – cross-connection rate
   The parameter specifies the cross-connection rate.
   Type: Alphanumeric value set.
   Range: VC3, VC4, VC44C, VC416C, VC464C.
   All rates are shown as SDH rates here. Internal conversion may be needed, see chapter 'Detailed behavior'. Refer also to *rate* in output parameters section of "RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759).
7. **`protsiglvl`** – protection signal level
   The parameter specifies the current protection state of locally added or dropped service cross-connection for the TOP+EX application. The information includes the current state of either the switches or the bridges of one side of a TOP+EX protection group. It does not represent the switch request state.
   Type: Alphanumeric value set.

   Range for cross-connections fulfilling the add role:
   - AFFBR, affected and bridged
   - AFFNOBR, affected but not bridged
   - NOTAFF, not affected OR bridging not allowed in general
   - UNKNOWN, unknown, ring communication in progress

   Range for cross-connections fulfilling the drop role:
   - AFFSW, affected and switched
   - AFFNOSW, affected but not switched
   - NOTAFF, not affected OR switching not allowed in general
   - UNKNOWN, unknown, ring communication in progress.

   Range for extra traffic cross-connections (ingressing and egressing):
   - AFFRSTBL, affected and reestablished
   - AFFPREMT, affected and preempted
   - AFFNORST, affected, but not reestablished
   - NOTAFF, not affected.

Detailed behavior description

Source and presentation of rate

The source of the parameter *rate* is the cross-connection rate, i.e. that value which had been provisioned before by means of the ENT-CRS-*modifier* command. The presentation of the parameter rate is always the SDH nomenclature. For the case that the cross-connection had been entered in the SONET nomenclature a conversion to SDH nomenclature is performed. Keep in mind that only service traffic cross-connections are presented.

Example input/output

The following example shows a RTRV-SPANSWS report:

```
   LT-UNITE 99-01-10 08:12:00
M  123456 COMPLD
   "1-1-f001:\"ring01\":EAST,DROP"
   "1-1-#-#-1-1-6:VC3:AFFSW"
   "1-1-#-#-1-1-7:VC4:AFFSW"
   "1-1-#-#-1-1-10:VC44C:AFFSW"
   "1-1-#-#-1-1-22:VC416C:AFFNOSW"
   "1-1-#-#-1-1-103:VC464C:NOTAFF"
;
```

Error responses

Validation rule: RTRV-SPANSWS only for TOPEX

The system shall reject all RTRV-SPANSWS commands if the addressed protection group is not provisioned for MS-SPRing TOP+EX (*protnmode* /= TOPEX)

Error code:

`SNVS – Status, Not in Valid State, command supported for MS-SPRing TOPEX only`

Validation rule: RTRV-SPANSW needs functioning XC pack

The command is denied if the XC pack is not present or in failed state.

Error code: `SPFA – Status, Protection unit FAiled` The **`RTRV-SPANSW`** command uses the protection state machine running on the XC pack.

RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack)

The **RTRV-STATE-EQPT** command retrieves the state information for circuit packs in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STATE-EQPT***:tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   The AID of a circuit pack.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for circuit pack in any slot
   - LoxcAID ::= UnivSlotAID-loxc for LOXC pack in universal slots.

   The keyword **xcall** is allowed for Simple_XCSlotAID
   The keyword **ctlall** is allowed for Simple_CTLSlotAID
   The keyword **all** is allowed for Simple_SlotAID
   Refer to the AID syntax description.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the **RTRV-STATE-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
       ...
       ...
```

```
   "aid:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command Parameter

1. **aid** – Access Identifier
   The AID of a circuit pack.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for circuit pack in any slot
   - LoxcAID ::= UnivSlotAID-loxc for LOXC pack in universal slots.

   The keyword **usall** is allowed for Simple_UnivSlotAID
   The keyword **xcall** is allowed for Simple_XCSlotAID
   The keyword **ctlall** is allowed for Simple_CTLSlotAID
   The keyword **all** is allowed for Simple_SlotAID
   Refer to the AID syntax description.

Spec block parameters

1. **opstate** – Operational State
   Each circuit pack has a retrievable attribute indicating whether circuit pack is operational for the system internal communication.
   Type: Alphanumeric value set.
   Range:
   - OS_ENABLED
   - OS_DISABLED (default).

Detailed behavior description

The **RTRV-STATE-EQPT** command on system level (AID = system) retrieves the current mode of the system.

Besides the normal operation mode, the system provides the maintenance to:

- handle error conditions the system cannot manage autonomously
- apply privileged commands

In the maintenance mode acceptance of commands is restricted in the following way:

- commands allowed in maintenance and in normal mode:
  - get any provisionable parameter: any RTRV command
  - get any non-provisionable parameter: any RTRV command

  - set interface standard default mode: **ED-EQPT (system)**
  - set tributary default mode: **ED-EQPT (system)**
  - set maximum switch capacity: **ED-EQPT (system)**
  - set port auto-to-mon delay: **ED-EQPT (system)**
  - set cross connect setup: **ED-EQPT (system)**
  - set port class default: **ED-EQPT (system)**
  - database download, SW download: **CPY-MEM**, **COPY-RFILE**
  - activate downloaded database: **APPLY** (database)
  - set time: **ED-DAT**
  - set date: **ED-DAT**
  - set LAN parameter: **ENT-FECOM-LAN** (note: restrictions depend on parameter base, details see command description)
  - set IP parameter: **ENT-ULS** (note: restrictions depend on parameter base, details see command description)
- commands allowed in maintenance mode only
  - set TID: **SET-SID**
  - set SONET/SDH synchronization default mode: **ED-EQPT (system)**
  - set UPSR port alarming mode: **ED-EQPT (system)**
  - database restoration (download + installation): **CPY-MEM**, **COPY-RFILE**
  - leave maintenance mode (accept data base): **ED-STATE-EQPT (system)**
  - set IP addresses and subnet mask: **ENT-FECOM-LAN**, **ENT-ULS** (note: restrictions depend on parameter base, details see command description)

Accepting the database will be a direct result of leaving the maintenance mode. The system shall autonomously leave maintenance mode without accepting the database after a database download from the management interface. The **RTRV-STATE-EQPT** command does not generate a **REPT DBCHG** message.

Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:1-1-#-#-2-cp:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ”1-1-#-#-2-cp:opstate=OS_ENABLE”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-STATE-EQPT** command.

Related TL1 messages

RTRV-STATE-EQPT (slot): Retrieve equipment state (slot)

The **RTRV-STATE-EQPT** command retrieves the state information for slots in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-STATE-EQPT***:tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a slot.
   Type: AID
   Range:
   - SlotAID
   - UnivSlotAID
   - XCSlotAID
   - CTLSlotAID.

   The keyword **usall** is allowed for Simple_UnivSlotAID.
   The keyword **xcall** is allowed for Simple_XCSlotAID.
   The keyword **ctlall** is allowed for Simple_CTLSlotAID.
   The keyword **all** is allowed for Simple_SlotAID.
   The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the **RTRV-STATE-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
```

```
       ...
       ...
   ″aid:spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

aid – Access Identifier

See definition of output parameter *aid* in “RTRV-EQPT (slot): Retrieve equipment (slot)” (p. 3-2386).

Spec block parameters

1. **`holdst`** – Holder Status
   Each provisionable slot has an attribute indicating its equipage state.
   Type: Alphanumeric value set.
   Range:
   - EMPTY. The system uses the value ″EMPTY″ if no circuit pack is equipped in that slot.
   - VALID. The system shall use the value ″Valid″ if a circuit pack is equipped in that slot as provisioned.
   - UNEXPECTED. The system shall use the value ″Unexpected″ if a different circuit pack is equipped in that slot as provisioned or if the circuit pack is not acceptable for this slot.
   - UNKNOWN. The system shall use the value ″Unknown″ if a circuit pack is equipped in that slot with non-readable functional type or illegal values for the functional type.

   Default: EMPTY.

Detailed behavior description

The system retrieves the output parameters as described above.

Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:1-1-#-#-2:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ″1-1-#-#-2:holdst=VALID″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ED-STATE-EQPT** command.

Related TL1 messages

RTRV-STATE-EQPT (socket): Retrieve equipment state

The **RTRV-STATE-EQPT** command shall retrieve the state information for sockets in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STATE-EQPT***:tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keyword *usall* or *all* is allowed for Simple_UnivSlotAID. The keyword *scall* is allowed for Simple_SocketAID. The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the **RTRV-STATE-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″aid[:spec_ block]″
   ... ...
   ″aid[:spec_ block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command Parameter

1. **`aid`** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keywords *all* / *usall* / *scall* shall are not allowed on any level.

Spec block parameters

1. **`holdst`** – Holder Status
   Each provisionable socket shall have an attribute indicating its equipage state.
   Type: Alphanumeric value set.
   Range:
   - EMPTY, the system shall use the value ″EMPTY″ if no module is equipped in that socket.
   - VALID, the system shall use the value ″Valid″ if a module is equipped in that socket as provisioned.
   - UNEXPECTED, the system shall use the value ″Unexpected″ if a different module is equipped in that socket as provisioned or if the module is not acceptable for this socket.
   - UNKNOWN, the system shall use the value ″Unknown″ if a module is equipped in that socket with non-readable functional type or illegal values for the functional type.

   For further details w.r.t. state transitions for holder status – see SRD_Configuration-Management.
   Default: EMPTY.

Detailed behavior description

The system shall retrieve the output parameters as described above.

Example input/output

This example shows a RTRV-STATE-EQPT command for a socket:

```
RTRV-STATE-EQPT:UNITE- NE:1-1-#-#-5-sc2:123456;

   UNITE- NE 00-11-03 08:00:00
M  123456 COMPLD
   ″1- 1-#-#-5-sc2:holdst=VALID″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ED-STATE-EQPT`** command.

Related TL1 messages

- “ED-EQPT (CP): Edit equipment (circuit pack)” (p. 3-349)
- “ENT-EQPT (slot): Enter equipment (slot)” (p. 3-1547)

RTRV-STATE-EQPT (system): Retrieve equipment state (system)

The **RTRV-STATE-EQPT** command retrieves the state information on system (NE) level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STATE-EQPT***:tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system; the usage of the keyword **all** on system level is not allowed.
   Default: system
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the **RTRV-STATE-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "system:spec_block"
       ...
       ...
   "system:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

1. **`aid`** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system; the usage of the keyword **`all`** on system level is not allowed.
   Default: system

Spec block parameters

1. **`commitstate`** – SW Commitment Status
   The system provides an indication of the SW generic commitment status.
   Type: Alphanumeric value set.

   Range:

   - PENDING = the SW generic is in trial phase, switch back to previous generic possible
   - COMMITTED = the SW generic is comitted, no switch back possible.

2. **`dbstate`** – Data Base Change State
   The system provides an indication of the validity of the active data base.
   Type: Alphanumeric value set.

   Range:

   - EMPTY = data base state empty.
   - NEW = data base state new
   - VALID = database state valid
   - UNKNOWN = database state is not known.

   Default: UNKNOWN.

3. **`mcond`** – Maintenance Condition
   This parameter denotes whether the system condition is in maintenance condition or not.
   Type: Alphanumeric value set.

   Range:

   - Y = maintenance mode
   - N = normal mode.

Detailed behavior description

The **`RTRV-STATE-EQPT`** command on system level (AID = system) retrieves the current mode of the system.

The system provides the maintenance mode besides the normal operation mode in order to – handle error conditions the system can not autonomously manage – apply privileged commands.

In this maintenance mode acceptance of commands is restricted in the following way:

- commands allowed in maintenance AND normal mode:
  - get any provisionable parameter: any RTRV command
  - get any non-provisionable parameter: any RTRV command
  - set interface standard default mode: ED-EQPT (system)
  - set tributary default mode: ED-EQPT (system)
  - set maximum switch capacity: ED-EQPT (system)
  - ED-EQPT (system)
  - database download to restore empty/corrupt DBCPY-MEM
  - set time: ED-DAT
  - set date: ED-DAT
  - set IP parameter: ENT-ULS
    (note: restrictions depend on parameter base, details see command)
  - set LAN parameter: ENT-FECOM-LAN
    (note: restrictions depend on parameter base, details see command).
- commands ONLY allowed in maintenance mode:
  - set TID SET-SID
  - set SONET/SDH synchronisation default
  - leave maintenance mode (accept data base): ED-STATE-EQPT (system)

  Accepting the database will be a direct result of leaving the maintenance mode.

The system autonomously leaves maintenance mode without accepting the data base after a data base download from the management interface.

The **RTRV-STATE-EQPT** command does not generate a **REPT DBCHG** message.

Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:system:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ″system:dbstate=EMPTY″
   ″system:mcond=Y″
;
```

Error responses

Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command Error responses section.

Related TL1 messages

- "ED-STATE-EQPT (system): Edit equipment state" (p. 3-866)

RTRV-STM1E: Retrieve STM1E port

The command **RTRV-STM1E** is used to retrieve all parameters related to the electrical STM1E port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STM1E**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM1E port.
   Type: AID.
   Range: SPortAID of STM1E port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-STM1E command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   ″aid[:spec_block]″
       ...
       ...
   ″aid[:spec_block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command Parameter

1. **`aid`** – Access Identifier
   Access Identifier of STM1 port.
   Type: AID.
   Range: SPortAID of STM1E port.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.
6. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
8. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
9. **`femspm`** – Far-end Multiplex Section PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
10. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
    Default: 14.

13. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.

Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
This identifies the maximum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
maxNNXCRate is introduced specifically for use by ONNS application.
Type: Alphanumeric value set.
Range: VC4 (default), VC3.
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
This identifies the minimum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
minNNXCRate is introduced specifically for use by ONNS application.
Type: Alphanumeric value set.
Range: VC3 (default), VC4.
18. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.

Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of portClass = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN.
If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used s by the ONNS application.

Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **nemspm** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
23. **networkTNAType** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP
24. **networkTNAAddress** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter in case explicit setting of the default value is allowed.

25. **`outql`** – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

Type: Alphanumeric value set.

Range:

- PRC
- SSUL
- SSUT
- SEC
- DNU (default).

26. **`pmmsfeses`** – Performance Monitoring MS Far-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default: for STM1: 28800.
27. **`pmmsneses`** – Performance Monitoring MS Near-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default: for STM1: 28800.
28. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.
29. **`pmrsneses`** – Performance Monitoring RS Near-End SES Threshold
This parameter describes the RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: 1 – 64000.
Default: for STM1: 2400.
30. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

31. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

32. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …25. The unit of this value is ″milliseconds″.

33. **`ptype`** – Port Type
This identifies the port type of the AID.
Type: Alphanumeric value set.
Range: STM1E.

34. **`rsmstca`** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

35. **`rspm`** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

36. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

37. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
38. **`sdhpn`** – SDH ASAP
    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
39. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON.
40. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
41. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

42. **`strc`** – Value of incoming J0
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

43. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc).
Type: Numeric string.
Default: 2

44. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

45. **`strcst`** – Status of incoming J0
This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
Type: Alphanumeric value set.
Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

46. **strcwfmt** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout).
Type: Numeric string.
Default: 2
47. **tcamd** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
Range: TR or TRRTR (default).
48. **trbmd** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
Type: Alphanumeric value set.
Range: ADAPTIVE, FIXED.
Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
49. **unequiposig** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.

Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM1E** does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a **RTRV-STM1E** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-STM1E:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=STM1E,frcdus=DISABLE,dexcthr=-3,degthr=-6,
      pmode=MON,...,pmmsneses=15,pmrsneses=30"
```

;

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the RTRV-STM1E command.

Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2899).

RTRV-STM1: Retrieve STM1 port

The command **RTRV-STM1** is used to retrieve all parameters related to the optical STM1 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STM1**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM1 port.
   Type: AID.
   Range: SPortAID of STM1 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid **RTRV-STM1** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command Parameter

1. **`aid`** – Access Identifier
   Access Identifier of STM1 port.
   Type: AID.
   Range: SPortAID of STM1 port.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter inputsig showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-… N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
6. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
8. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
9. **`femspm`** – Far-end Multiplex Section PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
10. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
12. **`inputsig`** – Tributary Input Signal Rate List
This parameter is a list of VCn rates across the port's bandwidth.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.
13. **`istd`** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
Type: Alphanumeric value set.
Range: SDH.
Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
14. **`linkResCls`** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
16. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
17. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 or VC4 (default)

19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default) or VC4.

20. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of portClass = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN.
If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of portClass = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string
Range: Each numeric string: 0…255
Default: 0-0-0-0

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: IPv4 format: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
26. **`nemspm`** – MS Near-End PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
27. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: Alphanumeric value set.
    Range:
    - IPV4 (default)
    - IPV6
    - NSAP
28. **`networkTNAAddress`** – Network TNA Address
    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`opdis`** – Optical Distance
It shows the type of application for which the optical transmitter on this port is suited.
Type: Alphanumeric value set.
Range:

- INTRA-OFFICE
- SHORT-HAUL
- LONG-HAUL
- VERY-LONG-HAUL
- OLS_PASSIVE
- OLS_400G

- OLS_800G
- XTREME
- NA

30. **`opwl`** – Optical Wavelength
 Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
 Type: Alphanumeric value set.
 Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM), NA (for client ports). T
 he value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.
31. **`outql`** – Outgoing timing quality
 This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.
 Type: Alphanumeric value set.
 Range:
 - PRC
 - SSUL
 - SSUT
 - SEC
 - DNU (default).
32. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
 This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
 Type: numeric value set.
 Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
 - STM-1/OC-3: 1 – 192000.

 Default: The default values differ for SDH and SONET:
 - STM1: 28800
 - OC3: 154.

33. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 28800
    - OC3: 154.

34. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

35. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of allowed ranges for SDH and SONET):1 – 64000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 2400
    - OC3: 155.

36. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

37. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT

38. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …25. The unit of this value is ″milliseconds″.

39. **`ptype`** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: STM1.

40. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

41. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295

42. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
43. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: ""
44. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
45. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
46. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

47. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
48. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
49. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.
50. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
51. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

52. **`strc`** – Value of incoming J0
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
   - 1: for specific repeating byte (SONET)
   - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
   - 16: for 16 byte specific string (ITU/ETSI mode 1).
   - 64: for 64 byte string (SONET).

54. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

55. **`strcst`** – Status of incoming J0
This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
Type: Alphanumeric value set.
Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.
56. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
57. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
Range: TR or TRRTR (default).

58. **trbmd** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
Type: Alphanumeric value set.
Range: ADAPTIVE, FIXED.
Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.

59. **unequiposig** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.

Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM1** does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a **RTRV-STM1** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-STM1:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1:ptype=STM1,frcdus=DISABLE,dexcthr=-3,degthr=-6,
      pmode=MON,...,pmmsneses=15,pmrsneses=30″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the RTRV-STM1 command.

Check CCB against ptype and istd

See definition of error response in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899).

RTRV-STM4: Retrieve STM4 port

The command **RTRV-STM4** is used to retrieve all parameters related to the optical STM4 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STM4**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM4 port.
   Type: AID.
   Range: SPortAID of STM4 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid **RTRV-STM4** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
      ...
      ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command Parameter

1. **`aid`** – Access Identifier
   Access Identifier of STM-4 port.
   Type: AID.
   Range: SPortAID of STM-4 port.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.
6. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
8. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
9. **`femspm`** – Far-end Multiplex Section PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
10. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4 or 4C representing VC3, VC4 or VC4-4C.
    Default: 44.

13. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

14. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
16. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
17. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: VC3, VC4 or VC44C (default)
19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: VC3 (default), VC4 or VC44C
20. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
21. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This Parameter identifies the unique node identifier of the neighbor node of ports of portClass = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN.
    If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **nemspm** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

27. **networkTNAType** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

28. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type:
   - networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
   - networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
   - networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

   Range:
   - IPV4: Each numeric string: 0…255
   - IPV6: Each hexadecimal number: 0000…FFFF
   - NSAP: Hexadecimal number:
     0000000000000000000000000000000000000000…
     FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

   Examples:
   - IPV4: 129.12.3.178
   - IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
   - NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

   Default:
   - IPV4: 0.0.0.0
   - IPV6: 0-0-0-0-0-0-0-0
   - NSAP: 0000000000000000000000000000000000000000

   The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
29. **`opdis`** – Optical Distance
It shows the type of application for which the optical transmitter on this port is suited.
Type: Alphanumeric value set.

Range:

- INTRA-OFFICE
- SHORT-HAUL
- LONG-HAUL
- VERY-LONG-HAUL
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

30. **`opwl`** – Optical Wavelength
Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
Type: Alphanumeric value set.
Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 471 … 1611 (for CWDM), NA (for client ports).
The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

31. **`outql`** – Outgoing timing quality
This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.
Type: Alphanumeric value set.
Range:
    - PRC
    - SSUL
    - SSUT
    - SEC
    - DNU (default).

32. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET:

- STM4: 115200
- OC12: 615.

33. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
   - STM-4/OC-12: 1 – 768000.

   Default: The default values differ for SDH and SONET and the different rates:
   - STM4: 115200
   - OC3: 615.
34. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.
35. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000.
Default: The default values differ for SDH and SONET and the different rates:
   - STM4: 2400
   - OC12: 616.

36. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
37. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
38. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …25. The unit of this value is ″milliseconds″.
39. **`ptype`** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: STM4.
40. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

41. **remLinkID** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295
42. **remRAID** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0
43. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: ″″
44. **rsmstca** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
45. **rspm** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

46. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

47. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

48. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

49. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.

50. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

51. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

52. **strc** – Value of incoming J0
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **strcfmt** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
   - 1: for specific repeating byte (SONET)
   - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)

- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
55. **`strcst`** – Status of incoming J0
This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
Type: Alphanumeric value set.
Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.
56. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
57. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (lso known as the implicit reset method)
- TR-RTR (lso known as the explicit reset method).

Type: Alphanumeric value set.
Range: TR or TRRTR (default).

58. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
Type: Alphanumeric value set.
Range: ADAPTIVE, FIXED.
Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
59. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.

Detailed behavior description

The command retrieves the parameters as described above.

The command **`RTRV-STM4`** does not generate a **`REPT DBCHG`** message.

Example input/output

The following example shows the successful execution of a **`RTRV-STM4`** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-STM4:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1:ptype=STM4,frcdus=DISABLE,dexcthr=-3,degthr=-6,
      pmode=MON,...,pmmsneses=15,pmrsneses=30″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the RTRV-STM4 command.

Check CCB against ptype and istd

See definition of error response in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899).

RTRV-STM16: Retrieve STM16 port

The command **RTRV-STM16** is used to retrieve all parameters related to the optical STM16 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STM16**:*tid:aid:ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Description: Access Identifier of an STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid **RTRV-STM16** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command Parameter

1. **`aid`** – Access Identifier
   Access Identifier of STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **`all`** is not allowed.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future. This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.

6. **`degthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

7. **`dexcthr`** – Excessive Degrade Threshold
Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when *sdsfmode* = POISSON
Type: numeric value set.
Range (as exponent of 10): –3; –4; –5.
Default: –3.

8. **`exprstrc`** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

9. **`femspm`** – Far-end Multiplex Section PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).

10. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.
    Range:
    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU
11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).
12. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
    Default: The initial value of X is 4.
    Example:
    An STM-16 signal might be represented by 93-14-14C-243 which implies 9 VC3s, 1 VC4, 1 VC4-4C, 24 VC3s. The representation is not unique, for example it could also be 33-63-14-14C-243. Worst case of string length for STM16: 47 characters.
13. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
14. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity
The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

16. **`localLPID`** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.

Range:

- YES
- NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4, VC44C or VC416C (default)

19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4, VC44C or VC416C

20. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This

parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

27. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

28. **networkTNAAddress** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **opdis** – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: Alphanumeric value set.

Range:

- INTRA-OFFICE
- SHORT-HAUL
- LONG-HAUL
- VERY-LONG-HAUL
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

30. **`opwl`** – Optical Wavelength
Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
Type: Alphanumeric value set.
Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM), NA (for client ports).
The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.
31. **`outql`** – Outgoing timing quality
This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.
Type: Alphanumeric value set.
Range:
    - PRC
    - SSUL
    - SSUT
    - SEC
    - DNU (default).
32. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

33. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

34. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

35. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.
36. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
37. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
38. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …25. The unit of this value is ″milliseconds″.

39. **`ptype`** – Port Type
This identifies the port type of the AID.
Type: Alphanumeric value set.
Range: STM16.

40. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

41. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

42. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

43. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: ""
44. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
45. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
46. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
47. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

48. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC48: Retrieve OC48 port" (p. 3-2638)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

49. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.

50. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

51. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

52. **`strc`** – Value of incoming J0
    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).
53. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
54. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.
    Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex

55. **`strcst`** – Status of incoming J0
    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
    Type: Alphanumeric value set.
    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.
56. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
57. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).
58. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
    Type: Alphanumeric value set.
    Range: ADAPTIVE, FIXED.
    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
59. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
    Default: 164 = all VC4.

Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM16** does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a **RTRV-STM16** command. Not all output parameters are listed (missing ones indicated by …):

```
 RTRV-STM16:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1:ptype=STM16,frcdus=DISABLE,dexcthr=-3,degthr=-
      6,pmode=MON,...,pmmsneses=15,pmrsneses=30″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the RTRV-STM16 command.

Validation rule: Check CCB against *ptype* and *istd*

Check wether the CCB fits to *ptype* and *istd*.

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=STM16 is made on a OP2G5 port which is provisioned as *istd* = SONET and *ptype* = OC48.

RTRV-STM16T: Retrieve STM16T port

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **`RTRV-STM16T`**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **`aid`** – Access Identifier
   Description: Access Identifier of an STM16T port.
   Type: AID.
   Range: SPortAID of STM16T port.
   The keyword **`all`** is allowed up to shelf level.
3. **`ctag`** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-STM16 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command Parameter

1. **`aid`** – Access Identifier
   Access Identifier of STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **`all`** is not allowed.

Spec block parameters

1. **`exprstrc`** – Value of Expected J0
   For RTRV-STM16T this parametr refers to the incoming (inress) direction
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
2. **`exprstrcout`** – Value of Expected J0 in outgoing direction
   Expected regenerator section trace identifier in outgoing (egress) direction.
   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
3. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

4. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
   Type: Alphanumeric value set.
   Range: SDH.
   Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
5. **`lpbk`** – Loopback
   This parameter specifies the current near-side loopback status of the considered output *aid*.
   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).
6. **`opdis`** – Optical Distance
   It shows the type of application for which the optical transmitter on this port is suited.
   Type: Alphanumeric value set.
   Range:
   - INTRA-OFFICE
   - SHORT-HAUL
   - LONG-HAUL
   - VERY-LONG-HAUL
   - OLS_PASSIVE
   - OLS_400G
   - OLS_800G
   - XTREME.
7. **`opwl`** – Optical Wavelength
   Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
   Type: Alphanumeric value set.
   Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM), NA (for client ports).
   The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

8. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.
9. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set.
   Range (superset of allowed ranges for SDH and SONET):1 – 64000
   Default: The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.
10. **`pmrsnesesout`** – Performance Monitoring Section/RS Near-End SES Threshold in outgoing direction
    This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
    Type: numeric value set
    Range (superset of allowed ranges for SDH and SONET): 1 – 64000
    Default:
    The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
11. **`ptype`** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: STM16T.

12. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
13. **`rspm`** – RS PM Enable
    For RTRV-STM16T this parameter refers to the incoming (ingress) direction.
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).
14. **`rspmout`** – RS PM Enable in Outgoing Direction
    Enable or disable regenerator section (section) performance monitoring for the outgoing (egress) direction.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
15. **`rstimmon`** – RS TIM Monitor Enable
    For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
16. **`rstimmonout`** – RS TIM Monitor Enable in Outgoing direction
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor

17. **sdhpn** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in “RTRV-OC48: Retrieve OC48 port” (p. 3-2638)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

18. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

19. **strc** – Value of incoming J0
For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port.
The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

20. **strcfmt** – Format of incoming J0
For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

21. **`strcfmtout`** – Format of outgoing J0
    The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).
    Type: Numeric string.
    Range:
    - 1, for specific repeating byte (SONET)
    - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
    - 16, for 16 byte specific string (ITU/ETSI mode 1)
    - 64, for 64 byte string (SONET).
22. **`strcout`** – Value of outgoing J0
    For RTRV-STM16T this parameter refers to the outgoing (egress) direction.
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.
    Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.
    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
23. **`strcst`** – Status of incoming J0
    For RTRV-STM16T this parameter refers to the incoming (ingress) direction.
    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
    Type: Alphanumeric value set.
    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.
24. **`strcstout`** – Status of outgoing J0
    This parameter shows the status of the value of the RS/Section Trace Identifier in outgoing (egress) direction which is available with parameter *strcout*.
    alphanumeric value set

Range:

- NORMAL, *strcout* contains a valid value
- UNAVAILABLE, no value for *strcout* could be obtained by the system
- AIS, no value for *strcout* due to an SF condition

25. **`tcamd`** – TCA mode

This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (lso known as the implicit reset method)
- TR-RTR (lso known as the explicit reset method).

Type: Alphanumeric value set.
Range: TR or TRRTR (default).

Detailed behavior description

The command retrieves the parameters as described above.

The **`RTRV-STM16T`** command does not generate a **`REPT DBCHG`** message.

Example input/output

The following example shows the successful execution of a **`RTRV-STM16T`** command. Not all output parameters are listed (missing ones indicated by …):

```
 RTRV-STM16T:LT-UNITE:1-1-#-#-1-1:123456;

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`RTRV-STM16T`** command.

Validation rule: Check CCB against *ptype* and *istd*

Check wether the CCB fits to *ptype* and *istd*.

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=STM16T is made on a OPT2G5 port which is provisioned as *istd* = SONET and *ptype* = OC48T.

RTRV-STM64: Retrieve STM64 port

The command **RTRV-STM64** is used to retrieve all parameters related to the optical STM64 port or the STM64 client .

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STM64**:*tid:aid:ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM64 port.
   Type: AID.
   Range: SPortAID of ST-64 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid **RTRV-STM64** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command Parameter

1. **`aid`** – Access Identifier
   Type: AID
   Range: STM-64 port AID

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC-64C.
6. **degthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
7. **dexcthr** – Excessive Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
8. **exprstrc** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex
9. **fec** – FEC Enable
Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
Type: Alphanumeric value set.
Range:
DISABLE (only) for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics

- OC192 / STM64 client ports (related to OTN ports)
- OC768 / STM256 basis low cost intra office 1310 nm optics.

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

ENABLE (only) for:

- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G.

Default:

DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768 / STM256 basis low cost intra office 1310 nm optics.

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

10. **`femspm`** – Far-end Multiplex Section PM Enable
    Enable or disable of the performance monitoring of the multiplex section.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
11. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: (set a forced DUS/DNU)
    - DISABLE (default): (clear a forced DUS/DNU).

12. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).
13. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.
    Default: 644.
14. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
15. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character
16. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be

retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

17. **`localLPID`** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of "no localLPID provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

18. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).

19. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4, VC44C, VC416C or VC464C (default)

20. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4, VC44C, VC416C or VC464C

21. **`msrei`** – MS-REI mode
An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.
Type: Alphanumeric value set.
Range: SINGLE or EXTENDED (default)

22. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

23. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic

neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

24. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

25. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

26. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

27. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

28. **nemspm** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

29. **networkTNAType** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

30. **`networkTNAAddress`** – Network TNA Address
    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type:
    - networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
    - networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
    - networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

    Range:
    - IPV4: Each numeric string: 0…255
    - IPV6: Each hexadecimal number: 0000…FFFF
    - NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

    Examples:
    - IPV4: 129.12.3.178
    - IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
    - NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

    Default:
    - IPV4: 0.0.0.0
    - IPV6: 0-0-0-0-0-0-0-0
    - NSAP: 0000000000000000000000000000000000000000

    The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
31. **`och`** – optical channel enable
    Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don’t have any impact on transmission.
    Type: Alphanumeric value set.

Range:

- for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
- for client ports on packs which support OTN: DISABLE disable, optical channel not applicable.

Default:

- for OP10 and OP40 packs, which cannot support OCH: DISABLE
- for OP10 packs, which cannot support OCH: ENABLE
- for OP10 and OP40 packs, which only support OCH: ENABLE
- for client ports on packs which support OTN: DISABLE.

32. **`opdis`** – Optical Distance
    It shows the type of application for which the optical transmitter on this port is suited.
    Type: Alphanumeric value set.
    Range:
    - INTRA-OFFICE
    - SHORT-HAUL
    - LONG-HAUL
    - VERY-LONG-HAUL
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G
    - XTREME.
33. **`opwl`** – Optical Wavelength
    Optical Wavelength in nanometers. It shows the type of optics that is used on this port.
    Type: Alphanumeric value set.
    Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM), NA (for client ports).
    The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

34. **`otnclient`** – OTN Client Port
    This parameter indicates whether the port is an OTN Client Port or an optical SDH/SONET port..
    Type: Alphanumeric value set.
    Range: YES for OTN client port; NO for optical SDH/SONET port.
35. **`outql`** – Outgoing timing quality
    This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.
    Type: Alphanumeric value set.

    Range:
    - PRC
    - SSUL
    - SSUT
    - SEC
    - DNU (default).
36. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

37. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

38. **pmode** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.

  The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

Default: AUTO for optical SDH/SONET ports; NMON for client ports.

39. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

40. **`polynomial`** – Optical Channel Scrambling Polynomial
This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (*och* = ENABLE).
Type: numeric value set.
Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.
Default: 2.

41. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

42. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

43. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …25. The unit of this value is ″milliseconds″.

44. **`ptype`** – Port Type
Definition: This identifies the port type of the AID.
It is derived from the functional name and functional qualifier of a circuit pack. If the functional qualifier indicates a pack with 10GE_WANPHY interfaces the port type has the value 10GE_WANPHY, else STM64.
Type: Alphanumeric value set.
Range: STM64.

45. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
46. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
47. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
48. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

49. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
50. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
51. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
52. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

53. **`sdhpn`** – SDH ASAP
    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC192: Retrieve OC192 port" (p. 3-2664)) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
54. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON.
55. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
56. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.

57. **`strc`** – Value of incoming J0
This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

58. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

59. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

60. **`strcst`** – Status of incoming J0
    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.
    Type: Alphanumeric value set.
    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.
61. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
62. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.
    Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).
63. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
    Type: Alphanumeric value set.
    Range: ADAPTIVE, FIXED.
    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
64. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.
    Default: 644 = all VC4.

Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM64** does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a **RTRV-STM64** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-STM64:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1:ptype=STM64,frcdus=DISABLE,dexcthr=-3,degthr=-6,
      pmode=MON,...,pmmsneses=15,pmrsneses=30″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the RTRV-STM64 command.

Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2899).

RTRV-STS1: Retrieve STS1 tributary

General

The command **RTRV-STS1** is used to retrieve all parameters related to the STS1 tributary.

Note: If a tributary AID (Access IDentifier) is specifed in the RTRV-STS1 request for a slot provisioned with a GE1 pack (e.g. 1-1-#-#-1-1-1 is used), then an empty reply is returned instead of: `IENE – Input, Entity Not Exists`.

For GE1 the “RTRV-VCGTRIB: Retrieve virtual concatenation group tributary ” (p. 3-3109) command must be used.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-STS1**:*tid*:*aid*:*ctag*;

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   AID of an SDH tributary. The keyword **all** is allowed on slot, port and tributary level. The so called ″dynamic parameters″ is reported, if a **all** is used at the tributary level.
   The ″dynamic parameters″ are:
   - *ptrc*, *ptrcst*, *siglb*, *trailstate*.

   Type: AID
   Range: STS1NumAID.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

   Important! To retrieve the dynamic parameters (*ptrc*, *ptrcst*, *siglb*, *trailstate*) of all tributaries use the “RTRV-ALL: Retrieve all (tributary)” (p. 3-2228) command and set the parameter *dyn* to YES.

Output format

In response to a valid RTRV-STS1 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   AID of the SONET tributary. The keyword **`all`** is not allowed on any level.
   Type: AID
   Range: STS1NumAID

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   If the STS-1 tributary is related to a EC1 port, then the parameter *sdsfmode* is fixed to POISSON. As a consequence, the parameter *brstintvl* will never be used by the system in this case.
   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
2. **`brstthr`** – Bursty Error Threshold
   If the STS-1 tributary is related to a EC1 port, then the parameter *sdsfmode* is fixed to POISSON. As a consequence, the parameter *brstthr* will never be used by the system in this case.
   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, 15, 20, 25, 30, … 50.
   Default: 30.

3. **`crslpbkrate`** – Cross-connect loopback Rate
   It is independent from the current interface standard and therefore both SDH and SONET values are allowed.
   The parameter *crslpbkrate* is not reported if the parameter *crlspbkstat* indicates that no loopback is set.
   Type: Alphanumeric value set.
   Range:
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
4. **`crslpbkstat`** – Cross-connect loopback status
   State of cross- connect loopback.
   Type: Alphanumeric value set.
   Range:
   - YES = Cross-connect loopback is provisioned
   - NO (default) = No cross-connect loopback is provisioned.
5. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON
   Type: numeric value set.
   Range (as exponents of 10): –5; –6 (default); –7; –8; –9
6. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.
   Type: numeric value set.
   Range (as exponent of 10) –3 (default); –4; –5.
7. **`exphptrc`** – Expected Path Trace (J1)
   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.

8. **feppm** – Far-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **loca** – Ring A-node TID
   This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
   loca is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in "RTRV-HDR: Retrieve header" (p. 3-2417) description.
   Default: empty string: "". This is displayed as \"\" in output direction.
10. **locz** – Ring Z-node TID
   This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.
   locz is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
   Default: empty string: "". This is displayed as \"\" in output direction.
11. **hptimmon** – Path Trace Monitoring Enable (J1)
   Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
12. **neppm** – Near-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).

13. **`pjepm`** – Pointer Justification Event PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

14. **`pmhpfeses`** – Performance Monitoring Path Far-End SES Threshold
    This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of ranges for SDH and SONET): 1-64000.
    Default: 2400.

15. **`pmhpneses`** – Performance Monitoring Path Near-End SES Threshold
    This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of ranges for SDH and SONET): 1-64000.
    Default: 2400.

16. **`pse`** – PDI-P Switching Enable
    The PDI-P Switching Enable parameter indicates if the PDI-P contributes to the automatic path protection switch criteria.
    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

17. **`ptca`** – Path TCA Profile Pointer
    Type: Alphanumeric string.
    Range: string with up to 24 characters.
    Default: DEFAULT0.

18. **`ptrc`** – Path Trace (J1)
    This parameter shows the value of the path trace identifier on the incoming path overhead J1 byte of a non-terminated tributary. The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then ptrc contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to a signal-fail condition or intra-NE

communication problems, and the output parameter ptrc is omitted from the response. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range:

- 1 byte for non-specific repeating byte
- 16 byte: These 16 byte shall consist of 15 byte information and the CRC7 byte
- 64 bytes: This is a pure byte stream without any restrictions.

19. **`ptrcrfmt`** – Path Trace Read Format (J1)
The read format of J1, the incoming path trace (ptrc).
Type: numeric string.

Range:

- 2: for non-specific repeating byte
- 16: for 16 byte specific string.
- 64: for 64 byte string.
Default: 2.

20. **`ptrcst`** – Status of Incoming Path Trace (J1)
This parameter shows the status of the value of the incoming path trace identifier which is available with parameter ptrc. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).
Type: Alphanumeric value set.

Range:

- NORMAL: ptrc contains a valid value
- UNAVAILABLE: no valid value for ptrc could be obtained by the system
- AIS: no valid value for ptrc due to an SF condition.

21. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in BURST or POISSON mode.
Type: Alphanumeric value set.

Range:

- BURST
- POISSON (default).

If the tributary is related to a EC1 port, then the range is limited to: POISSON

22. **`siglb`** – Signal Label
This parameter shows the value of the signal label on the incoming path overhead C2 byte of a non-terminated VC tributary.
The parameter is not reported if the *trailstate* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).
Type: Alphanumeric value set.
Range: 00, 01, …, FE, FF; i.e. two hexadecimal digits.

23. **`substr`** – Substructured

    This parameter indicates if the tributary is substructured.

    Substructure for LO cross-connections:

    A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross-connections.

    The parameter *substr* is set autonomously when LO cross-connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower order cross-connection creation/deletion behavior description for the commands ENT-CRS and DLT-CRS).

    A sub structured HO tributary cannot be used to set up HO cross-connections. The parameter *substr* is set autonomously when the LO substructure is created or deleted using the **`ED-SUBS`** command.

    Substructure for conversion cross-connections:

    A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross-connections.

    The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created.

    A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross-connections.

    Type: Alphanumeric value set.

    Range:

    - YES: Automatically sub structured for LO cross-connections
    - MANSUB: Manually sub structured for LO cross-connections
    - CNVSUB: Automatically sub structured for the LO side of conversion cross-connections
    - NO (default): Not sub structured, not used for conversion cross-connections

    If the STS-1 tributary is related to a EC1 port, then no LO cross-connections are allowed. As a consequence, the parameter *substr* can only have the values CNV and NO in this case.

24. **`tmonmd`** – Tributary Monitoring Mode

    This parameter indicates the mode of the tributary.

    Type: Alphanumeric value set.

    Range:

    - MON = alarm monitoring is taking place on the port.
    - NMON (default) = alarm monitoring is not occurring on the port.

25. **`trailstate`** – Trail State (C2)

    It is possible to read the accepted trail value status (C2) of every VC which is terminated/monitored in the system. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

    Type: Alphanumeric value set.

Range:

- NORMAL: for accepted TSL which has valid payload type
- AIS: for SSF, VC-AIS, dTIM or dUNEQ
- UNAVAILABLE: for TSL which does not meet the acceptance criteria or no reporting is possible.

Default: UNAVAILABLE.

26. **`tribsonetpn`** – Tributary Alarm Severity Assignment Profile
    This parameter points to a tributary ASAP profile name of type PATH for the designated AID.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.

Detailed behavior description

Applicability for STS3c and concatenated signals

The command **`RTRV-STS1`** is also applicable to STS3c tributaries. Even though an STS3c signal is not a concatenated STS1 signal in a strict sense, from a pointer processor viewpoint it can be considered to be comprised of three STS1 signals which have the properties of a concatenated signal. Thus it is not necessary to have a separate RTRV command for STS3c. Similarly, RTRV-STS1 is also applicable to other ″concatenated″ signals.

Retrieval of concatenated tributaries

The rules as defined for RTRV-VC3 apply as well.

Behavior for non-existing entities

If the specified VC3/VC4 tributaries do not exist, the command shall return an empty response. E.g. if an attempt is made, to retrieve VC3/VC4 tributaries on a GbE circuit pack.

Example input/output

```
RTRV-STS1:LT-UNITE:1-1-#-#-3-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ″1-1-#-#-3-1-1:crslpbkstat=NO,tmonmd=NMON,tribsonetpn=Default,
ptca=Default0,feppm=DISABLE,pmhpneses=30,pmhpfeses=30,degthr=-
      6,...,ptrcrfmt=1,dexcthr=-3,ptrc=00,ptrcst=NORMAL,sdsfmode=POISSON″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the RTRV-STS1 command.

Check CCB against *istd* of related port

See definition of error response in “RTRV-VC3: Retrieve VC3 tributary” (p. 3-3069).

RTRV-SYNCN: Retrieve synchronization

The command displays the provisioning and operational information of the synchronization attributes as set by the **SET-SYNCN** command and after initial system start-up. It also displays the status of the external timing reference input and output ports.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-SYNCN**:*tid*:*[aid]*:*ctag*;

Input parameters

Command parameters

1. **tid** – target identifier
   See definition of *tid – target identifier* in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – access identifier
   This parameter is used to identify the timing related settings. The AID separates the parameter in system timing related parameter, output timing related parameters, parameters related to assigned timing references and parameters for external timing input and external timing output. The *all* AID retrieves all retrievable parameters for synchronization. If the AID is omitted, the outputs for the whole synchronization area are given.
   Type: AID
   Range:
   - SystemAID
   - Timing_Output_AID
   - External_timing_ref_AID
   - Line_timing_ref_AID
   - External_Timing_input_port_AID
   - External_Timing_output_port_AID
   - **all**.

   Default: **all**.
3. **ctag** – correlation tag
   See definition of *ctag – correlation tag* in “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

After receiving the **RTRV-SYNCN** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
       ...
       ...
   "aid:spec_block"
;
```

Output parameters

Command parameters

1. **aid** – access identifier
   This parameter specifies the timing related settings.
   Type: AID
   Range:
   - SystemAID
   - Timing_Output_AID
   - External_timing_ref_AID
   - Line_timing_ref_AID
   - External_Timing_input_port_AID
   - External_Timing_output_port_AID

   Default: Not applicable.

Spec block parameters

1. System Timing
   a. **active_ref** – active timing reference status
      This parameter displays the active timing reference, which the system clock is currently using for locked mode of system timing.
      The value NONE is reported in the following cases:
      - no timing reference is assigned (or all references are failed or locked-out)
      - the system is in free-running mode
      Type: text string
      Range: External_timing_ref_AID, Line_timing_ref_AID; NONE
      Default: NONE.
   b. **clkmod** – clock mode
      This parameter specifies the provisioned operational mode of the system timing.
      In the clockmod = FREE-RUNNING mode the system clock process uses the internal oscillator as reference. In the clockmod = LOCKED mode the system clock process uses the input signal from the system.

Type: Alphanumeric value set.

Range: FREE-RUNNING, LOCKED.

Default: FREE-RUNNING.

c. **`clkmod_stat`** – system clock mode status

This parameter specifies the state of the system clock. The range is depending on the system synchronization characteristic.

NORMAL: This operational mode indicates either the NE derives timing from the internal oscillator when clockmod = FREE-RUNNING, or the system timing is locked to a timing reference signal when clockmod = LOCKED and the reference is derived from one of the timing input signals. Refer to *clkmod* parameter.

AUTONOMOUS-HOLDOVER: This state indicates that all references are failed and no higher priority request is present.

FORCED-HOLDOVER: This operational mode is caused by a Clock Backup Request.

FAST-START: This operational mode indicates for fast pull-in of the clock when recovering from holdover (for SONET only).

The values AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER and FAST-START are only possible when clockmod = LOCKED.

Type: Alphanumeric value set.

Range:

SONET: NORMAL, AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER, FAST-START.

SDH: NORMAL, AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER.

Default: NORMAL

d. **`refsw_stat`** – reference switch status

The System Timing Reference Switch Request State is a state of the system timing.

The value FORCED means, the system enters the Forced Switch state upon the initiation and successful completion of the Forced Switch command. While in the Forced Switch state the system may not switch the active timing reference, neither automatically nor by means of the Forced Switch or Manual Switch command.

The value MANUAL means, the system enters the Manual Switch state upon the initiation and successful completion of the Manual Switch command. While in the Manual Switch state the system may switch the active timing reference automatically if required for protection switching.

The parameter NO-REQUEST indicates, this is the routine-operation quiet state in which no external command activities are occurring. The system enters this state upon initial start-up, and following a clear command, or the clearing of an automatic switch.

Type: Alphanumeric value set.

Default: NO-REQUEST.

e. **`stratum_level`** – stratum level status

This parameter provides information about the level of the system clock. The parameter is depending from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 3

SDH: SEC

Default:

SONET: 3

SDH: SEC.

f. **`syncmsg`** – system synchronization status messaging mode

This parameter is used to ENABLE or DISABLE the SSM protocol.

The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs are set to DNU, for SONET all output SSMs are set to STU.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: ENABLE.

g. **`sysql_stat`** – system quality level status

This parameter indicates the overall system timing quality level status. If the system configured as SONET then the SONET related values are indicated and if the system configured as SDH the SDH related values are indicated.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3, DUS

SDH: PRC, SSUL, SSUT, SEC, DNU.

Default:

SONET: DUS

SDH: DNU.

h. **`timing`** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.

Default: Default

i. **`wtr`** – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 0SEC, 20SEC, 0…60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0…60MIN (1 minute steps); the values “0SEC” and “0MIN” can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

j. **wu_stat** – warm up status

This parameter is an attribute of the timing pack hardware design.

At initial start up of the system and at replacing of the active or standby timing function the system is in warm-up state. DNU/DUS is transmitted during this state on all ports. The clock would be expected to warm up for a temporary period of time before transition to NORMAL.

Type: Alphanumeric value set.

Range: NORMAL, WARMING-UP.

Default: NORMAL.

2. Output Timing (instance only valid for SDH)

a. **active_oref_stat** – active output timing reference status

This parameter displays the current selected timing reference of the timing link switch for the external output.

The value NONE is reported in the following cases:

- the external output timing is not locked to system timing (i.e. extout_prov ≠ SETG) AND none of the six line_timing instances (line1 to line6) is enabled OR all are failed OR locked out

- the external output timing is locked to system timing (i.e. extout_prov = SETG)

Type: text string.

Range: Line_timing_ref_AID, NONE.

Default: NONE.

b. **orefswr_stat** – output timing reference switch request status

This parameter indicates the output timing reference switch request state.

The value MANUAL means, a manual switch is active to the external timing output. The value FORCED means, a forced switch is active to the external timing output. The value NO-REQUEST means, no external command activities are occurring at the external timing output.

Type: Alphanumeric value set.

Default: NO-REQUEST.

3. Assigned Timing Reference

a. **extout_pri** – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number ″1″ indicates the highest priority. The priority ″0″ means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. **`inql`** – assigned timing reference quality value

This parameter displays the input synchronization message for each port of the timing link switch provisioning of the system timing and of the output timing. In the output timing context the values for SDH are valid only. In case of invalid SSM, the value DNU or DUS is displayed. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range: SONET: PRS, STU, ST2, ST3, DUS

SDH: PRC, SSUT, SSUL, SEC, DNU.

Default: Not applicable.

c. **`inql_stat`** – input quality status

This parameter indicates the synchronization messaging quality level status for the specified timing reference.

The parameter describes the validity of the incoming quality level and take the following values: VALID, when the QL is a valid SSM and stable, INVALID, when the QL is not a valid SSM, or unstable, NOT-SUPPORTED, when SSM reception is not supported on that interface due to HW capabilities or the chosen format of the input signal (such as 2MHz), NOT-APPLICABLE, when no port is assigned to the current timing reference or the assigned timing reference experiences a reference fail.

Type: Alphanumeric value set.

Range: VALID, INVALID, NOT-SUPPORTED, NOT-APPLICABLE.

Default: NOT-APPLICABLE.

d. **`ql_prov`** – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default is:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

e. **ref_lock** – timing reference lockout status

This parameter displays the timing reference lockout state to the specified timing reference. It is the input status for each port of the timing link switch provisioning of the system timing.

The value LOCKOUT means, the assigned reference has been locked out by the user, and cannot be used as a timing reference signal until the lockout is cleared.

Type: Alphanumeric value set.

Range: LOCKOUT, NO-LOCKOUT.

Default: NO-LOCKOUT.

f. **ref_stat** – assigned timing reference signal status

The Assigned Timing Reference Signal Status is a status of each timing reference.

The status NORMAL means, the timing reference is available and operating normally without faults. The status FAILED means, the timing reference is failed. The status WAIT-TO-RESTORE means, the wait to restore timer is active before transition to NORMAL. The status NOT-CONNECTED means, there is no timing reference signal connected to the timing port.

Type: Alphanumeric value set.

Range: NORMAL, FAILED, WAIT-TO-RESTORE, NOT-CONNECTED.

Default: NOT-CONNECTED.

g. **sclkref_lockstat** – station clock output timing reference lockout state

This parameter indicates the assigned station clock output timing reference lockout state. This parameter is only for SDH and for line timing references.

Type: Alphanumeric value set.

Range: LOCKOUT, NO-LOCKOUT.

Default: NO-LOCKOUT.

h. **syncref_pri** – system timing reference priority

This parameter defines the priority for assigned timing references.

When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority ″0″ means not assigned.

Type: Numeric value set.

Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

Default: 0 (means DISABLE).

i. **timing** – ASAP name

See definition in “RTRV-SYNCN: Retrieve synchronization” (p. 3-2955) section system timing of this parameter.

j. **`tpmode`** – timing port mode monitoring

This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

Type: Alphanumeric value set.

Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

k. **`tpql_in`** – incoming SSM value of the timing port

This parameter indicates the QL value for the timing port. The value range depends on the system synchronization characteristic.

The parameter describes the incoming SSM and takes the following values:

PRS – Stratum-1 Traceable STU – Synchronized Traceability Unknown

ST2 – Stratum-2

ST3 – Stratum-3

DUS/DNU – Don't Use for Synchronization

PRC – Primary Reference Clock

SSUT – Synchronization Supply Unit Transit node

SSUL – Synchronization Supply Unit Local node

SEC – SDH Equipment Clock

SSMn – other SSM values with invalid state (for SDH)

UNSTABLE – value is unstable

NONE – SSM value not supported by hardware

Type: Alphanumeric value set.

Range:

SONET: PRS (0001), STU (0000), ST2 (0111), ST3 (1010), DUS (1111), NONE

SDH: PRC (0010), SSUT (0100), SSUL (1000), SEC (1011), DNU (1111), SSM0 (0000), SSM1 (0001), SSM3 (0011), SSM5 (0101), SSM6 (0110), SSM7 (0111), SSM9 (1001), SSM10 (1010), SSM12 (1100), SSM13 (1101), SSM14 (1110), UNSTABLE, NONE.

Default: Not applicable.

l. **`tref_aid`** – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more then one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

4. External Timing Input

   a. **`ext_if`** – external input signal format

      This parameter specifies the format of the external timing input.

      The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

      Type: Alphanumeric value set.

      Range:

      SONET: SF, ESF

      SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

      Default:

      SONET: ESF

      SDH: 2MHz.

   b. **`ext_isa`** – external input sa bit location

      This parameter defines the external input Sa bit location. It is only valid for the external timing input format “2Mbit/s” framed; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

      The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

      Type: Alphanumeric value set.

      Range: SA4, SA5, SA6, SA7, SA8.

      Default: SA4.

   c. **`ext_issm`** – external input ssm support

      This parameter specifies if the SSM mode is supported or not on the external timing input port.

      The parameter is adjustable individually to both external timing input ports.

      Type: Alphanumeric value set.

      Range: SUPPORTED, NOT-SUPPORTED.

      Default: SONET: SUPPORTED, SDH: NOT-SUPPORTED.

5. External Timing Output

   a. **`ext_equ`** – cable equalization

      This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

      This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

      Type: Numeric value set.

      Range: 20, 40, 60, 80, 100.

Default: 20.

b. **ext_of** – external output signal format

This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

c. **ext_osa** – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format “2Mbit/s framed”; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

d. **ext_out_sig_stat** – external output signal status

This parameter indicates the external output signal status.

The value NORMAL indicates when the output timing signal is enabled and providing a correctly synchronized output timing signal. The value DISABLED indicates when the output timing signal has been disabled by means of user provisioning. The value UNACCEPTABLE indicates when the output timing signal is enabled but the timing output does not provide a suitable timing reference signal. This is caused by failed reference into the timing output process or references rejected based on threshold AIS criteria.

Type: Alphanumeric value set.

Range: NORMAL, DISABLED, UNACCEPTABLE.

Default: DISABLED.

e. **extout_en** – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

f. **extout_prov** – external timing output selection

This parameter specifies the operation mode of the external output timing.

The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.

Type: Alphanumeric value set.

Range:
SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]
SDH: SETG, TLS.
Default: SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]
SDH: SETG.

g. **extout_ssm** – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.
Range: AISMODE, QLMODE.
Default: QLMODE.

h. **frcdus** – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for ’2Mbit/s framed’ and ’DS1 ESF’; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: DISABLE.

i. **loopdelay** – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.
Range: 0…60 (1 seconds steps).
Default: 10.

j. **ql_out** – quality of the external timing output port

This parameter indicates the quality value on the signal for the timing output port.

Type: Alphanumeric value set.
Range:
SONET: PRS, STU, ST2, ST3, DUS
SDH: PRC, SSUL, SSUT, SEC, DNU.
Default: Not applicable.

k. **qlout_tais** – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the *extout_ssm* value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3

SDH: PRC, SSUT, SSUL, SEC.

Default:

SONET: ST3

SDH: SEC.

l. **regen_loop** – timing regenerator loop

This parameter specifies the avoiding of loops over the SASE/BITS clocks.

When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.

Type: Alphanumeric value set.

Range:

SONET: DISABLE, ENABLE

SDH: DISABLE, EXTREF1, EXTREF2, BOTH.

Default:

SONET: ENABLE

SDH: DISABLE.

m. **timing** – ASAP name

See definition in "RTRV-SYNCN: Retrieve synchronization" (p. 3-2955) section system timing of this parameter.

Detailed behavior description

The **RTRV-SYNCN** command retrieves the output parameters values for the specified input AID as described in "RTRV-SYNCN: Retrieve synchronization" (p. 3-2955) output parameters section.

Example input/output

The following is an example of the **RTRV-SYNCN** command:

```
RTRV-SYNCN:LT-UNITE:extrefall:123456;

   LT-UNITE 00-11-13 12:00:00
M  123456 COMPLD
   "EXTREF1:tref_aid=EXTTMG0,syncref_pri=2,ref_stat=NORMAL,
ref_lock=NO-LOCKOUT,inql=SSUT,inql_stat=NOT-SUPPORTED"
   "EXTREF2:tref_aid=EXTTMG1,syncref_pri=3,ref_stat=NORMAL,
ref_lock=NO-LOCKOUT,inql=SSUT,inql_stat=NOT-SUPPORTED"
```

;

RTRV-T3: Retrieve DS3 port

The command **RTRV-T3** is used to retrieve all parameters related to the electrical DS3 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-T3:*tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   Access Identifier of a DS3 port.
   Type: AID
   Range: APortAID of DS3 port. The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).

Output format

In response to a valid **RTRV-T3** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   ″aid[:spec_block]″
       ...
       ...
   ″aid[:spec_block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the **RTRV-HDR** command.

Output parameters

Command parameters

1. **aid** – access identifier
   Type: AID
   Range: APortAID of DS3 port

Spec block parameters

1. **cbitmis** – C-bit Signal Format Mismatch
   DS3 C-bit Signal Format Mismatch parameter indicates a mismatch between the C-bit parity formatand the format of the incoming DS3 signal (ingress direction).

   The DS3 C-bit Signal Format Mismatch parameter shall have the value:

   - NORMAL, if the Signal Format (fmt) is set to C-BIT and a DS3 signal in C-bit parity channelized DS3 format is received
   - MISMATCH, if the Signal Format (fmt) is set to C-BIT and a DS3 signal in M23 channelized DS3 format is received
   - NA, if the Signal Format (fmt) is set to C-BIT and one of the alarms DS3LOS, DS3LOF, DS3AIS, DS3IDLE is present, or if the Signal Format (fmt) is set to another value than C-BIT, or if the value cannot be determined because pmode is set to AUTO or NMON or the circuit pack is not present or other system internal reasons.

   Type: Alphanumeric value set.
   Range: NORMAL, MISMATCH, NA.

2. **ds3pn** – DS3 ASAP
   DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   Default: DEFAULT.

3. **eif** – Electrical Interface Type
   The parameter eif indicates the type of input the port has been provisioned to receive.
   Type: Alphanumeric value set.
   Range: DS3

4. **feac** – Far-End Alarm and Control
   The parameter *feac* indicates the status of the FEAC channel of the incoming C-bit parity formatted DS3 signal. The parameter is only applicable, if *fmt* is set to C-BIT. The parameter shall have the value "NA" if the parameter is not applicable (*fmt* = M23 or UNFRAMED-CC), or the value for the parameter is not available because it cannot be determined.
   Type: Alphanumeric string.
   Range: String with 6 characters.

5. **`fmt`** – Signal Format
This parameter shows the format for the DS3 signal
Type: Alphanumeric value set. A hyphen (“-”) is allowed in the alphanumeric values additionally.
Range:
   - C-BIT (default): C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format
   - UNFRAMED-CC: UNFRAMED and CLEAR-CHANNEL format
6. **`fsflpbkstat`** – Far Side Facility Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output aid. A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback exististing for the aid.
Note: not both loopbacks (lpbk and fsflpbkstat) can be set to YES at the same time
Type: Alphanumeric value set.
Range: YES, NO (default)
7. **`infepm`** – Incoming DS3 Far End Path PM Enable
This parameter enables/disables the incoming DS3 far end path performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
8. **`inlnpm`** – Incoming DS3 Line PM Enable
This parameter enables/disables the incoming DS3 line performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
9. **`inpm`** – Incoming DS3 Near End Path PM Enable
This parameter enables/disables the incoming DS3 near end path performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
10. **`lbo`** – Line Build Out
This parameter defines the cable length applicable for the DS3 port.
Type: Alphanumeric value set.
Range:
    - SHORT (default): 0 … 68.5 m (0 … 225 ft)
    - LONG: 68.5 … 137 m (225 … 450 ft).

11. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).
12. **`outmntc`** – Outgoing Maintenance Signal
    This parameter determines whether an AIS, a DS3AIS or IDLE signal is transmitted in response to an unconnected input.
    Type: Alphanumeric value set.
    Range: AIS (default), DS3AIS, IDLE
13. **`outfepm`** – Outgoing DS3 Far End Path PM Enable
    This parameter enables/disables the outgoing DS3 far end path performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
14. **`outpm`** – Outgoing DS3 Near End Path PM Enable
    This parameter enables/disables the outgoing DS3 near end path performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
15. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the *pmode* state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.
    Range: AUTO (default): indicates that, when a signal is detected at the port, then alarm monitoring will start. MON: indicates that alarm monitoring is taking place on the port. NMON: means that alarm monitoring is not occurring on the port.
16. **`pmsesl`** – PM Threshold for SES – Line
    PM Threshold (errors in a second) for declaring SES – Line
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
17. **`pmsesp`** – PM Threshold for SES – Path Incoming
    PM Threshold (errors in a second) for declaring SES – Path in incoming direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44

18. **pmsespfe** – PM Threshold for Far-End SES – Path Incoming
PM Threshold (errors in a second) for declaring Far-End SES – Path in incoming direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44
19. **pmsespfeout** – PM Threshold (errors in a second) for declaring Far-End SES – Path in outgoing direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44
20. **pmsespout** – PM Threshold for SES – Path Outgoing
PM Threshold (errors in a second) for declaring SES – Path in outgoing direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44
21. **ptype** – Port Type
This üparameter identifies the port type of the AID.
Type: Alphanumeric value set.
Range: T3
22. **sdthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-3 to 10exp-9.
Type: numeric value set.
Range: (as exponents of 10): -3, -4, -5 -6 (default), -7, -8, -9
23. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.
24. **tca** – DS3 PM TCA
The parameter tca assigns an DS3 PM TCA profile name to the designated AID.
Type: Alphanumeric value set. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters, DEFAULT, DEFAULT0 (default).
25. **vmr** – Violation Monitoring Mode
This parameter indicates the status of the DS3 P-bit parity violation monitoring and removal.
Type: Alphanumeric value set. A hyphen (“-”) is allowed in the alphanumeric values additionally.
Range: VMR, VM, NO-VM (default)

Detailed behavior description

The command shall retrieve the parameters as described above. The **RTRV-T3** command do not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a **RTRV-T3** command. Not all output parameters are listed (missing ones indicated by …).

```
RTRV-T3:LT-UNITE:1-1-#-#-21-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-21-1:cbitmis=NORMAL,eif=DS3,ptype=T3,fmt=C-BIT,.... sigmis=NORMAL,vmr=NO
      -VM"
;
```

Error responses

See definition in "RTRV-HDR: Retrieve header" (p. 3-2417) command error responses section for general validation rules. The error responses listed there also apply to the **RTRV-T3** command.

Validation rule: Check CCB against *ptype* and *eif*

Check wether the CCB fits to *ptype* and *eif*.

Error code: `ICNV – Input, Command Not Valid, Interface Type does not match`

RTRV-TACC: Retrieve test access

General

The **RTRV-TACC** command is used to retrieve the test access-related information on one or all of the test tributaries in the NE. Only the primary test tributary is retrieved.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-TACC**-*modifier:tid:aid:ctag;*

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection rate on which the retrieve test access command is to act.
   A distinction of the modifier usage has to be made between the retrieval (RTRV-TACC-modifier) and the other test access related commands (CONN-TACC-modifier, DISC-TACC-modifier, CHG-ACCMD-modifier):
   - The establishment (CONN-TACC-modifier), removal (DISC-TACC-modifier) or modification (CHG-ACCMD-modifier) of test access sessions is independent of the provisioned port interface-standard. I.e., either the SDH-rates (VC3, VC4 etc.) or the corresponding SONET-rates (STS1, STS3 etc.) can be used as modifier and no command validation between port interface-standard and modifier will be performed.
   - For the RTRV-TACC-modifier command the following holds: Again, no command validation between port interface-standard and modifier will be performed. The output parameter *rate*, however, is filled with the *rate* which was used with the CONN-TACC-modifier command.

   Type: Alphanumeric value set.
   Range:
   - ALL
   - SDH modifier: VC3, VC4, VC44C, VC416C, VC464C
   - SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.
2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).

3. **`aid`** – Access Identifier
   AID of a SONET or SDH tributary. The keyword **`all`** is allowed on slot, port and tributary level.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **`all`** or **`usall`** or **`vall`** values at all defined positions within the AID is allowed.
4. **`ctag`** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-TACC command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "tatrib1:rate[:spec_block]"
       ...
       ...
   "tatrib1:rate[:spec_block]"
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

The NE returns the following normal completion response for a successful RTRV-TACC command if no test access activity is found on the specified tributaries in the system:

```
   sid date time
M  ctag COMPLD
;
```

This output format is only valid if 'all' is used in the *aid*. Otherwise the validation rule leads to an error message.

Output parameters

Command parameters

1. **`tatrib1`** – primary Test Access Tributary
   AID of the primary test access tributary. The keyword **`all`** is not allowed on any level.
   Type: AID
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **`all`** or **`usall`** or **`vall`** values at any position of the aid is not allowed.
2. **`rate`** – Test Access rate
   This parameter specifies the rate of the signal that is being tested.
   Type: Alphanumeric value set.
   Range: VC3, VC4, VC44C, VC416C, VC464C, LOVT1, STS1, STS3, STS12, STS48, STS192.

Spec block parameters

1. **`eomode`** – output mode of the E-tributary
   This parameter is only present if the test session is created on a two-way cross-connection. The parameter is omitted for test sessions on one-way cross-connections or on idle E-tributaries.
   Type: Alphanumeric value set.
   Range:
   - NORM: this is the normal output i.e. the signal from the F-tributary is passed through to the E-tributary
   - AIS: this mode outputs an AIS signal.

   Default:
   - NORM, if the referring Ttest mode does not disconnect the output of the original cross-connection to this tributary
   - AIS, in all other case.
2. **`etrib`** – AID of the E-tributary
   AID of the E-tributary for the test session.
   Type: AID
   Range: GenTribAID or GenLOTribAID.
   The usage of **`all`** or **`usall`** or **`vall`**-values at any position of the aid is not allowed.
3. **`fomode`** – output mode of the F-tributary
   This parameter is only present if the test session is created on a one-way or two-way cross-connection. The parameter is omitted for test sessions on idle E-tributaries.
   Type: Alphanumeric value set.
   Range:
   - NORM: this is the normal output i.e. the signal from the E-tributary is passed through to the F-tributary
   - AIS: this mode outputs an AIS signal.

Default:

- NORM, if the referring test mode does not disconnect the output of the original cross-connection to this tributary
- AIS, in all other cases.

4. **`ftrib`** – AID of the F-tributary
   AID of the F-tributary for the test session. If there is no cross-connection at the E-tributary, this parameter is omitted.
   Type: AID.
   Range: GenTribAID or GenLOTribAID.
   The usage of **`all`** or **`usall`** or **`vall`**-values at any position of the aid is not allowed.
5. **`tatrib2`** – secondary Test Access Tributary
   AID of the secondary Test Access Tributary. In the case of test access modes with single test tributary the parameter is omitted.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **`all`** or **`usall`** or **`vall`** values at any position of the aid is not allowed.
6. **`tstmde`** – Test Access Mode
   Type: Alphanumeric value set.

   Range: Allowed values:

   - MONE – Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.
   - MONF- Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.
   - MONEF – Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a two-way cross-connection.
   - SPLTE – Split access E-end mode of test access. This test access mode splits the connection between the E end and F end of a one-way cross-connection or a leg of two-way cross-connection. Can also be used in an idle tributary.
   - SPLTF – Split access F-end mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing at the F-end.
   - SPLTEF – Split E-end and F-end mode of test access. This test access mode splits both directions of a two-way cross-connection to allow testing at both the E end and F end.

Example input/output

```
RTRV-TACC-STS1:LT-UNITE:1-1-#-#-3-1-1:123456;

   LT-UNITE 02-10-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-3-1-1:STS1:TSTMDE=MONEF,TATRIB2=1-1-#-#-4-1-1,ETRIB=1-1-#-#-6-1-
      1,EOMODE=NORM,FTRIB=1-1-#-#-7-1-1,FOMODE=NORM″
```

```
;
```

For Lower-order test access sessions:

```
RTRV-TACC-LOVT1:LT-UNITE:1-1-#-#-3-1-1-28:123456;

   LT-UNITE 02-10-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-3-1-1-28:LOVT1:TSTMDE=MONEF,\
    TATRIB2=1-1-#-#-4-1-1-28,ETRIB=1-1-#-#-6-1-1-28,\
    EOMODE=NORM,FTRIB=1-1-#-#-7-1-1-28,FOMODE=NORM"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-TACC** command.

Validation rule: Tributary is not assigned as a test tributary

If the aid is not assigned as a test tributary and 'all' is not used in the aid, the following error message is returned:

Error code:

`SNVS – Status, Not in Valid State, Tributary not assigned as a test tributary`

Related TL1 messages

RTRV-TCA-ASGNMT: Retrieve TCA assignment

The **RTRV-TCA-ASGNMT** command allows the user to retrieve a list of AIDs that have been assigned to the specified profile type and name.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-TCA-ASGNMT:*tid::ctag::pftype,pfname;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
4. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Output format

If the NE fully complies with the RTRV-TCA-ASGNMT request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "pftype,pfname:aid"
   .     .     .
   .     .     .
;
```

Output parameters

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

1. **aid** – Access Identifier
   Type: AID
   Range: SPortAID, STSNumAID, EPortAID, VCGAID, VCGNumAID, PTNumAID, GenLOTribAID, TMuxAPortAID, TMuxAPTNumAID, DS1NumAID.
2. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
3. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Example input/output

The following example shows the successful completion of a RTRV-TCA-ASGNMT command by the NE:

```
  RTRV-TCA-ASGNMT:UNITE-NE::123456::section-line,ATT;
   UNITE-NE 00-01-01 08:00:00
```

```
M  123456 COMPLD
   ”section-line,ATT:1-1-#-#-22-1”
   ”section-line,ATT:1-1-#-#-23-1”
   ”section-line,ATT:1-1-#-#-24-1”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-TCA-ASGNMT** command. See also subsection ’Partial Completion on RTRV Commands’ w.r.t. handling of internal error (e.g. communication to XC320 fails) for a subset of replies.

Validation rule: profile name does not exist

If the profile name specified does not exist.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

RTRV-TCA-PROF: Retrieve TCA profile

General

The **RTRV-TCA-PROF** command allows the user to retrieve either a list of profile names that have been created for a specific profile type or the contents of a profile whose type and name are given in this command. The system supports two default sets of profiles called “DEFAULT” and “DEFAULT0”.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-TCA-PROF:*tid::ctag::pftype;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
4. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Output format

If the system receives this command and the profile name is NULL, the following response is returned:

```
   sid date time
M  ctag COMPLD
   "pftype:pfname"
   "pftype:pfname"
   "pftype:pfname"
   .     .     .     .     .     .
   .     .     .     .     .     .
;
```

If the system receives this command with a valid profile name, the following response is returned:

```
   sid date time
M  ctag COMPLD
   "pftype,pfname:spec_block"
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters - general profile

1. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
2. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Command parameters - profile parameters of type SECTION-LINE

1. **qhcvsoc3**
   15-minute threshold for CV-S bin for OC-3.
   Type: Integer.
   Range: 0-57599100
   Default: 140.
2. **daycvsoc3**
   Day threshold for CV-S bin of OC-3.
   Type: Integer.
   Range: 0-4294967295
   Default: 1344.
3. **qhcvsoc12**
   15-minute threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-57599100
   Default: 560.
4. **daycvsoc12**
   Day threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-4294967295
   Default: 5376.
5. **qhcvsoc48**
   15-minute threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-57599100
   Default: 2240.
6. **daycvsoc48**
   Day threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-4294967295
   Default: 21504.
7. **qhcvsoc192**
   15-minute threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-57599100
   Default: 8960.
8. **daycvsoc192**
   Day threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-4294967295
   Default: 86016.

9. **qhcvsoc768**
   15-minute threshold for CV-S bin for OC-768.
   Type: Integer.
   Range: 0-57599100
   Default: 35840.
10. **daycvsoc768**
    Day threshold for CV-S bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 344064.
11. **qhcvsec1**
    15-minute threshold for CV-S bin for EC-1.
    Type: Integer.
    Range: 0-57599100
    Default: 47
12. **daycvsec1**
    Day threshold for CV-S bin of EC-1
    Type: Integer.
    Range: 0-4294967295
    Default: 448
13. **qhess**
    15-minute threshold for ES-S bin.
    Type: Integer.
    Range: 0-900
    Default: 25.
14. **dayess**
    Day threshold for ES-S bin.
    Type: Integer.
    Range: 0-86400
    Default: 250.
15. **qhsess**
    15-minute threshold for SES-S bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
16. **daysess**
    Day threshold for ES-S bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.

17. **qhsefss**
    15-minute threshold for SEFS-S bin.
    Type: Integer.
    Range: 0-900
    Default: 5.
18. **daysefss**
    Day threshold for SEFS-S bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.
19. **qhcvloc3**
    15-minute threshold for CV-L and CV-LFE bin for OC-3.
    Type: Integer.
    Range: 0-172799100
    Default: 140.
20. **daycvloc3**
    Day threshold for CV-L bin and CV-LFE for OC-3.
    Type: Integer.
    Range: 0-4294967295
    Default: 1344.
21. **qhcvloc12**
    15-minute threshold for CV-L and CV-LFE bin for OC-12.
    Type: Integer.
    Range: 0-691199100
    Default: 560.
22. **daycvloc12**
    Day threshold for CV-L bin and CV-LFE for OC-12.
    Type: Integer.
    Range: 0-4294967295
    Default: 5376.
23. **qhcvloc48**
    15-minute threshold for CV-L and CV-LFE bin for OC-48.
    Type: Integer.
    Range: 0-2764799100
    Default: 2240.
24. **daycvloc48**
    Day threshold for CV-L and CV-LFE bin for OC-48.
    Type: Integer.
    Range: 0-4294967295
    Default: 21504.

25. **`qhcvloc192`**
    15-minute threshold for CV-L and CV-LFE bin for OC-192.
    Type: Integer.
    Range: 0-4294967295
    Default: 8960.
26. **`daycvloc192`**
    Day threshold for CV-L and CV-LFE bin for OC-192.
    Type: Integer.
    Range: 0-4294967295
    Default: 86016.
27. **`qhcvloc768`**
    15-minute threshold for CV-L and CV-LFE bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 35840.
28. **`daycvloc768`**
    Day threshold for CV-L and CV-LFE bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 344064.
29. **`qhcvlec1`**
    15-minute threshold for CV-L and CV-LFE bin for EC-1
    Type: Integer.
    Range: 0-57599100
    Default: 47
30. **`daycvlec1`**
    Day threshold for CV-L bin and CV-LFE for EC-1.
    Type: Integer.
    Range: 0-4294967295
    Default: 448
31. **`qhesl`**
    15-minute threshold for ES-L and ES-LFE bin.
    Type: Integer.
    Range: 0-900
    Default: 25.
32. **`dayesl`**
    Day threshold for ES-L and ES-LFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 250.

33. **`qhfeccloc192`**
    15-minute threshold for FECC-L bin for OC-192.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 5184.
34. **`dayfeccloc192`**
    Day threshold for FECC-L bin for OC-192.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 497644.
35. **`qhfeccloc768`**
    15-minute threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 20736.
36. **`dayfeccloc768`**
    Day threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.
37. **`qhsesl`**
    15-minute threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
38. **`daysesl`**
    Day threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.
39. **`qhuasl`**
    15-minute threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
40. **`dayuasl`**
    Day threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.

Command parameters - profile parameters of type RS-MS

1. **qhrsnbbe**
   15-minute threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 9000.
2. **dayrsnbbe**
   Day threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
3. **qhrsnes**
   15-minute threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 180.
4. **dayrsnes**
   Day threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 1500.
5. **qhrsnses**
   15-minute threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 15.
6. **dayrsnses**
   Day threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 20.
7. **qhrsnuas**
   15-minute threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **dayrsnuas**
   Day threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 20.

9. **qhmsbbestm1**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 228000.
10. **daymsbbestm1**
    Day threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 432000.
11. **qhmsbbestm4**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 0-691199100
    Default: 912000.
12. **daymsbbestm4**
    Day threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 00-4294967295
    Default: 1728000.
13. **qhmsbbestm16**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-2764799100
    Default: 3648000.
14. **daymsbbestm16**
    Day threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 6912000.
15. **qhmsbbestm64**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 14592000.
16. **daymsbbestm64**
    Day threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 27648000.

17. **qhmsbbestm256**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 58368000.
18. **daymsbbestm256**
    Day threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 110592000.
19. **qhmses**
    15-minute threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-900
    Default: 50.
20. **daymses**
    Day threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
21. **qhmsnfeccstm64**
    15-minute threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 5184.
22. **daymsnfeccstm64**
    Day threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 49764.
23. **qhmsnfeccstm256**
    15-minute threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 20736.
24. **daymsnfeccstm256**
    Day threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.

25. **qhmsses**
    15-minute threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
26. **daymsses**
    Day threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-77760
    Default: 15.
27. **qhmsuas**
    15-min threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
28. **daymsuas**
    Day threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

Command parameters - reset profile parameters of type RS-MS

1. **qhrtrrsnbbe**
   15-minute reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
2. **dayrtrrsnbbe**
   Day reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
3. **qhrtrrsnes**
   15-minute reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 20.
4. **dayrtrrsnes**
   Day reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 150.

5. **qhrtrrsnses**
   15-minute reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **dayrtrrsnses**
   Day reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 0.
7. **qhrtrrsnuas**
   15-minute reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **dayrtrrsnuas**
   Day reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 0.
9. **qhrtrmsbbestm1**
   15-min reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 2400.
10. **dayrtrmsbbestm1**
   Day reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 43200.
11. **qhrtrmsbbestm4**
   15-min reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
   Type: Integer.
   Range: 0-691199100
   Default: 9600.
12. **dayrtrmsbbestm4**
   Day reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 172800.

13. **qhrtrmsbbestm16**
    15-min reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-2764799100
    Default: 38400.
14. **dayrtrmsbbestm16**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 691200.
15. **qhrtrmsbbestm64**
    15-min reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 153600.
16. **dayrtrmsbbestm64**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 2764800.
17. **qhrtrmsbbestm256**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 614400.
18. **dayrtrmsbbestm256**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 11059200.
19. **qhrtrmses**
    15-minute reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-900
    Default: 5.
20. **dayrtrmses**
    Day reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 15.

21. **`qhrtrmsnfeccstm64`**
    15-minute reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
22. **`dayrtrmsnfeccstm64`**
    Day reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
23. **`qhrtrmsnfeccstm256`**
    15-minute reset threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
24. **`dayrtrmsnfeccstm256`**
    Day reset threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
25. **`qhrtrmsses`**
    15-minute reset threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
26. **`dayrtrmsses`**
    Day reset threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
27. **`qhrtrmsuas`**
    15-min reset threshold for MS_N_UAS and MS_F_UAS.
    Type: Integer.
    Range: 0-900
    Default: 0.
28. **`dayrtrmsuas`**
    Day reset threshold for MS_N_UAS and MS_F_UAS.
    Type: Integer.
    Range: 0-86400
    Default: 0.

Command parameters - profile parameters of type ODU

1. **qhodupbbeodu1**
   15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-18377100
   Default: 32000.
2. **dayodupbbeodu1**
   Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-1764201600
   Default: 61000.
3. **qhodupes**
   15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 50.
4. **dayodupes**
   Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 150.
5. **qhodupses**
   15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 10.
6. **dayodupses**
   Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 15.
7. **qhodupuas**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **dayodupuas**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 20.

Command parameters - reset profile parameters of type ODU

1. **`qhrtrodupbbeodu1`**
   15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-18377100
   Default: 200.
2. **`dayrtrodupbbeodu1`**
   Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-1764201600
   Default: 4800.
3. **`qhrtrodupes`**
   15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 5.
4. **`dayrtrodupes`**
   Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 15.
5. **`qhrtrodupses`**
   15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **`dayrtrodupses`**
   Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 0.
7. **`qhrtrodupuas`**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **`dayrtrodupuas`**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 0.

Command parameters - profile parameters of type HO-VC

1. **qhvcbbevc3**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
2. **dayvcbbevc3**
   Day threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
3. **qhvcbbevc4**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
4. **dayvcbbevc4**
   Day threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
5. **qhvcbbevc44c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
6. **dayvcbbevc44c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
7. **qhvcbbevc416c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
8. **dayvcbbevc416c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.

9. **qhvcbbevc464c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
10. **dayvcbbevc464c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
11. **qhvcesvc3**
   15-minute threshold for VC_N_ES and VC_F_ES VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 150.
12. **dayvcesvc3**
   Day threshold for VC_N_ES and VC_F_ES VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 600.
13. **qhvcesvc4**
   15-minute threshold for VC_N_ES and VC_F_ES for VC4 bin.
   Type: Integer.
   Range: 0-900
   Default: 180.
14. **dayvcesvc4**
   Day threshold for VC_N_ES and VC_F_ES for VC4 bin.
   Type: Integer.
   Range: 0-86400
   Default: 1500.
15. **qhvcesvc44c**
   15-minute threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
   Type: Integer.
   Range: 0-900
   Default: 180.
16. **dayvcesvc44c**
   Day threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
   Type: Integer.
   Range: 0-86400
   Default: 1500.

17. **qhvcesvc416c**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
18. **dayvcesvc416c**
    Day threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.
19. **qhvcesvc464c**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
20. **dayvcesvc464c**
    Day threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.
21. **qhvcsesvc3**
    15-minute threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
22. **dayvcsesvc3**
    Day threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
23. **qhvcsesvc4**
    15-minute threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
24. **dayvcsesvc4**
    Day threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.

25. qhvcsesvc44c
    15-minute threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
26. dayvcsesvc44c
    Day threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Range: 0-77760
    Default: 20.
27. **qhvcsesvc416c**
    15-minute threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
28. **dayvcsesvc416c**
    Day threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
29. **qhvcsesvc464c**
    15-minute threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
30. **dayvcsesvc464c**
    Day threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
31. **qhvcuasvc3**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
32. **dayvcuasvc3**
    Day threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

33. **qhvcuasvc4**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
34. **dayvcuasvc4**
    Day threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
35. **qhvcuasvc44c**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
36. **dayvcuasvc44c**
    Day threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
37. **qhvcuasvc416c**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
38. **dayvcuasvc416c**
    Day threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
39. **qhvcuasvc464c**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
40. **dayvcuasvc464c**
    Day threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

41. **`qhpjcpos`**
    15-minute threshold for positive PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
42. **`daypjcpos`**
    Day threshold for positive PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
43. **`qhpjcneg`**
    15-minute threshold for negative PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
44. **`daypjcneg`**
    Day threshold for negative PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

Command parameters - reset profile parameters of type HO-VC

1. **`qhrtrvcbbevc3`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
2. **`dayrtrvcbbevc3`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
3. **`qhrtrvcbbevc4`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
4. **`dayrtrvcbbevc4`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.

5. **qhrtrvcbbevc44c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
6. **dayrtrvcbbevc44c**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
7. **qhrtrvcbbevc416c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
8. **dayrtrvcbbevc416c**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
9. **qhrtrvcbbevc464c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
10. **dayrtrvcbbevc464c**
    Day reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
    Type: Integer.
    Range: 0-691113600
    Default: 4800.
11. **qhrtrvcesvc3**
    15-minute reset threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
12. **dayrtrvcesvc3**
    Day reset threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 60.

13. **qhrtrvcesvc4**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
Type: Integer.
Range: 0-900
Default: 20.
14. **dayrtrvcesvc4**
Day reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
Type: Integer.
Range: 0-86400
Default: 150.
15. **qhrtrvcesvc44c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-900
Default: 20.
16. **dayrtrvcesvc44c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-86400
Default: 150.
17. **qhrtrvcesvc416c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-900
Default: 20.
18. **dayrtrvcesvc416c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-86400
Default: 150.
19. **qhrtrvcesvc464c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-900
Default: 20.
20. **dayrtrvcesvc464c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-86400
Default: 150.

21. **qhrtrvcsesvc3**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
22. **dayrtrvcsesvc3**
    Day reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
23. **qhrtrvcsesvc4**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
24. **dayrtrvcsesvc4**
    Day reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
25. **qhrtrvcsesvc44c**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
26. **dayrtrvcsesvc44c**
    Day reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
27. **qhrtrvcsesvc416c**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
28. **dayrtrvcsesvc416c**
    Day reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.

29. **`qhrtrvcsesvc464c`**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
30. **`dayrtrvcsesvc464c`**
    Day reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
31. **`qhrtrvcuasvc3`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
32. **`dayrtrvcuasvc3`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
33. **`qhrtrvcuasvc4`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
34. **`dayrtrvcuasvc4`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
35. **`qhrtrvcuasvc44c`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
36. **`dayrtrvcuasvc44c`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.

37. **`qhrtrvcuasvc416c`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
38. **`dayrtrvcuasvc416c`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
39. **`qhrtrvcuasvc464c`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
40. **`dayrtrvcuasvc464c`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
41. **`qhrtrpjcpos`**
    15-minute reset threshold for positive PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
42. **`dayrtrpjcpos`**
    Day reset threshold for positive PJC bin.
    Type: Integer.
    0-172800000
    Default: 0.
43. **`qhrtrpjcneg`**
    15-minute reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
44. **`dayrtrpjcneg`**
    Day reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 0.

Command parameters - profile parameters of type PATH

1. **`qhcvpsts1`**
   15-minute threshold for CV-P and CV-PFE bin for STS1.
   Type: Integer.
   Range: 0-57599100
   Default: 15.
2. **`daycvpsts1`**
   Day threshold for CV-P and CV-PFE bin for STS1.
   Type: Integer.
   Range: 0-4294967295
   Default: 125.
3. **`qhcvpsts3c`**
   15-minute threshold for CV-P and CV-PFE bin for STS3C.
   Type: Integer.
   Range: 0-57599100
   Default: 25.
4. **`daycvpsts3c`**
   Day threshold for CV-P and CV-PFE bin for STS3C.
   Type: Integer.
   Range: 4294967295
   Default: 250.
5. **`qhcvpsts12c`**
   15-minute threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 0-57599100
   Default: 75.
6. **`daycvpsts12c`**
   Day threshold for threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 4294967295
   Default: 750.
7. **`qhcvpsts48c`**
   15-minute threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 0-57599100
   Default: 300.
8. **`daycvpsts48c`**
   Day threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 4294967295
   Default: 3000.

9. **qhcvpsts192c**
   Day threshold for CV-P and CV-PFE bin for STS192C.
   Type: Integer.
   Range: 0-57599100
   Default: 1200.
10. **daycvpsts192c**
    Day threshold for CV-P and CV-PFE bin for STS192C.
    Type: Integer.
    Range: 0-4294967295
    Default: 12000.
11. **qhespsts1**
    15-minute threshold for ES-P and ES-PFE bin for STS1.
    Type: Integer.
    Range: 0-900
    Default: 12.
12. **dayespsts1**
    Day threshold for ES-P and ES-PFE bin for STS1.
    Type: Integer.
    Range: 0-86400
    Default: 100.
13. **qhespsts3c**
    15-minute threshold for ES-P and ES-PFE bin for STS3C.
    Type: Integer.
    Range: 0-900
    Default: 20.
14. **dayespsts3c**
    Day threshold for ES-P and ES-PFE bin for STS3C.
    Type: Integer.
    Range: 0-86400
    Default: 200.
15. **qhespsts12c**
    15-minute threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-900
    Default: 60.
16. **dayespsts12c**
    Day threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-86400
    Default: 600.

17. **`qhespsts48c`**
    15-minute threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-900
    Default: 240.
18. **`dayespsts48c`**
    Day threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-86400
    Default: 2400.
19. **`qhespsts192c`**
    Day threshold for ES-P and ES-PFE bin for STS192C.
    Type: Integer.
    Range: 0-900
    Default: 240.
20. **`dayespsts192c`**
    Day threshold for ES-P and ES-PFE bin for STS192C.
    Type: Integer.
    Range: 0-86400
    Default: 9600.
21. **`qhsesp`**
    15-minute threshold for SES-P and SES-PFE bin.
    Type: Integer.
    Range: 0-810
    Default: 3.
22. **`daysesp`**
    Day threshold for SES-P and SES-PFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 7.
23. **`qhuasp`**
    15-minute threshold for UAS-P and UAS-PFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
24. **`dayuasp`**
    Day threshold for UAS-P and UAS-PFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.

25. **`qhppjcgen`**
    15-minute threshold for PPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
26. **`dayppjcgen`**
    Day threshold for PPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
27. **`qhnpjcgen`**
    15-minute threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
28. **`daynpjcgen`**
    Day threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
29. **`qhppjcdet`**
    15-minute threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
30. **`dayppjcdet`**
    Day threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
31. **`qhnpjcdet`**
    15-minute threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
32. **`daynpjcdet`**
    Day threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

Command parameters - profile parameters of type ENET

1. **`qhpdege`**
   15-minute threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-183000000
   Default: 187500.
2. **`daypdege`**
   Day threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000.
3. **`qhpdevcg`**
   15-minute threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-183000000
   Default: 10.
4. **`daypdevcg`**
   Day threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
5. **`qhedfe1ge`**
   15min EDFE for 1GbE Ethernet port
   Type: Integer.
   Range: 0-1371951220
   Default: 1875000
6. **`dayedfe1ge`**
   24 h EDFE for 1GbE Ethernet port
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000
7. **`qhedfc1ge`**
   15min EDFC for 1GbE Ethernet port
   Type: Integer.
   Range: 0-1371951220
   Default: 20.
8. **`dayedfc1ge`**
   24 h EDFC for 1GbE Ethernet port
   Type: Integer.
   Range: 0-4294967295
   Default: 50.

9. **qhedfe10ge**
   15min EDFE for 10GbE Ethernet port
   Type: Integer.
   Range: 0-2147483647
   Default: 18750000.
10. **dayedfe10ge**
    24 h EDFE for 10GbE Ethernet port
    Type: Integer.
    Range: 0-4294967295
    Default: 90000000
11. **qhedfc10ge**
    15min EDFC for 10GbE Ethernet port
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
12. **dayedfc10ge**
    24 h EDFC for 10GbE Ethernet port
    Type: Integer.
    Range: 0-4294967295
    Default: 500.
13. **qhedfe1gevcg**
    15min EDFE for 1GbE VCG port
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
14. **dayedfe1gevcg**
    24 h EDFE for 1GbE VCG port
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
15. **qhedfc1gevcg**
    15min EDFC for 1GbE VCG port
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
16. **dayedfc1gevcg**
    24 h EDFC for 1GbE VCG port
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

17. **`qhedfe10gevcg`**
 15min EDFE for 10GbE VCG port
 Type: Integer.
 Range: 0-2147483647
 Default: 100.
18. **`dayedfe10gevcg`**
 24 h EDFE for 10GbE VCG port
 Type: Integer.
 Range: 0-4294967295
 Default: 500.
19. **`qhedfc10gevcg`**
 15min EDFC for 10GbE VCG port
 Type: Integer.
 Range: 0-2147483647
 Default: 100.
20. **`2.2.1.5.1.10.20`**
 24 h EDFC for 10GbE VCG port
 Type: Integer.
 Range: 0-4294967295
 Default: 500.

Command parameters - reset profile parameters of type ENET

1. **`qhrtrpdege`**
 15-minute reset threshold for PDE bin for GE.
 Type: Integer.
 Range: 0-183000000
 Default: 937500.
2. **`dayrtrpdege`**
 Day reset threshold for PDE bin for GE.
 Type: Integer.
 Range: 0-4294967295
 Default: 4500000.
3. **`qhrtrpdevcg`**
 15-minute reset threshold for PDE bin for VCG.
 Type: Integer.
 Range: 0-183000000
 Default: 2.
4. **`dayrtrpdevcg`**
 Day reset threshold for PDE bin for VCG.
 Type: Integer.
 Range: 0-4294967295
 Default: 5.

5. **`qhrtredfe1ge`**
   15min reset threshold for EDFE of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 937500.
6. **`dayrtredfe1ge`**
   24h reset threshold for EDFE of 1GbE Ethernet port
   Type: Integer.
   Range: 0-4294967295
   Default: 4500000.
7. **`qhrtredfc1ge`**
   15min reset threshold for EDFC of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 2.
8. **`dayrtredfc1ge`**
   24h reset threshold for EDFC of 1GbE Ethernet port
   Type: Integer.
   Range: 0-4294967295
   Default: 5.
9. **`qhrtredfe10ge`**
   15min reset threshold for EDFE of 10GbE Ethernet port
   Type: Integer.
   0-2147483647
   Default: 9375000
10. **`dayrtredfe10ge`**
    24h reset threshold for EDFE of 10GbE Ethernet port
    Type: Integer.
    Range: 0-4294967295
    Default: 45000000.
11. **`qhrtredfc10ge`**
    15min reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    0-2147483647
    Default: 20.
12. **`dayrtredfc10ge`**
    24h reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

13. **`qhrtredfe1gevcg`**
    15min reset threshold for EDFE of 1GbE VCG por
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
14. **`dayrtredfe1gevcg`**
    24h reset threshold for EDFE of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.
15. **`qhrtredfc1gevcg`**
    15min reset threshold for EDFC of 1GbE VCG port
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
16. **`dayrtredfc1gevcg`**
    24h reset threshold for EDFC of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.
17. **`qhrtredfe10gevcg`**
    15min reset threshold for EDFE of 10GbE VCG port
    Type: Integer.
    Range: 0-2147483647
    Default: 20.
18. **`dayrtredfe10gevcg`**
    24h reset threshold for EDFE of 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
19. **`qhrtredfc10gevcg`**
    15min reset threshold for EDFC of 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 20.
20. **`dayrtredfc10gevcg`**
    24h reset threshold for EDFC of 10GbE VCG port
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

Command parameters - profile parameters of type LOVC

1. **qhvcbbevc12**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-1799100
   Default: 9000.
2. **dayvcbbevc12**
   Day threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-172713600
   Default: 12000.
3. **qhvcbbelovc3**
   15minute threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
4. **dayvcbbelovc3**
   Day threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
5. **qhvcesvc12**
   15-minute threshold for VVC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-900
   Default: 120.
6. **dayvcesvc12**
   Day threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 350.
7. **qhvceslovc3**
   15-minute threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 150.
8. **dayvceslovc3**
   Day threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 600.

9. **qhvcsesvc12**
   15-minute threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 15.
10. **dayvcsesvc12**
    Day threshold for VC_N_SES and VC_F_SES for VC12 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
11. **qhvcseslovc3**
    15-minute threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
12. **dayvcseslovc3**
    Day threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
13. **qhvcuasvc12**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
14. **dayvcuasvc12**
    Day threshold for VC_N_UAS and VC_F_UAS for VC12 bin..
    Type: Integer.
    Range: 0-86400
    Default: 20.
15. **qhvcuaslovc3**
    15-minute threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin..
    Type: Integer.
    Range: 0-900
    Default: 15.
16. **dayvcuaslovc3**
    Day threshold for VC_N_UAS and C_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

Command parameters - reset profile parameters of type LOVC

1. **`qhrtrvcbbevc12`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-1799100
   Default: 50.
2. **`dayrtrvcbbevc12`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-172713600
   Default: 1200.
3. **`qhrtrvcbbelovc3`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
4. **`dayrtrvcbbelovc3`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
5. **`qhrtrvcesvc12`**
   15-minute reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-900
   Default: 5.
6. **`dayrtrvcesvc12`**
   Day reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 35.
7. **`qhrtrvceslovc3`**
   15-minute reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 10.
8. **`dayrtrvceslovc3`**
   Day reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 60.

9. **`qhrtrvcsesvc12`**
   15-minute reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
10. **`dayrtrvcsesvc12`**
    Day reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
11. **`qhrtrvcseslovc3`**
    15-minute reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
12. **`dayrtrvcseslovc3`**
    Day reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
13. **`qhrtrvcuasvc12`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
14. **`dayrtrvcuasvc12`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
15. **`qhrtrvcuaslovc3`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
16. **`dayrtrvcuaslovc3`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.

Command parameters - profile parameters of type LOPATH

1. **`qhcvvt1`**
   15-minute threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-14399100
   Default: 75.
2. **`daycvvt1`**
   Day threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-1382313600
   Default: 750.
3. **`qhesvt1`**
   15-minute threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
4. **`dayesvt1`**
   Day threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.
5. **`qhsesvt1`**
   15-minute threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-810
   Default: 40.
6. **`daysesvt1`**
   Day threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-77760
   Default: 900.
7. **`qhuasvt1`**
   15-minute threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
8. **`dayuasvt1`**
   Day threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.

Command parameters - profile parameters of type DS3

1. **`qhcvl`**
   15-minute threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0-7200000
   Default: 387.
2. **`daycvl`**
   Day threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0- 691200000
   Default: 3865.
3. **`qhesl`**
   15-minute threshold for Es-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
4. **`dayesl`**
   Day threshold for ES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
5. **`qhesal`**
   15-minute threshold for ESA-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
6. **`dayesal`**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
7. **`qhesbl`**
   15-minute threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
8. **`dayesbl`**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.

9. **qhsesl**
   15-minute threshold for SES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-810
   Default: 4.
10. **daysesl**
    Day threshold for SES-L bin of DS3 Line.
    Type: Integer.
    Range: 0-77760
    Default: 40.
11. **qhcvp**
    15-minute threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-7200000
    Default: 382.
12. **daycvp**
    Day threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-691200000
    Default: 3820.
13. **qhesp**
    15-minute threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
14. **dayesp**
    Day threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
15. **qhesap**
    15-minute threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.

16. **dayesap**
Day threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-86400
Default: 250.
17. **qhesbp**
15-minute threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-900
Default: 25.
18. **dayesbp**
Day threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-86400
Default: 250.
19. **qhsesp**
15-minute threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-810
Default: 4.
20. **daysesp**
Day threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-77760
Default: 40.
21. **qhuasp**
15-minute threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-900
Default: 10.
22. **dayuasp**
Day threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-86400
Default: 10.

23. **qhsasp**
    15-minute threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 2.
24. **daysasp**
    Day threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 8.

Command parameters - profile parameters of type DS1

1. **qhcvsfp**
   15-minute threshold for CV-P bin of DS1 Path with SF format in egress direction.
   Type: Integer.
   Range: 0-16383
   Default: 72.
2. **daycvsfp**
   Day threshold for CV-P bin of DS1 Path with SF format in egress direction.
   Type: Integer.
   Range: 0- 1048575
   Default: 691.
3. **qhcvesfp**
   15-minute threshold for CV-P bin of DS1 Path with ESF format in egress direction.
   Type: Integer.
   Range: 0-16383
   Default: 13296.
4. **daycvesfp**
   Day threshold for CV-P bin of DS1 Path with ESF format in egress direction.
   Type: Integer.
   Range: 0-1048575
   Default: 132960.
5. **qhesp**
   15-minute threshold for ES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-900
   Default: 65.
6. **dayesp**
   Day threshold for ES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 648.

7. **qhsesp**
   15-minute threshold for SES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-810
   Default: 10.
8. **daysesp**
   Day threshold for SES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 250.
9. **qhuasp**
   15-minute threshold for UAS-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-900
   Default: 10.
10. **dayuasp**
    Day threshold for UAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 10.
11. **qhsasp**
    15-minute threshold for SAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-900
    Default: 2.
12. **daysasp**
    Day threshold for SAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 17.

Detailed behavior description

The command shall retrieve the list of profile names of the specified profile type, if only the profile type is specified in the command. If profile type and profile name is specified, and a profile with the specified name exists, then the parameters of the profile is retrieved. If the profile does not exist, the system shall not return a response to the command.

Example input/output

The following example shows the successful completion of a RTRV-TCA-PROF command by the NE:

```
RTRV-TCA-PROF:UNITE-NE::123456::section-line;
```

```
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   "SECTION-LINE:DEFAULT"
   "SECTION-LINE:DEFAULT0"
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-TCA-PROF** command.

Related TL1 messages

RTRV-TMAT3: Retrieve asynchronous adjunct port of the TransMUX card

General

The command **RTRV-TMAT3** allows the user to retrieve all parameters related to the TransMUX asynchronous adjunct port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-TMAT3:*tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier of a TransMUX asynchronous adjunct port.
   Type: AID.
   Range: TMuxAPortAID.
   The keyword **all** is allowed up to shelf level.
   Default: None.
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).

Output format

In response to a valid **RTRV-TMAT3** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier.
   Type: AID.
   Range: TMuxAPortAID. The keyword **`all`** is not allowed.
   Default: None.

Spec block parameters

1. **`cbitmis`** – C-bit Signal Format Mismatch
   DS3 C-bit Signal Format Mismatch parameter indicates a mismatch between the provisioned C-bit signal format and the C-bit format of the DS3 signal.
   For the TransMUX Card: – outgoing DS3 signal (egress direction).
   The DS3 C-bit Signal Format Mismatch parameter will show a MISMATCH value if the DS3 port were provisioned for C-bit parity format, but it actually receives a different type of DS3 format. Otherwise, it will show the value NORMAL.
   The DS3 C-bit Signal Format Mismatch parameter shall have the value:
   - NORMAL, if the Signal Format (fmt) is set to C-BIT and a DS3 signal in C-bit parity channelized DS3 format is received
   - MISMATCH, if the Signal Format (fmt) is set to C-BIT and a DS3 signal in M23 channelized DS3 format is received
   - NA, if the Signal Format (fmt) is set to C-BIT and one of the alarms DS3LOS, DS3LOF, DS3AIS, DS3IDLE is present, or if the Signal Format (fmt) is set to another value than C-BIT, or if the value cannot be determined because pmode is set to NMON or the circuit pack is not present or other system internal reasons.

   Type: Alphanumeric value set.
   Range: NORMAL; MISMATCH; NA.
   Default: None.
2. **`ds3pn`** – DS3 ASAP
   DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   Default: DEFAULT.

3. **`feac`** – Far-End Alarm and Control
   The parameter *feac* indicates the status of the FEAC channel of the incoming C-bit parity formatted DS3 signal. The parameter is only applicable, if *fmt* is set to C-BIT. The parameter shall have the value "NA" if the parameter is not applicable (*fmt* = M23 or UNFRAMED-CC), or the value for the parameter is not available because it cannot be determined.
   For the TransMUX card, the FEAC channel of the outgoing DS3 signal (egress direction) is considered.
   Type: Alphanumeric string.
   Range: String with 6 characters.
   Default: None.

4. **`fmt`** – Signal Format
   This parameter shows the format for the DS3 signal
   Type: Alphanumeric value set. A hyphen ("-") is allowed in the alphanumeric values additionally.

   Range:

   - C-BIT: C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format. M23 format contains seven DS2 signals, which contain DS1 signals.

   Default: C-BIT.

5. **`outfepm`** – Outgoing DS3 Far End Path PM Enable
   This parameter enables/disables the outgoing DS3 far end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.

6. **`outpm`** – Outgoing DS3 Near End Path PM Enable
   This parameter enables/disables the outgoing DS3 near end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.

7. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.

   Range:

   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

   Default: NMON.

8. **ptype** – Port Type
   This identifies the port type of the AID.
   Type: Alphanumeric value set.
   Range: TMAT3
   Default: TMAT3
9. **servcond** – Service Condition
   This parameter indicates its status concerning service involvement.
   Type: Alphanumeric value set.
   Range:
   - INSERVICE: Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.

   Default: INSERVICE.
10. **tca** – DS3 PM TCA
    This parameter assigns a DS3 PM TCA profile name to the designated AID.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    - DEFAULT
    - DEFAULT0

    Default: DEFAULT.

Detailed behavior description

The command retrieves the parameters as described above. The **RTRV-TMAT3** command does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful completion of a **RTRV-TMAT3** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-TMAT3:UNITE-NE:1-1-#-#-21-tma1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ″1-1-#-#-21-tma1:cbitmis=NORMAL,ptype=TMAT3,fmt=C-BIT,....,tca=DEFAULT″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-TMAT3** command.

RTRV-TMST3: Retrieve synchronous adjunct port of the TransMUX card

General

The command **RTRV-TMAT3** allows the user to retrieve all parameters related to the TransMUX synchronous adjunct port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

RTRV-TMST3:*tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier of a TransMUX virtual synchronous adjunct port.
   Type: AID
   Range: TMuxSPortAID
   The keyword **all** is allowed up to shelf level.
   Default: None
3. **ctag** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

In response to a valid RTRV-TMST3 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   ″aid[:spec_block]″
       ...
       ...
   ″aid[:spec_block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   Access Identifier.
   Type: AID.
   Range: TMuxSPortAID. The keyword **all** is not allowed.
   Default: None.

Spec block parameters

1. **ptype** – Port Type
   This identifies the port type of the AID.
   Type: Alphanumeric value set.
   Range: TMST3
   Default: TMST3

Detailed behavior description

The command retrieves the parameters as described above. The command **RTRV-TMST3** does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful completion of a RTRV-TMST3 command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-TMST3:LT-UNITE:1-1-#-#-21-tms1:123456;

   LT-UNITE 00-11-27 08:00:00

RTRV-TMUXPM: Retrieve performance monitoring data of TransMUX pack

The **RTRV-TMUXPM** command is initiated by a user to request the network element to send the current and/or historical Performance Monitoring (PM) data associated with performance monitoring points located on a TransMUX pack. For each value in the *montype* parameter of the **RTRV-TMUXPM** input parameters section, PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command syntax:
RTRV-TMUXPM-*modifier*:*tid*:*aid*:*ctag*::*[montype]*,*[monlev]*,*[locn]*,,*tmper*,*[mondat]*,*[montm]*;

Input parameters

Command parameters

1. **modifier**
This parameter defines the type of performance monitoring point.
Type: Alphanumeric value set.
Range: The following value is for SONET only: TMAT3, TMASTS1, DS1.
Default: None.
2. **tid** – Target Identifier
See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **aid** – Access Identifier
Type: AID
Range:
For TMAT3 modifier: TMuxAPortAID
For TMASTS1 modifier: TMuxAPTNumAID
For DS1 modifier: DS1NumAID
Wildcard values in parts of both AIDs are usable as follows:
   - *all*, *usall* in Simple_UnivSlotAID,
   - *all* in Simple_TMuxAPortAID,

- *all* in Simple_TMuxAPTNumAID,
- *all* in Simple_DS1NumAID.

Default: None.

4. **`ctag`** – Correlation Tag
See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).

5. **`montype`** – Monitored parameter type
This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.
Type: value set.
Range:
   - The following values are for TMASTS1 modifier: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE
   - The following values are for TMAT3 modifier: CVP-EGR, ESP-EGR, ESA-P-EGR, ESB-P-EGR, SESP-EGR, UASP-EGR, FC-P-EGR, SEFS-P-EGR, SAS-P-EGR, AISS-P-EGR, CV-PFE-EGR, ES-PFE-EGR, ESA-PFE-EGR, ESB-PFE-EGR, SES-PFE-EGR, UAS-PFE-EGR, FC-PFE-EGR, SAS-PFE-EGR
   - The following values are for DS1 modifier: CVP-EGR, ESP-EGR, SESP-EGR, UASP-EGR, SAS-P-EGR, AISS-P-EGR

   The following value is also allowed for all input modifiers: ALL.
   Default: ALL.

6. **`monlev`** – Monitored Level
This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.
Type: value set.
Range:
   - 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
   - 0-UP: Means the NE will report zero and all positive data.

   Default: 1-UP.

7. **`locn`** – Location
Location for which the PM data is monitored. The parameter value is only considered if the *montype* value is ALL; otherwise it is ignored for the calculation of the command reply (i.e has no impact on the command).
Type: value set.
Range:
   - NEND: Near-End PM data is requested.
   - FEND: Far-End PM data is requested.
   - ALL: All near-end and far-end data is requested. It applies only to input direction.

   Default: ALL.

8. **tmper** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.
   Range:
   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

   Default: None.
9. **mondat** – Monitored Date
   This requests the beginning date of the interval for which the PM data is to be reported. For both values of tmper parameter, the maximum allowable range of valid dates includes the current and previous one day.
   Type: value set.
   Range:
   - MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
   - ALL: Current and previous day.

   Default: Current date
10. **montm** – Monitored Time
    This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:
    a. A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).
    b. A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).
    c. All applicable beginning times for the given *mondat* value (i.e., all).

    Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondat* value provided is ALL.
    Type: Character string.

Range:

- HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
- THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of $$-$$ indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##- ## indicates the previous 15-min interval.
- ALL: All applicable beginning times for the given *mondat* value.

If the *tmper* value is 1-DAY, the *montm* parameter will not be used.
Default:
If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.
If HOD-MOH is omitted, the PM period for the current time will be reported.

Output format

Normal completion message

If the network element fully complies with the **RTRV-TMUXPM** request, the following normal completion response is returned:

```
    sid date time
M   ctag COMPLD
   "aid:montype,monval,[validity],[tca],[locn],,tmper,[mondat],[montm]"
   . . . . .
   . . . . .
   . . . . .
;
```

Note: The trailing comma has to be present even if the optional parameter is not supported for a dedicated release.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Normal completion message – empty reply

If there is no PM data stored within the NE, then the following response is returned:

```
   sid date time
M   ctag COMPLD
```

;

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID
   Range:
   TMuxAPortAID, TMuxAPTNumAID, or DS1NumAID
   Wildcard values, for example *all*, *usall*, are not used in any parts of the AIDs.
   Default: None.
2. **`montype`** – Monitored parameter type
   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.
   Type: value set.
   Range:
   - The following values are for TMASTS1 modifier: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE
   - The following values are for TMAT3 modifier: CVP-EGR, ESP-EGR, ESA-P-EGR, ESB-P-EGR, SESP-EGR, UASP-EGR, FC-P-EGR, SEFS-P-EGR, SAS-P-EGR, AISS-P-EGR, CV-PFE-EGR, ES-PFE-EGR, ESA-PFE-EGR, ESB-PFE-EGR, SES-PFE-EGR, UAS-PFE-EGR, FC-PFE-EGR, SAS-PFE-EGR
   - The following values are for DS1 modifier: CVP-EGR, ESP-EGR, SESP-EGR, UASP-EGR, SAS-P-EGR, AISS-P-EGR

   The following value is also allowed for all input modifiers: ALL.
   Default: ALL.
3. **`monval`** – Monitored Value
   This parameter contains the measured value of the parameter specified in montype.
   Type: Integer.
   Range: 0-4294967295
   The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.
   W.r.t. value range for the specific PM parameters see
   - “Output parameters” section in “RTRV-TCA-PROF: Retrieve TCA profile” (p. 3-2982) (if thresholding is applicable for that parameter)
   - PM parameter introduction section (if thresholding is not applicable for that parameter).
4. **`validity`** – validity indicator
   This parameter indicates the validity of the PM data.
   Type: Integer.
   Range: 1: valid; (omitted): non-valid.
   If the value is omitted, it indicates that the validity is ″non valid″.

5. **`tca`** – Threshold Crossing Alert
   Type: value set.
   Range:
   For the current interval: *tca* indicates, that the current value exceeds the provisioned threshold. If the value is omitted, it indicates that the current value is below the provisioned threshold.
   For previous intervals, the *tca* parameter indicates the state at the end of the interval.
   Default: None.
6. **`locn`** – Location
   Location for which the PM data is monitored.
   Type: value set.
   Range:
   - NEND: Near-End PM data is requested
   - FEND: Far-End PM data is requested.
7. **`tmper`** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.
   Range:
   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

   Default: None.
8. **`mondat`** – Monitored Date
   This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.
   Type: value set.
   Range: MM-DD: Month-Day
   Default: Current date
9. **`montm`** – Monitored Time
   This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).
   Type: Character string.
   Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

Detailed behavior description

Fault tolerant and filtered retrievals

This command shall only return those parameters, which are specified by the input parameters. This command shall omit parts of the response (maybe to return an empty response) if related performance monitoring has not been enabled (independent whether this occurs due to a specific or wildcard query). This command shall oomitparts of the response due to a wildcard query (maybe to return an empty response) if the related entity does not exist.

Examples

If a command is executed for a specific existing TransMUX asynchronous port entity to retrieve all parameters but the entity has only near-end (thus no far-end) performance monitoring enabled, then a response will be returned containing only the near-end values.

Restrictions on current bin interval

Current bins can only be retrieved for one slot. The AID values “all” and “usall” cannot be used on slot level to retrieve current bins.

Current bins can only be retrieved if the TransMUX pack is plugged-in. If the retrieval of current bins is not possible because of one of the reasons listed above, then the system does not return a response on the **RTRV-TMUXPM** command.

Example input/output

The following example shows the successful completion of a **RTRV-TMUXPM** command by the network element for a TMAT3 port:

```
RTRV-TMUXPM-TMAT3:UNITE-NE:1-1-#-#-39-tma16:123456::\
cvp-egr,1-up,,,15-min ,,00-00&&08-00;

RTRV-ULS: Retrieve upper layer stack

The **RTRV-ULS** command is used to retrieve global parameters of the TCP/IP stack.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-ULS**:tid*::ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for input parameter syntax and description of this parameter.

Output format

If the RTRV-ULS request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   ″spec_block″
   .    .    .
   .    .    .
   .    .    .
   ″spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

1. **`ip_ad_astn`** – IP Address of ASTN
   This parameter is used to set or retrieve the router ID for the SCN and the ONNS node.
   Note: As a consequence, if ip_ad_astn is not configured the whole SWISS application can not be enabled. See also parameter xcsetup in RTRV/ED-EQPT (system).
   Type: Four dot separated numeric strings OR empty string.
   The empty string value is used as indication for an undefined IP address.
   Range: Each numeric string: 0 .. 255.
   Default: empty string.
2. **`ip_ad_uni`** – IP address for UNI
   This parameter is used to retrieve the UNI node IP address.
   Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.
   Range:
   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.

   The values 0.0.0.0 and 1.1.1.1 are not allowed.
   Default: empty string.
3. **`sigPCIP_Address`** – IP address for Signaling Controller (E-NNI node)
   This parameter is used to retrieve the signaling controller (E-NNI node) IP address.
   Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.
   Range:
   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.

   The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.
   Default: empty string.
4. **`sigPCID`** – ID of the Signaling Controller (E-NNI node)
   This parameter is used to retrieve the signaling controller (E-NNI node) ID.
   Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.
   Range: Four times numeric string: 0 .. 255
   Default: empty string.
5. **`ip_drad`** – IP Default Router Address
   This parameter is used to set or retrieve the IP default router address (IPv4) to which the host points to, needed for the T-TD functionality.
   Type: Four dot separated numeric strings OR empty string. The empty string value is used as indication for an invalid/undefined IP address.
   Range: Each numeric string: 0 .. 255.
   Default: empty string.

6. **`ip_drlan`** – IP Default Router LAN port AID
   This parameter specifies with which LAN port the default router is associated.
   Type: AID.
   Range: LanPortAID. The value lanall is not allowed.
   Default: 1-1-lan1.
7. **`lv_port`** – T-TD Length Value Port
   This parameter is used to set or retrieve the port number over which the T-TD function is accessible using the Length Value encoding method.
   Type: Numeric string.
   Range: Each numeric string: 0 .. 65535, except the value 3083.
   Default: 3081.
8. **`raw_port`** – T-TD Raw Mode Port
   This parameter is used to set or retrieve the port AID of number over which the T-TD function is accessible using raw-mode encoding.
   Type: Numeric string.
   Range: Each numeric string: 0 .. 65535, except the value 3083.
   Default: 3082.

Detailed behavior description

The command retrieves system parameters as described in the Output parameter section.

Example input/output

The following example shows the result of a RTRV-ULS command:

```
RTRV-ULS:LT-UNITE::123456;
   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
   ”ip_ad_astn=127.93.94.10”
   ”ip_ad_uni=221.131.82.1”
   ”ip_drad=198.84.65.20”
   ”ip_drlan=1-1-lan1”
   ”lv_port=3081”
   ”raw_port=3082”
;
```

The following example shows the result of a RTRV-ULS command:

```
RTRV-ULS:LT-UNITE::123456;
   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
   ”ip_ad_astn=127.93.94.10”
   ”ip_ad_uni=221.131.82.1”
   ”ip_drad=198.84.65.20”
   ”ip_drlan=1-1-lan1”
   ”lv_port=3081”
```

```
   "raw_port=3082"
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-NE** command.

Related TL1 Messages

“ENT-ULS: Enter upper layer stack” (p. 3-1944)

RTRV-ULSDCC-L3: Retrieve layer 3 related parameters

The command **RTRV-ULSDCC-L3** is used to retrieve the layer 3 parameters of the OSI nodes or the SCN node. Up to 8 independent OSI nodes can exist in an NE: Node-1 has an NSAP and is created by default. Node 2-8 have each a Network Entity Title (NET). NSAP = NET + SEL . Node 2-8 can be created and deleted, see commands **ENT-ULSDCC-L3**, **DLT-ULSDCC-L3**. The SCN node is created when an ASTN IP address is defined (see **ENT-ULS**), for this node the command retrieves only the NSAP parameter used by I-ISIS. For OSI nodes the parameters of the NSAP field, IS level, IS domain, RA prefix and RA destination node are retrieved.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-ULSDCC-L3**:*tid::ctag[::osinode];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command **ENT-ULSDCC-L3**. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.
   Type AID.
   Range: OSI_node_AID | SCN_node_AID.
   Default: If this field is omitted then the command shall provide output for all nodes which are created.

Output format

If the **RTRV-ULSDCC-L3** is successful, the following normal completion response is returned:

```
sid date time
```

```
M  ctag COMPLD
   "osinode:spec_block"
        ...
   "osinode:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **osinode**
   See definition of input parameter *osinode* in **RTRV-ULSDCC-L3**. The value *osinodeall* is not allowed as output parameter.

Spec block parameters

1. **autoencap** – Auto Encapsulation
   The parameter *autoencap* is used to enable or disable the Auto Encapsulation function. The parameter is only supported for osinode1. The parameter shall be omitted for all other osinodes.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.
2. **l3afi** – NSAP/NET Authority and Format Identifier
   This parameter sets or retrieves the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 10 – 99
   Default: 39. This value identifies the iso_dcc format.
3. **l3idi** – NSAP/NET initial Domain Identifier
   This parameter consists of two values:
   - a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
   - a 1 semi-octet (1-digit hexadecimal) IDI pad part. The parameter is used for set and retrieve values.

   Type: Hexadecimal number.
   Range: 0000 – FFFF
   Default:
   SONET: IDI = 840; IDI pad = F
   SDH: IDI = 000; IDI pad = 0.

4. **`l3dfi`** – NSAP/NET DSP Format Identifier
   This parameter (2-digit hex) NSAP is used to set or retrieve the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 00 – FF.
   Default: 80. This value represents the SONET DSP format.
5. **`l3org`** – NSAP/NET Organization Identifier
   This parameter of NSAP is used to set or retrieve the NSP (allocated Company Code).
   Type: Hexadecimal number.
   Range: 000000 – FFFFFF.
   Default: 000000.
6. **`l3res`** – NSAP/NET Reserved
   This NSAP part currently has not been assigned a specific purpose.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: 0000.
7. **`l3rd`** – NSAP/NET Routing Domain
   This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: 0000.
8. **`l3area`** – NSAP/NET Area Identifier
   This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: 0000.
9. **`l3sys`** – NSAP/NET System Identifier
   This system parameter of the NSAP is set by the Equipment Manufacturer. The value is fix and globally unique among all NEs. For values of NSAP/NET system parameter see chapter Default below.
   Type: Hexadecimal number.
   Range: 000000000000 – FFFFFFFFFFFF
   Default:
   - Node-1: IEEE-MAC address of LAN1
   - Node-2: IEEE-MAC address of LAN1 +1
   - Node-3: IEEE-MAC address of LAN1 +2
   - Node-4: IEEE-MAC address of LAN1 +3
   - Node-5: IEEE-MAC address of LAN1 +4
   - Node-6: IEEE-MAC address of LAN1 +5

- Node-7: IEEE-MAC address of LAN1 +6
- Node-8: IEEE-MAC address of LAN1 +7
- scnnode: IEEE-MAC address of LAN1 +8 (default)

10. **`l3sel`** – NSAP Selector
    This parameter serves to differentiate multiple access points (NSAPs) for the same NE (node-1). The values cannot be set manually. The NET addresses of node 2-8 have *l3sel*=00.
    Type: Hexadecimal number.
    Range: 00 – FF. Values:
    - 1D: For TP4 PDUs, whenTP4 runs over CLNP, Also used for SDH supporting NEs
    - 00: For NET, used for exchanging PDUs in the ES-IS and IS-IS routing exchange protocols
    - 04: For NSAP of CLNP PDUs, encapsulated IP packets
    - AF: For TARP PDUs, when TARP is run over CLNP.

    Default: 1D, see NET addresses of node 2-8 are reported as NSAP with *l3sel*=00.
11. **`l3isisnl`** – Layer 3 IS Level
    This parameter indicates the network router type: ES-IS (level1, value L1), IS-IS (level2, value L2) and partition repair capability (value3).
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: Alphanumeric string.
    Range:
    - L1: this means level1, IS-IS, only allowed when parameter l3radesnode=0
    - L12: this means level2, IS-IS which contains also level1, ES-IS
    - L12PRC : this means partition repair capable (PRC) and contains also level1 and level2.

    Default: L1.
12. **`l3domain`** – Layer3 IS Domain
    Per node in a NE, a domain group must be specified. This will be done with this parameter which can be set and retrieved. All nodes in the NE with the same domain-number are interconnected and can communicate without the need for inter-domain routing via RA-PREFIX.
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: Alphanumeric string.
    Range:
    - 1 for osinode1
    - 1 – 2 for osinode2 to osinode8.

    Default: 1.

13. **`l3raprefix`** – Layer3 Reachable Address Prefix
    This value specifies an area address or a part of an area address representing an area address group. This parameter is needed when nodes in different routing domains (see *l3domain*) must communicate. The node must forward then CLNP PDUs to the RA-Destination-Node if the destination NSAPs of CLNP PDUs match with the PA-Prefix.
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: Hexadecimal number.

    Range:

    - NONE,
    - a string of 1 to 13 bytes: first byte (most significant): 10 – 99; rest: 0000 – FFFF.

    The value represents an area address or a part of an area address beginning with AFI.
    Default: empty string.
14. **`l3radesnode`** – Layer3 Reachable Address Destination Node
    This parameter is in combination with parameter l3raprefix necessary. The value represents the destination node in the same NE. An internal connection over a domain-boundary is established between this node and the RA-Destination-Node, with IS-IS disabled over that connection.
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: AID and digit value.

    Range:

    - 0, osinode{2-8} for osinode1
    - 0, osinode1 for osinode2 to osinode 8.

    Value 0 indicates that functionality of RA-Prefix is disabled.
    Default: 0.
15. **`nsapcount`** – Number of OSI Nodes in level 1 Area
    This parameter indicates the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the osinode parameter is located. When the number of OSI nodes in the level 1 area is more than the maximum supported number (250), the value of this parameter is shown as ″250+″,which indicates a

state of NSAP count overflowed. The parameter is omitted for the SCN node.
Type: Value set.
Range: 1 – 250 if the number of nodes is less or equal to 250. 250+ if the number of nodes exceeds 250.
Default: 1

16. **`nsapthlev`** – Number of OSI Nodes Threshold Level
This parameter indicates the NSAP count threshold level for monitoring the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the *osinode* parameter is located. A threshold value of zero (0) indicates that NSAP threshold alarming is disabled. The parameter is omitted for the SCN node.
Type: Numeric string.
Range: 0 no alarming; 1 – 250 threshold alarming
Default: 0

Detailed behavior description

The command retrieves system parameter as described in the Output parameter section.

Example input/output

The following example shows the result of RTRV-ULSDCC-L3:

```
RTRV-ULSDCC-L3:NE-UNITE::123456::osinode1;
   NE-UNITE 00-12-24 11:01:59
M  123456 COMPLD
   ″osinode1:L3AFI=39,L3IDI=840F,L3DFI=80,
   L3ORG=100100,L3res=0000,L3RD=0000,L3AREA=0000,
   L3SYS=08006A112345,L3SEL=1D,L3ISISNL=L12PRC,
   L3DOMAIN=1,L3RADESNODE=0,NSAPCOUNT=2,NSAPTHLEV=0″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the RTRV-ULSDCC-L3 command.

Related TL1 messages

- “ENT-ULSDCC-L3: Create a further OSI node” (p. 3-1951)
- “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack” (p. 3-1312)
- “DLT-ULSDCC-L3: Delete a node ID other than node-1” (p. 3-265)

RTRV-ULSDCC-L4: Retrieve OSI layer 4 related parameters

The command **RTRV-ULSDCC-L4** is used to retrieve layer 4 parameters of the OSI stacks. Layer 4 include some TARP parameter which can be modified and the TARP Manual Adjacencies parameter which can be provided, modified or deleted.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-ULSDCC-L4**:*tid::ctag[::osinode];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command **ENT-ULSDCC-L3**. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.
   Type AID.
   Range: OSI_node_AID | SCN_node_AID.
   Default: If this field is omitted then the command shall provide output for all nodes which are created.

Output format

If the RTRV-ULSDCC-L4 is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "osinode:spec_block"
        ...
   "osinode:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Manual adjacencies

If more than one manual adjacency is defined for one osinode, they appears on separate output lines.

Example:

```
   sid date time
M  ctag COMPLD
   ″osinode1:<other spec_block parameters>″
   ″osinode1:l4ajnsap=39840F800000000000000000123456789ABC00″
   ″osinode1:l4ajnsap=39840F800000000000000000023456789ABCD00″
;
```

Output parameters

Command parameters

1. **`osinode`**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command **`ENT-ULSDCC-L3`**. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.
   Type AID.
   Range: OSI_node_AID | SCN_node_AID.
   Default: If this field is omitted then the command shall provide output for all nodes which are created.

Spec block parameters

1. **`l4etdc`** – TARP Data Cache
   This parameter is only valid for node-1. It is used to enable or disable TARP data cache.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE.
2. **`l4etof`** – TARP origination
   This parameter only valid for node-1. It is used to enable or disable TARP Origination function and is valid for all interfaces of a node.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: ENABLE (for osinode1), DISABLE (for osinode2-8, fixed).

3. **`l4etpf`** – TARP propagation
   This parameter is used to enable or disable TARP Propagation function for a node.
   Type: Alphanumeric value set.
   Range:
   - ENABLE (default)
   - DISABLE.
4. **`l4etrf`** – TARP responder
   This parameter is only valid for node-1. It is used to enable or disable TARP responder function
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE.

   Default: For node-1: ENABLE DISABLE (fixed for nodes 2-8).
5. **`l4ajnsap`** – TARP Manual Adjacency List
   This parameter specifies the NSAP address portion of an entry in the TARP Manual Adjacent NE list. Up to two addresses are possible for each node in a 1675 LambdaUnite MSS NE.
   Type: Hexadecimal number or alphanumeric value set.
   Range: NONE, 20 octet (40-digit hex) long address.
   The NSAP address / NET is composed of the following components:
   - l4ajafi 10 – 99
   - l4ajidi 0000 – FFFF
   - l4dfi 00 – FF
   - l4alorg 000000 – FFFFFF
   - l4ajres 0000 – FFFF
   - l4jrd 0000 – FFFF
   - l4jarea 0000 – FFFF
   - l4ajsys 000000000000 – FFFFFFFFFFFF
   - SEL 00 The last byte indicates the selector and is not to set.

   Note: For more details see description of ENT-ULSDCC-L3.
   Default: NONE (no TARP manual adjacencies).

Detailed behavior description

The command retrieves system parameter as described in the Output parameter section.

Example input/output

The following example shows the result of RTRV-ULSDCC-L4:

```
RTRV-ULSDCC-L4:NE-UNITE::456789::osinode1;
```

```
   NE-UNITE 01-17-01 18:11:01
M  456789 COMPLD
   "OSINODE1:l4etof=DISABLE,l4etpf=ENABLE,l4etrf=ENABLE,
   l4etdc=ENABLE,
   l4ajnsap=39840F80000000000000000000123456789ABC00"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the RTRV-ULSDCC-L4 command.

Related TL1 messages

- "ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
- "DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack" (p. 3-269)

RTRV-USER: Retrieve user

The **RTRV-USER** command retrieves a user's own security information.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S2

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-USER**:*tid*::*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output format

After receiving the **RTRV-USER** command, the following normal completion response is returned:

```
^^^sid^date^time
M^^ctag^COMPLD
^^^"uid::spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **uid** – User ID
   User ID whose security parameters are to be retrieved.
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of uid values for the **ACT-USER** command are not allowed. Valid uid values for the **ACT-USER** command are case-sensitive

alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
Type: Alphanumeric string (case-sensitive)
Range: 5 – 10 characters. The uid ALL is not allowed in any combination of upper or lower cases.

Spec block parameters

1. **`page`** – Password Aging Interval
   This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.
   Type: Integer.
   Range: 0, 7-999 [days]
   Default: 90

2. **`screen`** – Message Screening
   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)
   Type: Alphanumeric string An '&' is also allowed for concatenation of values.
   Range:
   - DBCHG
     Data Base Change notifications – changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes). The user will receive **`REPT DBCHG`** messages.
   - STCHG
     State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **`REPT DBCHG`** messages.
   - PSCHG
     Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.
   - ALARMS
     Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.
   - ONNS
     ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.
   - OWN
     Responses to own commands. The user will receive no other notifications.
     Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.
   - NA

Not applicable. This value is reserved for users with uidclass=MEMADMIN. The notification behavior is controlled in this case by the user class.

Default: OWN
If more than one value is set the values will be concatenated by ’&’.
Example: DBCHG&STCHG&ALARMS

3. **`tmout`** – Inactivity Timeout Period
   If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.
   Type: Integer.
   Range: 0 – 999 [minutes]
   Default: 30

4. **`uidclass`** – UID Class
   This is the user class of a *uid*.
   Type: Alphanumeric value set.
   Range:
   - OTHER – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
   - MEMADMIN – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command **`RTRV-AO`**.

   Default: OTHER

5. **`upc`** – User Privilege Code List
   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands (’&’). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.
   Type: Alphanumeric string; for concatenation “&” is also allowed.
   Range: P***i***, M***i***, T***i***, S***i***, PM***i***, D***i***, C***i***, where ***i*** is an integer ranging from 0 to 5, with ***i*** = 0 implying that there is no authorization for the functional category. S0 is not allowed.
   Default: P1&M1&T1&S1&PM1&C0 except for super users: P5&M5&T5&S5&PM5&C5.
   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.
   See also “List of user privilege codes” (p. 15-1).

Example input/output

The following example shows the successful completion of **`RTRV-USER`** command by the NE:

`RTRV-USER:LT-UNITE-123::123456;`

```
   sid date time
M  ctag DENY
```

```
   SDNC
   /* Status, Data Not Consistent,invalid instance of entity */
;
```

RTRV-USER-SECU: Retrieve user security

The **RTRV-USER-SECU** command can be initiated by a user to retrieve user security information of one or all the users in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-USER-SECU**:*tid*:[*uid*]:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **uid** – User ID
   If this parameter is omitted, all *uid*s will be retrieved.
   See definition of “ACT-USER: Activate user” (p. 3-24).
3. **ctag** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

If the NE has logins to report, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″uid::spec_block″
   .
   .
   ″uid::spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **uid** – User ID
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of uid values for the **ACT-USER** command are not allowed. Valid uid values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
   Type: Alphanumeric string (case-sensitive)
   Range: 5 – 10 characters. The uid ALL is not allowed in any combination of upper or lower cases.

Spec block parameters

1. **alw_login** – Allow Login
   This parameter displays the enable/disable state of a User ID.
   A User ID can be automatically disabled by the system when the time specified by parameter *usrage* (see “RTRV-NE-SECU: Retrieve NE security” (p. 3-2552)) expires or via the **ED-USER-SECU** command. A User ID can be enabled via the **ED-USER-SECU** command.
   If a User ID is disabled, logins with that User ID are denied.
   Type: Alphanumeric value set.
   Range:
   - YES: User ID is enabled
   - NO: User ID is disabled

   Default: YES
2. **initobs** – Initialization Observability
   This parameter allows the system to accept commands before it has completed initialization. Do not enable this parameter in networks using a Telcordia operations system.
   Type: Alphanumeric value set.
   Range: DISABLE – The feature is disabled.
   Default: DISABLE
   Note: 1675 LambdaUnite MSS does not support Initialization Observability feature. This parameter is only for compatibility. The DISABLE value will be returned as fixed value.
3. **page** – Password Aging Interval
   This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.
   Type: Integer.
   Range: 0, 7-999 [days]
   Default: 90

4. **`screen`** – Message Screening
   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)
   Type: Alphanumeric string An ’&’ is also allowed for concatenation of values.
   Range:
   - DBCHG
     Data Base Change notifications: changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes).
     File Transfer In-progress notifications: The user will receive **`REPT DBCHG`** and REPT EVT FXFR messages.
   - STCHG
     State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **`REPT DBCHG`** messages.
   - PSCHG
     Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.
   - ALARMS
     Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.
   - ONNS
     ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.
   - SECURITY: Security event notifications
   - OWN
     Responses to own commands. The user will receive no other notifications.
     Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.
   - NA
     Not applicable. For users with uidclass=MEMADMIN only this value is allowed. The notification behavior is controlled in this case by the user class. If the value NA is applied for users of other user classes, then the value has the same effect as DBCHG.

   Default: OWN
   If more than one value is set the values will be concatenated by ’&’.
   Example: DBCHG&STCHG&ALARMS

5. **tmout** – Inactivity Timeout Period
   If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.
   Type: Integer.
   Range: 0 – 999 [minutes]
   Default: 30
6. **ucpl** – User Community Priority Level
   This parameter specifies with which priority the commands of a user will be operated by the NE. Input commands from users with higher priority are executed before commands from users with lower priority.
   Type: Integer.
   Range: 1
   Default: 1
   Note: 1675 LambdaUnite MSS does not support User Community Priority Level's. Only the default value 1 will be reported. The value is not setable.
7. **uidclass** – UID Class
   This is the user class of a *uid*.
   Type: Alphanumeric value set.
   Range:
   - OTHER – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
   - MEMADMIN – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command **RTRV-AO**.

   Default: OTHER
8. **upc** – User Privilege Code List
   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands ('&'). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.
   Type: Alphanumeric string; for concatenation "&" is also allowed.
   Range: P***i***, M***i***, T***i***, S***i***, PM***i***, D***i***, C***i***, where ***i*** is an integer ranging from 0 to 5, with ***i*** = 0 implying that there is no authorization for the functional category. S0 is not allowed.
   Default: P1&M1&T1&S1&PM1&C0 except for super users: P5&M5&T5&S5&PM5&C5.
   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.
   See also "List of user privilege codes" (p. 15-1).

Example input/output

Example for specified user:

The following example shows the successful completion of **RTRV-USER-SECU** command by the NE. The example below retrieves the security information associated with the user specified in the *uid* field:

RTRV-USER-SECU:LT-UNITE-123:nbguser1:123456;

```
   sid date time
M  ctag DENY
   IENE
   /* Input, Entity Not Exists */
;
```

Example for all users:

The following example shows the successful completion of **RTRV-USER-SECU** command by the NE. The example below retrieves the security information associated with all the users from the NE:

RTRV-USER-SECU:LT-UNITE-123::123456;

```
   LT-UNITE-123 05-05-31 08:00:00
M  123456 COMPLD
   "LUC01::upc=S5,screen=DBCHG&STCHG&PSCHG&ALARMS,page=90,tmout=30,alw_

   "cathrin::upc=T2,screen=OWN,page=90,tmout=30,alw_login=YES,uidclass=OTHER"
;
```

Error responses

Validation rule: invalid uid

If the NE receives an RTRV-USER-SECU command with an invalid (unknown) Only the own *uid* value.

Error code: `IDNV – Input, Data Not Valid, invalid UID`

RTRV-VC3: Retrieve VC3 tributary

General

The command **`RTRV-VC3`** is used to retrieve all parameters related to a VC3 tributary.

Note: If a tributary AID (Access IDentifier) is specifed in the RTRV-VC3 request for a slot provisioned with a GE1 pack (e.g. 1-1-#-#-1-1-1 is used), then an empty reply is returned instead of: `IENE – Input, Entity Not Exists`.

For GE1 the "RTRV-VCGTRIB: Retrieve virtual concatenation group tributary " (p. 3-3109) command must be used.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **`RTRV-VC3`**:*tid*:*aid*:*ctag*;

Command parameters

1. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **`aid`** – Access Identifier
   AID of a SDH tributary. The keyword **`all`** is allowed on slot, port and tributary level. The so called ″dynamic parameters″ is reported, if a **`all`** is used at the tributary level.
   The ″dynamic parameters″ are:
   - *ptrc*, *ptrcst*, *siglb*, *trailstate*.
     Type: AID
     Range: STS1NumAID.
3. **`ctag`** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

   Important! To retrieve the dynamic parameters (*ptrc*, *ptrcst*, *siglb*, *trailstate*) of all tributaries use the ("RTRV-ALL: Retrieve all (tributary)" (p. 3-2228)) command and set the parameter *dyn* to YES.

Output format

In response to a valid RTRV-VC3 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Description: AID of the SDH tributary. The keyword **`all`** is not allowed on any level.
   Type: AID
   Range: STS1NumAID

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
2. **`brstthr`** – Bursty Error Threshold
   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, 15, 20, 25, 30, … 50.
   Default: 30.
3. **`crslpbkrate`** – Cross-connect loopback Rate
   It is independent from the current interface standard and therefore both SDH and SONET values are allowed.
   The parameter *crslpbkrate* is not reported if the parameter *crlspbkstat* indicates that no loopback is set.
   Type: Alphanumeric value set.

Range:

- VC3
- VC4
- VC44C
- VC416C
- VC464C
- STS1
- STS3
- STS12
- STS48
- STS192

4. **`crslpbkstat`** – Cross-connect loopback status
   State of cross- connect loopback.
   Type: Alphanumeric value set.
   Range:
   - YES = Cross-connect loopback is provisioned
   - NO (default) = No cross-connect loopback is provisioned.
5. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON
   Type: numeric value set.
   Range (as exponents of 10): –5; –6 (default); –7; –8; –9
6. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.
   Type: numeric value set.
   Range (as exponent of 10) –3 (default); –4; –5.
7. **`exphptrc`** – Expected Path Trace (J1)
   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.
8. **`feppm`** – Far-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

9. **hptimmon** – Path Trace Monitoring Enable (J1)
Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

10. **loca** – Ring A-node TID
This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
loca is introduced specifically for use related to ONNS application.
Type: TID or empty-string.
Range: Please refer to the TID definition in "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: "". This is displayed as \"\" in output direction.
11. **locz** – Ring Z-node TID
This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.
locz is introduced specifically for use related to ONNS application.
Type: TID or empty-string.
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: "". This is displayed as \"\" in output direction.
12. **neppm** – Near-End Path PM Enable
It indicates whether this performance monitoring feature is enabled or disabled.
Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

13. **pjepm** – Pointer Justification Event PM Enable
It indicates whether this performance monitoring feature is enabled or disabled.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

14. **`pmhpfeses`** – Performance Monitoring Path Far-End SES Threshold
This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
15. **`pmhpneses`** – Performance Monitoring Path Near-End SES Threshold
This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
16. **`ptca`** – Path TCA Profile Pointer
Type: Alphanumeric string.
Range: string with up to 24 characters.
Default: DEFAULT0.
17. **`ptrc`** – Path Trace (J1)
This parameter shows the value of the path trace identifier on the incoming path overhead J1 byte of a non-terminated tributary. The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then ptrc contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to a signal-fail condition or intra-NE communication problems, and the output parameter ptrc is omitted from the response. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).
Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range:
    - 1 byte for non-specific repeating byte
    - 16 byte: These 16 byte shall consist of 15 byte information and the CRC7 byte
    - 64 bytes: This is a pure byte stream without any restrictions.
18. **`ptrcrfmt`** – Path Trace Read Format (J1)
The read format of J1, the incoming path trace (ptrc).
Type: numeric string.

Range:

- 2: for non-specific repeating byte
- 16: for 16 byte specific string.
- 64: for 64 byte string.
  Default: 2.

19. **ptrcst** – Status of Incoming Path Trace (J1)
    This parameter shows the status of the value of the incoming path trace identifier which is available with parameter ptrc. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).
    Type: Alphanumeric value set.
    Range:
    - NORMAL: ptrc contains a valid value
    - UNAVAILABLE: no valid value for ptrc could be obtained by the system
    - AIS: no valid value for ptrc due to an SF condition.
20. **sdsfmode** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in BURST or POISSON mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON
21. **siglb** – Signal Label
    This parameter shows the value of the signal label on the incoming path overhead C2 byte of a non-terminated VC tributary. The parameter is not reported if the *trailstate* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE. For concatenated tributaries the system shall not return this parameter (see detailed behavior below) .
    Type: Alphanumeric value set.
    Range: 00, 01, …, FE, FF; i.e. two hexadecimal digits.
22. **substr** – Substructured
    This parameter indicates if the tributary is substructured.
    Substructure for LO cross-connections:
    A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross-connections.
    The parameter *substr* is set autonomously when LO cross-connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower order cross-connection creation/deletion behavior description for the commands ENT-CRS and DLT-CRS).
    A sub structured HO tributary cannot be used to set up HO cross-connections. The parameter *substr* is set autonomously when the LO substructure is created or deleted using the **ED-SUBS** command.
    Substructure for conversion cross-connections:

A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross-connections.
The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created.
A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross-connections.
Type: Alphanumeric value set.

Range:

- YES: Automatically sub structured for LO cross-connections
- MANSUB: Manually sub structured for LO cross-connections
- CNVSUB: Automatically sub structured for the LO side of conversion cross-connections
- NO (default): Not sub structured, not used for conversion cross-connections

23. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
   - TR-only (also known as the implicit reset method)
   - TR-RTR (also known as the explicit reset method).
   Type: Alphanumeric value set.
   Range: TR, TRRTR (default).
24. **`tmonmd`** – Tributary Monitoring Mode
This parameter indicates the mode of the tributary.
Type: Alphanumeric value set.
Range:
   - MON = alarm monitoring is taking place on the port.
   - NMON (default) = alarm monitoring is not occurring on the port.
25. **`trailstate`** – Trail State (C2)
It is possible to read the accepted trail value status (C2) of every VC which is terminated/monitored in the system. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).
Type: Alphanumeric value set.

Range:

- NORMAL: for accepted TSL which has valid payload type
- AIS: for SSF, VC-AIS, dTIM or dUNEQ
- UNAVAILABLE: for TSL which does not meet the acceptance criteria or no reporting is possible.

Default: UNAVAILABLE.

26. **`tribsdhpn`** – Tributary Alarm Severity Assignment Profile
This parameter points to a tributary ASAP profile name of type PATH for the designated AID.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: string with a maximum of 24 characters.
Default: DEFAULT.

Detailed behavior description

Applicability for VC4 and concatenated signals

The command **`RTRV-VC3`** is also applicable to VC4 tributaries. Even though a VC4 signal is not a concatenated VC3 signal in a strict sense, from a pointer processor viewpoint it can be considered to be comprised of three VC3 signals which have the properties of a concatenated signal. Thus it is not necessary to have a separate RTRV command for VC4.

Retrieval of concatenated tributaries

It is allowed to retrieve data from concatenated tributaries and the system responds by returning all parameters which are not derived from traffic. The details can be found in the parameter description.

Concatenated tributaries are such tributaries, that are not the leftmost ones in concatenated signals, e.g. if an OC 48 port is provisioned for a fixed traffic of AU4-16c, STS-1 #1 represents the VC4-16c defined and all other STS-1s #2 to #48 do currently not represent valid substructures and thus are concatenated tributaries. The retrievable values e.g. for the STS-1s #2 to #48 are irrelevant for transmission.

Parameters derived from traffic are data like trace identifiers and signal labels which are collected from the actual input signal and thus do not exist for concatenated tributaries.

Behavior for non-existing entities

If the specified VC3/VC4 tributaries do not exist, the command shall return an empty response. E.g. if an attempt is made, to retrieve VC3/VC4 tributaries on a GbE circuit pack.

Example input/output

```
RTRV-VC3:LT-UNITE:1-1-#-#-3-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-3-1-1:crslpbkstat=NO,tmonmd=NMON,tribsdhpn=Default,
ptca=Default0,neppm=DISABLE,pmhpneses=30,pmhpfeses=30,degthr=-
      6,...,ptrcrfmt=1,dexcthr=-3,ptrc=00,ptrcst=NORMAL,sdsfmode=POISSON"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the RTRV-VC3 command.

Check CCB against istd for related port

Validation rule: Check CCB against *istd*

Check wether the CCB fits to *istd* of the related port.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`.

E.g. DENY, if a command with rr=VC3 is made on a port which is provisioned as *istd* = SONET.

References

GR-199-CORE (RTRV-*rr*)

RTRV-VCG: Retrieve virtual concatenation group

The **RTRV-VCG** command retrieves the attributes of a virtual concatenation group.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-VCG***[-modifier]:tid:aid:ctag[:::spec_block];*

Input parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the virtual concatenation group of the unit. Implicit, it indicates the transmission rate for which VCG related data is retrieved. The parameter modifier must be given if a virtual concatenation group on a GE10PL1 or ES64U pack is addressed. Otherwise this parameter has to be omitted.
   Type: Alphanumeric value set.
   Range: 1GEPL representing a 1 GE port on the GE10PL1 pack; 10GEPL representing a 10 GE port on the GE10PL1 pack, ES64U representing a VCG port at an ES64U subsystem.
2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **aid** – Access Identifier
   This parameter specifies the virtual concatenation group (VCG) to be operated on.
   Type: AID.

   Range: VCGAID as defined in AID structure. The values

   - *vall* for Simple_VCGAID and
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID

- *all* for Simple_ShelfAID and
- *all* for BayAID

are accepted.

4. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Spec block parameter

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values *usall* or *vall* at the appropriate positions of the input AID. For input AIDs not using *usall* or *vall* this parameter is not allowed. This implies that with such input AIDs the dynamic parameters are always returned.
   The following output parameters of a vcgport port are affected: *mfiv*, *macaddr*, *stmd*, *stpop*, *stpid*, *stprole*, *vss*, *vvidlsd*.
   Note that not only those parameters have to be returned which are supported by the related Ethernet pack. Not all Ethernet packs support all listed parameters. For details refer to the detailed specification of those output parameters.
   For *modifier* ES64U, the parameter *dyn* is not supported because none of these parameters will be returned.
   Type: Alphanumeric value set.
   Range:
   - YES: Report dynamic parameters in the reply as well
   - NO (default): Do not report dynamic parameters in the reply.

Output format

If the NE fully complies with the **`RTRV-VCG`** request, the following normal completion response is returned:

```
sid date time
M  ctag COMPLD
   ″aid::spec_block″
      <1 or more of the line above>
   ″tribaid:mfiv,MFIV″
    <no such line, if the virtual concatenation mode is disabled, else
     no such line, if no dynamic data are retrieved, else
     no such line, if modifier = ES64U, else
     one or more lines, one for each tribaid belonging to aid>
       ...
       ...
   ″aid::spec_block″
```

```
      <1 or more of the line above>
   ”tribaid:mfiv,MFIV”
    <no such line, if the virtual concatenation mode is disabled, else
     no such line, if no dynamic data are retrieved, else
     no such line, if modifier = ES64U, else
     one or more lines, one for each tribaid belonging to aid>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter specifies the VCG to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values
   - *vall* for Simple_VCGAID and
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   are excluded.
2. **`tribaid`** – Tributary Access Identifier
   The tributary access identifier specifies a tributary belonging to the virtual concatenation group (VCG) given by the aid above.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   This specification is necessary due to hardware restrictions of the Gauss device. If the parameter *tribaid* is not supported, then the parameter shall be omitted.
   Type: AID.
   Range: VCGNumAID as defined in AID structure. The values
   - *all* for Simple_VCGNumAID,
   - *vall* for Simple_VCGAID,
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   are excluded.

3. **mfiv** – Multiframe Indicator Value
   This parameter reports the differential delay between the tributary addressed by *tribaid* (see above) and the fastest tributary of the VCG. The fastest tributary has the value zero. For each retrieve of a VCG there is a report of *mfiv* for all tributaries belonging to the VCG.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   This specification is necessary due to hardware restrictions of the Gauss device. If the parameter *mfiv* is not supported, then the parameter shall be omitted.
   Type: Alphanumeric value set.
   Range:
   - 0, 125, 250, 375, …, 511750, 511875 [microseconds]
   - NA
   - UNAVAILABLE

   In fact the reported range for delay is 0 … 255875 microseconds. Other values can only be reported as raw values without a delay calculation between the tributaries. UNAVAILABLE is reported when the accepted MFI contents do not meet the basic acceptance criteria (multiframe alignment not completed), or intra-NE communication with the reporting entity is disrupted. NA (Not Applicable) is reported under defect conditions detected by the Sn[i] termination function or the VC-n is not part of an S-n-Xv group.

Spec block parameters

1. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other eport classes in future.
   This parameter is supported by ports of *eportClass* UNI.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: IPv4 format: Four dot separated numeric string
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
2. **cnprole** – Customer/Network Port Role
   This parameter specifies whether the addressed port is used as a customer WAN port or a network WAN port.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.

If the parameter *cnprole* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: CUSTOMER, for a customer WAN port. NETWORK, for a network WAN port.
Default: NETWORK.

3. **`dftpri`** – Default User Priority
   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   If the parameter *dftpri* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - HIGH
   - LOW (default).
4. **`dftvlan`** – Default VLAN Identifier
   The parameter *dftvlan* specifies the value of the VLAN identifier which is applied to ingressing frames (tagging) . This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   If the parameter *dftvlan* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: 1, 2, 3, … 4092, 4093; UNAVAILABLE (default)
5. **`enetpn`** – Ethernet Alarm Severity Assignment Profile Name
   This parameter points to an ASAP profile name of type ENET for the designated AID.
   Ethernet port and VCG port have the same ASAP profile named ENET.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
6. **`enettca`** – Ethernet TCA Profile Name
   This parameter specifies the name of the threshold crossing alert (TCA) profile used for the VCG.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   If the parameter *enettca* is not supported, then the parameter is omitted.
   Type: Alphanumeric string.
   Range: 1 … 24 characters length.
   Default: DEFAULT0.

7. **eportClass** – Ethernet Port Class
   This identifies the Ethernet port class of the AID. *eportClass* is used to specify Ethernet ports for use by NN application.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: Alphanumeric value set.
   Range: Depends on the *modifier*:
   - if *modifier* is missing or is 1GEPL, then the value range is: TRADITIONAL, EDGE, UNI
   - if *modifier* is 10GEPL, then the value range is: TRADITIONAL, EDGE
   - if *modifier* is ES64U, then the value range is: TRADITIONAL

   Default: Depends on system parameters Cross Connect Setup (*xcsetup*) and Port Class Default (*portclassdefault*):
   - if *xcsetup* is TRADITIONAL, then the default value is TRADITIONAL
   - if *xcsetup* is SWISS, then the value of *portclassdefault* is used as default value.
   - if *modifier* is ES64U, then the default value is TRADITIONAL.
8. **eportControl** – Ethernet Port Control (Ethernet Port Administrative Mode)
   This identifies the administrative mode of Ethernet ports of *eportlass* = EDGE ot UNI. For Ethernet ports of other Ethernet port class this parameter is not relevant. *eportControl* is introduced specifically for use by NN application.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: Alphanumeric value set.
   Range: NORMAL (default), MAINT, LOCKOUT .
9. **htmr** – Hold-Off Time
   The parameter *htmr* specifies the hold off time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it goes to state faulty then this tributary is taken out of transmission by LCAS after the hold off time. This time is configured on group level, i.e. all tributaries have the same value for hold-off time. This parameter only affects NE behavior if *lcasmd* = ENABLE.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: numeric value set.
   Range: 0 (default), 100, 200, …, 9900, 10000 [milliseconds].
10. **inputsig** – Tributary Input Signal Rate List
   This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure depends on interface standard specified for this VCG by istd . For definition of *istd* refer to “RTRV-VCG: Retrieve virtual concatenation group”

(p. 3-3078) Output parameters.

If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the possible tributary structures depends on interface standard specified for this VCG by istd and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to RTRV-VCG Output Parameters.

Type: numeric string of the form NX

- N specifies the count of container type X
- X specifies the container type (or envelope).

Range:

- Values: N = 7, X = 4; Modifier=omitted; Interface Standard=SDH; Virtual Concatenation=not applicable; Represented Signal Structure: 7 times VC4
- Values: N = 7, X = 4; Modifier=1GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times VC4
- Values: N = 64, X = 4; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times VC4
- Values: N = 1, X = c64; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times VC4-64C
- Values: N = 21, X = 1; Modifier=omitted; Interface Standard=SONET; Virtual Concatenation=not applicable; Represented Signal Structure: 21 times STS-1
- Values: N = 21, X = 1; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 21 times STS-1
- Values: N = 7, X = 3; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times STS-3C
- Values: N = 192, X = 1; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 921 times STS-1
- Values: N = 64, X = 3; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times STS-3C
- Values: N = 1, X = 192; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times STS-192C

For *modifier* = ES64U, the value combination of “N” and “X” is done according to the following rules:

- *istd* = SONET
- X = 1 for STS-1
- N $\in$ {1, 2, ..., 192}

For *modifier* = ES64U, the parameter *inputsig* is visible for retrieval, but it cannot be modified once the VCG is established.

Default:

- modifier = omitted, Interface Standard=SDH, Default Value = 74
- modifier = 1GEPL, Interface Standard=SDH, Default Value = 74
- modifier = 10GEPL, Interface Standard=SDH, Default Value = 644
- modifier = omitted, Interface Standard=SONET, Default Value = 211
- modifier = 1GEPL, Interface Standard=SONET, Default Value = 211
- modifier = 10GEPL, Interface Standard=SONET, Default Value = 1921
- modifier = ES64U, Interface Standard=SONET, Default Value not applicable

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, i.e. VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception: For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.
For *modifier* = ES64U, this parameter will always be defined by the **`ENT-VCG`** command.

11. **`istd`** – Interface Standard
This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
For *modifier* = 1GEPL, 10GEPL, or ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: Alphanumeric value set.
Range:
    - SDH
    - SONET.

    Default: *modifier*: 1GEPL, 10GEPL, or ES64U: The value is derived from the circuit pack parameter *istd*. no *modifier*: As derived from parameter *istddflt* specified at configuration management, section **`RTRV-EQPT`**.
12. **`lcasmd`** – LCAS Mode
This parameter specifies the operation mode of the Link Capacity Adjustment Scheme for this VCG. This value is bidirectional.
For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: Alphanumeric value set.
Range:
    - DISABLE
    - ENABLE

    Default:
    - *modifier* = ES64U: DISABLE
    - other or no *modifier*: ENABLE

13. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view.
    Depending on the *eportClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkLPID", as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *eportClass* UNI.
    The parameter *localLPID* is used by ONNS for switching network connections on SONET/SDH layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: numeric value set.
    Range: 0 to 4294967295.
    Default: 0.
14. **`localLPIDVCAT`** – Local Logical Port Identity on VCAT layer
    The *localLPIDVCAT* provides a unique logical identification of a single VCG port with an *eportClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *eportClass* value of the port, the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like, for example, *networkTNAAddrVCAT*.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    The parameter *localLPIDVCAT* is used by ONNS for switching network connections on VCAT layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: numeric value set.
    Range: 0 to 4294967295.
    Default: 0.

15. **`macaddr`** – Port MAC Address
    This parameter specifies the MAC address of the WAN port.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.
    If the parameter is not supported, is shall be omitted.
    Type: Alphanumeric value set.
    Range: 000000000000 to FFFFFFFFFFFF or UNAVAILABLE if the value can not be retrieved.
16. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkTNAType", as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
    The parameter *networkTNAType* is used by ONNS for switching network connections on SONET/SDH layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: Alphanumeric value set.
    Range: IPV4, IPV6, or NSAP.
    Default: IPV4.
17. **`networkTNATypeVCAT`** – Network TNA Type on VCAT level
    The *networkTNATypeVCAT* identifies the type of the Network TNA Address on VCAT level attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    The parameter *networkTNATypeVCAT* is used by ONNS for switching network connections on VCAT layer.
    This parameter is supported by ports of eportClass UNI.
    This parameter is supported by ports of eportClass EDGE.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: Alphanumeric value set.
    Range: IPV4, IPV6, or NSAP.
    Default: IPV4.

18. **`networkTNAAddress`** – Network TNA Address
    The *networkTNAAddress* identifies the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given NetworkTNAType. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkTNAAddress", as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
    The parameter *networkTNAAddress* is used by ONNS for switching network connections on SONET/SDH layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type:
    networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
    networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
    networkTNAType= NSAP: Hexadecimal number (represents 20 Bytes)
    Range:
    IPV4: Each numeric string: 0…255
    IPV6: Each hexadecimal number: 0000…FFFF
    NSAP: Hexadecimal number:
    0000000000000000000000000000000000000000 …
    FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
    Examples:
    IPV4: 129.12.3.178
    IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
    NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF
    Default:
    IPV4: 0.0.0.0
    IPV6: 0-0-0-0-0-0-0-0
    NSAP: 0000000000000000000000000000000000000000
19. **`networkTNAAddrVCAT`** – Network TNA Address on VCAT level
    The *networkTNAAddrVCAT* identifies the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given *NetworkTNATypeVCAT*. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    The parameter *networkTNAAddressVCAT* is used by ONNS for switching network

connections on VCAT layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.
For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type:
networkTNAType= IPV4: Four dot separated numeric string (represents 4 bytes)
networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 bytes)
networkTNAType= NSAP: Hexadecimal number (represents 20 bytes)
Range:
IPV4: Each numeric string: 0…255
IPV6: Each hexadecimal number: 0000…FFFF
NSAP: Hexadecimal number:
0000000000000000000000000000000000000000 …
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
Default:
IPV4: 0.0.0.0
IPV6: 0-0-0-0-0-0-0-0
NSAP: 0000000000000000000000000000000000000000

20. **plcrthr** – Threshold for Partial Loss of Capacity (Receive)
The parameter *plcrthr* specifies the acceptable limit of valid VCG members in receive direction (refer to the *outmbs* parameter of all related VCGTRIB entities) for which the PLCR alarm will not yet be raised. The PLCR alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plcrthr* parameter – 1)] (if *plcrthr* ≥ 2). The PLCR alarm shall never be raised if *plcrthr* is set to 1.
The PLCR alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plcrthr* parameter (or if the number of those VCG members is 0 – in this case the TLCR alarm will be raised instead). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plcrthr* is not supported, then the parameter is omitted.
For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: numeric value set.
Range: 1, 2, 3, …, 192
Default:

Modifier	Input signal structure	Default value
1GEPL	74	7
1GEPL	211	21
10GEPL	644, 1c64	64
10GEPL	1921, 1192	192

Modifier	Input signal structure	Default value
ES64U	n × 1	n

21. **`plctthr`** – Threshold for Partial Loss of Capacity (Transmit)
The parameter *plctthr* specifies the acceptable limit of valid VCG members in transmit direction (refer to the *inmbs* parameter of all related VCGTRIB entities) for which the PLCT alarm will not yet be raised. The PLCT alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plctthr* parameter – 1)] (if *plctthr* ≥ 2). The PLCR alarm shall never be raised if *plctthr* is set to 1.
The PLCT alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plctthr* parameter (or if the number of those VCG members is 0 – in this case the TLCT alarm will be raised instead).
This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plctthr* is not supported, then the parameter is omitted.
For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: numeric value set.
Range: 1, 2, 3, …, 192
Default:

Modifier	Input signal structure	Default value
1GEPL	74	7
1GEPL	211	21
10GEPL	644, 1c64	64
10GEPL	1921, 1192	192
ES64U	n × 1	n

22. **`stdis`** – Spanning Tree Protocol Disable
This parameter allows to enable or disable the Spanning Tree Protocol for the given port. If the input parameter modifier is omitted, then this parameter is supported but applicable only if the port is a network port (cnprole = NETWORK). For customer ports (cnprole = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stdis* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range: DISABLE – STP is disabled, that means, the port is not used to build the spanning tree. ENABLE – STP is enabled, that means, the port is used to build the spanning tree.
Default: ENABLE.
As VCGs are by default network ports the default value is to enable STP.

23. **`stmd`** – Spanning Tree Protocol Mode
This parameter returns whether the normal STP according to IEEE802.1D or the rapid spanning tree protocol rSTP according to IEEE802.1w is used on the given port.
This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER), this parameter has no effect. However, changes are stored in the database.
If the input parameter *modifier* = 1GE, then this parameter is applicable meaningful only if the port is a network port (*cnprole* = NETWORK). For customer ports (cnprole = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stmd* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range:
   - 802.1D, for the normal ST
   - 802.1W, for rSTP
   - UNAVAILABLE if the value cannot be retrieved.

   Default: There is no default value.

24. **`stpcost`** – Spanning Tree Path Cost
The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.
If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.
If the parameter *stpcost* is not supported, then the parameter is omitted.
Type: Integer.
Range: 1 to 200000000.
Default: 20000.
The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.

25. **`stpid`** – Spanning Tree Port Identifier
    The port identifier is a 16 bit parameter consisting of the port priority (high-order bits) and the port number (low-order bits). The port number is assigned by the system to a port and is not provisionable.
    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stpid* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: 0 to 65535 and UNAVAILABLE if the value can not be retrieved.
26. **`stpop`** – Spanning Tree Protocol Operational
    This parameter indicates whether the Spanning Tree Protocol is operational or not.
    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stpop* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: YES, operational; NO, not operational, UNAVAILABLE if the value can not be retrieved.
27. **`stpp`** – Spanning Tree Port Priority
    The parameter *stpp* specifies the priority of the given port for the Spanning Tree Protocol.
    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stpp* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 0 to 255.
    Default: 128.
28. **`stprole`** – Spanning Tree Protocol Role
    The parameter *stprole* shall report the role of the given port in rSTP.
    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK) and operates in rSTP mode (*stmd* = 802.1W). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However,

changes are stored in the database.
This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stprole* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- ROOT, root
- DESG, designated
- ALT, alternative
- BACKUP, backup
- UNAVAILABLE if the value can not be retrieved.

29. **`tcamd`** – TCA Mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).
This parameter is not supported if the input parameter *modifier* = ES64U. If the parameter *tcamd* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: TR, TRRTR.
Default: TRRTR in SDH mode; TR in SONET mode.

30. **`unequiposig`** – Unequipped Tributary Output Signal Rate List
The parameter *unequiposig* specifies the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries are occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too.
If the input parameter *modifier* is omitted, then the tributary structure depends on interface standard specified for this VCG by *istd* . For the definition of *istd* refer to the “Output parameters” section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078).
If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the range of possible tributary structures depends on interface standard specified for this VCG by *istd* and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to the “Output parameters” section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078). The signal will be immediately terminated on the unit. So no unequipped signal is visible to the outside world.
If the input parameter: *modifier* = ES64U, then the parameter *unequiposig* is set automatically according to the value of the *inputsig* parameter.
For *modifier* = ES64U, the parameter *unequiposig* is only retrievable and cannot be changed because it follows always the value of the *inputsig* parameter.

Type: numeric string of the form ***NX***

- ***N*** specifies the count of container type ***X***
- ***X*** specifies the container type (or envelope).

Range:

Values	Modifier	Interface standard	Virtual concatenation mode	Represented signal structure
N = 7, ***X*** = 4	omitted	SDH	not applicable	7 × VC4
N = 7, ***X*** = 4	1GEPL	SDH	ENABLE	7 × VC4
N = 64, ***X*** = 4	10GEPL	SDH	ENABLE	64 × VC4
N = 1, ***X*** = c64	10GEPL	SDH	DISABLE	1 × VC4-64C
N = 21, ***X*** = 1	omitted	SONET	not applicable	21 × STS-1
N = 21, ***X*** = 1	1GEPL	SONET	ENABLE	21 × STS-1
N = 7, ***X*** = 3	1GEPL	SONET	ENABLE	7 × STS-3C
N = 192, ***X*** = 1	10GEPL	SONET	ENABLE	192 × STS-1
N = 64, ***X*** = 3	10GEPL	SONET	ENABLE	64 × STS-3C
N = 1, ***X*** = 192	10GEPL	SONET	DISABLE	1 × STS-192C

For *modifier* = ES64U, the same value set is applicable as for the parameter *inputsig*.

Default:

Modifier	Interface Standard	Default Value
omitted	SDH	74
1GEPL	SDH	74
10GEPL	SDH	644
omitted	SONET	211
1GEPL	SONET	211
10GEPL	SONET	1921
ES64U	SONET	not applicable

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, that means, VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception:

For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.

31. **`vcat`** – Virtual Concatenation
    The parameter *vcat* specifies whether the Ethernet signal is mapped to a number of virtually concatenated tributaries (value = ENABLE) or into a contiguously concatenated tributaries (value = DISABLE). In the latter case, LCAS related parameters become insignificant (values set to default, values cannot be changed). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *vcat* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - For *modifier* = ES64U: ENABLE.
    - Otherwise: ENABLE, DISABLE.

    For *modifier* = ES64U, the parameter *vcat* is visible for retrieval, but cannot be modified once the VCG is established.
    Default: Enable.
32. **`vmode`** – VCG Monitoring Mode
    the parameter *vmode* specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.
    Type: Alphanumeric value set.
    Range:
    - MON, for monitored
    - NMON (default), for not monitored.
33. **`vpm`** – VCG Performance Monitoring
    The parameter *vpm* specifies whether the performance monitoring is enabled or disabled for this port.
    This parameter is not supported if the input parameter *modifier* = . If the parameter *vpm* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - DISABLE (default)
    - ENABLE.
34. **`vrtswid`** – Virtual Switch Identifier
    This parameter identifies the instance of the virtual switch.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *vrtswid* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 1 – Currently this is the only allowed value

35. **`vss`** – Spanning Tree Status
    This parameter returns the status of the spanning tree protocol for the given port.
    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK
). For customer ports (*cnprole* = CUSTOMER), this parameter has no effect. However, changes are stored in the database.
    If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.
    If the parameter *vss* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - FWG, Forwarding
    - LRG, Learning
    - LIS, Listening (IEEE8102.D/STP only)
    - BLK, Blocking (IEEE8102.D/STP only)
    - DISF, Disabled due to a failure (IEEE8102.D/STP only)
    - DISA, Disabled via provisioning
    - BRK, Broken (IEEE8102.w/rSTP only)
    - DCD, Discarding (IEEE8102.w/rSTP only)
    - UNAVAILABLE if the value can not be retrieved.
36. **`vvidls`** – Valid VLAN Identifier List (static)
    This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&). The list is packed by the NE and the management systems as good as possible by using '&' and '&&' . The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK).
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *vvidls* is not supported, then the parameter is omitted.
    Type: Alphanumeric string and the character '&'.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
- In case the list has no members (empty list) –1.

Default: –1.

37. **`vvidlsd`** – Valid VLAN Identifier List (dynamic)
This parameter gives the list of all dynamic VLAN identifiers allowed for this port as gathered autonomously via GVRP. The list is ampersand grouped (& and &&). The vlan identifier of an incoming frame must be a member of this dynamic VLAN Id list or the static VLAN Id list vvidls. Frames tagged by a vlan identifier not member of these lists will be discarded. This parameter is also used in transparent tagging mode to report the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK) collected by GVRP.
This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.
Ths parameter is reported only if
    - the virtual switch entity exists (i.e. the VLAN tagging mode *vlantagmd* of the slot the addressed EPort belongs to is set to 802.1TAG) AND
    - GVRP is enabled on the virtual switch (*gvrpmode* = ENABLED)
    - the port is a NETWORK port (*cnprole* = NETWORK).

    Type: Alphanumeric string and the character "&".
    Range:
    - Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
    - In case the list has no members (empty list) –1.

    If the value can not be retrieved: UNAVAILABLE
    Default: There is no default value.
38. **`wtr`** – Wait To Restore Time
The parameter *wtr* specifies the wait to restore time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it recovers from a faulty state then this tributary is taken in again to transmission by LCAS after the wait-to-restore time. This time is configured on group level, i.e. all tributaries have the same value for the wait-to-restore time. This parameter only affects NE behavior if *lcasmd* = ENABLED.
For *modifier* = ES64U, the parameter is visible with default values for retrieval, but cannot be modified.
Type: Alphanumeric value set.
Range: 0, 1, 2, …, 59, 60 [minutes].
Default: 0.

Detailed behavior description

The **RTRV-VCG** does not generate a **REPT DBCHG** message. The command retrieves all VCG parameters as described in section Output parameters.

The values of the following parameters are directly requested form the hardware:

- mfiv
- macaddr
- stmd
- stpop
- stpid
- stprole
- vss
- vvidlsd.

Example input/output

Example of a VCG retrieval on a GE1 pack working in switched mode:

```
RTRV-VCG:UNITE-NE:1-1-#-#-2-v3:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   ”1-1-#-#-02-
      v3:cnprole=NETWORK,dftpri=LOW,dftvlan=UNAVAILABLE,enetpn=DEFAULT,enettca=DEFAULT0,eportCl
   ”1-1-#-#-02-v3-1:125,MFIV”
   .
   . for all 7 VCG Tributaries belonging to the VCG
   .
   ”1-1-#-#-02-v3-19:250,MFIV”
;
```

Example of a retrieval of all VCGs on a GE1 pack:

```
RTRV-VCG:UNITE-NE:1-1-#-#-2-vall:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   ”1-1-#-#-02-
      v1:cnprole=NETWORK,dftpri=LOW,dftvlan=UNAVAILABLE,enetpn=DEFAULT,enettca=DEFAULT0,eportCl
”1-1-#-#-02-
      v2:cnprole=NETWORK,dftpri=LOW,dftvlan=UNAVAILABLE,enetpn=DEFAULT,enettca=DEFAULT0,eportCl
”1-1-#-#-02-
      v3:cnprole=NETWORK,dftpri=LOW,dftvlan=UNAVAILABLE,enetpn=DEFAULT,enettca=DEFAULT0,eportCl
”1-1-#-#-02-
      v4:cnprole=NETWORK,dftpri=LOW,dftvlan=UNAVAILABLE,enetpn=DEFAULT,enettca=DEFAULT0,eportCl
;
```

Example of a VCG retrieval related to an UNI port on a GE10PL1 pack:

```
RTRV-VCG-1GE:UNITE-NE:1-1-#-#-39-v1:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   ”1-1-#-#-39-v1:enetpn=DEFAULT,enettca=DEFAULT0,eportClass=UNI,\
    eportControl=NORMAL,htmr=0,inputsig=211,istd=SONET,lcasmd=ENABLE,\
    plcrthr=21,plctthr=21,tcamd=TR,unequiposig=211,vcat=ENABLE,vmode=NMON,\
    vpm=DISABLE,wtr=0,networkTNAType=IPV4,networkTNAAddress=0.0.0.0,\
    localLPID=0,clientNodeID=12.1.31.11,networkTNATypeVCAT=IPV4,\
    networkTNAAddrVCAT=111.121.23.6,localLPIDVCAT=12”
   ”1-1-#-#-39-v1-1:2000,MFIV”
   .
   . for all 21 VCG Tributaries belonging to the VCG
   .
   ”1-1-#-#-39-v1-21:8000,MFIV”
;
```

Example of a VCG retrieval related to a 1 GE interface on a GE10PL1 pack (virtual concatenation mode enabled):

```
RTRV-VCG-1GE:UNITE-NE:1-1-#-#-39-v1:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   ”1-1-#-#-39-v1:enetpn=DEFAULT,enettca=DEFAULT0,eportClass=TRADITIONAL,\
    eportControl=NORMAL,htmr=0,inputsig=211,istd=SONET,lcasmd=ENABLE,\
    plcrthr=21,plctthr=21,tcamd=TR,unequiposig=211,vcat=ENABLE,vmode=NMON,
    vpm=DISABLE,wtr=0,networkTNAType=IPV4,networkTNAAddress=0.0.0.0,\
    clientNodeID=0.0.0.0,networkTNATypeVCAT=IPV4,localLPID=0,\
    networkTNAAddrVCAT=0.0.0.0,localLPIDVCAT=0”
   ”1-1-#-#-39-v1-1:2000,MFIV”
   .
   . for all 21 VCG Tributaries belonging to the VCG
   .
   ”1-1-#-#-39-v1-21:8000,MFIV”
;
```

Example of a VCG retrieval related to a 10 GE interface on a GE10PL1 pack (virtual concatenation mode disabled):

```
RTRV-VCG-10GEPL:LT-UNITE:1-1-#-#-39-v9:123456;

   LT-UNITE 01-03-20 09:05:00
M 123456 COMPLD
```

```
   ″1-1-#-#-39-v9:enetpn=DEFAULT,enettca=DEFAULT0,eportClass=TRADITIONAL,\
    eportControl=NORMAL,htmr=0,inputsig=1c64,istd=SDH,lcasmd=ENABLE,\
    plcrthr=64,plctthr=64,tcamd=TRRTR,unequiposig=1c64,vcat=DISABLE,\
    vmode=NMON,vpm=DISABLE,wtr=0″
;
```

Example of a VCG retrieval related to an ES64U pack:

```
RTRV-VCG-ES64U:UNITE-NE:1-1-#-#-35-v1:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   ″1-1-#-#-35-v1: enetpn=DEFAULT,eportClass=TRADITIONAL,\
    eportControl=NORMAL,htmr=0,inputsig=211,istd=SONET,lcasmd=DISABLE,\
    plcrthr=21,plctthr=21,unequiposig=211,clientNodeID=0.0.0.0,\
    vcat=ENABLE,vmode=NMON,wtr=0,networkTNAType=IPV4,\
    networkTNAAddress=0.0.0.0,localLPID=0,networkTNATypeVCAT=IPV4,\
    networkTNAAddrVCAT=0.0.0.0,localLPIDVCAT=0″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-VCG** command, too.

Validation rule: Command only allowed for VCG on GE*n* or ES64U circuit packs

If the command is not applied to a VCG on a GE*n* or ES64U pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: *modifier* mandatory for the GE10PL1 and ES64U circuit pack

The system shall verify that the modifier parameter is provided by the command if the related slot has been successfully provisioned with a GE10PL1 or ES64U circuit pack.

Error code:

`IDNC – Input, Data Not Consistent, modifier is required for this circuit pack type`

Validation rule: *modifier* consistent with given port-rate

The system shall verify that a given modifier parameter is consistent with the rate of the port (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-VCG** command for applicable combinations.

Error code:

`IDNC – Input, Data Not Consistent, modifier is inconsistent with existing port rate`

RTRV-VCG-TRANS: Retrieve virtual concatenation group transparent

The **RTRV-VCG-TRANS** command retrieves the attributes of a virtual concatenation group, used for fully transparent applications.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-VCG-TRANS***:tid:aid:ctag[:::spec_block];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the virtual concatenation group (VCG) to be operated on.
   Type: AID.

   Range: VCGAID as defined in AID structure. The values

   - *vall* for Simple_VCGAID and
   - *usall* for Simple_UnivSlotAID

   are accepted.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameter

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values usall or vall at the appropriate positions of the input AID. For input AIDs not using usall or vall this parameter is not considered. This implies that with such input AIDs the dynamic parameters are always returned.
   The following output parameters of a vcgport port are affected: *mfiv*, *rplt*.
   Type: Alphanumeric value set.
   Range:
   - YES: Report dynamic parameters in the reply as well
   - NO (default): Do not report dynamic parameters in the reply.

Output format

If the NE fully complies with the RTRV-VCG request, the following normal completion response is returned:

```
sid date time
M  ctag COMPLD
   ”aid::spec_block”
      <1 or more of the line above>
   ”tribaid:mfiv,MFIV”
    <no such line, if the virtual concatenation mode is disabled, else
     no such line, if no dynamic data are retrieved, else
     one or more lines, one for each tribaid belonging to aid>
       ...
       ...
   ”aid::spec_block”
      <1 or more of the line above>
   ”tribaid:mfiv,MFIV”
    <no such line, if the virtual concatenation mode is disabled, else
     no such line, if no dynamic data are retrieved, else
     one or more lines, one for each tribaid belonging to aid>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter specifies the VCG to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure with the exception of the value *vall*.
2. **`tribaid`** – Tributary Access Identifier
   The tributary access identifier specifies a tributary belonging to the virtual concatenation group (VCG) given by the aid above.
   Type: AID.
   Range: VCGNumAID as defined in AID structure with the exception of the value *all*.
3. **`mfiv`** – Multiframe Indicator Value
   This parameter reports the differential delay between the tributary addressed by *tribaid* (see above) and the fastest tributary of the VCG. The fastest tributary has the value zero. For each retrieve of a VCG there is a report of *mfiv* for all tributaries belonging to the VCG.
   Type: Alphanumeric value set.

   Range:

   - 0, 125, 250, 375, …, 511750, 511875 [microseconds]
   - NA
   - UNAVAILABLE

   In fact the reported range for delay is 0 … 255875 microseconds. Other values can only be reported as raw values without a delay calculation between the tributaries. UNAVAILABLE is reported when the accepted MFI contents do not meet the basic acceptance criteria (multiframe alignment not completed), or intra-NE communication with the reporting entity is disrupted. NA (Not Applicable) is reported under defect conditions detected by the Sn[i] termination function or the VC-n is not part of an S-n-Xv group.

Spec block parameters

1. **`camd`** – Consequent Action Mode
   This parameter specifies the mode of the consequent action to be executed in egress direction (to the synchronous port) on detected signal fail conditions (dPLM, AI_TSF or detected generic AIS) on the ODU layer
   Type: Alphanumeric value set.
   Range: GENERICAIS (default), MSAIS, LASEROFF
2. **`enetpn`** – Ethernet Alarm Severity Assignment Profile Name
   This parameter points to an ASAP profile name of type ENET for the designated AID.
   Some VCG related alarms have to be referenced via the ASAP profile named ENET.
   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
3. **`fevpm`** – Far End VCG Performance Monitoring
   The parameter fevpm specifies whether the far end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disable therefore far end PM on the ODUkP layer.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE
4. **`inputsig`** – Tributary Input Signal Rate List
   This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure is independent from the interface standard istd specified for this VCG.

   Type: numeric string of the form NX

   - N specifies the count of container type X
   - X specifies the container type (or envelope).

   Range:

   - N=17,
   - X = 4 for VC-4 / STS3.

   Default: 174.
5. **`istd`** – Interface Standard
   This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
   Type: Alphanumeric value set.

   Range:

   - SDH
   - SONET.

   Default: As derived from parameter *istddflt* specified at configuration management, section System RTRV-EQPT.

6. **`nevpm`** – Near End VCG (ODUkP) Performance Monitoring
   This parameter specifies whether the near end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer and on the VCG level. This parameter enables/disable therefore near end PM on the ODUkP layer.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE
7. **`pmvcgfeses`** – Performance Monitoring VCG (ODUkP) Far-End SES Threshold
   This parameter describes the ODUkP Far-End SES threshold value. It indicates the number of errored blocks per second to declare a second as severely errored. The default value is defined in G.8201 for OTN. If the interface standard is changed the current default value is not changed.
   Type: numeric value set.
   Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420
   Default: ODU1P: 3064
   G.8201 defines block based PM on the ODUkP layer.
8. **`pmvcgneses`** – Performance Monitoring VCG (ODUkP) Near-End SES Threshold
   This parameter describes the VCG (actually ODUkP) Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
   Type: numeric value set.
   Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420
   Default: ODU1P: 3064
   G.8201 defines block based PM on the ODUkP layer.
9. **`rplt`** – Reported Payload Type
   The parameter rplt shall report the received payload type for the constant bit rate mapping on the ODU layer.
   Type: Alphanumeric value set.
   Range:
   - 00, 01, …, FE, FF i.e. two hexadecimal digits
   - UNAVAILABLE
10. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.
    Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).
    Type: Alphanumeric value set.
    Range: TR, TRRTR.
    Default: TRRTR in SDH mode; TR in SONET mode.

11. **transpn** – Transparent Alarm Severity Assignment Profile Name
    This parameter points to a ASAP profile name of type TRANSPARENCY for the designated AID.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: 1 … 24 characters length
    Default: DEFAULT.
12. **transtca** – Transparent TCA Profile Name
    The parameter transtca specifies the name of the threshold crossing alert (TCA) profile used for the VCG..
    Type: Alphanumeric string.
    Range: 1 … 24 characters length
    Default: DEFAULT0
13. **unequiposig** – Unequipped Tributary Output Signal Rate List
    This parameter specifies the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries are occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too. The tributary structure is independent of the interface standard specified for this VCG.
    The signal will be immediately terminated on the unit. So no unequipped signal is visible to the outside world.

    Type: numeric string of the form NX.

    - N specifies the count of container type X
    - X specifies the container type (or envelope)

    Range:

    - N = 17
    - X = 4 for VC-4 / STS-3C

    Default: 174
14. **vmode** – VCG Monitoring Mode
    This parameter wtr specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.
    Type: Alphanumeric value set.
    Range: MON: for monitored; NMON (default): for not monitored.

Detailed behavior description

The RTRV-VCG-TRANS does not generate a **REPT DBCHG** message. The command retrieves all VCG parameters as described in section Output parameters.

The values of the following parameters are directly requested form the hardware:

- *mfiv*
- *rplt*

Thus the value ″UNAVAILABLE″ is reported, if the CP HW is not available in the system.

Example input/output

Example 1:

```
RTRV-VCG-TRANS:LT-UNITE:1-1-#-#-2-v3:123456;

   LT-UNITE 01-03-20 09:05:00
M 123456 COMPLD
   ”1-1-#-#-02-
      v3:camd=GENERICAIS,enetpn=DEFAULT,fevpm=DISABLE,inputsig=174,istd=SDH,nevpm=DISABLE,pmvcg
   ”1-1-#-#-02-v3-1:125,MFIV”
   .
   . for all 17 VCG Tributaries belonging to the VCG
   .
   ”1-1-#-#-02-v3-17:250,MFIV”
;
```

Example 2:

```
RTRV-VCG-TRANS:LT-UNITE:1-1-#-#-2-vall:123456;

   LT-UNITE 01-03-20 09:05:00
M 123456 COMPLD
   ”1-1-#-#-02-
      v1:camd=GENERICAIS,enetpn=DEFAULT,fevpm=DISABLE,inputsig=174,istd=SDH,nevpm=DISABLE,pmvcg
   ”1-1-#-#-02-
      v2:camd=GENERICAIS,enetpn=DEFAULT,fevpm=DISABLE,inputsig=174,istd=SDH,nevpm=DISABLE,pmvcg
   ”1-1-#-#-02-
      v3:camd=GENERICAIS,enetpn=DEFAULT,fevpm=DISABLE,inputsig=174,istd=SDH,nevpm=DISABLE,pmvcg
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-VCG-TRANS** command, too.

Validation rule: Command only allowed for VCG on Transparent Packs

If the command is not applied to a VCG on a transparent pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Related TL1 messages

“ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application” (p. 3-1405)

RTRV-VCGTRIB: Retrieve virtual concatenation group tributary

The **RTRV-VCGTRIB** command retrieves the attributes of a VCG tributary used for 1 and 10 GbE and ES64U or fully transparent applications.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-VCGTRIB**-*modifier*:*tid*:*aid*:*ctag*[:::*spec_block*];

Input parameters

Command parameters

1. **modifier**
   This parameter specifies the type of the tributary. The purpose is to distinguish between SDH/SONET tributaries and between the application of the VCG the tributary belongs to. Current applications are 1 and 10 GbE and ES64Uand fully transparency.
   Type: Alphanumeric value set.
   Range:
   - ALL
   - STS
   - VC.
   - STST
   - VCT.

   To distinguish the fully transparent application from a GE application, a letter ″T″ is appended. There is no distinction between VCGTRIB entities of the GE1 pack from the GE10PL1 or ES64U pack needed. In particular, the transmission rate in case the parameter *modifier* = STS needs to be derived from the parameters inputsig and unequiposig of the related VCG entity.
2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **aid** – Access Identifier
   This parameter specifies VCG tributary to be operated on.
   Type: AID.

Range: VCGNumAID as defined in AID structure. The values

- *all* for Simple_VCGNumAID
- *vall* for Simple_VCGAID
- *usall* for Simple_UnivSlotAID
- *all* for Simple_UnivSlotAID
- *all* for Simple_ShelfAID and
- *all* for BayAID

is accepted.

4. **ctag** – Correlation Tag
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Type: Alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameter

dyn – Retrieve Dynamic Parameters

This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values all, usall or vall at the appropriate positions of the input AID. For input AIDs not using all, usall or vall this parameter is not allowed.

The following output parameters of a vcgtrib are affected:

- aseqno
- tseqno
- ptrc
- ptrcst
- rsiglb
- trailst.

Type: Alphanumeric value set.

Range: YES: Report dynamic parameters in the reply as well; NO (default): Do not report dynamic parameters in the reply.

Output format

If the NE fully complies with the RTRV-VCGTRIB request, the following normal completion response is returned:

```
sid date time
M  ctag COMPLD
   ″aid::spec_block set1″
```

```
    <1 or more of the line above,
     or no lines, depending on dynamic data retrieval mode>
   ″aid,aidtype::spec_block set2″
    <1 or more of the line above>
       ...
       ...
   ″aid::spec_block set1″
    <1 or more of the line above,
     or no lines, depending on dynamic data retrieval mode>
   ″aid,aidtype::spec_block set2″
    <1 or more of the line above>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the VCG tributary whose attributes are reported.
   Type: AID.
   Range: VCGNumAID as defined in AID structure with exception of value all.
2. **aidtype** – Access Identifier Type
   This parameter specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range: STS or VC or STST or VCT.

To distinguish the fully transparent application from a GE application, a letter ″T″ is appended. There is no distinction between VCGTRIB entities of the GE1 pack from the GE10PL1 or ES64U pack needed. In particular, the transmission rate in case the parameter *modifier* = STS needs to be derived from the parameters inputsig and unequiposig of the related VCG entity.

Spec block parameters Set 1

1. **aseqno** – Accepted Sequence Number
   This parameter reports the accepted sequence number of the tributary. In case of a disrupted intra-NE communication with the reporting entity “not available” is reported.
   In case that the received sequence no. does not meet the basic acceptance criteria or under defect conditions a value is reported, which is outside of the designated range (see parameter *tseqno* for the designated range).
   If the tributary to be reported is no configured member of the VCG “not applicable” is reported.
   Type: Alphanumeric value set.

Range:

- 0, 1, 2, ..., 254, 255
- NA, for not applicable
- UNAVAILABLE, for not available/unavailable.

  Although the normal accepted sequence no. is limited to the designated range (see parameter *tseqno* for the designated range), the NE is not prevented to report a higher number (accompanied by a proper alarm).

2. **tseqno** – Transmitted Sequence Number

   This parameter reports the transmitted sequence number of the tributary. In case of a disrupted intra-NE communication with the reporting unit 'not available' is reported. If the tributary to be reported is no configured member of the VCG 'not applicable' is reported.

   Type: Alphanumeric value set.

   Range:

   - For modifier STS: 0, 1, 2, ..., 190, 191
   - For modifier VC: 0, 1, 2, ..., 62, 63
   - For modifier STST or VCT: 0, 1, 2, ..., 15, 16
   - For modifier STS or VC: NA for not applicable
   - For all modifiers: UNAVAILABLE for not available/unavailable.

   The following table explains the possible value ranges for the various pack types:

Pack type	*modifier*	*tseqno* range	Remarks
GE1	STS	0, [1, ..., 20]	depends also on configured and actual membership
	VC	0, [1, ..., 6]	
GE10PL1	STS	0, [1, ..., 20]	if VCGTRIB entities belong to 1 GE interface
	VC	0, [1, ..., 6]	depends also on configured and actual membership
	STS	0, [1, ..., 191]	if VCGTRIB entities belong to 10 GE interface
	VC	0, [1, ..., 63]	depends also on configured and actual membership
OPT2G5	STST	0, 1, ..., 16	always all 17 are needed and no LCAS is supported
	VCT		
<all>	<all>	NA	if not applicable
		UNAVAILABLE	if not available/unavailable

Values for the parameters are derived from the VCGTRIB number as follows:

modifier	Tributary rate	*tseqno* calculation
STS	STS-1	VCGTRIB No. - 1

modifier	**Tributary rate**	***tseqno* calculation**
STS	STS-3c	(VCGTRIB No. - 1) / 3 for VCGTRIB in {1, 4, ..., 190} otherwise NA
VC	VC-4	(VCGTRIB No. - 1) / 3 for VCGTRIB in {1, 4, ..., 190} otherwise NA
STST	STS-3c	VCGTRIB No. - 1
VCT	VC-4	

Spec block parameters Set 2

Mode STS | VC

Some of the spec block parameters set 2 depend on the *modifier* (for RTRV) or *aidtype* (for ED, ED Not. and ENT Not.). Those parameters are only applicable for the given mode, i.e in the other mode they is neither reported nor modifiable.

1. **`brstintvl`**- Bursty Interval
   This parameter specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstintvl* has no affect to NE behavior. The parameter *brstintvl* is only valid for modifiers different from STST and VCT, .e. is omitted in the command response for STST and VCT.
   Type: Integer.
   Range: 2, 3, ..., 10 [seconds].
   Default: 7 [seconds].
2. **`brstthr`** – Bursty Error Threshold
   This parameter specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior. The parameter brstthr is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
   Type: Integer.
   Range: 5, 10, 15, ... 50 [%].
   Default: 30 [%].
3. **`crslpbkstat`** – Cross-connect Loopback Status
   This parameter reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to “OPR-LPBK: Operate cross-connection loopback” (p. 3-2035).
   Type: Alphanumeric value set.
   Range: YES, for enabled loopback; NO, for disabled loopback.
4. **`degthr`** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if sdsfmode is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the

Output parameters section. The parameter degthr is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
Type: Integer.
Range: -5, -6, -7, -8, -9 i.e. range is 10exp-9 to 10exp-5.
Default: -6

5. **`dexcthr`** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section. The parameter *dexcthr* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
   Type: Integer.
   Range: -3, -4, -5 i.e. range is 10exp-5 to 10exp-3.
   Default: -3.
6. **`exphptrc`** – Expected HP trace identifier
   This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if ptrcrfmt is set to 16.
   For VCG tributaries located on ES64U packs this parameter is visible with default values for retrieval, but cannot be modified.
   Type: Hexadecimal number without a preceding “H”.
   Range: length, 32 hexadecimal digits; value, specific string acc. ITU/ETSI mode 1.
   Default: 89000000000000000000000000000000.
7. **`feppm`** – Far End Path PM Enable
   This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary. The parameter *feppm* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
   For VCG tributaries located on ES64U packs this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE.
8. **`hptimais`** – HP Trace Identifier Mismatch AIS Insertion
   This parameter specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.

Range: DISABLE , ENABLE.
Default: The default value depends on interface standard specified by istd for the VCG owning this tributary. For definition of *istd* refer to "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078) Output parameters. DISABLE, if *istd* = SONET; ENABLE, if *istd* = SDH.

9. **hptimmon** – HP Trace Identifier Mismatch Monitor
This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: DISABLE (default), ENABLE.

10. **inmbs** – Input Membership
This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Input direction in this case means from the LCAS source on the GE1 pack to the cross-connect pack XC***n***. The addressing scheme of the tributaries by using VCGNumAIDs is ensuring that only legal AIDs are used. So no consideration about the "illegal" tributaries (for example, 1-1-#-#-1-1-3 for VC-4) is necessary. The parameter *inmbs* is only valid for modifiers different from STST and VCT, that means, is omitted in the command response for STST and VCT.
The system shall not evaluate the parameter *inmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter is retrievable.
Type: Alphanumeric value set.
Range: DISABLE , ENABLE.
Default:
    - for modifiers STST or VCT: ENABLE
    - for all other modifiers: DISABLE.

    The VCG for GE***n*** and ES64U has as default the size 0, that means, it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user decide explicitly if one tributary take part to the transmission.

11. **inmbst** – Input Member Status
This parameter reports the status of the tributary related to its VCG membership in input direction. The parameter *inmbst* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
Type: Alphanumeric value set.
Range:
    - for modifiers STST or VCT always ACTIVE is reported
    - for all other modifiers:
    - NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled
    - ADD, the tributary is in the LCAS state ″Wait-for-Add″, ″Add″ or ″Wait-for-ACK″

- ACTIVE, the tributary is member of the VCG and working
- FAILED, the tributary is member of the VCG but taken off by LCAS (incoming failed condition for the sink tributary)
- UNAVAILABLE, for not available, i.e. the trib. is member of the VCG but the current data is not retrievable for any reason.

  The state FAILED can only be reported if *lcasmd* is set to ENABLE for the VCG owning this tributary. For parameter *lcasmd* refer to the Output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078).

  For VCG tributaries located on ES64U packs only ″NA″ will be reported.

12. **`neppm`** – Near End Path PM Enable
    This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary. The parameter neppm is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
    For VCG tributaries located on ES64U packs this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.
    Type: Alphanumeric value set.

    Range:

    - DISABLE (default)
    - ENABLE.

13. **`outmbs`** – Output Membership
    This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Output direction in this case means from the cross-connect pack XCn to the LCAS sink on the GE1 pack. The parameter *outmbs* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
    The system shall not evaluate the parameter outmbs if the parameter vcat of the related VCG is set to DISABLE. The parameter is retrievable.
    Type: Alphanumeric value set.

    Range:

    - DISABLE
    - ENABLE.

    Default: for modifiers STST or VCT: ENABLE. for all other modifiers:DISABLE.
    The VCG for GE***n*** and ES64U has as default the size 0, i.e. it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user decide explicitly if one tributary take part to the transmission.

14. **`outmbst`** – Output Member Status
    This parameter reports the status of the tributary related to its VCG membership in output direction. The parameter *outmbst* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
    Type: Alphanumeric value set.

Range:

- for modifiers STST or VCT always ACTIVE is reported, for all other modifiers:
- NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled
- ADD, the tributary is in the LCAS state ″Wait-for-Add″ or ″Wait-for-Data″
- ACTIVE, the tributary is member of the VCG and working
- FAILED, the tributary is member of the VCG but not working due to a failure condition. Includes period during ″Hold-Off″.
- WTR, failure condition has cleared, tributary is in wait to restore condition.
- UNAVAILABLE, for not available, i.e. the trib. is member status is not retrievable for any reason.

  The state WTR can only be reported if lcasmd is set to ENABLE for the VCG owning this tributary. For parameter lcasmd refer to RTRV-VCG Output Parameters. For a detailed explanation of the ADD state in the LCAS protection scheme, please refer to SRD_DATA_Virtual_Concatenation.

  For VCG tributaries located on ES64U packs only ″NA″ will be reported.

15. **pmhpfeses** – PM HP Far End SES Threshold
    This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078). If *istd* is not set to SDH then *pmhpfeses* has no affect to NE behavior. The parameter *pmhpfeses* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
    For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported..
    Type: Integer.
    Range: 1, 2, 3, ..., 63998, 63999, 64000, includes SDH/SONET range.
    Default: 2400.

16. **pmhpneses** – PM HP Near End SES Threshold
    This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end.
    The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078). If *istd* is not set to SDH then *pmhpneses* has no affect to NE behavior.
    The parameter pmhpneses is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
    For VCG tributaries located on ES64U packs this parameter can be modified

although it has currently no effect as performance monitoring on VCGTRIB level is not supported..
Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.
Default: 2400.

17. **`ptca`** – Path TCA Profile Pointer
This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.
The parameter *ptca* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported..
Type: Alphanumeric string.
Range: 1 … 24 characters.
Default: DEFAULT0.

18. **`ptpn`** – Path Terminating ASA Profile Name
This parameter points to a tributary ASAP profile name pfname for the designated AID.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: 1 … 24 characters.
Default: DEFAULT.

19. **`ptrc`** – Incoming Path Trace
This parameter reports the accepted higher order path trace identifier (J1). The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter *ptrc* is omitted from the response.
Type: Hexadecimal.

    Range: the range depends on the parameter ptrcrfmt specified in RTRV-VCGTRIB Output Parameters

    - 2 hexadecimal digits, if ptrcrfmt=2
    - 32 hexadecimal digits, if ptrcrfmt=16
    - 128 hexadecimal digits, if ptrcrfmt=64.

20. **`ptrcrfmt`** – Path Trace Read Format
This parameter specifies the format of the path trace (J1 byte) to be received (sink).
For VCG tributaries located on ES64U packs this parameter is visible with default values for retrieval, but cannot be modified.
Type: numeric string.

Range:

- 2, for non-specific repeating byte
- 16, for 16 byte specific string
- 64, for 64 byte string.

Default:
For VCG tributaries located on GE1 packs: 2
For VCG tributaries located on GE10PL1 or ES64U packs: 16 if istd = SDH, 64 if istd = SONET.

21. **`ptrcst`** – Status of Incoming Path Trace
This parameter shows the status of the value of the incoming Path Trace Identifier (J1) which is available with parameter *ptrc*. For VCG tributaries located on ES64U packs this parameter is always reported with UNAVAILABLE.
Type: Alphanumeric value set.
Range:
    - NORMAL, *ptrc* contains a valid value
    - UNAVAILABLE, no valid value for *ptrc* could be obtained by the system
    - AIS , no valid value for ptrc could be obtained due to SF condition.

22. **`ptrcwfmt`** – Path Trace Write Format
This parameter specifies the format of the path trace (J1 byte) to be sent (source). For VCG tributaries located on ES64U packs this parameter is visible with default values for retrieval, but cannot be modified.
Type: numeric string.
Range:
    - 2, for non-specific repeating byte
    - 16, for 16 byte specific string
    - 64, for 64 byte string.

    Default:
For VCG tributaries located on GE1 packs: 2
For VCG tributaries located on GE10PL1 or ES64U packs: 16 if istd = SDH, 64 if istd = SONET.

23. **`rsiglb`** – Received Signal Label
This parameter reports the accepted trail signal label (C2). The parameter is not reported if the *trailst* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE.
Type: Alphanumeric value set.
Range: 00, 01, …, FE, FF, i.e. two hexadecimal digits.

24. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
This parameter specifies the determination mode of degraded defect for transmission. The parameter sdsfmode is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
Type: Alphanumeric value set.

Range: BURST or POISSON.
Default: For VCG tributaries located on a GE10PL1 pack, the default is: BURST. For VCG tributaries located on other packs, the default value depends on interface standard specified by istd for the VCG owning this tributary. For definition of istd refer to RTRV-VCG Output Parameters. POISSON, if *istd* = SONET; BURST, if *istd* = SDH.

25. **`tcamd`** – TCA mode
This parameter is only available for SDH modeand the modifier must be VC. The parameter shows the modus of the PM thresholding. Two thresholding methods are applicable for SDH: TR-only (also known as the implicit reset method), TR-RTR (also known as the explicit reset method). For SONET the parameter *tcamd* does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.
Type: Alphanumeric value set.
Range: TR, TRRTR.
Default: SDH mode: TRRTR. SONET mode: TR (internal). For SONET the parameter tcamd does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.
The parameter *tcamd* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.

26. **`tmonmd`** – Tributary Monitoring Mode
This parameter specifies the monitoring mode for the tributary. For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect.
Type: Alphanumeric value set.
Range: MON or NMON (default).

27. **`trailst`** – Trail Status
This parameter reports the accepted trail status value.
Type: Alphanumeric string.
Range:
    - AIS, for Alarm Indication Signal in case of Trail Signal Fail Condition
    - UNAVAILABLE, for unavailable
    - NORMAL.

28. **`trc`** – Outgoing Path Trace
    This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
    For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.
    Type: Hexadecimal number without a preceding "H".

    Range: the range depends on the parameter ptrcwfmt specified in **`RTRV-VCGTRIB`** Output parameters length

    - 32, hexadecimal digits, if *ptrcwfmt* = 16
    - 128, hexadecimal digits, if *ptrcwfmt* = 64
    - value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt* = 16; 64 byte string, if *ptrcwfmt* = 16.

    Default: Depending on the default value of *ptrcwfmt*:

    - 00hex, if *ptrcwfmt* = 2.
    - 89hex followed by 15 bytes 00hex, if *ptrcwfmt* = 16.
    - 64 bytes 00hex, if *ptrcwfmt* = 64.

29. **`tslmmon`** – Trail Signal Label Mismatch Monitor
    This parameter specifies the mode of the TSL mismatch detection.
    For VCG tributaries located on ES64U packs, this parameter is visible with default values for retrieval, but cannot be modified.
    Type: Alphanumeric value set.

    Range:

    - DISABLE
    - ENABLE (default).

Detailed behavior description

The **`RTRV-VCGTRIB`** does not generate a **`REPT DBCHG`** message. The command retrieves all port parameter as described in section Output parameters.

Dependencies

brstintvl and *brstthr* are only meaningful if *sdfsmode* is set to BURST. *degthr* and *dexcthr* are only meaningful if *sdfsmode* is set to POISSON.

Parameters which are not meaningful at the moment are reported with their default values, nevertheless.

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-VCGTRIB** command, too.

Validation rule: Check *modifier* against circuit pack type

If the command is applied

- with modifier = VC or STS to a VCG tributary on a transparent pack or
- with modifier = VCT or STST to a VCG Tributary on a GE***n*** or ES64U pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Check CCB against *istd* of related VCG

Check wether the CCB fits to *istd* of the related VCG.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`.

E.g. DENY, if a command with *modifier* = VC or *modifier* = VCT is made on a port which is provisioned as *istd* = SONET.

Related TL1 messages

- “ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 3-1416)
- “OPR-VCGTRIB: Operate virtual concatenation group tributary” (p. 3-2082)

RTRV-VRTSW: Retrieve virtual switch

The **RTRV-VRTSW** command retrieves the attributes of a virtual switch of a GE1 pack.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-VRTSW**:*tid*:*aid*:*ctag[:::spec_block]*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.
2. **aid** – Access Identifier
   The access identifier specifies the slot containing a GE1 pack.
   Type: AID.
   Range: UnivSlotAID as defined in AID structure.
   The values
   - all and
   - usall for Simple_UnivSlotAID

   is accepted.
3. **ctag** – Correlation Tag
   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values all or usall at the appropriate positions of the input AID. For input AIDs not using *all* or *usall* this parameter is not allowed. This implies that with such input AIDs the dynamic parameters are always returned.
   The following output parameters of a virtual switch are affected:
   - *macaddr*
   - *rootpriority*
   - *rootmacaddr*

- *rootcost*
- *rootport*.

Type: Alphanumeric value set.
Range: YES, report dynamic parameters in the reply as well. NO (default), do not report dynamic parameters in the reply.

Output format

After receiving the **RTRV-VRTSW** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ”aid:vrtswid:spec_block”
   <this entire block is repeated for another vrtswid>
   <this entire structure is repeated for another slot>
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of.

The output is in the form of a nested list. The primary list is based on the slot AID. For each slot AID, there is a nested list for each instance of a virtual switch giving the spec_block parameters.

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the slot containing a GE1 pack to be operated on.
   Type: AID.
   Range: UnivSlotAID as defined in AID structure with the exception of the value all and usall.
2. **vrtswid** – Virtual Switch Identifier
   This parameter identifiers the instance of the virtual switch.
   - A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
   - There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

   Type: Integer.
   Range: 1 – Currently this is the only allowed value.
   Default: 1.

Spec block parameters

1. **`eplst`** – EPORT AID list
   This parameter specifies a list of EPORT instances connected to the virtual switch instance as specified by *vrtswid*.
   In R3 there is only one virtual switch instance to which all ports are mapped. Therefore this list is fix.
   Type: AID list.
   Range: A list of EPortAIDs as specified in the AID definition section with the exception of the values all and usall in the respective components of the AID, separated by an ampersand ('&')
   Example: If all four EPORTs of a GE1 are mapped to one virtual switch:
   1-#-#-1-1-1&1-#-#-1-1-2&1-#-#-1-1-3&1-#-#-1-1-4
2. **`ethertype`** – VLAN tag protocol ID
   This parameter specifies the VLAN tag protocol ID necessary for interworking purposes. This parameter is used to control whether the virtual switch operates in IEEE802.1Q tagging mode (i.e. set to 0x8100) or in transparent tagging mode (i.e. set to value different to 0x8100).
   Type: Hexadecimal value.
   Range: 0x0600 … 0xFFFF.

   The following values have a specific meaning:

   - 0x8100: virtual switch operates in IEEE802.1Q tagging mode
   - any other value: virtual switch operates in transparent tagging mode.

   Default: 0x8100.
3. **`gvrpmode`** – GVRP mode
   The parameter *gvrpmode* allows to control the dynamic VLAN registration mode.
   Type: Alphanumeric value set.
   Range: ENABLED, GVRP is enabled. DISABLED (default), GVRP is disabled.
4. **`macaddr`** – Bridge ID address
   The parameter *macaddr* specifies the bridge address field of the bridge identifier.
   Type: Alphanumeric value set.
   Range: 000000000000 to FFFFFFFFFFFF (hexadecimal value) and UNAVAILABLE, if the value can not be retrieved.
5. **`rootcost`** – Cost of Path to root bridge
   This parameter specifies the cost of the path to the root bridge as determined by the *Spanning Tree Protocol*.
   Type: Alphanumeric value set.
   Range: 0 to 4 294 967 295 and UNAVAILABLE if the value can not be retrieved.
6. **`rootmacaddr`** – Root bridge ID address
   This parameter specifies the bridge identifier of the root bridge as determined by the *Spanning Tree Protocol*.
   Type: Alphanumeric value set.
   Range: 000000000000 to FFFFFFFFFFFF (hexadecimal value) and UNAVAILABLE if the value can not be retrieved.

7. **`rootport`** – Root port identifier
   This parameter specifies the identifier of the root port, which offers the lowest cost path from the virtual switch to the root bridge.
   Type: AID or alphanumeric string.
   Range: *EPortAID* or *VCGAID* as specified in the AID definition section with the exception of the values *all*, *usall* and *vall* in the respective components of the AID; UNAVAILABLE.
   The value UNAVAILABLE is returned when the addressed virtual switch is currently the spanning tree root bridge. This is also the case if STP is disabled for all ports belonging to the virtual switch. The Value UNAVAILABLE is returned if the value can not be retrieved from the HW.
8. **`rootpriority`** – Root bridge priority
   The parameter *rootpriority* specifies the priority of the root bridge as determined by the Spanning Tree Protocol.
   The virtual switch defined with the lowest value for its bridge priority compared to other virtual switches in the network will be elected as the root bridge.
   Type: AID or alphanumeric string.
   Range: 0 to 65535 and UNAVAILABLE if the value can not be retrieved.
   Default: 32678.
9. **`rstpmd`** – Rapid Spanning Tree Protocol Mode
   This parameter allows to enable or disable the Rapid Spanning Tree Protocol for the given virtual switch.
   Type: Alphanumeric value set.
   Range: DISABLE (rSTP is disabled, i.e. the virtual switch only supports normal STP (IEEE802.1D)); ENABLE (rSTP is enabled, i.e. the virtual switch also supports rSTP (IEEE802.1w)).
   Default: ENABLE
10. **`stbrpriority`** – Spanning tree bridge priority
    This parameter specifies the priority of the bridge to be used by the Spanning Tree Protocol.
    Type: Integer.
    Range: 0 to 65535.
    The stepping as recommended by the standard (steps of 4096 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction ″0 to 61440″ is not done by the NE.
    Default: 32768.
11. **`stfdtm`** – Spanning Tree forward delay timer
    The parameter *stfdtm* specifies the rSTP-related bridge forward delay timer. This parameter is relevant for both rSTP and STP.
    Type: Integer.
    Range: 1 … 255.
    Default: 15.

12. **sthellotm** – Spanning Tree hello timer
 The parameter *sthellotm* specifies the rSTP-related bridge hello timer. This parameter is relevant for both rSTP and STP.
 Type: Integer.
 Range: 1 … 225.
 Default: 2.
13. **stmaxage** – Spanning Tree maximum age timer
 The parameter *stmaxage* specifies the rSTP-related maximum PDU transmission delay timer. This parameter is relevant for both rSTP and STP.
 Type: Integer.
 Range: 1 … 255.
 Default: 20.
14. **vcglst** – VCG AID list
 The parameter *vcglst* specifies a list of VCG instances connected to the virtual switch instance as specified by *vrtswid*.
 In R3 there is only one virtual switch instance to which all eports are mapped. Therefore this list is fix.
 Type: AID list.
 Range: A list of VCGAIDs as specified in the AID definition section with the exception of the values all, usall and vall in the respective components of the AID, separated by an ampersand ('&').
 Example: If all four VCGs of a GE1 are mapped to one virtual switch:
 1-#-#-1-1-v1&1-#-#-1-1-v2&1-#-#-1-1-v3&1-#-#-1-1-v4.

Detailed behavior description

Omit dynamic parameters if not accessible

If the system cannot access dynamic data related to the addressed slot, e.g. due to a missing or defect pack or a system-internal communication outage, the following parameters shall response the value ″UNAVAILABLE″::

- *macaddr*
- *rootpriority*
- *rootmacaddr*
- *rootcost*
- *rootport*.

Example input/output

```
RTRV-VRTSW:LT-UNITE:1-1-#-#-1:123456;
   LT-UNITE 02-05-15 13:31:30
M  123456 COMPLD
   ″1-1-#-#-1:1:eplst=1-1-#-#-1-1&1-1-#-#-1-2&1-1-#-#-1-3&1-1-#-#-1-
      4,gvrpmode=ENABLE,macaddr=010203040506,rootcost=1234567890,rootmacaddr=112233445566,ro
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-EPORT** command.

Related TL1 messages

- “ED-VRTSW: Edit virtual switch” (p. 3-1439)

Security event notification

Output format

Syntax:

REPT EVT *modifier aid:condtype,condeff,ocrdat,ocrtm:conddescr;*

Output parameters

Command parameters

1. **`modifier`** – Modifier
   The parameter specifies the value ’COM’ as an event that applies to the whole NE.
   Type: Alphanumeric value set.
   Range: COM
2. **`aid`** – Access Identifier
   Type: AID
   Range: SystemAID
3. **`condtype`** – Condition Type
   This parameter specifies/identifies the type of security event being reported.
   Type: Alphanumeric value set.
   Range:
   - SEC-USERLOGIN: Successful user login
4. **`condeff`** – Condition Effect
   The parameter shall indicate the effect of the reported security event on the NE.
   Type: Alphanumeric value set.
   Range:
   - SC: Standing condition
   - CL: Clear
5. **`ocrdat`** – Occurrence Date
   The parameter shall indicate the date of the security event being reported.
   Type: value set of format YY-MM-DD
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the year, MM the month, DD the day.
   Default: None.

6. **`ocrtm`** – Occurrence Time
   The parameter shall indicate the time of the security event being reported.
   Type: value set of format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.
   Default: None.

7. **`conddescr`** – Condition Description
   The parameter shall provide additional information w.r.t. the security event.
   Type: inner string
   Range:
   The following strings are applicable for the one remaining *condtype* SEC-USERLOGIN.
   Also see the relation between *condeff* and *conddescr*:
   condeff – *conddescr*
   SC – \″login – <uid>\″
   CL – \″logout – <uid>\″
   CL – \″forced logout – <uid> \″
   CL – \″inactivity timeout – \″
   CL – \″logout, disconnected – <uid> \″
   The security event notification is related to the user session which is indicated by the user ID (*uid*).

Example outputs

```
   sid date time
M  ctag COMPLD
;

   sid date time
M  ctag DENY
   SROF
   /* Status, Requested Operation Failed, processing failure */
;
```

SET-ATTR-CONT: Set attribute control

The **SET-ATTR-CONT** command can be initiated by users to set the description associated with an MDO port (Miscellaneous Discrete Output / external discrete control).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

Input format

Command syntax: **SET-ATTR-CONT**:*tid*:*aid*:*ctag*::*contmsg[,,asgcond]*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This is the address of the MDO port entities on which the command operates. If misc_outall is specified the configuration of all MDO's will be retrieved.
   Type: AID
   Range: Miscellaneous_out_discreteAID
   Default: misc_outall (if the *aid* is omitted).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **contmsg** – Control Message
   This is the name associated to a MDO port (environmental control).
   Type: text string
   Range: A string of up to 26 characters, any character except ″ and \, upper and lower cases considered. An empty string is allowed. The value would be ″″.
5. **asgncond** – Assigned Condition Type
   This parameter identifies the probable cause (type of alarm indication) which is assigned to an MDO port (external control). If one or more alarm(s) of this probable cause appears then the MDO port (external control) will be switched on.
   Type: Alphanumeric value set. Additionally a "-" will be allowed (not the first character).
   Range: All defined probable causes and UNDEF: if no probable cause is assigned.
   Default: UNDEF.
   If the value is omitted, then the actual value is not changed.

Output format

The following example shows the successful completion of the **SET-ATTR-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The name of a MDO via the aid specified will be updated according the value of *contmsg*. The update will be reported via a SET-ATTR-CONT – REPT DBCHG message. Refer to the definition of the SET-ATTR-CONT notification.

Example input/output

The following example shows the successful completion of the **SET-ATTR-CONT** command by the NE:

```
SET-ATTR-CONT:LT-UNITE-123:MISC_OUT3:123456::"fan 3",,FANF;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

The following example shows the successful completion of the **SET-ATTR-CONT** command by the NE if the *asgncond* parameter will be unchanged:

```
SET-ATTR-CONT:LT-UNITE-123:MISC_OUT3:123456::"fan 3";

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **SET-ATTR-CONT** command.

SET-ATTR-CONT notification

Output format

The **SET-ATTR-CONT** notification has the following specific syntax:

SET-ATTR-CONT:*aid::contmsg,,asgncond*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This is the address of the MDO port entity for which the configuration is retrieved or on which an operation is performed.
   Type: AID.
   Range: Miscellaneous_out_discreteAID. misc_outall must not be reported or used.
2. **contmsg** – Control Message
   This is the name associated to a MDO port (environmental control). It is a description which can be retrieved by the management system.
   Type: inner string.
   Range: string up to 26 characters, any character except ″ and \, upper and lower cases considered. A empty string is allowed. The value would be \″\″.
   Default: MDO port #n. n is the number of the port 1 … 8.
3. **asgncond** – Assigned Condition Type
   This parameter identifies the probable cause (type of alarm indication) which is assigned to an MDO port (external control). If one or more alarm(s) of this probable cause appears then the MDO port (external control) will be switched on.
   Type: Alphanumeric value set. Additionally a “-” will be allowed (not the first character).
   Range: All defined probable causes and UNDEF: if no probable cause is assigned.
   Default: UNDEF.

Example output

The example shows a normal SET-ATTR-CONT notification:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:SET-ATTR-CONT:MISC_OUT3::\″fan 3\″,,FANF″
;
```

SET-ATTR-ENV: Set attribute environment

The **SET-ATTR-ENV** command can be used to set the alarm message, name and assigned ASAP of an miscellaneous discrete input (MDI/environmental point).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command syntax: **SET-ALM-ENV**:*tid*:*aid*:*ctag*::,,*almmsg*,*envname*:*spec_block*;

Input parameters

Command parameters

- **tid** – Target Identifier
  See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
- **aid** – Access Identifier
  This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If misc_inall is specified the information for all entities will be retrieved.
  Type: AID.
  Range: Miscellaneous_in_discreteAID.
  Default: misc_inall (if the aid is omitted).
- **ctag** – Correlation Tag
  See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).

- **almmsg** – Alarm Message
  This is the condition description which is associated with the MDI port (environmental point). This description will be sent with the alarm generated from the MDI port.
  Type: inner string.
  Range: a string up to 32 characters, any character except ″ and \, upper and lower cases are considered.
  Default: Miscellaneous Discrete #<N> with N = 1 … 8 for the different MDI ports.
- **envname** – Environmental Point Name
  This is the name associated to a MDI port (environmental point). It is a description which can be retrieved by the management system. It is not to be mixed up with the envmsg parameter. The envname is just a name of the MDI port and not reported via the condition description of an alarm.
  Type: inner string
  Range: a string up to 26 characters, any character except ″ and \, upper and lower cases considered.
  Default: MDI port #n; n is the number of the port 1 … 8.

Spec block parameters

- **envinv** – Environmental Alarm Inversion
  This parameter indicates for the MDI (environmental point) whether an alarm is generated if the port is on or if the port is off.
  Type: Alphanumeric value set.
  Range:
  – YES: The alarm will be inverted
  – NO: The alarm will be not inverted.
- **pfname** – Profile Name
  This is the name of the ASAP that is assigned to the MDI port (environmental point). The ASAP must be of the type ENV.
  Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
  Range: string up to 24 characters.
  Default: DEFAULT.

Output format

The following example shows the successful completion of the **SET-ATTR-ENV** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **SET-ATTR-ENV** command updates the configuration of the almmsg, envname, pfname of the via aid specified MDI port. The changes will be reported via a REPT DBCHG message. See definition of SET-ATTR-ENV notification.

Example input/output

The following example shows the successful completion of the **SET-ATTR-ENV** command by the NE:

```
SET-ATTR-ENV:LT-UNITE-123:MISC_IN7:123456::,,”open door”,”door”:pfname=ENV_
      NM,envinv=YES;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ATTR-ENV** command.

Validation rule: *pfname* does not exist

An ASAP with the name pfname does not exist for an ASAP type ENV.

Error code: `IDNV – Input Data Not Valid, ASAP profile does not exist`

SET-ATTR-ENV notification

Output format

The **SET-ATTR-ENV** notification has the following specific syntax:

SET-ATTR-ENV:*aid,,almmsg,envname:spec_block*;

Output parameters

Command parameters

- **aid** – Access Identifier
  This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If misc_inall is specified the information for all entities will be retrieved.
  Type: AID.
  Range: Miscellaneous_in_discreteAID.
  Default: misc_inall (if the aid is omitted).
- **almmsg** – Alarm Message
  This is the condition description which is associated with the MDI port (environmental point). This description will be sent with the alarm generated from the MDI port.
  Type: inner string.
  Range: a string up to 32 characters, any character except ″ and \, upper and lower cases are considered.
  Default: Miscellaneous Discrete #<N> with N = 1 … 8 for the different MDI ports.
- **envname** – Environmental Point Name
  This is the name associated to a MDI port (environmental point). It is a description which can be retrieved by the management system. It is not to be mixed up with the envmsg parameter. The envname is just a name of the MDI port and not reported via the condition description of an alarm.
  Type: inner string
  Range: a string up to 26 characters, any character except ″ and \, upper and lower cases considered.
  Default: MDI port #n; n is the number of the port 1 … 8.

Spec block parameters

- **envinv** – Environmental Alarm Inversion
  This parameter indicates for the MDI (environmental point) whether an alarm is generated if the port is on or if the port is off.
  Type: Alphanumeric value set.

Range:

– YES: The alarm will be inverted

– NO: The alarm will be not inverted.

- **pfname** – Profile Name
  This is the name of the ASAP that is assigned to the MDI port (environmental point). The ASAP must be of the type ENV.
  Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
  Range: string up to 24 characters.
  Default: DEFAULT.

Example output

The example shows a normal notification after an SET-ATTR-ENV Command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ”TIME=08-00-12,DATE=00-01-01:SET-ATTR-ENV:MISC_IN7::,,\”open
      door\”,\”door\”:pfname=ENV_NM,envinv=YES”
;
```

SET-MAP-RING: Set map ring

The **SET-MAP-RING** command writes the transitional, manually provisioned ring map to NVM for use by the MS-SPRing/BLSR protection group.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command syntax: **SET-MAP-RING**:*tid*:[*aid*]:*ctag*::[*rid*]*;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **ctag** – Correlation Tag
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
4. **rid** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
   Option: If *aid* is specified, then *rid* can be omitted.

Output format

After receiving the **SET-MAP-RING** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

1. **sid** – Source Identifier
   This is the currently active name of the network element to which the command is addressed. The tid is a case insensitive character string.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: 1 to 20 characters.
2. **date** – Date
   Date when output message is generated. This has the format YY-MM-DD (year-month-day)
   Type: value set.
   Range: for YY 00 to 99, for MM 01 to 12, for DD 01 to 31
   TL1 messages use YY-MM-DD for the format of a date, meaning that the year only has two digits. This is consistent with Telcordia requirements. Internally, however, the system does use a 4-digit year. When the year appears in a response, the internal 4-digit year is truncated to two digits. When the year appears as an input parameter, for example in the **ED-DAT** command, years in the range 90-99 will represent 1990-1999, and years in the range 00-37 will represent 2000-2037.
   Default:00-01-01
3. **time** – Time
   Time when output message is generated. This has the format HH:MM:SS (hours:minutes:seconds).
   Type: Value set.
   Range: for HH 00 to 23, for MM 00 to 59, for SS 00 to 59.
   Default: 00:00:00
4. **M** – Message
   M indicates that the output message is generated in response to a manual command.
   Type: Value set.
   Range: M

5. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: Non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.
6. **IP** – In Progress
   IP is sent in response to all commands with the exception of commands that result in error code output.
   Type: Value set.
   Range: IP
7. **RL** – Repeat Later
   The requested command cannot be executed due to unavailable system resources. The command may be entered again later.
   Type: Value set.
   Range: RL
8. **COMPLD** – Completion Code
   It indicates that the command has been completed.
   COMPLD for successful command execution: For a command that is decomposed into a set of atomic commands a COMPLD completion code means that the command was successful for all atomic commands (e.g. AID ranges, group alias).
   COMPLD for no changes: If a parameter has a current value, and a provisioning command attempts to reprovision the parameter with a value that is the same as its current value, the command will return a COMPLD completion code.
   Type: Value set.
   Range: COMPLD.

Detailed behavior description

The **SET-MAP-RING** command is used to move the transitional manually provisioned ring map to NVM foe use by the BLSR port protection group. This command will be denied if automatic ring discovery is enabled.

The **SET-MAP-RING** command is also denied if the list does not contain the local node , if the list does not contain at least 2 nodes, or if duplicate nid values appear in the list. The **SET-MAP-RING** command generates a REPT DBCHG message.

Example input/output

The following is an example of a SET-MAP-RING command:

```
SET-MAP-RING:NENAME-1::123456::rid1;
   NENAME-1 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Automatic ring discovery to be disabled

If the automatic ring discovery is enabled, the following error response is returned:

Error code: `SNVS – Status, Not Valid State`

Validation rule: consistent aid and rid

If both an aid and an rid are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

SET-MAP-RING notification

Output format

Command syntax: **`SET-MAP-RING`**:*aid[:rid];*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
2. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
   Option: The rid is only included in the SET-MAP-RING notification if the rid has been specified in the **`SET-MAP-RING`** command.

Example input/output

The following example reports the creation of a ring map in LT-UNITE’s NVM:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:SET-MAP-RING:1-1-t001:rid1″
;
```

SET-OW: Set orderwire and user bytes

General

The **SET-OW** command associates the overhead byte (E1 or E2 or F1) on an optical port to an overhead access port or removes this association. Furthermore the port-interface (either G.703 or V.11) of the overhead access port can be specified.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

Input format

Command syntax: **SET-OW**:*tid*:*aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   The parameter *aid* specifies the overhead access port to be used for association (or removing the association).
   Type: UserBytePortAID.
   Range: As given by the UserBytePortAID definition, the value ″ubioall″ is not allowed.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **intfctype** – Interface Type
   This parameter specifies which electrical interface standard of the overhead access port is used.

Two different settings are possible:

- electrical interface according to G.703
- electrical interface according to V.11.

Note: The overhead access ports with AIDs ubio1, … ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.
Type: Alphanumeric value set.
Range: G703, V11.
Default: G703 (for the overhead access ports given by the AIDs ubio1 … ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 – fixed to V11).

2. **`ohbyte`** – Overhead-Byte
   This parameter specifies which of the overhead bytes is used.
   Three channels are possible:
   - E1 and F1 in the RSOH (section overhead)
   - E2 in the MSOH (line overhead).

   Type: Alphanumeric value set.
   Range: E1, F1, E2.
   Default: E1.
   Note: In output direction the empty string appears as \″\″.
3. **`portaid`** – Port Access Identifier
   This parameter specifies the optical/electrical port (of an OP***n***/EP***n***) of the userbyte to which the overhead access port (given by the command parameter aid) is associated, respectively dis-associated.
   Type: In case an association is established: SPortAID; in case an association will be removed: Alphanumeric value set (i.e. the string ″NOCONNECT″).
   Range: In case an association is established: SPortAID (No **`all`** value is supported); in case an association will be removed: NOCONNECT.
   Default: NOCONNECT.

Output format

If the **`SET-OW`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The attributes *portaid*, *ohbyte* and *intfctype* of the entity Userbyte port is updated by this command.

This update is reported by a SET-OW notification.

Example:

SET-OW:UNITE-NE:ubio3:123456:::portaid=1-1-#-#-5-1,ohbyte=E2,intfctype=V11;

REPT DBCHG

SET-OW:ubio3::port_aid=1-1-#-#-5-1,ohbyte=E2,intfctype=V11;

Circuit pack type related restrictions

The Orderwire and User Byte access is only functioning on the following circuit pack types: OP155, EP155, OPLB, all OP10xx packs.

Update affected entities

Apart from the Userbyte port entity no further entities are affected by the **SET-OW** command.

Example input/output

Example 1

Suppose the Userbyte port given by AID ubio1, to be configured to V11, is associated to the E1-Byte channel of the optical port of an OP10G in slot 10:

```
SET-OW:UNITE-NE:1-1-ubio1:123456:::portaid=1-1-#-#-10-1-1,ohbyte=E1,intfctype=V11;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 2

Suppose the association as made in Example-1 is removed (i.e. dis-associated):

```
SET-OW:UNITE-NE:1-1-ubio1:123456:::portaid=NOCONNECT,
ohbyte=E1,intfctype=V11;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Interface type compliant with port

Command processing shall verify that setting the interface type to G.703 is only possible for the UserByte-Ports *ubio1*, … *ubio4* (but not for ubio5 and ubio6).

Error code:
`IDNV – Input, Data Not Valid, Interface type not settable for specified UserByte-Port`

Validation rule: No association present (when associating)

Command processing shall verify that when setting up an association no association is already present.

This means, that only a one to one relation is allowed between the specified:

- Userbyte of a SDH/SONET optical/electrical port and
- UserByte port.

Error code: `SNVS – Status, Not in Valid State, association already exists`

Validation rule: Association present (when dis-associating)

Command processing shall verify that an association exists when trying to remove it.

Error code:
`IENE – Input, Entity Not Exists, Specified association does not exist`

Validation rule: *ohbyte* and *intfctype* values correct (when dis-associating)

Command processing shall verify in case of removing the association that the entered value for the parameters ohbyte and intfctype are identical with the current ones.

Error code:
`IDNV – Input, Data Not Valid, discrepancy between entered values and current value of spec-block parameters`

Validation rule: Port exists (when associating)

When setting up an association, the command processing shall verify that the specified SDH/SONET optical/electrical port exists.

Error code: `IENE – Input, Entity Not Exists, Specified port does not exist`

Validation rule: No Userbyte access at EC1 ports on EP51 pack

When setting up an association, the command processing shall verify that the specified port is not a EC1 port on an EP51 pack.

Error code:
`IDNV – Input, Data Not Valid, No Userbyte access at the specified port`

SET-OW notification

General

Command syntax: **`SET-OW`***:aid::spec-block;*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter specifies the overhead access port for which the following spec_block parameters are returned.
   Type: UserBytePortAID.
   Range: As given by the UserBytePortAID definition, the value ″ubioall″ is not allowed.

Spec block parameters

1. **`intfctype`** – Interface Type
   This parameter specifies which electrical interface standard of the overhead access port is used.

   Two different settings are possible:

   - electrical interface according to G.703
   - electrical interface according to V.11.

   Note: The overhead access ports with AIDs ubio1, … ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.
   Type: Alphanumeric value set.
   Range: G703, V11.
   Default: G703 (for the overhead access ports given by the AIDs ubio1 … ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 – fixed to V11).
2. **`ohbyte`** – Overhead-Byte
   This parameter specifies which of the overhead bytes is used.

Three channels are possible:

- E1 and F1 in the RSOH (section overhead)
- E2 in the MSOH (line overhead).

Type: Alphanumeric value set.
Range: E1, F1, E2.
Default: E1.
Note: In output direction the empty string appears as \″\″.

3. **`portaid`** – Port Access Identifier
   This parameter specifies the optical/electrical port (of an OP***n***/EP***n***) of the userbyte to which the overhead access port (given by the command parameter aid) is associated, respectively dis-associated.
   Type: In case an association is established: SPortAID; in case an association will be removed: Alphanumeric value set (i.e. the string ″NOCONNECT″).
   Range: In case an association is established: SPortAID (No **`all`** value is supported); in case an association will be removed: NOCONNECT.
   Default: NOCONNECT.

Behavior description

Refer to the *Detailed behavior description* of “SET-OW: Set orderwire and user bytes” (p. 3-3147).

SET-SID: Set SID

The **SET-SID** command is used to change the target/source identification of the NE. The command is denied if the system is not in maintenance condition.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: no

Input format

Command syntax: **SET-SID***:tid::ctag::newsid*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
3. **newsid** – New Target/Source Identification
   This is the new name of the NE. Future commands must use this name instead of the current name.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed, except the characters plus sign (″+″), number sign (″#″) and percent sign (″%″).
   Range: 1 to 20 characters.

Output format

If the NE fully complies with the SET-SID request, the normal completion response is returned as shown below:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

This command provides a new name to the NE.

The update is reported by means of an SET-SID notification.

The **SET-SID** command is denied if the system is not in maintenance condition. Maintenance condition applies only to NE.

The new SID will come into effect only after reset of the CTL. This reset takes place autonomously when the maintenance condition is left. Commands after the reset must use the new SID instead of the current name.

The response as well as corresponding **REPT DBCHG** notification use the old SID in the *sid* parameter.

The **SET-SID** command generates a **REPT DBCHG** message.

Updated affected entities

There is no further entities affected.

If the NE is a node in a BLSR ring/MS-SPRing and the TID is changed, then this may impact cross-connection entities of ring neighbors. Since these updates are reported by NEs not addressed in the command request, these events are treated like autonomous events. For further details see corresponding section in the transmission chapter – entity cross-connection.

Example input/output

The following shows an example of the **SET-SID** command where the target/source identification of the NE was changed to HARRY:

```
SET-SID:LT-UNITE::123456::HARRY;

   LT-UNITE 00-11-15 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **SET-SID** command.

Validation rule: Check of Maintenance Condition

If a SET-SID command is entered when the administrative state of the system is not in maintenance condition, the following error response is returned.

Error code:

`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: Uniqueness of TID within Ringmaps

If the new sid conflicts with an existing TID in at least one of the valid ringmaps, the following error response is returned.

Error code:

`IDNV – Input, Data Not Valid, sid is already used by another BLSR/MS-SPRing Node`

SET-SID notification

Output format

Syntax: **SET-SID**::*newsid*

Output parameters

Command parameters

1. **newsid** – New Target/Source Identification
   See definition of input parameter *tid* in “RTRV-HDR: Retrieve header” (p. 3-2417).

Example output

```
SET-SID:LT-UNITE::805::HARRY;

   LT-UNITE  00-11-17  10:11:00
M  805  COMPLD;

   LT-UNITE  00-11-17  10:12:03
A  610  REPT  DBCHG
   Time=13-49-30,DATE=00-11-17:SET-SID::HARRY”
;
```

SET-SYNCN: Set synchronization

The **SET-SYNCN** command is used to provision system timing clock mode, assign timing references, and external input and output timing port attributes. The command is used not only to assign system timing attributes but also to modify or remove them.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

Input format

Command syntax: **SET-SYNCN**:*tid*:*aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **tid** – target identifier
   See definition of *tid – target identifier* in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – access identifier
   This parameter specifies the timing related settings. The AID separates the parameter in system timing related parameter, parameters related to assigned timing references and parameters for port provisioning. The values all or *someprefix* all are not allowed in this context.
   Type: AID
   Range: SystemAID, External_timing_ref_AID, Line_timing_ref_AID, External_Timing_input_port_AID, External_Timing_output_port_AID
   Default: Not applicable.
3. **ctag** – correlation tag
   See definition of *ctag – correlation tag* in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. System Timing
   a. **clkmod** – clock mode
      This parameter specifies the provisioned operational mode of the system timing.
      In the clockmod = FREE-RUNNING mode the system clock process uses the internal oscillator as reference. In the clockmod = LOCKED mode the system clock process uses the input signal from the system.
      Type: Alphanumeric value set.
      Range: FREE-RUNNING, LOCKED.

Default: FREE-RUNNING.

b. **syncmsg** – system synchronization status messaging mode

This parameter is used to ENABLE or DISABLE the SSM protocol.

The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs are set to DNU, for SONET all output SSMs are set to STU.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: ENABLE.

c. **timing** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.

Default: Default

d. **wtr** – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 0SEC, 20SEC, 0…60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0…60MIN (1 minute steps); the values “0SEC” and “0MIN” can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

2. Assigned Timing Reference

a. **extout_pri** – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number ″1″ indicates the highest priority. The priority ″0″ means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. **ql_prov** – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default is:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

c. **`syncref_pri`** – system timing reference priority

   This parameter defines the priority for assigned timing references.

   When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority ″0″ means not assigned.

   Type: Numeric value set.

   Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

   Default: 0 (means DISABLE).

d. **`timing`** – ASAP name

   This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

   Type: Alphanumeric value set.

   Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.

   Default: Default

e. **`tpmode`** – timing port mode monitoring

   This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

   Type: Alphanumeric value set.

   Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

f. **`tref_aid`** – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more then one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

3. External Timing Input

a. **`ext_if`** – external input signal format

This parameter specifies the format of the external timing input.

The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

b. **`ext_isa`** – external input sa bit location

This parameter defines the external input Sa bit location. It is only valid for the external timing input format “2Mbit/s” framed; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

4. External Timing Output

a. **`ext_equ`** – cable equalization

This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

Type: Numeric value set.

Range: 20, 40, 60, 80, 100.

Default: 20.

b. **`ext_of`** – external output signal format

This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

c. **`ext_osa`** – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format “2Mbit/s framed”; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

d. **`extout_en`** – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

e. **`extout_prov`** – external timing output selection

This parameter specifies the operation mode of the external output timing.

The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG, TLS.

Default: SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG.

f. **`extout_ssm`** – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.

Range: AISMODE, QLMODE.

Default: QLMODE.

g. **`frcdus`** – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for ’2Mbit/s framed’ and ’DS1 ESF’; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

h. **`loopdelay`** – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.

Range: 0…60 (1 seconds steps).

Default: 10.

i. **`qlout_tais`** – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the *extout_ssm* value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3

SDH: PRC, SSUT, SSUL, SEC.

Default:

SONET: ST3

SDH: SEC.

j. **`regen_loop`** – timing regenerator loop

This parameter specifies the avoiding of loops over the SASE/BITS clocks.

When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.

Type: Alphanumeric value set.

Range:

SONET: DISABLE, ENABLE

SDH: DISABLE, EXTREF1, EXTREF2, BOTH.

Default:

SONET: ENABLE

SDH: DISABLE.

k. **`timing`** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.

Default: Default

Output format

After receiving the **`SET-SYNCN`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

After successful receiving the **`SET-SYNCN`** command a **`REPT DBCHG`** database change notification is returned. This notification consists the same parameter as per delivered by the command. Notifications are sent whenever a user-provisionable parameter has been changed.

When the system receives a SET-SYNCN command with changing of the clock mode, a REPT EVT report event notification is returned.

If the system receives a SET-SYNCN command with changing of the active timing reference, a REPT EVT report event notification is returned.

It is not possible to assign a reference from a protection port in a protection group.

If the system synchronization characteristic is SONET and the SSM is invalid the value DUS is displayed for QL values.

It is possible to provision a QL acceptance level to the external timing output. If the system quality below this acceptance QL level and QL control is enabled and the external timing output is enabled then an AIS signal or DUS, depending on settings of parameter *extout_ssm*, is substituted in the output.

If the system timing QL mode is DISABLED for SDH all output SSMs are set to DNU, for SONET all output SSMs are set to STU.

If the system synchronization characteristic is SDH and the external timing input format is either 2MHz or 2Mbit/s unframed or 2Mbit/s framed without SSM then the assigned timing reference status are default SSUT. If the system synchronization characteristic is SONET and the external timing input format is either SF or ESF without SSM then the assigned timing reference status are default STU. The value AUTO is rejected if SSM is not supported for the assigned timing reference.

It is possible to provision the automatic reference selection process to use the incoming QLs in QL-enabled mode. The input with the highest quality level is selected. If there is more then one input with the same highest quality level, then the input with the highest port priority is selected. In QL-disabled mode the reference selection is working by priority provisioning. It is possible to assign the same priority to multiple inputs. In this case, it implies non revertive switching between the associated references.

A MS-SPRing/BLSR span or MSP pair is handled as one transport port, so also counts as one reference signal. If one of the sections of the pair do not support SSM, the reported QL status is NOT-SUPPORTED.

If the timing port is in the NOT-MONITORED mode then no Timing Link Fail alarm will be active when reference is in FAILED status or no Timing Link Unequipped alarm will be active when the reference is in NOT-CONNECTED state.

If the external input signal format ext_if is changed to an unframed mode without also specifying the external input ssm support ext_issm then the external input ssm support ext_issm is set to NOT-SUPPORTED autonomously if not already having this value. The change is reported via a SET-SYNCN notification.

Example input/output

The following is an example of the **SET-SYNCN** command for System Timing:

```
SET-SYNCN:LT-UNITE:system:123456:::clkmod=LOCKED,wtr=1MIN;

   LT-UNITE 00-11-14 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **SET-SYNCN** command for Assigned Timing Reference:

```
SET-SYNCN:LT-UNITE:extref1:123456:::tref_aid=EXTTMG0,
ql_prov=SSUL;

   LT-UNITE 00-11-14 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **SET-SYNCN** command for External Timing Input:

```
SET-SYNCN:LT-UNITE:exttmg1:123456:::ext_if=2MHZ;

   LT-UNITE 00-11-14 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **SET-SYNCN** command for External Timing Output:

```
SET-SYNCN:LT-UNITE:exttmg0_out:123456:::ext_of=2MHZ,extout_en=ENABLE;

   LT-UNITE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Timing reference already assigned

If a timing reference already assigned to a timing port or circuit pack the system responds with:

Error code: `SDNC – Status, Data Not Consistent, reference already assigned`

Validation rule: One timing port for a circuit pack

If a second port of a circuit pack is assigned to a timing reference the system responds with:

Error code:

`SDNC – Status, Data Not Consistent, other port already assigned`

Validation rule: No timing port on protection pack of an MS protected timing port

If another port of a circuit pack where the protection port of an MS protection group is located whose associated worker port for this span has already a timing reference being assigned the system shall respond with:

Error code:

`SDNC – Status, Data Not Consistent, other port already assigned`

″MS protection group″ denotes an MSP/APS or a 4 fibre MS SPRING/BLSR group.

Validation rule: No out-of-service state for timing port

If an ’out of service’ port (i.e. the port attribute *servcond* has the value ’OUTOFSERVICE’) is assigned to a timing reference the system responds with:

Error code: `SDNC – Status, Data Not Consistent, port is out-of-service`

A port must be in the out-of-service before any port loop can be switched. Therefore it is sufficient to request for a timing reference assignment, that a port is not in the out-of-service state in order to prevent timing loops caused by port loops; i.e. a port that is not in out-of-service state will not have a switched port loop.

Validation rule: Timing reference from a protection port in a protection group only allowed in asymmetric spans of a ring

If a timing reference is assigned from a protection port in a protection group which is not part of an asymmetric span, the system shall respond with:

Error code:
`SDNC – Status, Data Not Consistent, reference in protection group`

The characteristic of an asymmetric ring is that one or more spans have only protection lines, no working lines (asymmetric spans). In these asymmetric spans it must be possible to use the protection ports for timing.

Validation rule: Port is already assigned to another timing reference

Ports can be assigned only one. If a port already assigned to a timing reference the system responds with:

Error code: `SDNC – Status, Data Not Consistent, port already assigned`

Validation rule: Command rejection if quality evaluation disabled

If the quality mode disabled the setting to forced DUS/DNU or the setting the quality output threshold AIS is rejected and the system responds with:

Error code:
`SDNC – Status, Data Not Consistent, quality evaluation disabled`

Validation rule: No transparent port as line timing reference

The system shall not allow to use a Transparent Port, i.e. ports with a rate of STM16T or OC48T, as line timing reference.

Error code:
`IDNV – Input, Data Not Valid, Transparent Ports not allowed as line timing reference`

Validation rule: No DS3 Port as line timing reference

The system shall not allow to use a DS3 Port, i.e. a port with a rate of T3, as line timing reference.

Error code:
`IDNV – Input, Data Not Valid, DS3 Ports not allowed as line timing reference`

Validation rule: No EC1 Port as line timing reference

The system shall not allow to use a EC1 Port as line timing reference.

Error code:
`IDNV – Input, Data Not Valid, EC1 Ports not allowed as line timing reference`

Validation rule: SSM not supported

SSM support is rejected for invalid input or output format types and the system responds with:

Error code:
`IDNV – Input, Data Not Valid, SSM not supported for this format`

Validation rule: SSM not supported for unframed formats

Setting an invalid combination of external input frame format (ext_if) and external input SSM support (ext_issm) by changing one or both parameters are rejected and the system shall respond with:

Error code:
`IDNV – Input, Data Not Valid, SSM not supported for this format`

Validation rule: Format not supported for forced DNU/DUS

DNU/DUS provisioning is rejected for invalid output format types and the system responds with:

Error code:
`IDNV – Input, Data Not Valid, forced DUS not supported for this format`

Validation rule: Input / Output format not supported for Sa bit settings

Sa bit location setting is rejected for invalid input or output format types and the system responds with:

Error code: `IDNV – Input, Data Not Valid, Sa bit location not supported`

Validation rule: SSM not supported if timing port provisioned AUTO

If a timing port provisioned AUTO and the reference which is being assigned does not support SSM, the assignment request is rejected and the system responds with:

Error code:
`IDNV – Input, Data Not Valid, SSM not supported for provisioned QL`

Validation rule: Output type not supported for AIS mode

If the AIS mode provisioned to a not supported output type then the system responds with:

Error code: `IDNV – Input, Data Not Valid, AIS mode not valid`

Validation rule: Cable equalization not supported

If the cable equalization provisioned to a not supported output type or if the system synchronization characteristic is SDH then the system responds with:

Error code: `IDNV – Input, Data Not Valid, cable equalization not supported`

Validation rule: Timing clock mode inconsistent

If the NE receives a command with FREE-RUNNING provisioning while the clock mode switch request state is forced holdover, the following error response is returned:

Error code:
`SNVS – Status, Not in Valid State, timing clock mode inconsistent`

Validation rule: Regenerator loops with SETG as timing output

If the output timing source selection is set to SETG and the timing regenerator loop is provisioned, then the system responds with:

Error code:
`IDNV – Input, Data Not Valid, no regen loop with SETG as timing output`

SET-SYNCN notification

Output format

The **SET-SYNCN** notification has the following specific syntax:

SET-SYNCN:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – access identifier
   The AID is used to specify the timing related settings. The AID separates the parameter in system timing related parameter, parameters related to assigned timing references and parameters for port provisioning. The values all or someprefix all are not allowed in this context.
   Type: AID
   Range:
   - SystemAID
   - External_timing_ref_AID
   - Line_timing_ref_AID
   - External_Timing_input_port_AID
   - External_Timing_output_port_AID

Spec block parameters

1. System Timing
   a. **clkmod** – clock mode
      This parameter specifies the provisioned operational mode of the system timing. In the *clockmod* = FREE-RUNNING mode the system clock process uses the internal oscillator as reference. In the *clockmod* = LOCKED mode the system clock process uses the input signal from the system.
      Type: Alphanumeric value set.
      Range: FREE-RUNNING, LOCKED.
      Default: FREE-RUNNING.
   b. **syncmsg** – system synchronization status messaging mode
      This parameter is used to ENABLE or DISABLE the SSM protocol.
      The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs are set to DNU, for SONET all output SSMs are set to STU.
      Type: Alphanumeric value set.
      Range: ENABLE, DISABLE.
      Default: ENABLE.
   c. **timing** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.

Default: Default

d. **`wtr`** – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 0SEC, 20SEC, 0…60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0…60MIN (1 minute steps); the values “0SEC” and “0MIN” can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

2. Assigned Timing Reference

a. **`extout_pri`** – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number ″1″ indicates the highest priority. The priority ″0″ means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. **`ql_prov`** – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default is:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

c. **`syncref_pri`** – system timing reference priority

This parameter defines the priority for assigned timing references.

When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority ″0″ means not assigned.

Type: Numeric value set.

Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

Default: 0 (means DISABLE).

d. **`timing`** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.

Default: Default

e. **`tpmode`** – timing port mode monitoring

This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

Type: Alphanumeric value set.

Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

f. **`tref_aid`** – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more then one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

3. External Timing Input
   a. **`ext_if`** – external input signal format

      This parameter specifies the format of the external timing input.

      The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

      Type: Alphanumeric value set.

      Range:

      SONET: SF, ESF

      SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

      Default:

      SONET: ESF

      SDH: 2MHz.
   b. **`ext_isa`** – external input sa bit location

      This parameter defines the external input Sa bit location. It is only valid for the external timing input format "2Mbit/s" framed; i.e. for ports with format unequal to "2Mbit/s framed" the parameter value is retrievable, but it has no impact on the ports transmission behavior.

      The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

      Type: Alphanumeric value set.

      Range: SA4, SA5, SA6, SA7, SA8.

      Default: SA4.
4. External Timing Output
   a. **`ext_equ`** – cable equalization

      This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

      This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

      Type: Numeric value set.

      Range: 20, 40, 60, 80, 100.

      Default: 20.
   b. **`ext_of`** – external output signal format

      This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.

      Type: Alphanumeric value set.

      Range:

      SONET: SF, ESF

      SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

c. **`ext_osa`** – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format “2Mbit/s framed”; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

d. **`extout_en`** – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

e. **`extout_prov`** – external timing output selection

This parameter specifies the operation mode of the external output timing.

The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG, TLS.

Default: SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG.

f. **`extout_ssm`** – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.

Range: AISMODE, QLMODE.

Default: QLMODE.

g. **`frcdus`** – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for ’2Mbit/s framed’ and ’DS1 ESF’; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

h. **`loopdelay`** – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.

Range: 0…60 (1 seconds steps).

Default: 10.

i. **`qlout_tais`** – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the *extout_ssm* value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3

SDH: PRC, SSUT, SSUL, SEC.

Default:

SONET: ST3

SDH: SEC.

j. **`regen_loop`** – timing regenerator loop

This parameter specifies the avoiding of loops over the SASE/BITS clocks.

When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.

Type: Alphanumeric value set.

Range:

SONET: DISABLE, ENABLE

SDH: DISABLE, EXTREF1, EXTREF2, BOTH.

Default:

SONET: ENABLE

SDH: DISABLE.

k. **`timing`** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.
Default: Default

Example output

The following is an example of the SET-SYNCN notification for System Timing:

```
   LT-UNITE 00-11-16 12:00:00
A  000 REPT DBCHG
   ”TIME=12-00-00,DATE=00-11-16:SET-SYNCN:SYSTEM::wtr=2MIN”
;
```

The following is an example of the SET-SYNCN notification for Assigned Timing Reference:

```
   LT-UNITE 00-11-16 12:00:00
A  000 REPT DBCHG
   ”TIME=12-00-00,DATE=00-11-16:SET-SYNCN:LINE2::ql_prov=PRC”
;
```

The following is an example of the SET-SYNCN notification for External Timing Input:

```
   LT-UNITE 00-11-16 12:00:00
A  000 REPT DBCHG
   ”TIME=12-00-00,DATE=00-11-16:SET-SYNCN:EXTTMG0::ext_isa=SA5,
ext_if=2MBIT-FRAMED”
;
```

The following is an example of the SET-SYNCN notification for External Timing Output:

```
   LT-UNITE 00-11-16 12:00:00
A  000 REPT DBCHG
   ”TIME=12-00-00,DATE=00-11-16:SET-SYNCN:EXTTMG1_OUT::ql_out=SEC,
extout_ssm=AISMODE”
;
```

TCA notification

Output format

Command syntax: **`REPT EVT`** *modifier aid:condtype,condeff,ocrdat,ocrtm,,,,thlev,tmper:conddescr*

Output parameter

1. **`modifier`**
   This parameter indicates the port type or tributary on which the **`INIT-REG`** command is to act on.
   Type: Alphanumeric value set.
   Range:
   The following values are for SONET only:
   - STS1, STS3C, STS12C, STS48C, STS192C, OC3, OC12, OC48, OC48T, OC192, OC768, T3, EC1, LOVT1.

   The following values are for TransMUX only:
   - TMAT3, TMASTS1, DS1

   The following values are for SDH only:
   - VC3, VC4, VC44C, VC416C, VC464C, STM1E, STM1, STM4, STM16, STM16T, STM64, STM256, ODU1, LOVC3, LOVC12

   The following value is for Ethernet only:ENET, 1GEPL, 10GEPL.
2. **`aid`** – Access Identifier
   Type: AID
   Range:
   - For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T ports: SPortAID
   - For Ethernet ports: EPortAID VCGAID
   - For DS3 ports: APortAID, TMuxAPortAID
   - For DS1 NIM: DS1NumAID
   - For ODU terminations: VCGAID
   - For STS/VC tribs: STS1NumAID, TMuxAPTNumAID
   - For VCG tribs: VCGNumAID
   - For LOXC related LO tribs: GenLOTribAID.
3. **`condeff`** – Condition Effect
   This parameter indicates the effect of the reported event on the NE. It is used to distinguish between persistent and transient alarms/events.

Two state transitions can be distinguished for a persistent alarm/event:

- raise transition: state change from not present to present
- clear transition: state change from present to not present.

A transient alarm/event has no 'presence' state; i.e. just the occurrence of that event/alarm is reported. ABN condition are always persistent and not transient.
Type: Alphanumeric value set.

Range:

- CL: Standing condition cleared for a persistent alarm/event.
- SC: Standing condition raised for a persistent alarm/event
- TC: Transient condition occurred for a transient alarms/events.

4. **`conddescr`** – Description Of The Condition
   The general format is: category, entity, description, additional text. If there is no additional text, then the trailing comma may be omitted.
   Type: inner string

   Range:

   - For STM<N>, STM<N>T, OC<N>T, OC<N> and EC1: Quality of service, {rr} port, TCA where rr is equal to the port rate
   - For ODU<N>: Quality of service, {rr} path, TCA where rr is equal to the ODU rate (e. g., ODU1)
   - For not terminated VC12, VC3, VC4, VC44C, VC416C, VC464C, VT1, STS1, STS3C, STS12C, STS48C and STS192C: Quality of service, {rr} CS, TCA where rr is equal to the signal rate
   - For terminated VC4 and STS1signals: Quality of service, {rr} path, TCA where rr is equal to the Constituent Signal (CS) rate
   - For GE port: Quality of service, {ge_rate}GE, TCA where ge_rate is the signal rate of the GE port
   - For VCG port: Quality of service, VCG, TCA.
   - For DS3 port: Quality of service, T3 port, TCA
   - For TMAT3 port: Quality of service, T3 port, TCA
   - For TMASTS1 path termination: Quality of service, {***`rr`***} path, TCA, where ***`rr`*** is equal to STS1 rate
   - For not terminated DS1 tributary: Quality of service, DS1 path, TCA

5. **`condtype`** – Condition Type
   This parameter identifies the type of event indication being reported.
   Type: inner string with the Format: T-<montype>

   Range:

   - Range for SDH signals

     The following values are for all *STM<N> signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-MS-N-ES, T-MS-N-SES, T-MS-N-BBE, T-MS-N-UAS, T-MS-F-ES, T-MS-F-SES, T-MS-F-BBE, T-MS-F-UAS

The following values are for all *STM<N>T signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-RS-N-ES-EGR, T-RS-N-SES-EGR, T-RS-N-BBE-EGR, T-RS-N-UAS-EGR

The following values also are for *STM64 and STM256 signals*: T-MS-N-FECC

The following values are for *VC3, VC4, VC44C, VC416C and VC464C tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, cVC-F-BBE, T-VC-F-UAS, T-PJCPOS, T-PJCNEG

The following values are for *VC12 tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, T-VC-F-BBE, T-VC-F-UAS

- Range for SONET signals

  The following values are for all *OC<N> and EC1 signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVL, T-ESL, T-SESL, T-UASL, T-CV-LFE, T-ES-LFE, T-SES-LFE, T-UAS-LFE

  The following values are for all *OC<N>T signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVS-EGR, T-ESS-EGR, T-SESS-EGR, T-SEFS-S-EGR

  The following values are also for *OC192 and OC768 signals*: T-FECC-L

  The following values are for STS1, STS3C, STS12C, STS48C and STS192C tributaries: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE, PPJC-PDet, NPJC-PDet, NPJC-PDet, NPJC-PGen

  The following values are for *TMASTS1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP, T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

  The following values are for *VT1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

- Range for DS3/DS1 signals

  The following values are for *DS3 signals with T3 modifier*:

  T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-SESL, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-SESP, T-UASP, T-SAS-P, T-CV-PFE, T-ES-PFE, T-ESA-PFE, T-ESB-PFE, T-SES-PFE, T-UAS-PFE, T-SAS-PFE, T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS3 signals with TMAT3 modifier*:

  T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS1 signals*:

  T-CVP-EGR, T-ESP-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR

- Range for other signals

  The following values are for all *ODU<N> signals*:

  T-ODU-N-ES, T-ODU-N-SES, T-ODU-N-BBE, T-ODU-N-UAS, T-ODU-F-ES, T-ODU-F-SES, T-ODU-F-BBE, T-ODU-F-UAS

  For *ENET signals*:

  T-PDE, T-EDFE, T-EDFC

6. **ocrdat** – Occurrence Date
   This parameter indicates the raising / clearing date of the alarm.
   Type: value set of the format MM-DD.
   Range: MM represents the month, DD represents the day, leading zeros are not suppressed.
7. **ocrtm** – Occurrence Time
   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.
   Type: value set of the format HH-MM-SS.
   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.
8. **thlev** – Threshold Level
   This parameter is only used for Threshold Crossing Alerts (TCAs). It reports the threshold level value which is set by ED-TCA-PROF.

   The two applicable thresholding methods (tcamd) must be distinguished. For TR-only mode:

   - the raise TCA threshold value is reported.

   For TR-RTR mode:

   - the raise TCA threshold value is reported for the raise event
   - the reset TCA threshold value is reported for the clear event.

   Type: Integer.
   Range: >1 (1 … 4294967295). Leading zeros will be suppressed.
9. **tmper** – Time Period
   This parameter reports the monitored time interval. This parameter is only used for Threshold Crossing Alerts (TCAs).
   Type: value set.
   Range: 15-MIN, 1-DAY.

Example input/output

TCA alarm for an STS-1 SES of slot 14 for port 3 STS-12 (24h register):

```
   UNITE-NE 00-01-01 08:00:50
A  009 REPT EVT STS1
   ″1-1-#-#-14-3-2:T-SESP,TC,01-10,08-00-49,,,,250,1-DAY:\″Quality of service, STS1
      CS, TCA\″″
;
```

4 TL1 messages - administration and security

Overview

Purpose

This section lists the TL1 interface definition for the domain “administration and security”.

Contents

Session

Overview

Purpose

This entity list the parameters which handle the establishment and removal of sessions between the NE and the Managers.

Contents

List of commands

NE security administration

Overview

Purpose

This entity lists the NE security parameters which are defined for the whole NE.

Contents

List of commands

- "RTRV-NE-SECU: Retrieve NE security" (p. 3-2552)
- "RTRV-BANNER" (p. 3-2272)
- "ED-NE-SECU: Edit NE security" (p. 3-446)
- "ED-NE-SECU notification" (p. 3-449)
- "ENT-BANNER" (p. 3-1452)
- "ENT-BANNER notification" (p. 3-1454)

User administration

5 TL1 messages - configuration management

Overview

Purpose

This chapter lists the TL1 interface definition for the domain “configuration management”.

Contents

System

Overview

Purpose

This section lists the system level configuration messages.

Contents

List of commands

Autonomous notifications

Change acceptable type list for CTL

During system startup it shall be detected which CTL type is plugged in.

Appropriate to this CTL the acceptable type list of the second controller slot shall be changed

- If the first controller is a CTL, the second controller can be CTL or CTL/2
- If the first controller is a CTL/2, the second controller must be CTL/2.

The term *first* and *second* is related on installation time. No database change notification will be send out during system initialization.

Change of the data base change status

The data base change state (see *dbstate* parameter in "RTRV-STATE-EQPT (system): Retrieve equipment state (system)" (p. 3-2845)) can change autonomously. This change is reported by means of an ED-STATE-EQPT notification.

System start-up with default DB

The system autonomously create the entity *system* when starting up with the default database. No notification is sent.

Bay

Overview

Purpose

This section lists the bay level configuration messages.

Contents

RTRV-EQPT: Retrieve equipment (bay)

For description of this parameter refer to "RTRV-EQPT (bay): Retrieve equipment (bay)" (p. 3-2373).

Autonomous notifications

System start-up with default DB

The system autonomously create the entity *bay* when starting up with the default database. No notification is sent.

Shelf

Overview

Purpose

This section lists the shelf level configuration messages.

Contents

List of commands

Autonomous notifications

System start-up with default DB

The system autonomously create the entity *shelf* when starting up with the default database. No notification is sent.

Slot

Overview

Purpose

This section lists the slot level configuration messages.

Contents

List of commands

Autonomous notifications

Circuit pack plug in

Autoprovisioning

If a circuit pack is plugged into an allowed slot, which is not provisioned to any circuit pack, this slot is auto-provisioned to this plugged-in pack. This change is reported by means of an ED-EQPT notification for this slot for the *nvmname, nvmqual* parameters and an ED-STATE-EQPT notification for the *holdst* parameter.

Unexpected, not acceptable, not recognizable CP handling

If an unexpected or not acceptable circuit pack or a circuit pack which inventory data can not be read is plugged into the slot only the holder status is changed and this is notified by an ED-STATE-EQPT notification.

For all these cases alarms will be sent out in addition.

Report of inventory data

In addition to the notifications above the system reports an ED-EQPT (slot) notification for the parameters *name, qual, app, ssn, clei, eci, sln*.

In case the inventory data can not be read the fields shall be reported as empty ("").

If circuit packs will be plugged in containing plugged in modules or fixed mounted modules implicit the socket entities will be updated and created according description of auto provisioning of modules.

Create CTL protection group- when plugging a second CTL

When plugging in a second CTL the system shall create one instance of 1+1 equipment protection group of type EQPTCTL

This shall be reported by means of ENT-PROTNGRP notification for 1+1 equipment protection group. The initial protection state shall be reported by means of a protection switch notification for the 1+1 equipment protection group.

Circuit pack plug out

If a circuit pack is plugged out the holder state for this board will change. This change is reported by means of an ED-STATE-EQPT notification for the *holdst* parameter.

In addition to the notification above the system reports an ED-EQPT (slot) notification for the parameters *name, qual, app, ssn, clei, eci, sln*.

If a circuit pack is plugged out which contains sockets with plugged in modules, then implicitly the socket entities shall be updated as required for the case of plug out of modules.

Change of functional type for neighbor slots

If a multislot circuit pack with *nvmname*=<XXX> is provisioned to slot n the parameters *nvmname*, *nvmqual* of each slots m to n-1 (n>m) change to <XXX>, EXTD and the parameter *actlname* is set to empty (i.e. the output contains one row with *actlname*="", see also Example Input/output section of ED-EQPT(slot) notification). This change is reported by means of ED-EQPT notification for slot m to n-1 for *nvmname*, *nvmqual*, *actlname* parameters.

If a circuit pack is provisioned and as side effect it is no longer possible to use one of the neighbor slot for a multislot CP, the parameter *actname* for this slot is changed and all multislot CPs are removed. This change is reported by means of an ED-EQPT notification.

If a multislot circuit pack of slot n is deprovisioned the parameters *nvmname*, *nvmqual* of each slots m to n-1 (n>m) change to UNDEFINED, UNDEF and the parameters *actlname* changes to list of acceptable CPs. This change is reported by means of ED-EQPT notifications for slot m to n-1 for *nvmname*, *nvmqual*, *actlname* parameters.

If a circuit pack is deprovisioned and as side effect it becomes now possible to use one of the neighbor slot for a multislot CP, the parameter *actname* for this slot is changed and all multislot CPs are added. This change is reported by means of an ED-EQPT notification.

System start-up with default DB

The system shall autonomously create all entities addressable by SlotAID when starting up with the default database. No notification is sent.

Socket

Overview

Purpose

Circuit packs can contain sockets where modules can be plugged in. For unite in the current version Pluggable Interfaces mainly optical modules will be plugged in. A module with a pluggable interface will be only related to one port (e.g. a STM64 port). The relation is done in that way that a socket number n is related to a port number n of the same slot (e.g.port 1-1-#-#-1-sc3 is related to socket 1-1-#-#-1-3) The port functionality (and the related e.g. tributaries) is not available as long no module is provisioned by a provisioning command or by plugging in. This means the related entities will be only available if a module is provisioned. A socket behaves similar like a slot. That means there can be inventory data of the module read out, it can be (pre- or auto-) provisioned and also the acceptable type list for the socket is available. Also the rules how and when a module can be provisioned or de provisioned are similar.

Contents

List of commands

Autonomous notifications

Module plug in

Auto provisioning

If a module will be plugged into a not provisioned socket the socket will be auto provisioned to the plugged in module if the plugged in module type matches the acceptable type list of the socked. This shall be reported by means of the ED-EQPT (socket) notification. In addition also all entities will be created and updated as described in the detailed behaviour of the ENT-EQPT (socket) command. The update of the holder status of the socket will be reported by means of the ED-STATE-EQPT (socket) notification.

Unexpected, not acceptable, not recognizeable module handling

If an unexpected or not acceptable module or a module from which inventory data can not be read is plugged into the socket only the holder status is changed and this is notified by an ED-STATE-EQPT(socket) notification. For all these cases alarms will be sent out in addition , either Optical Module Type Mismatch or Optical Module EPROM Access Fail.

Report of inventory data

In addition to the notifications above the system shall report an ED-EQPT (socket) notification for the affected parameters.

Affected parameters for Optical Modules with SFP or XFP EEPROM format:

- *app*,*clei*, *ccode*, *compatibilitybyte*, *connectortype*, *datecde*, *interchangemarker*, *name*, *physicalid*, *prodid*, *qual*, *transceivercode*, *uniquenumber*, *vendorname*, *vendoroui*, *vendorpartno*, *vendorrevlvl*, *vendorsln*, *wesserialno*,*wesvendorid*.

Affected parameters for Optical Modules with Small EEPROM format:

- *app*, *clei*, *eci*, *name*, *qual*, *sln*, *ssn*.

In case the inventory data can not be read the fields shall be reported as empty (“”).

Auto provisioning of CPs with plugged in modules

If a circuit pack is auto provisioned which contains already plugged in modules or fixed installed modules or an already provisioned circuit pack will be plugged in where the modules are not provisioned but already plugged in or fixed mounted then is the behaviour the same as the module will be auto provisioned by plugging in a module into a socket of the circuit pack. It can be seen as two independent actions, which will be performed one after the other: (auto) provisioning of the circuit pack with following auto provisioning of modules.

Module plug out

If a module is plugged out the holder state for this socket will change. This change shall be reported by means of an ED-STATE-EQPT (socket) notification for the holdst parameter.

In addition to the notification above the system reports an ED-EQPT (socket) notification for the affected parameters with the defined default value (empty string ″″).

Affected parameters for Optical Modules with SFP EEPROM format:

- *app,clei*, *ccode*, *compatibilitybyte*, *connectortype*, *datecde*, *interchangemarker*, *name*, *physicalid*, *prodid*, *qual*, *transceivercode*, *uniquenumber*, *vendorname*, *vendoroui*, *vendorpartno*, *vendorrevlvl*, *vendorsln*, *wesserialno*,*wesvendorid*.

Affected parameters for Optical Modules with Small or XFP EEPROM format:

- *app*, *clei*, *eci*, *name*, *qual*, *sln*, *ssn*.

The parameter set in the ED-EQPT (socket) Notification depends on the EEPROM format of the Optical Module which is plugged out.

Circuit pack plug out with plugged in modules

If a circuit pack will be plugged out with plugged in modules or with fixed mounted modules the system behaves like two independent actions, which will be performed one after the other: plug out of the plugged in or fixed mounted modules and plug out of the circuit pack. Regarding modules notifications will be sent as described for module plug out.

Circuit pack pre-provisioning

If a circuit pack, which supports sockets, is pre-provisioned using the ENT-EQPT command for a slot, then the creation of the socket entities shall be reported via ENT-EQPT notifications for sockets with empty spec block. Example:

```
   LT-UNITE^06-03-15 11:14:13
A  004 REPT DBCHG
   ″TIME=11-14-13,DATE=06-03-15:ENT-EQPT:1-1-#-#-39-sc1::″
;
```

Circuit pack

Overview

Purpose

This section lists the circuit pack level configuration messages.

Contents

List of commands

Autonomous notifications

System start-up with default DB

The system autonomously creates the following entities when starting up with the default database:

- backplane (backpl)
- user panel (upl)
- fan unit (fan)
- two TIs (tia and tib)
- CI-CTL (cictl)
- two PIs (pia and pib)
- CTL (ctlw-cp).

No notifications is sent.

Change of the operational state

A change of the operational state is autonomously reported by means of an ED-STATE-EQPT notification for this circuit pack.

Port

Overview

Purpose

The term “port” is defined as physical interface of the EP51, EP155 and OPn packs including the 10-Gigabit Ethernet WANPHY interface variant. The ports of the OPn packs can work in SDH or SONET mode. Therefore SDH and SONET related commands are defined for physically identical ports. The ports of the EP155 packs can only work in SDH mode. Therefore only SDH related commands are defined.

TL1 commands related to gigabit Ethernet LAN ports (GE1 packs) are described in the “Virtual switch” (p. 7-16) section.

- "DLT-OTU2 notification" (p. 3-216)

Tributary

Overview

Purpose

The following chapter lists the commands for VC-3/STS-1 tributaries and path termination functions. The tributaries are related to the synchronous optical/electrical interfaces (e.g. on OPn or EP155). The tributaries with path termination function are related to asynchronous ports (e.g. DS3 port on EP51).

SONET and SDH tributaries are supported to keep the compatibility to current generation equipment as far as possible and to be compatible with the Telcordia manager.

Contents

List of commands

Autonomous notification

Impact of ONNS cross-connection creation

On creation of an ONNS cross-connection (*xconcls*=NN), which involves tributaries on EDGE ports (*portClass*=EDGE) which are part of a BLSR/MS-SPRING protection group the non-empty *loca*, *locz* information of the tributaries are copied into the corresponding attributes of the cross-connection and the *loca*, *locz* parameters in the tributaries are reset to its default values.

The reset of the *loca*, *locz* parameters in the tributaries are reported by means of an ED-STS (*istd* of related port SONET) or ED-VC3 (*istd* of related port SDH) notification.

6 TL1 messages - fault management

Overview

Purpose

This section lists the TL1 interface definition for the domain *fault management*.

Contents

Introduction

Overview

Purpose

This chapter presents general information necessary to understand the subsequent sections.

Contents

Alarms, events, ASAPs

Alarms/events

The system reports failures via alarms and events. An alarm/event can be persistent or transient. If it is persistent then a declaration (when the alarm will be raised) and a clear (when the alarm will be cleared) message will be sent by the NE. If it is transient only a declaration message will be sent.

Each one has a probable cause assigned. This is an identifier for the alarm/event. It will be reported via the *condtype* parameter in several commands/messages.

Alarms (conditions) with the severity Critical, Major, or Minor – will be reported via REPT ALM and can be retrieved via RTRV-ALM. Events/Alarms (conditions) with severity Warning/Not-Alarmed – will be reported via REPT EVT and can be retrieved via RTRV-COND. Alarms of environmental points will be not reported and retrieved via this command. Refer to MDI/MDO description. The different reporting messages and retrieve commands are because of TL1 requirements.

Service affecting / non service affecting

An alarm can be service affecting (sa) or non service affecting (nsa). This indicates if transmission on a path may be affected (sa) or not (nsa). It is only a well educated guess based on the limited view of a single NE.

Alarm severity

Each alarm/event will be reported with a severity. The severity specifies the urgency of the alarm/event. The severity which will be sent for a specific probable cause can be configured via ASAPs.

The NE supports the following severities:

- CR – Critical (ITU / Telcordia)
- MJ – Major (ITU / Telcordia)
- MN – Minor (ITU / Telcordia)
- NA – Warning (ITU) / Not-Alarmed (Telcordia)
- NR – Non-Alarmed (ITU) / Not-Reported (Telcordia).

ASAPs

Alarm Severity Assignment Profiles (ASAP) assign for each probable cause and if applicable service affecting and non service affecting independent a severity. Each ASAP parameter of an ASAP refers to a probable cause and if applicable for service affecting or not. There are different types of ASAPs which defines the severities for different sets of probable causes. An entity which can raise an alarm/event will be assigned an ASAP which defines for the specific alarms/events of the entity the severity. For each ASAP type a default ASAP exists in the NE, which cannot be deleted. ASAPs can be created via ENT-ASAP-PROF, edited via ED-ASAP-PROF, deleted via DLT-ASAP-PROF and retrieved via RTRV-ASAP-PROF.

SONET / SDH Mode

The NE does not distinguish between SONET and SDH. For both the same alarms will be reported and only one set of severities is supported. Alarms use probable causes where applicable from the Telcordia (″SONET world″) standard. For alarm description is system specific and not adapted to Telcordia standards.

For severities the notation is used like described in the TL1 standards of Telcordia. For explanation the meaning in the SONET and SDH world is added.

MDI / MDO

MDI

Miscellaneous Discrete Inputs (MDI / environmental point) are used to have some external input which can raise alarms like from a fire detector. The name and alarm description of an MDI can be configured. The general discussion for alarms/events is also true for MDIs. Only the alarms will be reported via REPT-ALM-ENV and can be retrieved via RTRV-ALM-ENV. The configuration of MDIs can be edited via SET-ATTR-ENV and retrieved via RTRV-ATTR-ENV.

MDO

Miscellaneous Discrete Outputs (MDO / external control) are outputs which can operate equipment outside of the NE like a lamp. Each MDO has a name which can be configured. MDOs can be configured via SET-ATTR-CONT and can be retrieved via RTRV-ATTR-CONT.

MDOs can be operated in two modes: automatically and via management commands. For the automatic mode an MDO gets assigned a probable cause. If at least one alarm of this probable cause is active then the MDO will be operated. For operation with the management commands no probable cause must be assigned to the MDO. The MDO can be operated via OPR-EXT-COND and RLS-EXT-COND. The control state of an MDO can be retrieved with the RTRV-EXT-CONT command.

Alarm, event, ASAP tables

Overview

Purpose

This section describes which alarms and events in the system can occur.

For each possible alarm following will be described:

condtype

The *condtype*, it represents the probable cause.

sa/nsa

States if it is service affecting (sa) or/and non service affecting (nsa).

conddescr

The *conddescr* related to the alarm. It is of the format:

1. \″<category>, <entity>, <description>, <additional text>\″
2. \″<category>, <entity>, <description>, <additional text>-cleared\″.

If there is no additional text, then the trailing comma may be omitted.

The *conddescr* has two forms for persistent alarms:

1. It is used when the alarm is raised.
2. The string: ″-cleared″ is appended. It is used when the alarm will be cleared. Transient alarms use only the first form.

The description in the tables below defines the text for each part of the *condescr*. The leading and ending ’ \″ ’ are omitted.

ASAP Parameter

The ASAP parameter which are used in the RTRV-ASAP-PROF, ED-ASAP-PROF, ENT-ASAP-PROF commands for the specific ASAP type.

The name of service affected related ASAP parameters starts with the prefix ″sa_″, for non service affected one with ″nsa_″. The prefix can be omitted if the one probable cause reports only for service affected or non service affected.

default severity

The default alarm severity which is assigned to the ASAP parameter.

Description

A description for explanation.

modifier/aidtype

The to the alarm related *modifier* and *aidtype.*

AID

The AIDs which can be reported related to the alarms. All wildcard aids like **`all`** must not be used.

Alarm duration

It describes if the alarm is a persistent one or a transient one.

There are separate ASAP parameter for sa and nsa alarms. There applicable each parameter will be described separately together with their default values.

The Alarms will be described per ASAP type.

Please refer also to other fragments of the TL1 documentation where REPT EVT messages related to this fragment will be defined.

Remark to TCA: The alarm level of threshold crossing alarms (TCA) shall always be “not alarmed”, and it is not user provisionable. The system shall not allow the user to change any attribute of TCA alarm through ASA profile. All the attributes, such as TCA reporting enable/disable, that will affect TCA reporting shall be handled by the TCA profile.

ASAP Type ENV

Properties of all alarms

modifier/aidtype: ENV

AID: Miscellaneous_in_DiscreteAID

Alarm duration: persistent.

Reference ASAP Type ENV

Refer to the *envmsg* parameter in the output parameters section of the "RTRV-ATTR-ENV: Retrieve attribute environment" (p. 3-2257) command for string values as part of *conddescr*.

condtype: MISC_1

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_1

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_2

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_2

Default severity: NA

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_3

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_3

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_4

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_4

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_5

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_5

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_6

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_6

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_7

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_7

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_8

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_8

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

ASAP Type EQUIP-PROT

Properties of all alarms

modifier/aidtype: EQPT

Alarm duration: persistent

condtype: EQPT

sa/nsa: sa / nsa

conddescr: Equipment, {cpname}/{cpqual}, Circuit Pack Clock Failure

ASAP parameter: sa_eqpt;

Default severity: CR

Entity – ASAP relation

Introduction

This section describes which entity is related to which ASAP.

Entities

For description of the entities see in the fragments of the TL1 message description which defines and describes the entities. (Example: The slot entity is described in the configuration fragment.)

The entity of an alarm can be retrieved from the entity in the *condescr* in the ASAP descriptions above so it is not explicitly listed here.

If an entity has a relation to at least one ASAP does it mean that this entity will raise alarms for this entity.

Entity – ASAP relation

For each ASAP type must exist one ASAP pointer for the entity. Each ASAP pointer is related to only one ASAP type. That means that for some entities more than one ASAP pointer exist.

7 TL1 messages - transmission and cross-connect handling

Overview

Purpose

This section lists the TL1 interface definition for the

- high-order and low-order transmission domain
- user byte access functionality
- Gigabit Ethernet virtual switch configuration
- Gigabit Ethernet port (GEn) configuration
- virtual concatenation (group and tributary) configuration for GEn applications
- virtual concatenation (group and tributary) configuration for ES64U applications
- high-order and low-order remote test access function.

Contents

Cross-connection

Overview

Purpose

The cross-connection (CRS) commands cover all type of

- creating (ENT-CRS),
- removing (DLT-CRS),
- modifying (ED-CRS) and
- retrieving (RTRV-CRS) cross-connections.

Furthermore the commands ENT-ROLL directly affect existing cross-connections by rolling the input of an existing cross-connection towards another input while keeping the output unchanged.

Cross-connections and tributaries

Physically cross-connections are transport channels between tributaries within an NE. These cross-connections are logically modeled by the entity cross-connection and include provisionable parameters which describe the behavior of these channels.

Tributaries are path-level units of bandwidth within ports. With the introduction of the LOXC feature, there has been a second level of tributary added: Low-order tributaries are contained in high-order tributaries within ports.

These tributaries may belong

- either as high-order tributaries to SDH/SONET ports (for example, located on OP***n***), which are to be addressed via the STS1NumAIDs,
- or as high-order tributaries to Virtual Concatenation Group ports (for example, located on GE***n***) which are to be addressed via the VCGNumAIDs,
- or as high-order path terminations to asynchronous ports (for example, located on EP51) which are to be addressed via the STS1NumAIDs,
- or as high-order path terminations to adjunct ports (for example, located on TransMUX pack) which are to be addressed via TMuxAPTNumAIDs
- or as low-order tributaries to high-order tributaries of SDH/SONET ports (for example, located on OP***n***) which are to be addressed via the LONumAIDs
- or as low-order tributaries to high-order path terminations of adjunct ports (for example, located on TransMUX pack) which are to be addressed via theTMuxSLONumAIDs.

In the following, the general AID GenTribAID is used to reference all connectable high-order tributaries and path terminations.

In the following, the general AID GenLOTribAID is used to reference all connectable low-order tributaries.

High-order tributary-rate provisioning versus cross-connection-rate

For fixed-rate provisioned ports the high-order cross-connection-rate (either the SDH-rate or its equivalent SONET-rate) must match with the high-order tributary-rate.

As an example a tributary provisioned to vc44c can be cross-connected only at a rate of vc44c (or STS12, which is equivalent) - requests with other rates will be rejected. This restriction concerning the consistency of tributary-rate and cross-connection-rate does NOT hold in the case the port is provisioned as adaptive (which is only possible in case of a SONET-port).

Low-order tributary-rate provisioning versus cross-connection-rate

For SONET low-order tributaries, only one type is allowed (VT1.5) which causes to match its rate with the referring cross-connection rate.

For SDH low-order tributaries, two types are allowed (LO-VC3 and VC12). VC12 tributaries are created by default. However, if a cross-connection request allows to adapt the signal structure to the requested rate then this request will be granted.

As an example, a high-order VC4 tributary has been substructured to 63 times VC12 signals (e.g. because a first VC12 cross-connection has been previously established for the first timeslot out of the 63). A cross-connection request to cross-connect the last third of the VC4 as a low-order cross-connection at a LO-VC3 will be granted since an adaptation is possible (no VC12 cross-connection present yet). Thus, the NE does an automatic correction of the substructure (in this case it changes to 42 times VC12 plus 1 times LO-VC3), before the cross-connect request will be successfully executed.

Please note that the following features are not part of the current 1675 LambdaUnite MSS release and are thus not specified here:

- provisioning of adjunct path-protected cross-connection (no adjunct related parameter)
- changing working and protection leg for path-protected cross-connections (no TL1 command OPR-WKGLEG)
- no adaptive-mode is allowed for both *in_aids* of a path-protected cross-connection.

AU3/AU4 Conversion Cross-Connections

AU3/AU4 conversion cross-connections allow the conversion of a HO STS1 (SONET) or VC3 (SDH) to a LO SDH VC3, and the mapping into a HO VC4.

From cross-connection provisioning point of view, an AU3/AU4 conversion cross-connection is a cross-connection between a HO STS1 or VC3 tributary and a LO VC3 tributary.

A conversion cross-connection has a HO or AU3 side and a LO or TU3 side.

In the requirements the terms “HO side” and “LO side” are used, to show the similarity of a conversion cross-connection with a HO cross-connection at one side and a LO cross-connection at the other side.

Contents

List of commands

Autonomous notification

TID Change

***loca*, *locz* auto notification for service traffic**

If a source TID (*loca*) or destination TID (*locz*) is changed due to a TID change of one NE within a BLSR ring/MS-SPRing, the update is reported by means of corresponding ED-CRS notifications.

No auto notification for *loca* and *locz* change for extra traffic

For extra traffic the *loca/z* info are generated automatically, for this reason they will change after an initialization or a recovery. Too many intermediate, void changes would be detected and notified.

No notification for *sqfa* and *sqfz* change

If a source TID (*loca*) or destination TID (*locz*) is changed due to a TID change of one NE within a MS-SPRing with the *protnmode* = TOPEX, the related parameters *sqfa* and *sqfz* will change to AINVALID respectively to MINVALID for an intermediate time, depending on internal processing speed and fault conditions of the ring. Finally they will again change to other values. Due to this transient behaviour it is only suitable to make it retrievable on demand.

No auto notification for loca and locz change caused by Automatic Squelch Map Calculation

If Automatic Squelch Map Calculation is used in a BLSR/MS-SPRING, then changes of *loca*/*locz* and the related status information *locastate*/*loczstate* caused by the Automatic Squelch Map Calculation shall not be notified. *loca*/*locz* and the related status information *locastate*/*loczstate* are generated automatically. For this reason they will change after an initialisation or a recovery. Too many intermediate, void changes would be detected and notified.

ONNS triggered changes

The ONNS TL1 command ENT-PATH shall lead to ENT-CRS notifications in the NEs along the route of the new path. In case of a 1+1 protected ONNS path there are also ENT-PROTN-GRP notifications in the source and destination NE of the ONNS path.

The ONNS TL1 command DLT-PATH shall lead to DLT-CRS notifications in the NEs along the route of the deleted path. In case of a 1+1 protected path there are also DLT-PROTN-GRP notifications in the source and destination NE of the ONNS path.

The ONNS TL1 command ED-PATH-ROLL

- shall lead to ENT-CRS and ENT-PROTN-GRP notifications in the two NEs where the bridge/merge function is performed
- shall lead to ENT-CRS notifications in the NEs along the new route of the path

- shall lead to DLT-CRS notifications in the NEs along the old route of the path
- shall lead to DLT-CRS and DLT-PROTN-GRP notifications in the two NEs where the bridge/selector is removed. The ONNS TL1 command ED-PATH-PROT
- shall lead to ENT-CRS notifications along the route of the new protecting path and ENT-PROTN-GRP notifications in the A and Z node when a modification from unprotected to 1+1 protected is performed
- shall lead to DLT-CRS notifications along the route of the new protecting path and DLT-PROTN-GRP notifications in the A and Z node when a modification from 1+1 protected to unprotected is performed
- shall not lead to additional host notifications when a modification from unprotected to auto-reroute or vice versa is performed.

The (non-revertive) restoration of an ONNS path shall lead to ENT-CRS notifications in the NEs along the restored route of the path, and to DLT-CRS notifications in the NEs along the route of the failed path.

The revertive restoration of an ONNS path shall lead to ENT-CRS notifications in the NEs along the restored route of the path, and to ENT-PROTN-GRP notifications in the A and Z node of the path. When the restoration reverts, it shall lead to DLT-CRS notifications in the NEs along the restored route of the path, and to DLT-PROTN-GRP notifications in the A and Z node of the path.

UserByte port

Overview

Purpose

Physically the UserByte-Port is a physical transmission interface, consisting of both an input and an output, which can be used to carry traffic through channels given by the E1- or F1-Byte (located in the RSOH) or the E2-Byte (located in the MSOH). Logically an UserByte-Port is an entity within an NE which models the function of the physical UserByte-Port.

Six UserByte-Ports are available (with AIDs denoted ubio1 .. ubio6) each of which can be associated to an optical port of an OPn either to the E1- or E2- or F1-Byte. The association is always bidirectional. Four of these six UserByte-Ports (AIDs: ubio1 .. ubio4) are provisionable to either the G703- or V11-interface, while the others (AIDs: ubio5,ubio6) are fixed to V11-interface.

The association as well as this mode setting can be done via the SET-OW-command. Furthermore the SET-OW command allows to release the association (dis-association). With the RTRV-OW command the information related to an UserByte-Port can be retrieved from the NE.

Note: Throughout this section the term order-wire (OW) is retained in the command names for ″historical″ reasons although the name user-byte would be more appropriate, because these ports can not only be used for order-wire purposes.

Start-up with default database

The event *Start-up with default DB* causes the 6 instances of type UserByte port to be created.

Virtual switch

Overview

Purpose

Starting with the entity Virtual Switch the TL1 commands for all entities of the GE1 functionality will be described in the following chapters.

These are in detail:

- Virtual switch (VRTSW)
- Ethernet port (EPORT)
- Virtual concatenation group (VCG)
- Virtual concatenation tributary (VCGTRIB).

Each GE1 circuit pack consists of the following entities as shown in the following figure. The number of EPORT and VCG instances connected to the virtual switch is fixed. The number of VCGTRIBs per VCG depends on whether operating in SDH or SONET mode. In SDH mode there are 7 VCGTRIBs of type VC4 whereas in SONET mode there are 21 VCGTRIBs of type STS1s.

Commands for the entity *Virtual switch* allow to retrieve and modify its parameters. These commands are applicable to the GE1 circuit pack which supports one virtual switch instance.

The virtual switch as part of the physical switch on the GE1 pack is created by software. It serves to group and separate traffic within the physical switch via VLAN tagging.

The virtual switch is not applicable on the GE10PL1 pack.

The virtual switch is not applicable on the ES64U1 pack.

List of commands

Ethernet port

Overview

Purpose

Starting with the entity Ethernet port the TL1 commands for all entities of the GE1 functionality will be described in the following chapters. These are in detail:

- Ethernet port (EPORT)
- Virtual concatenation group (VCG)
- Virtual concatenation group tributary (VCGTRIB).

GE1 circuit pack

Commands for the entity Ethernet port cover the parameters for

- physical link layer (layer 1) and
- data link layer (layer 2)

of the LAN side of Gigabit Ethernet. These commands are applicable to the GE1 circuit pack which has 4 LAN ports.

Those ethernet ports are mainly intended to connect several parts of a LAN via standard transmission technique like SDH or SONET.

There is no interworking with the Data Communications Network application (which uses Ethernet-LAN ports, too) used to control the NEs. The latter one is specified in another section.

GE10PL1 pack

Modelling of the transmission path

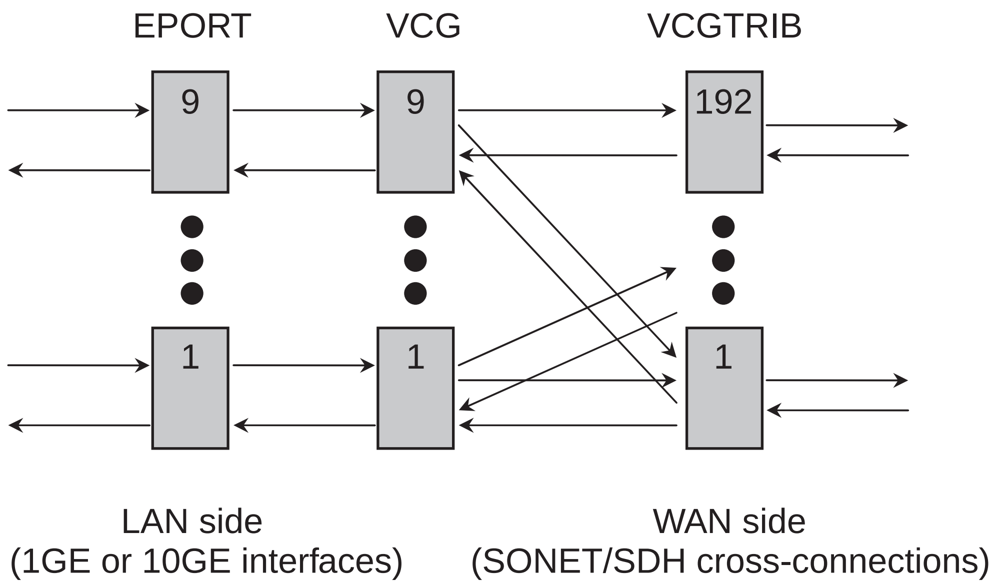
On the GE10PL1 pack, transmission functionality will be described by the following entities:

- Ethernet Port (EPORT)
- Virtual Concatenation Group (VCG)
- Virtual Concatenation Tributary (VCGTRIB).

Transmission entities on the GE10PL1/1A8

The GE10PL1/1A8 circuit pack consists of:

- 9 EPORTs (8 as 1 GE interface, 1 as 10GE interface)
- 9 VCGs (1 per EPORT)
- 192 VCGTRIBs (shared among the VCGs).



Existence of EPORT entities

EPORT entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned. The first 8 ports are reserved for 1GE interface types while the 9th port is reserved for 10GE interface types. There will be only one transmission rate being accepted at the same time (either 8 times 1GE ports or 1 times 10GE port). Each entity represents functionality always bidirectionally.

Existence of VCG entities

VCG entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned and are therefore created in conjunction to the referring EPORT entity. The same constraints are applicable here. Each entity represents functionality always bidirectionally.

Existence of VCGTRIB entities

VCGTRIB entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned and are therefore created in conjunction to the referring VCG entity.

The number and address of the entities depend on the VCG type as follows:

VCG No. X exists	Existing VCGTRIB Numbers
No	None
Yes, for X=1…8	Yes, with 1…21
Yes, for X=9	Yes, with 1…192

Significance of VCGTRIB entities (general)

Out of the created VCGTRIB entities for a specific VCG, not all of them may be significant (configurations have no effect). This depends on the configured transmission rate and on the membership configuration.

The following table illustrates those dependencies:

Signal structure	VCG membership	VCGTRIB significance
211 (21 times STS1) or 1921 (192 times STS1)	Enable	Significant
	Disable	Insignificant
73 (7 times STS3C) or 74 (7 times VC4) or 644 (64 times CV4)	Enable	Significant (each third VCGTRIB only) [if (VCGTRIB No. 1) modulo 3 == 0)] Insignificant otherwise
	Disable	Insignificant

Significance of 10GE VCGTRIB entities (contiguous concatenation mode)

For the 10GE VCG, it is possible to configure a signal mapping into a contiguous concatenated signal instead of a mapping into a number of virtual concatenated signals. The mapping is controlled by the VCG parameter *vcat*. In this case, the first VCGTRIB entity remains significant while the other 191 entities will become insignificant (if not yet insignificant before). Note that the parameters of the VCG and VCGTRIB entities which are not applicable in the contiguous concatenation mapping mode will be set to default and cannot be altered as long this mode is present.

Meaning of the terms “Existing” and “Significance”

If an entity does not exist then any operation for this instance will be rejected. If an entity is insignificant then all allowed operation may be executed. Configured values will be stored in the database and can be retrieved. However, the settings have no impact to the transmission flow in the hardware.

Contents

List of commands

Autonomous notifications

GE1 circuit pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned a GE1PORT instance will be created with the given default parameter values for all GE1 ports of the circuit pack.

This change is reported via the ENT-EPORT notification.

Optical Module for a GE10PL1/1A8 Circuit Pack is Auto-provisioned

If an optical module is successfully auto-provisioned as a socket of the GE10PL1/1A8 circuit pack then a related EPORT instance will be created with the specified default parameter values. In case that the socket with the Simple_SocketAID = sc9 has been created, the EPORT shall reflect an instance with a parameter value modifier = 10GEPL, otherwise with a parameter value modifier = 1GEPL. All applicable parameters listed in the ENT-EPORT notification shall be reported in a referring single ENT-EPORT notification.

Virtual concatenation group

Overview

Purpose

The Virtual Concatenation Group is an entity which exists for Gigabit Ethernet and Fully Transparent applications. For both applications the parameter set is slightly different, making a distinction of the related commands via a modifier for the Fully Transparent application necessary (e.g no LCAS is supported for the fully transparent application).

Overview of GE1 Application

Commands for the entity virtual concatenation group (VCG) cover the parameters for both

- the Ethernet side (WAN ports) and
- the EoS (Ethernet over SDH/SONET).

These commands are applicable to the GE1 circuit pack which has 4 WAN ports.

Note: The virtual concatenation group (VCG) and its tributaries (VCGTRIB) have some direction dependent parameters. Following the semantic for optical ports the direction indicators input and output are used.

Input direction

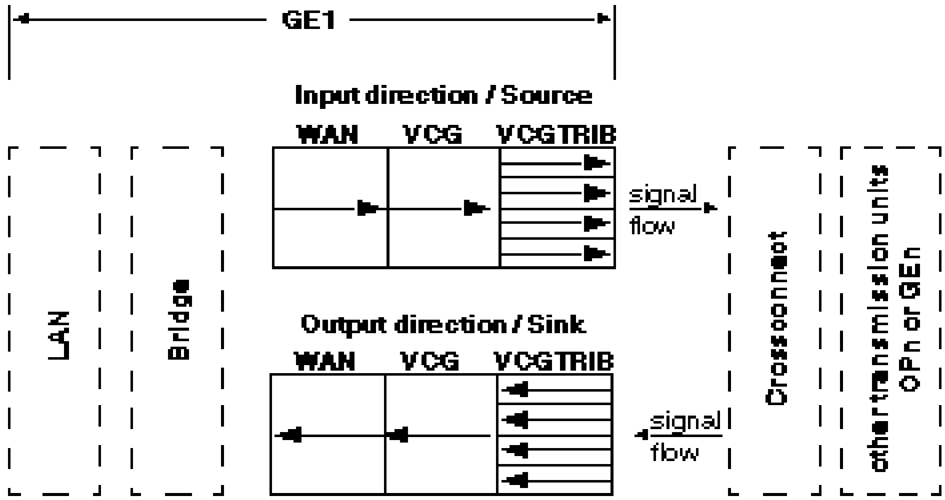
WAN → VCG → VCGTRIB → Cross-connect

As those tributaries have termination function, this is also often called source.

Output direction

Cross-connect → VCGTRIB → VCG → WAN

As those tributaries have termination function, this is also often called sink.



Overview of OPT*n* Application

Commands for the entity virtual concatenation group (VCG) cover the parameters for both

- the ODU layer and
- the Virtual Concatenation functionality.

These commands are applicable to the OPT2G5 circuit pack which has 3 client ports (one-to-one relationship to the VCG ports).

Note: The virtual concatenation group (VCG) and its tributaries (VCGTRIB) have some direction dependent parameters. Following the semantic for optical ports the direction indicators input and output are used. Also the equivalent terms ingress and egress are applicable.

Input direction

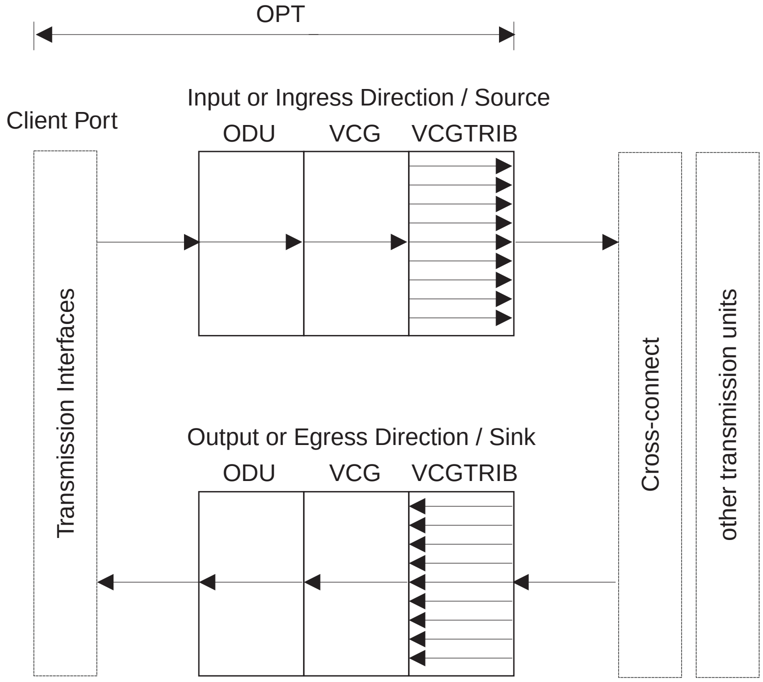
Client Port → VCG (including ODU) → VCGTRIB → Cross-connect

As those tributaries have termination functions, this is also often called source.

Output direction

Cross-connect → VCGTRIB → VCG (including ODU) → Client Port

As those tributaries have termination functions, this is also often called sink.



Overview of ES64U application

The ES64U has no LAN ports on the pack.

The virtual switch is other than for the GE1 application not managed via TL1 for the ES64U application. For the ES64U application it is managed via a direct CLI/SNMP interface to the data part of the ES64U.

The WAN port setting is other than for the GE1 application not managed via TL1 for the ES64U application. For the ES64U application it is managed via a direct CLI/SNMP interface to the data part of the ES64U.

Commands for the entity virtual concatenation group (VCG) cover the parameters for EoS (Ethernet over SDH/SONET).

These commands are applicable to the ES64U circuit pack which has up to 252 VCG ports.

Note: The virtual concatenation group (VCG) and its tributaries (VCGTRIB) have some direction dependent parameters. Following the semantic for optical ports the direction indicators input and output are used.

Input direction

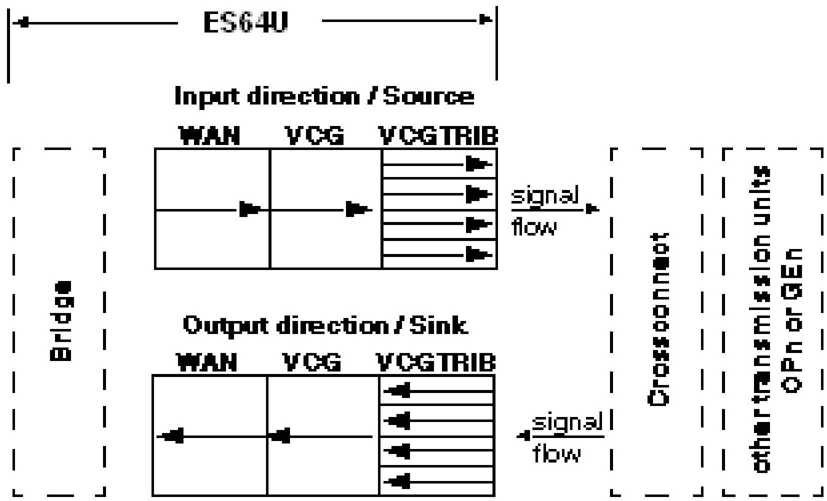
WAN → VCG → VCGTRIB → Cross-connect

As those tributaries have termination function, this is also often called source.

Output direction

Cross-connect → VCGTRIB → VCG → WAN

As those tributaries have termination function, this is also often called sink.



From the Ethernet bridge point of view the definition of input and output direction is quite confusing as it is contrary to expectation. However, the definition was made such that it fits to the usual nomenclature being used for optical ports from the cross-connect point of view. The terms input and output direction are e.g. used for parameters inputsig, istd, and unequiposig which are available on standard OC***n***/STM***n*** ports also.

For an overview about the resource allocation for an ES64U in a slot, the command **RTRV-RESALLOC-VCG** can be used. This command is needed to provide the user an overview about the backplane fragmentation and where the VCGs are located.

List of commands

Autonomous notifications

GE1 circuit pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned a VCG instance will be created with the given default parameter values for all VCGs of the circuit pack.

This change is reported via the **`ENT-VCG`** notification.

OPT*n* Circuit Pack is Auto-provisioned

If an OPT***n*** circuit pack is auto-provisioned a VCG instance will be created with the given default parameter values for all Virtual Concatenation Groups of the circuit pack. This change shall be reported via the **`ENT-VCG-TRANS`** notification.

Virtual concatenation group tributary

Overview

Purpose

For an overview of the GE1 related entities EPORT, VCG, and VCGTRIB see "ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1547).

For an overview of the OPT***n*** related entities EPORT, VCG, and VCGTRIB (and client port), see "Overview of OPTn Application" (p. 7-25).

For an overview of the GE10PL1 related entities EPORT, VCG, and VCGTRIB, see "GE10PL1 pack" (p. 7-19).

For an overview of the ES64U related entities VCG and VCGTRIB, see "Overview of ES64U application" (p. 7-26).

Commands for the entity virtual concatenation group tributary cover the parameters for

- standard termination as for other tributaries
- tributary related parameters of virtual concatenation.

Each virtual concatenation tributary can be configured independently.

Contents

List of commands

Autonomous notifications

GE1 circuit pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned 7 VC4 or 21 STS1 VCGTRIB instances will be created (dependent on the attribute *istddflt*) with the given default parameter values for all VCGs of the circuit pack.

This change is reported via the **ENT-VCGTRIB** notification.

OPT*n* circuit pack is auto-provisioned

If an OPT***n*** circuit pack is auto-provisioned 17 VC4 or STS3c VCGTRIB instances will be created (dependent on the attribute **istddflt**) with the given default parameter values for all Virtual Concatenation Groups of the circuit pack.

This change shall be reported via the **ENT-VCGTRIB** notification.

Optical module for a GE10PL1/1A8 circuit pack is auto-provisioned

If an optical module is successfully auto-provisioned as a 1 GE socket of the GE10PL1/1A8 circuit pack then 21 VCGTRIB instances will be created with the specified default parameter values.

If an optical module is successfully auto-provisioned as a 10 GE socket of the GE10PL1/1A8 circuit pack then 192 VCGTRIB instances will be created with the specified default parameter values.

All applicable parameters listed in the **ENT-VCGTRIB** notification shall be reported in a referring single **ENT-VCGTRIB** notification.

VCG on a ES64U circuit pack is provisioned

If a VCG is successfully provisioned on a ES64U circuit pack, then the VCGTRIB instances belonging to it will be created with the specified default parameter values. The VCGTRIB number range is from 1 up to the number of tributaries given by the parameter *inputsig* given with the **ENT-VCG** command. All applicable parameters listed in the **ENT-VCGTRIB** notification shall be reported in a referring single **ENT-VCGTRIB** notification.

VCG on a ES64U circuit pack is deprovisioned

If a VCG is successfully deprovisioned on a ES64U circuit pack, then the VCGTRIB instances belonging to it will be deleted. All applicable parameters listed in the **ENT-VCGTRIB** notification shall be reported in a referring single **ENT-VCGTRIB** notification.

Group notifications for VCG tributaries

For efficiency reasons the notifications for VCG tributaries shall be sent out as a single notification (so-called group notification) using a range over the aid which depends on the used mapping of the associated vcg port, i.e. the Simple_VCGNumAID field in the VCGNumAID is set to

- 1&&-<N> for sequential range
- 1&-4 .. &-<N> for non-sequential range

with N is maximal legal VCG tributary number.

Example:

The AID field in a group notification for VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping)

1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping)

For efficiency reasons the notifications for tributaries shall be sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to

- 1&&-<N>

with N is maximal legal STS-1/AU-3 number.

Example:

The AID field in a group notification for tributaries related to port 1 for a OP10 pack in slot 1 looks like:

1-1-#-#-1-1-1&&-192

Behavior

The **`ENT-VCG`** shall generate a **`REPT DBCHG`** message for the creation of the VCG together with a **`REPT DBCHG`** message for the creation of the VCG tributaries (**`ENT-VCGTRIB`** notification).

The command shall establish a virtual concatenation group together with the virtual concatenation group tributaries belonging to it according to the parameters given with this command. The virtual concatenation group tributary number range is from 1 up to the number of tributaries given by the parameter *inputsig*. The modification shall be reported by means of an **`ENT-VCG`** notification and grouped notifications for VCG tributaries.

Group notification for VCG tributaries

For efficiency reasons the notifications for VCG tributaries shall be sent out as a single notification (so-called group notification) using a range over the aid which depends on the used mapping of the associated VCG port, i.e. the *Simple_VCGNumAID* field in the *VCGNumAID* is set to:

- 1&&-***<N>*** for sequential range
- 1&-4 … &-***<N>*** for non-sequential range

where ***<N>*** is the maximal legal VCG tributary number.

Example:

The AID field in a group notification for a VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping)

1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping)

Incoming VCG tributary is dropped or added

If an incoming (sink direction) VCG tributary is dropped or added due to manual operation or a failure event, the parameter *outmbst* shall be set to the corresponding value considering the current LCAS mode. This change shall be reported via the ED-VCGTRIB notification with the parameter *outmbst*.

For the modifiers VCT or STST tributaries will be added or dropped only via manual operation.

Outgoing VCG tributary is dropped or added

If an outgoing (source direction) VCG tributary is dropped or added due to manual operation or a failure event, the parameter *inmbst* shall be set to the corresponding value considering the current LCAS mode. This change shall be reported via the ED-VCGTRIB notification with the parameter *inmbst*.

For the modifiers VCT or STST tributaries will be added or dropped only via manual operation.

Lower-order tributaries

Overview

Purpose

Higher-order tributaries on I/O packs (e.g. OPn, EP155) can be substructured as follows:

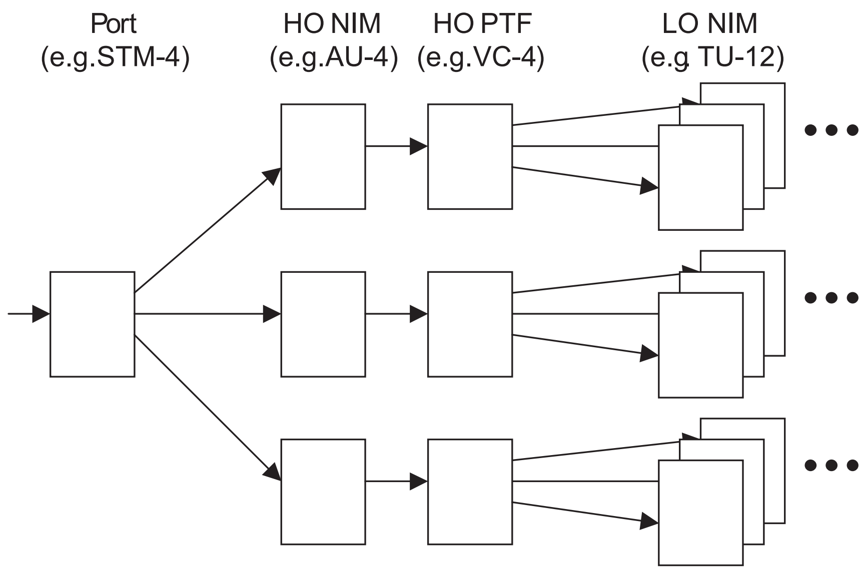
- HO path termination function (PTF, see SRD_TL1_Configuration)
- LO non-intrusive monitoring function (see below).

Following substructures are supported:

- SDH: VC4 PTF entity and 3 VC3 or 63 VC12 LONIM entities - or a mix of it,
- SONET: STS1 PTF entity and 28 VT1.5 LONIM entities.

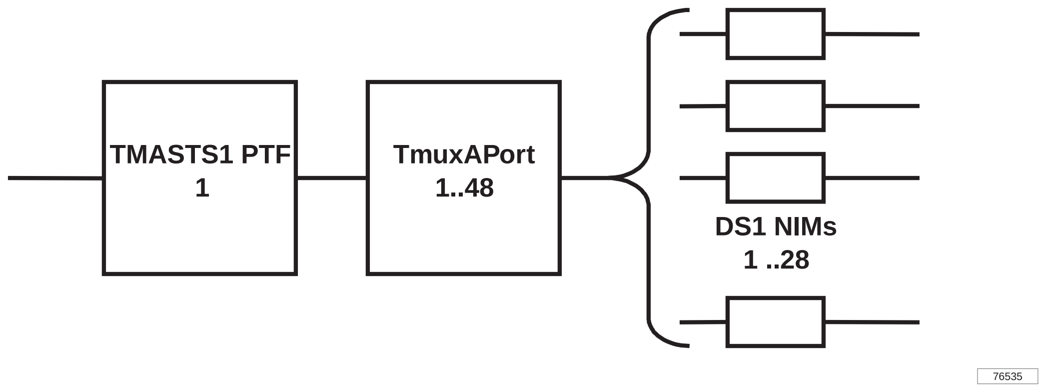
Example

The following figure shows an example:



HO and LO entities on the asynchronous side of the TransMUX pack

The entities at the asynchronous side of the TransMUX pack are static, i.e. are created when the TransMUX capacity is set away from 0 and persist until the TransMUX capacity is set to 0 again.



HO and LO entities on the synchronous side of the TransMUX pack

The static entities at the synchronous side of the TransMUX pack are created when the TransMUX capacity is set away from 0 and persist until the TransMUX capacity is set to 0 again. The dynamically created entities are created with the first LO cross-connection at the STS1 PTF and removed when the last LO cross-connection at the PTF is deleted

List of commands

Remote Test Access

Overview

Purpose

Test access consists of a set of non-intrusive operations (“monitoring” modes) and intrusive operations (“split modes”) that aid users in turning up facilities and in fault sectionalization of existing service circuits.

Basic user capabilities in test access include:

- assigning available tributary(ies) as “test access tributary(ies)”, whose line interface(s) will be connected by the user to the external testing system. These test access tributaries are assigned and released as part of establishing or disconnecting test access sessions.
- establishing test access cross-connections from tributaries to be tested to the test access tributary(ies) that either monitor or “split” connections for testing purposes.
- retrieving information about test access connections present on the system.
- releasing test access connections and test tributaries, upon which the system automatically restores any pre-existing cross-connections that were affected.

The architecture and nomenclature depicted below help to explain how test access is defined and used.

The E-Tributary and F-Tributary are the tributaries unter test. The E and F tributaries are the ends of a one-way or two-way cross-connection, with the dashed lines indicating the signal traveling through the system. The signal path from the E-end to the F-end is referred to as the ″A″ direction; the opposite direction as the ″B″ direction. If there is only a one-way cross-connection, the signal travels in the A direction. If an idle (un-cross-connected) tributary is the focus of test access, it is always the E-end.

In the context of Remote Test Access a Higher-Order (HO) connection topology is considered one-way if the Reported Leg Pair of the cross-connection between the involved tributaries indicates 1WAY (repleg = 1WAY). In the context of Remote Test Access a Higher-Order (HO) connection topology is considered two-way if the Reported Leg Pair of the cross-connection between the involved tributaries indicates 2WAY (repleg = 2WAY).

In the context of Remote Test Access a Lower-Order (LO) connection topology is considered one-way if there is a cross-connection from tributary #1 to tributary #2 AND there is no cross-connection in opposite direction between tributaries #1 and #2

This is applicable regardless whether the connection from #1 to #2 is unprotected, bridged or path-protected. Also note, that there might be other cross-connections from any other tributary with tributary #1 as output tributary.

In the context of Remote Test Access a Lower-Order (LO) connection topology is considered two-way if there is a cross-connection from tributary #1 to tributary #2 AND there is also a cross-connection in opposite direction from tributary #2 to tributary #1 This is applicable regardless whether the connections between tributaries #1 and #2 are unprotected, bridged or path-protected or any combination of both.

The following table shows the supported test access modes.

Two groups of test access modes are defined:

- single test access tributary modes
- dual test access tributary modes.

Mode	Description	Group
MONE	Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.	Single
MONF	Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.	Single
MONEF	Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a 2WAY cross-connection.	Dual
SPLTE	Split access E-end mode of test access. This test access mode splits the connection between the E end and F end of a 1WAY cross-connection or a leg of 2WAY cross-connection. Can also be used in an idle tributary.	Single
SPLTF	Split access F-end mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing at the F-end.	Single
SPLTEF	Split E-end and F-end mode of test access. This test access mode splits both directions of a 2WAY cross-connection to allow testing at both the E end and F end.	Dual
SPLTA	Split access “A” direction mode of test access. This test access mode splits the connection between the E and F tributaries of a one-way or two-way cross-connection to allow testing in the “A” direction.	Single

Mode	Description	Group
SPLTB	Split access “B” direction mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing in the “B” direction.	Single
SPLTAB	Split access A and B directions mode of test access. This test access mode splits both directions of a two-way cross-connection to allow testing in both the A and B directions.	Dual
TERME	Terminated test access mode. This test access mode splits the signal, sending the input to the testing system and injecting AU-AIS/AIS-P toward the path selector to allow monitoring the incoming signal of the leg that is not currently carrying service traffic without the risk that the path selector will switch away from the service-carrying leg.	Single

Topology in Remove Cross-connection Command (TL1-parameter: *cct*)	Topology of Existing Atomic Cross-connection (internal parameter: ″Atomic cross-connection topology″ as described in the RTRV-CRS section in the *repleg* context)	Leg Status of Existing Atomic Cross-connection (internal parameter: ″Leg status″ as described in the RTRV-CRS section in the repleg context)	Validation Response (″Accept″ means that the command is replied by a COMPLD, ″Deny″ means, that the command is rejected with the Error Code as stated above)
1WAY	point-to-point	1-way	Accept
1WAY	point-to-point	2-way	Accept
1WAY	pathprotected	1-way	Deny
2WAY	point-to-point	1-way	Deny
2WAY	point-to-point	2-way	Accept
2WAY	pathprotected	1-way	Deny
1WAYPPROT	point-to-point	1-way	Deny
1WAYPPROT	point-to-point	2-way	Deny
1WAYPPROT	pathprotected	1-way	Accept

Protection group

Overview

Purpose

The protection group commands cover all types of protections within the system. The following protection group types can be distinguished:

- 1+1 equipment protection group
- 1+1 multiplex section/line protection group
- 2-fibre MS-SPRing/BLSR protection group
- 4-fibre MS-SPRing/BLSR protection group
- Path protection group.

Dedicated subsections corresponding to these protection group types will cover the specific behavior. If such a separation is not made, the description is valid for all protection group types. In addition common properties are also described in a dedicated General section.

Three operation modes can be distinguished for a 4-fibre MS-SPRing/BLSR protection group:

1. 2-sided node: An east side (protection and worker) and a west side (protection and worker) is provisioned for that group. Therefore, four ports are members within that protection group.
2. 1-sided node: Only one side is provisioned for the protection group. That can be either the east or the west side. Therefore, two ports are members within that protection group. This mode is used in context of an open 4-fiber ring w.r.t. end node in that chain.
3. Asymmetric node: Both protection ports are members of the protection group and only one or zero worker ports are assigned externally.

All attributes/parameters specifying east/or west side properties are optional and will be omitted if the corresponding side is not provisioned in case of a 1-sided node.

Note: 1-sided node (open ring) is not supported in R1. As indication if and when this feature is supported use the following criteria (supported if criteria is met): Ports can be added/removed to/from one side of the protection group (conversion from 1-side node to 2-side node and the other way round). Be aware to differentiate that scenario from switching from an asymmetric node to a non-asymmetric and the other way round. The combination of a 1-sided and asymmetric node is not allowed.

Contents

Introduction to protection groups

General information

The following section presents on overview of all attributes of the different protection types and their use within the different commands. The information is derived from the corresponding sections describing the commands and notifications.

Note: The following tables are specifying the set of operations, notifications, and attributes for protection groups. They do not consider any release information. Check in the corresponding sections in which release the functionality is supported.

1+1 equipment protection group

Entity table for switching and controller equipment protection group (EQPTSWFBR and EQPTCTL)

Attribute	Opr	Not	Class	Note
aid – Switch And Timing Protection Group AID or Controller Protection Group AID	RTRV	ENT DLT PROTNSW	input	(1)
protype – Protection Type	RTRV	ENT DLT PROTNSW	input	
wkg – Worker Unit	RTRV	ENT PROTNSW	input	(2)
protn – Protection Unit	RTRV	ENT PROTNSW	input	(2)
actunit – Active Unit State	RTRV	PROTNSW	state	(3)
swreq – Switch Request State	RTRV	PROTNSW	state	(3)
protnsiglvl – Protection Fault Status	RTRV		state	
wkgsiglvl – Worker Fault Status	RTRV		state	

Note 1: protection switch events reported via **REPT EVT** message will use protection group aid for identification purpose.

Note 2: protection switch events reported via **REPT SW** message will use worker/protection unit aid for identification purpose.

Note 3: updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Entity table for EP155 Equipment Protection Group (EQPTEP155)

Attribute	Opr	Not	Class	Note
aid – EP155 equipment protection group AID	RTRV, ENT, DLT	ENT, DLT, PROTNSW	input	(1)

Attribute	Opr	Not	Class	Note

blsrpn – MSSPRING-BLSR ASAP Pointer	RTRV ED	ENT ED	user	
wtr – Wait To Restore Time	RTRV ED	ENT ED	user	
swtr – Span Wait To Restore Time	RTRV ED	ENT ED	user	
protnmode – protection switch Mode	RTRV ENT ED	ENT ED	user	
pgrate – protection group Rate	RTRV	PROTNSW	user	
eswreq – East Switch Request State	RTRV	PROTNSW	state	(3)
wswreq – West Switch Request State	RTRV	PROTNSW	state	(3)
eactunit – East Active Unit State	RTRV	PROTNSW	state	(3)
wactunit – West Active Unit State	RTRV	PROTNSW	state	(3)
ringndst – Ring Node APS State	RTRV		state	
eapschst – Incoming East APS Channel Status	RTRV		state	

Attribute	Opr	Not	Class	Note
wapschst – Incoming West APS Channel Status	RTRV		state	
eapsdnid – Incoming East APS Destination Node Id	RTRV		state	
wapsdnid – Incoming West APS Destination Node Id	RTRV		state	
eapsprotn – Incoming East APS Protection Path	RTRV		state	
wapsprotn – Incoming West APS Protection Path	RTRV		state	
eapssnid – Incoming East APS Source Node Id	RTRV		state	
wapssnid – Incoming West APS Source Node Id	RTRV		state	
eapssw – Incoming East APS Switch Priority	RTRV		state	
wapssw – Incoming West APS Switch Priority	RTRV		state	
elprotnsw – East Last protection switch Attempt	RTRV		state	
wlprotnsw – West Last protection switch Attempt	RTRV		state	

Note 1: AID field “transmission protection group ID” of protection group can be specified as part of **ENT-PROTN-GRP** command.

Note 2: Member port can be used as alias for identification of protection group entity.

Note 3: Updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Note 4: Parameter is called *newrid* in the context of **ED-PROTN-GRP** command.

Note 5: Port can be used as user parameter in **ED-PROTN-GRP** in case of adding/removing one side to/from the protection group (conversion from 1-side node to 2-side node and the other way round). It can also be used to convert a 2-side node to an asymmetric node and the other way round.

Path protection group

Entity table for path protection group

Attribute	Opr	Not	Class	Note
aid – protection group AID	RTRV ED DLT	ENT ED DLT	input	

Attribute	Opr	Not	Class	Note
protype – Protection Type	RTRV ED DLT	ENT ED DLT	input	
ppgname – Path protection group Name	RTRV ENT ED	ENT ED	input user	(1)(2)(5)
wkg – Worker Tributary	RTRV ENT	ENT ED	user	(1)
protn – Protection Tributary	RTRV ENT	ENT ED	user	(1)
dripathpn – SNCP-UPSR ASAP Pointer	RTRV ED	ENT ED	user	
rme – Protection Reversion	RTRV ENT ED	ENT ED	user	(1)
wtr – Wait To Restore Time	RTRV ENT ED	ENT ED	user	(1)
htmr – Hold-Off Time	RTRV ENT ED	ENT ED	user	(1)
snctype – SNC Protection Type	RTRV ENT ED	ENT ED	user	(1)
outtribaid – Output Tributary AID	RTRV ENT	PROTNSW	user	(1) (4)
cst – Constituent Signal Type	RTRV	PROTNSW	user	(1) (4)
actunit – Active Unit State	RTRV	PROTNSW	state	(3) (4)
swreq – Switch Request State	RTRV	PROTNSW	state	(3) (4)
actunitaid – Active Unit State AID	RTRV		state	(3) (4)
protnsiglvl – Protection Fault Status	RTRV		state	(4)
wkgsiglvl – Worker Fault Status	RTRV		state	(4)

Note 1: Initial value has to be specified as part of **ENT-CRS**/**ENT-ROLL** command.

Note 2: Parameter is called *newppgname* in the context of **ED-PROTN-GRP** command.

Note 3: Updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Note 4: Parameter may change dynamically if path-protection uses tributaries of ports in the adaptive mode.

Note 5: Parameter not supported for low order path protection groups.

List of commands

Autonomous notifications

1+1 equipment protection group

If the second switch circuit pack is auto created, the 1+1 switch equipment protection group entity shall be created. This entity creation shall be reported by means of **ENT-PROTN-GRP** notification.

Auto creation of the second switch circuit pack

If the second switch circuit pack is auto created, the 1+1 switch equipment protection group entity is created. This shall be reported by means of **ENT-PROTN-GRP** notification for 1+1 equipment protection group. The initial protection state shall be reported by means of a protection switch notification for the 1+1 equipment protection group.

Protection switch

A protection switch notification (that is, protection state change) is triggered by means equipment fail condition change as specified for the corresponding protection state machine.

Deletion of the second switch circuit pack

If the second switch circuit pack is deleted, the 1+1 switch equipment protection group entity shall be deleted. This entity deletion shall be reported by means of DLT-PROTN-GRP notification.

Deletion of the second controller circuit pack

If the second switch circuit pack is deleted, the 1+1 switch equipment protection group entity shall be deleted. This entity deletion is reported by means of DLT-PROTN-GRP notification for the 1+1 protection group.

Multiplex section/Line protection group

Protection switch and related events

A protection switch notification (i.e. protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry
- switch command received via APS message as specified for the corresponding protection state machine.

A protection switch notification shall be triggered upon a change of the Secondary Section Identifier (spec block parameter ’ssi’). This applies to MSP 1+1 optimized only. This requirement gives additionally to other requirements a further trigger for the autonomous notification for a MSP protection group. It does not require necessarily a separate notification beside other notifications of the same MSP protection group at the same time.

2-/4-fibre MS-SPRing/BLSR protection group

Protection switch

A protection switch notification (that is, protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry
- switch command received via APS message

as specified for the corresponding protection state machine.

Path protection group

Protection switch

A protection switch notification (that is, protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry

as specified for the corresponding protection state machine.

Note that a path protection switch notification may be suppressed if the WTR timer expiry notification follows immediately.

Protection log

Overview

Purpose

Each NE stores protection switch events in a protection log. The NE administrates the log autonomously. Therefore only a retrieve operation is defined for log the entity.

Contents

List of commands

Autonomous notifications

System start-up with default DB

The system will start up with an empty protection log as part of the default DB.

System start-up after DB transformation

The system will start up with an empty protection log after a database transformation has taken place in context of an SW upgrade.

Ring map

Overview

Purpose

Each NE within a 2-/4fibre MS-SPRing/BLSR ring will maintain a ring map entity for each MS-SPRing/BLSR protection group entity. The ring map either will be discovered automatically by the NEs (default) or manually be entered by the user (see also parameter ard in "ENT-PROTN-GRP: Enter protection group" (p. 3-1745)).

The ring map consists of:

- the nodes within the ring
- the links connecting the nodes.

If the automatic ring discovery is disabled and the ring map is entered manually, the links connecting the nodes may not be retrievable. The ring map can be edited manually with ED-MAP-RING and is then stored in volatile memory. With SET-MAP-RING, the new ring map is written to NVM and activated.

PM parameters

PM parameter overview

This section gives an overview of all PM parameters and the associated TCA profiles. Overview tables are given for the entities supporting of PM parameters:

- SONET ports/tributaries
- SDH ports/tributaries
- Ethernet ports
- DS3 ports (including the virtual TransMUX ports)
- OTN ports.
- DS1 tributaries

Note: In Ethernet, DS3, and Transparency application, the tributaries are acting as path terminations.

Each table consists of the following rows:

- PM parameter short name (as defined in the *montype* parameter)
- PM parameter long name
- associated TCA profile type (as defined in the *pftype* parameter).

Note: If thresholding is not applicable for a PM parameter, the value 'None' is specified as associated profile type.

SONET PM parameter table

Short name	Long name	Profile type

AISS-P	AIS Second Path	None

Details for PM parameters with no thresholding

Below those PM parameters are described which do not support thresholding. All other parameters which support thresholding are described in the Output Parameters section of RTRV-TCA-PROF.

SONET PM parameters

1. qhaissl
   Description: 15-minute AISS-L bin for SONET Line.
   The 15-minute AISS-L bin shall be supported for OC-n Line. The 15-minute AISS-L bin shall be supported for EC-1 Line.
   Type: integer
   Range: 0-900
2. dayaissl
   Description: Day AISS-L bin for SONET Line.
   The Day AISS-L bin shall be supported for OC-n Line. The Day AISS-L bin shall be supported for EC-1 Line.
   Type: integer
   Range: 0-86400
3. qhlosss
   Description: 15-minute LOSS-S bin for ONET Section.
   The 15-minute LOSS-S bin shell be supported for OC-n Section. The 15-minute LOSS-S bin shell be supported for EC-1 Section.
   Type: integer
   Range: 0-900

4. daylosss
   Description: Day LOSS-S bin for SONET Section.
   The Day LOSS-S bin shall be supported for OC-n Section. The Day LOSS-S bin shall be supported for EC-1 Section.
   Type: integer
   Range: 0-86400
5. qhfcl
   Description: 15-minute FC-L and FC-LFE bin for OC-n lines.
   The 15-minute FC-L and FC-LFE bin shall be supported for OC-n Line. The 15-minute FC-L and FC-LFE bin shall be supported for EC-1 Line.
   Type: integer
   Range: 0-900
6. dayfcl
   Description: Day FC-L and FC-LFE bin for SONET Line.
   The Day FC-L and FC-LFE bin shall be supported for OC-n lines. The Day FC-L and FC-LFE bin shall be supported for EC-1 lines.
   Type: integer
   Range: 0-86400
7. qhfcp
   Description: 15-minute FC-P and FC-PFE bin for STS1 and STS1-xC (x=3, 12, 48, 192) tributaries
   Type: integer
   Range: 0-900
8. dayfcp
   Description: Day FC-P and FC-PFE bin for STS1 and STS1-xC (x=3, 12, 48, 192) tributaries
   Type: integer
   Range: 0-86400

Ethernet PM parameters

1. qhcbr
   Description: 15-minute CBR for a Ethernet port
   Type: integer
   Range: 0-110000
2. daycbr
   Description: Day CBR for a Ethernet port.
   Type: integer
   Range: 0-10560000
3. qhcbs
   Description: 15-minute CBS for a Ethernet port
   Type: integer
   Range: 0-110000

4. daycbs
   Description: Day CBS for a Ethernet port.
   Type: integer
   Range: 0-10560000
5. qheinb1ge
   Description: 15 minute EINB for a 1 GbE LAN and WAN port
   Type: integer
   Range: 0-112500000000
6. dayeinb1ge
   Description: Day EINB for a 1 GbE LAN and WAN port
   Type: integer
   Range: 0-10800000000000
7. qheonb1ge
   Description: 15 minute EONB for a 1 GbE LAN and WAN port.
   Type: integer
   Range: 0-112500000000
8. dayeonb1ge
   Description: Day EONB for a 1 GbE LAN and WAN port.
   Type: integer
   Range: 0-10800000000000
9. qheinf1ge
   Description: 15 minute EINF for a 1 GbE LAN and WAN port
   Type: integer
   Range: 0-1371951220
10. dayeinf1ge
    Description: Day EINF for a 1 GbE LAN and WAN port
    Type: integer
    Range: 0-131707317073
11. qheonf1ge
    Description: 15 minute EONF for a 1 GbE LAN and WAN port
    Type: integer
    Range: 0-1371951220
12. dayeonf1ge
    Description: Day EONF for a 1 GbE LAN and WAN port
    Type: integer
    Range: 0-131707317073
13. qheinb10ge
    Description: 15 minute EINB for a 10 GbE LAN and WAN port
    Type: integer
    Range: 0-1125000000000

14. dayeinb10ge
Description: Day EINB for a 10 GbE LAN and WAN port
Type: integer
Range: 0-108000000000000
15. qheonb10ge
Description: 15 minute EONB for a 10 GbE LAN and WAN port
Type: integer
Range: 0-1125000000000
16. dayeonb10ge
Description: Day EONB for a 10 GbE LAN and WAN port
Type: integer
Range: 0-108000000000000
17. qheinf10ge
Description: 15 minute EINF for a 10 GbE LAN and WAN port
Type: integer
Range: 0-13719512195
18. dayeinf10ge
Description: Day EINF for a 10 GbE LAN and WAN port
Type: integer
Range: 0-1317073170732 Default
19. qheonf10ge
Description: 15 minute EONF for a 10 GbE LAN and WAN port
Type: integer
Range: 0-13719512195
20. dayeonf10ge
Description: Day EONF for a 10 GbE LAN and WAN port
Type: integer
Range: 0-1317073170732

DS3 PM Parameters

1. qhaissp
Description: 15-minute AISS-P bin for DS3
Type: integer
Range: 0-900
2. dayaissp
Description: Day AISS-P bin for DS3.
Type: integer
Range: 0-86400
3. qhfcp
Description: 15-minute FC-P and FC-PFE bin for DS3
Type: integer
Range: 0-900

4. dayfcp
   Description: Day FC-P and FC-PFE bin for DS3
   Type: integer
   Range: 0-86400
5. qhsefsp
   Description: 15-minute SEFS-P bin for DS3.
   Type: integer
   Range: 0-900
6. daysefsp
   Description: Day SEFS-P bin for DS3
   Type: integer
   Range: 0-86400
7. qhlossl
   Description: 15-minute LOSS-L bin for DS3.
   Type: integer
   Range: 0-900
8. daylossl
   Description: Day LOSS-L bin for DS3.
   Type: integer
   Range: 0-86400

DS1 PM Parameters

1. qhaissp
   Description: 15-minute AISS-P bin for DS1.
   Type: Integer.
   Range: 0 – 900.
   Default: None.
2. dayaissp
   Description: Day AISS-P bin for DS1.
   Type: Integer.
   Range: 0 – 86400.
   Default: None.

OTN PM Parameters

1. qhotnloss
   Description: 15-minute LOSS bin for OTN
   Type: integer
   Range: 0-900
2. dayotnloss
   Description: Day LOSS bin for OTN
   Type: integer
   Range: 0-86400

3. qhotnfecc
   Description: 15-minute FECC bin for OTN
   Type: integer
   Range: 0-4294967295
4. dayotnfecc
   Description: Day FECC bin for OTN
   Type: integer
   Range: 0-4294967295

List of commands

TCA Profile

Overview

Purpose

This section contains the TL1 interface definitions listed below.

Contents

TCA Profile

General

The threshold settings for the different PM parameters supporting thresholding is provisionable by means of TCA profiles. The profiles of a certain type contains all pm parameters related to a certain entity supporting enabling/disabling of performance monitoring. Therefore the following profiles types are defined:

- SECTION-LINE - used/referenced by SONET port entities
- RS-MS - used/referenced by SDH port entities
- PATH - used/referenced by SONET and TransMUX STS1 tributary (TMASTS1) entities
- HO-VC - used/referenced by SDH tributary entities
- ENET - used/referenced by Ethernet port entities
- ODU - used/referenced by ODU/VCG entities
- DS3 - used/referenced by DS3 and TransMUX (TMAT3) port entities
- DS1 - used/referenced by DS1 tributary entities
- LO-PATH - used/referenced by SONET lower order tributary entities related to the LOXC
- LO-VC - used/referenced by SDH lower order tributary entities related to the LOXC

All threshold data of one certain profile type is sometimes also called a profile image. This term may be used in other TCA profiles commands as parameter name. It is then used as an alias for all PM thresholds parameters of the corresponding profile type.

TCA suppression can be provisioned by means of setting the corresponding profile parameter to zero.

The system supports two default sets of profiles for each type of TCA profile. One set of default profiles shall contain zero threshold value for each parameter in the profile. Another set of default profiles contains real non-zero threshold value for each parameter in the profile. The name of the zero threshold value default profile shall be “Default0” and the name of the non-zero threshold value default profile shall be “Default”.

The number of TCA profiles are limited to a specific number per profile type. This number also includes the system default profiles.

The maximum numbers are for:

- PATH SDH and PATH SONET together (higher order) 80
- RSMS SDH and section/line SONET together 30
- for ENET and ODU together 10

TCA Profile

- DS3 10
- LOXC PATH SDH and SONET together 20.
- TMUX DS1 path 10

The user is able to change the threshold values of the non-zero default profile, but will not be allowed to change its name. The user is not allowed to change the name or the threshold values of the zero default profile.

All the profile pointers are pointed to zero threshold value default profiles when the ports are provisioned. That is, thresholding is not performed as a default. All the profile pointers are pointed to non-zero threshold value default profiles when thresholding is to be performed.

Threshold parameters names are defined using the following pattern:

<bintype>[rtr]<montype>[<port/trib rate|port type|monitoring point> with:

- bintype = day (for 24h) or qh (for 15 Min)
- [rtr] = rtr is inserted if the clear threshold is mentioned
- montype = montype as defined in **RTRV-PM** or **RTRV-TMUXPM** command
- portrate = ec1, oc3, oc12, oc48, oc192, oc768, stm1, stm4, stm16, stm64, stm256, odu1, ds3
- trib rate = sts1, sts3c, sts12c, sts48c, sts192c or vc3, vc4, vc44c, vc416c, vc464c, hosts1, vt1, hovc4, lovc3, vc12, ds1
- porttype = ge, 1ge, 10ge, vcg
- monitoring point = l, p.

List of commands

System Start-up with Default DB

General

The system shall create during start-up with default DB two TCA profiles per supported profile type with profile name ″DEFAULT″ and ″DEFAULT0″. The values for profile ″DEFAULT″ shall be as specified in corresponding default requirements for each profile parameter. The values for profile ″DEFAULT0″ shall be ’0’ for each profile parameter.

10 TL1 messages - synchronization

Overview

Purpose

This section contains the TL1 commands related to the synchronization management. The synchronization commands covers types of assigning, modifying or removing and retrieving system timing attributes. Furthermore they are initiating switch requests and releasing requests.

It contains following commands and levels.

- RTRV-SYNCN
  - System Timing
  - Output Timing
  - Assigned Timing Reference
  - External Timing Input
  - External Timing Output
- SET-SYNCN
  - System Timing
  - Assigned Timing Reference
  - External Timing Input
  - External Timing Output
- OPR-SYNCNSW
- RLS-SYNCNSW.

For the system, the choice between SONET and SDH is determined by the system synchronization characteristic. The system synchronization characteristic may only be adjustable in the MCOND state. If the system synchronization characteristic is SONET, all SONET related parameter and settings are valid. All SSM messages, based on the SDH market are handled as being invalid. If the system synchronization characteristic is SDH, all SDH related parameter and settings are valid. All SSM messages, based on the SONET market are handled as being invalid.

The values of a number of parameters will be distinguished from the system synchronization characteristic. The parameter *synccrtc* in RTRV-EQPT and ED-EQPT determines whether the system synchronization characteristic, and therewith the NE, is in SDH or in SONET mode.

Contents

List of commands

Synchronization protection switch notification

Output format

Syntax: The **REPT EVT** notification has following specific syntax:

REPT EVT *modifier aid:condtype,condeff,ocrdat,ocrtm:conddescr*

Output parameters

System timing

1. Clock Mode Protection Type
   a. modifier – message modifier
      This parameter indicates on which entity the report event belongs.
      Type: Alphanumeric value set.
      Range: SYST (means System Timing).
   b. aid – access identifier
      This parameter indicates on which AID the report event belongs.
      Type: Alphanumeric value set.
      Range: SYSTEM
   c. condtype – condition type
      This parameter specifies the type of event being reported.
      Type: alphanumeric value set.
      Range: See Table 10-1, "Range of condtype (clock mode protection type)" (p. 10-5).
      Default: none
   d. conddescr – description of the condition
      This parameter is a textual description of the condition.
      Type: inner string.
      Range: See Table 10-2, "Range of conddescr (clock mode protection type)" (p. 10-5).
2. Timing Reference Protection Type
   a. modifier – message modifier
      See definition above.
   b. aid – access identifier
      This parameter indicates on which AID the report event belongs. The values all or *someprefix* all are not allowed in this context.
      Type: Alphanumeric value set.
      Range:
      – External_timing_ref_AID
      – Line_timing_ref_AID
      – NONE.
      The value NONE shall be reported when the last timing reference is failed.

c. condtype – condition type

This parameter specifies the type of event being reported.

Type: alphanumeric value set.

Range: See Table 10-3, "Range of condtype (timing reference protection type)" (p. 10-5).

d. conddescr – description of the condition

This parameter is a textual description of the condition.

Type: inner string.

Range: See Table 10-4, "Range of conddescr (timing reference protection type)" (p. 10-6).

Table 10-1 Range of condtype (clock mode protection type)

Selection State	Attribute	Condtype
free running	clkmod = FREE-RUNNING clkmod_stat = NORMAL	FRNGSYNC
forced holdover	clkmod = LOCKED clkmod_stat = FORCED-HOLDOVER	HLDOVRSYNC
autonomous holdover	clkmod = LOCKED clkmod_stat = AUTONOMOUS-HOLDOVER	HLDOVRSYNC
locked	clkmod = LOCKED clkmod_stat = NORMAL	SYNCCLK

Table 10-2 Range of conddescr (clock mode protection type)

Selection State	Conddescr
free running	Protection switch, clock mode, Freerunning
forced holdover	Protection switch, clock mode, Forced Holdover
autonomous holdover	Protection switch, clock mode, Holdover
locked	Protection switch, clock mode, Locked

Table 10-3 Range of condtype (timing reference protection type)

Selection State / Lockout State	Attribute	Condtype
manual	refsw_stat = MANUAL	PS
forced	refsw_stat = FORCED	PS
no request	refsw_stat = NO-REQUEST	PS
lockout	ref_lock = LOCKOUT	INHSWPR
no lockout	ref_lock = NO-LOCKOUT	INHSWPR

Table 10-4 Range of conddescr (timing reference protection type)

Selection State / Lockout State	Conddescr
manual	Protection switch,sync reference, manual switch
forced	Protection switch,sync reference, forced switch
no request	Protection switch,sync reference, no Request
lockout	Protection switch,sync reference, lockout
no lockout	Protection switch,sync reference, no lockout

Output timing (only for SDH)

1. Output Timing Reference Protection Type
   a. modifier – message modifier
      This parameter indicates on which entity the report event belongs.
      Type: Alphanumeric value set.
      Range: OUTT (means Output Timing).
   b. aid – access identifier
      This parameter indicates on which AID the report event belongs. The values all or *someprefix* all are not allowed in this context.
      Type: Alphanumeric value set.
      Range:
      – Line_timing_ref_AID
      – NONE.
      The value NONE shall be reported when the last timing reference is failed.
   c. condtype – condition type
      This parameter specifies the type of event being reported.
      Type: alphanumeric value set.
      Range: See Table 10-5, "Range of condtype (Output timing reference protection type)" (p. 10-6).
   d. conddescr – description of the condition
      This parameter is a textual description of the condition.
      Type: inner string
      Range: See Table 10-6, "Range of conddescr (Output timing reference protection type)" (p. 10-7).

Table 10-5 Range of condtype (Output timing reference protection type)

Selection State / Lockout State	Attribute	Condtype
manual	orefswr_stat = MANUAL	PS
forced	orefswr_stat = FORCED	PS

Table 10-5 Range of condtype (Output timing reference protection type) (continued)

Selection State / Lockout State	Attribute	Condtype
no request	orefswr_stat = NO-REQUEST	PS
lockout	sclkref_lockstat = LOCKOUT	INHSWPR
no lockout	sclkref_lockstat = NO-LOCKOUT	INHSWPR

Table 10-6 Range of conddescr (Output timing reference protection type)

Selection State / Lockout State	Conddescr
manual	Protection switch, output reference, Manual switch
forced	Protection switch, output reference, Forced switch
no request	Protection switch, output reference, No Request
lockout	Protection switch, output reference, Lockout
no lockout	Protection switch, output reference, No Lockout

Example output

The following is an example of a protection switch notification for clock mode protection type:

```
   LT-UNITE 00-11-09 12:00:00
A  000 REPT EVT SYST
   ″SYSTEM:HLDOVRSYNC,TC,11-09,12-00-00,,,:\″Protection switch,clock
      mode,Forced Holdover\″″
;
```

The following is an example of a protection switch notification for timing reference protection type:

```
   LT-UNITE 00-11-09 12:00:00
A  000 REPT EVT SYST
   ″EXTREF1:PS,TC,11-09,12-00-00,,,:\″Protection switch,sync
      reference,Manual switch\″″
;
```

The following is an example of a protection switch notification for timing reference protection type when the last reference has failed:

```
   LT-UNITE 07-01-26 14:41:00
A  000 REPT EVT SYST
   ″NONE:PS,TC,07-01-26,14-40-30,,,:\″Protection switch,sync
      reference,No Request\″″
```

```
;
```

The following is an example of a protection switch notification for output timing reference protection type:

```
   LT-UNITE 00-11-09 12:00:00
A  000 REPT EVT OUTT
   ″LINE2:INHSWPR,SC,11-09,12-00-00,,,:\″Protection switch,output
      reference,Lockout\″″
;
```

The following is an example of a protection switch notification for output timing reference protection type when the last timing reference has failed:

```
   LT-UNITE 07-01-26 14:42:00
A  000 REPT EVT OUTT
   ″NONE:PS,TC,07-01-26,14-41-30,,,:\″Protection switch,output
      reference,No Request\″″
;
```

Autonomous notifications

System initialization with default values

After first system initialization for all parameters the described default values are valid and no timing reference is assigned. No database change notification will be returned during database auto creation.

System initialization after system synchronization characteristic change

It is possible to change the system synchronization characteristic later on. For this case, the system will behave as a new created node. All assigned timing references are un-assigned before and after changing in the MCOND state the system will start-up with the default values. No database change notification will be returned after changing the system synchronization characteristic and reset to default values.

Autonomous clock switch

If the provisioned clockmod = LOCKED and a failure of all timing references active, the system switches in autonomous-holdover state and return a report event and a report alarm notification to the management system. If at least one fault-free timing reference is available, the system switches back to the locked state autonomously. The following parameter are affected by the autonomous clock mode switch: clkmod_stat = [AUTONOMOUS-HOLDOVER, NORMAL].

Autonomous reference switch for system timing

The autonomous reference switching is initiated by the failure of a reference. The autonomous reference switching results also after a SSM change of the active reference or of any of the standby references. The choice for the next active timing reference primarily depends on provisioned QL values if QL mode is enabled and subsequent on provisioned priorities for each reference. In consequence of identical QL values and priorities the system supports non-revertive switching. The autonomous reference switch returns a protection switch notification for System Timing. The following parameter are affected by the autonomous timing reference switch: active_ref = [External_timing_ref_AID, Line_timing_ref_AID, NONE].

Autonomous reference switch for output timing (only for SDH)

The autonomous reference switching is initiated by the failure of a reference. The autonomous reference switching might also switch after a SSM change. The choice for the next active timing reference is primarily depending on provisioned QL values if QL mode is enabled and subsequent on provisioned priorities for each reference. In consequence of similar QL values and priorities the system supports non-revertive switching. The autonomous reference switch returns a protection switch notification for Output Timing. The following parameter are affected by the autonomous timing reference switch: active_oref_stat = Line_timing_ref_AID, NONE.

Synchronization instances

The following instances are created during system initialization:

- one system timing entity
- one output timing entity (only for SDH)
- two timing reference entities for external timing input
- six timing reference entities for line timing for

SDH only:

- one external timing output port entity

for SONET only:

- two external timing output port entities.

11 TL1 messages - software & database management

Overview

Purpose

This section contains the TL1 interface definition for the domain *software and database management*.

Background information:

In the Non Volatile Memory (NVM) of the NE, there are two regions: current and previous. Each region contains a software generic (code and static data) and a database.

The properties of the databases and the software generics can be retrieved by RTRV-PRMTR-DATA and RTRV-PRMTR-SFTWR.

The restore option of CPY-MEM is used to copy a database from a remote file store into previous NVM and then to install it as the working database. The backup option of CPY-MEM is used to copy the database that is in current NVM to a remote file store.

The download option of CPY-MEM is used to download new generics to previous NVM. Installation via APPLY causes the contents of previous NVM to be installed. Following installation, a ″pointer″ is changed so that what is identified as current NVM contains the currently executing generic and previous NVM contains the previous generic.

Transparent DCC cross-connection

Overview

Purpose

Transparent DCC cross-connections allows to cross-connect DCC channels (either DCC-R or DCC-M) of an OPn/EPn on the XCn without adding/dropping them to/from the OHI bus to/from the CTL/DCF. As such there is no processing on the DCF for those channels a transparent DCC cross-connection allows to transparently pass-through certain DCC channel without any processing by the system. The transparent DCC cross-connections are complete independent from the transmission cross C-connection. The transparent DCC cross-connections are always bidirectional. The system supports up to 25 bidirectional transparent DCC cross-connections.

IP Map

Overview

Purpose

This section describes commands dealing with the IP map:

- the IP map provides T-TD access to the NE via one of the LANs that is assigned to node 1. Only managers registered in the IP map are allowed to access the NE via TCP/IP unless the wildcard (255.255.255.255) is entered into the list. In this case the access restriction is disabled.
- historically, the application context identifier for TL1 over OSI connections has been used to tailor the characteristics of the TL1 session (e.g. which events are reported using TL1 notifications) to the calling manager.
- ADM40G bases the characteristics of a TL1 session on the user name passed in the ACT-USER command rather than the application context identifier.
- still, for backwards compatibility, the feature of having the application context identifier being determined by the address of the calling manager is required on the T-TD.

Connection and path state definitions

Overview

The Connection connStatus and the pathState variables are related, and the connStatus can be derived from the pathState. The two tables below show the possible states.

The column State Type characterizes the codes further:

- ES: connection/path is in a stable and active End State
- FR: Final Report state (indicates that the connection/path is no longer active)
- TS: Transient State
- RQ connection/path on Restoration Queue.

connStatus Codes

TL1 *connStatus* code	Description	State Type
CON&OK	Normal Connection Status	ES
CON&FAILED	Connection failure	ES
CON&NO-IN	No Input, source or destination (Initial setup)	ES
CON&FAILED&RSTRFL	Restoration attempt failed / connection going to the Restoration Queue	TS
CON&TRDOWN	Connection Delete (In Progress)	TS
DLT	Connection Deleted	FR
CON&DLT-FL	Conn Delete Failed, path not deleted	ES
CON&OK&RSTRD	Auto-Reroute Revertive Connection Status (after initial restoration)	ES
NOCON&SETUP	Initial connection setup in progress	TS
NOCOM&PREMPTD	Connection has been disconnected from original path	TS
CON&OK&WTORV	AUTORV Path ready, waiting for WTR (wait-to-revert) timer to revert to original path	TS
NOCON&WTORSTR	Preempted path removed & Connection has been added to the Restoration Queue.	ES / RQ
CON&FAILED&WTORSTR	Auto Connection failed & has been added to the Restoration Queue.	ES / RQ
CON&SETUP	Initial connection setup completed, waiting for check of signal	TS
NOCON&SETUPFL	Initial connection setup failed	FR
NOCON	Connection has been disconnected from original path by maintenance operation	TS

TL1 *connStatus* code	Description	State Type
CON&STBY	Protecting connection not being allocated for protecting a working one	ES
CON&USED	Protecting connection not being allocated for protecting a working one	ES
CON&UNKNOWN	Connection Status is not known after a recovery until the fault status is retrieved from the z-node	TS
CON&OK&DEGRADED	Path failure of a permanent 1+1 TS connection can't be restored by a new path	TS

PathState Codes

TL1 *pathState* code	Description	State Type
CON&OK	Normal Path Status	ES
CON&FAILED	Path failure	ES
CON&TRDOWN	Path Delete in progress	TS
DLT	Path Delete complete	FR
CON&NO-IN	No Input, source or destination, during initial setup	ES/TS
CON&OK&RSTRD	Auto-Reroute Revertive Restoration	ES
NOCON&SETUP	Initial connection setup in progress	TS
CON&DLT-FL	Path delete failed	ES
NOCON&PREMPTD	Path has been disconnected from original EDGE port and will be re-used on another restored connection	TS
CON&OK&WTORV	AUTORV Path ready, waiting for WTR (wait-to-revert) timer to revert to original path	TS
NOCON	Pre-calculated restore path available for use	ES
CON&SETUP	Initial connection setup completed, waiting for signal confirmation from the egress node	TS
CON&FAILED&WTORSTR	Restoration attempt failed and will be restored when a new path is available	ES
NOCON&SETUPFL	Initial connection setup failed	ES
RSVD&OK	Normal Path Status while associatedto a protecting connection	ES
RSVD&FAILED	Path Failure while associated to a protecting connection	ES

TL1 *pathState* code	Description	State Type
RSVD&DLT-FL	Path delete failed for a path associated to a protecting connection	ES
RSVD&SETUPFAIL	Initial connection setup failed for protecting connection	ES
RSVD&TRDOWN	Path Delete in progress for path associated to protecting connection	TS
RSVD&SETUP	Initial connection setup completed, for path associated to protecting connection, waiting for signal confirmation from the egress node	TS
CON&UNKNOWN	Path State is not known after a recovery until the fault status is retrieved from the z-node.	TS
RSVD&UNKNOWN	Path State for a path associated to a protecting connection is not known after a recovery until the fault status is retrieved from the z-node.	TS

Network optimization

Overview

Purpose

This section contains information about the TL1 commands related to the network optimization.

Contents

List of commands

Maintenance

Overview

Purpose

This section contains information about the TL1 commands related to the maintenance.

Contents

List of commands

UNI commands

Overview

Purpose

This section contains information about the TL1 commands related to the UNI feature.

List of commands

ENNI commands

Overview

Purpose

This section contains information about the TL1 commands related to the ENNI feature.

Contents

List of commands

14 Error codes

List of error codes

Error code	Meaning (validation rule)	Related to command
DNC - Input, Data Not Consistent, No BLSR/MS-SPRing inter-working with low-order traffic	LO Substructure creation not allowed on BLSR/MS-SPRing ports	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
DNC - Input, Data Not Consistent, revertive mode not supported for MSP Protection Type 1+1 and a port with the indicated rate	No MSP/APS 1+1 revertive protection for bitrate STM-256/OC-768	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
DNV - Input, Data Not Valid, DCC on DS3 Ports not allowed	No DCC on DS3 ports	"ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1510); "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
DNV - Input, Data Not Valid, DCC on EC1 Ports not allowed	No DCC on EC1 ports	"ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1510); "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
E001 - srvID - InSufficient Network Resources for connection setup	Insufficient network resources	"ENT-PATH: Create ONNS path connection" (p. 3-1701)
E001 - srvID - InSufficient Network Resources for connection setup	Insufficient network resources for alternate route	"ED-PATH-ROLL: Modify ONNS connection route" (p. 3-781)
E002 - SICE - Status, Inter-Processor Communication Error caused cmd failure	Access to the database is not possible I	"RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2539)
E002 - SICE Error - Status, Inter-Processor Communication Error caused cmd failure	Invalid componentID parameter II	"RTRV-NTDR: Retrieve ONNS network topology data repository" (p. 3-2588)
E003 - SNTT - Status, Network Topology database Timed out	Access to the database is not possible II	"RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2539)

Error code	Meaning (validation rule)	Related to command
E004 - srvID - InSufficient Network Resources for Alternate Path	Insufficient network resources for alternate route	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753)
E004 - srvID - InSufficient Network Resources for Alternate Path	Insufficient Network Resources for Alternate Route	"ENT-PATH: Create ONNS path connection" (p. 3-1701)
E020 - Maximum Transport Delay Exceeded (by calculated path)	Maximum delay errors on calculated path	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753); "ED-PATH-ROLL: Modify ONNS connection route" (p. 3-781)
E020 - srvID - Maximum Transport Delay Exceeded,errorData	Maximum Delay Exceeded by calculated path	"ENT-PATH: Create ONNS path connection" (p. 3-1701)
E030 - SMcon135*7.92468 - Syntax, Parameter Data Imvalid,Invalid_ parameter=SrvID	Invalid srvID	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E030 - SPDI - Syntax, Parameter Data Invalid, invalid_parameter= fieldName	ED-PATH request denied - Parameter invalid	"ED-PATH-ROLL: Modify ONNS connection route" (p. 3-781)
E030 - srvID - Syntax, Parameter Data Invalid,invalid_parameter= fieldName	ENT-PATH syntax, parameter data invalid	"ENT-PATH: Create ONNS path connection" (p. 3-1701)
E030 - Syntax, Parameter Data Invalid, invalid_parameter	ED-PATH-PROT request denied - Parameter invalid	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753)
E040 - srvID - Syntax, Data Not Consistent	ENT-PATH syntax, data not consistent	"ENT-PATH: Create ONNS path connection" (p. 3-1701)
E050 - IICG - Input, Invalid connection ID for connection group/conn ID	Retrieve path - Invalid connection ID for group retrieval	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E081 - IIEP - Input, Invalid ingress / Egress Port,errorData	NN PortID parameter value is not valid	"ENT-PATH: Create ONNS path connection" (p. 3-1701)
E082 - Status, NNI connPoint / port Unavailable ID=<ASTN node ID> <ConnPtID>	Port related problems	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753)
E150 - Status, Path Protection Group parameters Not Provisioned	ED-PATH-PROT Path Protection Group Parameter transfer failed	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753)
E160 - srvID - XConn Connect Failure, Port does not exist or is TRADITIONAL	Cross-connect connect failure	"ENT-PATH: Create ONNS path connection" (p. 3-1701)
E220 - 135.13.7.9-48 - Input, ConnectionID Non-Existent	Path ConnectionID does not exist	"DLT-PATH: Delete ONNS path connection" (p. 3-222)
E220 - 13513794 - Input, ConnectionID Non-Existent	connID Non-Existant (ICNE)	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)

Error code	Meaning (validation rule)	Related to command
E222 - IIDM srvID - Input, Invalid deletion of connection of protection	Connection is member of an M:N protected connection group	"DLT-PATH: Delete ONNS path connection" (p. 3-222)
E223 - SPCU 135.7.9.2-35 - Status, Protection Connection in Use, removal of the M:N worker connection aborted	Protection connection of an M:N protection group in use	"DLT-PATH: Delete ONNS path connection" (p. 3-222)
E224 - IIDC srvID - Input, Invalid Deletion of a Connection of a switched connection group	Connection is member of a switched VCG connection group	"DLT-PATH: Delete ONNS path connection" (p. 3-222)
E225 - IIGD srvID - Input, Invalid Grouped Deletion of EXT Connection	Grouped connection deletion on VCG EDGE affects EXT Connection	"DLT-PATH: Delete ONNS path connection" (p. 3-222)
E226 - IDNA - Input, Retrieve Detail_Route or Detail_State Not allowed for RTRV-PATH ALL	Error Responses Specific to RTRV-PATH	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E235 - Input, Invalid CoMmand, Command not found or recognized	Invalid command	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E240 - Syntax, InValid Punctuation	Syntax, Invalid punctuation	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E246 - Syntax, Parameter Not Implemented	Syntax invalid or unimplemented parameter	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E250 - Input, Invalid TArget Identifier	Invalid target identifier	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E260 - Input, Invalid ACcess identifier	Invalid access identifier	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E265 - Input, Invalid Correlation Tag	Invalid correlation tag (CTAG) or RequestID	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E280 - Status, All Resources Busy	Status, All Resources Busy	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E282 - SCSI - Status, Conn State Invalid for this Operation	Retrieve path with detailed route option - No path ID associated to ONNS connection	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E282 - SCSI Error - Status, Conn State Invalid for this Operation	Switch Back behavior modification	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753)
E283 - SOPI - Status, Operation Invalid for Protection Type MBYNPRT	Retrieve path with detailed state option - Operation Invalid for Protection Type MBYNPRT	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E290 - Status, Requested Operation Failed	Requested Operation Failed (SROF)	"RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698)
E360 - SPMF - Status, Path Modify Failed due to invalid protection type change	Protection modification for External Connections	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753)

Error code	Meaning (validation rule)	Related to command
E511 - IINO - Input, Invalid NOde_ ID	Invalid componentID parameter I	"RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2539)
E511 - IINO - Input, Invalid NOde_ ID	Invalid componentID parameter II	"RTRV-NTDR: Retrieve ONNS network topology data repository" (p. 3-2588)
E512 - IINI Error - Input, Invalid Neighbor node ID	Invalid componentID parameter	"RTRV-NNEVT-TCA" (p. 3-2582)
E512 - Input, Invalid Neighbor node ID	Invalid PortID or componentID parameter	"RTRV-NNDR: Retrieve ONNS neighbor nodal data repository" (p. 3-2561)
E520 - IIDD - Input, Invalid Degree of Disjointness	ENT-PATH syntax, invalid degree of disjointness value	"ENT-PATH: Create ONNS path connection" (p. 3-1701)
E520 - IIDD - Input, Invalid Degree of Disjointness for protection type N1PLUS1 or YCONN	ED-PATH-PROT syntax, invalid degree of disjointness value	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753)
E660 - LDOS - Local Data Out of Sync	ED-SYNCDATA-PATH not possible because of local data inconsistencies	"ED-SYNCDATA: Synchronization of ONNS data" (p. 3-1198)
E700 - ICID - Invalid Connection IDentification	OPR-MAINT-ONNS with reqType = REMLEG or REMLEG_RESV not allowed because of specified connection is not valid	"OPR-MAINT-ONNS: Maintenance actions for the ONNS application" (p. 3-2053)
E701 - DLID - Duplicate Leg IDentification	OPR-MAINT-ONNS with reqType = REMLEG or REMLEG_RESV not allowed because of both pathID and connPtID specified	"OPR-MAINT-ONNS: Maintenance actions for the ONNS application" (p. 3-2053)
E702 - ULID - Unsupported Leg IDentification	OPR-MAINT-ONNS with reqType = REMLEG or REMLEG_RESV not allowed because of invalid leg identification via pathID or connPtID	"OPR-MAINT-ONNS: Maintenance actions for the ONNS application" (p. 3-2053)
EATN - Equipage, not valid for Access Type, incorrect equipage	Incorrect Equipage (EATN)	"RTRV-HDR: Retrieve header" (p. 3-2417)
EATN - Equipage, Not Valid for Access Type, retrieved file TID mismatch	TID Mismatch in retrieved File (EATN)	"RTRV-HDR: Retrieve header" (p. 3-2417)
EATN - Status, incorrect equipage, unrecognized CP for this slot	Check whether CP is acceptable	"ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1547)
ENEQ - Equipage, Not EQuipped	Missing Equipage (ENEQ)	"RTRV-HDR: Retrieve header" (p. 3-2417)
ENEQ - Equipage, Not EQuipped osinode	Check for parameter osinode	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
ENEQ - Equipage, Not EQuipped, ES64U destination slot empty	No forced switch to empty slot (ES64U Protection Group);	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)

Error code	Meaning (validation rule)	Related to command
ENEQ - Equipage, Not Equipped, insufficient file space	Insufficient file space	"COPY-RFILE: Copy remote file" (p. 3-106); "CPY-MEM: Copy memory" (p. 3-114)
ENEQ - Equipage, Not EQuipped, insufficient file space	Insufficient File Space (ENEQ)	"RTRV-HDR: Retrieve header" (p. 3-2417)
ENEQ - Equipage, Not EQuipped, LOXC destination slot empty	No forced switch to empty LOXC slot (LOXC Protection Group)	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
ENEQ - Equipage, Not EQuipped, osinode	parameter osinode	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
ENEQ - Equipage, Not EQuipped, TMUX destination slot empty	No forced switch to empty slot (TransMUX Protection Group);	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
ENEQ - Equipage, Not EQuipped, XC destination slot empty	No forced switch to empty XC slot (Switching Protection Group)	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot	Check exchangeability rules for electrical packs	"ED-EQPT (slot): Edit equipment (slot)" (p. 3-370)
ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot	Check exchangeability rules for LOXC packs	"ED-EQPT (slot): Edit equipment (slot)" (p. 3-370)
ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot	Check exchangeability rules for optical packs	"ED-EQPT (slot): Edit equipment (slot)" (p. 3-370)
ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot	Check exchangeability rules for XC packs	"ED-EQPT (slot): Edit equipment (slot)" (p. 3-370)
ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot	Check whether CP is acceptable	"ED-EQPT (slot): Edit equipment (slot)" (p. 3-370)
ENRE - Equipage, Not Recognized Equipage, unrecognized module for this socket	Exchangeability III: Invalid module plugged in	"ED-EQPT (socket): Edit equipment" (p. 3-379)
ENRE - Equipage, Not Recognized Equipage, unrecognized module for this socket	Module must be part of acceptable module list	"ENT-EQPT (socket): Enter equipment (socket)" (p. 3-1557)
ENSG - Equipage, Not Software Generic, generic not available	Generic not available	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35); "CPY-MEM: Copy memory" (p. 3-114)
ENSG - Equipage, Not Software Generic, generic not available	Generic not available (ENSG)	"RTRV-HDR: Retrieve header" (p. 3-2417)
ICNV - Input Command Not Valid, Interface Standard does not match	modifier consistent with given port's interface standard	"OPR-LPBK: Operate facility loopback" (p. 3-2044); "RLS-LPBK: Release loopback (facility)" (p. 3-2198)

Error code	Meaning (validation rule)	Related to command
ICNV - Input, Command Not Valid	Input failure (ICNV)	"RTRV-HDR: Retrieve header" (p. 3-2417)
ICNV - Input, Command Not Valid	Login on established session	"ACT-USER: Activate user" (p. 3-24)
ICNV - Input, Command Not Valid, directory/URL must be specified	Directory/URL not specified	"COPY-RFILE: Copy remote file" (p. 3-106)
ICNV - Input, Command Not Valid, directory/URL must be specified	Directory/URL not specified for backup	"COPY-RFILE: Copy remote file" (p. 3-106)
ICNV - Input, Command Not Valid, directory/URL must be specified	Directory/URL not specified for database download	"COPY-RFILE: Copy remote file" (p. 3-106)
ICNV - Input, Command Not Valid, directory/URL must be specified	Directory/URL not specified for restoration	"COPY-RFILE: Copy remote file" (p. 3-106)
ICNV - Input, Command Not Valid, extra AID	Too much AID parameters (ICNV)	"RTRV-HDR: Retrieve header" (p. 3-2417)
ICNV - Input, Command Not Valid, file must be specified	Directory/URL not specified	"CPY-MEM: Copy memory" (p. 3-114)
ICNV - Input, Command Not Valid, FTTD must be specified	FT-TD device not specified	"COPY-RFILE: Copy remote file" (p. 3-106)
ICNV - Input, Command Not Valid, inmbst not NA	Correct state of tributary for being added (Source)	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
ICNV - Input, Command Not Valid, Interface Standard does not match	Check CCB against istd	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191) ; "RTRV-VC3: Retrieve VC3 tributary" (p. 3-3069)
ICNV - Input, Command Not Valid, Interface Standard does not match	Check CCB against istd of related port	"ED-STS1: Edit STS1 tributary" (p. 3-1177); "ED-VC3: Edit VC3 tributary" (p. 3-1339)
ICNV - Input, Command Not Valid, Interface Standard does not match	Check CCB against istd of related VCG	"RTRV-VCGTRIB: Retrieve virtual concatenation group tributary " (p. 3-3109)
ICNV - Input, Command Not Valid, Interface Standard does not match	Check CCB against ptfstd	"RTRV-PTF: Retrieve tributary with path termination function" (p. 3-2800)
ICNV - Input, Command Not Valid, Interface Standard does not match	Check CCB against ptfstd of related tributary	"ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-830)

Error code	Meaning (validation rule)	Related to command
ICNV - Input, Command Not Valid, Interface Standard does not match	Check CCB against ptype and istd	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111); "RTRV-STM16: Retrieve STM16 port" (p. 3-2899); "RTRV-STM16T: Retrieve STM16T port" (p. 3-2917)
ICNV - Input, Command Not Valid, Interface Type does not match	Check CCB against ptype and eif	"RTRV-T3: Retrieve DS3 port" (p. 3-2968)
ICNV - Input, Command Not Valid, missing TID	Input failure for omitted TID	"RTRV-HDR: Retrieve header" (p. 3-2417)
ICNV - Input, Command Not Valid, outmbst not NA	Correct state of tributary for being added (Sink)	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
ICNV - Input, Command Not Valid, Protocol Failure in Receive Direction	LCAS failure of protocol present in sink direction	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
ICNV - Input, Command Not Valid, Protocol Failure in Transmit Direction	LCAS failure of protocol present in source direction	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
ICNV - Input, Command Not Valid, required AID missing	Missing AID (ICNV)	"RTRV-HDR: Retrieve header" (p. 3-2417)
ICNV - Input, Command Not Valid, missing CTAG	Missing CTAG (ICNV)	"RTRV-HDR: Retrieve header" (p. 3-2417)
IDNC - Input Data Not Consistent, cross-connection-existence not consistent with cmdmde-value	cmdmde matches cross-connection non-/existence	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
IDNC - Input Data Not Consistent, Inconsistent loopback type w.r.t. aid	Valid loopback type	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
IDNC - Input Data Not Consistent, modifier is inconsistent with existing port rate	modifier consistent with given port-rate	"OPR-LPBK: Operate facility loopback" (p. 3-2044); "RLS-LPBK: Release loopback (facility)" (p. 3-2198)

Error code	Meaning (validation rule)	Related to command
`IDNC - Input Data Not Consistent, Rate is inconsistent with existing cross-connection`	Valid rate	"DLT-CRS: Delete cross-connection" (p. 3-145); "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035); "RLS-LPBK: Release loopback (cross-connection)" (p. 3-2195)
`IDNC - Input Data Not Consistent, Specified Tributary does not support the indicated rate`	Tributary provisioning and rate consistency	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`IDNC - Input Data Not Consistent, Tributary boundary is inconsistent with the indicated rate`	AID boundary and rate consistency	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`IDNC - Input Data Not Consistent, VGC-trib as input-trib in pathprotected crosconnection`	No VCG-trib as in_aid (for path-protected cross-connection)	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`IDNC - Input, Data Not Consistent`	all or no traffic for SCN node	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`IDNC - Input, Data Not Consistent`	can't enable isis_lanstat without enabling osi_lanstat	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`IDNC - Input, Data Not Consistent`	disabling of superusers	"ED-USER-SECU: Edit user security" (p. 3-1328)
`IDNC - Input, Data Not Consistent`	Invalid Input Parameter Value Combination (IDNC)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`IDNC - Input, Data Not Consistent`	l4ajsys must be supplied	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
`IDNC - Input, Data Not Consistent, a new trace value must also be supplied for a trace format change`	Supply of outgoing J0 trace	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`IDNC - Input, Data Not Consistent, a new trc must also be supplied for a path trace mode change`	supply of transmitted path trace	"ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-830)

Error code	Meaning (validation rule)	Related to command
IDNC - Input, Data Not Consistent, 'ALL' qualifier for port aid not allowed	'ALL' qualifier used for wrong parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111); "ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNC - Input, Data Not Consistent, Assigned Node not allowed for Auto Encapsulation	Only osinode1 supports Auto Encapsulation	"ENT-MANROUTE-MCN: Enter manual IP route for management communication" (p. 3-1614)
IDNC - Input, Data Not Consistent, Connections between BLSR/MS-SPRing working and protection tributaries are not allowed	No connections between BLSR/MS-SPRing working and protection tribs	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, conversion cross-connection not supported by that pack	Pack restrictions for conversion cross-connection sources	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, Corresponding loca/ locz information is missing	Corresponding loca/loca2/locz information is missing	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, default profile	deleting the system default profile	"DLT-TCA-PROF: Delete TCA profile" (p. 3-259)
IDNC - Input, Data Not Consistent, Default VLAN ID is already assigned for this System	Default VLAN ID is already assigned for this system	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNC - Input, Data Not Consistent, Flow Control settings do not match to existing autonegotiation mode	GE10PL1 Pack specific validation rule: No auto flow control settings if autonegotiation disabled	"ED-EPORT: Edit Ethernet port" (p. 3-329)
IDNC - Input, Data Not Consistent, Flow Control settings do not match to existing autonegotiation mode	GE10PL1 Pack specific validation rule: No fix flow control settings if autonegotiation enabled	"ED-EPORT: Edit Ethernet port" (p. 3-329)
IDNC - Input, Data Not Consistent, Inconsistent loca/ locz information	Consistent loca/loca2/locz for all low-order cross-connections using the same HO PTF at an MS-SPRing port	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, Inconsistent loca/ locz information	Consistent loca/locz for all conversion cross-connections using the same HO PTF at an MS-SPRing port	"ENT-CRS: Enter cross-connection" (p. 3-1464)

Error code	Meaning (validation rule)	Related to command
IDNC - Input, Data Not Consistent, IP address of level 1 Routing Controller already in use	SCN IP address already in use	"ACT-L1ROUTING" (p. 3-15)
IDNC - Input, Data Not Consistent, It is not allowed to specify loca/locz for EXTRA TRAFFIC	loca/locz information only retrievable for EXTRA TRAFFIC	"ED-CRS: Edit cross-connection" (p. 3-292)
IDNC - Input, Data Not Consistent, It is not allowed to specify loca/locz for EXTRA TRAFFIC	newloca not provisionable for Extra Traffic	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC - Input, Data Not Consistent, level 1 Routing Controller already in place	level 1 Routing controller in place	"ACT-L1ROUTING" (p. 3-15)
IDNC - Input, Data Not Consistent, LO tributary not supported by that pack	Pack restrictions for LO substructure creation	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
IDNC - Input, Data Not Consistent, LO tributary not supported by that pack	Pack restrictions for LO tributaries under test	"CONN-TACC: Connect test access" (p. 3-94)
IDNC - Input, Data Not Consistent, LO tributary not supported by that pack	Pack restrictions for LOXC cross-connection sources	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, modifier is inconsistent with existing port rate	modifier consistent with given port-rate	"ED-EPORT: Edit Ethernet port" (p. 3-329); "ED-VCG: Edit virtual concatenation group" (p. 3-1354); "RTRV-EPORT: Retrieve Ethernet port" (p. 3-2358)
IDNC - Input, Data Not Consistent, modifier is inconsistent with existing port rate	modifier consistent with given port-rate;	"RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078)
IDNC - Input, Data Not Consistent, modifier is inconsistent with the related circuit pack type	modifier consistent with the related circuit pack type	"ED-EPORT: Edit Ethernet port" (p. 3-329); "OPR-LPBK: Operate facility loopback" (p. 3-2044); "RLS-LPBK: Release loopback (facility)" (p. 3-2198); "RTRV-EPORT: Retrieve Ethernet port" (p. 3-2358)
IDNC - Input, Data Not Consistent, modifier is required for this circuit pack type	modifier mandatory for the GE10PL1 and ES64U circuit pack	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNC - Input, Data Not Consistent, modifier is required for this circuit pack type	modifier mandatory for the GE10PL1 and ES64U circuit pack;	"RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078)

Error code	Meaning (validation rule)	Related to command
IDNC - Input, Data Not Consistent, MSP 1+1 optimized not supported for SONET mode	No MSP 1+1 optimized protection for SONET	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNC - Input, Data Not Consistent, new name for default profile	rename default profile name	"ED-TCA-PROF: Edit TCA profile" (p. 3-1214)
IDNC - Input, Data Not Consistent, new name for default profile	Rename of default ASAP	"ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 3-284)
IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from 2 fiber MS-SPRing/BLSR protection	No low-order path protection input tributaries from the protection bandwith of 2-fiber MS-SPRing/BLSR protection	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from 4-fiber BLSR/MS-SPRing ports	No low-order connection with 4 fiber BLSR/MS-SPRing ports	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from BLSR/MS-SPRing ports	No low-order path protection with input tributaries from BLSR/MS-SPRing ports	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from protection bandwidth of 2-fiber MS-SPRing/BLSR protection	No low-order path protection with input tributaries from the protection bandwidth of 2-fiber MS-SPRing/BLSR protection	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, no OPT2G5-trib as input-trib in pathprotected crossconnection	No OPT2G5 related trib as in_aid (for pathprotected cross-connection)	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, No trib of MS-SPRing/ BLSR port allowed for conversion cross-connection	No tributary of an MS-SPRing/BLSR port for conversion cross-connection	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, NSA severity is higher than SA severity	Inconsistent severity level	"ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 3-284)
IDNC - Input, Data Not Consistent, only one of dccstat, scn_dccstat, uni_dccstat, or enni_ dccstat allowed	Single occurence of dccstat, scn_dccstat, uni_dccstat, or enni_dccstat parameter	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNC - Input, Data Not Consistent, pathprotected conversion cross-connections not allowed	No path-protected conversion cross-connection	"ENT-CRS: Enter cross-connection" (p. 3-1464)

Error code	Meaning (validation rule)	Related to command
IDNC - Input, Data Not Consistent, port_aid1 and port_aid2 not different	Different port AIDs	"ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1510)
IDNC - Input, Data Not Consistent, primary/secondary test access tributary not supported by that pack	Pack restrictions for primary and secondary HO test access tributary	"CONN-TACC: Connect test access" (p. 3-94)
IDNC - Input, Data Not Consistent, primary/secondary test access tributary not supported by that pack	Pack restrictions for primary and secondary LO test access tributary	"CONN-TACC: Connect test access" (p. 3-94)
IDNC - Input, Data Not Consistent, raw_port and lv_port must be unequal	check that raw_port and lv_port are unequal	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
IDNC - Input, Data Not Consistent, RC PC SCN address must be different from SC PC SCN address	SCN IP address already in use 2	"ACT-L1ROUTING" (p. 3-15)
IDNC - Input, Data Not Consistent, SCN not enabled	Check of SCN availability	"ACT-L1ROUTING" (p. 3-15)
IDNC - Input, Data Not Consistent, sigPCIP address and RC IP address must not be equal	SC IP Address and RC IP address must be different	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
IDNC - Input, Data Not Consistent, sigPCIP Address and sigPCID must be supplied together	sigPCIP_Address and sigPCID must be supplied together.	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
IDNC - Input, Data Not Consistent, Specified Tributary cannot be used for LOXC connections	Restrictions for LOXC cross-connection sources	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate	HO tributary rate consistency	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate	Restrictions for LO SONET test access rates	"CONN-TACC: Connect test access" (p. 3-94)
IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate	Restrictions for LOXC cross-connection rates	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate	Tributary provisioning and rate consistency	"CONN-TACC: Connect test access" (p. 3-94)

Error code	Meaning (validation rule)	Related to command
IDNC - Input, Data Not Consistent, strcout length must match the given outgoing J0 trace mode	transmitted path trace length	"ED-EC1: Edit EC1 port" (p. 3-317)
IDNC - Input, Data Not Consistent, This MSP protection type not supported for a port with the indicated rate	No MSP/APS 1+1 for bitrate STM-256/OC-768	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNC - Input, Data Not Consistent, trc length must match the given path trace mode	transmitted path trace length	"ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-830)
IDNC - Input, Data Not Consistent, Tributaries must not be on ports of portClass ENNI	LO Substructure creation not allowed on ENNI ports	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
IDNC - Input, Data Not Consistent, Tributaries must not be on ports of portClass INNI	(ONNS specific): LO Tributaries must not belong to ports of portClass INNI	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data Not Consistent, Tributaries must not be on ports of portClass INNI	LO Substructure creation not allowed on INNI ports	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
IDNC - Input, Data Not Consistent, Tributaries must not be on ports of portClass UNI	LO Substructure creation not allowed on UNI ports	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
IDNC - Input, Data Not Consistent, Tributary boundary is inconsistent with the indicated rate	LO-AID boundary and rate consistency	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
IDNC - Input, Data Not Consistent, UNI IP address, sigPCIP address, and ASTN IP address must not be equal	UNI IP address, SC IP Address and SCN IP address must be different.	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
IDNC - Input, Data Not Consistent, value change not allowed for profile Default0	value change of default profile Default0	"ED-TCA-PROF: Edit TCA profile" (p. 3-1214)
IDNC - Input, Data Not Consistent, VCG-trib as input-trib in pathprotected crossconnection	Tributaries must not be VCG tributaries	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
IDNC - Input, Data, Not Consistent	Can't assign same IP address to several LANs	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
IDNC - Input, Data, Not Consistent	Can't enable ip_lanstat and/or osi_lanstat when lanstat is disabled	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
IDNC - Input, Data, Not Consistent	Can't enable lanstat when ip_lanstat and osi_lanstat are DISABLED	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)

Error code	Meaning (validation rule)	Related to command
IDNC - Input, Data, Not Consistent, 2f-BSLR rate exceeds half of the port rate	Rate must not exceed half of the port rate (2f-BSLR only)	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data, Not Consistent, a new trc must also be supplied for a path trace mode change	supply of transmitted path trace	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
IDNC - Input, Data, Not Consistent, Bridging rate is not compliant with existing leg	Both legs must have same rate	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data, Not Consistent, default profile	pfname is default	"DLT-ASAP-PROF: Delete alarm severity assignment profile" (p. 3-134)
IDNC - Input, Data, Not Consistent, MSP 1+1 Optimized is always non-revertive	MSP type 1+1_optimized is never revertive	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNC - Input, Data, Not Consistent, MSP Protection Type 1x1 is always revertive	MSP type 1:1 is never non-revertive	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNC - Input, Data, Not Consistent, no allowed topology conversion	Topology conversion command must be consistent	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC - Input, Data, Not Consistent, No MSP protection supported for SONET mode	No MSP 1:1 protection for SONET	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNC - Input, Data, Not Consistent, not own uid	not the own uid specified	"CANC-USER: Cancel user" (p. 3-60)
IDNC - Input, Data, Not Consistent, Optimized exists only with 1+1 Protection Type	only MSP 1+1 can be optimized	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNC - Input, Data, Not Consistent, SNC Type not compliant with existing pathprotected crossconnection	SNC type compliance	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC - Input, Data, Not Consistent, SNC Type not compliant with existing path-protected cross-connection	SNC Type Compliance	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data, Not Consistent, Specified new Tributary does not support the indicated rate	New tributary rate validity	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC - Input, Data, Not Consistent, Specified Tributary does not support the indicated rate	Tributary provisioning and rate consistency	"ENT-CRS: Enter cross-connection" (p. 3-1464)

Error code	Meaning (validation rule)	Related to command
IDNC - Input, Data, Not Consistent, strcout length must match the given outgoing J0 trace mode	transmitted path trace length	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNC - Input, Data, Not Consistent, This MSP protection type not supported for a port with the indicated rate	No MSP 1:1 protection for bitrate STM-256	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNC - Input, Data, Not Consistent, This MSP protection type not supported for a port with the indicated rate	No MSP 1+1 optimized for bitrate STM-256	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNC - Input, Data, Not Consistent, trc length must match the given path trace mode	transmitted path trace length	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
IDNC - Input, Data, Not Consistent, Tributary boundary is inconsistent with the indicated rate	AID boundary and rate consistency	"CONN-TACC: Connect test access" (p. 3-94); "ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNC - Input, Data, Not Consistent, VCG-trib as input-trib in pathprotected crossconnection	No VCG-trib as in_aid (for pathprotected cross-connection)	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC - SARB - Status, All Resources Busy, LOXC capacity exhausted	Spare capacity for HO cross-connection legs on LOXC	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IDNC- Input, Data Not Consistent, level2 not allowed for scnnode	level2 parameter must not be present when osinode = scnnode	"RTRV-MAP-NETWORK: Retrieve network map" (p. 3-2526)
IDNC-Input, Data Not Consistent, Default VLAN ID is not an allowed member of valid VLAN list	BCMD mode - Default VLAN ID is no allowed member of valid VLAN list for this System	"ED-EPORT: Edit Ethernet port" (p. 3-329)
IDNC-Input, Data, Not Consistent, Default VLAN ID is already assigned for this System	Default VLAN ID is already assigned for this system	"ED-EPORT: Edit Ethernet port" (p. 3-329)
IDNV - Input Data Not Vaild, Both input tributaries are identical	path-protected cross-connection has unique input AIDs	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNV - Input Data Not Valid, ASAP profile does not exist	pfname does not exist	"SET-ATTR-ENV: Set attribute environment" (p. 3-3137)

Error code	Meaning (validation rule)	Related to command
`IDNV - Input Data Not Valid, invalid atagseg`	valid atagseq	"RTRV-AO: Retrieve autonomous output" (p. 3-2241)
`IDNV - Input Data Not Valid, Invalid loopback for EPort`	For ports on GEn packs only far-side loopback allowed	"OPR-LPBK: Operate facility loopback" (p. 3-2044)
`IDNV - Input Data Not Valid, osinode cannot be changed for LAN1`	only osinode1 for LAN 1	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`IDNV - Input Data Not Valid, Parameter(s) present which are not allowed`	Only those parameter present which are needed	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`IDNV - Input, Data Not Vaild, Both input tributaries are identical`	path-protected cross-connection has unique input AIDs	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
`IDNV - Input, Data Not Valid`	Any Input Parameter not valid (IDNV)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`IDNV - Input, Data Not Valid`	Check for that either dccstat, scn_dccstat, uni_dccstat, or enni_dccstat is present	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
`IDNV - Input, Data Not Valid`	Disabled User ID	"ACT-USER: Activate user" (p. 3-24)
`IDNV - Input, Data Not Valid`	Expired password and unsuccessful change of password	"ACT-USER: Activate user" (p. 3-24)
`IDNV - Input, Data Not Valid`	Input parameters not specified	"COPY-RFILE: Copy remote file" (p. 3-106); "CPY-MEM: Copy memory" (p. 3-114)
`IDNV - Input, Data Not Valid`	Invalid uid and/or pid	"ACT-USER: Activate user" (p. 3-24)
`IDNV - Input, Data Not Valid`	Parameter nvmname must be specified	"ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1547); "ENT-EQPT (socket): Enter equipment (socket)" (p. 3-1557)
`IDNV - Input, Data Not Valid`	Presence of spec_block parameter	"ED-CRS: Edit cross-connection" (p. 3-292)
`IDNV - Input, Data Not Valid, a loopback is existing`	No interface standard change on GE10PL1 pack with existing loopbacks	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, additional parameters required	Additional parameters required when setting ndetmd to MAN	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, AIS mode not valid	Output type not supported for AIS mode	"SET-SYNCN: Set synchronization" (p. 3-3158)
IDNV - Input, Data Not Valid, all tributaries must be different	All tributaries must be different	"CONN-TACC: Connect test access" (p. 3-94)

Error code	Meaning (validation rule)	Related to command
`IDNV - Input, Data Not Valid, ASAP profile does not exist`	ASAP profile exists	“ED-EC1: Edit EC1 port” (p. 3-317); “ED-EPORT: Edit Ethernet port” (p. 3-329); “ED-LONIM: Edit lower-order non-intrusive monitor” (p. 3-411); “ED-LOPTF: Edit lower-order path termination function” (p. 3-427); “ED-OC12: Edit OC12 port” (p. 3-523); “ED-OC192: Edit OC192 port” (p. 3-663); “ED-OC3: Edit OC3 port” (p. 3-461); “ED-OC48: Edit OC48 port” (p. 3-585); “ED-OC48T: Edit OC48 transparent port” (p. 3-648); “ED-PTF: Edit tributary with Path Termination Function (PTF)” (p. 3-830); “ED-STM1: Edit STM1 port” (p. 3-915); “ED-STM16: Edit STM16 port” (p. 3-1035); “ED-STM16T: Edit STM16T port” (p. 3-1097); “ED-STM1E: Edit STM1E port” (p. 3-870); “ED-STM4: Edit STM4 port” (p. 3-975); “ED-STM64: Edit STM64 port” (p. 3-1111); “ED-STS1: Edit STS1 tributary” (p. 3-1177); “ED-T3: Edit DS3 port” (p. 3-1202); “ED-TMAT3: Edit asynchronous adjunct port of the TransMUX card” (p. 3-1306); “ED-VC3: Edit VC3 tributary” (p. 3-1339); “ED-VCG: Edit virtual concatenation group” (p. 3-1354); “ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application” (p. 3-1405); “ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 3-1416)
`IDNV - Input, Data Not Valid, ASAP profile does not exist`	check for ASAP profile existence	“ED-EQPT (system): Edit equipment (system)” (p. 3-391)
`IDNV - Input, Data Not Valid, ASAP profile does not exist`	Check for ASAP profile existence	“ED-EQPT (shelf): Edit equipment (shelf)” (p. 3-365); “ED-EQPT (slot): Edit equipment (slot)” (p. 3-370); “ED-EQPT (socket): Edit equipment” (p. 3-379)
`IDNV - Input, Data Not Valid, ASAP profile does not exist`	Validate ASAP profile	“ED-EQPT (CP): Edit equipment (circuit pack)” (p. 3-349)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, Assigned bandwidth exceeds half port’s bandwith	Enough bandwidth reserved for 2F protection group	“ED-OC192: Edit OC192 port” (p. 3-663); “ED-OC48: Edit OC48 port” (p. 3-585); “ED-STM16: Edit STM16 port” (p. 3-1035); “ED-STM64: Edit STM64 port” (p. 3-1111)
IDNV - Input, Data Not Valid, Automatic Squelch Map Calculation only allowed with Automatic Ring Discovery	Automatic squelch map calculation only with automatic ring discovery	“ED-PROTN-GRP: Edit protection group” (p. 3-803); “ENT-PROTN-GRP: Enter protection group” (p. 3-1745)
IDNV - Input, Data Not Valid, cable equalization not supported	Cable equalization not supported	“SET-SYNCN: Set synchronization” (p. 3-3158)
IDNV - Input, Data Not Valid, can’t change l3domain for osinode1	l3domain can not be changed for osinode1	“ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack” (p. 3-1312)
IDNV - Input, Data Not Valid, change of worker port not allowed	Unallowed modification of worker ports	“ED-PROTN-GRP: Edit protection group” (p. 3-803)
IDNV - Input, Data Not Valid, Client Node ID must differ from Network Node ID	Check of UNI parameters	“ED-OC12: Edit OC12 port” (p. 3-523); “ED-OC192: Edit OC192 port” (p. 3-663); “ED-OC3: Edit OC3 port” (p. 3-461); “ED-OC48: Edit OC48 port” (p. 3-585); “ED-STM1: Edit STM1 port” (p. 3-915); “ED-STM16: Edit STM16 port” (p. 3-1035); “ED-STM1E: Edit STM1E port” (p. 3-870); “ED-STM4: Edit STM4 port” (p. 3-975); “ED-STM64: Edit STM64 port” (p. 3-1111); “ED-VCG: Edit virtual concatenation group” (p. 3-1354)
IDNV - Input, Data Not Valid, Combination of Modifier/ Parameters not allowed	Parameter Combinations	“DLT-ENNIMANROUTE: Delete manual route from the E-NNI node” (p. 3-164); “DLT-ENNIMANROUTE notification” (p. 3-168); “ENT-ENNIMANROUTE: Enter manual route to the E-NNI node” (p. 3-1520); “ENT-ENNIMANROUTE notification” (p. 3-1528)
IDNV - Input, Data Not Valid, Command not supported for test access rate LOVT1.5	Not Supported for Low-Order Test Access Rate	“CHG-ACCMD: Change access mode” (p. 3-65)
IDNV - Input, Data Not Valid, Consistent TNA parameter set required	(ONNS specific): Complete and Consistent Setting of TNA Parameter required when configured to EDGE VCGs	“ED-VCG: Edit virtual concatenation group” (p. 3-1354)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, Consistent TNA parameter set required	(ONNS specific): Consistent Parameters setting required when removing TNA information from EDGE VCGs	“ED-VCG: Edit virtual concatenation group” (p. 3-1354)
IDNV - Input, Data Not Valid, Consistent TNA parameter set required	Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports	“ED-OC12: Edit OC12 port” (p. 3-523); “ED-OC192: Edit OC192 port” (p. 3-663); “ED-OC3: Edit OC3 port” (p. 3-461); “ED-OC48: Edit OC48 port” (p. 3-585); “ED-STM1: Edit STM1 port” (p. 3-915); “ED-STM16: Edit STM16 port” (p. 3-1035); “ED-STM1E: Edit STM1E port” (p. 3-870); “ED-STM4: Edit STM4 port” (p. 3-975); “ED-STM64: Edit STM64 port” (p. 3-1111)
IDNV - Input, Data Not Valid, Consistent TNA parameter set required	Consistent Parameters setting required when removing TNA information from EDGE ports	“ED-OC12: Edit OC12 port” (p. 3-523); “ED-OC192: Edit OC192 port” (p. 3-663); “ED-OC3: Edit OC3 port” (p. 3-461); “ED-OC48: Edit OC48 port” (p. 3-585); “ED-STM1: Edit STM1 port” (p. 3-915); “ED-STM16: Edit STM16 port” (p. 3-1035); “ED-STM1E: Edit STM1E port” (p. 3-870); “ED-STM4: Edit STM4 port” (p. 3-975); “ED-STM64: Edit STM64 port” (p. 3-1111)
IDNV - Input, Data Not Valid, constraint l3radesnode	l3radesnode value and l3isisnl value	“ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack” (p. 3-1312); “ENT-ULSDCC-L3: Create a further OSI node” (p. 3-1951)
IDNV - Input, Data Not Valid, Conversion cross-connections not supported with current LO interface standard	Conversion cross-connections only with LOXC interface standard SDH	“ENT-CRS: Enter cross-connection” (p. 3-1464)
IDNV - Input, Data Not Valid, Cross-connections still existing	No interface standard change on GE10PL1 pack with existing cross-connection	“ED-EQPT (CP): Edit equipment (circuit pack)” (p. 3-349)
IDNV - Input, Data Not Valid, DCC on Transparent Ports not allowed	No DCC on transparent ports	“ENT-CRS-FECOM: Enter transparent DCC cross-connection” (p. 3-1510); “ENT-FECOM: Enter DCC channel related parameters” (p. 3-1565)
IDNV - Input, Data Not Valid, DCC type SECTION not allowed for SCN	(SCN specific): RS-DCC not allowed for SCN	“ENT-FECOM: Enter DCC channel related parameters” (p. 3-1565)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, different number of values in rnids and rtids	Consistent rnids and rtids lists	"ED-MAP-RING: Edit map ring" (p. 3-436)
IDNV - Input, Data Not Valid, discrepancy between entered values and current value of spec-block parameters	ohbyte and intfctype values correct (when dis-associating)	"SET-OW: Set orderwire and user bytes" (p. 3-3147)
IDNV - Input, Data Not Valid, DS3 Ports not allowed as line timing reference	No DS3 Port as line timing reference	"SET-SYNCN: Set synchronization" (p. 3-3158)
IDNV - Input, Data Not Valid, duplicate IP Map entry	Check for duplicate entries	"ENT-IP-MAP: Enter TCP/IP map" (p. 3-1594)
IDNV - Input, Data Not Valid, duplicate neighbor port information	No setting of duplicate neighborASTNNodeID and neighborPortID parameter combination	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, duplicate ring node identifiers	No duplicate Ring Node Identifiers	"ED-MAP-RING: Edit map ring" (p. 3-436)
IDNV - Input, Data Not Valid, duplicate ring node target identifiers	No duplicate Ring Node Target Identifiers	"ED-MAP-RING: Edit map ring" (p. 3-436)
IDNV - Input, Data Not Valid, duplicate ring node TID	No duplicate ring node TIDs	"ED-FETID: Edit far end target identifier" (p. 3-405)
IDNV - Input, Data Not Valid, duplicate UID	Entering user's own or existing uid.	"ENT-USER-SECU: Enter user security" (p. 3-1970)
IDNV - Input, Data Not Valid, duplicate UID	newuid has the same value of an existing uid	"ED-USER-SECU: Edit user security" (p. 3-1328)
IDNV - Input, Data Not Valid, E and F tributaries not cross-connected	E tributary and F tributary not cross-connected	"CONN-TACC: Connect test access" (p. 3-94)
IDNV - Input, Data Not Valid, EC1 Ports not allowed as line timing reference	No EC1 Port as line timing reference	"SET-SYNCN: Set synchronization" (p. 3-3158)

Error code	Meaning (validation rule)	Related to command
`IDNV - Input, Data Not Valid, ENNI Port Parameters must be different to their DEFAULT values`	Check of ENNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`IDNV - Input, Data Not Valid, equal l3domain`	l3domain value must be different for current node and l3radesnode	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312)
`IDNV - Input, Data Not Valid, equal node IDs`	l3radesnode value must be different from osinode	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312); "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951)
`IDNV - Input, Data Not Valid, forced DUS not supported for this format`	Format not supported for forced DNU/DUS	"SET-SYNCN: Set synchronization" (p. 3-3158)
`IDNV - Input, Data Not Valid, given TNA already exists`	(ONNS specific): TNA parameters on SDH/SONET layer already assigned on VCAT layer;	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IDNV - Input, Data Not Valid, incompatible screen, uidclass parameters`	Compatibility screen, uidclass parameter	"ENT-USER-SECU: Enter user security" (p. 3-1970); "ED-USER-SECU: Edit user security" (p. 3-1328)
`IDNV - Input, Data Not Valid, incomplete switch command`	complete switch command	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
`IDNV - Input, Data Not Valid, inconsistency l3domain with l3radesnode`	consistency l3domain with l3radesnode for nodes 2 to 8	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312); "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951)
`IDNV - Input, Data Not Valid, inconsistent aid and protype`	consistent aid and protype	"RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, inconsistent aid and rid	consistent aid and rid	"DLT-PROTN-GRP: Delete protection group" (p. 3-233); "ED-FETID: Edit far end target identifier" (p. 3-405); "ED-MAP-RING: Edit map ring" (p. 3-436); "ED-PROTN-GRP: Edit protection group" (p. 3-803); "OPR-PROTNSW: Operate protection switch" (p. 3-2057); "RTRV-MAP-RING: Retrieve map ring" (p. 3-2532); "RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759); "SET-MAP-RING: Set map ring" (p. 3-3142)
IDNV - Input, Data Not Valid, incorrect date/time format	Incorrect date/time format	"ED-DAT: Edit date and time" (p. 3-312)
IDNV - Input, Data Not Valid, incorrect new_pid	Missing or invalid or syntactically incorrect new_pid	"ED-PID: Edit password identifier" (p. 3-798)
IDNV - Input, Data Not Valid, input parameters are not matching	Input Parameters not matching	"DLT-CONN: Delete network connection" (p. 3-139); "RTRV-CONN: Retrieve data relevant for network connections" (p. 3-2294)
IDNV - Input, Data Not Valid, Interface Standard cannot be modified	Not allowed to change istd for VCG ports on a GE10PL1 pack	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, Interface type not settable for specified UserByte-Port	Interface type compliant with port	"SET-OW: Set orderwire and user bytes" (p. 3-3147)
IDNV - Input, Data Not Valid, invalid <parameter_name>	Input Parameter not valid (IDNV)	"RTRV-HDR: Retrieve header" (p. 3-2417)
IDNV - Input, Data Not Valid, invalid callID	Input Parameter callID not valid	"DLT-CONN: Delete network connection" (p. 3-139); "RTRV-CONN: Retrieve data relevant for network connections" (p. 3-2294)
IDNV - Input, Data Not Valid, invalid change of LO switch capacity	Only decreasing of LO switch capacity to 0 G allowed	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
IDNV - Input, Data Not Valid, invalid connection ID	Input Parameter connID not valid	"DLT-CONN: Delete network connection" (p. 3-139); "RTRV-CONN: Retrieve data relevant for network connections" (p. 3-2294)
IDNV - Input, Data Not Valid, invalid Destination TNA Address	Input Parameter Destination TNA Address not valid	"ENT-CONN: Establish network connections with TNA address parameters" (p. 3-1455)

Error code	Meaning (validation rule)	Related to command
`IDNV - Input, Data Not Valid, invalid ES64U switch capacity for ES64U in this slot`	ES64U capacity setting not for ES64U in protection functionality;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`IDNV - Input, Data Not Valid, invalid LO switch capacity for LOXC in this slot`	LO switch capacity setting only for LOXC in worker slots	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`IDNV - Input, Data Not Valid, invalid LO switch capacity for the LOXC type`	LO switch capacity allowed for both LOXC in an equipment protection group	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`IDNV - Input, Data Not Valid, invalid LO switch capacity for the LOXC type`	LO switch capacity allowed for LOXC type	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`IDNV - Input, Data Not Valid, Invalid loopback for PTF on LOXC`	No loopbacks for PTF on LOXC allowed	"OPR-LPBK: Operate facility loopback" (p. 3-2044)
`IDNV - Input, Data Not Valid, invalid sc`	Invalid switch command	"OPR-SYNCNSW: Operate synchronization switch " (p. 3-2077)
`IDNV - Input, Data Not Valid, invalid Service Level`	Input Parameter Service Level not valid	"ENT-CONN: Establish network connections with TNA address parameters" (p. 3-1455)
`IDNV - Input, Data Not Valid, invalid slots for worker and protection unit`	Slot restrictions for TransMUX equipment protection group	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`IDNV - Input, Data Not Valid, invalid Source LPID`	Input Parameter Source Logical Port ID not valid	"ENT-CONN: Establish network connections with TNA address parameters" (p. 3-1455)
`IDNV - Input, Data Not Valid, invalid Source TNA Address`	Input Parameter Source TNA Address not valid	"ENT-CONN: Establish network connections with TNA address parameters" (p. 3-1455)
`IDNV - Input, Data Not Valid, invalid switch command`	supported switch command	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
`IDNV - Input, Data Not Valid, invalid test access mode`	MONF or MONEF test access mode not allowed on a one-way cross-connection from E to F tributary	"CONN-TACC: Connect test access" (p. 3-94)
`IDNV - Input, Data Not Valid, invalid TNA address`	Input Parameter TNA address not valid	"RTRV-CONN: Retrieve data relevant for network connections" (p. 3-2294)
`IDNV - Input, Data Not Valid, invalid TransMUX switch capacity for TransMUX in this slot`	TransMUX capacity setting not for TransMUX in protection functionality	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`IDNV - Input, Data Not Valid, invalid UID`	invalid uid	"RTRV-USER-SECU: Retrieve user security" (p. 3-3063)
`IDNV - Input, Data Not Valid, invalid UID`	Invalid uid	"DLT-USER-SECU: Delete user security" (p. 3-272); "ED-USER-SECU: Edit user security" (p. 3-1328)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, invalid UPC	Invalid upc	"ED-USER-SECU: Edit user security" (p. 3-1328); "ENT-USER-SECU: Enter user security" (p. 3-1970)
IDNV - Input, Data Not Valid, Invalid Wildcarding for wrk_aid	Invalid wildcarding	"RTRV-OUC: Retrieve ONNS to UPSR/SNCP constructs" (p. 3-2690)
IDNV - Input, Data Not Valid, IP Address already used	dcn_ipad must be unique in the system ;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
IDNV - Input, Data Not Valid, IP Address already used	IP address already used for an active ES64U pack;	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
IDNV - Input, Data Not Valid, l3prefix and l3radesnode inconsistent	consistency of l3radesnode with l3raprefix	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312); "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951)
IDNV - Input, Data Not Valid, l4ajsys/osinode not unique	l4ajsys per osinode must be different	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
IDNV - Input, Data Not Valid, Labels and Bandwidth are not matching	Labels and bandwidth not matching	"ENT-CONN: Establish network connections with TNA address parameters" (p. 3-1455)
IDNV - Input, Data Not Valid, LAN1 not allowed for ENNI	Not allowed to use LAN1 for E-NNI	"DLT-ENNIMANROUTE notification" (p. 3-168); "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1520); "ENT-ENNIMANROUTE notification" (p. 3-1528)
IDNV - Input, Data Not Valid, LAN1 not allowed for UNI	Not allowed to use LAN1 for UNI	"DLT-MANROUTE-LAN: Delete manual route at LAN port" (p. 3-203); "ENT-MANROUTE-LAN: Enter manual route at LAN port" (p. 3-1610); "RTRV-MANROUTE-LAN: Retrieve manual route at LAN port" (p. 3-2516)

Error code	Meaning (validation rule)	Related to command
`IDNV - Input, Data Not Valid, local Link ID value must be unique`	Unique setting of localLinkID	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`IDNV - Input, Data Not Valid, local LPID value must be unique`	(ONNS specific): localLPID already assigned to VCG port as localLPIDVCAT	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IDNV - Input, Data Not Valid, local LPID value must be unique`	(ONNS specific): localLPIDVCAT already assigned to other EDGE or SONET/SDH UNI port	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IDNV - Input, Data Not Valid, local LPID value must be unique`	(ONNS specific): localLPIDVCAT already assigned to other VCG port	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IDNV - Input, Data Not Valid, local LPID value must be unique`	(ONNS specific): Unique setting of localLPID	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IDNV - Input, Data Not Valid, local LPID value must be unique`	(ONNS specific): Unique setting of localLPID wrt. localLinkID	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IDNV - Input, Data Not Valid, local LPID value must be unique`	(ONNS specific): Unique setting of localLPIDVCAT wrt. localLinkID	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IDNV - Input, Data Not Valid, local LPID value must be unique`	localLPID already assigned to VCG port at VCAT layer	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`IDNV - Input, Data Not Valid, local LPID value must be unique`	Unique setting of localLinkID wrt. localLPID	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, local LPID value must be unique	Unique setting of localLPID	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, local LPID value must be unique	Unique setting of localLPID wrt. localLinkID	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, Low-order cross-connections of this interface standard not supported	Entities must fit LOXC interface standard	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191) ; "ENT-CRS: Enter cross-connection" (p. 3-1464)
IDNV - Input, Data Not Valid, Low-order test access sessions of this interface standard not supported	Entities must fit LOXC interface standard	"CONN-TACC: Connect test access" (p. 3-94)
IDNV - Input, Data Not Valid, Manual route entry already exists	No duplicate Manual Route entries	"DLT-ENNIMANROUTE notification" (p. 3-168); "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1520); "ENT-ENNIMANROUTE notification" (p. 3-1528); "ENT-MANROUTE-LAN: Enter manual route at LAN port" (p. 3-1610)
IDNV - Input, Data Not Valid, Manual route entry does not exist	Manual MCN IP Route entry must exist	"DLT-MANROUTE-MCN: Delete one manual MCN IP route entry" (p. 3-207)

Error code	Meaning (validation rule)	Related to command
`IDNV - Input, Data Not Valid, Manual route entry does not exist`	Manual Route entry must exist	"DLT-ENNIMANROUTE: Delete manual route from the E-NNI node" (p. 3-164); "DLT-MANROUTE-LAN: Delete manual route at LAN port" (p. 3-203)
`IDNV - Input, Data Not Valid, Min. and max. NN XC rates incompatible`	No setting of minNNXCRate to values larger than value of maxNNXCRate and vice versa	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`IDNV - Input, Data Not Valid, missing F tributary`	Missing F tributary	"CONN-TACC: Connect test access" (p. 3-94)
`IDNV - Input, Data Not Valid, neighboring RC ID/IP address used by own RC`	Neighboring RC must differ from own RC	"ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers" (p. 3-1792)
`IDNV - Input, Data Not Valid, newuid for non superuser`	newuid defined for non superuser uid	"ED-USER-SECU: Edit user security" (p. 3-1328)
`IDNV - Input, Data Not Valid, Next Hop IP Address already assigned to other LAN`	No duplicate Manual MCN IP Route entries	"ENT-MANROUTE-MCN: Enter manual IP route for management communication" (p. 3-1614)
`IDNV - Input, Data Not Valid, Next Hop IP Address already assigned to other LAN`	No more than one LAN connected to same next hop	"DLT-ENNIMANROUTE notification" (p. 3-168); "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1520); "ENT-ENNIMANROUTE notification" (p. 3-1528); "ENT-MANROUTE-MCN: Enter manual IP route for management communication" (p. 3-1614)
`IDNV - Input, Data Not Valid, No Access via AID located on INNI port`	Access via tributary on INNI port	"ED-PROTN-GRP: Edit protection group" (p. 3-803); "OPR-PROTNSW: Operate protection switch" (p. 3-2057); "RLS-PROTNSW: Release protection switch" (p. 3-2203)
`IDNV - Input, Data Not Valid, no aid range in combination with rid`	aid range and rid	"RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, no Auto. Squelch Map Calculation	no automatic squelch map calculation	"RTRV-CKT: Retrieve circuit" (p. 3-2274)
IDNV - Input, Data Not Valid, no BLSR / MS SPRING tributary	no BLSR / MS-SPRING tributary	"RTRV-CKT: Retrieve circuit" (p. 3-2274)
IDNV - Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA	TNA parameter disjointness between EDGE and UNI;	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, No path protection group parameters allowed for directionality UNIDIR-ADD	No path protection group parameters must be given for Setup of a unidirectional-add OUC	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
IDNV - Input, Data Not Valid, no regen loop with SETG as timing output	Regenerator loops with SETG as timing output	"SET-SYNCN: Set synchronization" (p. 3-3158)
IDNV - Input, Data Not Valid, No support of TNA parameter set for UNI VCGs	Check of SONET/SDH layer parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, No support of VCAT TNA parameter set for EDGE VCGs	(ONNS specific): No Support of VCAT related TNA Parameters for EDGE VCGs;	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, No Userbyte access at the specified port	No Userbyte access at EC1 ports on EP51 pack	"SET-OW: Set orderwire and user bytes" (p. 3-3147)
IDNV - Input, Data Not Valid, No wildcarding for access via input tribs	No wildcarding on access via aid and aid1	"RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759)
IDNV - Input, Data Not Valid, node itself is not a valid neighbor	No setting of neighborASTNNodeID or neighborNodeID to corresponding IDs of local node	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, not possible for NNI port to assign both channels to MCN	(SCN specific): Prevent that both DCCs of a port are assigned to the MCN, when portClass = INNI	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNV - Input, Data Not Valid, not possible to assign both channels to E-NNI	(UNI/E-NNI specific): Prevent that both DCCs of a port are assigned to E-NNI	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNV - Input, Data Not Valid, not possible to assign both channels to SCN	(SCN specific): Prevent that both DCCs of a port are assigned to the SCN	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNV - Input, Data Not Valid, not possible to assign both channels to UNI	(UNI/E-NNI specific): Prevent that both DCCs of a port are assigned to UNI	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNV - Input, Data Not Valid, NSAP Area Addres matches with RA-Prefix	Address area value - RA-prefix value	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312)
IDNV - Input, Data Not Valid, NSAP Area Address matches with RA-Prefix	Address area value - RA-Prefix value	"ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951)
IDNV - Input, Data Not Valid, old TID not in in the list of ring node TIDs	Old TID not in ring map	"ED-FETID: Edit far end target identifier" (p. 3-405)
IDNV - Input, Data Not Valid, only a single node in separate domain supported	only one single node in a separate domain supported	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312); "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951)
IDNV - Input, Data Not Valid, optical wavelength not in optical window	Optical wavlength must be in the optical window	"ED-OTU2: Edit OTU2 port" (p. 3-730)
IDNV - Input, Data Not Valid, Parameter inputsig is mandatory	Parameter inputsig is mandatory	"ENT-VCG – Enter virtual concatenation group" (p. 3-1983)
IDNV - Input, Data Not Valid, parameter inputsig must be set individually	No other spec_block parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, parameter not required	Parameter not supported for modifier	"OPR-SYNCNSW: Operate synchronization switch " (p. 3-2077)
IDNV - Input, Data Not Valid, Parameter not supported	Change of FEC parameters only if supported by the current circuit pack	"ED-OC192: Edit OC192 port" (p. 3-663); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, Parameter not supported	Enabling of Optical Channel only if supported by the current circuit pack	"ED-OC192: Edit OC192 port" (p. 3-663); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, Parameter vcat is mandatory	Parameter vcat is mandatory	"ENT-VCG – Enter virtual concatenation group" (p. 3-1983)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, parameter vcat must be set individually	No other spec_block parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, Parameter(s) present which are not allowed	Parameters not supported on GE1 pack	"ED-EPORT: Edit Ethernet port" (p. 3-329)
IDNV - Input, Data Not Valid, Port Class not allowed for 10 GE ports	Ethernet Port Class EDGE not allowed for 10 GE ports	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, Port Class not allowed for 10 GE ports	Ethernet Port Class UNI not allowed for 10 GE ports	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, portClass must be ENNI	(UNI/E-NNI specific): Check consistency of input parameters with portClass	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNV - Input, Data Not Valid, portClass must be INNI	(SCN specific): Check consistency of input parameters with portClass I	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNV - Input, Data Not Valid, portClass must be UNI	(UNI/E-NNI specific): Check consistency of input parameters with portClass	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNV - Input, Data Not Valid, ppgname not allowed if aid1 is given	ppgname and aid1	"RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759)
IDNV - Input, Data Not Valid, ppgname not supported for this transmission rate	ppgname and low order path protections	"ED-PROTN-GRP: Edit protection group" (p. 3-803); "OPR-PROTNSW: Operate protection switch" (p. 3-2057); "RLS-PROTNSW: Release protection switch" (p. 3-2203); "RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759)
IDNV - Input, Data Not Valid, profile name does not exist	profile name does not exist	"DLT-TCA-PROF: Delete TCA profile" (p. 3-259); "ED-TCA-PROF: Edit TCA profile" (p. 3-1214)
IDNV - Input, Data Not Valid, provisioning of lapdmode and lapdrl not possible	(SCN specific): Invalid input parameters	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
IDNV - Input, Data Not Valid, RA-Prefix matches with the NSAP Area Address	RA-prefix value - Address area value	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312); "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, RC neighbor already provisioned	RC must not be in Neighboring List	"ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers" (p. 3-1792)
IDNV - Input, Data Not Valid, RC node not created	RC must be created	"DLT-RC-NEIGHBOR: Delete a routing controller from the list of neighboring routing controllers" (p. 3-247); "ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers" (p. 3-1792)
IDNV - Input, Data Not Valid, RC not created	RC must be created	"ED-RC-GENERAL: Edit general routing controller settings" (p. 3-853); "RTRV-RC-GENERAL: Retrieve general routing controller settings" (p. 3-2814); "RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers" (p. 3-2816)
IDNV - Input, Data Not Valid, RC unknown	RC must be in Neighboring List	"DLT-RC-NEIGHBOR: Delete a routing controller from the list of neighboring routing controllers" (p. 3-247)
IDNV - Input, Data Not Valid, related portClass not EDGE or port not in BLSR/MS-SPRING group	(ONNS specific): loca, locz changes only allowed when portClass = EDGE and part of a BLSR/MS-SPRING group	"ED-STS1: Edit STS1 tributary" (p. 3-1177); "ED-VC3: Edit VC3 tributary" (p. 3-1339)
IDNV - Input, Data Not Valid, rid is already used by another protection group	unique rid	"ED-PROTN-GRP: Edit protection group" (p. 3-803); "ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNV - Input, Data Not Valid, Sa bit location not supported	Input / Output format not supported for Sa bit settings	"SET-SYNCN: Set synchronization" (p. 3-3158)
IDNV - Input, Data Not Valid, screen value was not set by security administrator	screen value not allowed for uid	"ED-USER: Edit user" (p. 3-1323)
IDNV - Input, Data Not Valid, sid is already used by another BLSR/ MS-SPRing Node	Uniqueness of TID within Ringmaps	"SET-SID: Set SID" (p. 3-3154)
IDNV - Input, Data Not Valid, side information is not complete	complete side information	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
IDNV - Input, Data Not Valid, Slot still provisioned	Slot must not be provisioned	"ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1547)
IDNV - Input, Data Not Valid, Socket still provisioned	Socket must not be provisioned	"ENT-EQPT (socket): Enter equipment (socket)" (p. 3-1557)
IDNV - Input, Data Not Valid, SSM not supported for provisioned QL	SSM not supported if timing port provisioned AUTO	"SET-SYNCN: Set synchronization" (p. 3-3158)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, SSM not supported for this format	SSM not supported	"SET-SYNCN: Set synchronization" (p. 3-3158)
IDNV - Input, Data Not Valid, SSM not supported for this format	SSM not supported for unframed formats	"SET-SYNCN: Set synchronization" (p. 3-3158)
IDNV - Input, Data Not Valid, switch capacity cannot be decreased	No decrease of maximum switch capacity	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
IDNV - Input, Data Not Valid, TCA profile does not exist	profile name does not exist	"RTRV-TCA-ASGNMT: Retrieve TCA assignment" (p. 3-2979)
IDNV - Input, Data Not Valid, TCA profile does not exist	TCA profile exists	"ED-EC1: Edit EC1 port" (p. 3-317); "ED-EPORT: Edit Ethernet port" (p. 3-329); "ED-LONIM: Edit lower-order non-intrusive monitor" (p. 3-411); "ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-OC48T: Edit OC48 transparent port" (p. 3-648); "ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-830); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM16T: Edit STM16T port" (p. 3-1097); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111); "ED-STS1: Edit STS1 tributary" (p. 3-1177); "ED-T3: Edit DS3 port" (p. 3-1202); "ED-TMAT3: Edit asynchronous adjunct port of the TransMUX card" (p. 3-1306); "ED-VC3: Edit VC3 tributary" (p. 3-1339); "ED-VCG: Edit virtual concatenation group" (p. 3-1354); "ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application" (p. 3-1405); "ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
IDNV - Input, Data Not Valid, TID of local node not allowed	Local node TID not allowed	"ED-FETID: Edit far end target identifier" (p. 3-405)
IDNV - Input, Data Not Valid, TNA Address already assigned to UNI port	TNA parameter disjointness between EDGE and UNI	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, TNA Address not allowed for the Client Node ID	Network TNA Address Uniqueness per UNI client;	"ED-STM1E: Edit STM1E port" (p. 3-870); "ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, TNA already assigned to a VCG port	TNA parameters already assigned on VCAT layer;	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, TNA Type and TNA Address do not match	(ONNS specific): Check of TNA parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, TNA Type and TNA Address do not match	(ONNS specific): Check of VCAT layer TNA parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, TNA Type and TNA Address do not match	Check of TNA parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, Transparent Ports not allowed as line timing reference	No transparent port as line timing reference	"SET-SYNCN: Set synchronization" (p. 3-3158)
IDNV - Input, Data Not Valid, tributary already part of a cross-connection	(ONNS specific): loca, locz changes only allowed when tributary not involved in a cross-connection	"ED-STS1: Edit STS1 tributary" (p. 3-1177); "ED-VC3: Edit VC3 tributary" (p. 3-1339)
IDNV - Input, Data Not Valid, uid must not be the own uid	uid must not be the own uid	"CANC-USER-SECU: Cancel user security" (p. 3-62)

Error code	Meaning (validation rule)	Related to command
IDNV - Input, Data Not Valid, uid not in NE data base	uid not in NE data base	"CANC-USER-SECU: Cancel user security" (p. 3-62)
IDNV - Input, Data Not Valid, UNI parameters must be different to their DEFAULT value	Check of UNI parameter	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, UNI parameters must be different to their DEFAULT values	Check of UNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, UNI parameters must be different to their DEFAULT values	Check of UNI parameters;	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, UNI port parameters must be different to their DEFAULT values	Check of UNI parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, Valid values for ENNI parameters required	Check of ENNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
IDNV - Input, Data Not Valid, Valid values for UNI parameters required	Check of UNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IDNV - Input, Data Not Valid, VCG already exists	VCG already exists	"ENT-VCG – Enter virtual concatenation group" (p. 3-1983)

Error code	Meaning (validation rule)	Related to command
`IDNV - Input, Data Not Valid, wrong old_pid`	Invalid old_pid	"ED-PID: Edit password identifier" (p. 3-798)
`IDNV - Input, Data Not Valid, zero values can only be set for all neighbor information consistently`	Setting of neighbor information to UNKNOWN	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`IDNV - Input, Data Not Valid. Attempting to delete an administrator login. Two administrator user logins are required at all times`	Attempt to delete administrator's uid	"DLT-USER-SECU: Delete user security" (p. 3-272)
`IDNV - UNI parameters must be different to their DEFAULT values`	Check of UNI parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IDRG - Input, Data Range Error`	Check aid and dyn consistency	"ENT-LONIM notification" (p. 3-1598); "RTRV-LONIM: Low-order non-intrusive monitor" (p. 3-2486); "RTRV-LOPTF: Retrieve low-order path termination function" (p. 3-2478)
`IDRG - Input, Data Range Error`	Input Parameter Range Incorrect (IDRG)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`IDRG - Input, Data Range Error, osinode`	TARP data cache enabling only valid for node-1	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
`IDRG - Input, Data Range Error, osinode`	TARP origination only valid for node-1	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
`IDRG - Input, Data Range Error, osinode`	TARP responder only valid for node-1	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
`IDRG - Input, Data Range Error, Value not supported for this modifier and istd`	Improper Value	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`IEAE - Input, Entity Already Exists`	Entity already exists (IEAE)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`IEAE - Input, Entity Already Exists, cross-connection exists on test tributary`	Cross-connection exists on the test tributary	"CONN-TACC: Connect test access" (p. 3-94)

Error code	Meaning (validation rule)	Related to command
IEAE - Input, Entity Already Exists, cross-connection exists on test tributary	Not allowed for bridged cross-connections;	"CONN-TACC: Connect test access" (p. 3-94)
IEAE - Input, Entity Already Exists, duplicate profile name	Duplicate newname	"ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 3-284)
IEAE - Input, Entity Already Exists, duplicate profile name	Duplicate pfname	"ENT-ASAP-PROF: Enter alarm severity assignment profile" (p. 3-1446)
IEAE - Input, Entity Already Exists, duplicate profile name	profile name already exists	"ED-TCA-PROF: Edit TCA profile" (p. 3-1214); "ENT-TCA-PROF: Enter TCA Profile" (p. 3-1894)
IEAE - Input, Entity Already Exists, osinode	OSI Node is already created	"ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951)
IEAE - Input, Entity Already Exists, test access connection exists	Test tributary already connected	"CONN-TACC: Connect test access" (p. 3-94)
IENE - IENE - Input, Entity Not Exists, Specified crossconnection does not exist	LO cross-connection with specified topology must exist	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IENE - Input Entity Not Exists, Specified crossconnection does not exist	Entity (cross-connection) must exist	"ED-NNCRS: Edit NN cross-connection" (p. 3-457)
IENE - Input Entity Not Exists, Specified cross-connection does not exist	Entity (cross-connection) must exist	"DLT-CRS: Delete cross-connection" (p. 3-145); "ED-CRS: Edit cross-connection" (p. 3-292)
IENE - Input Entity Not Exists, Specified Transparent DCC Cross Connection does not exist	Entity (transparent DCC cross-connection) must exist	"DLT-CRS-FECOM: Delete transparent DCC cross-connection" (p. 3-156)
IENE - Input Entity Not Exists, Specified tributary/tributaries do not exist	Entities (tributaries) must exist	"DLT-CRS: Delete cross-connection" (p. 3-145); "ED-CRS: Edit cross-connection" (p. 3-292); "ED-NNCRS: Edit NN cross-connection" (p. 3-457)
IENE - Input Entity Not Exists, Specified tributary/tributaries do not exist	Entities must exist for HO cross-connections	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IENE - Input, Entity Not Exists	Check CCB against ptype and eif	"ED-EC1: Edit EC1 port" (p. 3-317); "ED-T3: Edit DS3 port" (p. 3-1202); "RTRV-EC1: Retrieve EC1 port" (p. 3-2332)
IENE - Input, Entity Not Exists	Check LONIM::modifier against PTF::istd	"ENT-LONIM notification" (p. 3-1598)

Error code	Meaning (validation rule)	Related to command
IENE - Input, Entity Not Exists	Check LONIM::modifier against PTF::ptfstd	"RTRV-LONIM: Low-order non-intrusive monitor" (p. 3-2486)
IENE - Input, Entity Not Exists	Check modifier against circuit pack type	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416); "OPR-VCGTRIB: Operate virtual concatenation group tributary" (p. 3-2082); "RTRV-VCGTRIB: Retrieve virtual concatenation group tributary " (p. 3-3109)
IENE - Input, Entity Not Exists	Command only allowed for ES64U	"RTRV-RESALLOC-VCG: Retrieve resource allocation virtual concatenation group" (p. 3-2819)
IENE - Input, Entity Not Exists	Command only allowed for VCG on ES64U circuit pack	"DLT-VCG – Enter virtual concatenation group" (p. 3-277)
IENE - Input, Entity Not Exists	Command only allowed for VCG on GEn or ES64U circuit packs	"RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078)
IENE - Input, Entity Not Exists	command only allowed for VCG on GEn or ES64U circuit packs;	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IENE - Input, Entity Not Exists	Command only allowed for VCG on Gigabit Ethernet Packs	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
IENE - Input, Entity Not Exists	Command only allowed for VCG on Transparent Packs	"ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application" (p. 3-1405); "RTRV-VCG-TRANS: Retrieve virtual concatenation group transparent" (p. 3-3102)
IENE - Input, Entity Not Exists	Directory not accessible	"CPY-MEM: Copy memory" (p. 3-114)
IENE - Input, Entity Not Exists	Invalid Entity (IENE)	"RTRV-HDR: Retrieve header" (p. 3-2417)
IENE - Input, Entity Not Exists	level 1 Routing controller does not exist	"CANC-L1ROUTING" (p. 3-54)
IENE - Input, Entity Not Exists	Protection Group must exist	"ED-PROTN-GRP: Edit protection group" (p. 3-803); "OPR-PROTNSW: Operate protection switch" (p. 3-2057); "RLS-PROTNSW: Release protection switch" (p. 3-2203)
IENE - Input, Entity Not Exists	Reject Request for CTL slots	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1547)
IENE - Input, Entity Not Exists, aid not part of substructure	Check aid against PTF substructure	"ED-LONIM: Edit lower-order non-intrusive monitor" (p. 3-411)

Error code	Meaning (validation rule)	Related to command
IENE - Input, Entity Not Exists, Command not allowed for a protecting ES64U pack	Command not allowed for ES64U protecting pack	"RTRV-RESALLOC-VCG: Retrieve resource allocation virtual concatenation group" (p. 3-2819)
IENE - Input, Entity Not Exists, Command not allowed for a protecting ES64U pack	Command not allowed for ES64U protecting pack	"ENT-VCG – Enter virtual concatenation group" (p. 3-1983)
IENE - Input, Entity Not Exists, Command not allowed for an inactive ES64U pack	Command not allowed for ES64U with switch capacity 0	"RTRV-RESALLOC-VCG: Retrieve resource allocation virtual concatenation group" (p. 3-2819)
IENE - Input, Entity Not Exists, Command not allowed for an inactive ES64U pack	Command not allowed for ES64U with switch capacity 0	"ENT-VCG – Enter virtual concatenation group" (p. 3-1983)
IENE - Input, Entity Not Exists, Command only allowed for a ES64U pack	Command only allowed for VCG on ES64U circuit pack	"ENT-VCG – Enter virtual concatenation group" (p. 3-1983)
IENE - Input, Entity Not Exists, constituent member does not exist	Boundary consistency for constituent members	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
IENE - Input, Entity Not Exists, Not for this interface standard	Entities must fit to the interface standard	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IENE - Input, Entity Not Exists, Specified association does not exist	Association present (when dis-associating)	"SET-OW: Set orderwire and user bytes" (p. 3-3147)
IENE - Input, Entity Not Exists, Specified crossconnection does not exist	Conversion cross-connection with specified topology must exist	"DLT-CRS: Delete cross-connection" (p. 3-145)
IENE - Input, Entity Not Exists, Specified crossconnection does not exist	Entity (cross-connection) must exist	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IENE - Input, Entity Not Exists, Specified cross-connection does not exist	LO cross-connection with specified topology must exist	"DLT-CRS: Delete cross-connection" (p. 3-145)
IENE - Input, Entity Not Exists, Specified low-order tributary/ tributaries do not exist/cannot be created (possibly connected at high-order level)	LO tributaries must be creatable for conversion cross-connections	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IENE - Input, Entity Not Exists, Specified OUC does not exist	Entity (OUC) must exist	"DLT-OUC: Delete ONNS to UPSR/SNCP constructs" (p. 3-217)
IENE - Input, Entity Not Exists, Specified port does not exist	Port exists (when associating)	"SET-OW: Set orderwire and user bytes" (p. 3-3147)
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	Entities (tributaries) must exist	"RLS-LPBK: Release loopback (cross-connection)" (p. 3-2195)
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	Entities must exist	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)

Error code	Meaning (validation rule)	Related to command
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	HO tributaries must exist	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	HO tributaries must exist for LO TACC sessions	"CONN-TACC: Connect test access" (p. 3-94)
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	HO tributary must exist for conversion cross-connection	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	LO tributary must exist/be creatable	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	No LO tributary at HO side of conversion cross-connection	"ED-LONIM: Edit lower-order non-intrusive monitor" (p. 3-411)
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	Tributaries must exist	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
IENE - Input, Entity Not Exists, Specified tributary/tributaries do not exist	Tributaries must exist for HO TACC sessions	"CONN-TACC: Connect test access" (p. 3-94)
IENE - Input, Entity Not Exists, Substructure cannot be adapted	Entities must be adaptable for LO cross-connections	"ENT-CRS: Enter cross-connection" (p. 3-1464)
IENE - Input, Entity Not Exists, Substructure cannot be adapted	Entities must be adaptable for LO loopbacks	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
IENE - Input, Entity Not Exists, Substructure cannot be adapted	Entity must be adaptable for LO cross-connections	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
IIAC - Input, Invalid ACcess identifier, incorrect syntax	consistent aid and protype	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
IIAC - Input, Invalid ACcess identifier, incorrect syntax	Incorrect AID Syntax (IIAC)	"RTRV-HDR: Retrieve header" (p. 3-2417)
IIAC - Input, Invalid ACcess identifier, unknown AID	Unknown AID (IIAC)	"RTRV-HDR: Retrieve header" (p. 3-2417)
IIAC - Input, Invalid ACcess identifier,incorrect syntax	consistent aid and protype	"RLS-PROTNSW: Release protection switch" (p. 3-2203)
IIAC - Input, Invalid ACcess identifier,incorrect syntax	consistent aid and rid	"RLS-PROTNSW: Release protection switch" (p. 3-2203)
IICT - Input, Invalid Correlation Tag (CTAG), incorrect syntax	Invalid CTAG (IICT)	"RTRV-HDR: Retrieve header" (p. 3-2417)
IISP - Input, Invalid Syntax or Punctuation	Syntax or Punctuation Error (IISP)	"RTRV-HDR: Retrieve header" (p. 3-2417)

Error code	Meaning (validation rule)	Related to command
`IISP - Input, Invalid Syntax or Punctuation, command too long`	Command too long	"RTRV-HDR: Retrieve header" (p. 3-2417)
`IITA - Input, Invalid TArget identifier, incorrect syntax`	Incorrect TID (IITA)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`IITA - Input, Invalid TID, Communications Failure`	Not reachable TID (IITA)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`IITA - Input, Invalid TID, Unknown TID`	Unknown TID (IITA)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`INUP - Input, Non-null Unimplemented Parameter`	Check if parameters are supported for the modifier	"ED-LONIM: Edit lower-order non-intrusive monitor" (p. 3-411)
`INUP - Input, Non-null Unimplemented Parameter`	Less than 2 nodes specified	"ED-MAP-RING: Edit map ring" (p. 3-436)
`INUP - Input, Non-null Unimplemented Parameter`	Parameter Input Failure (INUP)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`INUP - Input, Non-null Unimplemented Parameter, secondary test tributary not allowed`	Secondary test tributary not needed for MONE test modes	"CONN-TACC: Connect test access" (p. 3-94)
`INVS - Status, Not in Valid State, TARP propagation can not be disabled`	Can't disable TARP propagation while LAN TARP storm suppression is enabled	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
`IPMS - Input, Parameter MiSsing, abstractNodeID is missing`	Abstract Node ID missing	"ACT-L1ROUTING" (p. 3-15)
`IPMS - Input, Parameter MiSsing, <parameter_name> is missing`	Parameter Missing (IPMS)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`IPMS -Input, Parameter MiSsing, <parameter name> is missing`	Path-protected crossconnection: missing parameters	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`IPMS -Input, Parameter Missing, <parameter name> missing`	path-protected cross-connection: parameters missing	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
`IPNC - Input Parameter Not Consistent, Rate inconsistent with cross-connection rate`	Only those parameter present which are needed	"ED-CRS: Edit cross-connection" (p. 3-292)
`IPNC - Input Parameter Not Consistent, Rate inconsistent with cross-connection rate`	Specified rate consistent with the cross-connecton rate	"ED-CRS: Edit cross-connection" (p. 3-292); "ED-NNCRS: Edit NN cross-connection" (p. 3-457)
`IPNC - Input Parameter Not Consistent, TID not compliant with cross-connection configuration`	TID validation	"ED-CRS: Edit cross-connection" (p. 3-292)
`IPNC - Input, Parameter Not Consistent`	Invalid Command Qualifier (IPNC)	"RTRV-HDR: Retrieve header" (p. 3-2417)

Error code	Meaning (validation rule)	Related to command
`IPNC - Input, Parameter Not Consistent, 64 byte path trace not allowed`	Check modifier and ptrcrfmt consistency	"ED-LONIM: Edit lower-order non-intrusive monitor" (p. 3-411); "ED-LOPTF: Edit lower-order path termination function" (p. 3-427)
`IPNC - Input, Parameter Not Consistent, Rate inconsistent with crossconnection rate`	Inconsistent tributary rate	"CHG-ACCMD: Change access mode" (p. 3-65); "CONN-TACC: Connect test access" (p. 3-94); "DISC-TACC: Disconnect test access" (p. 3-129)
`IPNC - Input, Parameter Not Consistent, SES threshold out of range for this modifier`	Check modifier and pmlpneses/pmlpnefeses consistency	"ED-LONIM: Edit lower-order non-intrusive monitor" (p. 3-411)
`PICC - Privilege, Illegal Command Code`	Command requires higher privilege (PICC)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`PICC - Privilege, Illegal Command Code, invalid user class`	user class	"RTRV-AO: Retrieve autonomous output" (p. 3-2241)
`PLNA - Privilege, Login Not Active`	Session is not initiated (PLNA)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`SABT - Status, Aborted`	Command Aborted (SABT)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`SAOP - Status Already Operated, loopback already exists`	Loopback must not already exist	"OPR-LPBK: Operate facility loopback" (p. 3-2044); "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`SARB - Status, All Resources Busy`	APPLY already in progress	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
`SARB - Status, All Resources Busy`	Maximum logins exceeded	"ACT-USER: Activate user" (p. 3-24)
`SARB - Status, All Resources Busy`	System Busy with SW Generic Installation (SARB)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`SARB - Status, All Resources Busy`	Temporary exhaustion of resources	"COPY-RFILE: Copy remote file" (p. 3-106); "CPY-MEM: Copy memory" (p. 3-114)
`SARB - Status, All Resources Busy, LOXC capacity exhausted`	No Spare capacity for HO cross-connection legs on LOXC	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`SARB - Status, All Resources Busy, LOXC capacity exhausted`	Spare capacity for HO cross-connection legs on LOXC	"CONN-TACC: Connect test access" (p. 3-94)
`SARB - Status, All Resources Busy, system limit exceeded`	System Limit exceeded (SARB)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`SARB - Status, All Resources Busy, system limit exceeded`	Temporary system exhaustion	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)

Error code	Meaning (validation rule)	Related to command
SCNF - Status, Command Not Found, command not recognized or command parameters not valid	Command not recognized (SCNF)	"RTRV-HDR: Retrieve header" (p. 3-2417)
SDNC - Status, Data Not Consistent	Additional directory/URL specified	"COPY-RFILE: Copy remote file" (p. 3-106); "CPY-MEM: Copy memory" (p. 3-114)
SDNC - Status, Data Not Consistent	Additional directory/URL specified for backup	"COPY-RFILE: Copy remote file" (p. 3-106)
SDNC - Status, Data Not Consistent	Additional directory/URL specified for database download	"COPY-RFILE: Copy remote file" (p. 3-106)
SDNC - Status, Data Not Consistent	Additional directory/URL specified for restoration	"COPY-RFILE: Copy remote file" (p. 3-106)
SDNC - Status, Data Not Consistent	File inappropriate	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
SDNC - Status, Data Not Consistent	Source product type does not match network product type	"CPY-MEM: Copy memory" (p. 3-114)
SDNC - Status, Data Not Consistent, asgncond not empty	probable cause assigned to MDO port	"OPR-EXT-CONT: Operate external control" (p. 3-2032); "RLS-EXT-CONT: Release external control" (p. 3-2190)
SDNC - Status, Data Not Consistent, invalid combination of osinode parameter with dccstat, scn_ dccstat	(SCN specific): Check combination of osinode parameter with scn_dccstat	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SDNC - Status, Data Not Consistent, invalid combination of osinode parameter with dccstat, scn_ dccstat, uni_dccstat, enni_dccstat	(UNI/E-NNI specific): Check combination of osinode parameter with uni_dccstat / enni_dccstat	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SDNC - Status, Data Not Consistent, invalid file or directory	Invalid file or directory name	"CPY-MEM: Copy memory" (p. 3-114)
SDNC - Status, Data Not Consistent, invalid file or directory	Invalid File or Directory Name (SDNC)	"RTRV-HDR: Retrieve header" (p. 3-2417)
SDNC - Status, Data Not Consistent, invalid instance of entity	Invalid Instance (SDNC)	"RTRV-HDR: Retrieve header" (p. 3-2417)
SDNC - Status, Data Not Consistent, invalid instance of profile	pfname does not exist	"DLT-ASAP-PROF: Delete alarm severity assignment profile" (p. 3-134); "ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 3-284)
SDNC - Status, Data Not Consistent, Not allowed on ES64U pack	;	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)

Error code	Meaning (validation rule)	Related to command
`SDNC - Status, Data Not Consistent, Not allowed on ES64U pack`	Path trace not supported on ES64U;	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
`SDNC - Status, Data Not Consistent, Not allowed on ES64U pack`	Trail signal label mismatch monitor not supported on ES64U;	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
`SDNC - Status, Data Not Consistent, Not allowed on GE10PL1 pack`	64 byte path trace setting on GE10PL1 only for first VCG tributary of a VCG	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
`SDNC - Status, Data Not Consistent, Not allowed on GE10PL1 pack`	Path trace monitoring on GE10PL1 only for first VCG tributary of a VCG	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
`SDNC - Status, Data Not Consistent, other port already assigned`	No timing port on protection pack of an MS protected timing port	"SET-SYNCN: Set synchronization" (p. 3-3158)
`SDNC - Status, Data Not Consistent, other port already assigned`	One timing port for a circuit pack	"SET-SYNCN: Set synchronization" (p. 3-3158)
`SDNC - Status, Data Not Consistent, pgid is already used by another protection group of the same type`	unique pgid	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SDNC - Status, Data Not Consistent, port already assigned`	Port is already assigned to another timing reference	"SET-SYNCN: Set synchronization" (p. 3-3158)
`SDNC - Status, Data Not Consistent, port is out-of-service`	Check for service condition	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
`SDNC - Status, Data Not Consistent, port is out-of-service`	No out-of-service state for timing port	"SET-SYNCN: Set synchronization" (p. 3-3158)
`SDNC - Status, Data Not Consistent, profile in use`	ASAP in use	"DLT-ASAP-PROF: Delete alarm severity assignment profile" (p. 3-134)
`SDNC - Status, Data Not Consistent, quality evaluation disabled`	Command rejection if quality evaluation disabled	"SET-SYNCN: Set synchronization" (p. 3-3158)
`SDNC - Status, Data Not Consistent, reference already assigned`	Timing reference already assigned	"SET-SYNCN: Set synchronization" (p. 3-3158)
`SDNC - Status, Data Not Consistent, reference in protection group`	Timing reference from a protection port in a protection group only allowed in asymmetric spans of a ring	"SET-SYNCN: Set synchronization" (p. 3-3158)
`SIPC - E091::Status, Invalid command for protection class MBYNWRK or MBYNPRT`	protectionClass is not allowed	"ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-753)
`SLEM - Status, List Exceeds Maximum UIDs`	Maximum number of uids reached	"ENT-USER-SECU: Enter user security" (p. 3-1970)

Error code	Meaning (validation rule)	Related to command
SNVS - Not in Valid State, DCC needed for BLSR/MS-SPRING	DCC for 2 fiber BLSR/MS-SPRING	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - Not in Valid State, DCC needed for BLSR/MS-SPRING	Protection port for 4 fiber BLSR/MS-SPRING	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - Not in Valid State, DCC needed for BLSR/MS-SPRING	Worker port for 4 fiber BLSR/MS-SPRING	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - Not in Valid State, DCC protection available	Check for DCC Protection	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - Not in Valid State, part of 1+1 MSP protection	DCC Protection	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections are still existing	Setting of portClass to ENNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist	Setting of portClass to ENNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - SNVS - Status, Not in Valid State, LOXC switch capacity invalid	No lower order TransMUX cross-connections when LO switch capacity is lower than 40G	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State	Check for enabled DCC channels	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - Status, Not in Valid State	Check of the maintenance condition	"ACT-L1ROUTING" (p. 3-15); "CANC-L1ROUTING" (p. 3-54); "ED-RSVP: Modify RSVP parameters" (p. 3-857)
SNVS - Status, Not in Valid State	Command denied based on Mode, State or Status (SNVS)	"RTRV-HDR: Retrieve header" (p. 3-2417)
SNVS - Status, Not in Valid State	Deemed source file	"CPY-MEM: Copy memory" (p. 3-114)
SNVS - Status, Not in Valid State	ip_lanstat must be ENABLE for uninode and ennimode	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State	isis_stat must be DISABLE for uninode and ennimode	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State`	lanstat must be ENABLE for uninode and ennimode	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`SNVS - Status, Not in Valid State`	No SW installation during DB backup, DB download or DB restore	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
`SNVS - Status, Not in Valid State`	osi_lanstat must be ENABLE for enninode	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`SNVS - Status, Not in Valid State`	osi_lanstat must be ENABLE for uninode	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`SNVS - Status, Not in Valid State`	Restrictions for conversion to LO path protection	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
`SNVS - Status, Not in Valid State`	Restrictions for LO path protection	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`SNVS - Status, Not in Valid State`	Second APPLY on same software	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
`SNVS - Status, Not in Valid State, Auto-Encapsulation must be switched on`	Auto-encapsulation must be enabled ;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SNVS - Status, Not in Valid State, DCN IP Address is not configured`	dcn_ipad must be configured ;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SNVS - Status, Not in Valid State, Pack is protecting pack`	ESdcn_ipad setting not for card in protection functionality;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SNVS - Status, Not in Valid State, ES64U switch capacity invalid`	ES64U switch capacity and unit roles	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, a cross connect loopback exists`	(ONNS specific): Change the eportClass to UNI	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, a cross connect loopback exists`	Change the portClass to EDGE	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, a cross connect loopback exists`	Change the portClass to ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
`SNVS - Status, Not in Valid State, a cross connect loopback exists`	Change the portClass to INNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, a cross connect loopback exists`	Change the portClass to UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, a cross connect loopback exists`	No XC loopbacks allowed	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
`SNVS - Status, Not in Valid State, a cross-connect loopback exists`	no XC loopbacks for interface type change	"ED-EC1: Edit EC1 port" (p. 3-317); "ED-T3: Edit DS3 port" (p. 3-1202)
`SNVS - Status, Not in Valid State, a loopback is existing`	no loopbacks	"DLT-VCG – Enter virtual concatenation group" (p. 3-277)
`SNVS - Status, Not in Valid State, a loopback is existing`	no loopbacks for interface standard change	"ED-VCG: Edit virtual concatenation group" (p. 3-1354); "ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application" (p. 3-1405)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, a loopback is existing	no loopbacks for istd change	“ED-STM1: Edit STM1 port” (p. 3-915); “ED-STM16: Edit STM16 port” (p. 3-1035); “ED-STM4: Edit STM4 port” (p. 3-975); “ED-STM64: Edit STM64 port” (p. 3-1111)
SNVS - Status, Not in Valid State, a loopback is existing	no loopbacks for istd, trbmd change	“ED-OC12: Edit OC12 port” (p. 3-523); “ED-OC192: Edit OC192 port” (p. 3-663); “ED-OC3: Edit OC3 port” (p. 3-461); “ED-OC48: Edit OC48 port” (p. 3-585)
SNVS - Status, Not in Valid State, a loopback is existing	Not allowed if a member is looped	“ED-VCG: Edit virtual concatenation group” (p. 3-1354)
SNVS - Status, Not in Valid State, a path protection group is existing	no path protection for trbmd change to ADAPTIVE	“ED-OC12: Edit OC12 port” (p. 3-523); “ED-OC192: Edit OC192 port” (p. 3-663); “ED-OC3: Edit OC3 port” (p. 3-461); “ED-OC48: Edit OC48 port” (p. 3-585)
SNVS - Status, Not in Valid State, a protection group is existing	no protection for istd change	“ED-STM1: Edit STM1 port” (p. 3-915); “ED-STM16: Edit STM16 port” (p. 3-1035); “ED-STM4: Edit STM4 port” (p. 3-975); “ED-STM64: Edit STM64 port” (p. 3-1111)
SNVS - Status, Not in Valid State, a protection group is existing	no protection for istd, trbmd change	“ED-OC12: Edit OC12 port” (p. 3-523); “ED-OC192: Edit OC192 port” (p. 3-663); “ED-OC3: Edit OC3 port” (p. 3-461); “ED-OC48: Edit OC48 port” (p. 3-585)
SNVS - Status, Not in Valid State, a protection group is existing	No protection groups allowed	“DLT-EQPT (slot): Delete equipment (slot)” (p. 3-177)
SNVS - Status, Not in Valid State, a test access session exists	(ONNS specific): Change the eportClass to UNI	“ED-VCG: Edit virtual concatenation group” (p. 3-1354)
SNVS - Status, Not in Valid State, a test access session exists	(ONNS specific): Setting of eportClass to EDGE only possible, if no test access session actve	“ED-VCG: Edit virtual concatenation group” (p. 3-1354)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, a test access session exists	Change the portClass to ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, a test access session exists	Change the portClass to UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, a test access session exists	No interface standard change on GE10PL1 pack with existing test access session	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
SNVS - Status, Not in Valid State, a test access session exists	no test access session for interface type change	"ED-EC1: Edit EC1 port" (p. 3-317); "ED-T3: Edit DS3 port" (p. 3-1202)
SNVS - Status, Not in Valid State, a test access session exists	no test access session for istd change	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, a test access session exists	no test access session for istd, trbmd change	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, a test access session exists	Not allowed if involved in test access	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, a test access session exists	Setting of portClass to INNI only possible, if no test access session active	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, a test access session exists	Setting of portClass to INNI or EDGE only possible, if no test access session active	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Active Repeater Mode for this Port does not allow dftvlan to be modified	Default VLAN ID not allowed in repeater mode	"ED-EPORT: Edit Ethernet port" (p. 3-329)
SNVS - Status, Not in Valid State, Active Repeater Mode for this Port does not allow vvidls to be modified	VLAN filtering database not allowed in repeater mode	"ED-EPORT: Edit Ethernet port" (p. 3-329)
SNVS - Status, Not in Valid State, Assigned Node not allowed for IP	Assignmet of OsiNode without IP support	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, Assigned Node not allowed for IP	only osinode1, scnnode, uninode and enninode supports IP	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, association already exists	No association present (when associating)	"SET-OW: Set orderwire and user bytes" (p. 3-3147)
SNVS - Status, Not in Valid State, at least one port of the protection pack is used as timing reference	Not used as timing reference	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, at least one port used as timing reference	Not used as timing reference	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, Auto Encapsulation not enabled	Auto Encapsulation must be enabled	"ENT-MANROUTE-MCN: Enter manual IP route for management communication" (p. 3-1614)
SNVS - Status, Not in Valid State, Auto Encapsulation still in use	Check if Auto Encapsulation is still in use by ES64U pack;	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312)
SNVS - Status, Not in Valid State, Backplane serial number mismatch	Serial number in the database not equal to system backplane serial number	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
SNVS - Status, Not in Valid State, Broadcast with N greater 2 exists	Change the portClass to EDGE	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, can not change portClass must not be UNI	Some Parameter Values not settable for ports of portClass UNI	"ED-STM1E: Edit STM1E port" (p. 3-870)
SNVS - Status, Not in Valid State, can not change servcond for this port class	Check of parameters for ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, can not change servcond for this port class	Check of parameters for UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, can not disable servcond for INNI ports`	servcond must be enabled when portClass = INNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, can not disable servcond for protection ports`	servcond must be enabled for protection ports	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Cannot change servcond for this port class`	Change the portClass away from UNI	"ED-STM1E: Edit STM1E port" (p. 3-870)
`SNVS - Status, Not in Valid State, cannot disable IP on all LAN ports while T-TD or FTTD is enabled`	IP disabling while T-TD or FTTD is enabled	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`SNVS - Status, Not in Valid State, circuit pack is member of an equipment protection group`	ES64U pack already used in other equipment protection group	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, circuit pack is member of an equipment protection group`	TransMUX pack already used in other equipment protection group	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, circuit pack is member of an equipment protection group`	Check whether TransMUX circuit pack is member of an equipment protection group	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SNVS - Status, Not in Valid State, circuit pack is member of an equipment protection group`	Check whether ES64U circuit pack is member of an equipment protection group ;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SNVS - Status, Not in Valid State, circuit pack is member of an equipment protection group`	Check whether LOXC circuit pack is member of an equipment protection group	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, circuit pack is member of an equipment protection group	EPn pack already used in other equipment protection group	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, circuit packs not provisioned	Circuit pack not provisioned	"CONN-TACC: Connect test access" (p. 3-94)
SNVS - Status, Not in Valid State, clear request impossible	Clear wait to restore timer not applicable	"OPR-SYNCNSW: Operate synchronization switch " (p. 3-2077)
SNVS - Status, Not in Valid State, clock of destination XC is in warming-up state, please wait some minutes	Clock not in warming-up status (Switching Protection Group)	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
SNVS - Status, Not in Valid State, Command refers to protection tributaries of a BLSR/ MS-SPRing protection	2 Fiber BLSR/MS-SPRing protection access (Extra Traffic)	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, Command refers to protection tributaries of a BLSR/ MS-SPRing protection	4 Fiber BLSR/MS-SPRing protection access (Extra Traffic)	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, Command refers to protection tributaries of a BLSR/ MS-SPRing protection	BLSR/MS-SPRing protection access (Extra Traffic)	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, Command refers to protection tributaries of a BLSR/ MS-SPRing protection	loca/locz information only retrievable for EXTRA TRAFFIC	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, command supported for MS-SPRing TOPEX only	RTRV-SPANSWS only for TOPEX	"RTRV-SPANSWS: Retrieve SPAN switch state" (p. 3-2830)
SNVS - Status, Not in Valid State, Conflicting OUC already exists	No conflicting OUC must already exist between working and protection tributary	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
SNVS - Status, Not in Valid State, connection to OW port exists	Not used for OW	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
SNVS - Status, Not in Valid State, connection to OW port of the protection pack exists	Not used for OW	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, conversion cross-connections are still existing	Command not allowed while conversion cross-connections exist	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, conversion cross-connections are still existing`	newinaid must not be involved in conversion cross-connections	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
`SNVS - Status, Not in Valid State, conversion cross-connections are still existing`	no conversion cross-connections for interface type change	"ED-EC1: Edit EC1 port" (p. 3-317); "ED-T3: Edit DS3 port" (p. 3-1202)
`SNVS - Status, Not in Valid State, conversion cross-connections are still existing`	No LO cross-connections while conversion cross-connections exist	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`SNVS - Status, Not in Valid State, conversion cross-connections are still existing`	No LO loopback while conversion cross-connections exist	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`SNVS - Status, Not in Valid State, conversion cross-connections are still existing`	Substructure change not allowed while conversion cross-connections exist	"ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-830)
`SNVS - Status, Not in Valid State, conversion cross-connections not allowed with LOXC/1`	No conversion cross-connections with LOXC/1	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`SNVS - Status, Not in Valid State, cross connect loopback exists`	Change the portClass to ENNI	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Cross Connection of xconcls NN exists`	(ONNS specific): TRADITIONAL and NN cross-connections not on the same tributary	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`SNVS - Status, Not in Valid State, Cross-connection involved in Test Access Session`	Cross-connection not involved in Test Access Session	"ED-NNCRS: Edit NN cross-connection" (p. 3-457)
`SNVS - Status, Not in Valid State, Cross-connection must not be of xconcls NN`	Cross-connection must not be of xconcls NN	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "DLT-CRS: Delete cross-connection" (p. 3-145); "ED-CRS: Edit cross-connection" (p. 3-292)
`SNVS - Status, Not in Valid State, Cross-connection not of class NN`	Cross-connection must have xconcls = NN	"ED-NNCRS: Edit NN cross-connection" (p. 3-457)
`SNVS - Status, Not in Valid State, cross-connections are still existing`	crossconnection - interface standard change	"ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application" (p. 3-1405)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, cross-connections are still existing`	No cross-connections allowed	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
`SNVS - Status, Not in Valid State, cross-connections are still existing`	Not allowed if a member is cross-connected	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Cross-connections are still existing`	crossconnection - interface standard change	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, cross-connections or substructure still exist`	No HO/LO cross-connection or LO substructure at protection tribs	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, cross-connections or substructure still exist`	No HO/LO cross-connection or LO substructure at tributaries	"DLT-PROTN-GRP: Delete protection group" (p. 3-233); "ED-PROTN-GRP: Edit protection group" (p. 3-803); "ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, cross-connections still exist`	no cross-connections for interface type change	"ED-EC1: Edit EC1 port" (p. 3-317)
`SNVS - Status, Not in Valid State, cross-connections still existing`	no cross-connections for interface type change	"ED-T3: Edit DS3 port" (p. 3-1202)
`SNVS - Status, Not in Valid State, Cross-connections still existing`	(ONNS specific): Change the eportClass to UNI	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Cross-connections still existing`	Change the portClass to ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, Cross-connections still existing`	Change the portClass to UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Cross-connections still existing`	Check whether ES64U circuit pack is in use;	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SNVS - Status, Not in Valid State, Cross-connections still existing`	Modify of ENNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Cross-connections still existing`	Modify of UNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111); "ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Cross-connections still existing`	no crossconnection	"DLT-VCG – Enter virtual concatenation group" (p. 3-277)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, Cross-connections still existing	no cross-connections for istd change	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Cross-connections still existing	no cross-connections for istd, trbmd change	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, Cross-connections still existing	No modification of trbmd at ports of portClass ENNI with existing cross-connections	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, Cross-connections still existing	No modification of trbmd to ADAPTIVE at ports of portClass EDGE with existing ONNS cross-connections	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, Cross-connections still existing	No modification of trbmd to FIXED at ports of portClass EDGE with existing ONNS cross-connections	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, Cross-connections still existing	Setting of portClass to INNI only possible, if no cross-connection existing	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Database already installed	Second APPLY on previous database	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
SNVS - Status, Not in Valid State, database corrupt or not available	APPLY applied on corrupted database	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, database not compatible`	No DB restore with incompatible database	"COPY-RFILE: Copy remote file" (p. 3-106); "CPY-MEM: Copy memory" (p. 3-114)
`SNVS - Status, Not in Valid State, DCC channel already enabled`	DCC channels enabled	"ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1510)
`SNVS - Status, Not in Valid State, DCC channel can not be assigned to more than one of MCN, SCN, UNI and E-NNI at the same time`	Independent use of DCC channel for MCN, SCN, UNI, or E-NNI	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
`SNVS - Status, Not in Valid State, DCC channel occupied by MSP/APS DCC protection`	DCC protection	"ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1510)
`SNVS - Status, Not in Valid State, DCC channel used in transparent DCC cross-connection`	Transparent DCC cross-connection	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
`SNVS - Status, Not in Valid State, DCC channel used in transparent DCC cross-connection`	Transparent DCC for DCC Line/MS protection mode	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
`SNVS - Status, Not in Valid State, DCC channel used in transparent DCC cross-connection`	Transparent DCC for DCC Sect/RS protection mode	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
`SNVS - Status, Not in Valid State, DCC channels are active for this port`	servcond must be enabled when DCC enabled	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, DCC must not be assigned to ENNINode`	Change the portClass away from ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, DCC must not be assigned to UNINode`	Change the portClass away from UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, DCC not in use for ENNI`	DCC port not used for E-NNI	"DLT-ENNIMANROUTE notification" (p. 3-168); "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1520); "ENT-ENNIMANROUTE notification" (p. 3-1528)
`SNVS - Status, Not in Valid State, DCC on SCN may not be enabled`	Changing of portClass from INNI to TRADITIONAL not possible, if DCC for SCN is enabled on the port	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, dcc protection side carries traffic`	dcc protection: protection side is active	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
`SNVS - Status, Not in Valid State, DCC/LAN channels assigned`	Reject deletion when node is assigned to LAN or DCC	"DLT-ULSDCC-L3: Delete a node ID other than node-1" (p. 3-265)
`SNVS - Status, Not in Valid State, default router LAN port not configured`	check for correct configured Default Router LAN Port	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
`SNVS - Status, Not in Valid State, Different interface standards for input tributaries`	path-protected cross-connection has inputs from ports with same interface standard	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
`SNVS - Status, Not in Valid State, Different interface standards for input tributaries`	path-protected cross-connection has inputs from ports with same interface standards	"ENT-CRS: Enter cross-connection" (p. 3-1464)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, Different interface standards for working and protection tributaries`	Tributaries must belong to ports of equal interface standards	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
`SNVS - Status, Not in Valid State, DS3 path PM not allowed with Unframed Clear-Channel`	DS3 path PM not allowed with unframed clear-channel	"ED-T3: Edit DS3 port" (p. 3-1202)
`SNVS - Status, Not in Valid State, DS3AIS or IDLE not allowed with Unframed Clear-Channel`	DS3AIS or IDLE not allowed with unframed clear-channel	"ED-T3: Edit DS3 port" (p. 3-1202)
`SNVS - Status, Not in Valid State, Duplex Control Recovery in progress`	No DB activation during Duplex Control Recovery	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
`SNVS - Status, Not in Valid State, EDGE port carrying EDGE-prt must not be in LOCKOUT`	Affected EDGE port the EDGE-prt tributary is located on must not be in LOCKOUT state	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
`SNVS - Status, Not in Valid State, EDGE ports must not be in line or equipment protection schemes`	Affected EDGE ports must not be in a line or equipment protection scheme	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
`SNVS - Status, Not in Valid State, ENNI node must exist`	Setting of TNA information only if ENNI Node exists	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, ENNI Node not created`	(UNI/E-NNI specific): ENNI node must be created	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
`SNVS - Status, Not in Valid State, ENNI Node not created`	ENNI node must be created	"ED-RSVP: Modify RSVP parameters" (p. 3-857)
`SNVS - Status, Not in Valid State, E-NNI Node not created`	(UNI/E-NNI specific): E-NNI Node must be created	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
`SNVS - Status, Not in Valid State, E-NNI Node not created`	ENNI node must be created	"RTRV-RSVP: Retrieve RSVP parameters" (p. 3-2823)
`SNVS - Status, Not in Valid State, E-NNI Node not created`	E-NNI Node must be created	"RTRV-ENNIMANROUTE: Retrieve all manual routes of the E-NNI node" (p. 3-2348)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, ES64U destination not usable	No forced switch to unusable ES64U pack (ES64U Protection Group);	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
SNVS - Status, Not in Valid State, extra traffic cross-connections are still existing	No cross-connections allowed when leaving TOPEX	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, Facility Loopback is active for this port	servcond must be disabled for facility loopback	"ED-EC1: Edit EC1 port" (p. 3-317); "ED-EPORT: Edit Ethernet port" (p. 3-329); "ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-OC48T: Edit OC48 transparent port" (p. 3-648); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM16T: Edit STM16T port" (p. 3-1097); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111); "ED-T3: Edit DS3 port" (p. 3-1202)
SNVS - Status, Not in Valid State, Facility loopback with different type exists at neighbor port	Inconsistent facility loopback types on port pairs	"OPR-LPBK: Operate facility loopback" (p. 3-2044)
SNVS - Status, Not in Valid State, facility loopbacks still exist	No facility loopbacks allowed	"DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
SNVS - Status, Not in Valid State, facility loopbacks still exist	No facility loopbacks for interface type change	"ED-EC1: Edit EC1 port" (p. 3-317); "ED-T3: Edit DS3 port" (p. 3-1202)
SNVS - Status, Not in Valid State, facility loopbacks still exist at the protection pack	No facility loopbacks allowed	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, given TNA already exists	TNA parameters on VCAT layer already assigned on SDH/SONET layer;	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, given TNA already exists	TNA parameters on VCAT layer already assigned to other UNI or EDGE port	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, given TNA already exists	TNA parameters on VCAT layer already assinged to other VCG port	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, given TNA already exists	Uniqueness of TNA parameters on VCAT layer per UNI VCG	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, HO cross-connection exists`	LO cross-connections not at HO tributaries used in HO cross-connections	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`SNVS - Status, Not in Valid State, HO cross-connection exists`	LO Substructure creation not allowed on already cross- connected tributaries	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
`SNVS - Status, Not in Valid State, HO cross-connection exists`	LO TACC sessions not at HO tributaries used in HO cross-connection	"CONN-TACC: Connect test access" (p. 3-94)
`SNVS - Status, Not in Valid State, HO or LO cross-connections still exist`	Check whether TransMUX circuit pack is in use	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SNVS - Status, Not in Valid State, HO or LO cross-connections still exist`	Check whether TransMUX pack is in use	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177)
`SNVS - Status, Not in Valid State, HO tributary already substructured`	LO Substructure creation not allowed on already substructured tributaries	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
`SNVS - Status, Not in Valid State, illegal local node identifier`	Illegal local node ID	"ED-MAP-RING: Edit map ring" (p. 3-436)
`SNVS - Status, Not in Valid State, implicit channel re-assignment`	Implicit status change of dccstat, scn_dccstat, uni_dccstat, or enni_dccstat	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
`SNVS - Status, Not in Valid State, incompatibility istddflt and trbmddflt`	compatibility istddflt and trbmddflt	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
`SNVS - Status, Not in Valid State, incomplete IP configuration`	check for correct IP configuration	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
`SNVS - Status, Not in Valid State, incomplete IP configuration`	Check for correct IP configuration	"ED-NE: Edit NE" (p. 3-442); "ENT-IP-MAP: Enter TCP/IP map" (p. 3-1594)
`SNVS - Status, Not in Valid State, incomplete IP configuration`	Check for IP configuration of LAN1;	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312)
`SNVS - Status, Not in Valid State, incomplete IP configuration`	Check IP configuration	"ACT-L1ROUTING" (p. 3-15)
`SNVS - Status, Not in Valid State, incomplete IP configuration`	Compatibility xcsetup and IP configuration for SCN	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
`SNVS - Status, Not in Valid State, Inconsistent Input Tributary Mode`	Inconsistent Tributary Mode of Ingress Port	"ENT-CONN: Establish network connections with TNA address parameters" (p. 3-1455)
`SNVS - Status, Not in Valid State, Input tributary shared with other path protection group`	SNC Type change on higher order path protection groups sharing input tributaries	"ED-PROTN-GRP: Edit protection group" (p. 3-803)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, Interfering cross-connection existing on protection tributary`	No interfering cross-connection or OUC must exist on protection tributary	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
`SNVS - Status, Not in Valid State, invalid IP configuration`	Check IP configuration	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`SNVS - Status, Not in Valid State, invalid test access mode`	Invalid test access mode change request	"CHG-ACCMD: Change access mode" (p. 3-65)
`SNVS - Status, Not in Valid State, invalid test access mode`	Underlying cross connection belongs to BLSR/MS-SPRing	"CHG-ACCMD: Change access mode" (p. 3-65)
`SNVS - Status, Not in Valid State, invalid test access mode`	Underlying cross connection is not two-way	"CHG-ACCMD: Change access mode" (p. 3-65)
`SNVS - Status, Not in Valid State, Invalid topology`	Valid topology	"DLT-CRS: Delete cross-connection" (p. 3-145)
`SNVS - Status, Not in Valid State, IP communication not enabled for LAN port`	IP communication must be enabled for LAN port	"ENT-MANROUTE-MCN: Enter manual IP route for management communication" (p. 3-1614)
`SNVS - Status, Not in Valid State, J0 parameters can not be set for INNI ports`	Some Parameters not settable for ports of portClass = INNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, l3radesnode not in created stat`	l3radesnode must be in the created state	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312)
`SNVS - Status, Not in Valid State, l3radesnode not in created state`	l3radesnode must be in the created state	"ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951)
`SNVS - Status, Not in Valid State, LAN is in use for Default Router`	IP disabling while used as IP Default Router LAN	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`SNVS - Status, Not in Valid State, LAN port not in use for ENNI`	LAN port not used for E-NNI	"DLT-ENNIMANROUTE notification" (p. 3-168); "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1520); "ENT-ENNIMANROUTE notification" (p. 3-1528)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, LAN port not in use for UNI`	LAN port not used for UNI	"DLT-MANROUTE-LAN: Delete manual route at LAN port" (p. 3-203); "ENT-MANROUTE-LAN: Enter manual route at LAN port" (p. 3-1610); "RTRV-MANROUTE-LAN: Retrieve manual route at LAN port" (p. 3-2516)
`SNVS - Status, Not in Valid State, LAN1 can not be disabled`	Can't disable LAN1	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`SNVS - Status, Not in Valid State, LO cross-connections or substructure still exist`	No conversion-cross-connections while LO cross-connections or LO substructure exist	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`SNVS - Status, Not in Valid State, LO cross-connections or substructure still exist`	No HO loopback while LO cross-connection, substructure or conversion cross-connection exists	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`	Check whether LOXC circuit pack is in use	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`	Check whether LOXC pack is in use	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177)
`SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`	No HO cross-connections while LO cross-connections or LO substructure exist	"ENT-CRS: Enter cross-connection" (p. 3-1464)
`SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`	No HO cross-connections while LO cross-connections, substructure or conversion cross-connections exist	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
`SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`	No HO loopback while conversion cross-connection exists	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`	No HO TACC sessions while LO cross-connection, substructure or conversion cross-connection exists	"CONN-TACC: Connect test access" (p. 3-94)
`SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`	No HO/LO cross-connections, conversion cross-connections or substructure allowed	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist	No lower order cross-connections, conversion cross-connections, loopbacks or substructure allowed	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist	No lower order cross-connections, conversion cross-connections, loopbacks or substructure for istd change	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist	No lower order cross-connections, conversion cross-connections, loopbacks or substructure for istd, trbmd change	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist	Setting of portClass to INNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist	Setting of portClass to UNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist	Setting of portClass to UNI only possible, if no LO cross-connection, substructure, or conversion cross-connections exist	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, loopback does not exist	Loopback must exist	"RLS-LPBK: Release loopback (facility)" (p. 3-2198); "RLS-LPBK: Release loopback (cross-connection)" (p. 3-2195)
SNVS - Status, Not in Valid State, lower order cross-connect loopbacks are still existing	Substructure deletion not allowed with LO cross-connect loopbacks existing	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, lower order cross-connections are still existing	Substructure change not allowed with LO cross-connections at input tributaries	"ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-830)
SNVS - Status, Not in Valid State, lower order cross-connections are still existing	Substructure change not allowed with LO cross-connections at output tributaries	"ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-830)
SNVS - Status, Not in Valid State, lower order cross-connections are still existing	Substructure deletion not allowed with LO cross-connections existing	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
SNVS - Status, Not in Valid State, lower order test access sessions are still existing	Substructure deletion not allowed with LO test access sessions existing	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
SNVS - Status, Not in Valid State, low-order crossconnection loopbacks not allowed with LOXC/1	No low-order crossconnection loopbacks with LOXC/1	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
SNVS - Status, Not in Valid State, low-order test-access sessions not allowed with LOXC/1	No low-order TACC sessions with LOXC/1	"CONN-TACC: Connect test access" (p. 3-94)
SNVS - Status, Not in Valid State, low-order transmission entities present	protection unit is active and LO transmission entities	"DLT-PROTN-GRP: Delete protection group" (p. 3-233)
SNVS - Status, Not in Valid State, LOXC destination not usable	No forced switch to unusable LOXC slot (LOXC Protection Group)	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
SNVS - Status, Not in Valid State, LOXC switch capacity invalid	LOXC pack with more than 0G switch capacity	"CONN-TACC: Connect test access" (p. 3-94); "ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191); "ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, LOXC switch capacity invalid	LOXC pack with more than 0G switch capacity for conversion cross-connections	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, LOXC switch capacity invalid	LOXC switch capacity and unit roles	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, LOXC switch capacity invalid	No low-order loopbacks with LOXC cap. equal 0	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
SNVS - Status, Not in Valid State, Manual MCN routes still exist	Assignment to SCN/UNI/ENNI Node while manual MCN routes exist;	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, Manual MCN routes still exist	Check if manual MCN routes exist;	"ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, Manual MCN routes still exist	IP disabling while manual MCN routes exist;	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, Manual routes exist	(UNI/E-NNI specific): Can't disable DCC if associated node has manual routes via this DCC	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - Status, Not in Valid State, Manual routes exist	Can't de-assign LAN from a node if manual routes exist	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, Manual Switch for Protection Type 1+1_Optimized not allowed	MSP type 1+1_optimized does not allow manual switch commands	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
SNVS - Status, Not in Valid State, Manual Switch to Worker for Protection Type 1x1 not allowed	MSP type 1:1 does not allow manual switch requests to worker	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
SNVS - Status, Not in Valid State, Modification not allowed	No modification of rptmode if vlantagmd = 802.1TAG	"ED-EPORT: Edit Ethernet port" (p. 3-329)
SNVS - Status, Not in Valid State, Modification not allowed in Backward Compatible Mode	Parameter modification not allowed in backward compatible mode	"ED-EPORT: Edit Ethernet port" (p. 3-329); "ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, Modification of flow control mode not allowed	No Modification of fcmd if vlantagmd = 802.1TAG	"ED-EPORT: Edit Ethernet port" (p. 3-329)
SNVS - Status, Not in Valid State, multiple added XCs for MS-SPRing TOP	no multiple added XCs for MS-SPRing TOP	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, multiple added XCs for MS-SPRing TOP	No multiple added XCs for MS-SPRing TOP	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, multiple added XCs for MS-SPRing TOP	no multiple added XCs for TOP	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, ndetmd must not be AUTO	Some parameters not settable for ports of ndetmd AUTO	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, new Tributary has existing loopback	No cross-connection loopback existing	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing	(ONNS specific): Modify of TNA parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing	(ONNS specific): Modify of TNA parameters on VCAT layer	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing	Modify of EDGE parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, no dcc channel enabled	dcc enabled	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, no dcc channel enabled	dcc enabled on protection port	"ED-PROTN-GRP: Edit protection group" (p. 3-803); "ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, no dcc channel with mode UITS enabled	dcc enabled on worker port	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, no matching log entry	matching log entry	"RTRV-LOG-NTFCN: Retrieve notification log" (p. 3-2464); "RTRV-LOG-PROTNSW: Retrieve log protection switch" (p. 3-2468)
SNVS - Status, Not in Valid State, No matching NN cross-connection existing on working tributary	NN connection of matching directionality must exist on working tributary	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
SNVS - Status, Not in Valid State, no other LAN port with IP enabled for T-TD or FTTD available	Can't assign LAN to SCN Node when T-TD or FTTD is enabled and no other LAN port with IP configuration is available	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, no other LAN port with IP enabled for T-TD or FTTD available	Can't assign LAN to UNI Node or E-NNI Node when T-TD or FTTD is enabled and no other LAN port with IP configuration is available	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, No restore (RFR) with ES64U pack	No DB restore with ES64U pack;	"COPY-RFILE: Copy remote file" (p. 3-106)
SNVS - Status, Not in Valid State, No restore with ES64U pack	No DB restore with ES64U Pack	"CPY-MEM: Copy memory" (p. 3-114)
SNVS - Status, Not in Valid State, no SCN IP address provisioned	(SCN specific): Check for provisioned SCN IP address	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - Status, Not in Valid State, no SCN IP address provisioned	Can't assign LAN to scnnode when no ASTN IP address is provisioned	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, no SCN IP address provisioned	Can't assign LAN to uninode or enninode when no ASTN IP address is provisioned	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, no SCN IP address provisioned	Can't assign LAN to uninode when no ASTN and UNI IP address is provisioned	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, no SCN/ENNI IP address provisioned	Can't assign LAN to enninode when no ASTN and E-NNI IP address is provisioned	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, no SwiSS capable HW	Compatibility xcsetup and HW configuration	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
SNVS - Status, Not in Valid State, no test access session on the test tributary	No test access session on the test tributary	"CHG-ACCMD: Change access mode" (p. 3-65); "DISC-TACC: Disconnect test access" (p. 3-129)
SNVS - Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters	Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries	Removing of entries from srlgList not allowed if reservations wrt. M:N protecting connections exist	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, no XCs allowed for change of iNNI parameters	Check of INNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, no XCs allowed for removing of srlgList entries	Removing of entries from srlgList not allowed if NN cross-connections exist	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, node in use as RA destination node	Reject deletion when node is used as RA destination node by OSI node 1	"DLT-ULSDCC-L3: Delete a node ID other than node-1" (p. 3-265)
SNVS - Status, Not in Valid State, node not in idle state	Idle ring node for protocol conversion	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, Not allowed for 1 GE interfaces	Not allowed for 1 GE interfaces	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, Not allowed for SDH interface standard	Not allowed for SDH	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, Not allowed if VCAT disabled	Enabling of inmbs and outmbs not allowed while vcat disabled	"ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
SNVS - Status, Not in Valid State, Not allowed if VCAT disabled	Not allowed if virtual concatenation mode disabled	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, not in Maintenance Condition	Check of Maintenance Condition	"SET-SID: Set SID" (p. 3-3154)
SNVS - Status, Not in Valid State, not in Maintenance Condition	check of the maintenance condition	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
SNVS - Status, Not in Valid State, not in Maintenance Condition	Check whether system is in maintenance condition	"DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188); "ED-EC1: Edit EC1 port" (p. 3-317); "ED-EQPT (socket): Edit equipment" (p. 3-379); "ED-T3: Edit DS3 port" (p. 3-1202)
SNVS - Status, Not in Valid State, not in Maintenance Condition	Check whether system is maintenance condition	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "ED-EQPT (slot): Edit equipment (slot)" (p. 3-370); "ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1547); "ENT-EQPT (socket): Enter equipment (socket)" (p. 3-1557)
SNVS - Status, Not in Valid State, not in Maintenance Condition	Command denied based on Maintenance Condition (SNVS)	"RTRV-HDR: Retrieve header" (p. 3-2417)
SNVS - Status, Not in Valid State, Not in maintenance condition	check of the maintenance condition	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
SNVS - Status, Not in Valid State, Not in maintenance condition	check of the maintenance condition for SC IP address and/or SC ID change.	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
SNVS - Status, Not in Valid State, Not in maintenance condition	check of the maintenance condition for UNI IP address change	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
SNVS - Status, Not in Valid State, Not in Maintenance Condition	check of the maintenance condition	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
SNVS - Status, Not in Valid State, NVM contains DB for not existing ES64U packs	NVM contains DB for NOT existing ES64U pack;	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, NVM contains no DB for existing ES64U packs	NVM NOT contains DB for existing ES64U packs;	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
SNVS - Status, Not in Valid State, NVM size not sufficient	Compatibility xcsetup and NVM size	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
SNVS - Status, Not in Valid State, one port of protection unit is assigned as timing reference	Working port to be added is assigned as timing reference	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, only allowed for EDGE port in lockout sate	No modification of trbmd at ports of portClass EDGEwhile portControl is not LOCKOUT	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, only allowed for EDGE port in lockout state	(ONNS specific): Modify of TNA parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, only allowed for EDGE port in lockout state	(ONNS specific): Modify of TNA parameters on VCAT layer	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, only allowed for EDGE port in lockout state	Modify of EDGE parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, only allowed for ENNI port in lockout state	Modify of ENNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, only allowed for ENNI port in lockout state`	No modification of trbmd at ports of portClass ENNI while portControl is not LOCKOUT	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
`SNVS - Status, Not in Valid State, only allowed for INNI port in lockout state`	Setting of INNI properties only possible if portControl is LOCKOUT	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, only allowed for UNI port in lockout state`	Modify of UNI parameters	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, ONNS is active`	Deletion of XC circuit packs while ONNS is active	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177)
`SNVS - Status, Not in Valid State, ONNS is active`	SW installation in trial phase while ONNS is active	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
`SNVS - Status, Not in Valid State, Optical Channel must be enabled`	Enabling of FEC only while Optical Channel is enabled	"ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Optical Channel must be enabled`	IDNV - Input, Data Not Valid, Parameter not supported	"ED-OC192: Edit OC192 port" (p. 3-663)
`SNVS - Status, Not in Valid State, optical wavelength is not provisioned`	Output can only be enabled when wavelength is provisioned	"ED-OTU2: Edit OTU2 port" (p. 3-730)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, osinode not in created state	osinode must be in the created state	"DLT-ULSDCC-L3: Delete a node ID other than node-1" (p. 3-265); "ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack" (p. 3-1312)
SNVS - Status, Not in Valid State, other port of protection unit is assigned to a line timing reference	no timing reference on other port of protection unit	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, OUC to different protection tributary already exists	No OUC must already exist on working tributary to different protection tributary	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
SNVS - Status, Not in Valid State, Output is already crossconnected	Output not in use	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, parameter required	Parameter sc or dest is missing	"OPR-SYNCNSW: Operate synchronization switch " (p. 3-2077)
SNVS - Status, Not in Valid State, Parameter value for SNC Type not compliant to interface standard of working and protection tributaries	SNC Type must comply with interface standard of affected EDGE ports	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
SNVS - Status, Not in Valid State, Parameter(s) present which are not allowed	Only those parameter present which are needed	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, P-bit parity violation monitoring not allowed with Unframed Clear-Channel	P-bit parity violation monitoring not allowed with unframed clear-channel	"ED-T3: Edit DS3 port" (p. 3-1202)
SNVS - Status, Not in Valid State, Port Class must be TRADITIONAL	(ONNS specific): Change the portClass away from EDGE	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, Port Class must not be EDGE or INNI	(ONNS specific): Restrict number of crossconnection using same input tributary on EDGE port	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, port is already used in another protection group	port in one group	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, Port is not out-of-service	Port is out-of-service	"OPR-LPBK: Operate facility loopback" (p. 3-2044)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, port is out of service`	Change the portClass to ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, port is out of service`	Change the portClass to UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, port is out of service`	Setting of portClass to INNI only possible, if service condition not OUTOFSERVICE	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Port is still in use`	Change the eportClass away from UNI	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Port is still in use`	Change the portClass away from ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, Port is still in use	Change the portClass away from UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Port is still in use	Setting of portClass away from INNI only possible, if the port is not in use	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Port is still in use	Setting of portClass away from INNI only possible, if the port is not in use by M:N reservation	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Port is still in use	Setting of portClass from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, Port is still in use by ONNS`	Check if related port are not in use by ONNS	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177)
`SNVS - Status, Not in Valid State, Port is still in use by ONNS`	Check if related ports are not in use by ONNS	"DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
`SNVS - Status, Not in Valid State, Port is still in use by ONNS`	No port on protection pack in portClass EDGE	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, Port is still in use by ONNS`	No port on protection pack in portClass UNI	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, port mode change not allowed for INNI ports`	Port Mode not settable for ports of portClass = INNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Port must be in LOCKOUT mode`	(ONNS specific): Change the eportClass away from EDGE	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Port must be in LOCKOUT mode`	Change the eportClass away from UNI;	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Port must be in LOCKOUT mode`	Change the portClass away from EDGE	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, Port must be in LOCKOUT mode	Change the portClass away from ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Port must be in LOCKOUT mode	Change the portClass away from INNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Port must be in LOCKOUT mode	Change the portClass away from UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, Port must be in LOCKOUT mode	Modify of UNI parameters	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, Port must not be a 1:1 protection port	Change the portClass to UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, Port must not be a 1:1 protection port`	Setting of portClass from TRADITIONAL to EDGE	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Port must not be a 1+1 protection port`	Change the portClass to ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
`SNVS - Status, Not in Valid State, Port must not be a 1+1 protection port`	Change the portClass to UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Port must not be a 1+1 protection port`	Setting of portClass from TRADITIONAL to EDGE	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Port must not be a 4f-BLSR protection port`	Setting of portClass from TRADITIONAL to EDGE	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, Port must not be a member of a 1:1 protection group`	Change the portClass to ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Port must not be a member of a BLSR/MS-SPRing protection group`	Change the portClass away from UNI	"ED-STM1E: Edit STM1E port" (p. 3-870)
`SNVS - Status, Not in Valid State, Port must not be member of a protection group`	Setting of portClass to INNI not possible for ports in Protection Groups	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, Port must not be of portClass ENNI`	No loopbacks on tributaries below ports of portClass ENNI	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`SNVS - Status, Not in Valid State, Port must not be of portClass INNI`	No loopbacks on ports of portClass INNI	"OPR-LPBK: Operate facility loopback" (p. 3-2044)
`SNVS - Status, Not in Valid State, Port must not be of portClass INNI`	No loopbacks on tributaries below ports of portClass INNI	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`SNVS - Status, Not in Valid State, Port must not be of portClass UNI`	No loopbacks on ports of portClass UNI	"OPR-LPBK: Operate facility loopback" (p. 3-2044)
`SNVS - Status, Not in Valid State, Port must not be of portClass UNI`	No loopbacks on tributaries below ports of portClass UNI	"OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`SNVS - Status, Not in Valid State, port not in use for ENNI`	Port not used for ENNI	"DLT-ENNIMANROUTE: Delete manual route from the E-NNI node" (p. 3-164)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, port numbers cannot be changed when T-TD is enabled`	no TCP port number change with enabled T-TD function	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
`SNVS - Status, Not in Valid State, port rate not supported for this protection type`	supported port rate	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, port used for Linear MSP`	Port used for Linear MSP	"CONN-TACC: Connect test access" (p. 3-94)
`SNVS - Status, Not in Valid State, port used for MS-SPRing/ BLSR`	Port used for MS-SPRing/BLSR	"CONN-TACC: Connect test access" (p. 3-94)
`SNVS - Status, Not in Valid State, port used for NN application`	Port used for ONNS application	"CONN-TACC: Connect test access" (p. 3-94)
`SNVS - Status, Not in Valid State, port(s) for OUC in adaptive mode`	Tributaries must not belong to ports of tributary mode ADAPTIVE	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
`SNVS - Status, Not in Valid State, portClass may not be EDGE`	no EDGE protection port for 1:1 MSP	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, portClass may not be EDGE`	no EDGE protection port for 1+1 MSP	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, portClass may not be UNI`	no UNI protection port for 1:1 MSP	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, portClass may not be UNI`	no UNI protection port for 1+1 MSP	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, portClass must not be EDGE for TOP`	supported portClass for TOP	"ED-PROTN-GRP: Edit protection group" (p. 3-803); "ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, portClass must not be ENNI`	Some parameter values not settable for ports of portClass ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, portClass must not be INNI`	(ONNS specific): hptimmon changes to ENABLE only allowed when corresponding port is not of portClass INNI	"ED-STS1: Edit STS1 tributary" (p. 3-1177); "ED-VC3: Edit VC3 tributary" (p. 3-1339)
`SNVS - Status, Not in Valid State, portClass must not be INNI`	No port in portClass INNI	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, portClass must not be INNI`	portClass not INNI	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
`SNVS - Status, Not in Valid State, portClass must not be INNI`	Some parameters not settable for ports of portClass = INNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, portClass must not be INNI`	supported portClass	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, portClass must not be UNI`	Some parameter values not settable for ports of portClass UNI	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, portClass must not be UNI`	Some parameters not settable for ports of portClass = UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
`SNVS - Status, Not in Valid State, portClass must not be UNI`	supported portClass	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, portClass of protection port must not be EDGE`	supported portClass	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, ports have different interface types`	common interface standard	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
`SNVS - Status, Not in Valid State, ports have different interface types`	common interface type	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, ports have different port rates`	common port rate	"ED-PROTN-GRP: Edit protection group" (p. 3-803); "ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, ports must be on different circuit packs`	port on different packs	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, ports must be on different circuit packs	port on same pack	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, protection dcc channel is enabled	dcc protection side is enabled	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, protection group still exist	No protection groups allowed	"DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
SNVS - Status, Not in Valid State, protection port is assigned as timing reference	Timing Reference Assigned on Protection Unit	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
SNVS - Status, Not in Valid State, protection port is assigned to a line timing reference	no timing reference on protection port	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, protection port is assigned to a line timing reference	Timing reference on protection port only allowed in asymmetric spans of a ring	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, protection port is out-of-service	no out-of-service state on protection port	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, Protection switch with current combination of circuit pack types is traffic affecting	No manual protection switch if the switchover leads to traffic impairments	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
SNVS - Status, Not in Valid State, protection unit is active	protection unit is active and transmission entities exist	"DLT-PROTN-GRP: Delete protection group" (p. 3-233)
SNVS - Status, Not in Valid State, RC neighbor still exists	Neighboring routing controller still exists	"CANC-L1ROUTING" (p. 3-54)
SNVS - Status, Not in Valid State, reference unavailable	Reference switching during lockout or disabled state	"OPR-SYNCNSW: Operate synchronization switch " (p. 3-2077)
SNVS - Status, Not in Valid State, request not practicable	Forced or manual switch request while reference is in forced state	"OPR-SYNCNSW: Operate synchronization switch " (p. 3-2077)
SNVS - Status, Not in Valid State, request not practicable	No change of the request state, request not practicable	"OPR-SYNCNSW: Operate synchronization switch " (p. 3-2077)
SNVS - Status, Not in Valid State, resources in use by SwiSS	Setting xcsetup back to TRADITIONAL	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
SNVS - Status, Not in Valid State, ring circuit map discovery not yet completed	Invalid ring map	"RTRV-CKT: Retrieve circuit" (p. 3-2274)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, Roll of low-order cross-connections not allowed with LOXC/ 1	No Rolling of low-order cross-connections with LOXC/1	"ENT-ROLL: Enter roll" (p. 3-1796)
SNVS - Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port	inputsig consistent with existing cross-connections	"ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port	inputsig consistent with existing cross-connections for fixed tributary mode	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)

SNVS - Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port	unequiposig consistent with existing cross-connections for fixed tributary mode	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585)
SNVS - Status, Not in Valid State, socket is not provisioned	Socket must already be provisioned	"ED-EQPT (socket): Edit equipment" (p. 3-379)
SNVS - Status, Not in Valid State, socket is not provisioned	Socket must be provisioned	"DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
SNVS - Status, Not in Valid State, Software generic corrupt or not available	APPLY applied on corrupted software	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
SNVS - Status, Not in Valid State, SONET port not allowed for TOP	SDH ports for TOP	"ED-PROTN-GRP: Edit protection group" (p. 3-803); "ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, static VLAN configuration not cleared	Check whether VLAN lists are empty	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
SNVS - Status, Not in Valid State, SW generic is in trial phase	Compatibility xcsetup and software state	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, SW generic is in trial phase	No SW download, DB download or DB restore during trial phase	"CPY-MEM: Copy memory" (p. 3-114)
SNVS - Status, Not in Valid State, SW generic is in trial phase	No SW download, DB download, or DB restore during trial phase	"COPY-RFILE: Copy remote file" (p. 3-106)
SNVS - Status, Not in Valid State, SwiSS access possible	(ONNS specific): No interface standard change when in use by ONNS	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, SwiSS access possible	No ONNS for interface standard change	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, SwiSS access possible	No ONNS for interface standard change on GE10PL1 pack	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
SNVS - Status, Not in Valid State, SwiSS not enabled	(SCN specific): Check whether ONNS is enabled	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SNVS - Status, Not in Valid State, SwiSS not enabled	Do not accept ONNS TL1 commands when xcsetup = TRADITIONAL	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
SNVS - Status, Not in Valid State, SwiSS not enabled	Do not accept setting portclassdflt to EDGE when xcsetup = TRADITIONAL	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
SNVS - Status, Not in Valid State, SwiSS not enabled	Modification of SCN related parameters only while ONNS is enabled	"ED-NE: Edit NE" (p. 3-442)
SNVS - Status, Not in Valid State, SwiSS not enabled	portClass only settable when xcsetup = SWISS	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, switch back to previous software only allowed in trial phase	Switch back to previous SW only during trial phase	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, switch capacity below provisioned XC CP switch capacity`	Maximum switch capacity according XC CP	"ED-EQPT (system): Edit equipment (system)" (p. 3-391)
`SNVS - Status, Not in Valid State, switch command not allowed for actual protection state`	allowed switch command in that state	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
`SNVS - Status, Not in Valid State, system initializing`	System Initializing not completed (SNVS)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`SNVS - Status, Not in Valid State, target Port Class must be TRADITIONAL`	Change the eportClass away from UNI	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, target Port Class must be TRADITIONAL`	Change the portClass away from EDGE	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, target Port Class must be TRADITIONAL`	Change the portClass away from ENNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, target Port Class must be TRADITIONAL`	Change the portClass away from INNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, target Port Class must be TRADITIONAL	Change the portClass away from UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, TARP not enabled	Check for correct TARP configuration	"ED-NE: Edit NE" (p. 3-442)
SNVS - Status, Not in Valid State, TARP origination function disabled	TARP data cache change only if TARP origination enabled	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
SNVS - Status, Not in Valid State, TCA profile assigned	deleting assigned profile	"DLT-TCA-PROF: Delete TCA profile" (p. 3-259)
SNVS - Status, Not in Valid State, Test Access not allowed with path protected tributaries	Not allowed for path protected tributaries;	"CONN-TACC: Connect test access" (p. 3-94)
SNVS - Status, Not in Valid State, test access session exists	no test access session for istd change	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
SNVS - Status, Not in Valid State, the CP is not plugged out	CP must be plugged out	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177)
SNVS - Status, Not in Valid State, the module is not plugged out	Exchangeability II: Invalid module plugged in	"ED-EQPT (socket): Edit equipment" (p. 3-379)
SNVS - Status, Not in Valid State, the module is not plugged out	Module must be plugged out	"ENT-EQPT (socket): Enter equipment (socket)" (p. 3-1557)
SNVS - Status, Not in Valid State, the Module is not plugged out	module must be plugged out	"DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
SNVS - Status, Not in Valid State, TID inconsistent with existing cross-connection	TIDs consistent with existing cross-connection	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, timing clock mode inconsistent	Timing clock mode inconsistent	"SET-SYNCN: Set synchronization" (p. 3-3158)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, Timing reference is assigned to this port	servcond must be enabled when timing source	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM1E: Edit STM1E port" (p. 3-870); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
SNVS - Status, Not in Valid State, TMUX destination not usable	No forced switch to unusable TransMUX pack (TransMUX Protection Group);	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
SNVS - Status, Not in Valid State, TMUX switch capacity invalid	TransMUX switch capacity and unit roles	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, Too many crossconnection originating from same tributary	(ONNS specific): Restrict number of crossconnection using same input tributary on EDGE port	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, Too many crossconnection originating from same tributary	Restrict number of cross-connection using same input tributary	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, Too many cross-connection originating from same tributary	Restrict number of cross-connection using same input tributary	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, Transparent DCC connections are existing at protection pack	Transparent DCC connections	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, transparent DCC connections are still existing	No transparent DCC connections	"DLT-EQPT (slot): Delete equipment (slot)" (p. 3-177); "DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
SNVS - Status, Not in Valid State, Trial to change loopback type	No change of loopback allowed	"OPR-LPBK: Operate facility loopback" (p. 3-2044)
SNVS - Status, Not in Valid State, trib of 1x1 protection port as input-trib in pathprotected crossconnection	No trib of any MSP 1x1 protection port as in_aid for HO pathprotected cross-connection	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, trib of 1x1 protection port as input-trib in pathprotected cross-connection	No trib of any MSP 1x1 protection port as newinaid for HO pathprotected cross-connection;	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, trib of MSP 1+1/1x1 port as input-trib in pathprotected LO crossconnection	No input tributary of LO pathprotected cross-connection on the worker port	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, trib of MSP 1+1/1x1 port as input-trib in pathprotected LO crossconnection	No trib of any MSP port as in_aid for LO path-protected cross-connection	"ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, trib of MSP 1+1/1x1 port as input-trib in pathprotected LO cross-connection	No trib of any MSP port as newinaid for LO pathprotected cross-connection;	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, Tributaries must be on ports of portClass EDGE	Tributaries must belong to ports of portClass EDGE	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
SNVS - Status, Not in Valid State, Tributaries must not be on ports of portClass ENNI	(ONNS specific): LO Tributaries must not belong to ports of portClass ENNI	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, Tributaries must not be on ports of portClass ENNI	(ONNS specific): Tributaries must not belong to ports of portClass ENNI	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, Tributaries must not be on ports of portClass INNI	(ONNS specific): Tributaries must not belong to ports of portClass INNI	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, Tributaries must not be on ports of portClass UNI	(ONNS specific): LO Tributaries must not belong to ports of portClass UNI	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, Tributaries must not be on ports of portClass UNI	(ONNS specific): Tributaries must not belong to ports of portClass UNI	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1464)
SNVS - Status, Not in Valid State, tributaries used in test access session	Tributaries not used in a test access session	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, tributaries used in test access session	Tributaries not used in a test access session when removing a path protection	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
SNVS - Status, Not in Valid State, Tributary at port in adaptive mode	LO Substructure creation not allowed on ports in adaptive mode	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
SNVS - Status, Not in Valid State, Tributary has existing loopback	LO Substructure creation not allowed while loopback exists	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, Tributary has existing loopback`	No cross-connection loopback existing	"DLT-CRS: Delete cross-connection" (p. 3-145); "ENT-CRS: Enter cross-connection" (p. 3-1464)
`SNVS - Status, Not in Valid State, Tributary has existing loopback`	Test tributary or E or F tributary in a loopback	"CONN-TACC: Connect test access" (p. 3-94)
`SNVS - Status, Not in Valid State, Tributary is not in state wait-to-restore`	wait-to-restore is not pending	"OPR-VCGTRIB: Operate virtual concatenation group tributary" (p. 3-2082)
`SNVS - Status, Not in Valid State, Tributary is used in cross-connection`	no XC loopback on tribs	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
`SNVS - Status, Not in Valid State, Tributary is used in cross-connection loopback`	no XC loopback on tribs	"DLT-PROTN-GRP: Delete protection group" (p. 3-233)
`SNVS - Status, Not in Valid State, Tributary is used in cross-connection loopback`	No XC loopbacks on protection tribs	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, Tributary is used in cross-connection loopback`	no XC loopbacks on tribs	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, Tributary not assigned as a test tributary`	Tributary is not assigned as a test tributary	"RTRV-TACC: Retrieve test access" (p. 3-2974)
`SNVS - Status, Not in Valid State, Tributary used in test access session`	LO Substructure creation not allowed while test session exists	"ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary." (p. 3-1191)
`SNVS - Status, Not in Valid State, Tributary used in test access session`	No test access session	"CONN-TACC: Connect test access" (p. 3-94); "DLT-CRS: Delete cross-connection" (p. 3-145); "DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188); "ENT-CRS: Enter cross-connection" (p. 3-1464); "ENT-PROTN-GRP: Enter protection group" (p. 3-1745); "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035)
`SNVS - Status, Not in Valid State, Tributary used in test access session`	no test access session active	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
`SNVS - Status, Not in Valid State, T-TD enabled`	Not allowed to disable TARP when T-TD is enabled	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, Unframed Clear-Channel not allowed with DS3 path PM`	unframed clear-channel not allowed with DS3 path PM	"ED-T3: Edit DS3 port" (p. 3-1202)
`SNVS - Status, Not in Valid State, Unframed Clear-Channel not allowed with P-bit parity violation monitoring`	unframed clear-channel format not allowed with P-bit parity violation monitoring	"ED-T3: Edit DS3 port" (p. 3-1202)
`SNVS - Status, Not in Valid State, UNI Node IP address not provisioned`	UNI node IP Address must be provisioned	"ED-RSVP: Modify RSVP parameters" (p. 3-857)
`SNVS - Status, Not in Valid State, UNI Node IP Address not provisioned`	UNI node must be created	"RTRV-RSVP: Retrieve RSVP parameters" (p. 3-2823)
`SNVS - Status, Not in Valid State, UNI not enabeld`	Change the portClass to UNI	"ED-STM1E: Edit STM1E port" (p. 3-870)
`SNVS - Status, Not in Valid State, UNI not enabled`	(ONNS specific): Change the eportClass to UNI	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, UNI not enabled`	Change the eportClass to UNI;	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, UNI not enabled`	Change the portClass to UNI	"ED-OC12: Edit OC12 port" (p. 3-523); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC3: Edit OC3 port" (p. 3-461); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-STM1: Edit STM1 port" (p. 3-915); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM4: Edit STM4 port" (p. 3-975); "ED-STM64: Edit STM64 port" (p. 3-1111)
`SNVS - Status, Not in Valid State, unknown IP address within MAP`	Check for known IP address	"DLT-IP-MAP: Delete TCP/IP map" (p. 3-198)
`SNVS - Status, Not in Valid State, unknown module equipage`	Equipage status and inventory data of module must be accessible	"DLT-EQPT (socket): Delete equipment (socket)" (p. 3-188)
`SNVS - Status, Not in Valid State, unknown module equipage`	Equipage Status and Inventory Data of Module must be accessible	"ENT-EQPT (socket): Enter equipment (socket)" (p. 3-1557)
`SNVS - Status, Not in Valid State, unknown module equipage`	Exchangeability I: Equipage status and inventory data of module must be accessible	"ED-EQPT (socket): Edit equipment" (p. 3-379)
`SNVS - Status, Not in Valid State, unknown TARP Manual Adjacent NSAP`	Check for existing TARP manual adjacent NSAP	"DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack" (p. 3-269)

Error code	Meaning (validation rule)	Related to command
`SNVS - Status, Not in Valid State, unsupported MS-SPRing/BLSR DNI/DRI`	Supported MS-SPRing/BLSR DNI/DRI	"CNVT-CCT: Convert cross-connection topology" (p. 3-73)
`SNVS - Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`	No configuration of unsupported VCG tributary structure for EDGE 10GEPL VCG	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`	No configuration of unsupported VCG tributary structure for EDGE or UNI 1GEPL VCG	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`	Setting of eportClass of a 10GEPL VCG to EDGE only possible, if the configured tributary structure is supported	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`	Setting of eportClass of a 1GEPL VCG to EDGE only possible, if the configured tributary structure is supported	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`	Setting of eportClass of a 1GEPL VCG to UNI only possible, if the configured tributary structure is supported	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, VCG is still in use`	(ONNS specific): Setting of eportClass from EDGE to TRADITIONAL only possible, if the VCG tributaries on the port are not in use by ONNS	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, VCG members are still enabled`	Not allowed if a member is enabled	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, Virtual concatenation is disabled`	Parameter modification restrictions while vcat is set to DISABLE	"ED-VCG: Edit virtual concatenation group" (p. 3-1354)
`SNVS - Status, Not in Valid State, worker and protection LOXC must be of same type`	Worker and protection LOXC must be of same type	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
`SNVS - Status, Not in Valid State, working dcc channel is disabled`	dcc protection: working side is disabled	"ED-PROTN-GRP: Edit protection group" (p. 3-803)
`SNVS - Status, Not in Valid State, wrong IP configuration`	check for correct OSI node configuration	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
`SNVS - Status, Not in Valid State, wrong IP configuration`	Check for IP default router LAN	"ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1581)
`SNVS - Status, Not in Valid State, XC destination not usable`	No forced switch to unusable XC slot (Switching Protection Group)	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
`SNVS - Status, Not in Valid State, XC loopback exists on EDGE-wrk or EDGE-prt tributary`	No forced XC loopback must exist on EDGE-prt tributary	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
`SNVS - Status, Not in Valid State, XC loopback exists on EDGE-wrk or EDGE-prt tributary`	No forced XC loopback must exist on EDGE-wrk or EDGE-prt tributary	"DLT-OUC: Delete ONNS to UPSR/SNCP constructs" (p. 3-217)

Error code	Meaning (validation rule)	Related to command
SNVS - Status, Not in Valid State, XC loopback exists on EDGE-wrk or EDGE-prt tributary	No forced XC loopback must exist on EDGE-wrk tributary	"ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1691)
SNVS - Status, Not in Valid State, XC loopbacks still exist at the protection pack	No XC loopbacks allowed	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, XC Pack not provisioned	XC pack is (pre-)provisioned	"CONN-TACC: Connect test access" (p. 3-94); "ENT-CRS: Enter cross-connection" (p. 3-1464); "ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SNVS - Status, Not in Valid State, xcsetup must be TRADITIONAL	check of xcsetup for ip_ad_astn change	"ENT-ULS: Enter upper layer stack" (p. 3-1944)
SNVS - Status, Not in Valid State, tributary used in test access session	no test access session active	"DLT-PROTN-GRP: Delete protection group" (p. 3-233)
SNVS - Status, Not in Valid State. Duplex Control Recovery in progress	No SW installation during Duplex Control Recovery	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
SNVS - Status, Not Valid State	Automatic ring discovery to be disabled	"ED-FETID: Edit far end target identifier" (p. 3-405); "SET-MAP-RING: Set map ring" (p. 3-3142)
SPFA - Status, Protection unit FAiled	RTRV-SPANSW needs functioning XC pack	"RTRV-SPANSWS: Retrieve SPAN switch state" (p. 3-2830)
SPFA - Status, Protection unit FAiled	succeeding switch command	"OPR-PROTNSW: Operate protection switch" (p. 3-2057); "RLS-PROTNSW: Release protection switch" (p. 3-2203)
SPFA - Status, Protection unit FAiled, APS did not succeed	APS switch time constraint	"OPR-PROTNSW: Operate protection switch" (p. 3-2057)
SRAC - Status, Requested Access Configuration invalid, retrieved file NE mismatch	Product mismatch	"CPY-MEM: Copy memory" (p. 3-114)
SRAC - Status, Requested Access Configuration is invalid, retrieved file NE mismatch	Product Mismatch (SRAC)	"RTRV-HDR: Retrieve header" (p. 3-2417)
SROF - Status, Requested Operation Failed	no more than two TARP manual adjacencies per node	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
SROF - Status, Requested Operation Failed	Non-Hardware system difficulties	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
SROF - Status, Requested Operation Failed	Operation Failed (SROF)	"RTRV-HDR: Retrieve header" (p. 3-2417)

Error code	Meaning (validation rule)	Related to command
`SROF - Status, Requested Operation Failed`	Provisioning of TARP manual adjacencies only if TARP enabled	"ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1961)
`SROF - Status, Requested Operation Failed, external communications failure`	Communication Failure (SROF)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`SROF - Status, Requested Operation Failed, external communications failure`	External communication failure	"CPY-MEM: Copy memory" (p. 3-114)
`SROF - Status, Requested Operation Failed, invalid ES64U switch capacity without XC`	No ES64U capacity setting without XC;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SROF - Status, Requested Operation Failed, not all ES64U databases preserved`	Not all databases of ES64U preserved for trial phase;	"APPLY: Apply software generic or activate a downloaded database" (p. 3-35)
`SROF - Status, Requested Operation Failed, processing failure`	Processing Failed (SROF)	"RTRV-HDR: Retrieve header" (p. 3-2417)
`SROF - Status, Requested Operation Failed, unsuccessful file retransmission`	Backup failed after unsuccessful retransmission of files;	"CPY-MEM: Copy memory" (p. 3-114)
`SROF - Status, Requested Operation Failed,, invalid LOXC switch capacity without XC`	No LO switch capacity setting without XC	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SROF - Status, Requested Operation Failed,, invalid TransMUX switch capacity without XC`	No TransMUX capacity setting without XC	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SRQN - Status, invalid request, uid not logged in`	user with uid not logged in	"CANC-USER-SECU: Cancel user security" (p. 3-62)
`SSRD - Status, Switch Request Denied, clock mode inconsistent`	Clock backup switch request when clock mode is free running	"OPR-SYNCNSW: Operate synchronization switch " (p. 3-2077)
`SSRE - Status, System Resources Exceeded (sent by T-TD, TL1_TTD)`	Maximum number of user sessions via T-TD on Gateway NE	"ACT-USER: Activate user" (p. 3-24)
`SSRE - Status, System Resources Exceeded (sent by T-TD, TL1_TTD)`	maximum number of user sessions via T-TD on Gateway NE per TCP connection	"ACT-USER: Activate user" (p. 3-24)
`SSRE - Status, System Resources Exceeded (sent by T-TD, TL1_TTD)`	Maximum number of user sessions via T-TD on Gateway NE with CTL/4	"ACT-USER: Activate user" (p. 3-24)
`SSRE - Status, System Resources Exceeded,  no free DDC-M channel available for ES64U`	Check whether DCC Channel available for ES64U circuit pack ;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
`SSRE - Status, System Resources Exceeded, allowed limit exceeded`	Internal Limit exceeded (SSRE)	"RTRV-HDR: Retrieve header" (p. 3-2417)

Error code	Meaning (validation rule)	Related to command
SSRE - Status, System Resources Exceeded, allowed limit of DCC channels exceeded	(UNI/E-NNI specific): Maximum number of channels assigned to E-NNI	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SSRE - Status, System Resources Exceeded, allowed limit of DCC channels exceeded	(UNI/E-NNI specific): Maximum number of channels assigned to UNI	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SSRE - Status, System Resources Exceeded, allowed limit of neighboring RCs exceeded	Maximum Number of Neighboring RCs	"ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers" (p. 3-1792)
SSRE - Status, System Resources Exceeded, allowed limit of SCN DCC channels exceeded	(SCN specific): Maximum number of channels assigned to SCN	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SSRE - Status, System Resources Exceeded, allowed number of active ES64U packs exceeded	Check number of active ES64U packs ;	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
SSRE - Status, System Resources Exceeded, allowed number of active LOXC packs exceeded	Check number of active LOXC packs	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
SSRE - Status, System Resources Exceeded, allowed number of active TransMUX packs exceeded	Check number of active TransMUX packs	"ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-349)
SSRE - Status, System Resources Exceeded, allowed number of MS SPRING and BLSR protection groups is exceeded	maximum number of 2-fibre and 4-fibre MS SPRING / BLSR protection groups	"ENT-PROTN-GRP: Enter protection group" (p. 3-1745)
SSRE - Status, System Resources Exceeded, ENNI limit of manual route entries exceeded	Check if limit of 64 Manual Routes per ENNI Node exceeded	"DLT-ENNIMANROUTE notification" (p. 3-168); "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1520); "ENT-ENNIMANROUTE notification" (p. 3-1528)
SSRE - Status, System Resources Exceeded, limit of IP-MAP entries exceeded	Check if limit of 20 IP MAP entries exceeded	"ENT-IP-MAP: Enter TCP/IP map" (p. 3-1594)
SSRE - Status, System Resources Exceeded, limit of manual route entries exceeded	Check if limit of 20 Manual MCN IP Routes exceeded	"ENT-MANROUTE-MCN: Enter manual IP route for management communication" (p. 3-1614)

Error code	Meaning (validation rule)	Related to command
SSRE - Status, System Resources Exceeded, limit of manual route entries exceeded	Check if limit of 20 Manual Routes per LAN port exceeded	"DLT-ENNIMANROUTE notification" (p. 3-168); "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1520); "ENT-ENNIMANROUTE notification" (p. 3-1528); "ENT-MANROUTE-LAN: Enter manual route at LAN port" (p. 3-1610)
SSRE - Status, System Resources Exceeded, limit of PJE counters exceeded	Not more than one PJE PM monitor per port	"ED-STS1: Edit STS1 tributary" (p. 3-1177); "ED-VC3: Edit VC3 tributary" (p. 3-1339)
SSRE - Status, System Resources Exceeded, limit of PM monitors exceeded	maximum number of enabled PM monitors	"ED-T3: Edit DS3 port" (p. 3-1202)
SSRE - Status, System Resources Exceeded, limit of PM monitors exceeded	Maximum number of enabled PM monitors	"ED-EC1: Edit EC1 port" (p. 3-317); "ED-EPORT: Edit Ethernet port" (p. 3-329); "ED-OC192: Edit OC192 port" (p. 3-663); "ED-OC48: Edit OC48 port" (p. 3-585); "ED-OC48T: Edit OC48 transparent port" (p. 3-648); "ED-OTU2: Edit OTU2 port" (p. 3-730); "ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-830); "ED-STM16: Edit STM16 port" (p. 3-1035); "ED-STM16T: Edit STM16T port" (p. 3-1097); "ED-STM64: Edit STM64 port" (p. 3-1111); "ED-STS1: Edit STS1 tributary" (p. 3-1177); "ED-VC3: Edit VC3 tributary" (p. 3-1339); "ED-VCG: Edit virtual concatenation group" (p. 3-1354); "ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)
SSRE - Status, System Resources Exceeded, limit of ppgnames exceeded	Maximum number of ppgnames exceeded	"CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ED-PROTN-GRP: Edit protection group" (p. 3-803); "ENT-CRS: Enter cross-connection" (p. 3-1464)
SSRE - Status, System Resources Exceeded, limit of profiles exceeded	Maximum number of profiles	"ENT-ASAP-PROF: Enter alarm severity assignment profile" (p. 3-1446)
SSRE - Status, System Resources Exceeded, limit of profiles exceeded	Maximum number of TCA profiles reached	"ENT-TCA-PROF: Enter TCA Profile" (p. 3-1894)

Error code	Meaning (validation rule)	Related to command
SSRE - Status, System Resources Exceeded, limit of transparent DCC cross-connections exceeded	Maximum of DCC CCs exceeded with CTL/- or CTL/2	"ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1510)
SSRE - Status, System Resources Exceeded, limit of transparent DCC cross-connections exceeded	Maximum of DCC CCs exceeded with CTL/3;	"ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1510)
SSRE - Status, System Resources Exceeded, limit of tribs with loca, locz exceeded	(ONNS specific): Maximum number of tributaries with loca, locz entries must not exceed 100	"ED-STS1: Edit STS1 tributary" (p. 3-1177); "ED-VC3: Edit VC3 tributary" (p. 3-1339)
SSRE - Status, System Resources Exceeded, limit of VLAN Identifiers exceeded	Maximum number of entries in valid VLAN ID list exceeded	"ED-EPORT: Edit Ethernet port" (p. 3-329)
SSRE - Status, System Resources Exceeded, no sufficient backplane bandwidth available	Sufficient backplane bandwidth available	"ENT-VCG – Enter virtual concatenation group" (p. 3-1983)
SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded	Maximum number of channels assigned to MCN on CTL/-	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded	Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL/2	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded	Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL/3;	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded	Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL4	"ENT-FECOM: Enter DCC channel related parameters" (p. 3-1565)
SSTP - Status, Stopped, failed target hardware	Failed Target Hardware (SSTP)	"RTRV-HDR: Retrieve header" (p. 3-2417)
SWFA - Status, Working unit Failed, control hardware failed, missing or initializing	Hardware Failed (SWFA)	"RTRV-HDR: Retrieve header" (p. 3-2417)

15 User privilege codes

List of user privilege codes

TL1 command	User privilege code (UCFC/UCAL)
ACT-L1ROUTING	P1
ACT-USER: Activate user	Any
ALW-MSG: Allow message	M3
APPLY: Apply software generic or activate a downloaded database	S4
AUD: Perform audit data	P3
CANC-L1ROUTING	P1
CANC-USER: Cancel user	Any
CANC-USER-SECU: Cancel user security	S5
CHG-ACCMD: Change access mode	T4
CNVT-CCT: Convert cross-connection topology	P3
CONN-TACC: Connect test access	T4
COPY-RFILE: Copy remote file	S4
CPY-MEM: Copy memory	S4
DISC-TACC: Disconnect test access	T4
DLT-ASAP-PROF: Delete alarm severity assignment profile	M3
DLT-CONN: Delete network connection	P3
DLT-CRS: Delete cross-connection	P3
DLT-CRS-FECOM: Delete transparent DCC cross-connection	M3
DLT-ENNIMANROUTE: Delete manual route from the E-NNI node	S4
DLT-ENNIMANROUTE notification	S4
DLT-EQPT (slot): Delete equipment (slot)	P3
DLT-EQPT (socket): Delete equipment (socket)	P3
DLT-IP-MAP: Delete TCP/IP map	S3

TL1 command	User privilege code (UCFC/UCAL)
DLT-MANROUTE-LAN: Delete manual route at LAN port	S4
DLT-MANROUTE-MCN: Delete one manual MCN IP route entry	S4
DLT-OUC: Delete ONNS to UPSR/SNCP constructs	P3
DLT-PATH: Delete ONNS path connection	P3
DLT-PROTN-GRP: Delete protection group	M4
DLT-RC-NEIGHBOR: Delete a routing controller from the list of neighboring routing controllers	S3
DLT-TCA-PROF: Delete TCA profile	PM3
DLT-ULSDCC-L3: Delete a node ID other than node-1	S3
DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack	S3
DLT-USER-SECU: Delete user security	S5
DLT-VCG – Enter virtual concatenation group	P3
ED-ASAP-PROF: Edit alarm severity assignment profile	M3
ED-CRS: Edit cross-connection	P3
ED-DAT: Edit date and time	S4
ED-EC1: Edit EC1 port	P3
ED-EPORT: Edit Ethernet port	P3
ED-EQPT (CP): Edit equipment (circuit pack)	P3
ED-EQPT (shelf): Edit equipment (shelf)	P3
ED-EQPT (slot): Edit equipment (slot)	P3
ED-EQPT (socket): Edit equipment	P3
ED-EQPT (system): Edit equipment (system)	P3
ED-FETID: Edit far end target identifier	S3
ED-LONIM: Edit lower-order non-intrusive monitor	P3
ED-LOPTF: Edit lower-order path termination function	P3
ED-MAP-RING: Edit map ring	M3
ED-NE: Edit NE	S3
ED-NE-SECU: Edit NE security	S5
ED-NNCNFG: Modify ONNS system configuration	P4
ED-NNCRS: Edit NN cross-connection	P5
ED-OC3: Edit OC3 port	P3
ED-OC12: Edit OC12 port	P3
ED-OC48: Edit OC48 port	P3
ED-OC48T: Edit OC48 transparent port	P3

TL1 command	User privilege code (UCFC/UCAL)
ED-OC192: Edit OC192 port	P3
ED-OTU2: Edit OTU2 port	P3
ED-PATH: Add or modify alias of ONNS connection	P3
ED-PATH-PROT: Modify ONNS connection parameters or protection type	P3
ED-PATH-ROLL: Modify ONNS connection route	P3
ED-PID: Edit password identifier	S1
ED-PROTN-GRP: Edit protection group	M4
ED-PTF: Edit tributary with Path Termination Function (PTF)	P3
ED-RC-GENERAL: Edit general routing controller settings	S3
ED-RSVP: Modify RSVP parameters	S3
ED-STATE-EQPT (system): Edit equipment state	M4
ED-STM1E: Edit STM1E port	P3
ED-STM1: Edit STM1 port	P3
ED-STM4: Edit STM4 port	P3
ED-STM16: Edit STM16 port	P3
ED-STM16T: Edit STM16T port	P3
ED-STM64: Edit STM64 port	P3
ED-STS1: Edit STS1 tributary	P3
ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary.	P3
ED-SYNCDATA: Synchronization of ONNS data	P3
ED-T3: Edit DS3 port	P3
ED-TCA-PROF: Edit TCA profile	PM3
ED-TMAT3: Edit asynchronous adjunct port of the TransMUX card	P3
ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack	S4
ED-USER: Edit user	S1
ED-USER-SECU: Edit user security	S5
ED-VC3: Edit VC3 tributary	P3
ED-VCG: Edit virtual concatenation group	P3
ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application	P3
ED-VCGTRIB: Edit virtual concatenation group tributary	P3
ED-VRTSW: Edit virtual switch	P3
ENT-ASAP-PROF: Enter alarm severity assignment profile	M3
ENT-BANNER	S5

TL1 command	User privilege code (UCFC/UCAL)
ENT-CONN: Establish network connections with TNA address parameters	P3
ENT-CRS: Enter cross-connection	P3
ENT-CRS-FECOM: Enter transparent DCC cross-connection	M3
ENT-ENNIMANROUTE: Enter manual route to the E-NNI node	S4
ENT-ENNIMANROUTE notification	S4
ENT-EQPT (slot): Enter equipment (slot)	P3
ENT-EQPT (socket): Enter equipment (socket)	P3
ENT-FECOM: Enter DCC channel related parameters	S3
ENT-FECOM-LAN: Enter LAN related parameters	S4
ENT-IP-MAP: Enter TCP/IP map	S3
ENT-MANROUTE-LAN: Enter manual route at LAN port	S4
ENT-MANROUTE-MCN: Enter manual IP route for management communication	S4
ENT-OUC: Enter ONNS to UPSR/SNCP constructs	P3
ENT-PATH: Create ONNS path connection	P3
ENT-PROTN-GRP: Enter protection group	M4
ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers	S3
ENT-ROLL: Enter roll	P3
ENT-TCA-PROF: Enter TCA Profile	PM3
ENT-ULS: Enter upper layer stack	S4
ENT-ULSDCC-L3: Create a further OSI node	S4
ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks	S4
ENT-USER-SECU: Enter user security	S5
ENT-VCG – Enter virtual concatenation group	P3
INH-MSG: Inhibit message	M3
INIT-EQPT (slot): Initialize equipment (slot)	M4
INIT-SYS: Initialize system	S4
OPR-DEFRAG: Perform defragmentation	P3
OPR-EXT-CONT: Operate external control	M3
OPR-LPBK: Operate cross-connection loopback	T4
OPR-LPBK: Operate facility loopback	T4
OPR-MAINT-ONNS: Maintenance actions for the ONNS application	P5
OPR-PROTNSW: Operate protection switch	M4
OPR-SYNCNSW: Operate synchronization switch	M4

TL1 command	User privilege code (UCFC/UCAL)
OPR-VCGTRIB: Operate virtual concatenation group tributary	M3
RLS-EXT-CONT: Release external control	M3
RLS-LPBK: Release loopback (cross-connection)	T4
RLS-LPBK: Release loopback (facility)	T4
RLS-PROTNSW: Release protection switch	M4
RLS-SYNCNSW: Release synchronization switch	M4
RTRV-ACTL-CONT: Retrieve actual condition types	M1
RTRV-ACTLCP: Retrieve acceptable circuit pack list	P1
RTRV-ALL: Retrieve all (port)	P1
RTRV-ALL: Retrieve all (tributary)	P1
RTRV-ALM: Retrieve alarm	M1
RTRV-ALM-ENV: Retrieve alarm environment	M1
RTRV-AO: Retrieve autonomous output	S1
RTRV-ASAP-ASGNMT: Retrieve ASAP assignment	M1
RTRV-ASAP-PROF: Retrieve ASAP profile	M1
RTRV-ATTR-CONT: Retrieve attribute control	M1
RTRV-ATTR-ENV: Retrieve attribute environment	M1
RTRV-ATTR-MSG: Retrieve attribute message	M1
RTRV-AUDLOG: Retrieve audit result log for ONNS connection data	P1
RTRV-BANNER	S1
RTRV-CKT: Retrieve circuit	M1
RTRV-COND: Retrieve condition	M1
RTRV-CONN: Retrieve data relevant for network connections	P1
RTRV-CRS: Retrieve cross-connection	P1
RTRV-CRS-FECOM: Retrieve transparent DCC cross-connection	M1
RTRV-EC1: Retrieve EC1 port	P1
RTRV-ELDR: Retrieve ONNS external link data repository	P1
RTRV-ENNIMANROUTE: Retrieve all manual routes of the E-NNI node	S1
RTRV-EPM: Ethernet performance monitoring	PM1
RTRV-EPORT: Retrieve Ethernet port	P1
RTRV-EQPT (bay): Retrieve equipment (bay)	P1
RTRV-EQPT (CP): Retrieve equipment (circuit pack)	P1
RTRV-EQPT (shelf): Retrieve equipment (shelf)	P1
RTRV-EQPT (slot): Retrieve equipment (slot)	P1

TL1 command	User privilege code (UCFC/UCAL)
RTRV-EQPT (socket): Retrieve equipment (socket)	P1
RTRV-EQPT (system): Retrieve Equipment (system)	P1
RTRV-EXT-CONT: Retrieve external control	M1
RTRV-FECOM: Retrieve DCC related parameters	M1
RTRV-FECOM-LAN: Retrieve LAN channel related parameters	S1
RTRV-HDR: Retrieve header	Any
RTRV-IP-MAP: Retrieve TCP/IP map	S1
RTRV-L1ADR: Retrieve level 1 Address Data Repository	P1
RTRV-L1TDR: Retrieve level 1 topology data repository	P1
RTRV-LOG-ALM: Retrieve log alarm	S1
RTRV-LOG-NNEVT: Retrieve NN event log	S1
RTRV-LOG-NTFCN: Retrieve notification log	S1
RTRV-LOG-PROTNSW: Retrieve log protection switch	S1
RTRV-LOG-SECU: Retrieve log security	S5
RTRV-LOPTF: Retrieve low-order path termination function	P1
RTRV-LONIM: Low-order non-intrusive monitor	P1
RTRV-LOXCPM: Retrieve performance monitoring data of LOXC pack	PM1
RTRV-LPBK (cross-connection): Retrieve loopback (cross-connection)	T1
RTRV-LPBK (facility): Retrieve loopback (facility)	T1
RTRV-MANROUTE-MCN: Retrieve manual IP route for management communication	S1
RTRV-MAP-NEIGHBOR: Retrieve map neighbor	S1
RTRV-MAP-NETWORK: Retrieve network map	S1
RTRV-MAP-RING: Retrieve map ring	M1
RTRV-NADR: Retrieve ONNS network (domain) address data repository	P1
RTRV-NE: Retrieve NE	S1
RTRV-NE-SECU: Retrieve NE security	S1
RTRV-NNCNFG: Retrieve ONNS configuration data	P1
RTRV-NNDR: Retrieve ONNS neighbor nodal data repository	P1
RTRV-NNEVT-TCA	P1
RTRV-NTDR: Retrieve ONNS network topology data repository	P1
RTRV-OC3: Retrieve OC3 port	P1
RTRV-OC12: Retrieve OC12 port	P1
RTRV-OC48: Retrieve OC48 port	P1

TL1 command	User privilege code (UCFC/UCAL)
RTRV-OC48T: Retrieve OC48T port	P1
RTRV-OC192: Retrieve OC192 port	P1
RTRV-OTU2: Retrieve OTU2 port	P1
RTRV-OUC: Retrieve ONNS to UPSR/SNCP constructs	P1
RTRV-OW: Retrieve orderwire and user bytes	M1
RTRV-PATH: Retrieve ONNS connection data	P1
RTRV-PM: Retrieve performance monitoring	PM1
RTRV-PREDEFRAG: Perform an ONNS fragmentation analysis	P1
RTRV-PRMTR-DATA: Retrieve parameter data	S1
RTRV-PRMTR-SFTWR: Retrieve parameter software	S1
RTRV-PROTN-GRP: Retrieve protection group	M1
RTRV-PTF: Retrieve tributary with path termination function	P1
RTRV-RC-GENERAL: Retrieve general routing controller settings	S1
RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers	S1
RTRV-RESALLOC-VCG: Retrieve resource allocation virtual concatenation group	P1
RTRV-RSVP: Retrieve RSVP parameters	S1
RTRV-SCN-NEIGHBOR: Retrieve SCN neighbor	S1
RTRV-SPANSWS: Retrieve SPAN switch state	M1
RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack)	M1
RTRV-STATE-EQPT (slot): Retrieve equipment state (slot)	M1
RTRV-STATE-EQPT (socket): Retrieve equipment state	M1
RTRV-STATE-EQPT (system): Retrieve equipment state (system)	M1
RTRV-STM1E: Retrieve STM1E port	P1
RTRV-STM1: Retrieve STM1 port	P1
RTRV-STM4: Retrieve STM4 port	P1
RTRV-STM16: Retrieve STM16 port	P1
RTRV-STM16T: Retrieve STM16T port	P1
RTRV-STM64: Retrieve STM64 port	P1
RTRV-STS1: Retrieve STS1 tributary	P1
RTRV-SYNCN: Retrieve synchronization	M1
RTRV-T3: Retrieve DS3 port	P1
RTRV-TACC: Retrieve test access	T1
RTRV-TCA-ASGNMT: Retrieve TCA assignment	PM1

TL1 command	User privilege code (UCFC/UCAL)
RTRV-TCA-PROF: Retrieve TCA profile	PM1
RTRV-TMAT3: Retrieve asynchronous adjunct port of the TransMUX card	P1
RTRV-TMST3: Retrieve synchronous adjunct port of the TransMUX card	P1
RTRV-TMUXPM: Retrieve performance monitoring data of TransMUX pack	PM1
RTRV-ULS: Retrieve upper layer stack	S1
RTRV-ULSDCC-L3: Retrieve layer 3 related parameters	S1
RTRV-ULSDCC-L4: Retrieve OSI layer 4 related parameters	S1
RTRV-USER: Retrieve user	S2
RTRV-USER-SECU: Retrieve user security	S4
RTRV-VC3: Retrieve VC3 tributary	P1
RTRV-VCG: Retrieve virtual concatenation group	P1
RTRV-VCG-TRANS: Retrieve virtual concatenation group transparent	P1
RTRV-VCGTRIB: Retrieve virtual concatenation group tributary	P1
RTRV-VRTSW: Retrieve virtual switch	P1
SET-ATTR-CONT: Set attribute control	M3
SET-ATTR-ENV: Set attribute environment	M3
SET-MAP-RING: Set map ring	M3
SET-OW: Set orderwire and user bytes	M3
SET-SID: Set SID	S4
SET-SYNCN: Set synchronization	M3

16 Amendments

Overview

Purpose

The amendments are divided into:

- general amendments
- TL1-related amendments.

The syntax of the amendment number (for example, “Amendment 2.0 -nb12345”) is as follows:

- first part: the amendment is known since this release
- second part: internal number.

Contents

General amendments

Overview

Purpose

This section lists the general amendments.

Contents

General

Amendment 9.0 – nb74169

Traffic hits of about 2 ms when plugging the standby XC

When plugging the standby XC pack unexpected traffic hits of about 2 ms can be observed.

Amendment 10.0 – nb80809

Temporary CPFail alarm for standby CTL on autonomous reboot

When the standby CTL reboots autonomously after it was operational (that means *opstate* = OS_Enabled) a temporary `CPFail` alarm is raised for this pack. This alarm clears again after about two minutes, when the standby CTL has started the initial DB synchronization of the CF-Disk contents (that means *opstate* = OS_SYNCHING).

An autonomous reboot of the CTL may happen, for example, due to the following:

- a program exception on standby CTL
- detection that the CF-Disk synchronization does not work anymore

In case of an operator-driven reboot through TL1, `CPFail` is not raised.

Configuration management

Amendment 3.0.1 – nb19693

Unallowed changes of cross-connection parameters while remote test access sessions are provisioned are not rejected properly

If the operator tries to change the interface standard or tributary mode while a test access session for this cross-connection is active then a slightly wrong error message will be returned.

Amendment 3.0.1 – nb03284

IDNV TL1 error code without parameter name

A simple parameter problem within a TL1 command (for example, parameter out of range) will result in an anonymous IDNV error, without mentioning the affected parameter:

```
IDNV /*Input, Data Not Valid */
```

In most cases the TL1 commands are hidden behind the GUI (of for example, *WaveStar®* CIT or EMS), which does those checks up-front or does not allow to enter wrong values.

Amendment 8.0 – nb56630

Not possible to set lower-order switch capacity and ASAPs for LOXC pack together

If the command **`ED-EQPT`** is executed for a LOXC pack which has the lower-order switch capacity (parameter *loswcap*) and the ASAPs (parameters *eqptpn* and *eqptprotpn*) specified, then the command is denied.

Workaround

The operator should change lower-order switch capacity and ASAPs in two separate commands.

Optical network navigation system (ONNS)

Amendment 9.1 – ch00148

Changing of interface standard for ONNS ports may be denied, although all requested conditions are fulfilled

In some cases changing the interface standard of a port of port class other than TRADITIONAL may be denied, although all requested conditions are fulfilled (for example, no cross-connection existing and port control in LOCKOUT).

In detail the cases are:

- change from SONET to SDH for ports with port class INNI
- change from SDH to SONET for all ports with port class different from TRADITIONAL, in case the system default tributary mode is ADAPTIVE
- change from SDH to SONET for ports with port class INNI, in case the system default tributary mode is FIXED

Workaround

In case such a rejection occurs, the following should be applied to an affected port in the given sequence:

1. set port class of affected port to TRADITIONAL
2. change interface standard of affected port as required
3. set port class of affected port back to original value

Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)

Amendment 8.0.1 – nb68076

RTRV-CKT does not return the actual AID for add and drop tributaries in the local node

The Retrieve Circuit TL1 command (**`RTRV-CKT`**) provides the view of the local node on MS-SPRing / BLSR service and extra traffic circuits.

Currently the command does not return the actual AID of tributaries with ring add or drop cross-connections in the local node. Instead the string “REMAID” is returned as it is also done for tributaries of add and drop cross-connections in remote nodes.

Amendment 8.0.1 – nb68388

RTRV-CKT command on non existing tributary does not complete

If RTRV-CKT is used for a tributary, which does not exist (for example, at an empty/unprovisioned slot), then the command does not complete. That means, after the IP (in progress) response there is no further output.

This behavior will lead to time out of the command on management system or *WaveStar®* CIT. The user will not get an indication, why the command failed. The expected response from the system would be an IENE error code.

Area DCN/DCC management

Amendment 3.0.1 – nb17090

No specific error message when 64 DCC channel limit is reached

When the maximum number of available DCC channels is reached, the supplied error message does not distinguish the possible reasons and always replies with:

`SSRE, System Resources Exceeded, allowed limit of DCC channels exceeded.`

There is no distinction if the number of

- SCN (Signaling Communication Network) assignments or
- MCN (Management Communication Network) assignments or
- a combination of both.

is exceeded.

TL1 amendments

Overview

Purpose

This section lists the amendments related to the TL1 commands.

Contents

Administration

Amendment 10.0 – nbnb81953

Missing user ID in forced logout notification

If a user is logged out by a security administrator using the **`CANC-USER-SECU`** command, then the security notification indicating the forced logout does not contain the user ID of the logged out user.

Impact: Other users receiving the security notification do not know which user has been logged out.

Transmission and cross-connection handling

Amendment 9.0 – ch00071

Wrong error code when creating conversion cross-connection with not allowed parameters

If an AU3/AU4 conversion cross-connection is created, and path protection related parameters are specified in the **`ENT-CRS`** command, then the command is denied with one of the wrong error codes:

`Status – Not in Valid State, Parameter(s) present which are not allowed`

`Status – Command Not Found, command not recognized or command parameters not valid`

The expected error response is:

`Input – Data Not Valid, Parameter(s) present which are not allowed`

Amendment 9.1 – nb58910

Running LOXC script causes system to respond with “Status, All Resources Busy, System limit exceed”**, setup or roll of lower-order cross-connections on LOXC40 might fail when issued to fast, e.g. via TL1 script**

When setting up or rolling a lot of lower-order cross-connections being switched on a LambdaUnite NE equipped with LOXC40 it must be avoided to issue the **`ENT-CRS`** or **`ENT-ROLL`** commands too fast.

If the command sequence is sent to the NE too fast some lower-order cross-connection might not be set up correctly on LOXC40 even though all commands are correctly acknowledged by the COMPLD indication.

A reboot by applying a controller reset to the CTL or to the LOXC40 cleans up configuration and ensures to have all cross-connections set up correctly in HW. Waiting for the COMPLD is not sufficient.

When using the ranging support of *WaveStar*® CIT to set up lower-order cross-connections, the issue does not occur because at most 63 lower-order cross-connections can be set up with a single request which does not yet lead to the overload condition on LOXC40.

Workaround:

When issuing a lot of **`ENT-CRS`** commands to set up lower-order cross-connections or **`ENT-ROLL`** commands to roll lower-order cross-connections (for example, through TL1 script),

- limit the number of instances for one command series to 63,
- make the script wait for the NE reaction (COMPLD or DENY) after each single TL1-command sent to the Unite NE before sending the next one, and
- add delays of 500 ms, especially in the case of VC12 and VT1.5 connections, 800 ms in the case of LO-VC3 connections between the e.g. **`ENT-CRS`** commands.

See script examples adding delay below.

Sample of current script:

```
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-1-192-28,1-1-#-#-35-2-1-1:26882::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-1,1-1-#-#-35-2-1-2:26883::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-2,1-1-#-#-35-2-1-3:26884::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-3,1-1-#-#-35-2-1-4:26885::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-4,1-1-#-#-35-2-1-5:26886::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-5,1-1-#-#-35-2-1-6:26887::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-6,1-1-#-#-35-2-1-7:26888::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-7,1-1-#-#-35-2-1-8:26889::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-8,1-1-#-#-35-2-1-9:26890::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-9,1-1-#-#-35-2-1-10:26891::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-10,1-1-#-#-35-2-1-11:26892::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-11,1-1-#-#-35-2-1-12:26893::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-12,1-1-#-#-35-2-1-13:26894::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-13,1-1-#-#-35-2-1-14:26895::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-14,1-1-#-#-35-2-1-15:26896::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-15,1-1-#-#-35-2-1-16:26897::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-16,1-1-#-#-35-2-1-17:26898::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-17,1-1-#-#-35-2-1-18:26899::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-18,1-1-#-#-35-2-1-19:26900::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-19,1-1-#-#-35-2-1-20:26901::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-20,1-1-#-#-35-2-1-21:26902::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-21,1-1-#-#-35-2-1-22:26903::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-22,1-1-#-#-35-2-1-23:26904::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-23,1-1-#-#-35-2-1-24:26905::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-24,1-1-#-#-35-2-1-25:26906::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-25,1-1-#-#-35-2-1-26:26907::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-26,1-1-#-#-35-2-1-27:26908::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-27,1-1-#-#-35-2-1-28:26909::1WAY;
#delay=500
```

A) adding a delay of 500 ms or more if required, will prevent the CTL reboot

Example:

#delay=500, where the delay value is in milliseconds (that is, 500 ms).

B) adding delay more frequently through the script, will also prevent the CTL reboot

Example:

```
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-1-192-28,1-1-#-#-35-2-1-1:26882::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-1,1-1-#-#-35-2-1-2:26883::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-2,1-1-#-#-35-2-1-3:26884::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-3,1-1-#-#-35-2-1-4:26885::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-4,1-1-#-#-35-2-1-5:26886::1WAY;
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-5,1-1-#-#-35-2-1-6:26887::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-6,1-1-#-#-35-2-1-7:26888::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-7,1-1-#-#-35-2-1-8:26889::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-8,1-1-#-#-35-2-1-9:26890::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-9,1-1-#-#-35-2-1-10:26891::1WAY;
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-10,1-1-#-#-35-2-1-11:26892::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-11,1-1-#-#-35-2-1-12:26893::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-12,1-1-#-#-35-2-1-13:26894::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-13,1-1-#-#-35-2-1-14:26895::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-14,1-1-#-#-35-2-1-15:26896::1WAY;
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-15,1-1-#-#-35-2-1-16:26897::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-16,1-1-#-#-35-2-1-17:26898::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-17,1-1-#-#-35-2-1-18:26899::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-18,1-1-#-#-35-2-1-19:26900::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-19,1-1-#-#-35-2-1-20:26901::1WAY;
#delay=500
```

Should the system still exhibit undesired behavior, increase the delay times by a factor of at least 2. If there is a suspicion that not all lower-order cross-connections have been setup as expected, apply a controller reset to the CTL or LOXC pack.

Amendment 9.1 – nb74339

Wrong error code when creating conversion cross-connection with not allowed parameters

If an AU3/AU4 conversion cross-connection is created, and path protection related parameters are specified in the **ENT-CRS** command, then the command is denied with one of the wrong error codes:

```
Status – Not in Valid State, Parameter(s) present which are not allowed
Status – Command Not Found, command not recognized or command
   parameters not valid
```

The correct error code is:

```
Input – Data Not Valid, Parameter(s) present which are not allowed
```

Amendment 10.0 – ch00243

Wrong error when setting outgoing J0 section trace with wrong length

If it is tried to set the outgoing J0 section trace to a value with a length that does not fit to the J0 format specified in the same command, then the **ED-rr** command is denied with the wrong error code:

```
IDNV – Input, Data Not Valid, invalid strcout
```

The correct error code is:

```
IDNC – Input, Data Not Consistent, strcout length must match the given
   outgoing J0 trace mode
```

Amendment 10.0 – nb83216

GE1: Unsupported parameter rcf_htmr reported

When provisioning a GE1 pack, the parameter *rcf_htmr* is reported with the **ENT-EPORT** notification even though it is not supported by this pack. In addition, when retrieving the parameters of a LAN port of a GE1 pack using the command **RTRV-EPORT**, this parameter is erroneously reported.

When trying to modify it, the **ED-EPORT** command is rejected as expected.

Amendment 10.0 – nb83337

ED-VCG returns incorrect error codes for GE10PL1 related VCGs

The system returns the following incorrect error codes on **ED-VCG** for GE10PL1 related VCGs:

1. Try to set *vcat*="DISABLE" for a 1 GbE port on GE10PL1:
   `SDNC – Status, Data Not Consistent, Not allowed on GE10PL1 pack`
   The correct error code is:
   `SNVS – Status, Not in Valid State, Not allowed for 1 GE interfaces`
2. Try to set *istd*="SONET" for a 1 GbE port on GE10PL1:
   `SDNC – Status, Data Not Consistent, Not allowed on GE10PL1`
   The correct error code is:
   `IDNV – Input, Data Not Valid, Interface Standard cannot be modified`

3. Try to set *inputsig*="644" for a 10 GbE port while *vcat* is disabled:
   `SDNC – Status, Data Not Consistent, Not allowed on GE10PL1 pack`
   The correct error code is:
   `SNVS – Status, Not in Valid State, Not allowed if VCAT disabled`
4. Try to set *istd*="SONET" for a 10 GbE port on GE10PL1:
   `IDNV – Input, Data Not Valid`
   The correct error code is:
   `IDNV – Input, Data Not Valid, Interface Standard cannot be modified`

Amendment 10.5 – nb85483

Modification of a GE10PL1-related cross-connection where a specified tributary is not aligned to VC4/STS3C boundary causes a CTL reboot

When modifying a cross-connection using a tributary AID referring to GE10PL1 which is not aligned to a VC4/STS3C boundary (for example, tributary number 192 instead of 190), the CTL performs a reboot, thus losing all management connections. This reboot does not occur with tributary AIDs referring to SDH/SONET ports.

Workaround

Always use aligned tributary AIDs when using commands to modify cross-connections in cut-through mode.

Amendment 11.0 – nb86776

Wrong error code when creating a cross-connection at tributaries which are involved in a test access session

If it is tried to create a lower-order cross-connection with an input or output tributary which is used in a lower-order test access session, then the **`ENT-CRS`** command is denied with the wrong error code:

`SNVS, Status, Not in Valid State, output is already cross connected`

The required error code is:

`SNVS , Status, Not in Valid State, Tributary used in test access session`

Amendment 11.0 – nb86586

Wrong error code when modifying VCG parameters not supported on ES64U

If it is tried to modify parameters of a VGC on an ES64U pack, and the parameters specified in the command are not supported by the ES64U (that means, the parameters can be retrieved but not modified), then the **`ED-VCG-ES64U`** command is denied with the wrong error code:

`SDNC – Status, Data Not Consistent, Not allowed on GE10PL1 pack`

The correct error code would be:

```
SDNC – Status, Data Not Consistent, Not allowed on ES64U pack
```

Amendment 11.0 – nb87553

Wrong error code when creating cross-connections using lower-order tributaries which are used in a lower-order test access session

When trying to create lower-order cross-connections using lower-order tributaries which are used as E-trib or F-trib of a lower-order remote test access session, this request is rejected as required. However, the returned error code is misleading.

```
Status, Not in Valid State, Too many crossconnection originating  from
same tributary
```

The correct error code would be:

```
Status, Not in Valid State, tributary used in test access session
```

Amendment 11.0 – nb87448

DBCHG ENT-CRS-LOxx missing parameters for converting 1way to 2way for lower-order rates

The database change notification of the TL1 command **`ENT-CRS-LO`*`xx`*** for the creation of lower-order cross-connections does not follow the specification. The NE does not report the parameters *rtnxcappl*, *rtnxcnum*, and *rtnomode* in the **`DBCHG`** notification, if an existing 1way lower-order cross-connection is converted to a 2way lower-order cross-connection by the creation of a appropriate cross-connection in the opposite direction.

Workaround

Use the **`RTRV-CRS-LO`*`xx`*** command to retrieve the parameters.

Configuration management

Amendment 9.1 – ch00133

Parameters missing in RTRV response and ENT notification for OTN client port

The problem is related to the OC192/STM64 OTN client port on an OP10/XTT pack. In the ENT-OC192/ENT-STM64 notification for an OTN client port the ENNI parameters *clientNodeID*, *linkResCls*, *localLinkID*, *localLPID*, *neighborSigPCID*, *neighborSigPCIPAddr*, *remAdvNodeID*, *remLinkID* and *remRAID* are missing.

Because the OP10/XTT pack will not be used with ENNI in R9.1 and later, this problem is acceptable for customers. In the RTRC-OC192/RTRV-STM64 response for an OTN client port the parameters *opdis* and *opwl* are missing. The parameters *opdis* and *opwl* are always set to "NA" for client ports at the OP10/XTT, the customer will not loose relevant information.

Amendment 9.1 – nb77810

Wrong error code when path protected cross-connection is converted to 1-Way without specifying the leg to be dropped

When **CNVT-CCT** command is used to convert a lower-order path protected cross-connection to a 1-way cross-connection, and the parameter *in_aid2* with the leg to be dropped is not specified in the command, then the command is denied with the wrong error code:

```
SNVS – Status, Not in Valid State, Parameter(s) present which are not
   allowed
```

The preferred error code for a missing parameter is:

```
IPMS – Input, Parameter Missing, <parameter name> is missing
```

Because *in_aid2* is one of the command parameters, also this error code would be possible:

```
SCNF – Status, Command Not Found, command not recognized or command
   parameters not valid
```

Amendment 10.0 – nb82887

Wrong error code if CNVT-CCT is used with incorrect spec block parameter

When a **CNVT-CCT** command is applied to convert an unprotected cross-connection into a path-protected one using an incorrect value for the SNC type parameter, then the command is denied with the wrong error code:

```
SCNF /* Status, Command Not Found, command not recognized or command
   parameters not valid */
```

The required error code is:

```
IDNV /* Input, Data Not Valid */
```

Amendment 10.0 – nb83091

Unsupported parameters reported with RTRV-PTF-HOSTS1 and the ENT-PTF-HOSTS1 notification

For an STS1 PTF, which has been created by lower-order substructuring (modifier HOSTS1), some parameters are reported with **`RTRV-PTF-HOSTS1`** and in the **`ENT-PTF-HOSTS1`** notification which are not supported and should therefore be omitted. The wrongly reported parameters are:

`ENT-PTF-HOSTS1` notification: *dexcthr*, *feppm*, *neppm*, *pmhpfeses*, *pmhpneses*

`RTRV-PTF-HOSTS1`: *feppm*, *neppm*, *pmhpfeses*, *pmhpneses*

Amendment 10.0 – nb83149

Wrong error code if port of a 2F MS-SPRing/BLSR protection group is set to ENNI

If it is tried to set the port class of a port in a MS-SPRing/BLSR protection group to ENNI, then the **`ED-rr`** command is denied with the wrong error code:

```
SNVS – Status, Not in Valid State, port used for MSSPRING/BLSR
```

The required error code is:

```
SNVS – Status, Not in Valid State, Port must not be a member of a BLSR/
   MS-SPRing protection group
```

Amendment 11.0 – nb84678

Wrong error code on ED-LOPTF with invalid explptrc

If the **`ED-LOPTF-TMSVT`** command is used with an invalid value specified for the parameter *explptrc*, then the command is denied with the wrong error code:

```
IDNV – Input, Data Not Valid, invalid exphptrc
```

The parameter name in the error response is not correct.

The required and preferred error code is:

```
IDNV – Input, Data Not Valid, invalid explptrc
```

Optical network navigation system (ONNS)

Amendment 5.0.1 – nb31503

Grouped NN connection setup via TL1 cut-through accepted with egress EDGE port not being a VCG

When using TL1 cut-through commands it is possible to switch a group of more than one NN connection with ingress EDGE port being a VCG as required, but with the EDGE port being a standard SDH/SONET port.

The connections will be switched according to the ingress and egress tributary number association restrictions as defined for grouped connection setup between VCGs, i.e. there will be a one-to-one mapping of the egress tributary numbers to the ingress tributary numbers selected, egress tributary numbers will not be selectable separately.

Thus, connections out of this grouped setup might not be switched, if for example, corresponding egress tributaries are occupied already. Connections that are switched, however, will work properly.

Workaround

Be careful in choosing egress EDGE VCG identifier, if using **`ENT-PATH`** command in cut-through mode to execute grouped NN connection setup with VCGs.

Connections that might have been set up by accident between a VCG and an SDH/SONET EDGE port can be deleted using the normal connection deletion facility.

Amendment 7.0 – nb42305

Wrong notifications for autorv-connections

Some information in the PTHEVT notifications of a restored autorevertive connection by a signal change from no incoming signal to a valid incoming signal is misleading.

The event text of the PTHEVT notification of the failed path of a restored autorevertive connection is incorrect and shall be ignored. The text should indicate that the failed path of a successful restored connection is still available.

Amendment 8.0 – nb51731

Misleading error-message in case of failed path-roll

When setup a path with 3 legs using ED-PATH the following error message can occur:

```
Error=E018:\" Status, Edge Port Used up \":NodeID=29.54.173.73&1-1-5-1-4
```

Amendment 8.0 – nb61009

Inconsistent PTHEVT if trib is outside portrange

In case an ONNS connection setup is issued with an EDGE tributary on a GE1 port given, that is out of the allowed range, additionally to the expected rejection with the failure reason “Invalid EDGE port” and a corresponding **REPT PTHEVT** notification with the same failure reason a second **REPT PTHEVT** notification is sent with the incorrect and misleading failure reason “EDGE port used up” is sent.

Amendment 9.1 – nb73792

RTRV-CONN command completed instead of denied

A **RTRV-CONN** command with an invalid connection ID or an invalid TNA-address or a not matching connection ID and TNA-address is completed without output instead of denied.

Amendment 9.1 – nb78136

SRLGS not shown in output of RTRV-L1TDR

The TL1 command **RTRV-L1TDR** does not show shared risk link groups (SLRGs).

Amendment 9.1 – nb78498

Link defragmentation (OPR-DEFRAG) executed to ports of port class other than INNI formally accepted or denied with misleading error code

Although link defragmentation including “empty port” is only supported for INNI links, that is, can only be executed to ports of port class INNI, the following misbehavior may be observed:

If **OPR-DEFRAG** executed to a port of port class other than INNI, the action may be formally answered with completion code (thus pretending acceptance) or may be rejected with the misleading error response:

```
E621, No Target Port available
```

However, also if command is wrongly formally accepted, no action will be really executed and no traffic will be affected.

Workaround

Take care to execute link defragmentation (including “empty port”) only to INNI ports. Otherwise ignore responses as described above.

Amendment 9.1 – nb78846

Wrong error code when setting portClass to UNI without necessary parameters specified

If the port class is set to UNI and the parameters *clientNodeID*, *networkTNAAddress*, and *localLPID* are not specified in the command, then the **ED-RR** command is denied with the wrong error code:

`IDNV – Input, Data Not Valid, additional parameters required`

The expected error code is:

```
IDNV – Input, Data Not Valid, UNI parameters must be different to their
   DEFAULT values
```

Amendment 10.0 – nb82588

Missing validations related to allowed values and uniqueness when configuring ONNS SCN IP addresses

When configuring ONNS SCN IP addresses via **`ENT-ULS`**, there are no validations applied in the NE or in the management systems to deny invalid values or value ranges (for example, values 0.0.0.0 or 1.1.1.1) or to check uniqueness of ONNS SCN IP address within a domain. As a consequence, corresponding wrong settings would be accepted.

Such wrongly configured ONNS SCN IP addresses could lead to unpredictable behavior of the ONNS network.

Workaround

Be careful when configuring ONNS SCN IP addresses.

Amendment 10.0 – nb83005

Wrong error code if worker port of a MSP protection group is set to INNI

If it is tried to set the port class of the worker port of a 1:1 MSP to INNI, then the **`ED-rr`** command is denied with the wrong error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

The required error code is:

```
SNVS – Status, Not in Valid State, Port must not be member of a
   protection group
```

Amendment 10.0 – nb83318

Unspecific error codes in case of failed network connection setup

In the following cases the unspecific error code `E009 – Service affecting defect` is notified in case of a failure of a network connection setup:

- The egress port specified for the destination domain is not available.
  The correct error code is: `E008 – Invalid Egress address`
- An E-NNI link determined by routing is not available.
  The correct error code is:
  `E006 – Selected port on eNNI link already in use`

Amendment 10.0 – nb83357

Failure notifications may be unspecific during network connection setup failures

Notifications for **`ENT-CONN`** do not correctly distinguish on which port (EDGE or E-NNI) the problems are. This is especially the case if the domain only consists of one node.

In case a network connection setup fails due to a problem in a domain with coinciding A-node and Z-node for this connection, corresponding error notifications may be unspecific in mixing up `E006 – Selected port on eNNI link already in use` and `E007 – Invalid egress address`.

Amendment 10.5 – nb85399

Value "N/A" not supported for parameter ″protType″ in ENT-CONN

Within the **`ENT-CONN`** command, the value "N/A" for parameter *protType* is not supported. It is only possible to request either purely unprotected (value 0x1) or 1+1 protected (value 1+1) ENNI links for the requested network connection. It is not possible to specify that all available ENNI links irrelevant of their protection type can be used.

Amendment 10.5 – nb85192

RCDEAD alarm contains neighbor RC IP address instead of RA ID

The RCDEAD alarm raised by a routing controller in case of a routing controller (RC) in a neighbor routing area (RA) not being reachable will contain the IP address of the affected neighbor RC instead of the corresponding RA ID.

Workaround

As long as RC redundancy is not implemented, there is a 1 to 1 relationship between RA ID and RC IP address.

Amendment 10.5 – nb85411

Inconsistent or corrupt reporting of NO-IN condition clearing for ONNS connections

For the various types of ONNS connections, reporting of connection state transition from CON&NO-IN to CON&OK is inconsistent: For types AUTONR, N1PLUS1, and P1PLUS1, this transition will be reported as "Connection is OK", while for other types it will be reported as "EDGE port, IN Signal Fault has cleared". For type YCONN, the corresponding notification may even be corrupted.

Amendment 10.5 – nb85593

Misleading error notification in case of network connection setup failure due to unknown TNA

In case the setup of a network connection is denied due to a unknown TNA specified, the setup will be denied correctly. However, a **REPT CONNCHG** notification may be received with the misleading error code:

`E009, Service affecting defect – No route to destination found`

Amendment 11.0 – nb86788

Misleading error code in case of failed ONNS connection setup with certain constraints

In case of failure of an ONNS connection setup with given exclude and/or explicit constraints due to insufficient bandwidth, this failure may sometimes be reported with the misleading error response

`E033, INLI, Node list has Invalid/unknown ID`

instead of

`E001, ISNR, Insufficient Network Resources for conenction setup`

This misbehavior occurs if the given setup constraints are such that due to these constraints an explicit node given or the Z-node is not rereachablet all.

Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)

Amendment 3.0.1 – nb 18762

1+1 MSP accept incomplete Operate Protection Switch commands

For 1+1 MSP, incomplete Operate Protection Switch commands are accepted:

- Operate Protection Switch command with parameter source *sc=lockout* and without parameter destination *dest* is accepted. This is not a real problem, because the *dest* is redundant information.
- Operate Protection Switch command with parameter destination *dest=wkg* should not be accepted without the source information. The resultant state Manual Switch is not worse because it does not prevent further automatic switching.

Amendment 6.0 – nb35660

Wrong error code if tributary of OPT2G5 is used as input for path protection

If a path protected cross-connection is created with a tributary of an OPT2G5 as protection leg, then the command is denied with the unspecific error code:

```
IDNV – Input, Data Not Valid
```

The expected error code is:

```
IDNC – Input, Data Not Consistent, no OPT2G5-trib as input-trib in
   pathprotected crossconnection
```

(This correct error code is returned if the working leg is on an OPT2G5.)

Amendment 6.0 – nb40929

Unprecise error message for ED-MAP-RING

When the TL1 command **`ED-MAP-RING`** is used to provision the MS-SPRing / BLSR ring topology and different numbers of ring node identifiers and ring node target identifiers are entered, the command is denied. However, the related error message is not precise enough, but it simply states:

```
Input, Data Not Valid
```

The expected error code is:

```
Input, Data Not Valid, different number of values in rnids and rtids
```

Amendment 8.0 – nb64251

Wrong error code when locz/loca is entered on creation of a higher-order cross-connection to/from the protection bandwidth of an MS-SPRing / BLSR

When the *locz* parameter is present for the **ENT-CRS** command which tries to provision a higher-order add cross-connection to the protection bandwidth of a 2 fibre MS-SPRing / BLSR or when the *loca* parameter is present for an attempt to provision a higher-order drop cross-connection from the protection bandwidth of a 2 fibre MS-SPRing / BLSR, the system denies the command with an incorrect error code:

`IDNV: Input Data Not Valid`

The expected error code is:

```
SNVS – Command refers to protection tributaries of a BLSR/MS-SPRing
   protection
```

Amendment 9.0 – nb74289

Wrong error code when creating TOPEX protection group with SONET ports

When it is tried to create a 4F TOPEX protection group using 4 SONET ports, then the **ENT-PROTN-GRP** command is denied with the wrong error code:

```
SNVS – Status, Not in Valid State, port rate not supported for this
protection type
```

The correct error code is:

```
SNVS – Status, Not in Valid State, SONET port not allowed for TOP
```

Amendment 10.0 – nb83091

Unsupported parameters reported with RTRV-PTF-HOSTS1 and the ENT-PTF-HOSTS1 notification

When it is tried to create a 4F TOPEX protection group using 4 SONET ports, then the **ENT-PROTN-GRP** command is denied with the wrong error code:

```
SNVS – Status, Not in Valid State, port rate not supported for this
protection type
```

The correct error code is:

```
SNVS – Status, Not in Valid State, SONET port not allowed for TOP
```

Fault/Alarm management

Amendment 3.0.1 – nb20283

Changes of tributary output modes for test access sessions are not notified

Changing test modes of a remote test access session does not generate change notification for *eomode* or *fomode*, but the value really changes. However the retrieval of this test access session delivers the correct values.

Amendment 11.0 – nb86806

RTRV-LOG-ALM with reply type DBSYNC does not return log entries

If the **`RTRV-LOG-ALM`** command is used with reply type DBSYNC and no start date and time specified, then the command does not complete (time-out on management systems or *WaveStar*® CIT).

Remote test access

Amendment 3.0.1 – nb19569

Establishment of remote test access for bridged cross-connections is not rejected properly

If an operator tries to create a remote test access session on a cross-connection which is bridged (broadcast) then the operator gets a wrong error message.

Amendment 4.0 – nb20634

Changes of tributary output modes of test access sessions are not notified

Changing test modes of remote test access session does not generate change notification for *eomode* or *fomode* if the value really changes. However the retrieval of this test access session is correct.

Amendment 11.0 – nb87012

Wrong error code when creating lower-order test access in MONEF mode without secondary test access tributary

If the **`CONN-TACC-LOVT1`** command is executed which has the test access mode (*tstmde*) MONEF specified, but no secondary test access tributary (*tatrib2*), then the command is denied with the wrong error code:

```
IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist
```

DCN/DCC management

Amendment 3.0.1 – nb21562

No specific error message when 64 DCC channel limit reached

When the maximum number of available DCC channels is reached, the supplied error message does not distinguish the possible reasons and always replies with:

```
SSRE, System Resources Exceeded, allowed limit of DCC channels exceeded
```

In case the maximum number is exceeded due to SCN assignments, expected message is:

```
SSRE, System Resources Exceeded, allowed limit of SCN DCC channels
exceeded
```

In case the maximum number is exceeded due to combined MCN+SCN assignments, expected message is:

```
SSRE, System Resources Exceeded, overall limit of DCC channels exceeded
```
